The CPSIA has had the effective of creating new barriers of entry in the children's product market, once one of America's most entrepreneurial industries. The burdens are heavy in the toy industry but even worse in related industries like juvenile products. Large companies with steady cash flow enjoy considerable and valuable advantages over entrepreneurs who must put large sums of money at risk in their initial investment in compliance costs before receiving their first dollar of revenue. The effect of the CPSIA is one of picking winners and losers in affected markets. I question whether this is the appropriate role of the federal government in our markets.

We believe that these heavy costs will discourage investment in new products, by new entrants, by existing players and especially by small businesses. Recently, at the CPSC's hearing on the looming 100 ppm lead standard, representatives of the bicycle industry noted that in the wake of the 300 ppm lead standard, many small bicycle manufacturers have already left the market and large companies cut their product lines considerably. I have long predicted a reduction in product diversity as a necessary consequence of the CPSIA. Other evidence of market contraction exists, as well. At this year's ICPHSO, CPSC Acting Director of the Office of Compliance and Field Operations Robert ("Jay") Howell noted the CPSC's challenge in identifying a test lab that has or will agree to equip itself as a certified test lab for ATVs. Why? So many ATV manufacturers have stopped producing youth model ATVs under the effective ban by the CPSIA's lead standards that testing labs can't justify the capital investment to provide CPSIA compliance testing. Product diversity is declining all over the children's product market.

Toymakers will experience the same depressing effect and yes, that means that the next Trivial Pursuit inventor may be washed out. We may never know because the absence of a new toy or novel game will be hard to detect in the ad-driven, promotional toy market. It is clear, however, that entrepreneurs are free to deploy their capital wherever they want – they are seeking returns on their capital - so the combination of high CPSIA compliance costs, high regulatory risk, high legal costs and a generally hostile regulatory environment seems unlikely to attract new entrants to the toy market. War stories will also discourage new entrants – the well-known experience of toymakers who have suffered under this regulatory regime.

As a practical matter, the rules and regulations put out by the CPSC to implement the CPSIA for toys are incomprehensible, not to mention incomplete. We are now 31 months into the CPSIA era, yet the CPSC has yet to promulgate a final phthalate standard or certify even one phthalates testing lab. EACH and EVERY toy must be "phthalate-free" but the CPSC has yet to tell us how to know it has achieved this goal. This means we are subject to the risk that they will invalidate all the work we have done since 2008. While this regulatory delay is simply outrageous, it is more likely proof of the defects in the CPSIA than a sign of failure by the CPSC. Even the largest companies have complained to the CPSC about the blizzard of rules and interpretations. One of great frustrations in attempting to comply with the new rules is that many CPSC legal interpretations have been given in private letters, orally in speeches or even in the form of voicemails. Access to such information may be critical but is obviously inaccessible to anyone not obsessively watching every minute of every video, reading every letter,

attending every meeting or hearing and talking to every stakeholder in an attempt to master the breadth of this ever-morphing regulatory scheme.

3. Does the existence of a small business ombudsman at the agency solve the compliance problem?

The office of the Small Business Ombudsman serves a useful purpose as a friendly point of contact and possible advocate for small business within the agency. That said, there is no evidence that the office has power to make decisions, change policy or offer its own definitive interpretation of rules. For small businesses totally at a loss, the ombudsman is a good place to turn to for plain English answers to basic questions about rules. Notably, the office is not permitted to make decisions on behalf of the agency. The Ombudsman does not have the authority to make problems "go away". For this reason, the ombudsman function appears to be the regulatory equivalent of a shoulder to cry on. The current ombudsman, Neil Cohen, has been a good friend to the small business community, but unfortunately, he doesn't write the rules.

4. What problems do you anticipate occurring as a result of the public database?

We know that the public database will be administered on a post-it-and-forget-it basis. Based on our dealings with the agency, I believe that the agency will post all incidents unless a mistaken identity can be proven. As a consequence, we anticipate that the database will be allowed to be filled up with "incidents" that are conjectural, misleading or even proven WRONG. In the first and only filing against our company, an anonymous complaint accused one of our products of posing a small parts hazard. That accusation was based on an image viewed on a website – there is no indication that the filer had ever handled our product. Consequently, the filer had no reasonable basis for the small parts claim. As a matter of fact, we routinely test for small parts and have done so for years, and when we presented a valid CPSIA test report under F963 (and EN71, the European standard), we were told by the General Counsel of the CPSC that the claim would nevertheless be eligible to be published under current rules. Thus, we KNOW that the false and misleading filings will KNOWINGLY be published by the CPSC even if PROVEN false. *We believe this flagrantly violates our basic right to due process and creates the potential for damaging "feeding frenzies" that can consume our products and brands.*

Other claims may relate to "hazards" which affect a wide swath of products already well-known by regulators and industry. This presents many risks to industry and to brands. What will a consumer make of a "report of harm" relating to a general hazard and only one particular product? Is this a minor incident or a harbinger of a real risk? Should they stop using the product? Should they stop using the particular model or brand which is subject of the complaint? Given that many products may present the same hazard (for instance, that an electrical cord could pose a strangulation hazard), how does this information help consumers? Will consumers actually understand the issue and be able to put it into some sort of perspective? And when incidents accumulate, as they are likely to do, presumably the brands and models with the largest numbers in distribution will have more incidents even though, ironically, they may be better constructed and "safer"

than the alternatives. Will consumers falsely conclude that the models with more incidents are less safe and turn to something that really is?

Responding to this type of complaint obviously creates a new and terrible dilemma for manufacturers. Should they expend resources to respond? Do they need to lay out "a brief" about the nature of the failure and why their product is named? Will people just view whatever they say as unreliable, self-serving information or will they really be able to internalize the data? As noted above, most people will not be able to put these incidents in any kind of perspective. The only thing we know for certain is that brands and companies will be the losers.

The public portrayal of the database belies the unverified nature of the filings. Notwithstanding the disclaimers made by the agency, even esteemed media outlets like *The New York Times* refer to the database as a "database of unsafe products". Unsafe? That label presumes some kind of judgment or filter prior to filing, which even *The New York Times* must assume is being provided by the CPSC. Ironically, the CPSC is doing everything possible to avoid providing that service. The result may be disastrous for American manufacturers, importers, private labelers and retailers of children's products. It will be yet another self-inflicted economic injury.

5. **What can Congress do to return the agency to one that regulates on the basis of risk?**

Congress should mandate that the CPSC use principles of risk assessment to make all decisions relating to regulation of children's products. The legislatively-mandated use of judgment and proportionality will likely lead to better rulemaking and more regulatory common sense. It is the legislative banishing of the exercise of judgment that led to the devastation of the bicycle industry, the elimination of youth model ATVs from the market (even though those products owe their very existence to a concerted effort by the CPSC to protect children from injury on adult-sized ATVs), the banning of all products made of brass, the senseless and almost neurotic banning of rhinestones as embellishments on children's clothing, shoes and jewelry, and so on. NONE of these changes in rules have been tied to even ONE avoided injury.

Congress should also mandate the use of principles of cost-benefit analysis by the agency in its rulemaking processes. Under the CPSIA, all considerations of economics have flown out the window with predictably disastrous results. We can operate our government better according to basic common sense notions of cost-benefit analysis.

KID

Responses to questions from the Honorable G.K. Butterfield
Commerce, Manufacturing and Trade "A Review of CPSIA and CPSC Resources"
From Nancy A. Cowles, Kids In Danger
March 21, 2011

Can you please explain the mouthing behaviors of infants, toddlers, young children and not so young children and how lead in zippers, snaps, and other non-textile closures or embellishments can be ingested by infants, toddlers and other young children?

The main pathway for lead ingestion is getting lead on the hands and then putting hands into the mouth. Lead can be transferred from a surface to the hand and then to food or other objects put into the mouth or the hand directly put into the mouth. One particularly good quality study involved observation of children playing in a yard and video-observed their hand-to-mouth behavior and evaluated relationship of oral behaviors to children's blood lead levels. Children with higher hand-to-mouth occurrences had correspondingly higher blood lead levels. Investigators video-observed children ages 1-5 years putting a hand in their mouth 7 times hourly (maximum 67 times/hour) and an object or food in their mouth 17 time hourly (maximum 125 times/hour).[i] Embellishments on children's clothing are very likely to be handled by the child in dressing, playing, admiring the outfit's embellishments, etc.

Can you please discuss any science-based studies showing increases in children's blood lead levels from mouthing or hand to mouth contact?

A review of reports that describe children's mouthing was published by the U.S. Environmental Protection Agency in 2009.[ii] The EPA report has a significant quantity of similar data, with frequency of oral behaviors and minutes/day of mouthing. The amount of lead that would be transferred to a child may depend on mouthing behavior (times/hour and minutes/day) and the transfer rate of lead from the object to the hand (if the object is touched and not directly mouthed). Children as old as 10-12 years put their hand in their mouth an average of 4 times hourly. This rate is much higher among younger children, and exposures from mouthing behaviors can occur for several hours daily per child. Even for adult workers, hand lead is associated with blood lead level.[iii]

In addition, the Centers for Disease Control and Prevention's Mortality and Morbidity Weekly Report (CDC MMWR) has published cases of lead

email@KidsInDanger.org

poisoning not related to ingestion of objects. Most recently, the MMWR published a case study of a toddler poisoned by a metal charm on a necklace he wore and mouthed regularly.[iv] The MMWR has also published cases of lead poisoning from eating off lead-tainted dishware;[v] lead dust contamination of family vehicles;[vi] and exposure to led at a firing range among adolescent members of a shooting team.[vii]

Can you provide any information regarding the extent to which lead has been found in zippers, snaps, and other non-textile closures or embellishments used on children's products?

From 2002 to present, KID indentified 19 examples of clothing products or accessories recalled by CPSC because of lead in the fasteners or embellishments[viii]. It should be noted that prior to passage of the CPSIA in 2008, testing for lead in products was not required – therefore it is likely that many products might have contained lead, but only these were discovered. In addition, the testing requirement in CPSIA has been stayed, so even current clothing may still have lead-tainted fasteners or embellishments that have gone undetected.

FINANCIAL SERVICES AND GENERAL GOVERNMENT APPROPRIATIONS FOR 2012

FRIDAY, FEBRUARY 11, 2011.

U.S. POSTAL SERVICE INSPECTOR GENERAL

WITNESS

DAVID C. WILLIAMS, INSPECTOR GENERAL

Mrs. EMERSON. We will come to order. And I want to thank everybody for being here. Good morning.

Good morning, Inspector General Williams. Thank you so much for being here today. We are happy to have you.

And I want to welcome my colleagues, our ranking member, Joe Serrano, from the Bronx, New York.

And you haven't been here to hear our repartee about the Yankees and the Cardinals. We will refrain from that. We did a little bit yesterday. And, actually, I have a Kansas City Royals fan down here, but I do have another Cardinals fan, so that is pretty nice.

Mr. SERRANO. The Cardinals are still in the league?

Mrs. EMERSON. That is a good one, Joe. We are going to have to have running bets on Pujols, all right?

And Mr. Diaz-Balart.

So, anyway, thank you so much for being here. And you have a tough job, a really tough job. And I know that a lot of my colleagues are not familiar with the way that the Postal Service works and don't know that it is the largest civilian Federal agency, with 599,000 career employees and operating a total of about 37,000 facilities nationwide.

The Postal Service has annual spending expenses of approximately $75 billion and, in fiscal year 2010, had an $8.5 billion deficit.

With few exceptions, the Postal Service operations are self-funded and not in our jurisdiction on the Appropriations Committee. We only provide $75 million for mail for the blind and people with disabilities and for overseas voting. An additional $29 million is provided in our bill for reimbursement of insufficient appropriations to the Postal Service for fiscal years 1991 through 1993.

While the committee has limited jurisdiction over the Postal Service, it does provide $244 million for the Office of the Inspector General, of which $98 million is for audits to improve USPS operations and $147 million is for investigations into waste, fraud, and abuse.

With one of the largest inspector general budgets in the Federal Government, we do want to understand how you all are using your resources. Additionally, with the Postal Service facing long-term fi-

nancial challenges, we also want to know how you all are using the resources we give you to improve Postal Service operations and identify inefficiencies.

I look forward to your testimony.

And, with that, I would like to recognize the subcommittee's ranking member, Mr. Serrano, for any opening statements you wish to make, Joe.

Mr. SERRANO. Thank you so much.

I would also like to welcome you, Inspector General David C. Williams, to this hearing of the Financial Services and General Government Subcommittee. I am looking forward to hearing your testimony and having the opportunity to ask questions about your ongoing investigations.

The Postal Service plays, as we all know, a very important role in the lives of all of us who are dependent on timely mail delivery. I also understand that, because of declining mail volume, the Postal Service is now facing a significant budgetary shortfall.

In 2010, the postal OIG published a report addressing questions of whether there were possible overpayments made by the Postal Service to the Civil Service Retirement System pension fund. I look forward to discussing the results of this study and other issues with you at today's hearing.

I also want to mention how pleased I was with the 2009 report entitled, "U.S. Postal Service Electrification of Delivery Vehicles," which concluded that the use of electric vehicles would be operationally feasible, but requires a way to address the significant front-end cost issue. I will discuss this issue with you further during our question period.

So we thank you for the testimony you are about to give us. We thank you for your service. We know that the Postal Service is one agency we all want to be supportive of; we just, in all honesty, don't know how to deal with this major problem. But something will have to be done unless we just wrap it up, and I don't see that happening. So it continues to be one of the most dramatic challenges that we have around here.

So, once again, thank you for being before us today.

Mrs. EMERSON. Thank you, Joe.

I also want to recognize Ms. Barbara Lee from Oakland, California.

Now I will recognize you, Inspector General Williams. If you wouldn't mind keeping your statement to 5 minutes so that we have as much time as possible for questions and answers. Thank you.

Mr. WILLIAMS. Thank you, Madam Chairman, Mr. Serrano, and members of the subcommittee.

The Postal Service's situation is serious. Its leadership anticipates running out of money in September. Mail volume has dropped by 20 percent since 2006. And the monopoly no longer finances universal mail service for the Nation.

The situation is the product of an oversized postal networks, crippling payments for benefit funds, the lingering recession, and the disruption of the digital age. Lastly, the Postal Service's mission to bind the Nation together through a common communication infrastructure is evolving faster than the Postal Service can adapt.

Burdensome and flawed benefit payments have contributed to almost 90 percent of the $20 billion loss in the past 4 years. This has raised the cost of the infrastructure, postage rates, and forced the Postal Service to incur debt. My office has produced a series of reports highlighting the exaggerated estimates, enormous overcharges, and excessive prefunding levels that plague the retiree pension and health-care systems.

To continue contributing to funds that now appear to exceed the 100-percent funding levels is even more egregious when compared against benchmarks in the public and private sector and OPM's levels. I agree with Senator Susan Collins's call in September 2010 for OPM to change, under the current law, its calculation of Postal Service CSRS pension fund payments.

In the near term, the Postal Service and Congress should consider halting further payments to benefit funds until the surplus is used, funds restructured, and mistakes corrected. The Postal Service can use this time to learn how to live below or within the Consumer Price Index, shed its debt, and find its role in the digital age.

The Postal Accountability and Enhancement Act incentivizes the Postal Service to adopt a leaner, volume-driven infrastructure to assure readiness for the 21st century. This will require optimization of the network of post offices and plants; conversion to evaluated letter carrier routes to allow effective management; flexible work rules to match the ebb and flow of mail; a comprehensive delivery point strategy that maximizes curbside delivery and cluster boxes; simplification of mail acceptance and pricing; and evaluating the need for 74 districts, 7 areas, and 2 law enforcement agencies.

I mentioned earlier the disruption of the digital age as contributing to the Postal Service's instability. The digital age and globalization have put America on the cusp of a new age. Technological advances have given America low-cost instant communications, sophisticated data organization, search engines, hyperlinks, impressive mobility, and more.

However, the twin forces of the digital age and globalization grew at an unbridled pace. And as they leave their infancy, we see insecure platforms for financial transactions, a lengthening trail of American digital refugees, lack of confidentiality for communication content, predatory practices in the conversion of digital cash to currency, patterns of invasive digital profiling by infrastructure operators, emerging issues associated with Net neutrality, and a shocking loss of privacy.

These practices and others are unwelcome by many Americans. The Nation has not fully explored the respective roles of the private sector and governmental entities in addressing these issues.

Additionally, substantial elements of the Nation's communications infrastructure have passed from governmental to corporate hands. This transition has important positive aspects, but such sweeping change suggests the need for thoughtful examination to ensure that segments of society are not excluded and America's leading edge continues to advance.

Postal products and technological solutions are imperfect, but joining the two together might address some of the shortcomings

of each and provide a set of solutions and serve as a bridge to the 21st century.

I have outlined the need for substantial change to increase the readiness and recognize the Postal Service's role in positioning America in the communications revolution. The engine for this transformation is innovation, and the Postal Service needs to strengthen its systems for innovation. Innovators collaborate with customers, take risks, make mistakes; stop failures quickly and replicate successes. The Postal Service's success depends on embracing this environment.

Federal financial raids on the Postal Service have to be halted; and the Postal Service should be taken back off-budget as originally designed, and the benefit funds restructured. We will need strong collaborative efforts to enable the Postal Service to serve Americans in the 21st century.

Thank you, Madam Chairman.

[The information follows:]

Hearing before the Subcommittee on Financial Services and General Government, Committee on Appropriations House of Representatives

Oral Statement

Postal Service Inspector General Budget Hearing

February 11, 2011

David C. Williams
Inspector General
United States Postal Service

Madam Chairwoman and members of the subcommittee, the Postal Service's situation is serious, its leadership anticipates running out of money in September, mail volume has dropped by 20 percent since 2006, and the monopoly no longer finances universal mail service for the nation. This situation is the product of oversized Postal Service networks, crippling payments for benefit funds, the lingering recession, and the disruption of the digital age. Lastly, the Postal Service's mission to bind the nation together through a common communication infrastructure is evolving faster than the Postal Service can adapt.

Burdensome and flawed benefit payments have contributed to almost 90 percent of the $20 billion loss in the past 4 years. This has raised the cost of the infrastructure, postage rates, and forced the Postal Service to incur debt. My office has produced a series of reports highlighting the exaggerated estimates, enormous overcharges, and excessive prefunding levels that plague the retiree pension and health care systems. To continue contributing to funds that now appear to exceed the 100 percent funding levels is even more egregious when compared against benchmarks in the public and private sector and OPM's levels. I agree with Senator Susan Collins' call in September 2010 for the OPM to change, under current law, its calculation of Postal Service CSRS pension fund payments.

- In the near term, the Postal Service and Congress should consider halting further payments to benefit funds until the surplus is used, funds

restructured, and mistakes corrected. The Postal Service can use this time to learn how to live below or within the Consumer Price Index, shed its debt, and find its role in the digital age.

The Postal Accountability and Enhancement Act incentivizes the Postal Service to adopt a leaner volume driven infrastructure to assure readiness for the 21st century. This will require:

- Optimization of the network of post offices and plants;
- Conversion to evaluated letter carrier routes to allow effective management;
- Flexible work rules to match the ebb and flow of mail;
- A comprehensive delivery point strategy that maximizes curb side delivery and cluster boxes;
- Simplification of mail acceptance and pricing; and
- Evaluating the need for 74 districts, 7 Areas, and two law enforcement agencies.

I mentioned earlier the disruption of the digital age as contributing to the Postal Service's instability. The digital age and globalization have put America on the cusp of a new age. Technological advances have given America low cost instant communications, sophisticated data organization, search engines, hyper links, impressive mobility, and more.

However, the twin forces of the digital age and globalization grew at an unbridled pace and as they leave their infancy we see:

- Insecure platforms for financial transactions,
- A lengthening trail of American digital refugees,
- Lack of confidentiality for communication content,
- Predatory practices in the conversion of digital cash to currency,
- Patterns of invasive digital profiling by infrastructure operators,
- Emerging issues associated with net neutrality; and
- A shocking loss of privacy.

These practices and others are unwelcome by many Americans. The nation has not fully explored the respective roles of the private sector and governmental entities in addressing these issues. Additionally, substantial elements of the nation's communications infrastructure have passed from governmental to corporate hands. This transition has important positive aspects, but such sweeping change suggests the need for thoughtful examination to ensure that segments of society are not excluded and America's leading edge continues to advance.

Postal products and technological solutions are imperfect, but joining the two together might address the short comings of each, provide a set of solutions, and serve as a bridge to the 21st century.

I have outlined the need for substantial change to increase readiness and recognize the Postal Service's role in positioning America in the communications revolution. The engine for this transformation is innovation and the Postal Service needs to strengthen its systems for innovation. Innovators collaborate with customers, take risks, make mistakes, stop failures quickly, and replicate successes. The Postal Service's success depends on embracing this environment.

Federal financial raids on the Postal Service have to be halted; and the Postal Service should be taken back off-budget as originally designed, and the benefit funds restructured. We will need strong collaborative efforts to enable the Postal Service to serve Americans in the 21st Century.

United States Postal Service
Office of Inspector General
1735 North Lynn Street,
Arlington, VA 22209-2020

Officer Biography

DAVID C. WILLIAMS
INSPECTOR GENERAL
U.S. POSTAL SERVICE

David C. Williams was sworn in as the second independent Inspector General (IG) for the U.S. Postal Service on August 20, 2003. Williams is responsible for a staff of more than 1,100 employees — located in major offices nationwide — that conducts independent audits and investigations for the largest civilian federal agency that has $67.1 billion in annual revenues, a workforce of 671,687 employees and contractors and nearly 32,528 facilities.

The office is under the general supervision of the nine Postal Service governors and is not subject to any other Postal Service supervision.

In his last position, Williams served as the Deputy Assistant Administrator for Aviation Operations at the Transportation Security Administration (TSA) from August 2002 until August 2003, where he managed the Aviation Inspection Program at federalized airports.

Williams has served as IG for five federal agencies. He was first appointed by President George Bush to serve as IG for the U.S. Nuclear Regulatory Commission from 1989 to 1996. President William Clinton next appointed him IG for the Social Security Administration from 1996 to 1998, and then as IG for of the Department of the Treasury in 1998. In 1999, President Clinton named him as the first IG for Tax Administration of the Department of Treasury, where he directed a staff of 1,050 to detect fraud, waste and abuse. In 2001 President George W. Bush named Williams the Acting IG for HUD, while he was also serving at the Department of the Treasury.

Williams served in the U.S. Army Military Intelligence and began his civilian federal career as a special agent with the U.S. Secret Service. Moving up the career ladder, he served as Director of Operations in the Office of Labor Racketeering at the Department of Labor; the President's Commission on Organized Crime; and as Director of the Office of Special Investigations at the U.S. General Accounting Office. Williams is the recipient of the U.S. Bronze Star and the Vietnamese Medal of Honor for service in Vietnam.

A native of Illinois, Williams graduated from Southern Illinois University, Edwardsville, Ill., and received his Advanced Degree in Education and a Masters in Education from the University of Illinois in Champaign, Ill. He also attended the U.S. Military Intelligence Academy, the Federal Law Enforcement Training Center and the U.S. Secret Service Training Academy.

BACKGROUND: *The Office of Inspector General was created by Public Law 104-208 and passed by Congress in the fall of 1996. The Inspector General reports to the Postal Service's nine Presidentially appointed Governors and serves for a maximum term of seven years. To ensure accountability, the Inspector General keeps Congress, the Governors and Postal Service management informed of his office's work and alerted to potential areas where the Postal Service could be more economical and efficient.*

Mrs. EMERSON. Thanks so much, Mr. Williams.

There are lots of questions to ask and lots of different areas to cover, but let me start with an easy one, perhaps an easy one, at the beginning.

As you are well aware, we are doing our very, very best to find ways to reduce Federal spending. And we have to, in our Financial Services and General Government Subcommittee, at least try to get our numbers back to 2008 fiscal year levels.

Your Office of Inspector General is the largest civilian IG office and has the largest budget, at $244 million. So, have you all actually scrubbed your budget to identify savings and efficiencies that we will see in the next round, in the 2012 budget proposal?

Mr. WILLIAMS. We have in the past, and I promise you that we will in the future. And if I may, I will give you a couple of highlights.

Cuts to our office have not begun recently. It is something we have taken seriously from when I stepped on the property. We have never had a budget that matched inflation; it has always been lower than inflation.

In 2006, we took over enormous new jurisdiction from the Inspection Service. Seven hundred people were supposed to travel with that. We left 387 on the table for savings to the Postal Service and tried it with a much smaller number, and it has succeeded so far. We have been able to pick up the slack on that.

In 2008, we cut $5 million; in 2009, $10 million. And then last year, we cut 60 more positions, and that had $8 million associated with it.

Probably the thing that is coming up next, and I alluded to in the testimony, was whether or not the two law enforcement agencies should come together. That would eclipse all of the savings that have occurred in the past.

Mrs. EMERSON. Why don't you describe for my colleagues, some of whom are new to this subcommittee, precisely what those two law enforcement agencies do.

Mr. WILLIAMS. The postal IG is targeted toward internal kinds of problems at the Postal Service. Our largest areas of investigation, for instance, that takes the bulk of the resources, as you pointed out in your opening statement. Embezzlement and financial fraud and health-care fraud, both on the part of claimants but also on the part of providers, which is big business at the Postal Service. Mail theft, unfortunately, is something where we need to have a nationwide presence to combat.

And contract fraud has been—we have delivered some of the largest cases in the Federal Government in the area of contract fraud because of the huge portfolio that the Postal Service has. We do about $13 billion of new business every year, and the ongoing portfolio is closer to $50 billion.

The Inspection Service looks outward, and they look more at the victimization of people by fraudsters that are using the mail in order to complete the fraud. And they also look at mail theft not done by postal employees or postal contractors but by criminal groups in the neighborhoods.

So they are more focused outward, we are more focused upon the Postal Service.

Mrs. EMERSON. So, do you think it is possible to merge these and perhaps do more with less?

Mr. WILLIAMS. What I see in terms of—the early experiment, the one where we lost all those hundreds of people and still maintained a level of service, gives me hope. We are trying to migrate more toward automation and data-mining and the kinds of things that make the investigations shorter and richer. So I am hopeful that there is still more out there for that.

I think that having two law enforcement agencies in a department whose mission is not law enforcement is, in my mind, a little unusual. I was also the inspector general at the Treasury Tax Administration. And there, the law enforcement agency, the Inspection Service there, became the IG. So that, I have to say, is in my mind, that it is a possibility for achieving economies and efficiencies.

We do have two sets of offices and of the managers and of mission support functions that could be made more lean. And we could focus a bit more resources on postal-related matters. Some of the mail frauds tend to stray a bit from the mission of the Postal Service. We could curtail those.

Mrs. EMERSON. Okay. I appreciate that. And this is a portfolio that most people wouldn't anticipate that comes underneath you. So that is why I wanted you to explain it. And I really do appreciate it.

So then, as part of your mission, how are you using your resources, to identify waste and fraud and abuse in the Postal Service? And you were very general about the types of crimes and fraud that you all are encountering, but give us a few more examples of that.

So, two separate questions.

Mr. WILLIAMS. Thanks.

One large area for the auditors is the preparation of the financial statement. We work with Ernst & Young to do that. We provide most of the fieldwork, and then they examine that and come up with an opinion. So we end up doing the lion's share of the hours that are expended, which is a good deal for them, the government. We are far less expensive.

It is an unusual financial statement, too. For most departments, it is just the execution of the budget, but we are watching the money come in as well as go out. So it is a large effort.

We have aligned the rest of the audit resources to each of the major enterprises of the Postal Service, whether it is the delivery of the mission and the plants and post offices and delivery, or mission support, such as engineering the new automated tools that are coming in.

So we have those aligned—we have fairly small audit teams aligned to each of those that are normally headed by a postal vice president. And that has been very useful. They undergo the learning curve. And they have it when they walk into the audit; they can begin quickly.

On the investigative side, we have to have a nationwide presence. You mentioned the 37,000 locations. So the auditors can be aligned to the issues, but the investigators have to be geographi-

cally aligned to where the crimes are occurring, the space in which the crimes are occurring.

In the contract area, which has been very large, we have done a number of investigations that have focused on—a particularly vulnerable area is a multitude of transportation contracts with small firms. There has been a lot of dishonesty that we have discerned.

Mrs. EMERSON. These are third-party contractors instead of Postal Service employees who deliver mail from point to point to point?

Mr. WILLIAMS. Yes, ma'am. They move the mail across the country, and then the postal workers largely take over once it arrives for local distribution.

Mrs. EMERSON. And that would either be—well, I guess it could be by rail, by plane, by truck?

Mr. WILLIAMS. Increasingly, it has been migrating more and more to truck. And I think there are some concerns on the homeland-security side with regard to air cargo, including mail. So there has been a fairly substantial migration to trucks.

Also, trains tend not to go to where we have the mail distribution places. So trucking is a very attractive alternative.

Mrs. EMERSON. Don't you share resources with Federal Express, though, in a lot of the delivery? I mean, as a matter of fact, in my district, I have a person who owns, a regional air carrier, I guess you would call it, who works for FedEx, but they actually carry USPS mail.

Mr. WILLIAMS. Much of what remains in the air, we have worked with FedEx and others to transport that. They are in the air cargo business as opposed to passenger, which is much less of a concern for the area of terrorism.

Mrs. EMERSON. Okay. Thanks.

Mr. Serrano.

Mr. SERRANO. Thank you.

Can you take a moment to explain to us in some detail how you reached the conclusion that there was $75 billion of overpayment by the Postal Service to the Civil Service Retirement System pension fund and your thoughts on how this can best be resolved?

And, secondly, this is clearly a complicated issue with huge budgetary impacts on both sides. In the current economic environment, what is your advice for getting this matter resolved?

Mr. WILLIAMS. Thank you, sir.

We began studying the funds early on after my arrival, and we began to see things that didn't make sense. One of them was the moment in which the Postal Service received its own health funds and own pension funds.

They were shifted over in 1970 and 1971. At that point, the Office of Personnel Management said that, "In the future, you ought to collect these fees. We will pay for everything in the past; you pay for everything in the future."

What we discovered had happened is that, in 1971, when that began, the exact same contribution began to be made. But OPM decided that they would pay—your final pension is a product of the number of years you work and your final salary. They decided that they were going to cut off that salary at the 1970 levels instead of the retirement levels.

Now, they were collecting fees in order to pay at the final salary, so there was a huge windfall from them when they stopped. We began looking at that and realized, for example, if someone worked 15 years for the Postal Service and 15 years for the Federal Government, the Postal Service would pay 70 percent of the retirement and the Federal Government only 30 percent. Obviously, that ought to have been 50-50 given the provisions of the plan.

So we looked at that and issued that report. And we worked with actuarial firms for that expertise.

The Postal Regulatory Commission came in and looked at it a second time, working closely with the committees on the Hill. They came up with a very similar conclusion, that that ought not to have occurred. OPM collected a full contribution and only paid a partial benefit. That, over those years, resulted in a $75 billion overpayment.

I think it is going to be difficult to know how best to return those funds where they ought to have been. It is commingled Postal money and people's private money. But what I would recommend is that the money be used—until the surplus is gone—and there is a large surplus—they be used to make our annual payments until they are gone. That would result in relief to the Postal Service——

Mr. SERRANO. And the annual payments are how much?

Mr. WILLIAMS. The annual payments, all together, are over $10 billion. So that would pay that entire amount for some years.

That $75 billion is the largest of the segments, but there are other segments of overpayments that have occurred. And they——

Mr. SERRANO. By the Postal Service or by other agencies?

Mr. WILLIAMS. By the Postal Service. For instance, our FERS is overpaid by $6.8 billion. And we really need to stop doing that. It is causing the infrastructure that is intended for businesses and people to be clogged up with extra expenses.

Mr. SERRANO. Mr. Williams, tn your knowledge—and I know that you are here to answer questions about the Postal Service, but, to your knowledge, have other agencies overpaid, other departments in the Federal Government?

Mr. WILLIAMS. We took a look in the FERS area, which is the one I mentioned, the new retirement system that we have overpaid in, and it appears as though they collected exactly the right amount of money. And we have been unable to solve the mystery of how it is that we overpaid and others paid about the right amount.

Mr. SERRANO. And yet, if we were to, say, arrange the fair thing, which is return that $75 billion, or use it at this rate to pay dues, if you will, the premiums for the next 10 years, it would probably then break the system, because other people are living on that, I mean, so to speak.

Mr. WILLIAMS. Both systems were intended to ride separately, primarily because, at the moment that they did it, the administration was fearful that the Postal Service would be using Federal employees' money.

Mr. SERRANO. Right.

Mr. WILLIAMS. It turns out that that is not the case. Actually, the reverse is more the danger today.

They are not supposed to be commingled. They are both supposed to stand alone and be collecting and expending responsible amounts. The Federal side, something is going on there, and I think the IG over there is studying it now. But it ought not to be commingled with this other fund. It was set up so that it not be commingled.

Mr. SERRANO. Right.

I have one more question, Madam Chair, in this round.

Without significant intervention, the Postal Service will hit its statutory borrowing ceiling of $15 billion and will not be able to borrow or pay this year's contributions to the Retiree Health Benefit Fund.

What is the impact this September 30th of this impending insolvency? I mean, we keep talking about doomsday, but what will doomsday really look like? Do they have to close shop?

Mr. WILLIAMS. We are anxious to see what that looks like ourselves. No one has ever experienced it before.

But come September, when we make those payments to funds that appear to be overfunded, we won't just be at zero, we will be in the hole by $2.7 billion. And all of the money will have been borrowed. So it becomes very serious at that point.

I think discussions have occurred and probably need to occur with regard to whether to make those payments or not. If they are not made, it will allow time to resolve the issue. If they are made, it gets very serious.

I am sure that the Postal Service will try to pay its people for as long as possible, but payments to vendors—and, predictably, if you look at other companies, payments to vendors begin to get stretched out and all sorts of measures begin to occur once that level of catastrophe occurs.

Mr. SERRANO. Thank you.

Mr. WILLIAMS. Yes, sir.

Mrs. EMERSON. I am sure we are going to have lots more questions about this, Mr. Williams.

I am going to call on Mr. Womack to start the next round.

Mr. WOMACK. Thank you, Madam Chairwoman.

And thank you, Mr. Inspector General, not only for your service to the Postal Service, but the litany of other high-ranking, high-achieving positions that you have held, including service to our country through the United States Army. So thank you very much for your service to our country.

Mr. WILLIAMS. Thank you.

Mr. WOMACK. And I may have some other questions later, but there are a number of things that rush through my mind when we are talking about the fiscal condition that you articulate. And I suppose that, at that 30,000-foot level, I think of the impact of this new technological age on, say, the use of landline telephone service and how it is diminishing over time with cell phone usage. And I look at the impact of the media, the new technology on a lot of other issues. And, certainly, I believe that this technological impact is showing up in your business, as well.

Maybe this question is more appropriate for Mr. Donahoe or another person in the administrative chain of command, but what are we doing to get ahead of change so that—it is almost like we are

fighting old age. You can fight it and you can fight it and you can fight it, but at end of the day it is going to happen.

So what are we doing to get out ahead of change so that we can reverse the trend that not only plagues the U.S. Postal Service but also plagues every other agency in the United States Government?

Mr. WILLIAMS. That is probably the area that I care most about and I am most excited about.

There has been a hesitancy, and it has been a good bias on the part of the government, not to interfere with the technological advance, the march of advance through things. And it has been tremendously disruptive but also tremendously promising and exciting.

I can't answer for all those other enterprises. I know a lot of industries have been devastated and changed and evolved. With regard to the Postal Service, though, as I said, I think there are—we need to understand this. And we need to become part of that. It is not the enemy. The future is not our enemy. But it is misunderstood. And it has been disruptive to date.

I think there are a lot of things we can do to develop a symbiotic relationship between digital technology and physical networks and infrastructure of the Postal Service and of others. We need to explore that, though. And we have been standing back for fear of inflicting harm on—and that is a good bias to have. But, at this point, somebody needs to begin to study, what is the role of the Federal Government in looking out for Americans? We can sort of figure out where it is headed now, and we need to do something about it.

At the Postal Service, we haven't been very good with innovation. Our customers have some great ideas, and people that are in the digital business have some great ideas. We need to sit with them, and we need to make space for innovation. It has been very difficult for someone with an idea to come to the Postal Service. They have been rejected. And if they can somehow get in the system, it has been lost. We need to make space for innovation.

And we need to imagine how best—I can give you a couple of examples—how best to work with the digital age to make—this really isn't about whether the Postal Service survives. It only matters what America needs. And I think they have some needs in the digital age. I mentioned a few of the problems. We can address some of those at the Postal Service, if we will engage with them.

Debt collection would be an easy one. Debt collection is very time-sensitive. If you don't collect it in the first 100 days, you may not collect that debt. Bills are being sent out digitally. It would be a good strategy if someone would understand that the best combination, the most effective, is to send out a bill digitally, and if there was a delay in the payment, to send it out by letter. Because we know that is much, much more effective than digital billing, in terms of causing debt to be paid.

Hybrid mail, where you send it digitally to the point of delivery rather than transport it, with all of the problems associated with that, and have it printed and delivered locally would save so much and be so good for the United States.

This is not quite that, but right now we have—we made a decision a long time ago that every train would not have its own rail-

road tracks in the United States. There would be a set of railroad tracks, and it would do so much good. We probably should consider last-mile delivery as a decision like that, where all of the deliveries go on a single truck. We shouldn't be taking huge trucks into every neighborhood of the United States every day. It is dangerous, it is wasteful, and it serves no end.

So there is a lot that can be done. There is nothing more exciting than what is coming at us. But we haven't been ready for it, and we need to suddenly become ready for it. Our entire organization is set up for physical mail. We need to make some space for the arrival of the digital age. It is late, but it isn't serious if we will do it.

Mr. WOMACK. My other question is related to the people nature of your business. Obviously, with—I think the number is 590,000, almost 600,000 employees, it is an extremely expensive enterprise, from a people perspective.

And this question may, indeed, show my ignorance on the subject, and if that is the case, then so be it. But my experience has been, when an organization that has a lot of people, particularly those that are represented in collective bargaining agreements, begins to hemorrhage, that there are renegotiations or discussions about benefits.

And I have always held the position that, boy, it is best to have a job, as opposed to trying to maintain some level of benefit that you are used to having, and to run the risk on losing that job as a result of some kind of default or fiscal peril.

Are we renegotiating some of our benefit programs, and are we appealing to the people in your organization to help us achieve some of the solutions that go right to the heart of our fiscal gap, if you will?

Mr. WILLIAMS. Currently and next year, the labor contracts are being negotiated. It would be a very unusual role for me to enter into that picture, and I have not done so. But I know that there are some exciting ideas being brought to the table by the unions and by management.

With regard to making the infrastructure smaller, that has been a huge part of the recent past. We have 112,000 fewer employees than we did a couple of years ago. Eleven billion dollars has been cut out of the budget.

And I would say much more of that—we are poised to engage in a lot more of that, where we make sure that the plants are carefully aligned to volume and the post offices are carefully aligned to demand within the post offices. We know that if you do that, we are too large. And I know that there is aggressive planning under way to right-size that, to make that a lighter, leaner infrastructure.

And I know that that is probably going to be the most dramatic, visible sign of Postal Service action on that front. But I know the labor leaders. One of the gentlemen is here today. And I know that they care a lot about this, and they are committed to giving the Postal Service and the American public the very best they can.

Mr. WOMACK. Well, later this month, I will attend a hearing in Fort Smith, Arkansas, regarding the consolidation of mail-sorting operations to another area. And it becomes a major turf battle. And that concerns me, that we should applaud an organization that

looks for efficient ways of doing the same amount of work with perhaps fewer people so long as you do not disrupt the timeliness of delivery or some of the guarantees. And I know the Postal Service has certain guarantees for overnight delivery, this sort of thing.

So I truly appreciate and respect those. But I do worry about the turf battles that we seem to want to fight every time we try to consolidate and become a more efficient organization, which I believe gives government the bad name.

Mr. WILLIAMS. Thanks.

That has been difficult. And that is a very human instinct. This isn't about good people and bad people. I think that those interests need to be expressed and put on the table. But we do need to go forward, and we haven't always done that, with the action that is best for the American people.

I know that people locally feel very strongly, but you are absolutely right, that, to some degree, we have to be resistant to anything other than serving the Americans. And that is going to call for some tough decisions with regard to consolidations and creating the proper structure and the right-sized structure.

Mr. WOMACK. Thank you for your response.

And, Madam Chairwoman, I may have additional questions, but I yield back. Thank you.

Mrs. EMERSON. Thanks, Mr. Womack.

Ms. Lee.

Ms. LEE. Thank you very much, Madam Chair.

Good morning.

Mr. WILLIAMS. Good morning.

Ms. LEE. First, let me just say, my grandfather was the first African American letter carrier in El Paso, Texas. This, of course—I saw pictures of him—this was before my time, I mean, when he was carrying mail by horseback. And he was——

Mrs. EMERSON. The Pony Express days.

Ms. LEE. Pony Express, yeah. And he spoke fluent Spanish.

And I remember—of course, when I was born, he was retired. But I remember his retirement checks coming. And I remember how happy we were, I think it was the first of the month, once a month—I don't know how often they come now—because that retirement check helped take care of our family. And so, I shudder to think of what would happen or what could happen if the health and pension benefits somehow get stuck in this mess, the budget mess.

And so I hope that at the top of your priorities, the top of all of our priorities is to make sure that pensions are preserved, health benefits are preserved, and that people get their due when they retire.

Having said that, let me say a couple of things. One is, tough decisions are going to have to be made, but I certainly hope we don't talk about cutting back hours and cutting back staff. Given the economic crisis and the job crisis we have, we need to keep that really, I think, off of the table.

You know, and as we move into—and I know we are behind in terms of the digital age, but—and I think about grocery stores now. As we move into this new age of technology, you know, they have now the computerized checkouts.

Mr. WILLIAMS. Right.

Ms. LEE. Well, I refuse to do that, because I know that is a job or two or three that is gone. And so, as we talk about computerizing and coming up into the 21st century, I think we have to make sure there is that balance and that we don't get to the point where we are wiping out all of our postal workers and employees because we have so embraced technology that people don't matter anymore.

And so, I know that is a delicate balance, and I know we have to get to where we need to get in terms of technology. But I hope there are other ways to do that than to shortchange, you know, our postal workers and our letter carriers and our employees.

I wanted to ask you about—well, first of all, stamps keep going up, the cost of stamps. I mean, I still go to the post office and I buy stamps, because I want to make sure I support the Postal Service. But I think the public wonders and I am wondering every time I am in the post office, how in the world are we——

Mrs. EMERSON. Would the gentlewoman yield?

You should buy Forever Stamps. Then they stay forever at 44 cents.

Ms. LEE. But I am trying to support the Postal Service, though, so a few more pennies I am willing to pay.

But I think the public is going to get to that point, where they are going to say, we keep paying more and more and more for stamps, and we keep hearing all of these stories about the budget deficit and the budget crisis at the Postal Service. So, somehow you all are going to have to figure out how to let the public know what is really going on as the price of stamps continues to rise.

And so let me ask you about how you see preserving, though, as we move forward, postal services for the most vulnerable populations. There is still a huge digital divide in our country. And we can't forget about these people, because these people who don't have computers, many senior citizens, you know, many low-income individuals, many people in communities of color, they just haven't had the resources yet—schools haven't been able to catch up.

Mr. WILLIAMS. Right.

Ms. LEE. So how does the Postal Service intend to preserve the valuable services for communities based on what we now are witnessing in terms of the digital divide?

And then my second question is, in terms of minority vendors and minority contractors, how are you doing? Do you have a plan? I know Congressman Fattah had requested a diversity plan, in terms of the advertising contracts as it relates to minority subcontracting opportunities. I know you do a lot of that. And I would like to get some information on how you are doing in terms of contracting with companies—African American, Latino, and Asian Pacific American companies.

Mr. WILLIAMS. I am sorry, I just had a senior moment, I think. Can you give me the first question again?

Ms. LEE. Regarding the digital divide.

Mr. WILLIAMS. Thanks.

Ms. LEE. How are you going to preserve services for the most vulnerable populations, who are still stuck with the problems around the digital divide?

Mr. WILLIAMS. Thanks.

I think the Postal Service might be best situated. Today, I do worry about people in small towns and rural areas and also in large cities, in neighborhoods that are underserved by banks and by digital kinds of services. I think the Postal Service might be the best hope for making—well, I am sorry, I worry about them today. Tomorrow I worry about a much larger group of people. We are not sure where this is all headed.

But the Postal Service's primary mission of binding the Nation together and remaining inclusive and making sure nobody is left behind is going to become very, very important. It has always been important, but I think it is going to be crucially important.

Increasingly, I think people in service jobs and at the lower end of the income spectrum are going to be paid with value-stored cards. There is not capacity, particularly in those areas, rural and urban areas, for turning those into cash. I would love to see the Postal Service expand its current money-order enterprise in order to make banking available to people that have no banking.

I also think that it is important that we remain——

Ms. LEE. As long as we don't charge 20 or 30 percent like payday loan scam artists do.

Mr. WILLIAMS. In my statement, I alluded to predatory practices that are seen now. I think those are going to seriously expand if something is not being done. If there was an alternative and we were that alternative, that would serve—efficient market forces would cause that kind of predatory practice to disappear.

With regard to multichannel communications, I think, as the digital age begins to shut down and darken the possibility of receiving your bills in the mail and so forth, it becomes important for the Postal Service to be there to make sure that people have choice, and also, particularly where their choices are limited, that we are there for them.

And so I think we are about—I hope we have always been important, but I think we are about to serve a very important role with that lengthening trail of digital refugees. It is just in its infancy. We don't know where it is going. And I love the leading edge, but I care about the people that are left behind. And that could be something that we are important in helping.

Ms. LEE. And minority contracting?

Mr. WILLIAMS. Minority contracting, I know that the Postal Service is not subject to either small business or minority contracting. I know that voluntarily they have turned to that, they have adopted some of the practices that the departments have with regard to attention on that.

I know that they have a fairly good record, certainly with regard to the other departments, with regard to our hiring and promotion practices. We focus mostly on that. The——

Ms. LEE. But you spend a lot of money in advertising.

Mr. WILLIAMS. Yes, there is. There is a tremendous amount. And it hasn't always been a competitive process. So there is progress that ought to be done there.

If we may, so that we understand better, we would like to come and meet with your staff, and we will engage in a body of work that focuses on your question. I have to admit that it hasn't been

an area where I have gained a lot of knowledge. It is also possible someone in my office knows more about it than I do, and we will send you a note. But I have a feeling that what we really ought to do is a body of work for you. And, if we may, we will contact your staff.

Ms. LEE. Okay. I would love to work with you on that. And thank you very much. Good to meet you.

Mr. WILLIAMS. Yes, ma'am. Good to meet you, too.

Mrs. EMERSON. Thanks.

Mr. Yoder.

Mr. YODER. Thank you, Madam Chairman. I appreciate the opportunity to have a chance to have this conversation with the inspector general.

I do want to note, Madam Chair, that I was just sitting here for a second reminding myself of 1985 and the World Series. If you will recall, the Kansas City Royals and the St. Louis Cardinals played a seven-game series. And I don't quite remember the outcome——

Mrs. EMERSON. I was going to say, how old were you?

Mr. YODER. I don't quite remember the outcome, but I wondered if the chair could remind the committee what the result was.

Mrs. EMERSON. I know. I do have a husband who is from Kansas City, so I hear it all the time. Yes, the Cardinals lost, and barely lost, but that is beside the point.

Mr. YODER. Thanks for reminding us of that, Madam Chair.

Mr. SERRANO. That is one way of making money, if you do a stamp for the Kansas City Royals.

Mr. YODER. There you go. We will do it.

Sir, I appreciate your comments and your testimony today. And I have been listening to the dialogue from the members of the committee. And I take particular note of the debt that the Postal Service is under. And it appears, in 2010, there is a deficit of $8.5 billion.

I guess I would like a little bit more information on how this deficit—how it works, what the process is, what the accumulation is, is there an overall debt that is accumulated over time, what the procedure is for having that paid back, and who is ultimately liable for that debt——

Mr. WILLIAMS. Yes, sir.

Mr. YODER [continuing]. As we go forward.

Mr. WILLIAMS. In a word, the entire debt was accumulated because of the mischarges made against the Postal Service to its benefit funds. I believe 90 percent of the $20 billion came directly from having to pay those funds, which were not owed.

Here is how the debt accumulated. It began in earnest in 2008, where we went $2.8 billion; in 2009, $3.7 billion under; 2010 was the worst, $8.5 billion. And we are looking at a shortfall of $6.4 billion this year. Our payments into that fund are $10 billion, so I think you can see how I got there.

It is important to try to maintain some sort of a liquidity, as well. The Postal Service's aim is to try to have 30-day liquidity, which is $7 billion. The leading experts—and J.P. Morgan did a great study on this—is about 50 days. So it is quite modest. We haven't had that for a while, and it is going to get very serious.

We have a lending limit of $15 billion. We are going to hit that. We are over $13 billion now, and during the year we are going to hit the max. We can legally borrow no more money.

If somehow you closed your eyes and opened them on a Postal Service that was gone, we would easily be able to pay that back. In fully depreciated property, we have $20 billion. So the money is not at risk, but it is very, very serious with regard to continuing the operation as a going concern.

Mr. YODER. Well, how does it get paid back going forward? We are not going to liquidate all the property of the Postal Service.

Mr. WILLIAMS. No, no.

Mr. YODER. So, clearly, it is secured by those assets. But how do those last few years actually get paid back? Are you looking for congressional legislation that would fix the overpayment of benefits? Is that what we need to do here?

Mr. WILLIAMS. There are a number of pieces of legislation, some from your committee, that are aiming at correcting this.

The Postal Service needs to be saved from the Federal Government. And I can't imagine anybody except you that is going to do that. We are being victimized. We have to get out from under it. It has now caused the price of stamps to go up, it has caused the system to break down. We can't borrow any more money. And it is all about that.

Mr. YODER. Well, and that is interesting, because we had some dialogue here about the innovation and the efficiencies that need to be gained. And it sounds like, regardless of the $8.5 billion deficit, there are going to be moments in the future where, regardless of the pension situation, that the Postal Service is going to have to change how it operates. Is that correct?

Mr. WILLIAMS. Yes, I strongly believe that. I talked about some of the measures that need to occur in my testimony. Optimization, right-sizing the organization for the amount of mail coming through and the number of people coming into our Post Offices are important also.

Mr. YODER. But is there a projection, unrelated to if the pension overpayment was fixed, are there projected deficits moving forward?

Mr. WILLIAMS. The new Postmaster General is working on a plan now that will allow the cuts to zero out the losses that are occurring. It can't occur tomorrow, though. I think his efforts are directed at a further horizon. It is very timely, it is very strong action. The early actions he has taken are very decisive. So that is all going to help.

But, really, what we need is for that infrastructure to be as lean as possible. Regardless of whether we are making money or losing money, we need to get that down as lean as possible for the sake of the businesses and the citizens.

Mr. YODER. I guess that is what I am trying to understand. We have the pension deficit, or the deficit that is created by the pension overpayment. But if that matter were to be fixed, what are the projected deficits that require the post office to innovate?

Because my assumption is, if their books are balanced, that there is not going to be a necessity that would create the need or the de-

sire to change how business is done. So is there a projected deficit after this retirement concern was fixed?

Mr. WILLIAMS. If the retirement issue was fixed, there would be no deficit. As a matter of fact, for some time there would be additional funds available to address the debt. And then, beyond that, I think you need to combine it with some other actions, just because we want to be the best that we could possibly be. But correcting the benefit fund overcharges and raids would remove the problem in the near term and allow us to pay back the debt.

We do need to optimize. We need the right number of post offices and plants. We need a delivery point strategy in the United States where, instead of all these historic accidents with regard to how your mail is delivered, if there was a strategy for either delivering mail to the curb or in collected housing areas to a cluster, that would be several billion dollars. There are all kinds of levers we could pull, and are in the process of beginning to pull, that would make this much better.

But we also need that last digital piece. We need to come into the 21st century.

Mr. YODER. Well, as the Postal Service looks to reduce expenditures, you know, there have been closures in our community of postal offices. The chairwoman noted the 37,000 facilities nationwide and the 590,000 employees. What do you see as the optimal amount of facilities and the amount of employees?

And is that 590,000 and are those 37,000 facilities, where do those rank in terms of—you know, how has this gone over time? Are we at a high point, or have we eliminated facilities over time and that is a lower point?

And the same thing with the postal employees. Is 590,000 a high point, or have we been higher than that? And what does the future hold for the amount of Federal employees we need to disseminate the mail service in this country?

Mr. WILLIAMS. It was much higher than that. There was a time in which I believe I am right in saying there were 800,000 employees. So it has come down. I would say, by the time we arrive at the proper number, it will come down further, almost certainly.

With regard to the reduction of the plants for sorting, there has been a fairly vigorous removal of the small facilities that surround our large sorting facilities, which are called P&DCs. There hasn't been much progress in closing P&DCs, but I would say that that is coming. We have done many studies of the throughput of the mail. We know how many that is going to require. And I would say that there is plenty of room for further reduction of those plants, while assuring that the service to the public remains the same or better.

With regard to the post offices, we think probably about a third of those need to be validated with regard to whether they ought to continue or not. Generally, in the smaller areas, it appears that we have too many in certain places. They are stacked a mile away from one another. In the cities, there appears to be about the right number, but they need a few more windows.

So we need to make some adjustments, but, at the end of the day, it is going to be smaller. It ought to be. If you look at other

people in the business—drug stores, grocery stores—it is very instructive, and it is a much more compact infrastructure.

Mr. YODER. And lastly—and I appreciate you, sort of, helping us understand this—there has been some concern or there has been discussion about 6-day delivery. People ask me about this issue a lot, or it comes up from time to time, I guess.

Is that being actively discussed in the Postal Service, moving to a 5-day delivery? What is the prognosis on that? And what would be your recommendation?

Mr. WILLIAMS. They are looking at it right now at the Postal Service, but we stood back from looking at it because it has gone to the Postal Regulatory Commission for examination. The kind of examination that we would normally do is by legislation given to the Postal Regulatory Commission.

They are very close to issuing their report on the issue of 5 days, whether to allow it or recommend against it.

Mr. YODER. And do we know what their report is going to be?

Mr. WILLIAMS. We do not.

Mr. YODER. And who ultimately makes that decision? Is that a decision that Congress has oversight over, or is that a decision that the Postal Service makes?

Mr. WILLIAMS. I am going to have to refresh my memory with regard to whether there is a final congressional approval required. But I know that the Postal Rate Commission—a lot of deferral is being made to the Postal Rate Commission's decision on this. And I would say that a lot of the action is going to surround that.

After that decision—I have a great staff here—after that decision, it will require congressional action.

Mr. YODER. It will require congressional action to change from a 6-day to a 5-day delivery?

Mr. WILLIAMS. And if I may, I will send you kind of a detailed note concerning that and exactly what would be required.

Mr. YODER. I would appreciate that. Thank you, sir.

Thank you, Madam Chair.

Mrs. EMERSON. I might inform our colleague from Kansas that, traditionally, our bill contains a rider preventing the Postal Service from going to a 5-day from a 6-day. And your chairperson is in favor of keeping it 6-day for the moment.

And I am going to interrupt, because I know it is Mr. Bonner's turn. But here is a problem. There are so many ways, in looking at the organizational chart of the Postal Service—and I want to go over this with you—there is so much room for efficiency. Too many high salaries, too many layers of management, that does not impact your customers and should be addressed before any kind of reduction in service, particularly when you think about the fact that there is so much mail-order pharmacy, for example, that if there is a 3-day holiday and you all aren't delivering mail on the Monday for that holiday, and I am a senior citizen and I am waiting to get my 90-day supply of medicine, we got big trouble here because I can't get it if I am going to run out on that Monday.

And so, how do you deal with those types of issues? And, unfortunately, there is no other way other than through the Postal Service.

But, anyway, I want to ask you about those, and I will let Mr. Bonner go. Thanks.

Mr. BONNER. Thank you, Madam Chair.

Mr. Williams, I think we all associate with Mr. Womack's earlier comments, in reading your bio, not only for your distinguished service, Bronze Star in Vietnam, but I think, by my staff's unofficial count, some 10 different Federal agencies and departments that you have worked in, many in senior positions, as you are in today. Thank you. It was incredibly impressive.

Mr. WILLIAMS. Thank you, sir. That is kind of you.

Mr. BONNER. I am going to try to focus on three quick questions that I would just like your experience on.

Having been at these different departments and agencies, and now in the senior position that you are in with the Postal Service, how do the problems and the challenges of the Postal Service differ from some of the other government agencies and departments that you have served in? And are these differences of kind or differences of degree, or are they both?

Mr. WILLIAMS. There were two departments that are very like the Postal Service, in my mind: the Social Security and the Internal Revenue Service.

They both have ranks of senior people that have been with them their entire careers. I think all of them could probably benefit from the introduction of new people into their ranks. Now, true, there is a very difficult learning curve also, particularly at the IRS and at the Postal Service, for newcomers. But the infusion of new ideas, I think, would be something that would help all three of those departments very much.

There is a surrogate for that. You can begin active dialogue with the stakeholders and bring them in and get ideas from the entire world. It has never been easier. And the digital age is part of the reason. You can have blogs and forums; you can have people come in. You can have a very strong, clear way of inviting outsiders in to bring in new ideas and the best ideas.

And I think that probably the Postal Service is in that category of depending too much on "if it is not invented here, it can't be worth anything," and of throwing their arms open to other people in the digital business and among our own customers, in looking at new product lines. It would make things a lot better.

We are not in the business of protecting and defending the existence of the Postal Service. We are in the business of taking care of Americans. And if we forget for even a second, we have missed the entire point of our existence.

Mr. BONNER. Well, that is a great lead-in to my second question. How receptive has the Postal Service been to your and your staff's suggestions and recommendations over the years?

Mr. WILLIAMS. They have been more receptive than any place I have ever been. Usually, there is sort of an arm's length; here I am sort of being dragged behind the rapidly moving vehicle.

When we complete studies of the plants and we look at closures and consolidations on the part of Congress, the Postal Service takes it to the bottom line before we can put it in writing. And they are constantly demanding that we look at important issues. I have never been so close to the heartbeat of an organization.

And I think it is probably because of the crisis. I don't think those other people were bad and these people are angelic or anything, but they do business here. They can't spend any money if they don't make that money. And so, there is a very different feel here with regard to its auditor. They want to cut costs; they want to look for new opportunities.

And I have enjoyed it here, I obviously have. I have stayed for a while, and I never do that.

Mr. BONNER. Well—and I don't mean to cast a blanket critique. That is not fair when people do that of Congress; it is not fair to do it of the Postal Service. I would love, though, for the tone upon which you have responded just to this panel's questions, the assurance you gave Ms. Lee about getting back in touch with her, and other Members, I would love to think that that customer service, that we exist but for the taxpayers of this country, were more readily noticeable.

I will give you a quick example. And, again, this isn't fair. It certainly doesn't fall under your purview. But my wife and I were going to take our children on a trip overseas. I am from Mobile, Alabama, the greatest city in the world, other than the great cities that are also represented at this table.

And so my wife took the passport applications to the Postal Service window at the downtown post office in Mobile. And after waiting in line for 45 minutes, there was only one other person in front of her. The clerk took a break, came back, and said, "Well, where is the father of these children?" And she said, "Well, the father is not here today." And she got into about a 20-minute argument about the fact that I needed to physically be there to sign a piece of paper or to vouch that the children were there. Well, guess what? I was here. I wasn't there.

So the answer that the postal clerk gave to my wife was, "You know what, ma'am, you just need to call the congressman." And she said, "Well, actually, I sleep with him, so I will be happy to." I am not trying to embarrass anyone back in Mobile, I am not trying to embarrass my wife on Valentine's weekend.

But the point is this. I spent a day with one of the other package delivery firms—I won't call their name. As unpopular as Congress is, they might not want us saying that we spent a day with them. But it was fascinating, unloading that cargo, those packages, off the plane at 5:00 in the morning, getting in that truck, putting on the uniform with shorts and brown socks——

Mrs. EMERSON. I did that, too. It was fun.

Mr. BONNER [continuing]. And driving all over. But down to the point of knowing how many right turns they are going to make so that they can more efficiently manage their gas and make sure that their timing is right and that they get back in.

I would love to think that, both from a customer service spirit and also an efficiency, when you have the kind of deep hole that the Postal Service is in financially, that there would be a new esprit de corps that would be coming from the top down and from the bottom up that would say, this is a really—as you noted in your testimony and in answers to the questions, the challenges of the digital age and coming into it, the Postal Service can either embrace it and lead on it and become a vibrant part of the fabric of

this country for the next 100 years, or it can go the way of the dinosaurs down at the Smithsonian Institute. I think we all hope that it is the former, not the latter.

But I really do salute you for the example that you have shown today. And I hope that others in this room and others around the country see that this is not an individual, but this is a reflection of an attitude that needs to be adopted at all levels of government, not just the Postal Service—certainly here in Congress, as well.

I promise you one thing. If my staff told a constituent who called, "Well, you need to call the Senator's office; we can't help you," then these 2-year terms would end much sooner for us than they do for—anyway, thank you very much.

Mr. WILLIAMS. Yes, sir.

If I might very quickly, that is a very disturbing story. The new Postmaster General has set out the customer experience—he set out as a goal to substantially improve the customer experience. And it is problematic in places.

And there are many other instances where the opposite is the case. During Katrina, postal workers from their own funds fed and made sure water was supplied to elderly customers and things. It is all over the board.

But he is committed to make that steadfast and much improved.

The other thing is, we have too many post offices. As those come together, we want them to be more full-service. We don't want postmasters to go to lunch together and close the place down for 2 hours. So that is a goal, too.

With regard to the trucks that—Pat Donahoe has just asked that we begin looking at smart trucks, ones that can be part of the digital age and can operate with unparalleled efficiency. Someday, we hope our competitors come and compare themselves to us in that area.

Mrs. EMERSON. Thank you all. You did do a great job, I must say, on the Christmas commercials with the flat-rate boxes, I must say.

Mr. WILLIAMS. Thanks, I liked those, too.

Mrs. EMERSON. Hopefully the advertising agency did not charge too much, but it really was quite good.

Let me ask you one question and then I want to get back to the whole management structure within the Postal Service. So, on the retirement fund issue, your office says that it is a $75 billion problem. And the Postal Regulatory Commission says it is a $50 billion to $55 billion problem, and that is a fairly significant difference. Are you all basing those on different actuarial bases? Why is there such a discrepancy?

Mr. WILLIAMS. The regulatory commission acknowledged that the way we computed it, they could see how we would get there. I think they were trying to adopt a middle ground and one of moderation. That is—I think that the Postal Service is trying to do that as well. And so a lot of the savings are revolving around the Postal Rate Commission's more moderate figure of the 55.

I do want to point out, though, that that is not the only problem that exists. FERS, as I mentioned, is overfunded by some $6 billion. And then the rate of inflation we believe that OPM has set is much more aggressive than the private sector and other govern-

ment entities. The delta is 5 versus 7 percent, which is another $6 billion. There are a lot of corrections that need to be made.

What I would most like to see is that the Postal Service make a proposal to Congress with regard to its pension and health funds, rather than have it imposed by OPM. When we benchmarked pensions, we discovered that the gold standard was 80 percent, not 100 percent prefunding. And for health, it was 30 percent, not 100 percent. And if you look at OPM's own prefunding, it is only 40 percent. It is far below the gold standard for pension and it is zero for health. I am always suspicious of someone saying I have a fabulous idea for you, but I don't want any part of it. That is basically what we are suffering under.

Mrs. EMERSON. I am going to play the devil's advocate and ask you this question. That is, I believe, that the Congress has passed legislation twice within the last decade—2003 and 2008—to address obligations, health benefits funding and the like, but yet here we are back again. So what promises could be made that hypothetically if we were to—okay, arrive at some figure of overfunding and it was fixed, how can you assure us that is not going to happen again, since we have already dealt with this twice in the last 10 years?

Mr. WILLIAMS. Actually, what we are seeing are a series of errors on the part of OPM that are quite serious and congressional action earlier addressed those errors. We hope they were errors. We hope they were not intentional. But we were seriously overcharged earlier. When I arrived, those had already occurred. But we saw that things still weren't right.

I don't know if there is more there or there is not mnre there, but no one is asking for—no one is asking for relief or a bailout or a penny to be given to us. The Postal Service is trying to look for a competent way to run its benefit plans, which we care very much about, as does Congresswoman Lee. That has not been the case. I am wondering if it is time for OPM to step away from the plate and let someone come in here that is able to construct a model of a world-class pension and health care fund, because I know it would be much more reasonable than it is today.

Mrs. EMERSON. Do you believe that OPM actually has the authority to recalculate? Because OPM does not think they do. But you all believe that they can do this without legislative action?

Mr. WILLIAMS. I do. I don't know if they ever said they didn't have the authority. They said they didn't want to; that there are lots of ways to do those things and they are doing it one way, and if someone wants them to do it differently, then they should be told. Not to try to do it on their own. They are awaiting instructions from legislation. I believe they do have the authority.

Congress has now, based on this bad information that they had received, the Postal Accountability and Enhancement Act did structure payments, and that would require congressional action to stop those once we realize that an error has been made.

With regard to correcting the error, I think all of us feel that OPM can—I believe OPM does, too. The difference is whether they will and should. They are telling us they would rather be told to do it rather than do it on their own.

Mrs. EMERSON. Okay. That is something we need to explore more fully with the authorizing committee.

Back on the whole management structure, I was pleased to hear in your testimony that the Postal Service was going to reduce the number of regional offices from 74—I don't know how many they plan to have, but I still don't understand why we don't have one per State and one for each of the territories. I just want you to notice that I have begun to use "the territories" every time I mention the States for the last 2 years.

Mr. SERRANO. And I appreciate that, really.

Mrs. EMERSON. You really do get used to it and that, I think, is a very important distinction that we all should make, Joe.

Mr. SERRANO. Yes. And let me say publicly that you were very supportive the last 4 years when it really started. We started pushing that in the last 4 years. We have all of these folks, and when I look at——

Mr. WOMACK. I didn't know the Bronx was a territory.

Mr. SERRANO. And here I was going to praise you. I was going to say that no one more than those who have been in the military understand and respect the folks in the territories, because they served side by side with folks from the territories. So that is one thing, you know, that we always ask around here: How are you treating the territories? Because they seem to be an afterthought.

But I am still praising you. The Bronx is a State all by itself.

Mrs. EMERSON. So anyway, the idea of having 74 offices to me is ridiculous. And somehow I think that there are much more efficient models. For example, we have two in Missouri. I have one in Kansas City and one in St. Louis, and even though my district is closer to St. Louis, Kansas City has jurisdiction over all but one of my counties. It is ridiculous, it is stupid, and it is inefficient.

And just the management structure at the local level, it is crazy as far as too many different people trying to tell people what to do, instead of having just much more defined reporting assignments. I spent a lot of years in the private sector so I am sensitive to that sort of thing.

And then at the D.C. headquarters, I am aware that a lot of the senior management folks who are out in the field have been brought back to management so that senior management at the D.C. headquarters will say, yes, we have reduced the number of people out in the field. And so it just seems to me—I wanted to ask, have you all actually looked at organizational structure?

Mr. WILLIAMS. We did a study of the areas and districts. And also if you looked at this structure, it is going to remind you of the government. And it did go back to a time when we were part of the government, particularly with the area structures.

We did a study and we said that the number of districts ought to be—the districts are the lower level, the areas are the higher level—that the number of districts needed to be looked at, and we recommend that we have sort of a modest and increasingly aggressive reduction in those numbers.

With regard to the areas, those are a bit of a historic artifact, and we recommended that some thought be given to whether those could all be brought back to Washington and joined together for messaging. For one thing, it invites fiefdoms, and everybody does

it in a different way, which is as expensive as it can be. And it is personality based, where based on somebody's code of ethics, they are treated differently than they ought to be.

So the reason for them has been, of course, command and control. It is a huge organization. It is still 600,000. But we see that a lot of the messaging that goes down and that goes up could be automated, and we think that if the data, the performance data were automated, many of the physical things that occur, and the meetings that occur, and the time that it takes from postmasters and from plant managers would be reduced if it was an automated environment.

Mrs. EMERSON. Well, and certainly with the digital age, if you will, and the sophisticated machinery that you use for sorting and the like, certainly I believe those area offices are probably obsolete.

Do you happen to know how many people work in the Government Affairs Department of the Postal Service headquarters here in Washington, D.C.?

Mr. WILLIAMS. I am going to look to the staff and ask them. It is about 50 people.

Mrs. EMERSON. And how many—and what do those 50 people do?

Mr. WILLIAMS. The job of the office is to manage correspondence and then visits to the——

Mrs. EMERSON. And how many pieces of correspondence does the Government Affairs Department average a year?

Mr. WILLIAMS. I don't have that information.

Mrs. EMERSON. Can anybody tell me?

Mr. WILLIAMS. We can't tell you today, but we will do—if we may, we will come and sit with you and look at that. We have not looked at it and we would be happy——

Mrs. EMERSON. I would appreciate it, given the fact, just to give you an example, I think we are pretty lean and mean in our offices and we average 1,500 e-mails or letters a week. And I have three people and a quarter to do that, to answer them within a turnaround time of, I don't know, 3 to 4 weeks, because sometimes we get backed up. And all of those people attend all of my committee meetings.

I guess my point is 50 is outrageous, because I bet you you all don't have as much mail as I have in my office on a monthly base—on a yearly basis. I would bet that. So I would really appreciate you getting back to me on that. It is a little thing, but it is annoying, because to me your face is out there, out in the public in our communities. And I love my post offices, and I love most all of the people who work at them, and the people who deliver the mail, et cetera. But that is where you really need to be. Obviously, you have got—but I think you are real heavy here, and I would certainly like to see much more management efficiency here to start helping to reduce costs there. And go ahead.

Mr. WILLIAMS. We will be happy to undertake and will meet with your staff right away to do that. To be fair, I should say in the early hours of the new postmaster general's time after coming on board, he reduced the number of direct reports that he had. He reduced the layering of Senior Vice Presidents overseeing Vice Presidents. He did away with that. And he also tried to, in addition to making the place more lean, he did try to align the place more to

the mission and to the customers, to make it clear that that alignment was strong. So it has been started.

Mrs. EMERSON. That is good. And he is a very nice man and I know he has got a tough job to do. But there was a job I think advertised—you have a head of Government Affairs, and suddenly somebody was going to get hired above her at $250,000 a year.

Mr. WILLIAMS. That is true. That is——

Mrs. EMERSON. She was perfectly good at what she did.

Mr. WILLIAMS. That clearly is a piece of the solution to this.

Mrs. EMERSON. That is why a very, very detailed and close examination. And I know at one time PriceWaterhouse or somebody came in and tried to do something to make it more lean and mean, and I thought it was still excessively bulky. But that is from personal experience.

I also recommend, and I know that Steve will be happy if I say that, if you look at the way that Wal-Mart does its distribution system and it moves things around this country. They do it in a very cost-effective way, but a lot of what they do is what you do. And so there are some lessons to be learned that to me would make good sense just for purposes of trying to save money.

Because the easy things are, yeah, we will go to 6-day delivery. Okay. We will close all of these rural post offices that are the heart and soul of a community, when, quite frankly, if it cost $100,000 a year to run, you got people making 800,000 bucks a year at the Postal Service, and so let them take a pay cut and leave a post office open. I just don't think the decisions—you are picking easy—not you specifically, but easy things are being picked; but the hard decisions are it is way too top-heavy with management, just from what I have seen of your organizational charts.

Mr. WOMACK. If the gentlelady would yield for just a minute. Good point, Ms. Emerson.

A few years ago, while serving as a mayor of a city of about 50,000 people, we had a catastrophic failure on an automation platform system involving our courts. It was a serious issue. And rather than being tempted to throw a lot of money at the problem from my job as a mayor into a major IT fact-finding mission and potential solution, I turned, as the gentlewoman has just recommended, I turned to the private sector. And in this case it was J.B. Hunt Trucking, not because of the heavy computer assets involved in a logistical perspective, but I turned to the J.B. Hunt Corporation, to people in that entity, and asked them if that was their problem, how would they solve it. And I was able to fix a problem a lot faster because the private sector knows how to do this stuff in a much more efficient way than we in government ever hope to be able to do that.

And that is why I think that she is on to something here. That when we are looking for solutions, are we indeed looking into the private sector to people who have these logistical frameworks already established that do some of the same things you do? And are we, shall we say, plagiarizing some of that effort?

Mrs. EMERSON. No need to reinvent the wheel. Stealing good ideas is smart business in my opinion. You know, not intellectual property, but rather if somebody has a good idea, it saves me from having to think about the idea.

I want to ask you one more question. And—oh, I want to know if it is true. Is it true that the Postal Service actually has vehicles made specifically for it, as opposed to buying platforms from General Motors or Chrysler or Ford? Does it actually design and have trucks and/or other vehicles made for it, as opposed to—not anymore? Okay.

Mr. WILLIAMS. The idea is to build the box on top of an——

Mrs. EMERSON. Of an existing platform?

Mr. WILLIAMS. Ford or General Motors.

Mrs. EMERSON. When did they stop actually having them made? Do you all know?

Mr. WILLIAMS. About 20—I arrived after that occurred. As long as I have been there they have used——

Mrs. EMERSON. They have actually used the existing platform. All right. That is good. Mr. Serrano.

Mr. WILLIAMS. If I may, I would like to say that my office—and a lot of it has been at the request of Pat Donohoe, having engaged in benchmarking, and UPS and FedEx have both been great about joining in that. Target department stores have some fabulous inventory techniques along with Wal-Mart. There is a lot to be learned, and they have done great stuff and we are trying to understand it.

Mrs. EMERSON. That is good to know. Seriously, it really is easier, because they will give you advice for free and you don't have to pay an expensive consultant to do it.

Mr. WILLIAMS. They have, and sometimes they are more real world than the consultants are.

Mrs. EMERSON. Consultants just want your money.

Mr. WILLIAMS. Yes, I think you might be on to something there as well.

Mrs. EMERSON. Mr. Serrano.

Mr. SERRANO. The good news is that President Mubarak has stepped down. I don't know whether to believe that or not. He steps down more times than Jack Benny celebrated his 39th birthday.

Mr. WOMACK. He is probably scuba diving in Sharm el-Sheikh.

Mr. SERRANO. Yes, probably. Every so often in these hearings, we say something which brings about another discussion. And so after hearing you and after hearing Mr. Womack comment on the private sector, I guess it is my duty to say, yes, I think we have to always consult with the private sector. I mean, be supportive of it so it grows. And we have to consult with academia and make sure that they are included.

But I think what we have to be careful about, especially in the next couple of years as we get more and more folks who say that the private sector is the way is that while the private sector has played a major role in building the country that we have today, it wasn't the private sector that said that children should not work; it was government who said that there should be a child labor law.

It won't be the private sector that will care at times too much about whether the rivers are clean or who is dumping into them. It was government that stepped in. It was not the private sector, for the most part, who said you shouldn't work more than 40 hours a week and you should have certain pay. It certainly wasn't the

private sector who, on their own, volunteered to treat minorities and women better; it was government.

So I think it is important, perhaps more than ever, to say the private sector and our universities have to play a role. But you know, there is something for government to do. And which invites me to say something I have been rehearsing recently, I want to try it on you. I am sick and tired of hearing TV reporters saying, Go up to a businessman and say if you ran your business the way the government runs theirs, what would you have? And then they would say, We would be bankrupt.

Well, if they ran their business the way we run ours, they would have a business that has been around since 1776, that has been the envy of the world, that played a major role in stopping Hitler and the Nazis from taking over the world, that every so often checks on itself, looks back and corrects past injustices, and whose doors are still being knocked on a daily basis by people who want to come into this place.

So government has problems. But you know, for a couple of hundred years now, we have created a pretty good place that a lot of people want to be a part of. In the process of making it better, let's not throw out government. Because if you let the other guys do it alone, it could be a mess.

Mrs. EMERSON. Will the gentleman yield?

Mr. SERRANO. Sure.

Mrs. EMERSON. Please note that I was not at all talking about changing the governmental function of the Postal Service. I was suggesting that they get free advice from a distribution system that actually works as to how to make themselves more efficient. So it was not replacing the government with the private sector.

Mr. SERRANO. I understand that. And I understand Steve Womack's statement, which I take very seriously, that he had the ability and the vision to say it doesn't have to be government; let me go see how they do it. And he accomplished it. I just know that there is a sense in this country right now, by a small group but a very vocal group, that we don't need a government.

Mrs. EMERSON. Well, I disagree. I agree that there is a group that are——

Mr. SERRANO. There are people that are asking a President to step down because they want a government that looks like ours. Trust me.

Mrs. EMERSON. Joe, I don't disagree with your statement. You did a nice job on that statement. I liked that. You practiced it well.

Mr. SERRANO. I did. I have a Spanish version of it, too.

Mrs. EMERSON. Let's see, we are willing to listen to that too.

Mr. SERRANO. Before I ask my last round of questions here, in defense of the Postal Service, my understanding is as to Mr. Bonner's statement, my understanding is that the Postal Service basically carries out the instructions given out by the State Department on how to handle it. That is my understanding. They set the rules for how you get a passport, and then the Postal Service just does what they are told. That is my understanding.

Anyway let's get to one of my favorite issues. This report that came out about electric trucks. I know again it is a small thing, small in the sense that it may take a while to go to that point of

having a full fleet. And not everybody in this country is sold yet on the idea of moving in that direction. Lastly, that they are not $10,000 trucks. They are quite expensive.

So what can you tell us about that report? And what can you tell us about the possibility and the feasibility of the Postal Service moving in that direction?

Mr. WILLIAMS. We were very—actually, you asked us to do that. We were very excited at the results though. I am not sure we would have thought of it on our own, which is not good. We should have thought of it. Today—the technology is getting better all the time, but today an electric truck that could carry our load could go 40 miles very, very reliably. That covers all but 3 percent of our routes. Only 3 percent would begin to test the outer limits of that.

So it would seem that we would be a very good candidate for that, in addition to, of course, there not being fuel consumption and there being exhaust in all the neighborhoods of the United States. It seemed to be a very forward-looking, great initiative to undertake.

The Nation is also about to go, as you told us and we verified, to taking the electric grid and reducing it—or expanding it, rather, to allow vehicles to be plugged into it, the batteries of vehicles to be plugged into it. There is a requirement that electric utilities maintain a certain margin of excess in order to assure that we will all receive electricity when we need it.

With vehicle-to-grid, V-to-G, it allows, rather than us to manufacture more of that by burning coal or oil or nuclear solution, it allows them to rely on the dormant batteries of vehicles. We are really well positioned for that because we don't drive our vehicles at night. That could be a huge fleet of vehicles that would take care of a national issue and allow for a national economy. It would also jump-start a new technology and create new jobs and it would allow those—the price of those vehicles to come down, as all technologies do when they are finally embraced.

We were tremendously excited about what you did and what we found.

Mr. SERRANO. Thank you. And just for the record, to remind the chairwoman that this was something that we asked for in the committee, and this report came back. And I understand that part of the problem is you have 146,000 delivery vehicles which average 10 miles per gallon; am I right?

Mr. WILLIAMS. That is correct.

Mr. SERRANO. Is that a huge problem? And we always talk about our dependency on foreign oil and we seem to do little. Although I see more happening, certainly in the last 5 to 10 years. Where is this at? You did your report. Is there any desire on the part of the Postal Service to move in that direction?

Mr. WILLIAMS. It is also a fleet at the end of its life. So to introduce this, whether it is in our trucks now or whether we would do new vehicles—I ought to have added that at the end—I think there was concern on the part of postal management, but I never had a clear statement of how they received this. But there was some concern that the technology was new and they wanted to select a vendor that they were confident would be around, because the vehicles

last a very long time. I think that was the things that concerned them. And I think there was also interest in this.

I think with each year that passes, as you said, sometimes progress is slow. But the arc of the progress seems to suggest that this is a very promising direction and route that you have embarked the Postal Service on. We have a new postmaster general. I will be glad to express to him—remind him of what we have done, and express your desire and interest in the area.

Mr. SERRANO. I have, Madam Chair, just one more question and then we can submit some for the record. Under the heading of innovation, is there anything you think or that has been suggested that the Postal Service could be doing to sort of help themselves acquire more revenue? I am not suggesting that they sell T-shirts in the lobbies of the Postal Service. But you wonder if e-mail—and we are all guilty of it—if e-mail has taken away from the Postal Service—I am not trying to be funny, but should the Postal Service get into the business of being another AOL where it provides e-mail service to the public? I know that sounds crazy, but you know—no, nothing that I say sounds crazy.

Mr. WILLIAMS. No, it does not.

Mr. SERRANO. What could they be doing? Is there, you know, are there five people sitting in a room somewhere at the Postal Service trying to figure out where we could go?

Mr. WILLIAMS. At this point I would say all the near-term efforts are the ones that I outlined. And I think there is an openness to this idea, but we need there to be an excitement about it and we need to run to it.

I think some of the time was lost dreading it and fighting, and some in the past were chagrined over its arrival. There are some wonderful opportunities. There could be a symbiotic relationship between the various communication vehicles, whether they are physical or digital, that could be combined, that would place American businesses and American people in a much stronger position than they have ever been.

And there are all of those difficulties I said that need to be addressed with regard to the digital age, too. The Postal Service could be part of that solution. We need to aggressively engage with the other players in the digital area and our own customers, and also the people who are not our customers but they ought to be. And we begin to need a very vigorous dialogue with regard to that. And we need a very disciplined process with regard to inviting innovation, triaging the ideas and designing them, and then implementation.

I have seen some really great ideas that we stumbled on on implementation of them in the field. But there are wonderful ideas for products out there. I think people would love to see an integration of their digital mail and their physical mail on the same list, for instance. Sort of a reverse hybrid. Hybrid mail is clean, fast, and it is the future. I would love to see us be a part of that.

I think we need to guard against giving middlemen money for nothing. It isn't just hard to the Postal Service. It is picking winners and losers. And that is not something that is a very American idea for an infrastructure. There is a ton to do. We need to create

processes for that. We need to clear out some space to meet the future and to embrace it.

Mr. SERRANO. One quick question. Do we make money, does the Postal Service make money on those commemorative stamps every time we honor someone? And please understand that I am not knocking it. I attended the Frank Sinatra stamp ceremony in New York and it was wonderful and what a great ceremony that was. And there were people from all over the city, stamp collectors and fans. Does it make money? I know that a lot of these things just kind of tap a little bit into the problem.

Mr. WILLIAMS. I think the idea behind the commemorative stamp—there have hardly been any. Of course, the breast cancer stamp was certainly the most dynamic and important of those initiatives. The Postal Service makes the usual amount of money, and the charity receives anything above and beyond the Postal Service's normal income. So it is split.

Mr. SERRANO. It is split?

Mr. WILLIAMS. It is, sir. Yes.

Mr. SERRANO. Okay. All right. Just in closing, let me thank the chairwoman for reiterating our position. And it was our position before, and I am glad it is still going to he our position this year that sometimes it is easy when you look at the Postal Service to take the easy shot. And the easy shot is 5-day delivery, without thinking of what that does for service and, in all honesty, what it does for jobs, even part-time jobs. And this is not the time to be cutting jobs anywhere.

So I think the message that she is sending is the message that I try to send. Let's focus on the hard decisions and not go after the easy one, which is 5-day delivery. I thank you for that. And I thank you for your testimony and your service, and that concludes my questions.

Mrs. EMERSON. Thank you. Mr. Womack?

Mr. WOMACK. I have nothing further, Madam Chair.

Mrs. EMERSON. Are you certain?

Mr. Williams, thank you. I do want to ask you one more question and that has to do with closing and consolidating post offices. I know as part of the Postal Service's action plan, they want to close or consolidate I think about 2,000 retail facilities. You alluded to that in your opening statement.

I understand that the Postal Regulatory Commission is actually investigating whether the Postal Service has been improperly using reasons such as lease expirations to suspend service. And obviously this impacts us, and it would be more in Mr. Womack's and my districts rather than Joe's, just because we have very rural populations. So have you all examined this issue as well?

And then my follow-up question would be, do you think the Postal Service is taking responsible steps in its efforts to restructure those operations?

Mr. WILLIAMS. Actually, early on—I am unfamiliar with the PRC's work in the area. It is actually early on. There haven't been many that, of course, closed that I am aware of. But we are obviously right at the edge of an aggressive initiative in the area of the 2,000. And there are also about 400 that are in process, so it is actually a bit larger than that. I am unaware of those, but I talk and

interact with the PRC all the time. I would be glad to find out what concerns they have. And I will also keep an eye out for it with regard to that.

The process around this is new. They recently developed a way that is far more expedited than in the past. We are about to review on that and the moment we are done with it, we forward it—if we find something disturbing——

Mrs. EMERSON. I would be appreciative. I am sure all of us would.

Mr. WILLIAMS. It is a new process. We will be glad to watch that and report back to you.

Mrs. EMERSON. "New" meaning it just started or "new" meaning it is a different type of process than what you have done?

Mr. WILLIAMS. It is going to be an aggressive effort. I am certainly not against that effort. As I indicated, I think probably the network is too large. But 2,000 is more than we have ever done. And there is also a new process with regard to expediting and putting it in a more automated environment. That is the one that we have embarked on studying, now that it is complete.

Mrs. EMERSON. Any information that you can get to us as soon as possible would be great.

Mr. WILLIAMS. We will.

Mrs. EMERSON. Especially any in conversations with the PRC as well.

Mr. WILLIAMS. I will meet with them before they are out of the room.

Mrs. EMERSON. Terrific. Thank you so very much for being here today and for your patience. You did a great job answering questions and we will look forward to working with you in the future.

Mr. WILLIAMS. I do as well. And thank you so much for having me.

Financial Services and General Government Subcommittee
FY 2012 Budget Hearing for the Inspector General of the U.S. Postal Service

Questions for the Record From Chairwoman Jo Ann Emerson

REDUCING COST/IMPROVING EFFICIENCY AT USPS

Mrs. Emerson: Delivery is the Postal Service's largest cost segment—accounting for about one-third of total costs. Your office has issued several reports about how the Postal Service could improve efficiency and reduce costs in this area.

Has the Postal Service taken action on your recommendations and what more needs to be done to reduce delivery costs and improve efficiency?

Mr. Williams: The Postal Service has taken action on many of our recommendations involving standardization of operations, optimizing and elimination of routes, reduction of office time for carriers, supervision of carriers, and mail address hygiene. In FY 2010, the Postal Service reduced workhours in city delivery by over 16 million hours (nearly 4 percent), and rural delivery workhours by almost 4 million hours (about 2 percent).

The Postal Service needs to continue to reduce delivery costs and improve efficiency in the following areas:

- Pursue workforce flexibility to better match workload with the workforce, including evaluating increased use of flexible and part-time workers to better address declines in mail volume.
- Consider changes to service standards in cases where customer needs could be met at lower costs.
- Centralize delivery modes – develop and implement a strategy to move from door to curbside delivery and, where practical, from curbside to cluster box, which could result in multi-billion dollar savings annually.

Mrs. Emerson: In your view, Mr. Williams, what are the major elements needed by the Postal Service as a solution to their financial problems?

Mr. Williams: I see the critical points of a Postal Service solution as three-fold:
1) address the overpayments and punitive prefunding into the retiree benefit funds,
2) optimize and simplify current operations, and
3) innovate for the digital age.

First, in the near term, the Postal Service and Congress should consider halting further payments to benefit funds until surpluses are used, and mistakes are corrected. The Postal Service can use this time to learn how to live below or within the Consumer Price Index, shed its debt, and find its role in the digital age. The Postal Service should be taken back off-budget as originally designed. Otherwise, scoring makes it impossible to correct errors in retirement funding.

Second, the Postal Accountability and Enhancement Act incentivizes the Postal Service to adopt a leaner, volume-driven infrastructure to assure readiness for the 21st century. This will require:

- Optimization of the network of post offices and plants;
- Conversion to evaluated letter carrier routes to promote more effective management;
- Flexible work rules to match the ebb and flow of mail;
- A comprehensive delivery point strategy that maximizes curbside delivery and cluster boxes;
- Simplification of mail acceptance and pricing; and
- Evaluating the need for 74 districts, 7 Areas, and two law enforcement agencies.

Finally, the Postal Service needs to strengthen its systems for innovation. Innovators collaborate with customers, take risks, make mistakes but stop failures quickly, and replicate successes. The Postal Service's success in the new digital age depends on embracing a culture of innovation.

WORKER'S COMPENSATION

Mrs. Emerson: Your office recently reported on the Postal Service's workers compensation liability of about $12 billion at the end of fiscal year 2010 and has issued numerous reports on Postal Service safety and workers' compensation issues.

What more can the Postal Service do to reduce the risks and costs related to workers compensation— and in doing so reduce these major costs?

Mr. Williams: The Federal Employee's Compensation Act (FECA) provides a variety of benefits to employees injured in the performance of duty. As currently structured, FECA provides disincentives for employees to return to work. For example, the base rate for FECA compensation is 66 2/3 percent of the injured employees' salary for employees without dependents or 75 percent for those with dependents. FECA compensation is tax-free and there is no age or time limits on benefits as long as a physician certifies the work related condition or the disability continues.

Between 2003 and 2006, we issued several reports covering workers compensation issues, and reporting thousands of dollars in overpayments and underpayments in the program. The Postal Service, using a database we developed to identify potentially fraudulent billing schemes, identified more than $3 million in duplicate medical payments. Additionally, in 2005, we issued a whitepaper identifying broader issues that if addressed, could result in significant savings. Subsequent to our issuance of that paper, the Department of Labor notified the OIG that they took exception to the OIG auditing these programs on behalf of the Postal Service, and our access to Postal Service data held by the Department of Labor was restricted.

Significant improvements and savings could be achieved if the Postal Service were permitted to make broader reforms to its workers' compensation program, such as moving from the Department of Labor to a third-party administrator to administer its workers' compensation program, selecting physicians for injured employees, and providing offers of settlement for more permanent cases. All of these solutions would require legislative changes, but would likely result

in significant savings from reduced administrative fees, improved service, better case management, and reduced fraud in the workers' compensation program.

We are currently working on a project to further evaluate issues with the workers' compensation program at the Postal Service and update prior work conducted in this area. We can provide your staff a copy of that report when it is issued.

Mrs. Emerson: Additionally we have heard that employees well past retirement age continue to get worker's compensation benefits. Is this appropriate?

Mr. Williams: Although allowed by the current law, we do not believe this is appropriate. Disabled retirement-eligible employees have a choice between FECA benefits and federal retirement benefits. However, neither the employee nor the Postal Service paid into the retirement system while the employee was on workers' compensation. Consequently, most employees choose to remain on workers' compensation because it results in a higher payment and significant tax incentives, and there are no age or time limitations in the current law.

FECA was never intended to be a retirement program. We issued a report covering this area in 2003, and we are currently working to update the results. We can provide you a copy of this report when it is issued.

EXPANDING PRODUCTS AND SERVICES

Mrs. Emerson: In your testimony you mentioned the long-term challenges facing the Postal Service as mail continues to shift to electronic communication in an increasingly digital age. The Postal Service's action plan proposed introducing new products and additional services for customers. The Postal Service is asking Congress to allow them additional flexibility in their ability to introduce new products. Currently, every new potential product requires review by the Board of Governors and the Postal Regulatory Commission.

In your view, should Congress seek to amend the current regulatory framework, broadening the definition of postal products, to give the USPS added flexibility to innovate and incorporate new products and services?

Mr. Williams: The exploration of non-postal products should be considered once the latitude currently allowed under the existing regulatory framework for ancillary products is fully explored. Ancillary products could move the Postal Service into the digital age and allow for an update of the mission within existing legislation. This may provide a great deal of flexibility for innovative products and services to allow the Postal Service to be a product platform for government, postal, and commercial services available to all.

New ancillary products should reflect the evolving universal service obligation to "bind the nation together" in a new world where people are increasingly communicating digitally. For example, the Postal Service could provide digital currency exchange to complement its existing money order business. Another possibility is a digital platform that facilitates communications

and commerce, that could provide a physical address linked to an electronic mail box for every resident and business.

Both the digital and physical worlds are imperfect; they each have their own shortcomings. A digital platform provided by the Postal Service could bridge the physical-digital divide and help address some of the privacy, security, and confidentiality issues associated with the current digital age.

Mrs. Emerson: Should USPS be allowed to offer new nonpostal products and services that compete with private-sector firms?

Mr. Williams: Certain non-postal products could prove useful in providing additional sources of revenue to keep unprofitable post offices open for universal service. These products could also serve the underserved segments of society that the private sector may not be currently interested in serving. These products could be limited to rural areas, thus reducing the likelihood of competition with businesses and providing welcome and needed products for more remote populations.

Mrs. Emerson: How would the Postal Service finance such initiatives?

Mr. Williams: If the retirement fund overpayments are solved, a portion of the no longer needed annual retirement benefit fund payments could be used to finance initiatives. Otherwise, the Postal Service would have to cut off old investments to fuel new investments and redirect less profitable investments to more profitable investments. To the extent possible, these initiatives should be self-financing, so that the return on investment will cover the costs. In many cases, funding already being expended to pay for the current workforce could be leveraged to provide these additional services.

FLEET MAINTENANCE

Mrs. Emerson: The Bowles Simpson Fiscal Commission recommended large reductions to funds budgeted for travel, vehicles and printing. I am aware that the Postal Service must maintain a large delivery fleet as part of its day-to-day operations.

In your view, are there steps the Postal Service can take to reduce costs spent on its delivery fleet?

Mr. Williams: The most effective way to minimize fuel costs for postal owned trucks and contract carriers is to optimize volume capacity per trip and reduce the number of transportation trips. Additionally, providing the correct incentives (such as cost and risk sharing arrangements) to its large fleet of contracted carriers also creates the potential for significant savings. Finally, the Postal Service can reduce fuel costs through development of, and compliance with, national acquisition and consumption strategies aimed at reducing the cost and use of fuel, such as an expansion of mobile fueling for city and rural delivery units.

When considering the acquisition of trailers, cargo vans, and other transportation vehicles, the Postal Service should perform a comprehensive lease versus buy analysis, to compare the total cost of leasing to the total cost of ownership. The Postal Service should also establish schedules for its internal drivers that match employee work hours with workload and increase overall utilization and combine or eliminate unnecessary trips. Additionally, once facilities are optimized for mail volume there could be savings from reduced inter-facility transportation routes. Finally, the adoption of alternative fuel vehicles, such as electric vehicles, should help reduce delivery costs for fuel and maintenance.

Mrs. Emerson: What is the Postal Service doing to make its delivery fleet more green and efficient, and improve the longevity of its fleet?

Mr. Williams: The Postal Service has the world's largest fleet of alternative-fuel vehicles with over 44,000 alternative fuel vehicles, including compressed Natural Gas, Propane, E-85, Hybrid, Electric and Fuel Cell vehicles.

- The Postal Service is testing differing models of hybrid vehicles to include sport utility, mini-vans and step-van vehicles. Test results indicate that until hybrids become more competitively priced and replacement batteries are more affordable, it is not recommended as an option for carrier vehicle replacement
- Engineering is working with potential suppliers on prototypes to convert five existing carrier vehicles to run on electricity. Data is currently being collected on range, maintenance costs, and other general diagnostics. These vehicles will be tested for one year and the results of the tests will be published.
- The testing on two hydrogen fuel cell delivery vehicles ended in February. Fuel cells present several challenges such as:
    - Hydrogen production
    - Hydrogen storage
    - Infrastructure, and
    - Fuel Costs

In 2009, at the request of Representative Jose E. Serrano, Chairman, Subcommittee on Financial Services and General Government, Committee on Appropriations, we conducted a study of the potential for electric vehicles within the Postal Service. Our report suggested that the Postal Service could offer a unique test-bed for a broad implementation of electric vehicles in the delivery environment. Significant fuel cost savings could be achieved through such a program, but initial investments would have to be made to support such a strategy.

Regarding fleet longevity, the Postal Service has maintained their carrier vehicles in safe working condition for over 20 years. This is attributed to a robust preventive maintenance program. Vehicles are serviced and repaired at USPS vehicle maintenance facilities and in many commercial garages throughout the country. Vehicles are kept in a safe and operable condition, while meeting established standards and requirements. However, we have found instances in which the cost to maintain a subset of the vehicle fleet is more than it would cost to replace them.

Questions for the Record From Representative Barbara Lee

Ms. Lee: Mr. Inspector General, it has been reported that mail volume is rising slightly from the lows caused by the recession.

Would any disruptions or abrupt price hikes at the USPS caused by a failure to solve financial shortfalls at the Postal Service interrupt this recovery in mail volume?

Mr. Williams: A natural disaster such as a hurricane or terrorism event could have a significant impact on mail volume recovery. In addition, the financial shortfall could limit capital expenditures that if made, might have decreased future costs or provided for revenue generating opportunities or additional services in high-growth areas.

REPORTING ON DIVERSITY

Ms. Lee: Are you able to provide the Subcommittee with information regarding the diversity of professional full time employees at the Office of the Inspector General, broken down by job title or GS level?

Mr. Williams: The chart below shows the diversity of professional full time employees at the Office of the Inspector General.

- Column 1 identifies the job title and the GS equivalent level.
- Columns 2 and 3 break down the total workforce by gender.
- Columns 4 through 14 break down the total workforce by Race, and each of these categories is broken down by gender.

The totals and percentages for each workforce category are shown at the bottom of the report.

1	2	3	4	5	6	7	8	9	10	11	12	13	14
USPS OIG Title - Ideal Pay in Terms of Pay Band	Total By Gender		Native American		Asian		Black		Hispanic		White		Total
	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female

RECRUITMENT AND HIRING

Ms. Lee: What is your office doing to ensure that it is recruiting and hiring a diverse staff? Does your office recruit or have an internship program at any Historically Black College/s and University/ies?

Mr. Williams: To ensure that the OIG recruits and hires a diverse staff, the agency currently advertises positions through the following sources:

- Historically Black Colleges and Universities
- Historically Asian Colleges and Universities
- Colleges for the Hearing Impaired.

The OIG routinely recruits at Women in Federal Law Enforcement conferences, and participates in local and national job fairs for the National Society of Hispanic Professionals.

We also support the following law enforcement organizations through individual memberships and attendance at sponsored events.

- Federal Hispanic Law Enforcement Officers Association
- Hispanic American Police Command Officers Association
- National Organization of Black Law Enforcement Executives
- Women in Federal Law Enforcement

Further, the OIG ensures that a dedicated telephone line is available for applicants requiring handicap accommodations.

PROCUREMENT AND CONTRACTING

Ms. Lee: Are you able to provide us with information regarding the amount and percent of contracts with small, disadvantaged businesses that are female or minority-owned?

Mr. Williams: The Postal Service, as an agency that does not operate on appropriated funds, does not have to set and report on goals for contracting with small and disadvantaged businesses. However, the Postal Service has a program supporting small, minority owned, and women owned businesses (SMWOB) that has won awards. These awards include America's Top Government Agency for Multicultural Business Opportunities in 2006 – 2009, 2011, and in 2010 they were rated second.

The Postal Service has a supplier outreach program that participates in over 25 outreach events annually. The Postal Service also has memberships and/or partnerships with advocacy groups and councils.

The Postal Service Supplier Diversity Program established goals for providing contracting opportunities to SMWOB in 2006. The goals currently set are comparable to those set in the Federal sector. The Postal Services achievements against its goals are noted in the chart below.

SMWOB Category	Goal	Goal Achievement	% of Change	Value $(M)
FY 10 Small	36.3%	40.64%	↑4.34%	2,991.7
FY 09 Small	35.0%	39.05%	↑4.05%	3,016.8
FY 08 Small	35.8%	31.39%	↓4.41%	2,798.2
FY 07 Small	31.2%	34.30%	↑3.10%	3,464.3
FY 10 Minority-Owned	4.1%	4.87%	↑0.77%	358.2
FY 09 Minority-Owned	3.5%	4.80%	↑1.30%	370.8
FY 08 Minority-Owned	3.6%	3.49%	↓0.11%	304.6
FY 07 Minority-Owned	3.1%	3.50%	↑0.40%	349.7
FY 10 Women-Owned	7.5%	7.63%	↑0.13%	561.4
FY 09 Women-Owned	7.1%	9.02%	↑1.92%	696.5
FY 08 Women-Owned	5.8%	5.97%	↑0.17%	520.9
FY 07 Women-Owned	4.6%	5.60%	↑1.00%	565.0

WEDNESDAY, MARCH 2, 2011.

U.S. ELECTION ASSISTANCE COMMISSION

WITNESS

CURTIS W. CRIDER, INSPECTOR GENERAL, U.S. ELECTION ASSISTANCE COMMISSION

Mrs. EMERSON. Thank you so much for being here, Inspector General Crider. We look forward to hearing your testimony. As you may know, this committee is committed to reducing nonsecurity discretionary spending to fiscal year 2008 levels, and so we have asked several Inspectors General to meet with us so that you all can help us identify savings where we can, in fact, achieve it.

Your oversight is valuable, not only to ensure that taxpayer dollars are used in the most cost-effective manner possible, but also to determine whether the Commission is contributing to the integrity of our Federal elections. While the Election Assistance Commission has taken on a number of roles, it was specifically established to help States meet new voting standards and the overall enhancement of election administration called for under the Help America Vote Act.

In order for our democracy to thrive, people must be able to place complete confidence in the integrity of our Federal voting system. In general, I am interested in hearing your perspective on the Commission's operating expenses, the necessity of having so many high-level administrative staff, as well as the Commission's overall management practices. While it appears that the Commission has matured since it was first set up, my observation of some of its decisions and activities suggests that the EAC still has a lot of work to do.

In addition, I continue to find it interesting that so many of the States that received grant funding under HAVA have yet to spend significant amounts of the funding provided to them in spite of the fact that it has been available for a number of years. I would like to hear your views on the Commission's management of those funds.

I look forward to your testimony and to gaining a better understanding of your efforts to hold the Election Assistance Commission accountable.

I would now like to recognize my good friend, Ranking Member Jose Serrano.

Mr. SERRANO. Thank you so much.

I would also like to welcome Inspector General Crider to this hearing today. The Inspector General's Office has the important job of reducing waste, fraud, and abuse not just at the Election Assistance Commission but also among the States and territories that have received and used Help America Vote Act funds.

As you know the Help America Vote Act was passed in the wake of the 2000 elections. The goal of the act was to help States to upgrade their voting equipment and election administration, to help develop an ongoing series of testing standards and best practices in these areas, and to create a clearinghouse of information for States to use. I am looking forward to hearing more about how well the EAC has done this job and what they can do to improve their efforts. In addition, I am interested in learning more about how States have used their Help America Vote Act funds to improve their voting systems and election administration.

From your testimony, I understand that you are concerned about the amount of money the Election Assistance Commission spends on management activities. While I think this should be an area of concern, I would like to point out that many of these activities, in particular, the public meetings and advisory board activities, are mandated by law. These are activities that improve the EAC's transparency and accountability to the States it provides assistance to and to the public as a whole. As we move forward with the fiscal year 2012 budget request and as we continue to work on the continuing resolution for 2011, I would hope that we remember that.

I always like to say that the Election Assistance Commission is a small agency with a big job: to help ensure that our elections are open, accessible, and secure. The IG's Office plays an important role in ensuring that the EAC performs its work to the best of its ability. I look forward to your testimony.

Thank you.

Mrs. EMERSON. Thank you, Joe.

Mrs. EMERSON. Mr. Crider, we will now recognize you for your opening statement. If you would be so kind as to try to keep it to 5 minutes, that will give us more time to ask questions. Thank you.

Mr. CRIDER. Good morning, Chairwoman Emerson, Ranking Member Serrano, and members of the subcommittee. Thank you for inviting me to come today to talk to you about the U.S. Election Assistance Commission and our operations in the Office of Inspector General.

My office is an independent office in the EAC. Our role is to review EAC programs and operations with an eye toward helping the agency be more efficient and more effective. We also audit the funds distributed by the EAC to ensure the money is spent for the right purposes and in keeping with Federal rules.

A large portion of our resources have been dedicated to auditing the Help America Vote Act grants that have been given to the States. The EAC has distributed $3.3 billion in funding to the States for election equipment and procedures. To date, we have completed 31 audits of 28 States covering $1.3 billion. We examined State expenditures to determine if they were made for appropriate purposes, were properly charged to HAVA grants, and were supported by appropriate and sufficient records.

Our audits have shown that, by and large, States use HAVA funds for appropriate purposes and that they have the needed documentation to support those charges. We have identified $31.3 million in questioned costs and additional program income in our 31 audits.

The EAC has also distributed $50.9 million in discretionary grants in the six smaller programs. We have only audited a few of these smaller grants. However, those audits have raised some concerns about these funds and the manner in which they were used.

In 2009, we received a congressional request to audit two small grants under the Help America Vote College Program. We began what we believed would be a very simple, straightforward audit of $33,000. What we found was that the grantee did not have records to support his charges to the grant. We questioned all of the costs charged to the grant, and the grantee is in the process of repaying those funds now.

The second major focus of our work was on EAC operations. We oversee the annual audit of the EAC's financial statements and fiscal compliance reviews which is done by outside contractors. In addition, we have issued seven reports covering six reviews and one investigation of EAC operations.

Our reports have revealed the good and the bad about EAC operations. Not all of our reports are negative. We conducted reviews of the EAC's Internet usage and the use of appropriate funds for settlement. We determined the EAC had proper controls to prevent access to adult content, gambling, and shopping sites. That is what our report says. We also found that the EAC followed the laws in using its funds to settle a prohibited personnel practices claim.

Our reports have also identified areas where EAC can improve its operations. For example, in 2008, we issued a major report on the assessment of EAC's financial and program operations. We found that the EAC did not have internal controls or policies and procedures in place to guide its programs and operations. We made 29 recommendations related to needed policies and procedures. The EAC has implemented the vast majority of these recommendations and adopted policies and procedures in most of its programs.

We also found a situation where EAC did not violate law or regulation, but where better choices could have been made in the use of Federal funds. One such example was our review of the EAC purchase of T-shirts. While this was only a $7,000 purchase, the EAC bought 5 shirts for each of its employees as an employee incentive award, and they still had about 200 shirts in inventory. While this purchase was not illegal, it was just not a good use of taxpayers' funds.

Our investigation in the EAC's operating environment also showed no violation of Federal antidiscrimination laws or whistleblower laws but did reveal employees fear retaliation for making complaints or identifying wrongdoing. It also showed that employees believe that it was an "us versus them" atmosphere at the EAC.

In the failure of the EAC's employee service in 2007, 2008, and 2009, they showed that an information divide exists between management and staff. The 2010 survey results are now in, and the EAC is in the process of evaluating those. Those results should be available the middle of March, and we are hoping that there is significant improvement in the results of the survey.

The EAC's fiscal year 2012 budget request seeks $13.7 million, with $3.25 million being transferred to the National Institute of Standards and Technology. The EAC proposes the operating budget

of $10.45 million. This is a 27.7 percent reduction from its operating budget in 2010. The OIG takes its fair share of that cut. Our portion of the EAC budget will be $1.56 million. While this is a sizeable reduction from our previous budgets, we will continue to conduct audits and investigations, albeit just a few less than we have done in previous years.

We know that members of this committee have previously raised concerns about EAC's overhead and management costs. This budget would appear to verify those concerns. More than 51 percent of the EAC's fiscal year 2012 budget is dedicated to overhead and management charges. The EAC should take a hard look at its management and overhead costs to determine if savings could be achieved to bring management costs more in line with program costs.

The EAC has committed to doing this analysis. In their transmittal with the budget justification that was provided to Congress, they have indicated they are willing to do a study and make the necessary changes to bring the costs in line. We think this committee should hold the EAC accountable to its word, make sure this analysis is conducted and whatever changes that need to be made are made by the EAC.

Our role is to make recommendations that improve the EAC and to protect the taxpayers' investment in our Nation's election process. We will continue to work with the EAC and this committee to make the EAC's programs and operations economical, effective, and efficient.

It is my pleasure to be here today, and I will be more than happy to answer any questions you have.

Mrs. EMERSON. Thank you so much, Mr. Crider.

[The information follows:]

March 9, 2010

Testimony of Curtis W. Crider, Inspector General, before the U.S. House Appropriations Committee, Subcommittee on Financial Services and General Government

Curtis W. Crider, Inspector General
U.S. Election Assistance Commission

Chairwoman Emerson, Ranking Member Serrano, and Members of the Subcommittee, thank you for inviting me to testify today. I am pleased to be here this morning to discuss the activities of the Office of Inspector General (OIG) and to provide insight into the economy and efficiency of the programs and operations of the U.S. Election Assistance Commission (EAC).

INTRODUCTION

The EAC is a bipartisan Commission created and authorized by the Help America Vote Act of 2002 (HAVA). The OIG is an independent division of the EAC required by HAVA and the Inspector General Act of 1978 (IG Act) and created by the EAC in 2005. Our office is comprised of three full-time staff: the Inspector General, the Assistant Inspector General for Audits, and Counsel to the Inspector General. We also contract with two independent accounting firms for audit support and use the investigative services of other Federal agencies, when necessary.

The OIG's mission is to promote economy, efficiency and effectiveness in the EAC programs. To accomplish this goal, the OIG conducts regular audits of recipients of grant funds distributed by the EAC, annual financial audits of EAC's operations, and periodic reviews and audits of EAC program operations. In addition, the OIG helps to identify waste, fraud, abuse and mismanagement in EAC programs and operations by conducting investigations of complaints against the EAC, its grant recipients, or third parties involved in EAC programs.

GRANT AUDITS

The EAC administers several formula and discretionary grant programs. The EAC has distributed $3.2 billion in funding under the formula grants established in titles I and II of the HAVA. In FYs 2003, 2004, 2007, 2008 and 2009, the Congress appropriated funding to these programs totaling $3.3 billion. Approximately $56 million is left to be distributed. In addition to these grants, the EAC has distributed $14.9 million in discretionary grants under the following grant programs: Help America Vote College program, Parent Student Mock Election program, Election Data Collection grant program, and Military Heroes Initiative. Last, the EAC has $11 million in funding yet to be distributed under two discretionary grant programs: the Pre-election Logic and Accuracy Testing and Post-election Audit Initiative and Accessible Voting Technology Initiative.[1]

[1] HR 1 would rescind $5 million from the funding available for these programs.

Over the past five years, the OIG has focused on auditing the large sums of money distributed to and spent by the states to improve the election infrastructure and procedure. These grants were available for limited uses. The uses of these funds include:

HAVA Section	Approved Uses
101	Comply with title III of HAVA; improve the administration of elections for Federal office; Voter education regarding voting procedures, voting rights, and voting technology; training election officials, poll workers, and election volunteers; develop the state plan required in title II of HAVA; improving, acquiring, leasing, modifying or replacing voting systems; improving accessibility of polling places; and establishing a hotline for voters to use to report voting fraud and voting rights violations, obtaining election information and information about the voter's status, polling place location and other relevant information.
102	Replace punch card and lever voting systems that were in use during the November 2000 election
251	Purchase or lease voting equipment that meet standards established in Section 301 of HAVA; implement a program of provisional voting; provide specified information to voters at the polling place; develop and implement a single, statewide list of registered voters; and identify first-time voters in keeping with the requirements of HAVA.

Section 102 funds were available for a limited period of time.[2] At the end of the period of availability, states must return any unspent funds or funds associated with precincts that still use punch card or lever voting systems. Section 251 funds required states to submit a state plan and to appropriate matching funds equal to five percent of the combined state and Federal shares. All funds must be deposited into an interest bearing account ("election fund") wherein earned interest could be used for the types of activities allowed under Section 251.

We audit the HAVA funds expended by the states. Our audits examine whether the funds were spent for approved purposes, whether expenses were made in keeping with HAVA and Federal guidelines for the use of grant funds, whether expenses were properly documented, whether the state met its matching requirement, and whether state and Federal funds were timely deposited into the election fund. We have completed audits of 28 states. These audits covered $1.3 billion and resulted in $31.3 million in questioned costs or additional program costs. Some common audit findings were:

[2] The deadline was originally the November 2004 election. However, states were permitted to request a waiver until January 1, 2006. This deadline was subsequently extended. The most recent change made the deadline November 2010.

- Failure to maintain adequate time records for persons whose wages/salaries are paid from grant funds;
- Failure to maintain property control/inventory records for equipment purchased with Federal funds;
- Failure to appropriate sufficient matching funds;
- Failure to timely deposit matching funds or interest earned on HAVA funds; and
- Errors in reports filed with the EAC.

There have been state and/or Federal investigations in three states regarding the use of HAVA funds. In one instance, former state officials and contractors have been indicted on charges of money laundering, kickbacks and tax evasion.

We have ten state audits in progress.[3] Those audits cover $800 million in HAVA expenses. Final reports on these audits will be available by the end of the current fiscal year. Approximately $1.3 billion of the $3.2 billion distributed by the EAC under the HAVA grant programs is yet to be audited.

Below is a chart detailing the HAVA funds that have been subject to audit by the OIG. The chart aggregates the amounts received and audited under the three HAVA grant programs. The amount audited also includes interest earned on HAVA funds as of the date of the respective audit.

State	HAVA Funds Received	Required State Match on HAVA Funds Received	Total HAVA Funds Available Excluding Interest	Total HAVA Funds Audited	Unaudited HAVA Fund Balance
Alabama	$40,907,194	$1,887,711	$42,794,905	$30,330,539	$12,464,366
Alaska	$18,021,803	$685,358	$18,707,161	$0	$18,707,161
American Samoa	$3,319,361	$0	$3,319,361	$0	$3,319,361
Arizona	$52,532,244	$2,395,615	$54,927,859	$0	$54,927,859
Arkansas	$30,396,569	$1,275,456	$31,672,025	$28,205,912	$3,466,113
California	$380,356,043	$15,562,763	$395,918,806	$213,941,386	$181,977,420
Colorado	$45,784,267	$2,039,309	$47,823,576	$0	$47,823,576

[3] These audits cover some states that have previously been audited. The OIG selected these states for re-audit due to the large amount of money that had been spent since the states' prior audits.

State	HAVA Funds Received	Required State Match on HAVA Funds Received	Total HAVA Funds Available Excluding Interest	Total HAVA Funds Audited	Unaudited HAVA Fund Balance

* Audit in progress
†Second audit in progress
^Audit planned for FY 2011

The OIG has completed an audit of two of the Help America Vote College Program grants. Both grants were given to a single grantee and totaled $33,750. Due to a lack of supporting records, we questioned all costs and the grantee is in the process of repaying all $33,750. The OIG also has an ongoing audit of one of the five grants distributed under the Election Data Collection grant program. That grant is in the amount of $2 million. The audit is expected to be completed in 2010.

AUDITS, EVALUATIONS, AND INVESTIGATIONS OF EAC

The OIG oversees annual audits of the EAC's financial statements and compliance with the Federal Information Security Management Act (FISMA). These audits are conducted by an independent public accounting firm. The EAC received an unqualified opinion on its FY 2010 financial statements. The EAC has shown dramatic improvement in its financial management processes since its first financial statement audit in FY 2008, which resulted in a disclaimer. The FY 2010 audit of EAC's FISMA compliance also demonstrated vast improvement and substantial compliance with FISMA. Prior audits had noted significant deficiencies in meeting FISMA requirements.

In addition to these annual reviews, the OIG has conducted six reviews of EAC programs and operations and one investigation into the working environment at EAC. Two of those reports found favorable conditions at the EAC and resulted in no recommendations. In each of the other reports, we made recommendations to improve the efficiency and effectiveness of the EAC programs.

These reports form the basis of our annual report on the EAC's top management challenges. For FY 2010, the OIG reported on five management challenges facing the EAC: performance management and accountability, financial management and performance, information technology and security, human capital management and records management. We resolved the financial management and performance challenge as the EAC had taken steps to implement all of the recommendations that had been made in the past financial statement audits and obtained an unqualified opinion on its current audit. The other four challenges remain open as EAC has yet to implement all recommendations made in various reports to improve its internal control structure, information technology and privacy act information security, working environment issues, and records management.

We consider the performance management and accountability and human capital management challenges to be the most significant. In 2008, the OIG issued its Assessment of the U.S. Election Assistance Commission's Programs and Financial Operations. In that report, the OIG issued numerous findings related to the need for documented policies and procedures. These recommendations touched nearly every division then existing at EAC, including communications, research, testing and certification, finance and administration, and programs and services (grants). While the EAC has made significant progress in developing policies and procedures, work remains to be done to complete policies and procedures for all of EAC's operations.

The absence of documented policies and procedures has created and exacerbated other problems at the EAC. One example is the disclaimer that EAC received in its first financial statement audit. Also, failure to implement policies and procedures has left an information gap and a lack of understanding of expectations on the part of EAC employees. This information divide is evidenced in EAC's employee surveys. In 2007, 2008, and 2009, the employees reported a lack of understanding of the goals and priorities of the organization as well as the expectations on them as individual employees. Based on the 2009 survey, less than half of respondents believed that:

- Managers communicate the goals and priorities of the organization (45%);
- Leaders generate high levels of motivation and commitment in the workforce (42%);
- Employees have a feeling of personal empowerment with respect to work processes (34%);
- Promotions are based on merit (34%);
- Employees understood what they had to do to achieve a certain performance rating (41%); and
- Pay raises are dependent on how well a job is performed (28%).

Employee Survey 2009, questions 15, 18, 20, 26, 29, and 31.

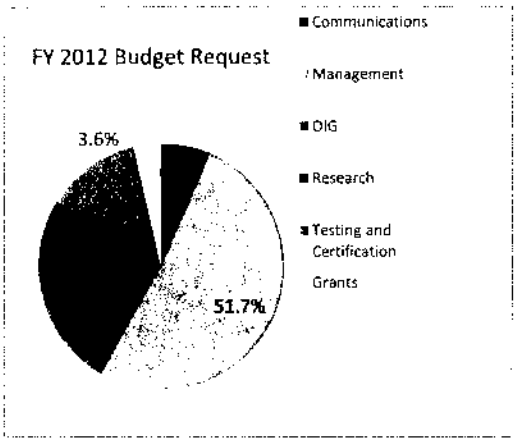
These employee concerns were echoed in our 2010 investigation into the EAC's working environment. The investigation was spurned by 15 complaints from confidential and anonymous sources alleging infractions from cronyism to retaliation. The investigation was conducted by another Federal Office of Inspector General on our behalf. It revealed that the EAC did not have a hostile working environment as defined by Federal statute and no actual retaliation occurred. However, it did open a window in to the fears and concerns of EAC employees, the existences of an "us/them" environment, and potentially inappropriate activities at EAC events.

We referred the investigative report to EAC management for follow up under our human capital management challenge. As a part of that challenge, we admonished the EAC to address expressed concerns with performance measurement. Employees who are performing should be rewarded, and those that are not should be disciplined. In addition, we noted that EAC must ensure that people with appropriate skill sets are tasked to perform critical functions. The EAC has hired a number of competent and trained personnel to assist with its financial and other administrative needs. The EAC has significantly increased the total number of employees and its corresponding administrative costs. In these tight economic times, the EAC must take a hard look at its workforce and resources to ensure that needed skills are retained.

EAC'S OPERATING BUDGET

The EAC's FY 2012 budget request totals $13,715,665, which includes a transfer of $3.25 million to the Department of Commerce National Institute of Standards and Technology. EAC is left with an operating budget of $10,465,665. This is a significant reduction over its FY 2010 and FY 2011 continuing resolution operating budget of $14,459,000. In its submission accompanying the President's budget request, the EAC disburses the $10,465,665 as follows:

	Amount
Management†	$5,406,718‡
Communications	$669,583
OIG	$1,562,346
Research	$1,137,025
Testing & Cert	$1,307,493
Grants	$372,500



†Management includes expenses for the following offices and activities: Commissioners, advisory boards, Executive Director, public meetings, General Counsel, Chief Operating Officer, and Chief Financial Officer. We believe that the management allocation also includes infrastructure costs such as rent that could be allocated to the programs.
‡The $5,406,718 proposed by the EAC for its management expenses is understated by $10,000. The sum of the line items in the management section total $5,416,718. For purposes of this testimony, we will use the numbers as presented by EAC despite their errors.

The OIG's portion of the FY 2012 budget is proposed at $1,562,346. With these funds, the OIG expects to continue to audit states and EAC programs, albeit at a reduced level. We will continue to work with three full-time staff and contract auditors.

The FY 2012 allocations result in reductions to all programs but at different levels. Below is a chart showing the amounts allocated to the EAC programs in FY 2010 and the percentage reduction to the programs in the FY 2012 proposed budget.

EAC Program	FY 2010 Allocation	FY 2012 Request	% Reduction in FY 2012
Management	$6,520,094	$5,406,718	17.1%
Testing and Certification	$1,861,008	$1,307,493	29.7%
Research	$1,544,817	$1,137,025	26.4%
Communications	$848,752	$669,583	21.1%
Grants	$1,914,069	$372,500	80.5%
Office of Inspector General	$1,770,259[4]	$1,562,346	11.7%
Total	**$14,458,999**	**$10,455,655**	**27.7%**

We believe that the EAC's FY 2012 budget request demonstrates a continuing concern that this Committee has voiced regarding EAC's operation: that the EAC's overhead is too high. EAC uses $5,406,718 to manage programs totaling $3,486,601.[5] In its FY 2012 budget submission, the EAC stated a commitment to developing structural reorganization scenarios that would allow the agency to meet its statutory obligations with fewer resources. We would urge the EAC to take a hard look at its overhead and infrastructure in comparison to its program costs. We believe that there are cuts to be made and efficiencies to be accomplished in its administrative operations, winnowing away at what has become a bloated bureaucracy. We also would urge this Committee to hold the EAC to its word. The EAC must be accountable to this Committee and thereby the taxpayers of the United States as to their use of Federal funds.

However, we must caution that change may come slowly at the EAC. The EAC is operating with only two of the four Commissioner positions filled. With only two Commissioners, the EAC lacks a quorum and cannot vote or act to make policy and strategic changes. We hope that the Administration and Congress will act swiftly to fill these vacancies.

CONCLUSION

As you are aware, some of your colleagues would propose to do away with the EAC. Representative Harper has filed a bill to abolish the EAC. While the Office of Inspector General functions as a part of the EAC, it is neither our job nor our prerogative to urge the abolishment

[4] The FY 2010 President's budget request for the EAC included $1,888,960 for the OIG, while the EAC allocated $1,770,259. The $1,562,346 requested in the FY 2012 President's budget is actually a 17.3% reduction from the FY 2010 President's request.
[5] The program total excludes the funding for the OIG as the EAC provides no management function over the OIG.

or the salvation of the EAC. Rather, it is ours to work with EAC and this Committee to make EAC operations more effective and efficient and to ensure that the money dedicated by Congress for election reform is spent for its intended purpose.

I appreciate the opportunity to come before the Committee today and share with you our work and our thoughts on how to improve EAC programs and operations. I would be pleased to address any questions that you may have.

Curtis Crider
Inspector General
U.S. Election Assistance Commission

Curtis Crider was appointed as the Inspector General for the U.S. Election Assistance Commission in August of 2006. Mr. Crider has 35 years of auditing experience in the Federal government. Mr. Crider is a 1975 graduate of Clemson University. He is a certified public accountant and a certified internal auditor.

Mrs. EMERSON. As you are well aware, our country's debt is about $14 trillion, and we in Congress are soon going to have to face the hard decision of whether or not to raise the debt limit. Our committee has a responsibility to address the unsustainable debt by reducing spending, and certainly I intend to do my best to make sure that the reductions we make in our budget are reasonable and sustainable. We are looking for any cost savings we possibly can find.

While I am pleased to note that the EAC requested $4 million less for fiscal year 2012, which is a 24 percent reduction—and it would be good if all agencies could reduce their request by that much—I wonder if you believe that they could reduce costs by operating more efficiently; and, if so, what specific areas of their operations would you highlight?

Mr. CRIDER. The management administrative costs in particular are something that need to be looked at. It is that they have a very large management staff at EAC, and that is an area where I think that some savings could be generated. As I stated earlier, the EAC is committed to doing that type of an analysis, but I would think this committee should hold them accountable for that, to make sure that it does in fact get done.

There are opportunities to contract certain activities out to other Federal agencies such as human resources, accounting; procurement to other Federal agencies, such as the Bureau of Public Debt. Now, there will need to be resources on the EAC side to manage those functions or to make sure those functions are performed properly. But there are agencies that do this for other Federal agencies; like I said, the Bureau of Public Debt. That might be an area where we could take a look at in terms of okay, what do we need to do in-house and what can we let somebody else do for us?

When we have a contract in the IG's Office that needs to be let, we use the National Business Center to do our contracting because I don't have a contracting officer. We used the EAC to do one contract for us, but for all intents and purposes, we contract that function out to another Federal agency.

When we need an investigation done—I don't have an investigator on staff, and for a small agency like EAC, that may not be practical—I contract with another Federal agency to perform those services for us. So there may be areas like that that they could take a look at in terms how we can conserve some funds there.

Mrs. EMERSON. I appreciate that. The Bowles-Simpson Commission Report—I don't know whether you have read the whole thing or not—recommended significant reductions in government travel, printing, and other administrative costs. I believe the EAC should be able to achieve reductions or savings in those areas.

There have been some reports that the EAC has sent numerous representatives to conferences around the country, where simply a few staffers or perhaps one might have sufficed. Do you believe that the EAC could further reduce its costs in areas recommended by Bowles-Simpson?

Mr. CRIDER. It is my understanding the EAC is taking a very hard look at that. In terms of the printing costs, there was a proposal put forward in terms of not printing the State plans in the Federal Register, which would save a fairly significant amount of

money in terms of the EAC. And it is my understanding from talking to staff at the EAC, that they are taking a very hard look at the number of people that are going on this travel and trying to see whether they can reduce it. But I do think those are areas that need to be looked at. Like we don't travel. We do everything by conference call that we possibly can in order to cut our travel costs, and I think that is something the EAC should be looking at also, and I believe that they are looking at that.

Mrs. EMERSON. I appreciate that, and I also appreciate the fact that you are finding significant savings within your own office by using other parts of the government who have expertise in those areas.

It is my understanding that the EAC actually determines how much funding your office should request in the annual budget process, and I find that troubling given the fact that you are an independent office, given your oversight of the Commission. Do you find that that arrangement limits your ability to seek the level of resources you all need to accomplish your mission?

Mr. CRIDER. I put my budget in separately in terms—I submit a separate budget package to the EAC detailing how much money that we need. The cut that we are taking this year is at the direction of OMB. The cash drawer is empty, and we all have to conserve money. We all have to understand that there is not near as much money as we would like to have necessary for operations.

We are not a line item in the budget. The budget is then allocated back by the EAC, back to my office. We have not had any major problems in the past in terms of getting those funds back, but it is an area that could—it is just a matter of time before I irritate the agency again because that is just the nature of my work. They could take that out and say, okay, we are not going to give you any finding, or we are going to cut your funding. And my only recourse at that point in time would be to go to OMB and then to appeal to our oversight committee saying, they are doing this to us. But if nobody stepped up and said, okay, you can't do this, then they could, in fact, do that.

So we are concerned about it. We would like to be a line item in the budget to protect that funding, and I think that would give us—that would help our independence. It is just something we would like.

Mrs. EMERSON. Are there any other agencies whose IG budget is not a separate line item?

Mr. CRIDER. Yes, there are a number of them, okay. We are small. We are considered a DFE, a Designated Federal Entity IG, and a number of us are very small. And like I said, we are not necessarily line items. We would like to be a line item.

Mrs. EMERSON. Okay. I appreciate that. Mr. Serrano.

Mr. SERRANO. Thank you.

Before I ask you a couple of questions, something comes to mind that I just think we need to remember. You know, if we are thinking only about cutting budgets—and that is what we are doing now—this statement could be true for every agency that we face on any subcommittee, which is that we have to try to balance what we do with the services that are rendered by those agencies.

One of the characteristics of human beings is that we tend to forget—and we are looking now at the EAC—it is a small agency that may have problems and that a lot of people are not ready to stand up and support during difficult budget times, and it may disappear in the future. The law may be one of those that also doesn't get fully implemented, unfortunately.

We forget HAVA came about because in 2000 we had a very, very, very difficult election result; and when I say difficult, that count that went on and the uncertainty and the pain, and the gentleman's State went through a very difficult time, and it doesn't matter what side of the equation you are on, Bush or Gore. It was painful for our country, and HAVA came about because of that, to try to remedy that.

And I think as we move forward we have to remember that. We shouldn't forget that that was the reason the EAC was created, to hope that in the future we never have a situation like the one we had. Because when you see folks all over the world clamoring for systems that look a lot like ours, then you have to make sure you keep reinforcing ours and give everyone a chance. It is not enough to say we have the greatest system on Earth of any kind. The question is, is everyone participating equally? Is everyone getting the opportunity to participate? And that is what HAVA is supposed to accomplish.

Inspector General, the last page of your testimony sums up what I believe is one of the biggest challenges facing the EAC today. Only two of the four commissioner positions are filled. Without a full Commission, the EAC cannot vote or act to make policy and strategic changes. Understanding that these vacancies are not the most pressing issue before Congress right now, what can the EAC do to address your concerns right now? Without the other two commissioners, what is realistic?

Mr. CRIDER. The agency can function, according to the General Counsel's Office. They can perform a lot of their duties and responsibilities. While they cannot set policy, they can undertake some of the other actions that might be warranted at this point. We agree we would like to see the commissioners appointed. I think that would be a very beneficial thing for EAC to stabilize the organization, get the new commissioners in, and let the agency move forward if it is to continue to exist.

But we do agree with you, we would like to see the two commissioners appointed, but they can still do a lot of stuff. They can award grants. They can conduct oversight. They can continue with their testing and certification programs. Their research projects can continue. So the EAC can continue to function on an operational level.

Mr. SERRANO. And you don't feel that not having the commissioners fully in place may leave open challenges where people say, well, the Commission was not fully put together when it made that decision?

Mr. CRIDER. I would—there is that possibility. Like I said, we would like to see the two commissioners appointed, because I think that would be best for the organization, and it would forestall anything like that. There was another small commission that had only 2 commissioners. They continued to operate, and the Supreme

Court basically set aside a lot of the work that they had done because they did not have a quorum. And like I said, we obviously want to make sure that doesn't happen at the EAC.

Mr. SERRANO. Okay. We all want our tax dollars to be used efficiently and effectively. That is not an issue of disagreement, and we all want open, fair, and accessible elections. With that established, what are the most important steps that you believe the EAC should take to increase efficiency?

Mr. CRIDER. We would like to see them not only to take a look at the administrative and management side to see, okay, can we streamline this, can we move some of the money back into the program side to help the programs perform their mission and objective? That is the issue in the human capital management at the EAC, or areas where we would like to see aggressive—things being addressed aggressively so that the EAC can move forward.

The EAC is a very good organization. I think it has a mission to perform, but it needs to be managing itself efficiently and effectively.

Mr. SERRANO. Now, how does that balance with my comments in my opening statement that some of these decisions, if not all, are mandated by law?

Mr. CRIDER. There are only a few positions mandated by law.

Mr. SERRANO. Okay. And the rest you think are just fat that could be removed in some cases?

Mr. CRIDER. I don't want to use the term "fat". This is where they need to do their analysis to determine what resources level they need and what skill-sets they need. We are not necessarily talking here about numbers of bodies, we are talking about skill-sets. What skill-sets are needed by the agency and do we have those skill-sets, and can we then trim in terms of anything that we don't feel is a success at this point?

I realize we are talking about human beings and their jobs, but in the tight budgetary times that we have, we have to be efficient and effective.

Mr. SERRANO. But your suggestion is, trim it and then use it for programmatic——

Mr. CRIDER. If there are ways we can trim it, and can we move the funds now to the program side?

Mr. SERRANO. One last question for this round. The President's budget for the EAC for fiscal year 2012 is $13.7 million, of which 3.25 million will be transferred to the National Institute of Standards and Technology. This leaves EAC with $10.5 million for fiscal year 2012, which is $4.2 million below the fiscal year 2010 level in terms of operating expenses. Isn't the reduction in budget for the EAC proof that this agency has, in fact, found efficiencies already? Are you advocating for further reductions in the budget?

Mr. CRIDER. The budget reductions have not—are just now starting to occur, and the EAC has got to look at its operations in terms of how much money we are going to have and how we are then going to get the work done. And this is where we think they need to look at the administrative side, because they are still operating at $17.9 million in terms of the continuing resolution. So this is going to be a very drastic reduction in 2012, and we think that

they need to start planning for that now, looking at their administrative side and determining what resources they do need.

Mr. SERRANO. Thank you.

Mrs. EMERSON. Mr. Diaz-Balart.

Mr. DIAZ-BALART. Thank you very much, Madam Chairwoman. How are you, sir? Thanks for being here.

Do you know approximately how many States that have HAVA grants, how many of them are yet to be audited?

Mr. CRIDER. There are 55 jurisdictions, and we have completed audits of 28 States.

Mr. DIAZ-BALART. Any idea what the timetable is of the completion of those that have not been completed?

Mr. CRIDER. There is still a fairly significant amount of money out in the States that has not been spent; in excess of $800 million. So a lot will depend upon, in terms of how fast the States spend those funds. I mean, they control how fast they spend it. So a lot will depend on how fast they spend it.

We are able to do—this year, we have 10 audits underway right now and covering another $800 million in costs, which will bring our total audit up to about $2 billion, and that will leave about 1.3, $1.4 billion still out there to be audited at that point.

Mr. DIAZ-BALART. Eight hundred million dollars that still has not been spent. That is quite a substantial amount of money. Do we know why is it——

Mr. CRIDER. I don't know the answer to that, sir. The EAC may have a better understanding of that. When we go out, we just look at how much they have spent.

Mr. DIAZ-BALART. Great. It is my understanding that your office did an audit of two EAC project vote grants——

Mr. CRIDER. Yes, we did.

Mr. DIAZ-BALART [continuing]. Which funds subsequently went to ACORN?

Mr. CRIDER. Yes, sir.

Mr. DIAZ-BALART. And it is also my understanding they provided no records of where the money went. Is that correct? Is my understanding correct?

Mr. CRIDER. Yes. Yes, it is.

Mr. DIAZ-BALART. Any ideas of how to prevent similar situations like that one from happening in the future?

Mr. CRIDER. Well, audit is one. By going out and doing audits is how we find this stuff, so I think audits are very important. But I also think oversight—is that when we looked at the records at the EAC, is that we found they should have had some additional records that they did not have, and I think that would have helped them. But you know, when you go out and grantees do what they do, and usually you find out after the fact in terms of whether or not the records are adequate or not. Like I said, that is where audit comes into play.

Mr. DIAZ-BALART. Absolutely. That is why it is crucial you are there to do your job. Is that an unusual situation, where no records are found to follow the money?

Mr. CRIDER. Unusual. Like I said, we thought we would be in and out in a couple of weeks. It is not that much money involved. So we were a little bit dismayed when we found that they had no

records. I hope I don't find we are in that situation again. Now, we run into problems with States periodically where their records are inadequate, but usually we work through the issue with the State. But in this particular case, like I said, there were just no records.

Mr. DIAZ-BALART. Who is responsible so that that doesn't happen? You know, are the States the ones who are responsible for that? Who is supposed to be tracking that at the time? Obviously you go back and you do audits afterwards, but at the time, who is responsible? And the reason for my question is: Is there any accountability for those who are responsible; or is there a clear, you know, chain of responsibility in a case like that?

Mr. CRIDER. The grantees are required to maintain their records. So that is where that responsibility lies. As the grantor, the agency has limited ability at times to go—because that is what audit is all about.

Mr. DIAZ-BALART. True. I think I know the answer to the next one, but I have to ask it. In the fiscal year 2012 budget request for your office, I believe it shows 50 percent of your proposed funding will go to management expenses compared to 10.9 for research and 12.5 for testing and certification. You know, in a vacuum, one would say, wow, that is a lot of money for management. I think you have kind of addressed that, but I think it is important that we hear it from you as to why those numbers look like that, because obviously if you looked at it in a vacuum, it wouldn't look that good.

Mr. CRIDER. There is no doubt we are concerned about the amount of overhead at the EAC, and as Ranking Minority Member Serrano indicated, it is a small agency and there are certain functions the EAC has to perform. They need to look at ways to be more efficient and more effective, and that is what we are asking them to do. Like I said, as a part of their budget package, they have indicated their willingness to do that. I talked to the person doing the analysis this morning. They are doing the analysis, and hopefully we will have some results here shortly in terms of what the analysis shows.

But I think it is important for this committee to also monitor that to make sure, in fact, it does get done; and if reductions are identified, that those reductions, in fact, do occur.

Mr. DIAZ-BALART. Right. Because, again, in a vacuum, if you looked at an agency where it is 50 percent management and then, what, 12.5 and 11 for testing and certification and research, it gets to the point where you think, again, they are small—I understand that—but it gets to the point if they are that small and they are spending this little on research and testing, and then are they really even doing what they are charged to do? It may not be their fault because they don't have enough budget, but the fact may be the same that they are basically spending all their money, in essence, on management and not doing much else.

Mr. CRIDER. And that is what our concern is, okay, and that is why we think it needs to be looked at.

Mr. DIAZ-BALART. Thank you, Madam Chairman.

Mrs. EMERSON. This is interesting because when we had the Commission members, or at least the Chair, before us last year, and we brought up the management issue, we were told that they

needed all the management staff. Of course, now we know that other agencies, whether it is GSA or the Debt Commission or whomever, can perform those functions for the smaller agencies, and it is an interesting contrast.

Mr. CRIDER. What happened was they were over here and then they got over here. The answer is somewhere in the spectrum here in terms of where they need to be, and I think they are starting to recognize that themselves and they are willing to look at it. And I think it is a very positive step on their part that they are willing to look at it. We just need to make sure they do it.

Mrs. EMERSON. I appreciate that. Ms. Lee.

Ms. LEE. Thank you, Madam Chair. Good morning. Thank you for being here.

Let me ask you how the EAC carries out its core mission of ensuring the voting systems are in place and are accessible for everyone; also, to count both quickly and accurately and to ensure that any contested elections can be resolved so that we don't face the uncertainty of the 2000 elections again.

I don't believe, and correct me if I am wrong, that you asked detailed questions about the specific failure of electronic machines. And so if you don't do that, how do you measure the performance of voting systems that you certify if you don't ask States how the voting systems are performing or failing to perform in actual elections? I think all of us know the difficulties and some of the problems with voting machines in the past, and so we thought that probably the EAC would be able now to assess their performance and know what the States are doing as it relates to these machines.

Mr. CRIDER. Congresswoman, I am going to have to punt back to the agency. The EAC is the best one to be able to answer that question for you. I am not in a position to provide that information. So I think you need to go to the EAC for that.

We have put an audit in our work plan for 2011 to go out and try to do an operational review of the testing and certification program. We will have to contract that audit out because we do not have the wherewithal internally to do it. The IG's Office is only three people, and it is a fairly technical review. We have actually had some conversations with GAO about the review and actually tried to get GAO to do it because they have already done—they did two policy reviews of the EAC testing and certification program. We are not going to be able to do that audit in 2011. Due to budgetary situations, we can't award a contract. Like I say, we have to contract the review out. We won't get it done this year, but we do agree that the program should be looked at. So if you guys would like to request GAO do that, we would be more than happy to help GAO on that.

Ms. LEE. So you think it should be looked at?

Mr. CRIDER. It should be looked at, okay. The program is moving now into actually testing equipment, certifying equipment. Now is the time to do operational review and say, okay, is it working properly? In order for us to get the voting public confidence in this equipment, we have to make sure the certification program is working properly, and I think that will help people get some confidence in our voting process, and like I said, we just don't have

the wherewithal to do it right now, but we do think it needs to be done.

Ms. LEE. Well, have you requested that it be done or requested us to ask for it to be done?

Mr. CRIDER. Well, this is our first opportunity to testify before this committee. So, like I said, you know, we have talked to GAO and they have indicated that they don't have—they have got a lot of requests, too, and we did talk to House Admin last year about maybe trying to get them to get it done, but it hasn't been done yet. Like I said, it is something that needs to be done, and if you would like to get a letter from us indicating——

Ms. LEE. I would like to do that because we have been asking for quite a while. There seem to be roadblocks and we would like to get a letter.

Mr. CRIDER. Okay.

Ms. LEE. And then I would definitely pursue how we can get that done.

Mr. CRIDER. Okay. Thank you very much. We appreciate the help.

Ms. LEE. Thank you again. Can I ask one more question? When you do these audits, do you do them—when you contract out with minority women-owned audit companies and accounting companies—or how do you make sure that the audit functions are inclusive of diversity in the industry?

Mr. CRIDER. The first contract we awarded for our grant audits was a straight competitive procurement, and we tried to make sure that the solicitation was sent to some minority firms. The firm that was selected to do the financial audit is a minority firm. We targeted small businesses, minority firms for that particular award, because it is perfect. And so like I say, we had it split.

But we are very cognizant of those goals and we try to make sure that we do make sure that when we do have a solicitation it goes to all appropriate problems.

Ms. LEE. Do you use the 8A program through SBA?

Mr. CRIDER. No, we do not. We have not used it in the past. We use the GSA schedules, and like I said, we did target this one for a——

Ms. LEE. Well, if you have a breakdown of the money that you use, the money that is spent on audit services and the breakdown of the contracts or the companies, I would like to see that.

Mr. CRIDER. Sure. We can provide that to you.

Ms. LEE. Thank you very much. Thank you, Madam Chair.

RE: Contracts awarded by the U.S. Election Assistance Commission Office of Inspector General

Dear Congresswoman Lee:

During a recent hearing before the House Appropriations Subcommittee on Financial Services and General Government, you requested additional information regarding contracts awarded by the U.S. Election Assistance Commission (EAC) Office of Inspector General (OIG). Specifically, you requested information concerning OIG contracts awarded to minority firms.

The OIG has two major contracts in place. One is for contract auditors to perform audits of states. That contract was begun in 2009, was for one year with four option years, and will expire in July of 2011. That contract was awarded to Clifton Gunderson, LLP, a large, regional audit firm. To our knowledge, Clifton Gunderson, LLP is not minority owned or a small business. The annual value of that contract averages approximately $642,000. The second contract is for contract auditors to perform annual audits of the EAC's financial statements and compliance with the Federal Information Security Management Act (FISMA). That contract was begun in 2009, was for one year with four option years, and will expire in 2013. The financial statement and FISMA audit contract was awarded to Leon Snead and Company, a small, minority owned business. The annual value of that contract averages approximately $163,000. Both of these contracts were competed using the General Services Administration's Federal Supply Schedule (GSA schedule) of prequalified vendors. In both instances, we were able to negotiate rates below those set on the GSA schedule.

If you have any further questions related to procurements by the OIG or wish to discuss either of the contracts in more detail, please contact me at 202-566-3125.

Sincerely,

Curtis W. Crider
Inspector General

Mrs. EMERSON. Mr. Womack.

Mr. WOMACK. Thank you, Madam Chairwoman, and I apologize for my late arrival.

You are a CPA?

Mr. CRIDER. Yes, sir.

Mr. WOMACK. So numbers mean something to you. When I look on the management side—and I know in response to Mr. Balart's question a minute ago, you talked about that—I want to drill down just a little bit further on it—$5.4 million to manage programs totaling $3.4 million; is that correct?

Mr. CRIDER. Yes, sir.

Mr. WOMACK. How do you justify that?

Mr. CRIDER. That is something you need to talk to the EAC about, okay, in terms of what their justification for that is. We share your concerns.

Mr. WOMACK. Now, I heard you use the "hope" word just a minute ago in response. I think it was to some audits or accountability. I was taught a long time ago in my military service that "hope" is not a method. And I think from hearing colleagues here talk about these very problems, that we are looking for solutions, real solutions, and more importantly than that, we are looking for some benchmarks and for some timelines, suspense dates, when certain things are going to be fixed or this can gets kicked down the road. And so I am hopeful, hopeful, that the words actually mean something and they are not just an appeasement to us at the committee level. So, your response.

Mr. CRIDER. I agree with you. That is why I would think this committee's oversight in terms of making sure the EAC does what it needs to do is very, very important. One of the reasons is that—we got the recommendations implemented from our assessment report that we issued in 2008—was that Congresswoman Zoe Lofgren, when she was the chair of the Subcommittee on Elections as part of House Admin, required that the EAC report to her on a monthly basis in terms of where they were at in implementing those recommendations. That congressional oversight I think was extraordinarily valuable and critical in terms of getting those recommendations implemented. And I think that is a very valid approach for this subcommittee is to request that type of information from the EAC to make sure they do what they are supposed to do.

Mr. WOMACK. What would happen if there is a bill pending that you reference in your testimony from Representative Harper about abolishment of the EAC. And I realize, you know, you can't speak to do that, but what would be the net effect in America if the EAC and its programs went away?

Mr. CRIDER. I can't speak necessarily to the EAC side of the house in terms of their programs and operations. But I can speak to my operation in terms of what it would mean for us, or what it would mean, is that those funds would not be audited that are sitting out there unless the audit function was to move to another Federal entity, which is possible. That is doable, okay. It happens. So we would like to make sure that those type things and make sure that there is an opportunity for States to draw down their money. The States need to know where to file their financial reports. And the audit function, whether or not that should continue,

whether or not it is moved to another Federal agency or stays in the EAC is somebody else's decision.

But in terms of the implication on the rest of the Nation, they are talking about moving the testing and certification program to another Federal entity. I think the EAC would be in the best position to address your concerns, sir, in terms of what impact that would have.

Mr. WOMACK. That is fair. Thank you for your testimony.

Mrs. EMERSON. I want to go back to the grants just a little bit, if you don't mind. While I understand the funding has left the Federal Government coffers and is being held by the States, is there any realistic way that you can see for us to return some of that money to the U.S. Treasury since the States aren't using it?

Mr. CRIDER. No, ma'am. I don't think so. Chairwoman Emerson, GAO issued an opinion on this matter last year or the year before. These are considered formula grants, and that the money is obligated based on law, and that the States have a legal right to those funds at that particular point. So getting the money back does not seem to be a legal, viable option, in my view.

Mrs. EMERSON. Okay. So, in light of that, what is your assessment of the EAC's management of that funding?

Mr. CRIDER. They really don't—they send the funds out. The funds go out up front. The States have to put up their match and they have to file their certifications, and then the States are able to draw down their funds. They then file annual financial reports to the agency in terms of what they spent the money on. The States then are allowed to—the States do come in and request periodic guidance and things of that nature, but we have never really looked at their management and administration of those funds. Like I said, we have been focusing on the States at this point.

The EAC has just now developed policies and procedures for most of its operations as of September 2010. So we have somewhat held off on issuing the same report over and over again until they got their structure in place. And we couldn't see making the same recommendation multiple times: You need policies and procedures.

Mrs. EMERSON. Okay. So to what degree have you examined the manner in which the States are spending this funding? Have you uncovered any instances where the funding has been spent in a manner inconsistent with the intent under HAVA?

Mr. CRIDER. We have questioned $31 million in costs that we have audited, which is not a huge percentage of the amount of money we audited.

Now, we have had a situation down in New Mexico where the Attorney General's Office of the State of New Mexico is actually prosecuting four individuals related to a contract that was awarded by the State for educational training and advertisements of the public media campaign, and the Attorney General's Office is prosecuting, like I said, four individuals, and two of the individuals have been indicted for Federal income tax evasion charges.

So, I mean, we do have situations, like I said, and we have had two inquiries from the FBI on two grants in two localities. With the FBI, they get information from you and they don't always tell you what they do. But like I said, we have a couple cases where things have happened.

Mrs. EMERSON. Have you actually found fraud in looking at the grants yourself, or has the FBI found out separately. How has that worked?

Mr. CRIDER. The New Mexico situation came out of one of our audits, okay. We had been requested by the new Secretary of State to come down several years ago and take a look at that program. And based on the results of the audit is that the State then picked it up from where we finished and followed the money all the way through. We went to the contractor. They took the money from the contractor after that point, and that is where it seems to be most of the activity occurred according to the indictment. That could have come out of one of our audits.

We have actually been very impressed with the States. I mean, they want to do the job right. They want to make sure the money is spent properly. They want to make sure they have adequate documentation. So, I mean, we are very impressed with the States. They have a very—they are very dedicated to the program. Like I say, they want to make sure they do it right, and we have had I think a fairly good working relationship with most of the States.

Now, one of the things they do do is sort of an interesting—is that when we publish a report, they all read that report and say, okay, do we have this problem? So a lot of times when we go out there, they have already fixed things that they had done that might have been questioned, and we welcome that. We think that is a wonderful mechanism in terms of trying to make sure the program is run properly.

We also publish a semiannual newsletter where we try to put out results so people are aware of what is going on. So, you know, if they have a problem in their program, they can fix it.

Mrs. EMERSON. That is good. Let me shift gears for just a minute to some contracting issues.

Chairman Lungren of the House Administration Committee and I have both raised concerns in the past with regard to the Commission's contracting practices and, specifically, we raised some questions concerning the EAC's practice of awarding contracts noncompetitively or in instances where they received only one bid. Additionally, we questioned the degree to which EAC contracted out positions that contain inherently governmental roles. Have you looked into their contracting practices; and if so, what recommendations have you issued in response?

Mr. CRIDER. We have had that particular view in our work plan for 2 years running now, but because of resource limitations, we have not been able to get to it. But we do think it is a review that needs to be done, but we just haven't had an opportunity to get to it. We looked at, well, should we contract the review out in order to get it done? That is something we are looking at this year in terms of possibly contracting it out, but due to budgetary situations we have not been able to get there yet.

Mrs. EMERSON. I guess that begs the bigger question, then: do you think it is more cost effective for EAC to hire contractors for many of the missions it is responsible for, including you?

Mr. CRIDER. You have to look at each situation specifically in terms of what is being done and what is inherently governmental and what the results—what their accomplishments are. There is no

blanket answer to that one because there are certain things that are inherently governmental that you can't contract out.

Mrs. EMERSON. All right. I appreciate that. Mr. Serrano.

Mr. SERRANO. Thank you so much. You know, we talk about budget cuts and budget cuts, but I see from the proposed budget that you are asked to take an 11.7 decrease, your own office, from fiscal year 2010 to 2012. How will this affect you? What are you planning to do? Will you reduce the number of contractors that you use?

Mr. CRIDER. Yes, that is exactly it. We won't do a couple of audits, possibly. That is how we will do it. We will absorb it through our contracting.

Mr. SERRANO. You still feel confident that you can do the job, accomplish your mission?

Mr. CRIDER. Well, we contract our grant audits out, and that is where we will take the cut. We just won't do a couple grant audits. Will it extend the audit cycle? Yes, it will, but I have to live within the parameters of the budget that we are given because, like I said, the money is tight.

Mr. SERRANO. Now, in your testimony, you point to the fact that the EAC has made strides in several areas. They showed improvement in financial management processes and in compliance with the Federal Information Security Management Act. Can you tell us about these improvements?

Mr. CRIDER. Yes, sir. Whenever we did the first financial in 2008, the EAC received a disclaimer which is not unusual for a first-year audit, but they were not able to produce the records that the auditors needed to conduct their audit. There were a lot of internal control issues identified. There were a lot of problems in terms of their financial reports. They actually had to hire somebody, a contractor, to come in and help them figure out how much money they had left to spend. So there were a lot of issues involved.

They have subsequently gotten an unqualified opinion. They received an unqualified opinion on their financial statements last year, which is extremely good. So they made a tremendous amount of steps and improvements in that area, and I do want to give them compliments for that. They went from being in total disarray to having an auditable financial system.

In terms of the FISMA, they actually had no FISMA—they had no IT security program at all when I first got there, and we were issuing reports on an annual basis: You have no IT security program. They now have an IT security program. They are starting to address the PII data in terms of security. So they have made a lot of steps in that area, also. Like I say, they should be very pleased and very proud of what they have accomplished.

Mr. SERRANO. Let me ask you a quick question. Our chairwoman was asking you whether those dollars that went to the States and are not being used, can they be returned, and you said no.

Mr. CRIDER. Right.

Mr. SERRANO. I don't know if you answered this part or if she asked. Why would the States not be using the money or what is the problem locally?

Mr. CRIDER. I don't know the answer——

Mr. SERRANO. And you are hearing this from a person who represents a State that we almost had to drag into submission at one point. Probably will not go well back home that I said that. But you know, folks, there is money here, can we get it going, you know; and I think we were the last ones to use the scanning machine and so on, which I thought was kind of cool because you could see the whole ballot.

You know, I don't know how it is in your State, but in New York, you are placed on the ballot based on the size of your district. So if you represent the whole borough of the Bronx at a local level, you will appear on top of a Member of Congress because that is a smaller district. So on election day when you look at our numbers and you see lower numbers than the other parts of the country, some of the reasons are I have one of the youngest districts in the Nation, I have a lot of, as you know, a lot of immigrants, poor folks at times, but it is line number 24 to find Serrano. I mean, it is very——

Mrs. EMERSON. So, small physically. Is that what they are talking about?

Mr. SERRANO. Yes. So, for instance, we have a position called Bronx borough president—I am not mocking that. It is like county executive, except it really isn't. So that person represents the whole county of the Bronx. If we got on the ballot the same year, that person would be higher than the Member of Congress. Yet the Senator goes on top. So you see Schumer and Gillibrand, and then you have to go through a thousand judges and everybody else to get to your local Congressman. You know, very painful and very difficult for your ego, you know. Don't you know I am a Federal official, Federales, you know?

I don't know, I don't know what the question was, but if you can answer it.

Mr. CRIDER. Well, Ranking Member Serrano, I think you have a valid question, but I don't have an answer for you in terms of why the States are not spending their money. Maybe the EAC would be able to give you some perspective on that, but I don't know. But it is a good question, and I wish I had an answer for you.

Mr. SERRANO. Thank you. Incidentally, nothing—a great sense of pride in the Balart family who would understand this, but my son is a State senator. So, in addition, try in a primary Jose Serrano for Congress and then you have underneath Jose M. Serrano for State senate. You have a heart attack until they count the votes.

Mrs. EMERSON. You ought to try running twice in the same election like I did the first time in two different parties. That was even more interesting.

Mr. SERRANO. Thank you.

Mrs. EMERSON. Mario.

Mr. DIAZ-BALART. I am fine.

Ms. LEE. Well, I do have to follow up on this whole issue of unexpended funds in the States. I am just looking at my State, for example. What is it, $181 million California has not——

Mr. CRIDER. Right.

Ms. LEE. What precludes States with budget deficits from using this money? And I know there are Federal strings attached that

have to do with, you know, HAVA; but what precludes them from back-filling, using this to backfill budget deficits?

And then, secondly, if they are not using the money, why don't we give them a waiver to use it for other efforts? If they don't use it for—if everything has been completed as it relates to HAVA, then what is the problem?

Mr. CRIDER. Well, what prevents them from using the money for other purposes is me.

Ms. LEE. Is what?

Mr. CRIDER. Is me. When I go out and do the audits, that is what we look for: Are you using the money for its designated purposes; are you using it for HAVA purposes, and of course with the law? That is what we do, and so that is where the benefit of audit comes into play.

Now, there are always activities related to some improvement of Federal elections in terms of there are always things that probably can be done. Now, if the Congress wanted to give them waivers to allow them to use the money for other purposes, that would would be up to the Congress. That is a legislative thing but that is a congressional initiative.

Ms. LEE. But if they are not using it for HAVA, are they given suggestions on—maybe they haven't completed the work. Is that a possibility why these funds haven't been expended? Are they holding it for the next election, or what could be some of the reasons? I know you haven't had—goodness, if we cut your budget, how are you ever going to find out?

Mr. CRIDER. Like I said, that is something you try to direct to the EAC and see if they have any knowledge as to why these States are not expending their funds, but they are facing, as you pointed out, tough budgetary times, too, and some of this equipment at some point in time will have to be replaced. This is electronic equipment, and we are seeing some States are now having to replace some of the equipment.

I think Florida did it, and they were allowed to use the Federal funds for that. So, I mean, there will be a point in time where this equipment has to be replaced. It is electronic. So there are future expenditures that may be required.

Ms. LEE. So they could be holding them for future kinds of efforts?

Mr. CRIDER. The money is in an interest-bearing account, and the interest can be used by the State for program purposes. Now, that is a unique aspect of the HAVA law is that most States, when we have Federal funds in an interest-bearing account, the interest goes back to the Federal Government. HAVA was unique. It allowed the States to use those funds.

Ms. LEE. Only for program purposes relating to HAVA, though.

Mr. CRIDER. Yes.

Ms. LEE. That is good. So the States that haven't expended their funds, we don't need to assume they are using it for other purposes.

Mr. CRIDER. Right.

Ms. LEE. Also that they don't need it; they probably do need it for future expenditures.

Mr. CRIDER. Like I say, maybe the EAC will have a better perspective on that than I do. Okay, I am sorry I am not really able to address that for you.

Ms. LEE. Well, is there a way we can find out?

Mrs. EMERSON. We can have a meeting with the EAC commissioners if you would like. We could do a hearing, but we might get more out of a meeting.

Ms. LEE. I think that would be a good idea.

Mrs. EMERSON. Okay. I am happy to do that.

Let me ask you, Mr. Crider, you have investigated a number of questionable management practices within the EAC. Would you do me a favor and elaborate on some of the issues and the recommendations that you have offered to address them?

Mr. CRIDER. When you go back and read our assessment report in 2008, like I say, it contained 29 recommendations about policies and procedures and changes and strengthening internal controls. And that was a very significant report.

In the financial audit in 2008, we issued a number of recommendations there in terms of how to tighten the financial management system, how to improve the internal controls over the financial management.

The investigative report, we did not make any recommendations in the investigative report that was done by the Department of the Interior for us on the hostile work environment, because that was something that I think I should be held responsible for. We should have made recommendations in that report, and I did not. There are a number of issues in that report I think the EAC needed to address in terms of how its employees felt about managers, the employee appraisal system, things of that nature, that we should have made recommendations to them that we did not.

We just did a little review on an incident that happened at the Christmas party. We made recommendations in that report for additional EEO training for all of its employees, make sure supervisors were aware of their responsibilities regarding EEO, and if they see something that happens, how they needed to address it.

Mrs. EMERSON. Have you seen any cultural or management changes in the past several months that have been made there at the EAC?

Mr. CRIDER. They have a new general counsel on staff, and I think that he brings a perspective to the organization that will be very beneficial to the organization. He is the one that is doing the analysis of the administrative workload at the EAC, and I think that he recognizes that certain things need to be done at the EAC in terms of EEO training and EEO processes. And I am very hopeful that his leadership will be very beneficial to the EAC in helping them move forward in some of these areas.

Mrs. EMERSON. Will you be able to report back to us in about 3 months and let us know how that is going?

Mr. CRIDER. We will do that, yes, ma'am.

Mrs. EMERSON. All right. I would appreciate that very much. Mr. Serrano.

Mr. SERRANO. See, here is the concern that I have. Again, I think the EAC is an easy target for people who want to cut budgets, and when I say "people," everybody wants to cut budgets, some people

want to cut more than others. And at what point do we know if the States are set up to conduct elections with less or perhaps none of the concerns that we had in 2000 that brought us to create the EAC to begin with?

Mr. SERRANO. As I said before, these discussions go across the government. You know, I just came from a hearing of the Interior Subcommittee with the EPA. And you know, the discussion by one side, or 1½ sides of both aisles, will be when you cut, you know, how much do you cut EPA's ability to look after our water and our air and so on? What is the future going to be?

So, what is within your mechanism, within your setup, to tell Congress, you or someone else in the future, you know, States are doing what you wanted them to do or what you hoped would be accomplished by these grants and by this kind of oversight and this involvement? Because, you know, we—and again, this is just a statement for the record; everyone in this room can make the same statement.

We speak about the budget. We speak about the system. We speak about the future of the country. But at the center of all of that is this great ability we have to go to the polls in November and pick the people who will lead us at the local level or at the Federal level. So, to me, this agency is small but extremely important. Is there a setup, an ability to tell the Congress, to tell the American people we have reached a point where things are going well at the local level?

Mr. CRIDER. It is a changing target. A lot of these officials at the local level are elected. Most secretaries of state are elected. So there is turnover there. There is change. So I am not sure how you will ever get to that point where you are saying, yeah, everything is going to work perfectly, because it probably won't. Elections are a very complicated, very difficult process. There are going to be problems periodically. And whether or not those problems rise to the level of a national crisis, I don't know the answer to that. I don't have a good answer for you, Ranking Member Serrano. I don't.

Part of it is a political decision on the part of the United States Congress: Do they feel like we have gone far enough or not gone far enough or whatever they think needs to be done? I don't have a good answer for you.

Mr. SERRANO. Just for the record, the reason I asked you, because I don't have an answer at all. So don't feel bad.

Madam Chair, I have a couple more questions that I would like to submit for the record.

Mrs. EMERSON. Absolutely.

Mrs. EMERSON. Mr. Diaz-Balart, do you have any questions?

Mr. DIAZ-BALART. No, Madam Chairman. I am looking forward, though, to getting some answers on the other issue of the unspent funds.

Mrs. EMERSON. I think it is a great idea for us to have a meeting with the Commission members.

Mr. Crider, just to follow up with what Joe asked you, are you in a position to tell us whether or not the EAC actually provides States with useful information on voting technology and on administration?

Mr. CRIDER. Not at this point. We have not looked at those particular programmatic areas. And like I said, we would like to take a look at the testing and certification program because I think that is the linchpin program of EAC. That is their flagship.

Mrs. EMERSON. Well, I certainly think this does warrant us to have a meeting.

You touched on this in your testimony and this is my last question, and I have a couple to submit for the record as well. We didn't pursue it, but you said the secretaries of state and State election officials are, they are calling for the dissolution of the EAC, and it confounds me. Do you have some thoughts on this?

Mr. CRIDER. We have talked about it. We don't have an answer as to why they want to have EAC abolished. You know, it would be nice to know if there was an inherent problem or an issue that we need to address internally at the EAC or whether or not it is just a political decision or what it is. I don't have an answer for you. EAC may have a better feel for that than I do.

Mrs. EMERSON. All right. Well, certainly we have given the Commission these funds, and perhaps it is just "you have given us the money and now let us do our job" attitude. Who knows? But it certainly is something that we need to pursue. It is just puzzling to me, if nothing else.

With that, we will submit the rest of our questions for the record.

Mrs. EMERSON. And we thank you so very much for being here today.

The Honorable Jo Ann Emerson — Via U.S. Mail and Electronic Mail
Chairwoman
House Committee on Appropriations
Subcommittee on Financial Services and
General Government
B300 Rayburn House Office Building
Washington, DC 20515

RE: Review of U.S. Election Assistance Commission's Procurement Process

Dear Chairwoman Emerson:

In a March 2, 2011 hearing before the U.S. House Committee on Appropriations, Subcommittee on Financial Services and General Government, you requested some information related to a future review of the U.S. Election Assistance Commission's (EAC) procurement process. This is a review that the Office of Inspector General (OIG) has been interested in conducting for some time. It has been listed on several of our work plans. However, due to budgetary constraints we have not been able to conduct this review.

We believe that the best use of resources would be for the OIG to contract with an independent auditing firm to conduct this audit. The audit should encompass a review of EAC credit card purchases, purchase orders, and contracts. The audit should examine the extent to which the EAC has used sole source and other than full and open competition. The audit should further examine the contract awards, administration, modification, and any subsequent work or contracts awarded to a prior vendor. The audit should also consider whether the EAC is using contractors to perform work that should be done by Federal employees. Last, the contract should examine the EAC's goals for contracting with small, disadvantaged firms and whether the EAC is meeting those goals.

We have not conducted an initial survey to identify the number and types of procurements that would be involved in the audit. We would anticipate that a sampling of the total procurements conducted by the EAC. Without a full understanding of the possible scope of the audit, it is impossible to provide an exact or tailored cost estimate for the audit. However, based upon the information discussed above, the OIG believes that it could procure a contract with an outside firm to conduct this audit for somewhere between $90,000 and $110,000. The administration and oversight of the contracted audit would be included in the OIG's then current salaries and expenses allocation.

We appreciate the opportunity to provide you with additional information concerning our plans to review the EAC's procurement process. If you have any questions or we can provide any additional information, please contact me at 202 566-3125.

Sincerely,

Curtis W. Crider
Inspector General

TUESDAY, MARCH 8, 2011.

SMALL BUSINESS ADMINISTRATION

WITNESS

KAREN G. MILLS, ADMINISTRATOR, SMALL BUSINESS ADMINISTRATION

Mrs. EMERSON. The subcommittee will come to order. Good afternoon to my colleagues, especially good afternoon to you, Administrator Mills, and welcome to our subcommittee. We appreciate your being here and greatly appreciate all the work you do on behalf of our small businesses around the country. We all know because of our districts—whether Joe's or Rodney's or mine—that small businesses are critical to improving the health of our economy. And with unemployment a wee bit better but still almost at 9 percent, job creation is the most important goal that we have.

America's small businesses account for half of the country's Gross Domestic Product, and we are responsible for creating 65 percent of net new jobs between 1993 and 2009. And I believe very strongly that the Federal government must find innovative ways to assist small business development and expansion. And I think you all are doing a good job.

And because of the critical role you play in assisting small businesses through capital—giving them opportunities to compete for government contracts and for all the work that you do with regard to technical assistance, I know that without SBA, an awful lot of businesses in my district would probably not even be there, so we are grateful to you.

The President's fiscal year 2012 budget request for the Small Business Administration totals $985 million, $161 million, or an approximately 20 percent increase over fiscal year 2010. This includes a $132 million increase in the 7(a) lending subsidy, and a $90 million increase in administration for the disaster loans account. And I am worried about flooding. Heaven knows we are going to have some real challenges with regard to the whole disaster loan account.

I do understand that carryover from prior year supplementals previously supported costs associated with administering the disaster loan account and that this funding has run out.

I would like to see the administration find better ways to use the SBA to provide small business assistance instead of burdening entrepreneurs with additional tax and regulatory hurdles. And I am also concerned that in implementing massive new regulations on the health care and financial industry, the administration is overregulating our small businesses and slowing their ability to expand operations and create new jobs.

With that being said, I am very interested and I know my colleagues are too in really listening to your ideas on how to stimulate job growth. I look forward to your testimony. I know you all are working tirelessly to help all American small businesses and we are grateful for your efforts.

Let me recognize our ranking member, Mr. Serrano, for his remarks and then we will go to you. Joe.

Mr. SERRANO. Could you do me a favor? Could you bang that gavel once?

No, no, no. Bang it. Elections have consequences for the chairwoman, and I want you to use that gavel with all your strength.

Mrs. EMERSON. I have been using it on the House floor quite a bit.

Mr. SERRANO. Yes, you have. If you have analyzed what I just said, in some weird way, it is a compliment.

Mrs. EMERSON. Well, I appreciate that. And it helps get rid of my frustrations, because I actually was thinking about who I was smashing.

Mr. SERRANO. Once I got the gavel I used it well.

Mrs. EMERSON. You did indeed, I agree.

Mr. SERRANO. If it comes back again, I will use it very hard.

Mrs. EMERSON. We will do our best to make sure that doesn't happen.

Mr. SERRANO. I am sure.

Mrs. EMERSON. As much as I love you.

Mr. SERRANO. You and a lot of other folks. Thank you and we welcome you, Ms. Mills, to this hearing today. Because of the crucial part that small businesses play in job creation in our continued economic recovery, the SBA has a very important role in promoting job growth. SBA facilitates small business development, training, technical assistance and company programs, government contracting programs and advocacy. The agency also helps businesses and homeowners affected by disasters through its disaster loan programs.

The agency's budget request for fiscal year 2012 is $985 million in new budget authority. And I look forward to discussing this request with you during our questions. I am disappointed, however, that once again, this budget request underfunds some small business assistance programs that specifically help low income populations.

For example, Microloan Technical Assistance, a program that assists our smallest business owners, would be cut by $9.2 million from fiscal year 2010.

Zero funding was requested for the Program for Investment on Micro Entrepreneurs, or PRIME. This program provides grants to help with training and technical assistance for disadvantaged business owners, particularly those in very low income areas. Particularly during difficult economic times these are not the programs we should be targeting for cuts.

I look forward to talking to you today about these programs and learning more about the progress you are making in some of your newer efforts. Again, we welcome you and we thank you for your service to this agency and to our country, thank you.

Mrs. EMERSON. Administrator Mills, please go ahead.

Ms. MILLS. Well, thank you very much, Chairwoman Emerson and Ranking Member Serrano and members of the committee. I am pleased to testify before you. Small businesses, as the chairwoman said, are the backbone of the economy, they create two out of every three jobs. And more than half of working Americans own or work for a small business. The SBA is a small agency, but we have a big mission. We put the maximum possible resources directly into the hands of small businesses, focusing on the 3 Cs, capital, counseling, contracting.

Last year we helped over 50,000 small businesses get the capital to grow and hire. We helped put about $100 billion in Federal contracts in the hands of small businesses, and we counseled more than a million small businesses across your districts and throughout the country.

We put these resources in their hands while providing taxpayers a big bang for their buck. For example after credit froze in 2008, the Recovery Act and the Small Business Johs Act supported more than $42 billion in SBA loans at a subsidy cost of $1.2 billion. Many small businesses suffered greatly from the recession. Our job is to support them as they grow and create jobs, and this job is not done.

The President's proposed fiscal year 2012 budget for the SBA of $985 million, will support up to $27 billion in loan guarantees, as well as many other tools and resources to help our small businesses across the country.

At the same time, this budget reflects a commitment to tighten our belts, to streamline our processes, and to eliminate duplication. This includes some of your ideas. For example, we looked hard at our technical assistance programs, and as a result, we do propose eliminating the PRIME program that the ranking member referenced.

With the work of our microlenders and some new efforts to recruit community-based lenders, we can continue to provide technical assistance just in a more cost effective way. In addition to the process reengineering, our disaster loan operations are now much more efficient. We can preserve our level of preparedness, with steady state core staff levels of 850, instead of 1,000, along with our 2,000 reservists.

The largest increase in our budget reflects the fact that we have reached the statutory limit of fees that we can assess. We request additional subsidy because losses, including those from loans approved when collateral such as real estate was inflated, have pushed up subsidy costs. We also request a legislative fix to return to near zero subsidy. We also request incremental increases for our new women's contracting program, and continued efforts to remove fraud, waste and abuse in contracting.

Overall, our priorities are twofold. We placed a focus on SBA programs that put money and support directly into the hands of small business owners in the places where they live. And we will continue to invest in oversight, to preserve the integrity of these programs, and to protect the interests of taxpayers.

I look forward to working with all of you, to continue to insure that small businesses are succeeding, because as you know, when they succeed, America succeeds.

Thank you very much, I would be happy to take your questions.

[The information follows:]

U.S SMALL BUSINESS ADMINISTRATION
WASHINGTON, D.C. 20416

TESTIMONY OF KAREN G. MILLS
ADMINISTRATOR
U.S. SMALL BUSINESS ADMINISTRATION
BEFORE THE
SUBCOMMITTEE ON FINANCIAL SERVICES AND GENERAL GOVERNMENT
HOUSE COMMITTEE ON APPROPRIATIONS
MARCH 8, 2011

Chairwoman Emerson, Ranking Member Serrano, and members of the Committee. I'm pleased to testify before you.

Small businesses are the backbone of our economy. They create nearly 2 of every 3 new private sector jobs. And more than half of working Americans either own or work for a small business.

The SBA is a small agency but we have a big mission. We put the maximum possible resources directly into the hands of small business, focusing on the three "Cs" of capital, contracts and counseling.

Last year, we helped over 50,000 small businesses get the capital to grow and hire; we helped put about $100 billion in federal contracts in the hands of small businesses; and, we counseled more than a million small businesses across your districts and throughout the country.

Over the past two years, we provided taxpayers with a big bang for their buck. One example: Since credit markets froze in 2008, we supported more than $42 billion in small business lending.[1] We still have work to do to help small businesses create the jobs we need, and the President's proposed FY12 budget for SBA is $985 million.

Many small businesses suffered greatly from the Recession. Our job to support them as they grow and create jobs is not done.

The President's proposed FY12 budget for SBA of $985 million will support up to $27 billion in loan guarantees as well as many other tools and resources to help them do just that.

[1] For more information about SBA's credit programs, see the 2012 Budget's Credit Supplement.

At the same time, this budget reflects a commitment to tighten our belts, streamline our processes, and eliminate duplication. This includes some of your ideas. For example, we looked hard at our technical assistance programs. As a result, we propose eliminating the PRIME program. With the work of our Microlenders and new efforts to recruit community-based lenders, we can continue to provide technical assistance in a more cost-effective way.

Also, we reduced the request to support Small Business Development Centers by $10 million. This was a tough choice, but we believe it is reasonable due to additional funding in the Small Business Jobs Act.

In addition, due to process reengineering, our disaster loan operations are now much more efficient. We can preserve our level of preparedness with a steady-state core staff level of 850 instead of 1,000, along with our 2,000 reservists.

The largest increase in this budget reflects that we have reached the statutory limit for fees that we can assess. We request additional subsidy because losses – including those from loans approved when collateral such as real estate was inflated – have pushed up subsidy costs. We will also request a legislative fix to reduce or eliminate the need for credit subsidy.

We also request a sustainable level of support for administrative costs in our disaster loan program, as well as incremental increases for the new women's contracting program and continued efforts to remove waste, fraud and abuse in contracting.

Overall, our priorities are twofold. We have placed a focus on SBA programs that put money and support directly into the hands of small business owners where they live. And, we will continue to invest in oversight to preserve the integrity of these programs and to protect the interest of taxpayers.

I look forward to working with all of you to continue to ensure that small businesses are succeeding. Because as you know, when they succeed, America succeeds.

SMALL BUSINESS ADMINISTRATION

Funding Highlights:

- Provides $985 million, a 45 percent decline from 2010 enacted funding, which included $962 million in supplemental appropriations. Excluding supplemental funding, the 2012 request is $161 million higher primarily due to increased estimated credit subsidy costs. Funding for administrative costs and Small Business Development Centers will go down as a result of fiscal restraints.
- Supports $27 billion in loan guarantees for small businesses to enable them to invest, expand, and create jobs.
- Promotes impact investment in economically distressed regions.
- Helps innovative small businesses obtain early-stage financing.
- Encourages business development and economic growth through funding for technical assistance, including competitive grants to develop business leaders in underserved markets and to help businesses benefit from regional economic strategies.
- Continues implementation of Small Business Jobs Act initiatives, promoting technical assistance and small business exporting.
- Provides long-term disaster recovery loans for homeowners, renters, and businesses of all sizes.
- Strengthens lender and procurement program oversight to protect taxpayer dollars.
- Upgrades the Agency's financial management systems to improve the financial integrity and efficiency of SBA credit programs.

Small businesses play a vital role in job creation, economic recovery, global competitiveness, and the long-term strength of the Nation. The Small Business Administration's (SBA) mission is to help Americans start, build, and grow businesses. To deliver on this promise, the Administration proposes $985 million, a substantial decline from 2010 enacted funding, which included significant supplemental appropriations for fee reductions and credit programs. Small business loan guarantees are funded in 2012 at historical fee and guarantee levels, but reflect higher estimated loss rates. As part of the Government-wide effort to reduce spending, funding for administrative costs and Small Business Development Centers will decrease.

Invests in America's Businesses to Foster Economic Growth and Competitiveness

Spurs Job Creation by Enhancing Small Business Access to Credit. Small businesses are the engine of economic growth and job creation. That is why the Administration is taking a series of steps to improve the access to capital for small businesses. First, the Administration supports $16.5 billion in 7(a) loan guarantees, which will help small businesses operate and expand. This includes an estimated $14.5 billion in term loans and $2 billion in revolving lines of credit; the latter are expected to support $48 billion in total economic activity through draws and repayments over the life of the guarantee. The Administration also supports $7.5 billion in guaranteed lending for commercial real estate development and heavy machinery purchases; $3 billion in Small Business Investment Company (SBIC) debentures to support new businesses and new jobs through early-stage and mezzanine small business financing; and $25 million in direct Microloans, for intermediaries to provide small loans to emerging entrepreneurs and other borrowers unable to receive credit elsewhere.

Promotes Impact Investment in Economically Distressed Regions, for Disadvantaged Groups, and in Sectors of National Significance. Beginning in 2012, SBA will be leveraging the SBIC debenture program to support $200 million annually over the next five years in impact investments that are "place-based" (located in or employing residents of economically distressed regions); "people-based" (owned or managed by women, veterans, or a member of a socially or economically disadvantaged group); or "sector-based" (sectors that have been identified as national priorities). Two other initiatives—the Small Loan Advantage and Community Advantage programs—will increase the number of SBA 7(a) loans going to small businesses and entrepreneurs in underserved communities.

Helps Innovative Small Businesses Obtain Early-Stage Financing. SBA will also create within the SBIC debenture program a new vehicle—the Innovation Fund—to address the capital gap many start-ups face between "angel investor" financing and later-stage venture capital financing. Over each of the next five years, up to $200 million in guarantees for matching funds will be available to investors aiming to support innovative companies seeking to ramp up their operations and create new jobs.

Helps Small Businesses Grow Smarter. Entrepreneurs can be found in every part of the Nation. However, some need assistance to develop their idea fully into a growing business and start hiring new employees. That is why the Administration includes $15 million for competitive technical assistance grants to support SBA's Emerging Leaders initiative and to enhance small business participation in regional economic clusters. The Emerging Leaders initiative provides intensive technical assistance to companies that have high growth potential and are located in distressed economic areas, such as inner cities and Native American communities, and connects them to regional business networks to accelerate economic and job growth. SBA will also promote small business participation in regional economic clusters by awarding competitive grants to facilitate greater coordination of resources such as business counseling, training, and mentor-protégé partnerships.

Fully Funds and Reforms Long-Term Disaster Recovery. The Administration supports $1.1 billion in direct loans, the normalized 10-year average, for homeowners and businesses whose property is damaged by natural disasters. The Administration also proposes $167 million for disaster-loan administrative expenses. SBA will streamline staffing and operations to use administrative funds in the most effective and cost-efficient manner, which is expected to provide savings relative to operating levels in recent years.

Improves Cost-Effectiveness

Prioritizes Resources by Reducing Overlapping Funding and Extending Tax Breaks. In 2012, small businesses will continue to benefit

from technical assistance funded by the Small Business Jobs Act, which for the 2011 and 2012 period provided $50 million to Small Business Development Centers (SBDCs) and $60 million for grants to States and localities to help small businesses export. Given the availability of these funds and fiscal constraints, the Budget proposes modest reductions in the level of additional SBDC funding requested for 2012. The Act also provided a variety of other credit program expansions and tax changes that are significantly benefiting small businesses, and the Administration proposes to permanently extend the Act's provision eliminating all capital gains taxes on investments in small business stock in order to enhance the flow of capital to small businesses.

Helps Make the Guaranteed Loan Program Self-Sufficient. Due to the economic downturn and higher defaults on prior loans, SBA's guaranteed loan programs are recording in 2011 a $3.7 billion increase in losses and subsidy costs on their outstanding loan portfolios, excluding interest, particularly on guarantees made between 2004 and 2008. To strengthen these programs' long-term economic foundation, the Administration will submit a legislative package to provide SBA the flexibility to adjust fees in these programs to enable them to be self-sustaining over time. These changes in the program's fee structure would become effective for loans originated in 2013.

Strengthens Core Agency Capabilities. The Administration provides the resources needed to upgrade the agency's financial management systems in order to improve the financial integrity and efficiency of its loan operations. SBA is also modifying its procurement strategy for the Loan Management and Accounting System to better ensure the system delivers results.

Karen G. Mills, Administrator
U.S. Small Business Administration

Karen Gordon Mills was sworn in April 6, 2009, as the 23rd Administrator of the U.S. Small Business Administration. She leads a team of more than 2,000 employees whose mission is to help entrepreneurs and small business owners grow and create jobs by providing greater access to capital, counseling, and federal contracting opportunities. The SBA also provides loans to business owners, homeowners and renters affected by disaster.

Mills earned an A.B. in economics from Harvard University and an M.B.A. from Harvard Business School where she was a Baker Scholar. Since then, her career has involved counseling, managing, mentoring, and investing in businesses of all sizes across a number of U.S. states.

During the recession of the early 1990s, Mills helped several small manufacturers increase efficiency in order to improve their competitiveness and ultimately survive the downturn. This included producers of hardwood flooring, refrigerator motor manufacturers, plastic injection molding companies, and more. More recently, she worked in management consulting for businesses in sectors such as consumer products, food, textiles, and industrial components.

In 2007, she was appointed by Maine Gov. John Baldacci as chair of the state's Council on Competitiveness and the Economy, where she focused on attracting investment in rural and regional development initiatives. She also served on the Governor's Council for the Redevelopment of the Brunswick Naval Air Station.

She is a leading voice for American competitiveness and an expert on new approaches to business growth such as "regional innovation clusters." Before becoming Administrator, she worked to form a cluster of boatbuilders in Maine, helping them compete around the world by leveraging composite technologies at a local university.

Already, at the SBA, Mills' has helped strengthen SBA lending, increase small business' share of federal contracts, and reinvigorate the SBA's network of about 14,000 affiliated counselors.

She has also served as a member of the Council on Foreign Relations and has been vice chairman of the Harvard Overseers.

Mills and her husband, Barry Mills, president of Bowdoin College, live in Brunswick, Maine. They have three sons.

Mrs. EMERSON. Thank you, very, very, much. I will go ahead and start the questions, and welcome to Mr. Womack too.

As you have heard, as you have seen, at least with the continuing resolution that was passed a couple of weeks ago, the House majority is committed to reducing non-security discretionary spending to fiscal year 2008 levels. And for this subcommittee, that represents a 17 percent reduction. Though I will readily admit I am not sure that a reduction to 2008 levels is good for the SBA with employment at 8.9 percent, we are still asking agencies to tell us what it would look like to live at that 2008 level. So hypothetically, hopefully hypothetically, what is the impact of a 17 percent reduction to your agency's operations?

Ms. MILLS. Well, that would be a tremendous impact if we went back to 2008 levels. As you know, we are a small agency, and as I described, we have a big mission, and it is a most difficult time to this day because small businesses have not recovered completely from the recession.

So it would have an enormous impact. For instance, we would run out of money in our loan program. Because of the subsidy issues that I described, we would not be able to make loans after the money ran out, and that would curtail what has been a very, very effective program to provide access and opportunity to small businesses as the capital markets froze.

In addition, we would curtail the tremendous progress that we have been making, or reduce the level of the progress we have been making in curtailing fraud, waste and abuse. And finally, of great concern, is our preparedness would go back to Hurricane Katrina levels which is unacceptable for the level of preparedness that we need to support our small businesses and homeowners in times of distress and disaster.

Mrs. EMERSON. So——

Ms. MILLS. From the point of view of small business, it would be a real setback.

Mrs. EMERSON. And if you couldn't reduce the budget or we didn't feel that it was appropriate to reduce the budget by the 17 percent to go back to 2008 levels, the cuts that you all have self directed, do you think that you have gotten to the bare bones at this point in time, in order to fulfill your mission? We talk about the subsidy levels and that is why you have asked for an increase, et cetera. I mean, because if we can actually come up with a figure that works, I mean, we can sell it on our sides of the aisle. Joe has the luxury of—isn't that the luxury of supporting increases from 2011 levels?

Mr. SERRANO. I have the responsibility of not destroying government.

Mrs. EMERSON. Well, in this case we are leveraging for the private sector so this is kind of one of those in between agencies as far as I am concerned. I think 17 percent impacts your mission, I will readily admit that. My other colleagues may not agree, I think it does.

You know, I was at—on Friday, at a small business that is owned by a 23-year-old woman who started this clothing store in a place where there were no sort of fashions for the 25- to 40-year olds. She had this dream, 21 years old, she saved a lot of money,

then she was able to get some help through an SBA loan and cosigning. I think the grandparents may have cosigned.

However, she is making a lot of money, she is 23 years old, and a half, I think. And were it not for that SBA loan—I mean, it is remarkable, and I can't imagine being and being willing to take the risk, especially because she kind of started in a down economy, but by God, she has got it figured out. So I am obviously a huge fan. Nonetheless, we really have to be realistic. I am not going to make you answer that question.

But Bowles Simpson recommended lots of reductions for things like travel, and vehicles, and printing. Do you all think that you can make savings, at least in those types of categories? Does that impact your mission very much?

Ms. MILLS. Well, as you know we are a small agency and much of our activity happens on the ground helping small businesses one by one. You have described, I think, the great joy of this job, which is supporting entrepreneurs because it is the entrepreneurs and the small businesses that actually create the jobs.

When we have looked through our budget, we have submitted a budget that has difficult cuts in it for us, that streamlines operations, that eliminates duplication and that really tightens our belts. And we are trying to do that while preserving the two priorities. The priority is to get the money into the hands of the small businesses, through our system out where it is helping them, either as a loan or counseling or a government contract or disaster assistance. When we do spend money, we want to make sure that it is to oversee taxpayers interest in terms of oversight and eliminating fraud, waste and abuse.

Mrs. EMERSON. When your staff travels to visit with small businesses around, people who are trying to either expand their business and perhaps need an SBA loan guaranteed, for example, or something to just make the bank feel a little bit more comfortable and others. I mean, I have to believe that your staff gets faced with the same questions that we get faced with with regard to regulations and more and more government, not necessarily regulations through the SBA, but rather other types of policies, whether it is greenhouse gas emissions, financial regulatory reform, health care. And how does your Office of Advocacy help them, or does it, because I think that is what their mission is to navigate through endless regulations. How exactly does it work?

Ms. MILLS. Well, we share a goal, I think, that is very much a bipartisan goal, which is to reduce the regulatory burdens on small businesses. And that is part of the agency's goals and activities across the board and through our ombudsman activity, and also part of the Office of Advocacy which is our independent operation that is highly focused on that.

As you know, the President has issued a memorandum in January on regulatory flexibility, small business and job creation where he says that reinforcing the need for Federal agencies to consider ways to reduce, to reduce regulatory burdens on small business. And talks about requiring agencies to provide justifications when those flexibilities are not included in the proposed regulations.

So across the administration, the President has led the charge that we have long been fully committed to, which is to reduce the

unintended consequences of regulation on small business. We are active in a day-to-day manner, both through advocacy and our own internal ombudsman on that front.

Mrs. EMERSON. So how does that information get fed into like the Domestic Policy Council or people at the White House? Do you feed through OMB, for example? You have your SBA regional person for region 7, which I think is me. Anyway, that person is out among lots of different businesses, and they are talking and they are hearing, 75 percent of the people say this isn't going to work and this isn't going to work, or this really is going to make doing business far too expensive. So they feed that into you, somehow I am sure. But then how does that get fed into the White House decision-makers? Is it through OMB? I mean, I am just curious more than anything.

Ms. MILLS. Yes, it is through the OIRA function of OMB, and we have a series of ongoing roundtables conducted by our ombudsman and our regional network where we invite small businesses and talk about these regulatory issues on an ongoing basis. And we have just announced, an eight-city tour, I believe it is, on regulatory issues and barriers to entrepreneurs and high-growth businesses. And we kicked off the first one of those in Durham last week on Thursday.

Mrs. EMERSON. Well, hopefully I think you all have the appropriate sensitivity to all of this. I hope that it is appreciated and/or understood by the folks at the top who are making decisions like at OMB. I mean, because even when we were in charge of the White House, we were driven crazy by OMB.

Ms. MILLS. There is a top-level commitment behind this.

Mrs. EMERSON. Okay. I appreciate that. Joe.

Mr. SERRANO. Thank you so much. And you are right the minority party gives you—the status gives you the ability to say let's do this and let's do that, and you have to come up with the final decisions. But it is a joint thing, joint decision.

My concern is exactly as you said that there's a contradiction when you set out to cut, cut, cut, cut without analyzing. Maybe there isn't enough time to analyze as much as I want. Two things come to mind, when you say to the Small Business Administration, we are going to cut you 17 percent perhaps, if we do everything across the board, you devastate an agency which is then a contradiction to the majority party's and the minority party's claims that we want to help small business.

If they are overregulating, that is one issue. But to cut them where they can't help people help set up a small business and create jobs, that is a contradiction. There is something else that is happening in this Congress and has been happening for the last 10, 12 years, which is a dangerous thing for me to say. I hope it doesn't affect anybody on this panel, but there seems to be a movement in the country of electing people, and you take great pride in electing Members of Congress who have never held public office before, that is a great thing. I think that is a terrible thing.

I believe you were a mayor, right? We may nnt agree, Mr. Womack, on cuts exactly where they go. But when you tell me the Federal Government treats mayors this way or the Federal Government treats localities this way, I have to listen because you were

there. I was in the State legislature for 16 years, you were a mayor. We understand each other before we got here. Some folks who got here, with all due respect to them, in the last couple of months, have never served before and that is why we are different, and we are going to cut everything. Well, you just can't cut everything, you have to think, stop for a second. We are not going to cut everything. There are some places that we are just never going to touch.

I want to say something, I speak for myself, I don't speak for my party. I am a believer that if you get into a little debt because you are saving the people after Katrina and trying to put them back on their feet, so be it. If you have to get into a little debt to build the best school system in the world again, so be it. Do you have to get into debt looking for weapons of mass destruction that never existed? I am not sure. But certainly in supporting the troops, you get into debt, and so what? Some things you have to do.

So the word "debt" sounds horrible, but not all debt is bad. After all, we have to behave like the American people who balance their checkbook every month. Not true. They all have a mortgage or they have a car payment that they are going to pay for a long time. They are borrowing too. I am not suggesting that we continue to get into debt the way we have been, but I am suggesting that we can't just cut, cut, cut. And we certainly can't contradict ourselves. If we are going to create jobs, then you have to be supportive, your agency has to be supportive.

If it is about overregulating, I am open for discussion, but just cutting across the board and enjoying this statement that I never served in public office before, therefore I am the greatest. No, he is a better Congressman because he was a mayor, you know. And when you used to come here without public service before, you didn't brag about it, you just kind of kept that to yourself. Now it seems to be like a badge of honor. Well, I did 16 years of budgets in New York State and I think that helps me on this committee. That is my speech for the day. Now a question.

What are you seeing in terms of lending to small businesses? Has the Recovery Act and the extensions of its funding been effective in unfreezing the credit market for small businesses? And what do you think has been more helpful, the fee reductions or the guarantee increases?

Ms. MILLS. Well, thank you to this Congress and to this committee for its support in the timeframe where really all credit had frozen, October 2008. We were able to step up, thanks to the Recovery Act and the multiple extensions that you granted with $42 billion in money that went into the hands of small business. The subsidy cost on that was $1.2 billion. So a pretty good, as I said earlier, bang for the taxpayer's buck.

We were able to raise our guarantee to 90 percent and reduce or eliminate our fees. I spent a lot of time traveling all over the country and I asked that question many times, and I got both answers. To some, it was a 90-percent guarantee that allowed the bank to step up and take the risk because they only had to put up 10 percent of the capital and this was a business they wanted to fund. And other times it really was that people saw, well, there is an incentive here, and maybe I will invest in that next piece of equip-

ment and hire that next person, and maybe this is enough incentive to get that economy rolling. So both were very, very critical.

We had the largest quarter in SBA lending in the quarter ending in December. We did $11 billion in loans, and those were just critical in filling the capital gap. We now know that there is some recovery, but that there are still holes, there are still gaps that exist. One is in underserved areas, and the other is in smaller loans, and that is why we introduced our Small Loan Advantage program and our Community Advantage program, two things that operate within, without incremental funding, but they are targeted to fill the continued gaps, particularly in underserved markets where the access and opportunity is the last to return.

Mr. SERRANO. Now you said this was your largest quarter ever, or in the last year or so?

Ms. MILLS. Largest quarter ever.

Mr. SERRANO. Now we get unemployment numbers, we get economic recovery numbers, we get all those numbers. What do those numbers tell you if it was the best quarter that people feel free to set up a business to invest? What does it mean?

Ms. MILLS. We are seeing the rate of business formation and entrepreneurship go up. We know that some of the best businesses were actually started in recessions looking back. We see encouraging signs from our small businesses in that they are taking advantage of things like accelerated depreciation to buy that piece of equipment and hire someone, but they are not out of the woods yet. The economy is still fragile. Small businesses took a tremendous hit, and they still very much need to be supported with access to capital, which the capital markets are not fully functioning and not fully back beyond the SBA, the traditional capital banking markets.

And they need the opportunities to provide access to government contracting, and they very much need our counseling and advice because that shows that there are greater success rates when you have a long-term counselor and you hire more people.

Mr. SERRANO. May I ask one more question?

Mrs. EMERSON. Sure.

Mr. SERRANO. You are requesting a $161 million increase over the fiscal year 2010 level for the SBA and of this amount, $131.6 million, to a 7(a) loan program to cover subsidies which has not been the case in the past. Now in the past, as you know, it was zeroed out and then we would kind of force you guys to take the money in a way. What does this funding cover and why is it needed now? What is the difference this time? And how much of the regular 7(a) appropriation for fiscal year 2010, which was $80 million has been spent thus far?

Ms. MILLS. The request, the largest increases as I said in our budget, go to subsidy. And the reason is that we have fully used our fees and brought them to the fee caps. The subsidy rates are up because of losses that we are seeing from the 2005 to 2008 cohorts. In that time period, as you know, small business owners used their real estate as collateral, and their house or their building had inflated values in that time period, 2005 to 2008.

So as we look now, we see that those values are not there, and they are creating loss rates that have gone up as have rates for tra-

ditional lenders, our subsidy rates and our loss rates have gone up. Those subsidy rates calculations, when applied to the 2012 budget, require incremental funding that we cannot cover with our fees because we have maxed out to our statutory fee limits. We have asked for the ability to adjust fees and have flexibility in 2013, because we believe that if we can, we should move our loans to zero subsidy.

Mr. SERRANO. Thank you.

Mrs. EMERSON. Thank you, Joe. Mr. Alexander.

Mr. ALEXANDER. Thank you, Madam Chairman. Ms. Mills, it is good to see you. You mentioned something about preparedness program, and you mentioned something about Hurricane Katrina. Can you tell us what that means?

Ms. MILLS. I am sorry, I didn't quite hear the last part.

Mr. ALEXANDER. Preparedness program, you said something about it in relation to Hurricane Katrina, and you were hoping to do better than we were prepared during Hurricane Katrina.

Ms. MILLS. As you know, we have completely revamped our disaster loan program in the post-Katrina era to significantly elevate our state of readiness, and our commitment has been significant. In Hurricane Katrina era, we had 366 seats at our processing centers. And it took us 70 days to process loans.

Right now, we have 1,750 seats, and it takes us 7 to 10 days to process loans. We operate a new technology system that allows us to have 10,000 concurrent users on it versus 800 in the Katrina level. And we have 2,000 ready reservists, they are not on payroll, but they are on call. So actually, when we call them up, following a disaster, they will go from the ice storms in Maine, and then they will travel to the wildfires in California, and then the flooding in the Midwest, and then the tornados, and then the hurricane, and then they do it again. So our staffing levels fluctuate up and down depending on the need.

Our commitment is to maintain that level of preparedness. And what we have done is look for cost savings. In this budget, we deliver to you $8 million of cost savings by taking our steady state of readiness down to 850 permanent staffing or steady state staffing versus 1,000. And we have done that by process engineering and streamlining our centers, not by reducing our level of readiness.

Mr. ALEXANDER. Okay. In your opening statement, you said over the past 2 years we have provided taxpayers with a big bang for their buck. The Transportation Department argues that for every dollar spent, we benefit by $3. Can you compare what you mean by big bangs for their bucks compared to the Transportation Department?

Ms. MILLS. In the one example I gave there, the subsidy costs of our SBA loans was $1.2 billion, and the amount of money that actually went into people's hands, because we provide guarantees, was $42 billion. But this is true across our various programs. We have partnered with the private sector and others in our Small Business Development Centers, in our SBIC programs, so that we really try to give a lot of activity off of a smaller budget number.

Mr. ALEXANDER. Okay, out there in the public when some of the banks that we hear about who are denying loans, there is an ap-

peals process that one can go through. Do you all have a similar process? If a loan is denied, is there an appeals process?

Ms. MILLS. Yes, and we do review loans, multiple times. We have lots of ways that small businesses can get help. I will give you one statistic which is in our North Carolina center. We were able to take those who were denied loans, and we got 60 percent of them funding by working with them in counseling and on their business plan and then bringing them back and introducing them to banks who, you know, were interested in making loans in their particular area.

Mr. ALEXANDER. Thank you, Madam Chairman.

Mrs. EMERSON. Are you finished for this round?

Mr. ALEXANDER. I am.

Mrs. EMERSON. Mr. Womack.

Mr. WOMACK. Thank you, Madam Chairwoman. It is good to see you, Ms. Mills. I appreciate the work that your agency does and continues to do for small business and job creation. I just have a couple of questions, and then I have to step out; I have got to go to the floor here in just a minute.

But one of the things that the gentleman from across the way, Mr. Serrano, has indicated that I am a former mayor and a former small business man. So I think my background is pretty unique in terms that I have seen it from virtually every side.

I think I would look at it this way; one of the things that I have always been in favor of is the capacity to leverage public dollars, that too often we get caught up in the notion that we are going use someone else's money in total, and to try to accomplish some desired outcomes in small business or whatever the case is. I am huge on the leveraging piece of it.

In other words, I like to see more than one person, i.e. Our Federal Government, have skin in the game when we are talking about making major investments in small business. I certainly agree the facts speak for themselves, that our way out of this economic mess is through the creation of jobs in the private sector.

So what are you doing to encourage the leveraging of the support that comes through your agency in the public-private arena to ensure that the Federal Government's not absorbing all of its cost? Instead, that we have our stakeholders in the game? That is a big question, that is a broad subject area, so you can probably go a lot of different directions with it, but I am curious about your response.

Ms. MILLS. We share your objective of using public-private partnerships to get more leverage for the small businesses that are out there. And let me just give you a couple of examples. In our SBIC program, small business investment companies, they actually run at a zero subsidy level because we provide the debenture guarantees for other partners, and we are able to put billions of dollars out into small and growing businesses, all across the country and with zero subsidy cost.

We also have a program we call SCORE, and there we use private sector individuals, 12,000 of them, who are volunteer small business people who have had the experience of growing their own business. And they counsel, for free, small businesses that we put into their network.

A third quick example, we have just announced something called Startup America, which is going to be led in the public-private partnership by Steve Case, a fabulous entrepreneur who started AOL. And a number of companies have joined this public-private partnership to help in Entrepreneurial Mentor Corps and other activities which are going to grow our small high-growth businesses that are really one of the most important job creators for the country.

Mr. WOMACK. How active is your agency, say, in some of the business-directed institutions on campuses of higher education? How do you interact with different schools of business?

Ms. MILLS. We have multiple interactions with different schools of businesses. I was just informed this morning that we have a joint partnership with one of the top, top-tier business schools who is helping us establish an entrepreneurial center in partnership with our small business development center. So we do everything from work with them in our emerging leaders, entrepreneurship education program to our local guidance and counseling and advice.

Mr. WOMACK. It goes back to my question of leveraging, because I really think that all the major stakeholders—health care, education, higher education, government, business industry, I think, there are unlimited opportunities for us to work through a lot of those stakeholders in bringing formations of capital and expertise, counseling, et cetera, to the table. And I would like to see a lot more of that.

The last thing I want to ask, and this is as close to editorializing as the gentleman a few minutes ago was doing and issuing some opinions. You have an impressive background in consulting and management and helping small business. What are you hearing right now about what I believe is one of the single biggest barriers to the growth of jobs, particularly in the private sector, the overreach of our government into areas that just cause the potential entrepreneur to throw his hands up and say, it is just not worth it, it is just not cost effective.

It will cost me a lot more to do this than it is worth. What wonderful opportunities are we throwing away because we just live in such a terrible and inefficient, burdensome regulatory environment?

Ms. MILLS. Well, I thank you for the question and the kind comments. I did grow up in the world of small business, and we travel around the country and listen to small businesses all the time, talk about this issue of the unintended consequences of regulation. I will say I am very, very happy that across the administration in OMB and OIRA, and the President himself have made very strong statements in support of small business and making sure that they don't have unintended consequences from this excess regulation.

We have been proactive. We have our day-to-day operations and our ombudsmen and our advocacy. But we have been even more proactive in recent months by initiating an effort to go around the country and listening to small businesses in the high-growth entrepreneur area, talk about specific barriers that they have.

And it might be regulatory barriers, it might be can they get paid on time. But whatever those barriers are, this forum, which is under the Startup America Initiative, is explicitly designed to lis-

ten and then take action on those kinds of barriers and concerns. The goal is to help entrepreneurs, put some wind at their back, and let them do what they do best, which is grow their companies and create jobs.

Mr. WOMACK. I represent the third district of Arkansas, and once upon time back in the 1960s, there was a very small business, it started ironically enough, the first—and you know where I am going with this probably—the first store happened to be, Mr. Serrano, in Rogers, Arkansas. That is where the very first Wal-Mart store happened to be located. I can take you to the site just around the block from my city hall.

Mr. Walton is not here to confirm or deny this opinion that I will give, but it is in my strong opinion that that small business, which later would become one of America's most famous companies and certainly one the largest in the world, may not have ever survived a regulatory environment quite like we have right now. And if small business people are ever going to be able to live that American dream, I don't know how they survive. A lot of the things that the unfunded mandates and the demands that we are placing on small businesses.

And so with that said, my question for you would be when you make your travels and when you hear back from these organizations—these entrepreneurs—that your agency tries to help. And you hear, I am sure, of many horror stories about the problems associated with developing small business, up-start businesses undercapitalized in a regulatory environment like we are, do you have direct access to the President's ear? Do you—I know you have quoted the President as saying he wants to solve this regulatory burden that we have right now—but do you have direct access? Do you have his ear on these important matters?

Ms. MILLS. Well, first, I have to say that I appreciate your comments about the small businesses born in Arkansas. And I actually have traveled there quite a bit. I have been in Arkadelphia recently with all the loggers, I have been in Bald Knob, I have been in Heber Springs, and I have been in Searay, and really appreciate that we have fabulous small businesses throughout the State.

Mr. WOMACK. Well, if the gentlelady would yield, let me just say, since I mentioned Wal-Mart, let me just throw Tyson and J.B. Hunt Trucking, there are three major ones in my district, three big ones that I don't think would have survived the regulatory environment we are in today.

Ms. MILLS. But the answer to your question about the President is yes, I have had discussions about this with the President. I know he is committed. The memorandum that he issued on small business and regulation is a very strong statement to all agencies on exactly the issue that you described in support of making sure that they produce more flexibility for the smaller business who doesn't have the staff and the time and the money to really deal with those regulatory burdens. And while preserving the health and safety issues to make sure small businesses can also operate.

Mr. WOMACK. Did the Health Care Patient Protection Affordable Care—I never get that right.

Mrs. EMERSON. Patient Protection and Affordable Care Act.

Mr. WOMACK. Patient Protection, yes, thank you. Has that come up in your discussions with small business entrepreneurs?

Ms. MILLS. Yes, and I will say we have supported a very important amendment that I know is under discussion. We are very much in support of the repeal of the 1099 provision which does place an undue burden on small business.

Mr. WOMACK. But stop there?

Ms. MILLS. The other aspects actually provide great benefit to small businesses particularly in the tax credits that are available as we speak. The 2010 tax credits are available to potentially 4 million of the 6 million small businesses. And as I travel, I am seeing small businesses coming to us now for information because they are getting dollars back in their pocket and there is nothing a small business likes better than dollars in their pocket.

Mr. WOMACK. Thank you for your testimony. Madam Chairwoman, I yield back.

Mrs. EMERSON. Mr. Yoder.

Mr. YODER. Thank you, Madam Chair. I appreciate the opportunity to be here. And I, too, have to head to the floor shortly. So I will ask just a couple brief questions. I appreciate your service and appreciate your work here today. And I want to maybe follow up on the questions from my colleague from Arkansas.

Everyone, including yourself, spent a lot of time talking to small business owners. Our focus, I think, my focus and many of my colleagues, is to try to figure out how we get innovators and entrepreneurs back home, creating jobs and expending and growing. I mean, that is the key. We know that no matter how many dollars and trillions of stimulus dollars are spent in Washington or how many rules and regulations or how many new bureaucrats we hire, it is not going to help that American somewhere that has a dream to start a small business if they can't get off the ground and get moving.

So I hear a lot of same things probably my colleagues do. And I guess wanted to trail backward.

Mr. Womack was going here, and related to a word I didn't see, at least in your report, you might kind of discuss your feelings on this, and that is related to uncertainty. Almost every meeting I have been in with the small business, they have brought up the uncertainty in Federal policy uncertainty in tax policy, uncertainty in rules and regulations, inability to borrow money. So many things that are related to, what I believe are poor government policies that the instability and uncertainty that many of them either can't expand, or feel they shouldn't expand because of the risks that are involved.

And so I have been heading down the pathway, along with many others, trying to figure out how we create that stability and certainty for small business owners. And I note the discussion about regulations, and I note that your comments regarding the President's positions of trying to review some of those, but there is a mountain of rules and regulations heading to small business owners. I meet with community banks, and I meet with small business owners; they feel inundated.

And I don't know if this is what you are hearing when you go out and talk to them, but the third district of Kansas they feel

overwhelmed and inundated with so many new things coming their way. They are completely overwhelmed by what the health care bill may mean to their bottom line. I can't tell you the amount of small business owners I have talked to that have said, because of that bill, I am not going to hire anybody until I see what the impact is on our bottom line.

So I see a real bottle neck coming, not from a statement the President might make that we should go review these rules and regulations, but from all the rules and regulations coming from the health care bill, all the rules and regulations coming from the Dodd-Frank Act, all the rules and regulations that are still coming from EPA and OSHA and so many different organizations, that I can't tell you the amount of times I talked to a small business that feels overwhelmed. And they don't say, well, if you could give a little bit more money to the SBA, we would be back at it. They say stop, change the rules of the game. Stop sending so many rules and regulations our way. Let us create jobs.

And so I guess I really want to get at what the SBA is doing or how you are advocating, what is your position on that? Do you agree or do you think the rules and regulations are helpful to those innovators and entrepreneurs who are trying to get their businesses moving?

Ms. MILLS. Well, as you know, we do a tremendous amount of traveling around the country listening to small businesses as well in these roundtables. And explicitly in the roundtables that we have just announced, we are going to be asking entrepreneurs to come and talk about those specific regulations on which they have concerns. So when they talk about specific regulations, they mention 1099, which we have come out to ask for repeal. And when they talk about specific regulations, we have the ability with our ombudsman to go back to those issuing agencies and help work with those small business through them.

Overall, when small businesses talk about uncertainty, which they don't do in a generalized sense, they are referring to the uncertainty they see in the economic environment. Small businesses do feel that the recession is not over. They do feel that they want now to fulfill that next order. They do come to us for counseling and advice on what is available to them. And one of the things I would hope that we might be able to do to help your small businesses is to bring them into our counseling operations.

We have 900 small business development centers, we have 12,000 SCORE volunteers, and they have access to bring a small business owner to those things that will benefit them, whether it is a tax credit. We have 17 tax credits that have been enacted for small business. Now it is tax time, we need to make sure that those small businesses know what is possible for them. And then, I just wanted to mention that those services are free.

Mr. YODER. I appreciate you highlighting that. How many small businesses are there in the United States, do you have an idea?

Ms. MILLS. Yes, just under 30 million small businesses in the United States, of which 6 million have employees.

Mr. YODER. And how many small businesses have received services from the SBA in the last year?

Ms. MILLS. We have many, many ways that we deliver services, but some of the highlights are that we had 50,000 businesses that we gave capital to, and loan guarantees. There are about $100 billion of contracts that we put into their hands. I don't have the exact number of small businesses, and we counseled more than a million.

Mr. YODER. So 30 million small businesses, and you have counseled a million. How many do you think you could reasonably touch? So of all of our districts and all the small businesses that we have talked to who share with us maybe a little different perspective that you are sharing today, that the health care bill is making it difficult for them to feel like they should risk capital right now until they see how that all plays out.

The impact of the Dodd-Frank bill and its regulation of the small community banks and their impact and their ability to borrow money, that those things from the EPA and other organizations or other entities in Washington that are unpredictable that don't go through the democratic process, that are coming through the executive branch, those things, how many small businesses can you sit down with to allay those concerns so that all those things that are coming their way, and all that uncertainty that they talk to me about, how many of those folks can the SBA effectively resolve so they don't have the uncertainty anymore? And what do we do about the other 29 million?

Ms. MILLS. Well, we hope more and more of them will be able to. But I think if you want to help them with some of these issues, we can. And I would just put in a small plug for our redesigned Web site, sba.gov. And we have millions and millions of visitors to that Web site. We are helping everyday provide access and opportunity to things that small businesses need, and what we call the 3 Cs, capital, counseling, contracts, those we help in our disaster operations as well.

Mr. YODER. And then one small question and I have got to move here. But regarding trade, what do you do to help a small business owner in my district that might want to figure out if there are international partners they could trade with? Anything the SBA does or where would I direct a business that brings a question like that to me?

Ms. MILLS. I am sorry you have to go, because this could be a very long answer. We have an intensive program. One of the most important things we can do now is achieve the mission of the National Export Initiative, which is to double our exports over the next 5 years. Small businesses are 30 percent of exports, but they are the fastest growing element. And there are only 250,000 of those millions of small businesses that I described that actually export. And most of them, 60 percent of them, only export to 1 country.

So we are working on two things: We are working on bringing more into the funnel, and this is where there are lots of rules and learning curves on exports. So we have a whole set of how can you become an exporter tools on our Web site and in our district offices.

And if you bring them into us, have them registered at export.gov, and we will send them what the available online and in-person contact possibilities are, because it is our mission to help

them find a way to connect them to all the resources that might be available because that is how we are going to create jobs here at home.

Mr. YODER. Great. Thank you, Madam Chair. I yield back.

Mrs. EMERSON. Thank you, Mr. Yoder. Mr. Diaz-Balart.

Mr. DIAZ-BALART. Thank you, Madam Chairwoman. Madam Administrator, it is good to see you. By the way, I think of some those small business that export probably a lot of them are in south Florida I would imagine. A big chunk of those have to be in south Florida, because I run into them all the time. And I also must tell you that I have been involved a couple of times when people from your outfit have been out there, and you have got some good people that do a good job explaining some of the programs.

The questions that I have are a little bit more limited. And that is that a recent investigation by the GAO identified 14 companies that received, I believe it was $324 million in set-aside contracts through the 8(a) program for small and disadvantaged businesses.

The GAO director of Forensic Audit Investigative Services testified that officials of 13 of those firms, "Misrepresented their eligibility for the program to finally acquire or maintain set-aside status and obtain Federal contracts awarded with limited or no competition."

Now, GAO's investigation showed that the SBA staff allegedly responsible for assessing annually the firm eligibility allegedly allowed three firms to remain in the 8(a) program and receive contracts despite evidence—and they say clear evidence—provided by the company officials during that review period that show that they were no longer qualified. Here are the questions, if that is the case, why were those three firms allowed to remain in the program, first question?

Ms. MILLS. So I am glad that you brought up this issue, because we have a very terrific program. Probably the largest program for small business across government, is our government contracting program. And our goal is to make the goal, which is over $100 billion into the hands of small business. But in order to do that, the program must have integrity. And therefore, we went after fraud, waste and abuse in these programs. This is an issue that the GAO report and other reports had brought up. I believe the report you were referring was issued approximately a year ago.

We took this issue face on and we instituted a three-pronged strategy for getting rid of fraud, waste and abuse in these programs, making sure they bad integrity. The first part of it is effective certification, making sure that the program benefits are getting to the intended recipients. And this, I think, was one of the issues, flagged in that report. We have done a whole series of things across all programs, not just 8(a), to tighten certifications and to ensure that we are screening those potential program entrants.

The second is continued surveillance and monitoring, which is conducting increased exams. And the third is robust and timely enforcement.

To your question on enforcement, we have now quite a substantial record on prompt and proactive enforcement. Every single case

that has been in an IG report or a GAO report we can show you the follow-on activity and documentation.

We will respect due process. There is a due process activity that happens for each of these small businesses. But we will go after the bad actors, and we have now a very strong track record in this front.

Mr. DIAZ-BALART. Good. Now, let me ask you, obviously you have got the bad actors who, you know, who did a fraudulent application. Now, the GAO, I guess claimed that some on staff knew that there were some bad actors potentially that didn't qualify. Is there any disciplinary action to those, the people inside your organization who may have—I am not saying, you know, obviously willingly, that missed seeing this? I mean, you know, because disciplinary actions have to not only be for those that apply, which is a problem, but if there were those who saw it and either missed it or whatever. I mean, what action can be taken or has been taken internally about those individuals?

Ms. MILLS. I am not aware of any staff issues to this regard. In each of those cases, in every GAO report, there were follow-on activities. In addition, there is a new suspension and debarment task force throughout our agency, which has made even more robust activities around the suspensions. We have had over 100 suspensions, debarments and activities throughout our programs, and this is a great acceleration. We are serious about this. All of the staff has come forward and put tremendous effort into the more intensified certification activities, the continued surveillance activities and monitoring and the enforcement.

Mr. DIAZ-BALART. And I understand that. And I appreciate that. And I think it is important. And I commend you for, obviously, your passion on that, which is important, because as you said, without that integrity, obviously we are in serious deep trouble.

However, I just want to make sure that my point is clear, that obviously there is always two sides of this issue. There are two culprits. There is the one who applied and then there are those who may have not caught it when maybe they should have. And I am not saying that is the case. My understanding is that the GAO—and I may be wrong, talked about staff allowed three firms to remain in the program and received contract, despite, I guess, what they claim are clear evidence provided by company officials during the review that show they were not eligible. So I just want to make sure that it is—I commend you for your efforts, I do. And I just want to make sure though that one of the things that people get frustrated about, whether it is true or not by the way, is a lot of people claim or think, well, there are no consequences for those in government who may have either made the wrong choice or just didn't do an adequate job and that is really what I am going to as well, because you clearly answered one very well, but——

Ms. MILLS. Well, in this particular circumstance I would look to, also, the due process activity. And in terms of our personnel, our performance management standards have been augmented to be very clear about what is expected.

Mr. DIAZ-BALART. Good. And if you can keep us informed on just what those actions are and how you are doing that, because I understand that, I guess, are you asking for increased funding for 8(a)

program? I believe you were, or you are. And again, as you were stating before, and I agree with that, we have got to make sure that that integrity is there, particularly if you are going to be asking for any more money.

Ms. MILLS. Yes, we are asking for 24 more positions, largely around, 18 of them, around fraud, waste and abuse and enforcement in our contracting area; 10 for the implementation of the women's business rule.

Mr. DIAZ-BALART. What is that? I am sorry, the last one?

Ms. MILLS. The women business rule.

Mr. DIAZ-BALART. Okay.

Ms. MILLS. Which we just brought forth on February 4.

Mr. DIAZ-BALART. Okay. And lastly, I guess there was a little bit of conversation about the health care bill a little while ago, about, I am not going to ask you to—I am not going to put you on the spot on this. But you must have heard from some small businesses that have some concerns, right, about the health care bill and how it affects them. I mean, because you mentioned that obviously if you hear about specific regulations, and commend you for your support of the 1099 changes. But have you not heard any concerns about the health care bill, about particularly, for example, businesses because I get it all the time from a number of businesses.

I am just wondering if we just live in totally different worlds. Particularly those that are maybe 46 employees, about what happens when they reach 50. And have you, do you not get a lot of concerns about—you explained the positive things. But do you not get concerns from small businesses about the effect of the health care bill on their bottom line or on their future availability to grow, particularly if they are not at 50?

Ms. MILLS. Here is what I hear from small businesses. The number one concern of small business is access to affordable health care. It has been that in the NFIB survey since 1986, number one concern. And small businesses want to provide health care. The first thing that I have heard from them is that they are benefiting from this tax credit. Probably there are 6 million small businesses that have employees. We estimate that up to 4 million may potentially be eligible for this tax credit, which kicked in in the 2010 year.

So that is the first thing that they want to know is, can I get some, you know, money back on my health care, or might this make it affordable, because small businesses want to provide health care. They just can't get a quote. And that is where the second piece comes in. The second piece they ask about are the exchanges. Right now when small businesses want to get a rate quote, they have to call two or three or four brokers before they can get even someone to bid on their business. Small businesses pay 18 percent more for health care, just because they are small and they have a smaller pool. And if somebody gets sick their rates go up. These exchanges will pool those risks and they know that. And the next thing they said is when are they coming? How do I get more access to an affordable quote?

There is no mandate for small businesses who are over 50 to provide health care. There is no mandate in this. So they have not—when they look at the facts of what is in there and what their con-

cerns would be, they have not expressed concerns about those because there is no mandate.

Mr. DIAZ-BALART. So you are not hearing a lot of concern. I just want to make sure that I get this right. You are not hearing—I am sure you are hearing a lot of concerns about a lot of different things. You are not hearing a lot of concerns about the health care bill.

Ms. MILLS. I am hearing—and this is from, you know, small businesses that we go out to talk to about other things, credit. One of them said, you know, when I was able to now provide health care for my employees, that was the day that I considered my business a success.

Mr. DIAZ-BALART. I appreciate that and thank you for being here. Again, I am just wondering, because I do also meet with small businesses, maybe not as many as you meet with, but there seems to be a lot of concern about, as one of my colleagues said, about the uncertainty, if nothing else about the health care. But I am just surprised because I hear it all the time, unsolicited. I recently had meetings with, about, I don't know, 25 manufacturers, Madam Chairman, in my district, by the way, which I was even surprised existed that many in South Florida. And one of the issues that always comes up is concerns about that bill.

So I am just interested that I guess you haven't heard that. But that is interesting. Maybe it is just that they are talking to you and they are talking to me and they will say different things. But I clearly hear it a lot. Thank you so much for being here. Thank you, Madam Chairman.

Mrs. EMERSON. Of course, Mr. Diaz-Balart, she is the lender and they don't want to tell them too much, I mean, I am convinced of that because I hear it all the time too. It is just absolutely nonstop, nonstop.

Let me ask you a question. How does the SBA define a small business? Because we are always having all these arguments about what is a small business. And so, define a small business for me, number of employees.

Ms. MILLS. In the numbers that I quote when I say there are you know, so many small businesses, the general break-off is 500 employees or more. And that is done in the Office of Advocacy data. We actually have different definitions for every industry category because a manufacturer who has 100 people may be small, but an accounting firm that has 100 people might be big.

Mrs. EMERSON. And so, but it is generally employee-driven, number of employees driven as opposed to profit margin or anything like that?

Ms. MILLS. There are actually a number of complicated pieces to it. It can be also some things to do with revenues and net worth as well.

Mrs. EMERSON. It just occurs to me that since we are always fighting among ourselves, whether it is the House, the Senate, the executive branch, whomever, or even the private sector, and I used to work in small businesses myself and larger business, so I have kind of been all the way around. There was never a definite example. The number, you could pick any number to suit your purposes. And to me, that is kind of duplicitous.

I wish we could just arrive at a number, you know, whether it is more specific as you go down through categories or not. But that way, it is not always gotcha. But that is just a pet peeve of mine. Just a second on the business loans because we talked about why are the subsidy costs increasing, should fees be increased, et cetera. Tell me, what is the process that you use to monitor risk to make sure that your loans are going to creditworthy businesses?

Ms. MILLS. Well, we have a complicated and robust, you know, credit process driven largely through our private sector partners, the banks. And banks use their credit processes, and then we provide credit guarantee over them. But the first screen is the banks credit process. There are a number of factors that occur in that underwriting, and it is different by loan product. But I do know that we pay quite a bit of attention to loans and that the loans at issue, as I described earlier, are really coming from the 2005, 2006, 2007, even 2008 cohort where the market was very hot and banks were making lots and lots of loans. And now we see that our credit scores on our new loans since 2009 are actually higher. They are actually higher.

Mrs. EMERSON. Interesting. I am just really curious about that. But then again, the whole drop in real estate prices just had a huge impact on everything. All right. Now that I am very, very concerned about floods, and I live, my whole eastern border is the Mississippi River, so everything that flows from North Dakota, Minnesota on down goes right by our area. And I know that you have asked for $167 million for administrative costs, which is $90 million more than 2010. But you haven't requested a subsidy appropriation for fiscal year 2012. So I know that the administrative increase looks very large, but this is because—if I understand correctly, it is because the fiscal year 2010 appropriation was partially offset by carry-over funds appropriated for prior disasters.

And now there is no more carryover. We are done. So for fiscal year 2011, most of your disaster administration funds, or expenses rather, were funded through reprogramming of $126 million in disaster subsidy. So, what assumptions do you all use to arrive at the requested level of disaster loan administrative expenses? I mean, how do you determine what those are going to be?

Ms. MILLS. In 2012, our request reflects an $8 million savings in disaster loan administration, and this is the result of the re-engineering in our disaster loan centers that I described. So instead of operating at a steady state level, remember, our disasters staffing actually goes up and down, up and down. But on average, the steady state funding that we have been using is 1,000 people. And we are able to provide, by 2012, the same at this time of readiness with a steady state staffing of 850 people. And that is, you know, some efforts that we have done to streamline and re-engineer and improve our processing operation, that is a continuous process that we feel is our responsibility to pursue aggressively and to provide those savings in these tough fiscal times. We believe that we need to be at that level of readiness. We also have 2,000 ready reserve on top of that. So if something happens, we do have those staff that we can bring into the system. But the cost level that we are asking for is that. For subsidy level, we have no year money reserves that we are using.

Mrs. EMERSON. So what do the ready reserve people do on a day-to-day basis? Do they work in banks, or are they small business people, or who are these people?

Ms. MILLS. Well, they are all kinds of people actually. And I have met a number of them. I have been out in our disaster centers when we had the flooding in Nashville. I met a number of them. And when we went to the Gulf in the BP oil spill, a number of them came in. And they are from all walks of life, from all kinds of operations. And we have a system by which, you know, we ping them and say, are you ready, are you available. And they come back. So we try to keep a full complement available.

Mrs. EMERSON. That is interesting, and very nice to have those people who want to help. So what happens if we have a large disaster, say, another Nashville or heaven forbid, a Katrina-like episode? Do you have enough subsidy carryover to support the program level that you need to be able to respond to such a thing?

Ms. MILLS. We have built a substantial capability in the post Katrina era, in our physical activity. So as I said before, we went from 366 seats in the processing center. We have the people. We need someplace to put them. Now we can seat 1,750. We couldn't put them all on the computer system. We could only get 800 concurrent users. Now we can put 10,000 concurrent users in so we could even staff up more aggressively. And we maintain our ready reserve.

We have made an electronic loan application now so that 30 percent of our loans actually come in electronically. We were able, last year, to operate in over 40 regions concurrently because we stay for a bit of time so as we're finishing up, you know, the flooding, we are deploying down in the Gulf. And we can stay for up to 9 months. So we can service numbers of locations concurrently and/or a large location.

The other thing that we have done to prepare for a very, very serious disaster, besides simulating it, is we have engaged our full-time district staff members who do not operate on the disaster operations to be linked on the ground in cases such as Nashville or BP oil spill or any other large-scale disaster so that we have not only our disaster operating people, but we have our core SBA district office people coming to the assistance and lending their support, our SBDCs, our SCORE people, everybody is on the ground.

Mrs. EMERSON. So from the money standpoint, how much in disaster subsidy do you have in reserve?

Ms. MILLS. We can get you an answer to that. But we have a number of years of disaster subsidy in reserve.

Mrs. EMERSON. So presumably then, if, let's just say, you can get us the numbers and it amounts to 5 years or so, then could we possibly look to disaster loan subsidy funds to pay for the 2012 disaster administrative expenses if necessary?

Ms. MILLS. Well, the issue there is the level of preparedness and the level of risk that we want to take on. Our commitment has been to be prepared for intensive disasters, and that was the commitment we made after Hurricane Katrina. Nobody really knows what the future will bring in terms of hurricanes and earthquakes and other issues. And we have seen around the world that they do come. So we have a level of preparedness now that we think we

can handle it, and we want to make sure when we go into the field, that we also have the loan subsidy so that we can execute the loans.

Mrs. EMERSON. I would thank you and appreciate and thank you in advance for getting us those numbers if you could. One quick question, then I will turn it over to Mr. Serrano. Our current continuing resolution is set to expire, I guess, week after this. What day is today, the 8th? Okay. So 10 days. I don't think a shut down will occur, in spite of the hype.

I mean, hopefully we will be able to work out our differences and keep the government running. But do you all have a plan for operating during any kind of government shutdown? And if so, then, can you tell us just generally speaking what kind of activities and which personnel would be considered essential?

Ms. MILLS. Well, everyone is working very hard, I know, on averting a shutdown. The President has said, and we agree, that a shutdown would hurt the economy and would hurt small businesses. Since 1980, every agency has been required to have a plan that would go into effect in case of a shutdown. We are on an ongoing basis updating that plan. We are committed, I know across the bipartisan effort, to work on making sure there is funding for 2011. The activities that would or would not be shut down are actually governed by law. There are rules around it. There is one thing I can tell you, which is that our disaster operation will not be shut down. That is considered an essential operation and it would not be part of an appropriation.

Mrs. EMERSON. I appreciate that. I don't know that it is presumptuous for me to ask, but would it be possible to get a copy of your plan?

Ms. MILLS. Well, we are updating the plans on an ongoing basis, and at this moment, I know that things are so fluid that, you know, we are sort of in the continuous update mode.

Mrs. EMERSON. So would it be possible to get last week's plan?

Ms. MILLS. Well, we know——

Mrs. EMERSON. Just to give us a sense. I mean, it is not to give to the press. It is really for our own, for our own sense. All right. We can have further discussion on this. I will pass it to Mr. Serrano.

Mr. SERRANO. Thank you. Boy, you really want that plan, don't you?

Mrs. EMERSON. Yeah. I do.

Mr. SERRANO. So do I. Wouldn't it be nice if a government shutdown meant a real government shutdown like the war ended, like the troops would have to come home immediately.

Mrs. EMERSON. But you would be stuck here in Washington.

Mr. SERRANO. No. No. I could go for that. I could be supportive of a shutdown if all the troops just had to pack up and leave, the war is over. But something tells me that would continue. We would find money.

Let me ask you a question. The fiscal year 2012 budget calls for a reduction in the small business development centers, $10 million, and proposes to eliminate the prime technical assistance program. For micro loans, the budget proposes a cut citing the funding received in the recovery act. Can you explain your rationale for cut-

ting technical assistance to small businesses, both through micro loans, the prime program and the small business development centers, and how do you intend to serve small disadvantaged businesses without these resources?

Ms. MILLS. Well, as you know——

Mr. SERRANO. I mean, I must tell you that, anticipating what I think you knew, the cuts that would be proposed, why any agency is on their own cutting is beyond me. I know that sounds irresponsible, but if you knew what was coming, why would you propose any cuts?

Ms. MILLS. Well, as a part of being part of this fiscally responsible process, we all are tightening our belts. We are all streamlining our operations. And that really makes us make some really difficult choices, as you just pointed out. We have a program, as you described, prime, which gives technical assistance in communities that are involved with our micro loans. What we have done is try to look at places where we can streamline without losing the value of that technical assistance. So we have initiated a very strong overall activity around underserved markets. In it, we have made some changes to our loan programs and opened our 7(a) program to our micro lenders and CDFIs, (Community Development Financial Institutions that meet certain qualifications that will be responsible to our program). They provide technical assistance for those loans at their own cost.

What they want from us really is the availability of the loan subsidy, the loan guarantees. So we are looking at ways we can do what we do best, open more access and opportunity to the loan guarantees, and encourage our partners to provide the technical assistance which they do best. That set of activities, I think, will give a robust set of help to the small business because technical assistance is a critical part. And we are looking forward to working with our partners to boost their capability to give loans and then also to give that technical assistance from their capability.

The SBDCs you asked about are also very important partners to us. I just wanted to point out one piece, which is that half of the reduction in the SBDC funding does not relate to their base level. We have been able to reduce prior special purpose counseling grants, which takes account of about just over half of the proposed reduction.

Mr. SERRANO. Well, let me just, for the record, tell you that you mentioned the CDFIs. That is part of this subcommittee, and they are being devastated too, so you may not have the partner you think. But the part that confuses me, even after your explanation, is in answer to one of the early questions, you said that if there were a couple of shortcomings in the Agency, it was the inability to do more in low income communities.

So why would you voluntarily cut those programs that affect those communities? I know that I mix my questioning with an attempt at humor at times. I really think that Members of Congress sound too serious. We should be serious, but we don't have to sound serious all the time. But I am very serious when I tell you that all agencies should be aware that the plan here is to cut to the bone. So yes, it is important to be fiscally responsible, but don't give up the house before half the house is taken away from you.

Ms. MILLS. If I might clarify, I think what I was referring to is that the gaps in the market are in the area of underserved communities. The market has not come back to provide access and opportunity to those underserved communities. At the SBA we have actually intensified our efforts around the underserved market. We just actually announced a council that is going to be led by Cathy Hughes, a fabulous entrepreneur who founded Radio One. And we are working, across all of our programs to increase access and opportunity in the underserved markets because that is a really important role that we play and that the markets don't. So as we go forward, we have developed this program called community advantage. And this is going to bring the CDFIs into our activity as lenders in our traditional 7(a) product. This is something that they have been eager to do and asking for for quite a bit of time, and I think will help us get what we want, which is more points of access in these underserved communities with lenders who understand those small businesses.

I don't need to tell you that these are the people who hire in these communities. Across the board, our government contracting programs, our 8(a), our Hub Zone and other programs, our counseling operations also are going to be part of this underserved council and underserved effort that we have. Because the role of government, I think, is to provide access and opportunity. We at the SBA are three to five times more likely to make a loan to a minority-owned business or a woman-owned business than a conventional lender. So this is the place where we see our participation to be critical.

Mr. SERRANO. As an extension of that, how are we doing at meeting the contracting targets for women-owned businesses?

Ms. MILLS. Well, as I say to everybody, the goal is to make the goal. And we had a very good experience in the Recovery Act where we were able to exceed not only our 23 percent goal, we were over 30, but we made every single sub goal. In the past, we have not made our women's contracting goal and we have fallen short. And every percentage point you fall short in government contract is $4 billion that is not in the hands of that constituency. We have been able to implement, this year, the women's contracting rule. This was a rule that was passed in the year 2000, but was never implemented until we came on board and made it a priority.

And finally, through the efforts, fabulous efforts, of a whole set of committed people across the agency and outside and across government, that rule went live on February 4. There are, I can get you the number. It is more than 1,000 small businesses that have uploaded their data, certification data into our certification data bank, and we are hopeful and determined to make sure that this new tool allows us to make the goal.

Mr. SERRANO. Let me ask you something about these regional clusters. I know you received 173 applications and you funded 10. Can you tell us a little about the winning proposals and how you see this program evolving in the years ahead, especially this year?

Ms. MILLS. Well, as you said, this was a very highly competitive process. We had very high demand, huge demand from the small business community. And we were able to fund some really extraordinary initiatives. The closest example to where you are is the

Connecticut Hydrogen Fuel Cell Coalition, which includes New York, Connecticut, Massachusetts, Maine and others. In the Gulf Coast, for instance, a geospatial solutions innovation cluster. I was just in Northwest Ohio, in Cleveland, where Nortech won, which does flexible electronics. That is electronics that you can put on a piece of flexible material, so it has circuits, but it bends and you can put it anywhere, on a helmet, on anything.

We have a Carolina nuclear cluster. We have an agricultural cluster in California for agricultural innovation. We have a defense cluster. What these clusters do is they allow small businesses, who don't have the power individually, to access the resources that big business do. When they cluster together they can access university research, community college curriculum and that gives small businesses in these high growth sectors the ability to transform the region. They are what I call the link, to leverage and align money on a regional basis that create new economies, and therefore transform those economies, create jobs at a pretty good bang for the taxpayer buck.

Mr. SERRANO. I have one last question and then I will submit a couple for the record. How has the emerging leaders program been implemented so far? And again, sounding like a big spender, with $3 million requested, what is it that you do that would have an impact?

Ms. MILLS. Well, this program has an extraordinary impact. This is specialized training for entrepreneurs, largely in the inner city and underserved communities. We have expanded it to the Native American community with great success. And just a couple of statistics. We track and measure the metrics very heavily on this. Half of the participating businesses, after they went through this program, had an increase in revenues. They secured nearly $10 million in financing. They also secured nearly 500 Federal state and local contracts, which were over $100 million. And 60 percent of them have hired new workers.

So we know that this program creates the intended effect, which is to help entrepreneurs learn how to grow their businesses. And that we have an expanded list of cities where we are able to bring this program; it is proven, we have actually been running it for quite a bit of time. And we know that in each of these communities we can really build a new core of successful entrepreneurs.

Mr. SERRANO. Thank you. And actually, I stand corrected here. Myself. There is only one question I am submitting for the record.

Mrs. EMERSON. Perfect. So how would I become an emerging leader if I had a small business? How would I become part of that program? Just because it is fascinating to me so I would like to know how.

Ms. MILLS. Yes. I believe it is a competitive process. We run a curriculum-based program, so you come into a class with a cohort and that cohort is designed to work so there is thought placed on the different kinds of businesses to have together in that cohort. And the trainings are pretty intensive. I will say that we have had some good success also expanding this in the Native American community where there has been significant unemployment and we are doing it in Albuquerque. We are doing it in Phoenix, we are doing

it in Portland, Oregon, in California and Seattle and Oklahoma and Ohio and St. Louis actually.

Mrs. EMERSON. So if you are a small business person, or you own a small business, then you would actually make application.

Ms. MILLS. You would make application in one of the cities. We put out a call for applications.

Mrs. EMERSON. I see. Okay. So would that be advertised in the newspaper or does it go to local Chambers of Commerce? How do you put out a call? I mean, I am just curious since I don't have a small business myself.

Ms. MILLS. I will find out for you, but I would imagine it is all of those, yes.

Mrs. EMERSON. I would love to know because I certainly know a few people who could take advantage of that. But that is why I want you to come to the district so we can tell people about these good programs that you have.

So I recently read a rather scary report, and I am sure that Joe, if you read it too, you would think it was pretty scary, that the GAO did duplicative government programs. As a matter of fact, I was anticipating being, at least having several people yell at me about those sorts of things over the weekend, which surprisingly they didn't. So I was pleased about that on the one hand. But I did know that in economic development, in the economic development category, there are about 80 different programs at four agencies being investigated, with y'all included, I guess, to assess the potential overlap and to the extent to which agencies collaborate to achieve a common goal. And so since you mentioned in your testimony about your efforts to streamline processes and eliminate duplication, tell us how you actually coordinate the SBA's efforts with other economic development agencies to make sure that, number one, everybody knows the opportunities available from the SBA and perhaps other areas or other programs in the government to do economic development. And then, after you tell us that, tell me how do you actually ensure that Federal agencies aren't duplicating one another?

Ms. MILLS. As you know, we operate on the ground. And I will say, I think we have done a really extensive job at collaborating across agencies. The President said, no silos, and we have worked, particularly at the SBA, across numerous agencies to make sure that we are linked, leveraged and aligned and not duplicating effort. Let me just give you two examples, and I could actually give you many. But one is the Veterans Administration.

Early on, we did a collaboration with the Veterans Administration to make sure that every veteran service operation was also telling the veterans about our loan programs. We have special veterans loan programs and counseling operations and we wanted to make sure that they knew about the access to our programs. And we, on the other hand, became more educated as to what was available to veterans through traditional, avenues or at least how to integrate them back, and we have worked to make sure our Web sites are linked, that we have cross links. If you come on our Web site as a veteran you can get back to other VA programs. A second place that we have actually formalized an MOU, as well, is with Tom Vilsack and the Department of Agriculture.

We operate in rural areas and we operate in very close collaboration at our district office levels with the USDA operations, so that we can find out which loan program is right for a particular borrower. And we are always referring back and forth between our programs and their programs to make sure that we guide the small business to that which is right for them. We collaborate extensively across multiple agencies on exports. We coordinate with the Export Import hank. We have joint programs with them. We coordinate with Commerce on a daily basis, on all of these activities. And we coordinate as well in an interagency effort in clusters.

And as I said, I could go on. We are fortunate to represent small businesses and to be, I think, a powerful force now in making sure that those small businesses find their way to the resources that they need.

Mrs. EMERSON. So you had a very successful professional career in small businesses and sort of bringing innovation and the like. So taking off your SBA hat just for a second, and thinking about it from the perspective of an entrepreneur or someone who is helping entrepreneurs, what recommendation do you have to us as Members of Congress, how do we sort of figure out what is duplicative and what is not, and how do we best streamline it? I mean, obviously, y'all should be doing that at SBA, or SBA, you are not working there anymore, just temporarily here, while we're talking about this, so SBA, you know, has the expertise to do small business, anything with regard to small business. And you know, I don't know what other agency, if there are any, who do it. But I do know there are about, at least eight agencies that do renewable energy, including the USDA, I might add. How do we take this program and leverage off each other and streamline it, as opposed to having eight different sets of rules and regulations and therefore, we get nothing done.

So what do you recommend, how can you help us do our job better, having been in the arena yourself?

Ms. MILLS. Well, as you know, there are lots of different kinds of small businesses. And they have different kinds of needs. So Main Street small businesses, they need capital, contracting, counseling, but it is a different kind of capital perhaps than a high impact small business. So I think the first thing that we have thought about, I think quite effectively now, across the Federal Government is what are the needs for the high-growth, high-impact small business. And that is Startup America, the interagency effort around both removing barriers and providing the tools that a small business needs.

So I think the best place to see strong examples of effective elimination of duplication and even more than that, coordination of all the assets that are available, are in some of these interagency efforts, and in some of the electronic information one stops that we have been able to do. If you look on SBA.gov and business.gov, you will see that we leverage other agencies' activities in order to make sure that the small business gets an opportunity to navigate to what is right for them. And we can continue, we plan to continue to do that to make those pathways even more easy to find for small businesses.

Mrs. EMERSON. Are there other agencies that horn in on any of the work that you are doing?

Ms. MILLS. Well, we invite them in.

Mrs. EMERSON. That is different. That is not what I asked. I said, are their agencies who somehow try to get in and do your, do what do you? Because if there is, that is what we need to know because obviously, y'all have the expertise and perhaps other agencies, well, rural development may well actually be one that would horn in, or as you were saying, you should work actually more collaboratively I would think.

Ms. MILLS. We do not find extensive duplication in the respect that we operate on the ground and we tend to be the agency that lives on the ground, helping small businesses one by one by one by one. And I think we are able to bring a tremendous set of assets in the interagency activity, and our role is generally that we do a lot of the groundwork. We do the heavy lift in direct contact with the small business day by day, one by one. And I really have to just take the moment to commend our staff that does that on the ground. They have a real love of small business and that is how we help them.

Mrs. EMERSON. And I would attest to that, working, you know, my staff works extensively with your folks on the ground. But hopefully the other agencies with whom you collaborate will jump as fast as you do so that if there is a whole package and you are only doing part of it, they are doing their piece simultaneous to yours. And that would be my frustration.

Actually having worked in an administration many, many years ago, that was my frustration. It was because there was a lot of interagency work that had to be done and we did our part and the others didn't. I am not asking you to make a comment. But that is a very frustrating reality sometimes of unwieldy government. I have got a bunch of questions that I want to actually, and I also have one from Mr. Walden of Oregon who has asked me to submit a question for him, which I am happy to do. There are things that I want to, questions about 504 loan refinancing, particularly since you all are not actually asking for any subsidy costs, but is there something that we ought to know about in case something happens?

Might there be a cost associated with those 504 loan refinancings? These are the types of questions that we are going to submit. And if we could get an answer back. Some of these are pretty critical. If we could get an answer back within 10 days I would be very grateful. We will rank them many. And Joe, you want an answer back quickly too?

Mr. SERRANO. Yes, to my one solitary question. I do have a question for you. Do you think the Senate is a duplication of the House? Because that would solve a lot of our problems.

Mrs. EMERSON. Well, on the one hand it could solve some problems. On the other hand, sometimes the Senate is able to act—well, they frustrate me a great deal because it takes so long to do things. Sometimes they can, perhaps, bring a little balance.

Mr. SERRANO. Madam Chair. I am joking. I expect them to save us from H.R. 1.

Mrs. EMERSON. I guess that is what I was trying to say in a more diplomatic way, given the fact that this is all on record.

Mr. SERRANO. Listen we have been doing stand up here at times and it is all on TV too.

Mrs. EMERSON. All right. We won't keep you any longer. Thank you. Thanks so very much for all you do.

Mr. SERRANO. Thank you for your service.

Mrs. EMERSON. Thank you for all you do and all that your staff does. You all really are the front lines and we need to keep you in the business of doing just that.

Mr. SERRANO. And you know my mantra, don't forget the territories.

[The information follows:]

The Small Business Administration's Answers to
QFRs submitted by
Financial Services and General Government Subcommittee
Regarding
Hearing on the Small Business Administration FY 2012 Budget

Questions for the Record Submitted by Chairwoman Jo Ann Emerson

DISASTER LOAN PROGRAM

The fiscal year 2012 budget request for the Disaster program includes $167 million for administrative costs which is an increase of $90 million over fiscal year 2010. You haven't requested a subsidy appropriation for fiscal year 2012. While the administrative increase looks very large, I understand this is because the fiscal year 2010 appropriation was partially offset by carryover funds appropriated for prior disasters and that all of this carryover has been expended. For fiscal year 2011, much of your Disaster administration expenses were funded through a reprogramming of $126 million in Disaster subsidy.

Do you have enough subsidy carry-over to support the program level that SBA needs to be able to respond to a large disaster?

It is estimated that SBA will carry over $539 million in disaster subsidy from FY 2011 into FY 2012. This amount of carryover is more than sufficient to cover the estimated subsidy usage of $135 million in FY 2012 which is based on an estimated ten year average program of $1.1 billion based upon "normalized" activity adjusted for inflation.

How much in Disaster subsidy do you have in reserve and how many years of reserve does that equate to?

It is estimated that the disaster subsidy carry over into FY 2012 from FY 2013 will total $414 million. This amount of subsidy equates to a reserve of 3 years assuming an estimated ten year average program of $1.1 billion based upon "normalized" activity adjusted for inflation.

What are your thoughts on looking to the Disaster loan subsidy funds to pay for fiscal year 2012 Disaster admin expenses?

The President's FY 2012 Congressional request does not propose a reprogramming of disaster loan subsidy funds to pay for FY 2012 disaster administrative expenses.

LOAN MANAGEMENT AND ACCOUNTING SYSTEMS

SBA launched a multi-year, $250 million project to create a loan management and accounting system in 2006 to upgrade your outdated IT systems that track tens of billions of dollars in outstanding loans. After much time and cost overrun, I understand that you have halted that plan and have taken a much more incremental approach to addressing these critical IT upgrades. The President's budget requests $14.2 million for this purpose in fiscal year 2012.

What assurance can you give that the project is being properly managed moving forward, is on time, within budget and meeting stakeholder expectations?

There have not been any cost overruns on the SBA's planned projects to upgrade the Loan Management and Accounting Systems (LMAS). The SBA modified its LMAS strategy in order to address its business needs faster and at lower cost with less risk than a traditional long-term, high-cost IT system replacement. Specifically, this strategy achieves more than $113 million in cost-savings and an estimated delivery timeframe of 30 months rather than the nine years initially scheduled.

SBA is confident that this approach will keep the project on time and within budget. Instead of treating LMAS as a single large project whose success or failure depends on a final delivery that is far in the future, the SBA divided the LMAS program into smaller, separately funded projects intended to provide meaningful deliverables and decision points. This approach enables the SBA to adjust project plans in "real-time" and to identify and implement corrective actions, as needed. Additionally, this strategy provides flexibility to incorporate lessons learned, changing circumstances, and funding levels.

Stakeholders have been engaged in defining the incremental improvement projects, which have been prioritized to deliver necessary improvements earlier than had been anticipated under the original LMAS project. A comprehensive communications plan that keeps stakeholders informed and involved in the projects improves accountability for project delivery times and product quality

What activities and upgrades will these resources be used for?

The FY 2012 funding request includes the following projects:

- Accelerate the migration of user interfaces from the legacy platform (Unisys) to the Agency's current application infrastructure (i.e. ColdFusion / Java / Oracle), including additional electronic loan application capability
- Port the batch COBOL systems from the legacy platform (Unisys) to a more up-to-date and platform independent COBOL environment
- Migrate the Agency's legacy Sybase systems to the Agency's current database infrastructure (i.e. Oracle)
- Analyze remaining issues and develop plans to prioritize additional projects to address the Agency's most important business needs.

NEW PROGRAMS SMALL BUSINESS INTERMEDIARY LENDING PILOT PROGRAM

You've proposed funding for a number of new initiatives, while at the same time decrease funding for programs that have a proven track record of helping disadvantaged small businesses (like Small Business Development Centers) and keep many others at flat funding.

Under the proposed Small Business Intermediary Lending Pilot Program 20 intermediaries will be loaned $1 million each to make loans of up to $200 thousand to small businesses. The intermediaries will not have to repay these loans for a period of two years and then the interest payment is one percent. Basically, this program could wind up making loans to exactly 100 businesses (with each intermediary making $200 thousand loans to five businesses) and my understanding is that the purpose of this program is to alleviate the lack of credit availability to small businesses? With some 2B million small businesses, is this a good use of resources?

The Intermediary Lending Pilot (ILP) Program was authorized by the Small Business Jobs Act of 2010 ("Jobs Act"), which was signed by President Obama on September 27, 2010. The Jobs Act directs SBA to establish a program that will provide direct loans of up to $1 million to eligible intermediaries that will use those funds to make loans of up to $200,000 to startup, newly established and growing small businesses.

The SBA will make ILP loans to no more than 20 non-profit lending intermediaries per year. In order to maximize the impact of this program, however, SBA has proposed draft regulations that will require intermediaries to re-lend their SBA funding rather than allow it to lie dormant. Based on similar programs at other federal agencies, as well as discussions with potential participants, we expect that each dollar will be loaned out approximately 2.5 times; therefore, we expect that the program will support significantly more than 100 loans.

The Jobs Act also provided direct appropriations for the program in FY 2011 and FY 2012. SBA believes the program offers an additional point of access to capital for small businesses and entrepreneurs, but will monitor program performance before deciding whether to request appropriations for the program in FY 2013.

The budget proposes to reduce the Small Business Development Center program from $112 million to $103 million and eliminate the Drug Free Workplace program. Why are these reductions proposed and how will they impact small businesses?

Considering the current budgetary environment, SBA has had to take a serious look at our budget and make some tough decisions. The Agency has reviewed all of the agency's non-credit programs in order to ensure that budget reductions are implemented in an appropriate and equitable manner.

It is important to stress that the SBDC program is a fundamental part of the Agency's portfolio as it is on the front line of small business counseling.

Furthermore, SBA is mitigating the effects of reductions in the SBDC program by using the $50M in additional grant funding provided by the Small Business Jobs Act.

The Drug Free Workplace program had uncertain impact and we believe is duplicative of programs carried out by other federal agencies and private sector organizations. SBA is still working with ONDCP to provide support for its efforts/website.

REGIONAL INNOVATION CLUSTERS

In fiscal year 2010, SBA received $10 million to develop regional innovation clusters and the fiscal year 2012 request includes $12 million to expand the existing cluster program. I understand the idea behind a cluster is to establish partnerships between entrepreneurial education programs, industry and training programs to all work collaboratively on a common roadmap to improve a region's economy.

How many jobs have been created to date as a result of this program?

Results from cluster work are typically viewed over long-term periods. We are tracking certain metrics in the short-term and others in the long-term. We will have data on the number of jobs created at the end of the fiscal year. Once the data has been collected the Agency will be able to brief the committee.

Looking at the budget request, it's difficult to say whether those clusters would have formed without any assistance or whether the clusters will continue to exist with or without assistance.

Do communities really need the Federal government to give them money in order to collaborate?

One of the criteria of our clusters initiative was that applicants already be existing clusters. SBA funds are used to augment the small business capacity of these existing clusters.

504 LOAN REFINANCING

I understand that the economic downturn and the subsequent decline in the value of real estate has had a significant, negative impact on many small businesses with mortgages maturing in the next few years. Even small businesses that are doing well and making their payments on time could face foreclosure because of the difficulties in refinancing and restructuring their mortgage debt. You just launched a new initiative last month which will allow small businesses to use a version of SBA's 504 loan program, which traditionally serves small businesses requiring brick and mortar financing, to refinance their mortgage debt.

Can you tell me a little more about this program and how you expect it to work?

The Small Business Jobs Act authorized SBA to approve up to $15 billion in loans for refinancing projects under the 504 loan program over the next two years: $7.5 billion in each 2011 and 2012. The program will require no subsidy as it will be funded through additional fees to borrowers. SBA estimates the new program could help as many as 20,000 businesses.

Debt refinanced under the 504 loan program will be structured as a standard 504 loan: typically 50 percent of the loan is provided by a commercial lender, up to 40 percent is provided by an SBA-approved Certified Development Company (CDC) with funds provided by an SBA-guaranteed debenture, and the remaining 10 percent or more is contributed by the borrower in equity.

Is this program only eligible for small businesses with existing 504 loans or are other small businesses also able to take advantage of this program?

Government-backed loans or 504 third-party loans are not eligible for refinancing under this program.

How has the response been so for to this new program?

SBA began accepting applications on February 28, 2011. It traditionally takes several weeks for new loan programs to see significant lending volume. Industry interest in the program has been high. The trade association for SBA CDC lenders, NADCO, held a web-based seminar in early March that attracted over 2,500 participants—by far the largest training ever held by the organization.

SMALL BUSINESS INVESTMENT COMPANY

To become licensed as a SBIC, an applicant must go through a two phase licensing process. Currently it is taking almost 6 months for SBA to begin the review of the application. Is a 6-month delay reasonable?

Our goal is to complete the initial review within 8 weeks of receipt of an accurately completed Management Assessment Questionnaire (MAQ). With the increased interest in the program, a large number of MAQ's were received within a short period of time, thus creating an instant backlog. We are addressing this backlog by reassigning resources from other areas.

What is the SBA doing to increase the efficiency of the licensing process to address the many new investment funds which are currently interested in the program and applying for a license?

We are now offering a weekly "pre-screening" call for potential applicants that would like an opportunity to speak with our Program Development staff about their qualifications prior to filing a MAQ. In addition, we are using the time after a green light letter has been issued, and prior to receipt of the application to conduct further analysis on the prospective fund.

On January 31st the Administration announced as part of the Startup America Initiative that the SBA will create within the SBIC debenture program a new vehicle – the Innovation Fund – to address the capital gap in the market for early stage investing. How will the Innovation Fund be paid for?

Using existing authority, with no new cost to the taxpayers, the SBA will commit $1B over five years to early-stage funds.

Will it operate at zero subsidy?

Yes, it will operate at zero subsidy.

Will the licensing standards be lower?

No. Licensing standards will not be lower.

What safeguards does SBA have in place to ensure that the Impact Investment Fund will not lower the standard for existing SBIC funds?

Impact fund managers will apply for an SBIC license and up to two tiers of SBA leverage according to the standard requirements of the SBIC program.

SMALL BUSINESS SET-ASIDE

The SBA administers the small business set aside program which ensures that small business lumber mills will be able to buy a fair proportion of the timber sold by federal agencies – mainly the forest service and the Bureau of Land Management (BLM). This program has enobled small business mills to survive in small rural communities.

Recently this program has seen its already small staff reduced further. The program is down to only three field representatives to cover the entire country. There is no longer any field representative in Portland, Oregon, even though Oregon has the largest concentration of federal timber sale programs. The SBA hos eliminated the central director for the program in the national office. We are told that these staff cuts have hurt communication between the SBA and small business mills it is obligated to help.

How is the SBA coordinating with the forest service and BLM?

What are the SBA's plans for communications with small business mills to ensure that they will be able to buy a fair proportion of the timber sold by federal agencies?

How does the SBA plan to address staffing of field representatives and headquarter positions for this program?

The program has had staff reductions due to employee retirements. The Industrial Specialist (Forestry) position in Atlanta (which was vacant before the Portland position) was filled last fiscal year. While we have not filled the position in Portland, we are providing coverage and support using the Industrial Specialist (Forestry) in Seattle.

Recently the SBA HQ Senior Timber Program representative briefed the Under Secretary (Forestry) at the USDA on several issues impacting timber sales, the "Stewardship Timber Sales Program", and "Appraising set-aside sales to the nearest small business mill".

Part of the normal SBA Industrial Specialist (Forestry) duties is to review Forest Service timbers sales, and when small business set-aside sale are warranted, the SBA representative consults with the small business timber community prior to the offering of the sale. Recently the SBA provided consultation to the small business industry on the recent re-computation of small business timber purchase shares (percentages) that will be in effect for the next 5 years. With the current SBA Timber Program staff, we are providing coverage for all of the 148 Market Areas (Forest Service and Bureau of Land Management) , and we coordinate our efforts with each of the Forest Service Regions through their Regional Timber Staff Officers.

SBA has established a headquarters Senior Representative for the Timber Program who is responsible for the day-to-day operations of this National Program and the point-of-contact to the Department of Agriculture, U. S. Forest Service, Bureau of Land Management, Department of the Interior, and the Fish and Wildlife Service (and any other Federal agencies who sell timber on Federal lands) on all issues involving this Program.. The current timber staff is providing coverage for all areas of the program.

Questions for the Record Submitted by Ranking Member Serrano

COMMUNITY ADVANTAGE PROGRAM

The budget proposes that the Community Express program transform into the new Community Advantage Program, which opens up funding to CDFIs and CDCs.

Q. *Please explain how you are changing the old Community Express program and when you expect to be reaching out to CDFIs to make the transition.*

The Community Advantage pilot program makes SBA's traditional 7(a) loan program available to 'mission-based' financial institutions it was not previously open to, including Community Development Financial Institutions (CDFIs). These organizations have a strong track record of lending in underserved communities. Community Advantage will increase the number of places small business owners can go to get an SBA loan, while also ensuring that those borrowers who need it have access to technical assistance and counseling to help better ensure their success.

SBA began accepting applications from organizations interested in participating in Community Advantage on February 15, 2011, and a number of CDFIs have already applied. (The first Community Advantage lender, a CDFI, was admitted to the program on March 16.) In addition, SBA has conducted a number of working sessions with CDFI leadership to discuss the transition, and plans to continue its outreach efforts.

Questions for the Record Submitted by Congresswoman Lee

7(a) COMMUNITY ADVANTAGE

Many Members are committed to maximizing the impact of SBA programs in their local communities.

How is the new Community Advantage program different from Community Express?

Community Advantage was designed around several elements that will allow SBA to avoid the performance issues exhibited in Community Express. First, the Advantage processing method requires documentation and underwriting that, while streamlined from our typical 7(a) loan process, is more detailed than that typically used by Community Express lenders.

Second, the mission-focused lenders participating in Community Advantage have a proven track record of success in underserved communities, including providing quality technical assistance and counseling that borrowers sometimes need to help better ensure that they succeed.

How can the SBA help Members of Congress and community groups in their local Districts inform their local small businesses about new opportunities that the Community Advantage program might provide?

SBA is always interested in working with Members of Congress to promote SBA programs, including Community Advantage. The agency has District Offices in every state that regularly conduct outreach events to encourage lenders to participate in SBA lending; these offices welcome the support of Members or their staffs.

8(a) PROGRAM

I believe that it provides critical business development assistance, management and technical assistance, access to capital and other forms of financial assistance and provides disadvantaged small businesses access to sole source and limited competition Federal contract opportunities.

Given how critical a role that the 8(a) program plays I am concerned about exactly how the new regulations will be implemented and carried forward in the coming years.

The new 8(a) Business Development (BD) program regulations became effective on March 14, 2011. These regulations are now the governing guidance followed by SBA Field and headquarters personnel in the administration of the program. To ensure effective implementation of the changes reflected in these new regulations and improved program administration, SBA will provide training to its 8(a) BD workforce in April and June of 2011. Additionally, to compliment this training and to ensure ongoing consistent application of the regulations, SBA will revise its internal operating procedures manual which will provide the necessary guidance and direction to assist its 8(a) BD workforce in carrying out their day-to-day program administration responsibilities.

What plans does the SBA have in place to ensure the rapid and fair adoption of the new regulations?

As noted above, the new 8(a) Business Development program regulations became effective on March 14, 2011 and are the current governing guidance for the administration of the program. Also as previously noted, SBA will train its 8(a) BD workforce in April and June, 2011, and will revise its internal operating procedures manual, as appropriate.

Is it possible for you to give the subcommittee a sense of the impact of the regulatory changes on the small businesses that qualify for the program?

These regulations are intended to ensure that the benefits of the 8(a) BD program flow to the intended individuals. The impact of these changes on eligible small businesses is varied. While strengthening some program participation requirements, the regulations also enhance business development opportunities. Notable impacts include closing loopholes that have had the unintended consequence of allowing large businesses to inappropriately receive program benefit; ensuring that 8(a) firms that enter into joint venture agreements or Mentor-Protégé Agreements receive the intended benefits of these relationships; and, recognizing the growth in the size of Federal contracts by increasing the levels required for competition in the program and the need for greater personal capital to help sustain business operations.

Has the SBA improved or enhanced data collection around the 8(a) program in the last year?

We have made enhancements to our internal data collections systems as this as an ongoing priority for the SBA as it continues to identify continuous improvement opportunities.

How can members work with the SBA to ensure that businesses in their home Districts are informed and have access to the necessary technical assistance that may be available surrounding the changes to the 8(a) program?

The SBA delivers its programs through its 68 District Offices (at least one in each State) and its extensive network of resources partners (e.g., Small Business Development Centers, SCORE, and Women Business Centers). The SBA District Offices serve as a conduit for the services provided by our resource partners and are the key point of contact for member constituents to learn more about SBA programs and the many training and management and technical assistance opportunities that are available.

Will there be any training or technical assistance available for local small businesses?

As noted before, training and management and technical assistance will be available for all local small businesses through SBA's District Offices and its network of resource partners.

INTERACTION WITH THE NEW OFFICES OF MINORITY AND WOMEN INCLUSION

As the new Offices of Minority and Women Inclusion begin their work across the financial services agencies, will the SBA support their work and share their expertise on how to maximize the impact of Minority and Women Inclusion?

SBA is committed to fostering the development of all small businesses. Minority and women owned companies continue to be some of the fastest growing components of our economy. The Agency is committed to helping those companies succeed.

Will the SBA have a role in establishing best practices for how regulated financial services sector companies do more to ensure fair and equal opportunities for Minorities and women?

SBA is a vocal advocate of minority and women owned small businesses. Expanding opportunities for these companies is fundamental to SBA's mission.

DIVERSITY GOALS IN PRIME CONTRACTS / IMPACT ON SMALL BUSINESS GOALS

Currently diversity and inclusiveness goals in subcontracting that are included in contracting proposals tie any included bonus structure or threat of liquidated damages only to an overall goal of meeting a small business sub contracting opportunity target.

Setting goals that fail to tie financial consequences to meeting minority owned, veteran owned, women owned, or historically disadvantaged businesses in separate and discreet categories allows true diversity targets to go unnoticed and unfulfilled with little or no consequence on the prime contractors.

What can the SBA do to promulgate more effective diversity goals in contracts and apply more refined and disaggregated small business goals in future contracting proposals?

SBA is committed to implementing and running the small business contracting programs designed and put into statute by Congress. This includes providing increased contracting opportunities to small businesses, including those owned by underserved communities. Additionally, this includes working towards achieving the statutorily mandated goals of 23% of eligible federal contracting dollars being awarded to small businesses, as well as the following socio-economic goals for prime and subcontractors:

- 5% for small disadvantaged businesses
- 5% for women-owned small businesses
- 3% for Historically Underutilized Business Zone businesses
- 3% for service-disabled veteran-owned small businesses

Questions for the Record Submitted by Congressman Bonner

INDEFINITE DELIVERY, INDEFINITE QUANTITY

Many experienced acquisition managers question the adverse impact Indefinite Delivery, Indefinite Quantity (IDIQ) contracts have on small businesses -- as the smaller specialized businesses cannot compete with larger firms to be awarded IDIQs and are thus forced to partner with a larger firm to deliver their goods and services when the agency elects to procure using an IDIQ. How does the SBA assess the 'value added' of IDIQ contracts and the impact of IDIQs on small businesses?

IDIQ contracts, also referred to as task and delivery order contracts, allow agencies to award an umbrella contract for a range of products and services and place orders for work as needs arise. They are used when a federal agency cannot predetermine the precise quantities of products or services that will be required over a fixed period of time. Agencies often make multiple awards under the umbrella contract and conduct streamlined competitions among the contract holders before placing orders. Multiple award IDIQ contracts have become increasingly popular over the past 15 years, as have the Federal Supply Schedule contracts managed by the General Services Administration (GSA) (which is a form of a multiple award contract) because all of these vehicles allow agencies to use competition simply and quickly to keep pace with mission demands.

With proper agency leadership, management attention, and guidance, agencies can use IDIQ contracts both to tap into the creativity, innovation and technical expertise that small businesses offer and save resources. There are many examples of agencies combining the benefits of streamlined order competition under multiple award IDIQ contracts with access to a cadre of prequalified small businesses to support ongoing needs for goods and services. The Small Business Alliant contracts managed by GSA are just one example. That said, opportunities for small businesses are being lost because policies and practices regarding the application of set-asides to placing orders under multiple award IDIQ contracts has been unclear.

The President's Interagency Task Force on Small Business Contracting (created in April 2010) recommended that government-wide acquisition policies and regulations be updated to provide clear guidance on when and how set-asides and related tools can be used on multiple award IDIQ contracts to increase opportunities for small businesses. On September 17, 2010, the President signed into law the Small Business Jobs Act. Section 1331 of that Act, when it is implemented in regulation, will give contracting officers the ability to use set asides on multiple award contracts. SBA is working closely with the Office of Federal Procurement Policy and the acquisition community to ensure regulations and policies related to IDIQ contracts appropriately balance the need for efficiency with the need to maximize opportunities for small businesses.

What is the estimated 'pass through' cost of customized & specialized products and services delivered by small businesses through IDIQs and subcontracts that could be directly contracted with the small businesses?

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (Councils) revised the Federal Acquisition Regulation (FAR) to implement section 866 of the Duncan Hunter National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2009, to minimize excessive pass-through charges by contractors from subcontractors, or from lower tiers of subcontractors, that add no or negligible value, and to ensure that neither a contractor nor a subcontractor receives indirect costs or profit/fee (i.e., pass-through charges) on work performed by a lower-tier subcontractor to which the higher-tier contractor or subcontractor adds no or negligible value.

The data required to estimate the 'pass through' cost is not collected or maintained by the Government in the contract award data repository, FPDS-NG. In addition, this type of data is not reported by large businesses as part of their subcontracting reporting requirements for their prime federal contracts in eSRS.

What percentage of business would go to small businesses if the government acquisition agents were to directly contract work which is now a 'pass through' to larger firms?

It is not possible to "extract" data relative to what small businesses can supply if those products/services were broken out from a large business prime contractor since that data is not readily available from either federal contract reporting systems or from large business federal prime contractors. Further, FPDS-NG, the repository for federal contract awards does not capture whether a small or large business is the manufacturer or non-manufacturer of the items furnished to the Government. However, the Small Business Administration continues to work in collaboration with the Office of Federal Procurement Policy to ensure there are increased opportunities for small business contracting and to remove barriers to entry for small businesses.

In the professional sports, construction, film and several other complex industries, producers contract directly with specialized firms to deliver specialized sub-systems and services -- and hire an expert small management firm to direct and coordinate the joint efforts of these firms working in concert toward delivering a common complex system. Does the SBA see value in this 'professional team consortium' approach -- and how would the SBA propose establishing 'pilot' programs to prototype and assess the value of this approach across government acquisition programs in the other departments and agencies?

This type of approach described in the question is already in use within the Government, where a prime contractor (large or small) coordinates the delivery of supplies or the performance of services for multiple vendors.

The recommendations that came out of the President's Small Business Task Force as well as the passage of the Small Business Jobs Act has certainly brought to bear the need to focus efforts on maximizing opportunities for small businesses in the federal marketplace. Once regulations are in-place, our continued oversight of agencies achievements in reaching and achieving their small business goals will continue to allow small businesses to increase their footprint in the federal arena.

Two significant events took place in 2010 to increase the number and amount of federal contracts awarded to small businesses. The first was on April 10, 2010 when the President issued his Memorandum on the Interagency Task Force on Federal Contracting Opportunities for Small Business (Task Force). The purpose of the Task Force was to ensure that small businesses, including women-owned, minorities, socially and economically disadvantaged individuals, and service-disabled veterans, have fair access to Federal Government contracting. The Task Force was co-chaired the Secretary of Commerce, the Director of the Office of management and Budget and the Administrator of the Small Business Administration. With the help of our major buying agencies, who were represented by officials from both the acquisition and small business offices in those agencies, the Task Force developed a set of recommendations to clarify small business contracting policies, enhance training of the acquisition workforce on small business issues, and improve the use of technology. Several of the Task Force's recommendations dovetail with ongoing efforts to increase interest in federal marketplace and the potential for competition. For example, all agencies are working to improve their outreach efforts and increase small business awareness and interest in agency contracts that may fit their capabilities. As an additional step, the Administration recently launched the Small Business Central Event Listing on FedBizOpps, where small businesses can search for information on upcoming agency matchmaking, business development and training events. This tool will help small businesses more easily navigate the federal marketplace and participate in more agency competitions.

The second event was on Sept. 27, 2010 when President Obama signed into law the Small Business Jobs Act, the most significant piece of small business legislation in over a

decade. The Small Business Jobs Act contained 19 provisions that will help small businesses compete more effectively for federal contracts and subcontracts. Highlights of the contracting-related provisions of the Act include:

1) Equal treatment across federal contracting programs. The law reaffirmed "parity" among federal small-business contracting programs. When awarding contracts that are set-aside for small businesses, contracting officers are free to choose among businesses owned by women and service-disabled veterans, as well as businesses participating in HUBZone and 8(a) programs;

2) More opportunities for small businesses. The law eliminates the "Competitiveness Demonstration" program, which limited opportunities for small contractors in 11 industries where they excel, such as construction, landscaping and pest control. This will build on the $24 billion small businesses won in these industries in Fiscal Year 2009 (effective January 31, 2011)

3) Focus on unbundling contracts. The law makes it harder for agencies to "bundle" contracts, a practice that makes it more difficult for small businesses to compete

4) Combating fraud, waste and abuse. The law establishes a legal standing of "presumption of loss" when a business misrepresents its ownership status or size in winning a government contract. This allows a federal agency to claim a loss on the purchase, enabling those agencies, including the Department of Justice, to vigorously pursue fraudulent firms

5) Subcontracting accountability. The law holds large prime contractors more accountable to their own subcontracting plans by requiring written justification when plans aren't met and when small business subcontractors aren't paid on time. This helps eliminate "bait-and-switch" tactics that occur when large primes – after winning the prime contract – don't follow through with their own plans to give subcontracts to small businesses.

SBA is in the process of working with the Office of Federal Procurement Policy and its agency colleagues to implement both the recommendations of the Task Force and the provisions of the Small Business Jobs Act of 2010.

Are the quotas for small-business set-asides realistic? If not -- why not?

We believe the goals set forth in the Small Business Act to build the capacity of our nation's small business contractors (which Congress appropriately labeled as goals, and not quotas) are attainable and this Administration is taking significant steps to help the government meet the goal of awarding 23% of federal contracting dollars to small businesses, including:

- 5% for small disadvantaged businesses
- 5% for women-owned small businesses
- 3% for Historically Underutilized Business Zone businesses
- 3% for service-disabled veteran-owned small businesses

An indicator of whether this is an appropriate goal is the historical small business utilization that agencies report into the Federal Procurement Data System. In fiscal year 2008, 21.5% of eligible federal contracting dollars was awarded to small businesses and in fiscal year 2009, that number grew to 21.9%. The fiscal year 2010 numbers are in the process of being finalized and are expected to be over 22%.

What additional support does the Congress need to give the SBA to expand the scope and amount of government program work being done by small businesses?

SBA continues to work collaboratively with Congress to provide updates on changes and improvements to our programs, as well as share ways to increase federal contracting opportunities for small businesses. Additionally, SBA's budget proposal outlines and provides rationale for the resources, funding and support required to provide small businesses opportunities to participate in the federal procurement process, including additional funding to combat fraud, waste and abuse and to effectively run the new Women-Owned Small Business Federal Contract program.

Can you detail the administration's position regarding ensuring adequate funding for all HUB Zones?

SBA has outlined the necessary funding and resources, as well as the rationale, to operate the HUBZone program in its Congressional Budget Justification.

Most contracting officers seem to have their own list of 8 (a) eligible companies and many small businesses have difficulty making inroads to utilized these set asides. What recommendations do you have for new small business owners, who are 8 (a) eligible, for getting a consideration by contracting officers?

SBA is committed to ensuring the benefits of the 8(a) Business Development program flow to eligible recipients. The 8(a) program offers participants many benefits including federal contracting opportunities and technical assistance.. To successfully leverage the benefits of the program, participants should work closely with their local SBA District Office. Through the local District Office, participants can gain access to the many resources available to assist them in their efforts to successfully compete in the federal marketplace, such as gaining introduction to federal contracting officials and Agency program managers; receiving assistance through Procurement Technical Assistance Centers (PTACs); participating in Federal Contract Fairs; receiving direct assistance from SBA's Procurement Center Representatives; and receiving training and assistance through SBA's 7(j) Management and Technical Assistance program.

THURSDAY, MARCH 31, 2011.

CONSUMER PRODUCT SAFETY COMMISSION

WITNESSES

INEZ MOORE TENENBAUM, CHAIRMAN, CONSUMER PRODUCT SAFETY COMMISSION

ANNE NORTHUP, COMMISSIONER, CONSUMER PRODUCT SAFETY COMMISSION

Mrs. EMERSON. This hearing will come to order. I want to wish everybody happy opening day of baseball. Go Cards. Joe.

Mr. SERRANO. It is opening day because the Yankees are playing.

Mrs. EMERSON. And who are the Yankees playing today?

Mr. SERRANO. The Yankees are playing the Tigers. And we are going for number 28. That is arrogance, is it not? If I was not a Yankee fan I would be upset that they can buy every player in the world.

Ms. EMERSON. So now we are trying to find out if I have a Cardinals cap here, and we are going to decorate the dais, do you have one in your office, Steve? Not yet.

Mr. WOMACK. All my Cardinals caps are soiled with sweat and grease.

Mr. SERRANO. You realize the Tea Party is outside listening to all of this, right?

Mrs. EMERSON. All right, anyway, I guess we will get serious. I am hoping that the Yankees and the Cardinals win today, in fairness. And I want to welcome our witnesses, Chairman Tenenbaum and Commissioner Northup. Thanks for being here and testifying on the Consumer Product Safety Commission's fiscal 2012 budget request. You all at the CPSC have the daunting task of overseeing tens of thousands of consumer products. These products are used by all of us daily. It is important that the CPSC lives up to its mission of protecting consumers from unsafe products while at the same time not promulgating rules that are unnecessarily onerous for American businesses and manufacturers.

Of particular interest to me is the Commission's effective and efficient use of its resources. As you know very well, the current spending levels are unsustainable. There has been much interest, and there has been concern expressed to me by many people, about your product complaint database, so I am interested in hearing both of our witnesses' thoughts on that, and particularly because I tried using it myself yesterday, just to see how easy it was to work. But then I realized I did not have a complaint, and I could not submit things that were not true. I have concerns with its tangible impact on dangerous products, and perhaps some of the unintended consequences. I do want to get into that because I did go on it and saw how it worked, and I looked through and saw some

of the complaints that had been made, most of which seemed quite legitimate to me.

But on the other hand I do want to explore further problems that could arise. It just worries me about over-regulating business in a very fragile economy. Certainly we do not want higher prices for consumers, but nor do we want American businesses to close or not even try to grow due to regulations that make it too hard for them to comply. In addition, I do have concerns about the amount of taxpayer money that is going into this database. Hopefully we will discuss this, because as you remember, during the debate on HR–1, there was an overwhelming vote to not fund the consumer complaint database. I suspect that this is not going to be the last we hear about it from colleagues, and perhaps we can work together on trying to figure out how to best make people feel comfortable about it, or changes that need to be made. I want to thank you all so very much, and look forward to your testimony. I want to recognize my very good friend and Yankees patron, Mr. Serrano.

Mr. SERRANO. I wish I was a Yankees patron. I cannot even afford the tickets now.

Ms. EMERSON. How much are the tickets?

Mr. SERRANO. Top ticket to Yankees Stadium is $1,250.

Mrs. EMERSON. To go to a game? Who would spend that kind of money?

Mr. SERRANO. It was built with Wall Street in mind, but that is another story. That was before the crash. Do not get me going. Thank you, Madam Chair, I too would like to welcome Inez Tenenbaum, the Chairwoman of the Consumer Product Safety Commission, and Commissioner Anne Northup, a colleague is always a colleague, to this hearing of the Financial Services and General Government Subcommittee. This agency has a vital role to play in all of our lives, as it is responsible for making sure that the products we use every day are safe. For fiscal year 2012, the budget request for the Consumer Product Safety Commission is $122 million. Your agency has important and ongoing responsibilities in making sure that hazardous products are recalled, imported products are safe, and that our children are protected from dangerous toys and other baby products.

I am particularly interested in learning more about your ongoing efforts to implement the Consumer Product Safety Improvement Act of 2008. I am also pleased that you have launched your new Consumer Products Safety Information Database, which will give consumers an important tool as they use or purchase new products. Finally, I look forward to discussing your efforts to address safety issues with respect to imported products. We must make sure that we continue to provide for a strong Consumer Products Safety Commission, and I am hopeful that today's hearing will give us an opportunity to learn more about your ongoing programs and the progress that you are making in some of your newer initiatives.

Again, we welcome you. And we have a delicate balance, here. And that is that it is obvious that there will be some serious cuts across the board in this year's budget, and in future budgets. That is the mood in many places, and that is certainly the mood in the House. Our challenge is to make sure that as we apply these cuts, especially in this agency, that they are done in a way where we do

not hurt the effort that we should be making on behalf of the American people. Our Chairwoman said we have to be careful that we do not over-regulate. I agree with that. But my statement is we have to be careful that we do not under-protect the American consumer. And there is the balance. Do not over-regulate, do not under-protect. If we can strike that balance, the American people will be well-served. Thank you.

Mrs. EMERSON. Thanks, Mr. Serrano. Chairman Tenenbaum, we will recognize you for your opening statement. If you would not mind keeping it to five minutes, it gives us more time for questions. Thanks.

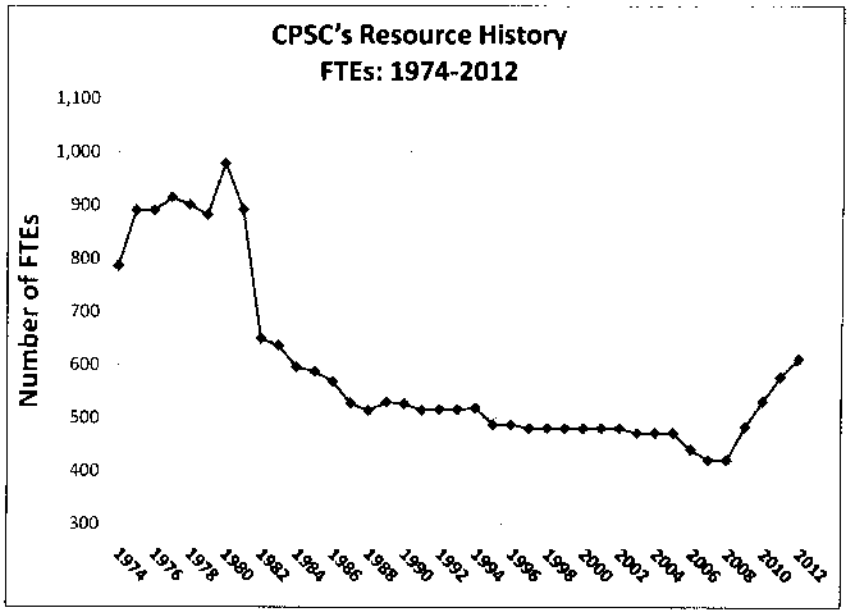
Ms. TENENBAUM. Good morning, Chairwoman Emerson, Ranking Member Serrano, and members of the committee. I am pleased to be here today to update the subcommittee on the positive changes we have made at the agency. Since my last appearance before the subcommittee a year ago, I have focused on three key objectives. First, I have worked diligently to implement the Consumer Product Safety Improvement Act, the CPSIA, and used that Act's new authorities in a manner that is both highly protective of consumers, and fair to industry stakeholders. On March 11, we officially launched our new publicly available Consumer Product Safety Information Database. The database, now available at saferproducts.gov, will empower consumers with information, allowing them to quickly determine which products they already own, or are considering purchasing, are associated with safety hazards or recalls. Second, I have focused on changing the CPSC's internal processes, so that the agency is more proactive and more capable of addressing safety challenges presented by thousands of types of consumer products imported from around the world.

In the last year, the Commission has unanimously adopted a five-year strategic plan that establishes a plan to move CPSC closer to becoming the global leader in consumer products safety. We have established a new office of education, global outreach, and small business ombudsman that has already begun to provide outreach to small businesses and crafters. And we have embarked on a substantial upgrade of our information-technology system, which has formed the backbone of our database, and our new cpsc.gov homepage. Third, I have focused on proactive prevention of consumer harms, identifying emerging hazards and keeping those products out of the stream of commerce. We have taken a number of steps to increase our surveillance of potentially harmful consumer goods by signing several information-sharing agreements with customs and border protection, and increasing our physical presence at the ports-of-entry. The Commission's Safe Sleep team has also made great strides to rid the marketplace of dangerous cribs, usher in a new generation of safer cribs, and educate parents about the importance of maintaining a safe sleep environment for infants and toddlers. A key component of this was the mandatory crib safety standards, which was unanimously adopted by the Commission. In addition, the Commission's staff has already worked very hard to address new hazards, such as the potential use of toxic metals in children's products, and the Commission's continuing efforts to provide information and outreach to homeowners impacted by problem-drywall.

Overall, I am extremely proud of the Commission's talented staff, and the work they do every day to create a safer consumer product marketplace for all Americans. Our proposed fiscal year 2012 budget reflects these priorities, and will give the Commission the staffing and resources it needs to respond to new hazards and keep consumers safe. In fiscal year 1980, the commission had about 100 full-time employees, and an inflation-adjusted budget of over 150 million. By 2007, the commission had fallen to 385 full-time employees and was barely able to fulfill its core mission. Full-time staff now stands at approximately 550 employees. As noted earlier, these resources allow us to staff several ports-of-entry, and leverage cooperation and information sharing with CBP to keep dangerous products out of the country, staff our new lab facility, scheduled to open in May, and test potentially dangerous products, and allow us to respond more rapidly to emerging hazards like toxic metals and problem-drywall. I am highly cognizant of the desire for fiscal restraint that has been expressed by the administration, the Congress, and the American people. Yet I believe that CPSC is, dollar-for-dollar, a great investment to the taxpaying public. There are, however, several areas of critical need that the Commission must address in fiscal year 2012 to maintain our forward progress. Accordingly, the fiscal year 2012 CPSC budget requests $122 million; a slight increase from the $118.2 million funding level the Commission is currently operating under the continuing resolution, and the $118.6 million request for fiscal year 2011.

If enacted, this level would allow the agency to hire an additional 34 full-time employees to fill areas of critical need, such as rapid review of incident reports, and increased defect investigations. These resources will allow us to continue our rebuilding efforts, improve outreach to consumers, and most importantly, prevent injuries and save lives. Madam Chairman, Ranking Member Serrano, Mr. Womack, thank you for inviting me today to provide testimony before the Subcommittee, and for your support of the CPSC. And I would like to share with you a reflection of the statement, a chart that reflects the CPSC resource history from 1974 to 2012.

[The information follows:]



CPSC's Resource History
FTEs: 1974-2012
Number of FTEs
1,100
1,000
900

2008
2010
2012

As you can see, in the 80s, we were almost to 1,000 employees, and adjusting our budget to inflation, we had about 150 million. And as the cuts were made in the Clinton Administration and the Reagan Administration, we went down, and this right here is when the year of the recall occurred, when Congress directed us to hire 500 people by October 1, 2010. That was in the CPSIA. And that is when we started climbing, when we got that direction from Congress in the CPSIA. It said, The Commission shall increase the number of full-time professionals employed by the Commission to at least 500 by October 1, 2010, subject to the availability of appropriations. So, thank you, Thank you for letting us use the charts.

[The information follows:]

Statement of
Inez Tenenbaum
Chairman
U.S. Consnmer Product Safety Commission

Before the

House Committee on Appropriations

Subcommittee on Financial Services and General Government

March 31, 2011

Good morning, Chairwoman Emerson, Ranking Member Serrano, and Members of the Subcommittee on Financial Services and General Government. I am pleased to be here today to discuss the U.S. Consumer Product Safety Commission's (CPSC) significant activities over the past year, as well as the Commission's fiscal year (FY) 2012 budget request.

Since my last appearance before the Subcommittee almost 12 months ago, I have focused on three key objectives at the Commission: fair and effective implementation of the Consumer Product Safety Improvement Act of 2008 (CPSIA); reinvigoration of the Commission's business processes; and expanding our program of early interdiction of dangerous products and prevention.

Fair and Effective Implementation of the CPSIA:

Children's Product Safety Provisions: In the last two years, Commission staff has worked diligently and successfully to implement almost all major provisions of the CPSIA, with particular emphasis on infant and children's safety provisions. As part of this process, the Commission has sought to implement certain sections of the law in a manner that recognizes and is responsive to the concerns expressed by some segments of the regulated community. One example of this is the Commission's recent decision to extend the current stay of enforcement for third-party testing and certification for lead substrate in children's products until December 31, 2011.

It is important to note, however, that the majority of CPSIA rules and requirements have been adopted unanimously by the Commission and widely accepted by industry, consumers groups, and families across the country. These provisions include:

- new durable infant and toddler product standards, so that we never again have to hear of an infant who drowned in a baby bath seat or a toddler who is paralyzed by a poorly designed baby walker that tumbles down a flight of stairs;

- product registration cards that now accompany many juvenile products, so parents who register can receive direct notification and respond to recalls; and

- the inclusion of tracking labels, to the extent practicable, on children's products so that parents can identify who made them—even long after the packaging is thrown away.

The Public Searchable Database: On March 11, 2011, we officially launched our new publicly available consumer product safety information database, which was mandated by section 212 of the CPSIA. This database, available online at www.SaferProducts.gov and through the Commission's homepage at

www.CPSC.gov, is a powerful source of information for consumers, allowing them to determine whether products they already own, or are considering purchasing, are associated with safety hazards or recalls. The SaferProducts.gov site also has an enhanced reporting tool, so that consumers can tell CPSC about a consumer product that caused harm or has the potential to cause harm. CPSC has used the launch of the database to encourage more reporting to CPSC. Increased reporting will help our agency respond faster to product dangers and will, for the first time, empower consumers with online access to vital safety information.

I recognize that the rollout of this database has caused concern among some in the manufacturing community. Several incorrect claims have been made about the database, including assertions that the database rules allow anonymous unverifiable reports and that manufacturers do not have adequate time to respond to reports containing "materially inaccurate" information. Let me respond to those claims upfront.

First, the database does not and will not include reports of harm submitted anonymously. Each submitter is required to provide eight pieces of information, including a description of the product; identity of the manufacturer, private labeler or importer; description of the harm; incident date or approximation; category of submitter; submitter's contact information; consent to include the report in the database; and a verification that the information provided in the report is "true and accurate" to the best of the submitter's "knowledge, information, and belief." Any reports filed that do not include the minimum required information—including the submitter's contact information—are not eligible for posting on SaferProducts.gov.

Second, the database rules were designed to provide manufacturers with the ability to challenge any potentially inaccurate information in a report and to post a comment about the consumer's report. For a qualifying report that contains the minimum required information, the Commission has five business days, where practicable, to send it to the manufacturer. For manufacturers registered with the Commission, the reports are sent by e-mail and are received almost immediately by the manufacturer. Once a report is sent to the manufacturer, it has 10 business days to provide, if it wishes, comments on the report, or to make claims of materially inaccurate or confidential information prior to the posting of the report. For those businesses registered with the Commission, they can provide comments or make claims through the SaferProducts.gov Business Portal.

If a manufacturer provides comment within the 10 business day period, the comment most likely will be posted with the incident report when the report first appears on the database. A manufacturer is also allowed to provide an unlimited number of additional comments on a report at any time. If a manufacturer submits a claim of materially inaccurate information, the Commission will endeavor to determine the claim before the report publishes. For example, if a business makes a claim of material inaccuracy stating that it has been incorrectly

identified as the manufacturer, the CPSC will quickly determine the merits of the claim and, if accepted, will remove the business's name from the report. Information identified by a company as confidential within the 10 business day period will never be posted publicly. Overall, I believe this strikes an appropriate balance between due process for manufacturers and consumers' right to know about potentially dangerous products that could cause harm or injury.

Furthermore, I believe it is important to provide a reminder of just how powerful a resource this database will be for consumers. Rather than use my words, I would like to repeat the words of Lisa Olney, whose daughter died in a defective portable crib just after her first birthday in 2002. Ms. Olney posted the following on the *Kids in Danger* web blog:

> *On December 19, 2002, my daughter Elizabeth, just 13 months old, died in a poorly designed play yard. I live my life often looking back through "what ifs" and "should haves," but I've learned to give most of that up in order to save myself from being a horribly miserable individual. Instead, I realize the importance of focusing on efforts to protect our children so that no parent has to suffer what I have, along with too many other victims of unsafe children's products. The CPSC database is going to protect millions of children, because it provides a place to go when considering the choices parents make when purchasing products, especially those products intended to be beneficial to our children's safety.*

This database will prevent injuries and save lives. Congress recognized this when it added section 212 to the CPSIA, and I hope you will continue to support this very powerful, and potentially lifesaving, open source of consumer information.

A Reinvigorated Commission:

New CPSC Strategic Plan: Last year, the CPSC launched a comprehensive strategic planning initiative to update the Commission's outdated 2003 Strategic Plan. As a result of this effort, the Commission unanimously approved the agency's new 2011-2016 Strategic Plan, which lays out five key goals and also details programmatic objectives that will allow the CPSC to move closer to becoming the global leader in consumer product safety.

New Office of Education, Global Outreach, and Small Business Ombudsman: On September 22, 2010, the Commission voted to create a new office to coordinate and provide outreach to various domestic and international stakeholders, including manufacturers, retailers, resellers, small businesses, and foreign governments. Within this office, we have a full-time Small Business Ombudsman who is dedicated to serving the nation's many smaller businesses in the area of product safety. In particular, special attention will be given to developing "plain English" information tailored to small businesses and small

batch manufacturers so that they can understand and comply with new and existing safety standards.

New CPSC Website: As part of the Commission's overall Information Technology improvement project, the Commission also launched a new updated CPSC.gov home page last December, and currently is in the process of upgrading the entire website. As of now, the rest of the revised content on the new website is scheduled to go live in September.

These improvements will allow consumers to more easily search for safety information and view videos on keeping their families safe from product hazards. In addition, the new website will provide industry, and particularly small businesses, with increased access to resources on how to produce safe products that comply with applicable safety standards.

An Increased Commitment to Early Interdiction and Prevention:

Import Surveillance: Traditionally the Commission has spent the bulk of its resources investigating harmful products in the marketplace. This will always form a substantial part of the CPSC's activities, but I believe the more effective approach is ensuring that harmful products never even enter the country. To that end, I have taken a number of steps to add additional technological resources and personnel to the Commission's Import Surveillance Division. This Division works directly with the Department of Homeland Security (DHS) and Customs and Border Protection (CBP) to keep dangerous products out of the United States.

On the technological side, the CPSC recently executed two interagency Memorandums of Understanding (MOUs) with CBP that allow us to access more "real time" importer information and target the most dangerous incoming shipments. The first of these MOUs, signed in April 2010, allows CPSC personnel to work at CBP's Commercial Targeting and Analysis Center (CTAC) in Washington, DC, and access real time manifest entry data collected by CBP. This, in turn, allows Import Surveillance Division personnel at the ports to target high-risk shipments prior to their entry into the domestic stream of commerce.

The second MOU, signed with CBP in August 2010, gives the CPSC access to information in the Treasury Enforcement Communications System (TECS). This will assist CPSC Import Surveillance staff at the ports by providing them with additional information to improve local targeting and interdiction of dangerous products.

The CPSC is also actively involved in supporting the Importer Self Assessment – Product Safety (ISA-PS) initiative that is currently being piloted by CBP. The ISA-PS is intended as a partnership among CBP, CPSC, and importers to ensure product safety compliance. It is based on a voluntary approach that provides

meaningful benefits to importers who demonstrate readiness to assume additional responsibility for managing and monitoring their own product safety compliance.

We have also taken steps to increase CPSC's physical presence at ports of entry. In FY 2008, the Import Surveillance Division had only five full-time employees (FTEs), and of those only three FTEs were actually stationed at ports of entry. Through FY 2010, we expanded staffing in the Division to 18 FTEs, with 14 FTEs actually stationed at ports of entry. I am very pleased to note that, as of March 28, 2011, the Division now has 25 FTEs, with 19 FTEs collocated at 15 different ports of entry.

Putting more "cops on the beat" has already yielded substantial positive results. In FY 2010, we performed 6,953 screenings at ports, collected 1,776 samples for testing, and of those found 987 that violated CPSC standards. At the same time, we have also seen the number of recalls start to drop—from 563 in FY 2008 to 428 in FY 2010. Maintaining those positive trends is a key goal for the upcoming year.

The Safe Sleep Team. The overall safety of cribs and the infant and toddler sleep environment is a critical concern of the CPSC and a personal priority of mine. Parents across the country expect cribs to be a sanctuary for their children, regardless of price or size. Unfortunately, that is not always the case. In the past nine years, there have been at least 32 deaths attributed to drop-side crib failures. This number is tragic. The majority of crib deaths, however, are still directly linked to the use of soft bedding and pillows in the crib.

To address this, I directed Commission staff to embark on a two-prong strategy. The first prong was to recall old, dangerous drop-side cribs in the marketplace and promulgate new mandatory crib safety rules that will prohibit dangerous drop-side cribs from ever being sold again in the United States. I am pleased to report to the Members of this Subcommittee that the new mandatory crib safety rule was approved by the Commission in a unanimous vote on December 15, 2010.

The second prong of this initiative is education: teaching parents and caregivers how to keep the inside of cribs free from suffocation risks like stuffed animals, comforters, and pillows. In partnership with the American Academy of Pediatrics and a child advocacy group called Keeping Babies Safe, we have a wonderful new Safe Sleep video that is being shown in maternity wards and pediatricians' offices around the country. This video is currently available on the CPSC's website, and I urge Members of the Subcommittee to view the video and see its powerful message.

Rapid Response to New Hazards:

Toxic Metals in Children's Products: The Commission has increased its efforts to provide a rapid response to new and emerging hazards. One

example of this response is the CPSC's efforts to stop the use of toxic metals in children's products. Earlier this year, it came to our attention that some foreign manufacturers might be using cadmium or other toxic metals as a substitute for lead due to the Commission's lead limits for children's products.

I sent a strong message to Asian manufacturers and regulators that this was unacceptable and that we would not allow there to be an influx of products with cadmium like we saw a few years ago with lead. We have also asked several standards setting bodies – including the committee that oversees the ASTM F963 toy safety standard— to improve safety standards in this area. In addition, Commission staff is closely examining the use of other toxic metals in children's products, such as barium and antimony, and the CPSC will not hesitate to take further action in this area if necessary.

Problem Drywall: I have personally visited several homes and met with a number of homeowners impacted by problem drywall. I am keenly aware of the pain and frustration many families have faced in dealing with this issue, and the CPSC has devoted more resources—over $5 million in the past two years – to investigate this issue than for any other product investigation in the Commission's history. As a key strategy of the investigation, we have worked collaboratively with several other agencies, including the U.S. Department of Housing and Urban Development (HUD) to formulate guidance that potentially impacted homeowners can use to identify whether a home contains problem drywall and, if so, a remediation protocol for repairing the impacted dwelling.

On January 28, 2010, CPSC and HUD issued preliminary guidance on how to identify the presence of metal corrosion as well as other indicators of problem drywall in homes. This was followed on April 2, 2010, by preliminary remediation guidance, which detailed steps that homeowners could take to address potential safety hazards in homes with problem drywall. When the remediation protocol was released, CPSC and HUD staff noted that the protocols would be updated based on further scientific studies conducted by Sandia National Laboratories (Sandia) and the National Institute of Standards and Technology (NIST) to analyze the long-term impact of electrical component, electric wiring, and fire alarm exposure to the gases emitted by problem drywall.

On March 18, 2011, CPSC and HUD released a new remediation protocol based on an in-depth study at Sandia that simulated the long-term exposure of wiring and other electrical components to hydrogen sulfide gas, which is associated with problem drywall. In the study, Sandia staff simulated 40 years of corrosive conditions that could exist in problem

drywall homes, and did not observe any acute or long-term electrical safety events, such as smoking or fire.

The new guidance should prove helpful to many homeowners who wish to remediate their homes. In addition, I also hope that the guidance will continue to provide actionable criteria for other federal, state, and private entities considering possible financial relief for homeowners, as has been the case with earlier versions of the guidance.

CPSC's Proposed FY 2012 Budget:

The past three years have been a period of rebuilding for the Commission, after decades of reduced funding and staff reductions that decimated the agency's ability to carry out its critical public safety mission. In FY 1980, the Commission had almost 1,000 full-time employees and an inflation-adjusted budget of over $150 million. By 2007, the Commission had fallen to 385 full-time employees—and was barely able to carry out its core functions.

As a result of the increased resources provided by Congress over the past three years, we have been able to rebuild. Full-time staff now stands at approximately 550. As noted above, these resources have allowed us to staff several ports of entry and increase cooperation with CBP to keep dangerous products out of the country. They will allow us to increase staff at our new laboratory facility, scheduled to open in May, to test potentially dangerous products that could injure or kill consumers, including infants and young children. And they will allow us to stay on top of emerging hazards, like problem drywall and toxic metals in toys.

The increased funding also allows us to conduct outreach directly to consumers. It ensures that we can get the message out to families after a hurricane or ice storm that the use of a portable generator in a home can result in carbon monoxide poisoning and tragedy. It also allows us to reach out to new mothers—so that they do not place their newborns into an unsafe sleep environment that could result in tragedy.

I am highly cognizant of the desire for fiscal constraint that has been expressed by the Administration, the Congress, and the American people. Yet, I believe the CPSC is a great return on investment to the taxpaying public. In allocating funds, we have attempted to maximize existing resources to the greatest extent possible. There are, however, several areas of critical need that the Commission must address in FY 2012.

The proposed FY 2012 budget requests $122 million – a slight increase from the $118.2 million funding level the Commission is currently operating under, and the $118.6 million request for FY 2011. If enacted, this level would allow the agency to hire an additional 34 FTEs to fill areas of critical need. In addition, it will allow us to shift resources from expenses associated with IT modernization and CPSIA rulemaking to increased investigation and enforcement activities.

Some highlights of these proposed changes include:

IT Modernization Cost Savings: Section 212 of the CPSIA contained two major components: 1) modernization of the Commission's IT systems; and 2) implementation of the searchable consumer product safety information database. Over the past two years, much of the IT spending has focused on infrastructure and staff to support the overall IT modernization. By the end of FY 2011, the bulk of the capital upgrade will be complete, and the Commission's needs shift mainly to maintenance costs.

Accordingly, the FY 2012 budget request includes a decrease of $3.104 million for costs associated with IT capital and development. This decrease is partially offset by an increase of $1.44 million to hire four new FTEs and three contractors to maintain the new IT systems. This results in a net decrease in this area from the FY 2011 proposal of $1.64 million.

Increased Incident Review and Investigation: In recent years, the CPSC has experienced a substantial increase in the number of product incident reports filed by consumers. In 2003, for instance, the Commission received slightly more than 22,000 reports. By 2009, that number had jumped to almost 50,000. At the same time, however, the number of investigations conducted as a percent of total reports received dropped from approximately 20 percent in 2003 to less than 10 percent in 2009.

This is a trend that we must reverse. To address this challenge, the FY 2012 budget proposes an increase of approximately $3.08 million to hire four new FTEs and four contractors to assist with data intake activities, 14 new FTEs to assist with rapid incident review, and six new FTEs to investigate the increasing number of incident reports received. Without this new staff, the agency will see a further reduction in the percentage of incident reports investigated – and this will reduce our ability to respond to emerging hazards.

IT Capital Replacement Funds: Currently, CPSC allocates approximately $1 million each year for capital replacement of equipment and software. However, recent growth in agency personnel and increased reliance on technology has increased the agency's requirements in this area. Accordingly, the FY 2012 budget requests an additional $500,000 (for a total with baseline funding of $1.5 million) for capital IT replacement.

Office of Education, Global Outreach, and Small Business Ombudsman: As detailed earlier in my testimony, the Commission recently voted to create an Office of Education, Global Outreach, and Small Business Ombudsman. Most of the staff in the office will come from existing FTEs transferred from other offices. However, the FY 2012 budget proposes an additional $400,000 to support the addition of two FTEs: a director to develop the office and a senior small business

ombudsman dedicated to assisting small business entities in the area of consumer product safety.

Financial Management, Oversight and IG Support: The FY 2012 budget requests $665,000 for three FTEs (an accountant, a budget analyst, and a senior internal controls officer) to support enhanced financial management oversight and support. The budget also requests $204,000 for the Inspector General's office to hire an independent legal counsel, consistent with the Inspector General Reform Act.

* * * * *

Madame Chairwoman, thank you again for the opportunity to testify on the proposed FY 2012 budget for the U.S. Consumer Product Safety Commission.

I look forward to working with you and other members of the Subcommittee on the budget request, and would be happy to now answer any questions you may have.

Inez Moore Tenenbaum, Chairman
U.S. Consumer Product Safety Commission

Inez Moore Tenenbaum was nominated by President Barack Obama on June 9, 2009 to serve as the ninth Chairman of the U.S. Consumer Product Safety Commission. Ms. Tenenbaum was confirmed by the Senate on June 19, 2009 and sworn into office on June 23, 2009 to a term that expires in October 2013.

Ms. Tenenbaum was elected South Carolina's State Superintendent of Education in 1998 and completed her second term in 2007. Throughout her career, Ms. Tenenbaum has been an energetic and determined advocate for children and families and has extensive experience in administrative and regulatory matters.

During her tenure as South Carolina's State Superintendent of Education, student achievement in South Carolina improved at the fastest rate in the nation, with scores increasing on every state, national, and international tests administered. At the end of Ms. Tenenbaum's tenure, the prestigious journal Education Week ranked South Carolina number one in the country for the quality of its academic standards, assessment, and accountability systems.

She previously practiced health, environmental, and public interest law with the firm Sinkler & Boyd, P.A. Before attending law school, Ms. Tenenbaum served as the director of research for the Medical, Military, Public and Municipal Affairs Committee of the South Carolina House of Representatives. She carried out the Committee's responsibilities for all legislation relating to public health, the environment, child welfare, social services, adult and juvenile corrections, state military affairs, and local government.

Ms. Tenenbaum served as special counsel to the McNair Law Firm in the area of public school finance prior to being nominated by the President.

She has also served on numerous task forces that provide oversight on children and family services in the state.

Ms. Tenenbaum received her Bachelor of Science in 1972 and Master of Education degrees in 1974 from the University of Georgia and her law degree in 1986 from the University of South Carolina. She is the recipient of numerous honorary degrees and has been recognized by several state and community organizations for her civic work on behalf of children and families.

Ms. Tenenbaum is married to Samuel J. Tenenbaum.

Mrs. EMERSON. Thank you so much, Chairman Tenenbaum. I would now like to recognize Commissioner Northup. Try to keep it please to five minutes.

Ms. NORTHUP. Yes, thank you. Is it on? Yes. I am delighted to be here. Congratulations, Madam Chair, for your position as Chairman of this committee, and Mr. Serrano, I am delighted to see you again as you said, Once a colleague, always a colleague. This is an opportunity to come before you and share some of the perspectives that I have since being a Commissioner at the Consumer Products Safety Commission since August of 2009. I appreciate the challenge of this committee to fund essential services, and the trade-offs that occur even in the best of years there were trade-offs that always had be made. And it is with that in mind that I come before you today. As our Chair said, we have grown from 80 million to 118 million since 2008. We have gone from 385 employees to 549. And if we complete our hiring for this year, our targets, and we get the increase that we are requesting, we will be at 600 by the end of the 2012 fiscal year.

With that in mind, I wish I could tell you that all of this money that has been spent has been a good investment. Certainly, our Chair has done a wonderful job at reaching out and looking for better ways, and new ways, to accomplish what the CPSC is required to do. However, the overwhelming amount of time, energy, and money, is being spent on implementing the CPSIA. And while the CPSIA had important, new, good safety requirements that it put in place, some of what we spend our time on, and much of what businesses have been required to do, have absolutely nothing to do with risk. There was never an assessment made that what we were preventing was risky to children in the first place, nor is a lot of the requirements in order to comply with the law based on risk.

However, we get weekly, sometimes daily, information from associations, from individual businesses, from people all across this country that tell us about the fact that they have closed their business, or they have left the child products area of their business. The number of small businesses that we put out of business has to be in the 100s. It was estimated by our agency back in 2009 that the cost to businesses is in the billions of dollars. And when you hear these stories individually, people that come and talk about businesses that they have grown, where they have hired people, the ideas they had, and they are simply unable to comply with this law, and so they are leaving, many of them, trying to sell to a larger company because they just simply cannot absorb the cost and the overhead that it has added. It has really been very sad.

I hope we will have a chance to talk about some of the challenges that they have, but I can tell you on the market that besides the loss of jobs, the loss of businesses, particularly in this country, because small businesses are the ones that have the biggest problems, the biggest companies that make toys do not make any of them here in this country. They make them in China. They make such a large number that they are at least more able to spread the cost of complying with this law over many more products. But it is also the cost in the marketplace, the number of toys and products that are no longer being sold in this country. We used to have the most vibrant market. Now there are Websites to which you can

go, where they say, Not sold in the United States. Whole companies, a Swedish company, a German company that are no longer selling any of their toys in our market; ones that were very popular with parents. There are also people that sell to small markets, to our schools, small number of products that say they simply cannot abide by all the responsibilities of this Act. If it were related to risk, of course, I would strongly endorse these regulations. But in many cases, risk is not even something that we are allowed to consider.

I am here to ask you to do two things as the Appropriations Committee where I think you can make a big difference. The first is simply do not let third party testing and certification go into effect. To the Chairman's credit, she endorsed delaying the implementation of that until December. But businesses tell us that that is a staggering cost to them. Not only the cost to do third-party testing, but also to certify and to track every single component of every single good and the certification number, and label every single product, so that that cohort of information is available is a staggering price. And it is unnecessary.

The Chairman, in my opinion, has been so creative in establishing much better border procedures that ways to intercept violative products, ways to test in a more efficient way. We have companies it is not the same world as 2007. The companies that were violative have all come in and told us about the new production oversight companies that have responded to us, have all talked about their ISO labs that are inside their production facilities all over the world today. And so, they themselves because of the cost of the penalties that increase, the chance of a class-action lawsuit, Mattel settled the class-action lawsuit because of their toys for $14 million, and so the need to avoid those sort of costs, the ability to intercept violative products here, we do not need the old-style command and control formula that was in that bill that is going to stagger the products that fall into under this regime.

And finally, I know we will talk about this more, I beg you to stop the funding of our database. It is a database right now. There are 12 of our top people in our agency. Everybody from the General Counsel, her top assistant, the person in charge of compliance, their top people meet every day Tuesday, Wednesday, and Thursday at 8 a.m. in the morning to incident by incident go over every single one of these, and it is those multi-group teams that you will be funding in the additional request that is just counterproductive, both in terms of fairness to our businesses, fairness to the public, and giving accurate information to the public, which is the only reason Congress stated for the database. So those two things defunding would, I think, not only create a better agency but also be a better expenditure for money. Thank you.

[The information follows:]

Testimony of Anne M. Northup
Commissioner
United States Consumer Product Safety Commission

Hearing on the 2012 Performance Budget Request of the CPSC

Before the

U.S. House of Representatives
Committee on Appropriations

Subcommittee on Financial Services
and General Government

March 31, 2011

Chairman Emerson and Ranking Member Serrano, thank you for the opportunity to provide testimony to this Subcommittee regarding the Consumer Product Safety Commission's 2012 Performance Budget Request. This Commission has a proud history of assessing risk and providing leadership in consumer product safety issues across a variety of industries.

As a Commissioner since August 2009, I now have a tremendous appreciation for the work that goes on in an agency, including the time and effort that agencies expend implementing the laws Congress passes. It is not a simple task, and my colleague, Chairman Tenenbaum, has put in countless hours to ensure that the Commission meets its deadlines and fulfills the difficult tasks it has been given.

As you know, I did not support the Commission's overall 2012 budget request of $122 million, because it calls for an increase in $3.8 million over current funding levels. I believe we can be doing much more with less. Given the imperatives of reducing the national deficit and controlling federal spending, we as Commissioners have a responsibility to cut programs or advocate for reforms that will ensure that we are using our resources efficiently and not straying from our core mission of safety.

In that regard, my testimony today focuses upon the ways in which Commission resources have been wisely spent to improve safety outcomes for Americans, and areas where I believe there could be vast improvement. In particular, my testimony will focus on the Consumer Product Safety Improvement Act (CPSIA), a law that largely is not based on risk and whose implementation has overwhelmed the time and resources of this agency since August 2008. Because the CPSIA's lead, phthalates, and testing and certification standards are not risk-based, the enforcement of such standards diverts the Commission from focusing on real risk. The law has strained the Commission's resources and has had a devastating impact on American business growth and competitiveness, all with little or no offsetting improvement in product safety.

Effective Uses of Commission Resources:

Improved Enforcement Tools

Today, the Commission has enforcement tools vastly improved over those available even a few short years ago. Since the advent of our agency's Import Surveillance Division in 2008, we have continued to grow our full-time presence of CPSC investigators at key U.S. ports. We have also expanded cooperation with Customs and Border Patrol to maximize our ability to screen for products at all U.S. ports. Today, the Commission intercepts non-compliant toys through more extensive border control efforts, application of x-ray technology to identify violative lead content, and computer databases that flag previous offenders for greater scrutiny. The CPSIA also increased the incentive for compliance through the threat of confiscated and destroyed violative products at the border, by authorizing the Commission to impose higher penalties of up to fifteen million dollars, and by streamlining its authority to seek criminal penalties.

I support the agency's investments in expanding these emerging enforcement methods because I believe they can grow to become a more sophisticated and technologically advanced method of deterring the entry of hazardous products into commerce. Notably, even prior to the Commission's improved enforcement tools, the Chinese manufactured toys containing lead paint that were the impetus for the CPSIA were themselves identified and intercepted using the Commission's traditional methods. The companies responsible faced a class action lawsuit and a massive fine. Today, retailers, private labelers, importers and manufacturers are collaborating to prevent violative products from entering commerce, in order to protect themselves from lawsuits, damage to their reputations, the cost of recalls and the loss of inventories.

Consumer Education and Outreach

Providing safety information to American families is a top priority of the Commission. I have urged the Commission to do more to educate the public on broad-based safety hazards in concert with any new mandatory standards we are required to issue under the CPSIA. Additionally, I have long advocated for broadening the Commission's messaging through non-English language posters, and by working with non-traditional groups, like churches, to increase our outreach to minorities and harder-to-reach populations.

The Chairman's staff has done an excellent job using social media (e.g., online videos, text messaging, Twitter) and other creative ways to broadcast the Commission's many safety messages. In fact, as of last fall, there is now a downloadable "app" available for the Android phone that allows consumers to monitor and search recalls from the CPSC and other agencies: http://apps.usa.gov/product-recalls2/ I continue to support these efforts.

Ineffective Use of Agency Resources: CPSIA

The law's non-risk based requirements

In both 2009 and 2010, the CPSC focused its time and resources principally on implementing the CPSIA. Although the Commission is a relatively small agency (FY 2010 funding of $118.2 million), its budget has grown by nearly 48 percent since the law's passage in 2008, with both old and new resources shifted away from risk-based priorities to implement the arbitrary, non risk-based mandates of the CPSIA, including the lead content and phthalates bans, the Public Database, and the third-party testing, certification and labeling requirements. Over the past two and one-half years, the Commission has issued an estimated 3,500 pages of regulations and guidance documents as a result of the CPSIA—a large portion of which must be read and understood by every affected company in order for them to grasp the law's complex requirements.

The diversion of the Commission's resources to CPSIA implementation reduces our focus on genuine safety hazards. Our agency is charged with "protecting the public from unreasonable risks of serious injury or death" from consumer products—but we cannot

fulfill this mission if our time is spent primarily enforcing the CPSIA, including its non-risk-based lead content and testing requirements.

Indeed, since 2008, there has been a significant delay in progress on actions to address many genuine safety hazards, such as promulgating standards to reduce the risk of death and injuries caused by cigarette lighters, table saw blades and portable generators. These issues would be front and center on the Commission's schedule if it were not for the CPSIA.

Small Business Ombudsman

The creation of a new Office of Education, Global Outreach, and Small Business Ombudsman to assist small businesses will also likely end up a waste of Commission resources. This office was created last fall with an unspecified budget and staff size.[1] The stated purpose of the new office is to provide additional information to small businesses and other industry stakeholders through a "coordinated approach to education and outreach activities."

But this purpose could be fulfilled under existing Commission offices, and does not address small businesses' real concerns with the CPSIA. Small businesses are not clamoring for more information about how to comply with this law; they are asking for relief from this law because it is killing them.

The solution for small businesses negatively impacted by the CPSIA is to repeal the portions of the law that impose tremendous costs without increasing safety. Furthermore, no matter how successful this new office may be, small businesses will still need to hire lawyers to understand their obligations under the Commission's far-reaching and complex regulations.

To date, the Small Business Ombudsman has focused on responding to CPSIA-related questions posed by small handcrafters. This limited service to a small minority of manufacturers does not begin to assist the vast majority of small businesses – with greater numbers of employees and a much larger impact on the economy -- suffering under the CPSIA. If the Commission really wanted to help all small businesses, it would use its rulemakings to mitigate the unintended consequences of the CPSIA, and propose meaningful legislative reforms to Congress. It is wasteful and counterproductive to instead create a new Small Business Ombudsman office to perform limited outreach to micro-businesses when an existing agency office could perform the same service.

---

[1] The agency has moved around existing employees to fill vacancies in this new office, including an Acting Small Business Ombudsman. The 2012 budget request includes two new FTEs to allow the Commission to hire a Director to develop the office and a permanent Small Business Ombudsman.

Public Database

The new Public Database will also unjustifiably drain Commission resources. According to the Commission's 2012 budget request, by the end of fiscal year 2011, the Commission will have already spent $29 million on IT modernization and to develop the Database—two expenses that are interlinked. But the official $29 million figure understates the real cost of the database. It does not include the hours CPSC staff dedicated to developing the database and preparing for its launch, including managing contracts.

Moreover, the $29 million figure represents only the estimated contracting costs through FY 2011. And while we have not been able to estimate future costs, it is likely that the costs to maintain the Database will continue to strain Commission resources for years. For instance, the agency has yet to estimate the number of new FTEs we may need, year after year, to administer the public database, including new Compliance investigators and lawyers to handle claims of material inaccuracy. The Commission's 2012 Performance Budget Request discounts these expenses. According to that document, the "New and Reallocated Resources" dedicated to "Data Intake, Incident Review, and Investigation" is derived from an extrapolation of the growth trend line for reported incidents and investigations dating back to 2003. If, as is likely, this projection is proved to be too low, the assigned staff will be unable to timely manage all of the information reported through the database. As a result, Commission staff will be even less likely to resolve claims of material inaccuracy within the ten-day period prior to the posting of unverified information. The Commission will then either request and be provided additional funding in subsequent years, or preside over an increasingly misleading database.

Additionally, the Commission did not perform a cost-benefit analysis of their Database Rule. I believe the rule that was passed by the Commission's Majority is tremendously flawed and will result in a public database that is full of inaccurate or unverifiable information and therefore helpful to no one.[2] If this Commission is to have a public database funded by taxpayers, it should be ***different and better*** than any source of information that already exists in the public domain, such as websites like Amazon.com or Yelp.com. Unfortunately, due to the agency's regulation, our public database will be no more useful than similar sites that are already available to the public today, and will, in fact, be more misleading to the public, given the likelihood of inaccurate reports and the lack of ability for anyone to verify them. Many believe the public database, if left unchanged, will be useful only to trial lawyers or advocacy groups that will be able to populate it with unverifiable, second-hand information for their own purposes.

---

[2] The Commission Majority's database rule suffers from three major infirmities: 1) It interpreted the statute to allow *anyone* to report incidents to the database – even consumer advocacy groups, trial lawyers, and others with ulterior motives and who may not have firsthand knowledge of the incident; 2) the rule fails to require enough information from submitters so that reports are even verifiable; and 3) the rule requires that all reports will be made public on the 10th day following transmittal to the manufacturer, regardless of whether there's a pending, valid claim of material inaccuracy.

Further, the Commission has limited resources for enforcement. As a result, unverifiable information in the Database will divert resources from addressing genuine risks to monitoring and processing the likely increase in reports to the agency. Additionally, because inaccurate incident reports will be indistingnishable from accurate ones, the media's attention may focus on inaccurate reports, pressuring the agency to prioritize its efforts based on publicity rather than risk level.

CPSIA: Impact on the Economy

The lack of cost-benefit analyses

In March 2009, Commission staff reported that the economic costs associated with the CPSIA would be "in the billions of dollars range."[3] Industry associations representing manufacturers of furniture, mattresses, sports equipment, children's clothing and handmade toys, just to name a few, have all told us that they will be saddled with enormous costs, first to reengineer their products to satisfy the new standards imposed by the law, and then to third-party test every component of every product they make to demonstrate compliance with all of the applicable standards.

This Commission has received a considerable amount of anecdotal evidence from companies and trade associations regarding the costs to test at independent labs, as well as the cost of certification, tracking labels, continued testing, record keeping, testing to product standards, and the potential reputational and litigation costs that will result from the upcoming Public Database. **Attached** is a sample list of businesses impacted by the CPSIA, as well as other economic data. Our staff has compiled some sample testing costs for toys and bikes, as part of a Regulatory Flexibility Analysis for our Testing and Labeling Rule. But the Commission has never conducted a full cost-benefit analysis of any regulation we have promulgated under the CPSIA.[4]

I believe such analyses would reveal that much of our CPSIA mandated regulation cannot be justified. To begin with, there is no scientific evidence suggesting there is any benefit from many of the law's requirements. For instance, no government health agency, including the CPSC, has ever concluded that the components of children's products containing either 300ppm lead content or the interim-banned phthalates pose a safety risk to children. The Environmental Protection Agency (EPA) and the Centers for Disease Control (CDC) report that in 1978, about 13.5 million children ages 1-5 had elevated blood lead levels. However, by 2007-2008, this number had declined to about 250,000 children.[5] Similarly, 2007 data indicates that one percent of children selected for testing across the country showed an elevated blood lead level as established by the CDC. This

[3] Letter from Acting CPSC Chairman Nancy Nord to Representative John Dingell, March 20, 2009.
[4] Most of the CPSIA mandated regulations are not required to be promulgated under Section 9 of the CPSA, which normally would entail a cost-benefit analysis. However, it also does not ***prohibit*** the agency from doing so, if the Commission recognizes a need for such analyses.
[5] http://www.epa.gov/opeedweb/children_body_burdens/bl-graph.html

number was down from nearly eight percent in 1997,[6] and is likely attributable to the elimination of lead in gasoline, as well as lead paint education and abatement. The CDC and the EPA have issued guidance for reducing children's exposure to lead, and neither has ever suggested that parents take away a child's bicycle because of the lead in the substrate of the metal comprising the spokes, pedals or handlebars. Nor has it ever been argued that the CPSIA, with all of its costs, will lower the number of children reaching the "tipping point" of having an elevated blood lead level.

Burdensome Testing and Certification Requirements

Given the available tools of manufacturers to determine compliance and our own improved enforcement methods, I do not believe the complex, third-party testing and certification requirements of the CPSIA are necessary or helpful in ensuring compliance with the law's new requirements. In fact, relief from the law's testing requirements is the number one request of small businesses, many of whom may be able to comply with the law's lead and phthalates limits but still cannot afford the mandatory third-party testing.

By requiring all manufacturers of children's products to send their products to be tested at a third-party lab, regardless of risk, the law disproportionately hurts companies with robust in-house testing programs, those with more creative and effective ways of ensuring compliance internally, as well as domestic American companies who have never had a violation. The CPSIA's micromanagement of a company's testing, certification and tracking of each and every component of a product is entirely unnecessary—and in fact, will be less helpful than the sophisticated internal controls manufacturers are currently using and continue to develop and perfect. Furthermore, a "bad actor" with a casual attitude toward safety standards compliance will be just as casual about maintaining accurate records to support CPSIA-mandated certifications.

The CPSIA also requires the creation of massive new paperwork and tracking systems, often without any safety enhancing product changes. A member of the American Home Furnishings Alliance reported that it spent $13 million dollars on tests, new systems and tracking processes, despite the fact that every single component it used on children's furniture already complied with the current lead standard. The company was therefore not required to change a single material used in its manufacture of children's furniture, and there was no corresponding benefit in the improved safety of its children's furniture to justify the costs.

Similarly, some industry associations have had very few, if any, safety violations; yet, they are required to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety. The American Apparel and Footwear Association writes in their public comments on the Component Parts rule:

> As the CPSC continues to issue specific compliance requirements, manufacturers become increasingly wrapped up in ensuring compliance over ensuring product safety. All AAFA members have had long-standing quality control programs in

[6] http://www.cdc.gov/nceh/lead/data/national.htm

place that have developed based on the product, production of the product and the manufacturer's unique circumstances. These programs are effective and do not need to be changed. To demonstrate, only .0084% of all apparel and footwear sold in the U.S. in 2008 were involved in a recall. Moreover, most apparel and footwear recalls have been drawstring violations -- a compliance issue that results from lack of information not lack of testing.[7]

The testing and certification requirements of the CPSIA have yet to be fully implemented. This Subcommittee can therefore prevent the law's onerous testing requirements from going into effect by withholding in any upcoming appropriations laws funding from the Commission for the purpose of promulgating regulations to implement the third-party testing and certification requirements of the CPSIA. This would allow the Commission's House and Senate authorizing Committees to fulfill their pledge to reform the CPSIA before it can further undermine the nation's economic recovery.

Recommendations to Reform the CPSIA and Reduce the Budget :

1) Reform the CPSIA's major requirements to be risk-based:

Reforming the CPSIA so that the law's principle requirements are based on risk, would greatly relieve the pressure on agency resources to have to implement, enforce and monitor non-risky products—and allow the agency to use its limited resources more effectively to fulfill its safety mission. This can be accomplished in a variety of ways:

- Amend the law's Absorbability Exclusion §101(b)(1)(A) so that it is meaningful:

The CPSIA included three statutory exclusions from the lead limits. But the Commission has meaningfully interpreted only two of them. The law's third exclusion, based on the absorbability of lead in a product, has not excepted a single product from the CPSIA' scope. The CPSIA should therefore be amended to exclude products or materials with a level of absorbable lead that the CPSC determines not to be harmful to a child's health.

Drawing the line at the level of absorbable lead that is harmful to a child's health is consistent with the findings of our leading scientific agencies, the National Institutes of Health, the CDC and the EPA. Only lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under. Thus, the experts at the CDC and NIH have found that lead paint in old houses and lead in dirt near old gas stations are the main source of environmental lead presenting a danger to small children (http://www.cdc.gov/nceh/lead/). In other words, the *risk of absorbability* from lead in dirt that is tracked into a home or lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high. Notably, the EPA standard for lead in soil is 400 ppm

[7] American Apparel and Footwear Association. Request for Comments. Docket No. CPSC-2010-0037 & CPSC-2010-0038. August 3, 2010.

(http://www.epa.gov/lead/). This standard for safety is less strict even than the current 300ppm lead content standard provided in the CPSIA for children's products, including bicycle handlebars where any lead is embedded in the metal substrate and cannot be absorbed.

Unlike other Commission rules, the CPSIA, as interpreted by the Majority, has led to the banning or substantial reengineering of many products that pose no risk of harm from lead. For example, the CPSIA has led to a ban on children's books published before 1986, because the ink in them is likely to contain lead above the allowable level. But children are not likely to eat the pages of old books or ingest more than miniscule amounts of lead after touching their pages. Likewise, youth ATVs and bicycles are outlawed or must be reengineered even though the lead that is in the hood, handlebars, or hubcaps will not become ingested and absorbed in meaningful amounts. Other everyday products such as school lockers, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens are outlawed if they have a toy or game attached to them and are marketed to children, due to the brass found on the tip. Because there are still *negligible amounts of lead detectable by scientific equipment* that may be wiped off by touching a bicycle handlebar, the CPSIA treats these items in exactly the same way it treats products that truly could hurt a child by increasing the blood lead level.

If the law is amended to unambiguously exclude products with a level of absorbable lead that is not harmful to a child's health, the scope of the CPSIA will be considerably narrowed, and the Commission can focus its limited resources on real risks to children.

- Lower the age-range of products impacted by the law:

Under the CPSIA, a "children's product" is any product intended primarily for use by children twelve years old or younger. The CPSIA thus treats all products intended primarily for use by children under thirteen the same, regardless of whether they are intended for one-year olds or twelve-year olds. Recognizing the substantial difference in risk presented by the same products to different age groups, CPSC staff have suggested to the Commissioners that lowering the age range of products impacted by the CPSIA would be one of the most efficient ways to amend the law in order to exclude those products which many believe should not be impacted.

The 12-and-under age range affects many products that are also used by teenagers, thus creating enforcemeot difficulties over marginal products. Producers argue that the products are primarily intended for children age thirteen and older, and the Commission examines marketing and other factors tn asses the claim. Some blurring of the age lines will happen regardless of the age cut-off, but there are many more products subject to this uncertainty for "tweens" (*e.g.*, certain sporting goods, apparel, etc.)

In addition to enforcement difficulties, the benefits of the law are vastly reduced as applied to products for older children who are well past the age when they mouth things or constantly put their hands in their mouths. Thus, Congress could amend the statute to apply only to products primarily intended for children under age six, while giving the agency discretion to raise that age limit for particular materials or categories of products that are found in the future to pose a risk to older children. And in any event, the CPSC would retain the authority to issue a stop-sale order or to recall any product determined to pose "substantial product hazard" under the FHSA.

- Eliminate third-party testing and certification requirements:

As stated previously, the law's third-party testing, certification, tracking and labeling requirements are the most burdensome for small manufacturers. They are also unnecessary for verifying compliance, particularly given the agency's improved traditional enforcement tools. As a result, Congress could eliminate current third-party testing and certification requirements all together, allowing manufacturers to test in-house and/or in the best way they know how to determine compliance. The Commission would retain the discretion to impose third-party testing requirements on products with a risk that such testing would address.

At the same time, this Subcommittee can also prevent the law's onerous testing requirements from going into effect by withholding funding from the Commission for the purpose of promulgating regulations to implement any further third-party testing and certification requirements of the CPSIA.

2) Eliminate the 5-member Commission and put the agency under one Administrator:

I believe the CPSC could be run more efficiently by one Administrator, rather than a Commission of five or even three. In fact, similar proposals have been considered in the past: http://www.gao.gov/products/T-HRD-87-14. Managing a small agency simply does not require more than an Administrator. Additionally, I have confidence that Chairman Tenenbaum (or a future Administrator) would be able to run the agency much more efficiently without the pressures from her Democrat and Republican colleagues, who wish constantly to influence her actions in one direction or another. Reducing from five Commissioners to an administrator would save the substantial costs of office space, Commissioner and staff salaries, and all other expenses associated with a Commissioner's office.

The Chairman is already solely accountable for all of the agency's core functions, including setting the rulemaking agenda, public relations, human resources duties, and budgeting. The other four Commissioners may be asked to sign off on these things from time to time as a formality or to provide input, but ultimately all accountability lies with the Chair.

Rulemaking involves the participation of five Commissioners. However, I would argue that this "participation" rarely involves more than duplicative analytical efforts—all of which usually result in a 3-2, party-line vote. This also means five different Commissioners, all their staffs (12 people), plus dozens of technical staff and lawyers are reviewing, editing and analyzing the exact same rule-making document. Moreover, despite hours of effort by me and my staff, many of the Commission's largest regulations approved by the Majority have actually become ***worse*** through the process rather than more balanced—simply because at the end of the day, the Majority's vote rules on any contentious, policy votes.

3) Public Database – require reforms to the Database Rule to ensure that incident reports are verifiable and useful.

Finally, the Commission's Database Rule could be revised in order to ensure that incident reports going up on the new, public database are verifiable. Potentially inaccurate and unverifiable information is of no value to the Commission in its enforcement efforts, and useless to consumers seeking actionable product safety information.

Several features of the Majority's rule guarantee a database populated by inaccurate information. The Majority has broadly defined the statutory categories of submitters to the Database to include groups and individuals with no direct knowledge of the incident or the person harmed. Such groups include consumer advocacy groups, trade associations and attorneys, for whom the accuracy of the incidents they report may be secondary to their own agendas, giving them no incentive to avoid the posting of false or misleading information.

The Database Rule also does not require sufficient information from the submitter to ensure that Commission staff or consumers can tell one type of product from another. Only the minimal amount of information is required, including manufacturer name and a "description of the product" which could include simply "baby stroller." But one company may produce dozens of different models of baby strollers, some of which may no longer be in production. As a result, the limited product information required is insufficient to permit the Commission to investigate the claim, and of no value to a consumer seeking to identify a safe model of baby stroller.

The problems created by permitting inadequate product identification and allowing individuals and groups without firsthand knowledge to report alleged incidents of harm, are compounded by the rule's failure to require the identification of the victim or product owner who experienced the risk of harm. As a result, the Commission's staff may be unable to verify the accuracy of the report by speaking to the only party with actual knowledge of the product and incident. Moreover, because manufacturers' bear the burden of proving a material inaccuracy, the Commission will publish a report that contains the

minimal required information, even where inadequate product identification or the absence of victim contact information leaves the report unverified. There are therefore likely to be many cases where a manufacturer will have good reason to believe a reported incident is either completely false or materially misrepresented (and companies routinely receive these types of mistaken or fraudulent claims), but neither the manufacturer nor the Commission will be able to obtain the information necessary to resolve the claim. Under those circumstances, the manufacture will be unable to meet its burden and the challenged, but unverified and unverifiable report, will remain on the database forever.

Inaccurate information will likely also be posted on the database - at least temporarily - even when there is sufficient information to eventually confirm the truth. That is because the Majority's rule requires the Commission to publish an incident report on the public database by the 10th day after sending notification to the manufacturer, notwithstanding that a manufacturer has adequately supported a claim that the report is materially inaccurate. Unless the Commission can conclude within 10 days that the report is materially inaccurate, it is published on the 11th day and remains on the Database while the Commission completes its investigation. And because there is no fixed period within which the Commission must complete its investigation, inaccurate information can remain on the site indefinitely.

Killing Small Businesses:
CPSIA in the News, Letters and Public Comments

A MESS OF A LAW:
March 11, 2011

"President Obama has been on a campaign to shake his antibusiness reputation, so a good place to start would be to revisit the Consumer Product Safety Improvement Act, a mess of a law that has put new burdens on small businesses…"

http://online.wsj.com/article/SB10001424052748703408604576164510202890494.html "Get the Lead Out, Sir," *The Wall Street Journal*, March 11, 2011. Editorial.

HIGHER COSTS FOR SCHOOLS:
January 11, 2010

"NSSEA members sell educational supplies, equipment and instructional materials to schools, parents, and teachers…

… the costs to schools, municipalities, libraries, and others of identifying and replacing such books would be extremely high and there is no reason to impose such costs given the lack of identifiable risk.

…While we applaud the efforts the CPSC has made to find solutions for small businesses…we believe the CPSC could do more if given more discretion by Congress. The alternative is the elimination of many valuable educational toys and products, some manufactured in low volume for niche markets (such as the deaf, blind, or otherwise differently-abled children) and typically not supplied by the huge multi-national toy manufacturers."

Letter from the NSSEA (National School Supply and Equipment Association) to Commissioner Northup, January 11, 2010

HIGHER COSTS FOR PROOUCTS WITH NO LEAD RISK:
October 13, 2010.

"The government wants to regulate Hannah Montana CDs and DVDs. The bureaucrats at the Consumer Product Safety Commission (CPSC) insist that the discs marketed to children be tested for lead, but when the same young starlet churns out raunchier material under her real name, Miley Cyrus, they will escape scrutiny. Never mind that the same 10-year-olds will likely end up buying both products.

"…Never mind that Hannah Montana's fans aren't likely to eat their DVDs, the latest red tape makes no distinction between products where lead is likely to be consumed and those where it isn't."

http://www.washingtontimes.com/news/2010/oct/13/bureaucrats-way-out-of-tune/ "Bureaucrats way out of tune," *Washington Times*, October 13, 2010.

PUNISHING SMALL BUSINESSES, WHILE MATTEL AND THE BIG GUYS SQUEEZE OUT THE COMPETITION:

June 17, 2010

"Now Mattel is testing and making toys without any trouble at all, and those of us who were never the problem are in danger of losing our businesses," says Herizler, who runs EuroSource, based in Lancaster, Pa., with his wife and two sons…

"Nearly two years after the safety law was enacted, Congress and the Consumer Product Safety Commission are still struggling to reduce its burden on small businesses while eliminating the risk of lead and phthalates in children's products."

http://www.usatoday.com/money/industries/retail/2010-06-17-productsafety17_ST_N.htm "Lead testing can be costly for mom and pop toy shops," *USA Today*, June 17, 2010

BORDERING ON RIDICULOUS:

June 17, 2010

…"What the law should be about is ensuring safe products," says Edward Krenik, a spokesman for the children's product alliance. "We've crossed over into ridiculousness."

http://www.usatoday.com/money/industries/retail/2010-06-17-productsafety17_ST_N.htm "Lead testing can be costly for mom and pop toy shops," *USA Today*, June 17, 2010

REGULATION FOR REGULATIONS' SAKE

November 8, 2010

"Regulation for regulations' sake, where there is no inherent change to a bill of materials, a process or a product indicated after extensive, statistically significant testing across multiple points of input and verification, is simply wasteful."

American Home Furnishings Alliance
November 8, 2010 – Letter to Commissioners

MATTEL FINDS CPSIA A CHALLENGE – HOW MUCH MORE FOR SMALL BUSINESSES?

November 9, 2009

"Officials of the toy manufacturer, Mattel, met separately with two CPSC commissioners November 3 to talk about how challenging it was for Mattel to comply with the CPSIA…

Peter Biersteker, a lawyer for Mattel with the law firm Jones Day in Washington D.C., said his client is finding the CPSIA difficult to decipher… "It's a lot of work. I don't know how smaller companies do it," Biersteker told Commissioner Robert Adler.

Despite Mattel's large team of in-house lawyers, he said, the company needed to hire outside lawyers to help understand the CPSIA. He said Mattel holds weekly conference calls on the issue, discussing how to comply with the act while remaining "cost competitive."

"Mattel Finds CPSIA to be a Challenge," *Product Safety Letter*, November 9, 2009.

COMMISSION ACTION ADDS TO CPSIA'S PROBLEMS:

August 16, 2010

"The latest dictates from the Consumer Product Safety Commission (CPSC) will drive up the cost of manufacturing products intended for children. The agency adopted a pair of new rules in July and August implementing the Consumer Product Safety Improvement Act of 2008, but as drafted, these regulations will force companies to waste time and money on redundant testing programs solely for the entertainment of bureaucratic busybodies.

… The redundant examinations, mostly checking flammability, can be prohibitively expensive. For instance, the regulations could require a manufacturer to build a queen-sized-bed prototype of a baby's crib just so it can be tested in an independent lab. Yet each of the component parts - the crib-sized mattresses, blankets and all other component parts - already are individually tested for the same hazards when manufactured."

Editorial: "The Red Tape Stimulus," *Washington Times*, August 16, 2010
http://www.washingtontimes.com/news/2010/aug/16/the-red-tape-stimulus/

EVEN THE NEW YORK TIMES SPOTLIGHTS THE UNINTENDED CONSEQUENCES OF THE CPSIA:

September 28, 2010

"… a new federal crackdown on dangerous toys has left some in the industry crying foul and not wanting to play."

"…Critics point to provisions in the law that they deem ludicrous. For instance, a paper clip that is included in a science kit for schoolchildren would have to be tested for lead. But a teacher can walk into any drug store and buy a box of paper clips that would not be subject to the same testing.

Similarly, a lamp that is festooned with cartoon characters would have to be tested, but a lamp without the characters would not."

http://www.nytimes.com/2010/09/29/business/29toys.html "Toy Makers Fight for Exemption From Rules," *New York Times*, September 28, 2010

SCIENCE KITS ARE "NOT BANNED" – BUT THE TOOLS USED INSIDE THEM ARE!

October 1, 2010

"The science kit makers had asked for a testing exemption for the paper clips and some other materials. On Wednesday, in a close 3-2 vote, the commission declined to give them the waiver they sought."

"…After the science kit vote, CPSC Chairman Inez Tenenbaum sought to reassure people that, "There is nothing in this rule that bans science kits."

Right. But while the commission vote doesn't ban the kits, manufacturers say it may crimp the supply of kits for elementary school children."

FURNITURE MANUFACTURERS FACED WITH ADDED COSTS, ZERO SAFETY BENEFIT TO CHILDREN:

November 8, 2010

"…there has not been a corresponding benefit in the improved safety of children's furniture for children. All the representatives told you that their respective companies have not had to change a single material they use in the manufacturing of their children's product lines since they began testing to CPSIA in 2008.…The testing is simply being done to attempt to prove a negative."

American Home Furnishings Alliance

FURNITURE MANUFACTURERS FACED WITH ADDED COSTS, FORCED TO CUT JOBS:
November 8, 2010

"The majority of the annual costs will be in the record keeping requirements because none of the companies have the requisite IT infrastructure to handle the tracking of test reports per batch…Hooker estimates that it will cost them from $350,000 to $400,000 per year. Furniture Brands International said this will cost them over $4.5 million per year which is more than the profits from their best quarter in the last 2.5 years. In addition, this company must invest an additional $2 million in start up costs for setting up the production testing, programming computer systems to work with existing systems, and hiring and training employees for the administration of the CPSIA."

To offset these new costs, the company is forced to consider these choices: 1) shut down a small domestic plant which will mean the loss of 64 full time and 30 temporary US jobs; 2) shut down a larger domestic plant which will mean the loss of 384 US jobs; 3) significantly increase prices to offset the loss in revenue making them less competitive; 4) offer a lower quality product… or 5) shut down all domestic production which incorporates any finishing processes, which will mean the loss of approximately 460 US jobs."

American Home Furnishings Alliance
November 8, 2010 – Letter to Commissioners

NO MORE MOM AND POP TOY SALES:
July 7, 2010

"The second program involves making wooden toys that are given to the church and other charitable organizations in the county for distribution to needy children throughout the year especially at Christmas. Last year we created over 700 toys. The idea that we now are required to have these handcrafted toys certified will bring the program to a halt."

Dupage Woodworkers, Downers Grove, IL (July 7, 2010, Public Comment, Testing rule)

ECONOMIC IMPACT OF THE CPSIA - EXAMPLES
2009 and 2010

Costs associated with the CPSIA

1. In a letter from the CPSC to Representative Dingell in March 2009, Commission staff reported that the overall economic impact of the CPSIA would be in the "**billions of dollars range**." The Commission also acknowledged that the testing and certification costs will fall disproportionately on small-volume businesses. (*Letter from Acting Chairman Nancy Nord to Representative Dingell, March 20, 2009*)

2. **"MAJOR RULE"** - CPSC acknowledges in its FY 2011 Regulatory Agenda that its main rule pertaining to the CPSIA's testing requirements (**[PDF] CPSC Docket No. CPSC-2010-0038)** is a "major rule" under the Congressional Review Act, resulting in, or likely to result in: 1) an annual effect on the economy of $100,000,000 or more; 2) a major increase in costs or prices for consumers, individual industries, government agencies or geographic regions; or 3) significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

3. In an article entitled "Makers Are Pushing Back on Toxic-Toy Law" (*Wall Street Journal*, March 5, 2009 http://online.wsj.com/article/SB123621357629835121.html), Joe Periera reported the following loss statistics:

    - Goodwill Industries to destroy **$170 million** in merchandise.
    - Salvation Army expects to lose **$100 million** in sales and disposal costs.
    - The Toy Industry Association estimates inventory losses at **$600 million**.
    - Members of the Coalition for Safe and Affordable Childrenswear lost **$500 million.**
    - The California Fashion Association estimates troubled inventory at **$200 million**.
    - The Motorcycle Industry Council expects to lose 50,000 motorized bikes and four-wheelers worth at least **$125 million**.

4. On March 11, 2009, *Playthings Magazine* reported updated data from the Toy Industry of America (see http://www.playthings.com/article/CA6643505.html), including:

- From a pool of nearly 400 manufacturers and 220 retailers, the TIA estimates **losses of $2 billion in retail value**.
- More than **$1 billion** in already shipped merchandise has been returned or is being withheld for return.
- More than **$800 million** in compliant merchandise is at risk of return.
- **40%** of all respondents plan to eliminate jobs to pay for the CPSIA, with more than 1200 jobs reported to be in jeopardy.

"TIA: Safety Act puts $2B crimp in toy biz"
3/11/2009

5. Separately, the Motorcycle Industry Council advised that total losses from disruptions in its members' businesses could total **$1 billion**. See: http://www.1st5ive.com/harley-davidson/motorcycles/2009/02/2452/new-lead-rule-could-cost-motorcycle-industry-1-billion-annually

BIOGRAPHICAL INFORMATION

Anne Meagher Northup, Commissioner
Consumer Product Safety Commission

Anne Meagher Northup served the Third Congressional District of Kentucky, representing the Louisville district in the United States House of Representatives as a Republican from 1997-2006. Before her tenure in Congress, Northup served in the Kentucky House of Representatives for nine years, from 1987-1996.

Soon after taking office in 1997, Northup was appointed to the House Appropriations Committee, the committee that considers all federal spending bills. She sat on the Labor, Health and Human Services, and Education; Transportation, Treasury, HUD and Independent Agencies; and Military Quality of Life and Veterans Affairs Subcommittees.

Throughout her tenure in Congress, Northup was recognized for her straightforward, honest style in taking on tough issues. She is a pro-trade, pro-economic expansion Republican focused on issues that create a better environment for competition, growth, and worldwide commerce. She is a proponent of permanent tax relief for all American taxpayers, expanding affordable health insurance, cutting red-tape and making sure government programs are measured based on results.

Congresswoman Northup is the recipient of numerous legislative awards. In 2003, she received the prestigious "Adam Smith Award," which is presented annually to one federal elected official who exhibits an exemplary commitment to economic freedom.

Congresswoman Northup has been an aggressive advocate for education reform. In March 1998, she founded the House Reading Caucus, a bipartisan caucus that raises awareness about the growing number of children who are failing to learn to read. She introduced legislation commissioning the National Reading Panel, the findings of which were incorporated into the "Reading First Initiative" of the 2001 No Child Left Behind education law.

Additionally, Congresswoman Northup was a member of the Congressional Coalition on Adoption and was an instrumental proponent of legislation promoting adoption. As co-chair of the coalition in 2002, Northup traveled to China to work on eliminating the growing bureaucratic obstacles between the United States and China that were threatening to reduce the number of Chinese orphans available to American families for adoption. In 2003, Northup introduced legislation that resulted in extended paperwork deadlines for families adopting children from China who were impacted by delays due to the SARS epidemic. Northup and her husband are the parents of two adopted children.

In February 2005, Northup was elected by a committee of her Republican House colleagues to chair the GOP's Retirement Security Public Affairs Team. As chairman of the group, Northup was front and center in the effort to strengthen Social Security for younger generations of American workers.

Congresswoman Northup has been highlighted by the national press for her pragmatic approach to public policy and her ability to effectively communicate the priorities of Congress. She has appeared on such shows as Meet the Press, Fox News Sunday, CBS Evening News with Dan Rather, Larry King Live, CNN & Co., The News Hour with Jim Lehrer and Hardball with Chris Matthews and Lou Dobbs.

Congresswoman Northup graduated from Saint Mary's College in 1970 with a Bachelor of Arts degree in Economics and Business. She has served for years on community boards, is a recipient of numerous civic awards, and is an active community volunteer. She is a member of Holy Spirit Catholic Church, and has been married to "Woody" Northup, a small business owner, for over 37 years. Together, the Northups have six children.

Mrs. EMERSON. Thank you so much, Commissioner Northup. I want to welcome Mr. Diaz-Balart, the Vice-Chair of our committee today. Chairman Tenenbaum, can you do me a favor and have somebody pull that chart up again that you just showed us before.

Ms. TENENBAUM. These are full-time equivalents.

Mrs. EMERSON. Okay. Do you have budget numbers?

Ms. TENENBAUM. It was 150, but that is what the equivalent was. I can give you that budget number. We had 978 FTEs. And then, in 2007, when we had the year of the recall which prompted the CPSIA, we had 393 workers. And that is why, in the CPSIA, the language was put in that we had to hire 500 by October 1, 2010.

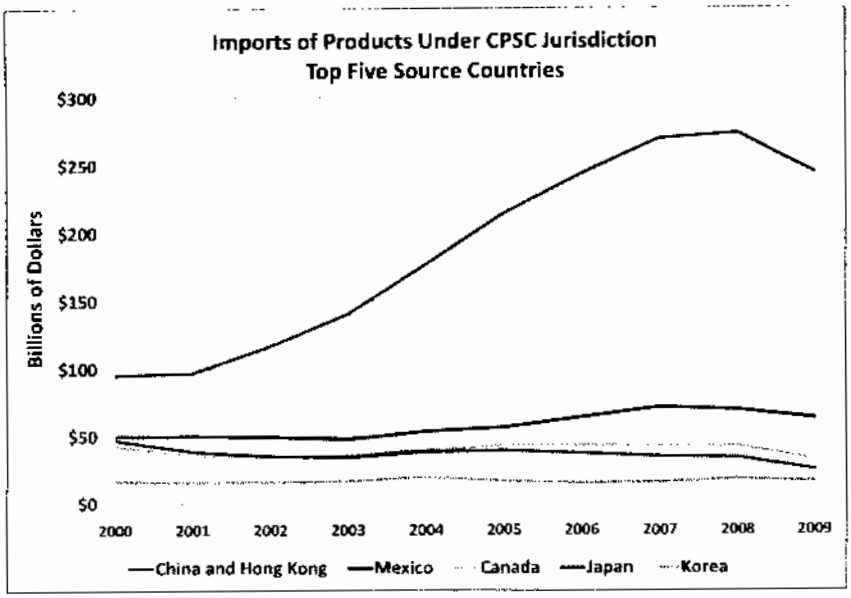
Mrs. EMERSON. Right. Here is what is interesting to me, and now that I think about it, how is it that we ever arrived at having you all having to hire 500 people? How would we have known how many people have had to hire? Do you recall?

Ms. TENENBAUM. I was not here during that.

Mrs. EMERSON. I know you were not.

Ms. TENENBAUM. I think that they looked at the agency, and the second part of that law said, Ports of entry, overseas inspections, as part of the 500 full-time employees required by Paragraph one, the commission shall hire personnel to be assigned to duty stations at United States ports of entry, or to inspect overseas manufacturing facilities. They envision that we go to China, subject to the availability of appropriations. And one of the things that is so interesting, and it affirms what Commissioner Northup just said, is here are our imports.

[The information follows:]



Imports of Products Under CPSC Jurisdiction
Top Five Source Countries
Billions of Dollars
$300
$250
$200
$150
$100
$50
$0
2000

China and Hong Kong
Mexico
Canada
Japan
Korea

As you can see, the red line represents China and Hong Kong. So it starts off in 2000 at roughly just under 100 million. And now before the recession it peaks in 2000.

But look at that, 80 percent of all the toys that are imported in the United States come out of China, just like she said, and 42 percent of all consumer products come out of China. Our second largest importer has flat lined, that is Mexico. Canada is the green, and then you have Japan and Korea. We both made visits to China, and we are I am glad to tell you that we opened up our first overseas office in China, and Ambassador Huntsman allowed us to be in the building right next to his residence. In fact, every time I go to China, he has always met with me personally at the residence, because it is so important for him to keep up with our issues. And if you want me to show you these other charts, I can. They have to do with FTE's.

Mrs. EMERSON. All right. Tell me what the impact would be, because I know you all have had to plan for it, or at least noodle ideas around, about what a return to Fiscal 2008 finance levels would mean for the CPSC?

Ms. TENENBAUM. I have that right here. If we go back to 2008, which would put us back at 80 million, and it would be a 32 percent reduction, we would have to furlough staff for 92 days, or four out of the last six months of the year, effectively shutting down the agency. We would have only available 340 FTEs versus the 576 that was planned for 2011. A strict hiring freeze would prevent filling critical vacancies. We would also have to not do our nanotechnology project. We would be stopped from implementing the CPSIA in terms of the durable nursery equipment rules that we are supposed to write. We would have to close the Beijing office, and we would have to stop our hotline where consumers can call and tell us about their experiences. The Virginia Graham Baker Pool and Spa Safety Act, which is about swimming and drowning prevention, would be cut. And we would have to slow down our modernization of our technology overhaul at our agency.

Mrs. EMERSON. Okay, thanks. Mrs. Northup. How would you address those two questions? First, the FTE question, and, secondly, going back to 2008 budget levels?

Ms. NORTHUP. First of all, Madam Chair, I have to ask for a clarification. I thought that the law said we were to go to 500 by 2013, not by 2010.

Ms. TENENBAUM. It was 2010.

Ms. NORTHUP. Was it 2010? If somebody could just clarify that.

Ms. TENENBAUM. It was 2010.

Ms. NORTHUP. In any event, we are of course approaching 600 employees, and I would just say that I think you see what happens when you have a very complex bill, and you have to implement it, and it has a lot of regulations. The regulations are horrendous. Any business, just about any small business, when we talk about the ombudsman, the ombudsman is primarily dealing with micro-businesses, with crafters with people that are one-person businesses. If you are a small business, you are going to have to hire a lawyer to make sure you comply with all the new regulations that we have written.

I would just point out that, when we were at the low point, that is when the recalls happened, and that in a sense you could make the argument the system worked. They caught the toys coming in, the agency was able to do a sweep of all toys, and while it is true that there were somewhere, I think in the area of 78 toys that were recalled, it means that there were thousands upon thousands that complied with all the paint specifications. And so we were able to do that, and to implement a system. We assessed very serious penalties for those companies that broke the law, Mattel was the leading one. They paid about a $1 million, $1.5 million I think, maybe $1.8 million but they also settled the class-action lawsuit for $14 million. And there is no evidence that any child was hurt by those products. Obviously, lead in paint is dangerous, unlike lead in handlebars, I might point out, of a bike, or a peddle or the other things where the law went way beyond what was risky. But the law worked, and we did catch those toys, and they were removed from the market. And the companies were penalized and that is what set into motion these companies establishing far more oversight over their plants in other countries, putting in in-plant labs. So, you could make the argument that the CPS, being out of compliance in 2007 with 380 employees, that the system did work.

Ms. TENENBAUM. I have a correction to make. Commissioner Northup was right, it was 2013.

Mrs. EMERSON. The 500?

Ms. TENENBAUM. Yes, my notes say 2010, but it is 2013.

Ms. NORTHUP. Okay, thank you, so we are already 100 over that. We are going to be 100 over that if you fully fund us, and we are still a year out from 2013. So the bureaucracy that is growing, it is staggering.

Mrs. EMERSON. Okay, I am going to turn it over to you Mr. Serrano, we have lots of questions and I have to let my colleagues have their shot too, thanks.

Mr. SERRANO. So far, Chairman Tenenbaum on the implementation of the Consumer Product Safety Improvement Act, we are talking about numbers. How are you working to educate manufacturers about their new responsibilities under the law, and also with regard to the improvement act, since the commission has delayed until 2011, its enforcement of testing and certification requirements for many children's products, how can consumers be assured that the law is being followed and that children's products are safe? What are you telling the business community about this, and what are you doing about the children's products?

Ms. TENENBAUM. Okay, thank you Mr. Serrano. We have held workshops for the business community as early as 2008, before I came to the commission. The staff pulled together all stakeholders to teach them about the CPSIA and what the requirements are. We also have made a new Office of Education, Global Outreach, and Small Business Ombudsmen. For almost 20 years we have had a small business ombudsman at the CPSC, but it was only part time. And Commissioner Nord and I talked, and she argued that we really need to go fulltime again to a small business ombudsman. We have had a wonderful time young attorney who is working with small businesses, taking the Plain English Act and writing summaries of our regulations of frequently asked questions for the

business community. We frequently go to trade shows, we work with the major manufacturers to tour-businesses.

I think that what we really need to celebrate is the number of American manufacturers that have extremely high-quality quality assurance programs, that they are state of the art. That they are keeping risk away from people. That they have been testing using third party testing for ten years. Many of the people, once they have gone into China, determine that since it was a global market, it was a supply chain they could not keep control of, they needed to test, even before they left China, the raw materials that went into the product before it was sent to the United States. And once it gets to the United States, the manufacturers retest.

I have been to manufacturers who tell me what they do to make their product safe, and it is extraordinary. So, many of the larger manufacturers have been complying with third party testing and testing for chemicals and lead. Recently, I went to the toy fair in China and met with the top five Chinese companies that manufacture probably most of the toys made in the world. And they have worked with their industry to develop a chemical database, so that every chemical that you use in a toy is listed in that database. And you can keep up with every chemical that is in that toy, so that if you have a recall, the batch and the lot number, and you can pull that toy even before it is sent.

In terms of what we have done, we have implemented the Consumer Product Safety Improvement Act. Although we stayed enforcement for some of the products until December of this year, we did not stay compliance. So you still had to comply with the lead limits, the small parts, the phthalates, and F963. We did not stay compliance. And that is why so many people have already complied, because you have to comply with the lead paint limits, 90 parts per million, total lead content, 300 parts per million, limits on phthalates, small parts, and ASTM, which is the major toy standard. We only stayed testing and certification.

Mr. SERRANO. Right.

Ms. TENENBAUM. And most people already do that already.

Mr. SERRANO. Right. Yes?

Ms. NORTHUP. Third party testing and certification is just a giant step different from what is currently being done. When we proposed the rule, we have hundreds of pages of comments coming in from small and large businesses alike, telling us that when we actually go, when they actually have to comply with the paperwork requirements of that, when they have to comply. Third party testing, some businesses use it, many businesses have brought in ISO labs inside their companies. That is my point. They are very eager to make sure that they comply with all of our regulations.

But the command and control requirements of the law in the CPSIA, and the tracking of that information, and the way it is being implemented at the CPSC is a gigantic step in a different direction than what they are asking for. And if it were true that they were all doing it, you would not get, universally, and it is universal, from small and large businesses, saying this is going to be horrific. It is going to be costly and impossible in many cases.

Let me also say that I am glad we have a Small Business Ombudsman. Unfortunately, this office is going now from one to—now

we are requesting two more, which was a reason I did not support it. Small businesses are not asking us for more information. They are asking for changes in the law. They are telling us it is killing them. And they are saying, it is not more information they are asking for, yes, crafters are, but small businesses that have 10, and 15, and 20, and 30 employees? They are hiring their own lawyers en mass. And even people like Mattel told us that they had to hire a huge cohort of new lawyers, internally and externally, because what they had was simply not enough for them to comply with the law. They said in a public statement that was printed, they did not know how a small business could comply with this law.

Mr. SERRANO. Well, when you two speak to us here today, we see what the problem is. And I am in, it must be because it is opening day, I am in a, baseball opening day.

Ms. NORTHUP. You are in a good mood.

Mr. SERRANO. I am in a, let us find common ground and the middle ground here. Now, you walk into, and I hate to mention names. You walk into Toys R Us, staying on the issue of children. Sure, it is a business. And they want to make money. But I do not think they are irresponsible people, the people who own Toys R Us. They know what impact they have on children. So there has to be testing. There has to be some government oversight of those products coming into the country.

But at the same time, since I am in this great mood today, there should not be something that strangulates the economy and the business community. So what is it, to both of you, that the business community is willing to comply with? And what is it that bothers them? Because if you tell me, I mean, let us be honest. You served with us. You know that there are some colleagues of ours who want no oversight of anything, no regulation; they are all good people, and they will take care of the American people. That is not how it works.

Ms. NORTHUP. No.

Mr. SERRANO. Right?

Ms. NORTHUP. And you see that every day when you are at the Commission.

Mr. SERRANO. Exactly. So what is it that is squeezing them too much, and what are they willing to do on their own? Because one of our big complaints, besides, China owns all our economy, or whatever, all our debt, is, all these products come from China. And we cannot just accept them as they are. So just briefly, can you tell me, where is the middle ground here?

Ms. TENENBAUM. Well, last year, we sent a report to Congress saying that we needed four things changed in the Consumer Product Safety Improvement Act. First of all, we needed greater flexibility in granting exclusions for the lead limits. For the lead limit, CPSC only allows three exemptions: one if it is an inaccessible part, two, if it is certain electronic parts, and the third thing is, by use and abuse of the product, any lead is not absorbed into the human body. So we wanted greater flexibility, because we had ATVs and bicycles where the child is not going to mouth the handlebars, and we wanted to be able to give them an exception.

The second thing is we wanted an exclusion for children's books. In August, the lead limits go to 100 parts per million. And we also

said, Do not make this retroactive like CPSC did for the 600 parts per million. Only make it prospective, so people will not have to get rid of their inventory. And we also wanted relief for small manufacturers and crafters. In fact, we are working on a rule called Periodic Testing. We are looking at carving out an exception, that, if you make 10,000 units or less, you do not have to periodically test. You have to initially test, but you do not have to periodically test.

We also came up with a component part rule. So if you made children's dresses, you did not have to test the whole dress, you could just buy buttons that were already tested, from the button maker, and you were compliant. We made rules that say, if you had cotton, untreated wood, if you were a handcrafter and made things out of untreated wood, you never had to test. So those are the things we have done to be creative, to exempt people from testing and certification.

The common ground is that we need flexibility. But to do away with third party testing really goes against what I have seen in the marketplace. And I think that it is to whom you speak. I went to see a major children's clothing manufacturer, and they told me, just two weeks ago, that when they started manufacturing in China 10 years ago, they started doing third party testing because they wanted to make sure they met the flammability standard and that the fabric did not contain toxic metals.

Mr. SERRANO. Madam Chair, I do not want to go over my time, but I would like the commissioner to comment because she did say, she did.

Mrs. EMERSON. Yes.

Mr. SERRANO. I was pleased to hear that you say you see it every day at the Commission. So you are not one of those who says get rid of the Commission.

Ms. NORTHUP. Let me just say that every day we get the overnight incident reports. And there are children that have died, there are cases. We see products that catch fire; we see products that are harmful. There is no question that there is a very important responsibility at this agency. However, what has been a tidal wave of focus of this agency has sort of swamped everything, is the implementation of the CPSIA. I have to tell you, Mr. Serrano, had I been here, and I was not in 2008, I feel sure I would have voted for that bill.

And because in reading it, it seems as though it is logical. But of the three exceptions to the lead limit, the question of inaccessible electronic components, the third one is absorbability. The majority of the commissioners have determined that this is in conflict. But they have interpreted that to not apply to one single thing: not a button, not a snap, not a zipper, not a handlebars, not any part of a toy, not the screw in your crib. None of those things can have 300 parts per million of lead. Now, you could absorb lead in paint. We know what you can absorb lead in. We know if you can swallow a charm that has lead in it, that your body will absorb it.

But we also know that if you lick the handlebars all day or the screw in your crib, that has slightly more than that but has more strength, it has machineability. I mean, lead also contributes certain things that you are not going to—there are just going to be an unregisterable amount in a child's blood lead level.

Europe has had lead levels for years. They are based on the absorbability. They call it bioavailability, whether or not that lead can be extracted out and into a child's body. We should make that absorbability mean something. And then finally, the testing, I would just say that I do not believe that I have heard from one plant that said, I am sure I have not, that said, Oh, yes. We think third party testing, outside of our plant, the way it is written in this law, is going to be good.

Do they use third-party labs? Of course they do, because they care about it. But they do it for their own check and recheck, not so that they then have to change the label every time they have the red paint runs out one day. Now, you have a new set of red paint. It has a new certification level. Now, the final certificate has to change the number on that. Now, the label has to be batch #107 instead of 106. An hour later, the yellow paint runs out. You have to stop the presses. You have to change every single thing all the way through. The next minute, the snaps run out and you have a new batch of snaps. You have a new lot number, so you have a new certificate number. All of that has to be reflected in the label.

This is chaotic and Ashley Furniture came in and told us they had spent $14 million on third-party testing and setting up a system by which they could track all the layers on a piece of furniture and everything. Not one single component of this furniture violated the lead limit. They were in compliance. They still did not know how, once we applied this, once we put in testing, third-party testing, and that they were going to be able to comply. So you got no benefit in safety and 13 or $14 million and cost.

Mr. SERRANO. Thank you. Thank you, Madame Chair, for allowing me to go over my time but it has been quite a while since I have heard this kind of very direct testimony.

Mrs. EMERSON. Oh, and it is excellent.

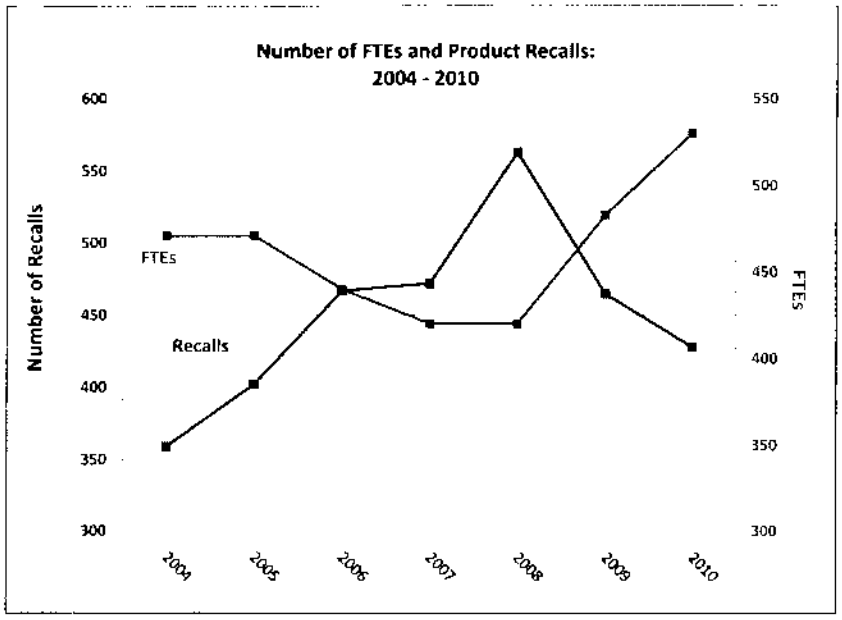
Mr. SERRANO. So informative. Thank you.

Mrs. EMERSON. And it is very helpful, very helpful for us. Mr. Womack.

Mr. WOMACK. Wow. Where do I begin? I was a mayor for 12 years and I spent a great deal of my time fighting my own bureaucracy. And it has been my experience that when you hire a lot more people, those people start trying to justify their existence. And so, my first question is, when the law was passed, that pegged 500 as the number of people, where did we get that number? How did we, all of the sudden, decide 500 employees was the magic number?

Ms. TENENBAUM. Well, I will show you two things that probably prompted Congress to do that.

[The information follows:]



Number of FTEs and Product Recalls:
2004 - 2010
Number of Recalls
FTEs
600
550
500
450
400
350
300
FTEs
Recalls
550
500
450
400
350
300
2004
2005
2006
2007
2008
2009
2010

The blue line are the full time equivalents. As you can see, in 2004 we were a little over 500. And then, in 2005, we were at 500, and then we dipped. And this right in here was the year of the recall. If you look here at the number of recalls, they spiked. They spiked a little around 2007.

So what Congress, in looking at this data, determined, is that with the less people you have doing port surveillance, working in China to make sure manufacturers understand our regulations, the more recalls you are going to have. Recalling costs money for manufacturers.

Mr. WOMACK. Do you have a chart that shows the competency level of those employees?

Ms. TENENBAUM. We hire people who are competent. And we hire really good people.

Mr. WOMACK. I will give you that. I am sure you do on paper. The point I am making is, can we just simply conclude, based on a numerical chart, that the spike in recalls was directly related to the fact that we had a fewer number of people.

Ms. TENENBAUM. Yes, we only had 393 people and we did not have enough people. We had five people at the ports. Now we have 19 people at the ports. We are working with Customs, and have 19 people at 15 ports. We work with Customs and Border Patrol. We were the first agency to sign a memorandum of agreement with them and, we get all the pre-arrival manifest data. We go through all of that data, and we target now shipments before they are even unloaded. Products like fireworks and electrical products, we pull them so they do not get on the store shelves.

Mr. WOMACK. Well, Madame Chairman, everywhere I go in my district and look, I have got a major retailer that is in my backyard. A small five-and-dime named Walmart. And they sell a lot of toys.

Everywhere I go in my district, I hear people telling me about pushing jobs overseas, moving jobs overseas. Is it possible that maybe part of our problems is that we continue, the reason we have so many imports of toys, is our tax policy and our government bureaucracy is so big, so reaching, so much into the private sector that there might be some other quantifiable data that might yield a different conclusion about pegging the number at 500. I am just using that as a thought process because it always bothers me when somebody says, Golly! We are in trouble. We need more people.

Ms. TENENBAUM. I have been in plants in China. And people in China make $1.50 an hour. They live in dormitories and they may or may not get food in those dormitories, and they also do not have air-conditioning in some of the dormitories. So, if you look at textiles, my state, South Carolina, was a major textile state. And now, textiles and toys have moved. And the chart I showed you, 80 percent of all the toys coming into the United States come from China. Forty-two percent of all the consumer products come from China. And they make $1.50 an hour.

Here is another thing that Congress looked at when they passed the CPSIA. Here are the number of investigations. And you can see, in 2003, we were over 50,000 investigations. And we had dropped to below 30,000 by 2009. Here were the number of pro-

jected incidents, and this is before we even implemented the database—the public database that people have been talking about.

So, we are able to only investigate about 10 percent of all the claims of injury that consumers send us. Ten percent. And one reason that we are asking for 24 more people this year is because we have so much data and so many reports from emergency rooms, coroner reports, the newspaper, and we have our public database, that we cannot even investigate because we do not have the people. This is where the majority of the new people were going, is to investigation. And our new employees have gone into our laboratory as well as in Compliance and Enforcement.

Mr. WOMACK. I would like for Ms. Northup to comment.

Ms. NORTHUP. Well, I think your question is, Can we do more with less? And I think I would like to say, first of all, that I have been exceedingly impressed by the people that work at the CPSC. They work hard. They are talented and they are well-trained. They know what they are doing. But they have been given a responsibility to implement a law, and all these rules and regulations are very involved. They are very complicated.

But I would tell you this, all of the new ways of screening things coming in work with the Border Patrol Customs and Border Patrol. That is a new way of doing more with less. And so that is why I have asked, please, do away with the requirement of third-party testing and tracking and certification, because both within businesses and the huge investment they have made and our investments at the port, this is an emerging world where new technologies are available that were not available or were not used previously, and we could do a lot more with less.

And finally, I would just like to say that the rules that we have implemented, the ones that affect businesses the most have been written and there has been division between the majority and the minority. Where we could have made it apply to fewer items, we made it apply to more items. Where we could have allowed fewer tests, we have interpreted it in the most severe manner. And now, yes, much of the regulations and investigations is going to be investigating whether or not people complied with the certifications, whether they complied with the third-party testing, as opposed to whether or not the item is compliant.

And finally, just the very fact that every single lab that uses a third-party test, we have to certify the lab. We have to take in that information. These businesses know what third-party labs they can trust, but you create a bureaucracy that stretches back. It is not just any third-party lab, it is a third-party lab that is ISO certified? No, it also has to be certified by us. And so, even though that seems like it is not a lot of time, everything is incremental. When every single child's product, every component of it has to be third-party tested in a lab that we have certified, you are talking about an enormous process of just doing that.

Mr. WOMACK. That raises costs. And I just want to make this comment for the record, that my question about competency was not related or not in any means directed at the quality of your staff. I realize you have a quality staff. What I am simply asking is, are there other measurable criteria that could point to other factors that may contribute to the incidents, or the investigations, or

the complaints. And that is merely the line of direct thinking I had at that stage.

Finally, let me just ask this. Are we sure that we are doing everything we can to mitigate the impact on small business? As my colleague from the Bronx said just a moment ago, we do not want to under regulate, but we really do not want to over regulate. And I would like to know where that line is in an ideological sense, as to when this organization is going too far, trying to do much, and exponentially raising the price of goods in an attempt to try to remove all risk from the public.

Ms. TENENBAUM. Well, thank you, Mr. Womack. And one thing I want to clarify is we will only have one small business ombudsman. I created this office of Education, Global Outreach, and Small Business Ombudsman, and we put three offices in there together. We put the International office, the Inter-governmental office, and the Small Business Ombudsman. And so, the two new positions in that would be to hire an Executive Director for that office. But let me go back to what we have done for small businesses. We want the full-time Small Business Ombudsman because we are working so that people do not have to hire a lawyer. We are doing seminars, we are going to trade shows. Our Small Business Ombudsman gives his card out to people at seminars, and they call him personally. He answers questions for them. But we also have done other things. When we were debating tracking labels, we decided that one size did not fit all, that the small businesses did not have to have the same compliance as the large companies. We developed component part testing guidance and that is so that the small business, we were hopeful, could buy component parts already tested and would not have to re-test their products.

The third thing we did was determinations, that if you were a small business and you were making children's clothing or handmade toys, that there were certain materials that never had to be tested, like untreated wood, textiles, and gem stones. So those are the kinds of things we look at. We also have the Regulatory Flex Act. We look at how it is going to impact small businesses before we come up with a rule. And so, Reg Flex Act is something we look at and point out the impact. But we are very mindful of small businesses. But, under the Consumer Product Safety Improvement Act, everyone had to test third-party testing, regardless of the size. That is why we were hopeful that component parts would be developed so that people could buy those, could go in a hobby store, or buy them from the manufacturer already tested, and they would not have to re-test.

We also hope that this year, that the House and the Senate will give us more flexibility so we can allow companies, if we do not think there is a likelihood of mouthing the product, or swallowing the product, that we can give them flexibility and they will not have to test.

Mr. WOMACK. I yield back.

Mrs. EMERSON. It seems to me that you are the perfect agency to make sure that the President's call for cost-benefit analyses of regulations actually comes to be, because obviously some things are so onorous. There is no way that you can say they are not. It appears that if we do not understand the impact at the end of the

day in a very fragile economy, we may be cutting our nose off to spite our faces, in which case there is no businesses to have to regulate anyway. I do want to come back and talk about cost-benefit analysis of regulations. So far, I have not seen any federal agency in this government who is capable of doing that.

Mr. SERRANO. Would you yield for a second?

Mrs. EMERSON. Yes.

Mr. SERRANO. I am sorry. I usually do not interrupt. In listening to our new colleague, Mr. Womack, I think the balance here is that we are appropriators. We are not authorizers, although on many occasions we behave as authorizers.

Mrs. EMERSON. And we have.

Mr. SERRANO. We appropriate. And we have to. We keep them in check. This is a law that is in place already. The question is, Do we fund it and to what extent do we fund it? And that is the balance, because if we get back to 2007, and you see people, kids actually being hurt because maybe for insufficient funding, or funded to a point where they function. And that is not how they authorized it. They passed that law. It is on us. That is the delicate balance that we have to reach. So we do not over regulate, but as I said, do not under protect. And that is the challenge.

Mr. WOMACK. Which I think feeds it directly into Madame Chairwoman's request, that a cost-benefit analysis probably fits this agency as well as any in government.

Mr. SERRANO. Absolutely.

Mrs. EMERSON. And thank you all. So with that, it is time for Mr. Diaz-Balart.

Mr. SERRANO. Of the Florida Marlins.

Mr. DIAZ-BALART. Who did beat the Yankees, if I recall, a few years ago in the World Series? My memory is not very good, but did not that happen recently?

Mr. SERRANO. I think that was your moment of glory.

Mr. DIAZ-BALART. Madam Chairman, you see how he cannot admit it. It just hurts him to admit it. It hurts him.

Mr. SERRANO. All right, it hurts me. It hurts me.

Mr. DIAZ-BALART. Thank you, Madam Chairwoman. It is good to see you the both of you. You know, if I may, I have some questions on Chinese drywall. But Mr. Womack really peaked my curiosity. So if that is all right, I would like to submit the ones on Chinese drywall in writing later on, because I do want to go back to what our colleague was asking.

One of the things that we have to be careful in government not to do is get stuck with that kind of weird logic of, Since cheese is round and the moon is round, so therefore the moon must be made of cheese. And I think sometimes, when you look at these charts, it is not always the case, but sometimes we get stuck in that syndrome about, Oh well, if we had a spike and we only had 300 people. So if we have 500 people, we would not have a spike. Is it just because of the products that all of a sudden are manufactured differently, because of technology, because of whatever. And again we just need to be very careful about that. If I may, kind of, follow up on my colleague's line of questioning. By the way, before I do that, when was the hotline created?

Ms. TENENBAUM. We have had the hotline for years. It is the publicly searchable database that was mandated that we created under the CPSIA in 2008. So we just launched it in March.

Mr. DIAZ-BALART. Madame Chairwoman, when you mention about the things that you would have to get rid of or cut if we went back to 2008, you mentioned the hotline. But it was there before. It was there in 2008. So why, all of a sudden, if you could do it in 2008, and it was there before 2008, when we had less money, more money; I am not quite sure.

Ms. TENENBAUM. Because what we are trying to do is increase the number of investigations and increase our rate of compliance in investigations that we are able to do. When we are asked to make cuts, we look at what are some items that are discrete that we can cut. And so that was one of the things that would have to be cut. The fact that we had more money also allowed us to spend the $5 million that we have done on the drywall investigation, which is the most expensive inquiry and investigation we have ever done in the history of the Commission.

Mr. DIAZ-BALART. Okay. Let me go back to what Mr. Womack started talking about. We have heard a lot about some of the issues that may be onerous to business owners. Specifically what are the things that you are doing that are actually helping business be more competitive? Because, obviously, with technology and everything else, there have got to be areas where you look at ways to be less onerous, less expensive to business, and you can go to them and say, Hey, look, right now you are required to do A, B, and C. Let me show you a way that you can do that and you can reach the same level of safety without having to go through the expenses. Are there specific recommendations like that, that you all are going to the private sector on and saying, Here is where we can help you streamline, that you do not have to do certain things that you were doing before because technology has changed. What are some of the specifics that you are doing in order to help business be more competitive?

When I looked at that chart of the number of Chinese toys, and again, now I am going back to the same analysis that really kind of frightened me, was the fact that there was at one time in our history when we manufactured a lot of those toys. There were a lot of reasons why; clearly labor costs is one of them. But if labor cost was the only issue, we would not be doing anything in this country because labor costs are a lot less expensive in a lot of places, and yet we are still competitive in a number of different areas; obviously, toy manufacturing is not one of them, unfortunately.

But what are the areas, specifically, that you all are looking at to be more competitive where you can cut cost for business? Some specific areas like that that you are bringing forward?

Ms. TENENBAUM. Well, education is a service that we can provide, and businesses tell me that helps them tremendously. If we educate them on what our requirements are, then they do not make mistakes. They can build safety into the product. And that is why when I came here I wanted to create the Office of Education Global Outreach and Small Business Ombudsman and put three offices together so that we could have a targeted, standardized approach. We could work with colleges and universities, trade asso-

ciations, other government agencies, so that we can help people understand what the requirements are, thereby saving them money so they do not have their products recalled. Recalls are not the best way; it hurts industry; it hurts their brand. We want to get ahead of that.

Another thing is counterfeiting. We get complaints on counterfeiting. The largest problem on counterfeiting in China that we find is electrical products. And so the good people want us to catch the counterfeiters. And we are constantly working with AQSIQ, letting them know when we find counterfeiters.

Another thing we have is called the 15J Rule, which means if it is a standard that the industry is complying with, and it is visible to the eye, we can then stop products that are not compliant, so that the good people and the compliant people get to sell their products. We have done this on drawstrings, hair dryers—the bob on the end of the hair dryer that is the circuit breaker—if we see one coming in the country that does not have that, we stop that at the port. So one way that we help industry is by helping the compliant have their share of the market and remove the people who do not comply.

And the other day, Diane Sawyer did a piece where she went into a home and took out all the furniture that was made in China and replaced it with furniture made in the United States. And the cost of the furniture was essentially the same. I am going down next week for two days in North Carolina to go to the furniture market. A lot of furniture is still an industry that the United States has a large market share in. Next year we need to go and create an upholstered fabric standard; the industry has asked us for it. We worked on the standard for 16 years.

We also work with standards-making bodies, such as the UL, which are the electrical products bodies, as well as ANSI, and ASTM. We work with them when we see a product that is not working. And with the staff working with industry on these committees, we come up with a standard that improves the product and reduces everyone else's risk. And those are voluntary standards.

Mr. DIAZ-BALART. Let me see if I can give the Commissioner a shot at that, too.

Ms. NORTHUP. Well, first of all, let me just say that there is nobody that wants recalls less than every business. And that is why they are more efficient and better at putting in prevention ways: ways to test their own things, internally; ways to make sure that they are in compliance. For us trying, without manufacturing experience, being in the plant, and knowing what is going on, it is impossible that we could ever provide the sort of expertise that businesses are able to hire and provide for their own businesses.

In the rule-making, first of all, the rule itself, the law itself, said that absorbability would be one of the exclusions. If you could not absorb lead. If that had actually meant something, and I presume when you passed it in Congress you meant for it to mean something, much of our problems would not exist today. But the majority of the commissioners decided that if you rub the handlebars and a fraction of a fraction of a fraction of a molecule comes off, of that, and one percent of it is lead, the fact you could put your hand in

your mouth, that meant that nothing could comply with the absorbability standard. Even though in the world, and in Europe, it is an absorbability standard, if you suck on the handlebars and you cannot get the lead out, it is not what they call bio-available, they exempt all of those things.

So when the Chair talks about, we exempted materials like cotton, it is the smallest, it is a list of about eight things and they are mostly materials.

Mr. DIAZ-BALART. Is there an issue in Europe with lead?

Ms. NORTHUP. No. And more importantly, let's look at our own. We have CDC, NIH, EPA, that all talk about lead issues. First of all, one percent of the children tested in this country reach what we call the tipping point of lead. They are about one and a half years old. They are crawling around on the floor; they are picking up dust that has lead in it; it is either from chipping paint, or it is tracked in from outside because lead was in gasoline, it was in the dirt; it gets tracked in, it gets on the floor.

We do not have to research that; they tell us where children are impacted by lead, and how they get impacted by it. And none of them say, Take away your child's toys; take away their bicycle. None of them say, Change the screws in the cribs. And yes, there are some groups: the American Academy of Pediatric wants us to make it 60 parts per million. But when you look at their website, about what they recommend for children that start to have an increase in blood lead level, and maybe are approaching the tipping point, they do not say one word about it being in their toys, in the furniture. And why would they? Think about it. We are requiring, much to my dismay, and something I think the law would have allowed us to do differently, we are going to say that a lamp in a child's room that has a child's, say a fairy for a little girl's room, every single component of that is going to have to be third party tested: the brass; none of that is going to comply, because it all has lead in it.

But that child is going to walk around the rest of the house and turn on the lights. And no one would say, Do not let your child touch a lamp. There is a ludicrousness in this. And a lack of reasonableness that we could have not required it in carpets. We have a requirement on flammability and testing of rugs and carpets. But we decided that we still had to apply this third party testing requirement to rugs in a child's room. If they have a child's rug, say a star in the middle of it, that would be bought at Pottery Barn, you can go to Pottery Barn and buy the exact same thing with solid color with a yellow outline, and do not have to third party test it. If it has a star in the middle of it, then you have to third party test it. And so, do you think there will be that right? And what is the difference? And in the meantime, the child is going to crawl out of the bedroom, into the living room, into the mother's bedroom, none of which is tested. It does not make common sense to me. In places where I think we could have written the rule so we could have exempted out products where we already have protocols and they are in general use; we did not.

Mr. DIAZ-BALART. Yes, well, that does not pass this.

Ms. TENENBAUM. First of all, when Congress was considering the CPSIA, they heard testimony from scientists, from physicians, who

told them there is no safe level of lead. That is why Congress put it in the statute that you could not let a product be used, or that we could not get an exemption if any lead could be absorbed. So it was not the majority that came up with this ruling, it was the plain language of the statute.

Mr. DIAZ-BALART. Are you going to come back with recommendations to change the statute, then?

Ms. TENENBAUM. We did last year.

Ms. NORTHUP. But not that.

Ms. TENENBAUM. And we also wanted more flexibility in letting out certain products where we knew the exposure was very low. But in August we will go down to one hundred parts per million. Canada already set its lead limit for content in children's articles to 90. So Canada is already below us. We are seeing remarkable progress where industry is getting the lead out. You see lead coming out of zippers for children's clothing, for buttons, for toys, out of vinyl, you see it out of rhinestones and bling. The market is getting the lead out of children's products. And we do not want an amendment to this that will take us back so we have to test every article, because the CPSC does not have the capability.

You are talking about more staff, Mr. Womack? If we had to test everything for solubility, when solubility depends on the child. A child that is deficient in calcium will absorb more lead. Lead is a powerful neurotoxin. There is no safe level. It reduces the brain functions and it interferes with the brain functions and the IQ of children. It is well-documented. So it is something that Congress did hear plenty of testimony about, when they said, we want the lead out of children's products.

Mr. DIAZ-BALART. Let me just, in the interest of time, thank you, Madame Chairman, you are being very generous. Allow me to say that this is, frankly, one of the most informative hearings that I have been in, in my years here because we are actually beginning to talk about the issues.

There always seems to be, and the legislation is part of that, an increase in regulation. Could you tell me what decreases in regulations you are either doing or you are proposing, again, because of changes in technology, because the need is not there, because the cost is too much, or the cost is too much for the gain? Are there any areas where you are looking at decreasing regulation, decreasing activism or activity, in the private sector?

[The information follows:]

Response of Chairman Inez Tenenbaum to Question from the Honorable Mario Diaz-Balart

The Commission is always seeking new scientific approaches and regulatory pathways that can decrease the burden on the regulated community, while at the same time maintaining a high level of health and safety protection for consumers. One very recent example of the Commission's effort to ease regulatory requirements where appropriate involves the testing requirements for determining compliance with the standard for lead (Pb) in paint and other similar surface coatings. *See Third Party Testing for Certain Children's Products; Notice of Requirements for Accreditation of Third Party Conformity Assessment Bodies – Lead Paint*, 76 *Fed. Reg.* 18,645 (April 5, 2011).

The previous CPSC staff test method for determining total lead in paint recognized a "wet chemistry" method that involved removing paint from a product by scraping or using a solvent, dissolving the paint scrapings in nitric acid, and analyzing the acid solution by spectroscopic means, such as inductively coupled plasma optical emission spectrometry (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame atomic absorption spectrometry (FLAA), or graphite furnace atomic absorption spectrometry (GFAA).

These analytical techniques used in "wet chemistry" are capable of yielding precise and accurate results and have low enough detection limits to measure lead in paint at the new limits of 90 mg/kg.

However, this test method is time consuming, and typically requires several hours to prepare and analyze samples, and is sample destructive. Insufficient quantities of paint, such as samples from an item with a thin coating of paint in a small area, also can impact use of this procedure. For example, this test method recommends that a minimum of 5 mg of paint be collected. Collecting at least 5 mg of paint from products with small painted areas can be difficult, sometimes requiring compositing of like paints from multiple items to obtain sufficient material for analysis.

As a less burdensome alternative, the Commission recently recognized the use of XRF technology, in addition to the "wet chemistry" method, to test for lead in paint and other similar surface coatings. The main advantages of utilizing XRF over the current digestion/ICP method are:

1) XRF analysis is often nondestructive, and the paint can be tested *in situ* on the item.

2) Little to no sample preparation is required, which greatly reduces the analysis time and cost. Sample times for XRF *in situ* analysis are typically less than five minutes. It takes several hours to collect, digest, and analyze paint scrapings using the "wet chemistry" test method.

3) XRF has the potential to directly test small painted areas, without the sometimes difficult task of removing enough paint from a small area to quantitatively analyze using the current digestion and ICP method. XRF analyzers equipped with video cameras can be used to analyze spot sizes of a few millimeters.

4) Some XRF analyzers are portable, allowing for field-screening of products.

As resources permit, the CPSC is also considering whether to reinitiate a program, started in 2004, to conduct a systematic review of its current substantive regulations. The primary purpose of the review is to assess the degree to which the regulations under review remain consistent with the Commission's program policies.

Ms. TENENBAUM. I want to go back and talk to our laboratory and our scientists to give you a complete answer. We regularly meet with standards-making bodies. In fact, the law is plain that we cannot write a mandatory rule unless the voluntary rule is shown to be inadequate to protect the consumer. So the great majority of our rules are voluntary standards. The UL writes standards for electrical products, for example, and most of the rules that the industry uses to make products are voluntary. We only make a rule if it is not adequate. So we will get back to you.

Going back to the President's executive order. The order asked all agencies to look at significant rules. Significant is defined as having a certain financial, I want to say, $100 million; is that correct? $100 million?

Mr. DIAZ-BALART. I think it is $100 million.

Ms. TENENBAUM. So it has to have the impact of a $100 million. The only rule that we have implemented that rises to that level, since I have been the Chair, has been our new crib rule. And we worked together to give the industry time to manufacture those, and also public accommodations to purchase those. But I will send you a list of those. But I just want to clarify, the rule-making, mostly, are voluntary rules that industry uses.

Ms. NORTHUP. If I could just correct, Canada left many of their things at 600 parts per million lead. It was the things that were swallowable that they lowered to 90 parts per million. And, again, I think that anything that is risky, we can ban. We have that authority.

Ms. TENENBAUM. Well, and the AAP really wanted 40 parts per million, not 60; so the American Academy of Pediatrics wanted us to set our limits not at 100, but at 40. And the compromise was 100 when they passed the CPSIA.

Mrs. EMERSON. Thank you all.

Mr. Serrano.

Mr. SERRANO. Thank you. Before I start, I will preface my comment. You spoke, Madame Chair, about the cost benefit analysis. And I think it is fine, in some cases, when we talk about paperwork or regulations. But cost benefit analysis can never be acceptable in terms of a child's life or safety. And I think that is where we have to be careful. When we study how much we are spending, it can never be at the risk of having a child, or any person, but certainly children, who were the most affected in 2007, so that is important.

Which brings me to the question of the new product testing lab that is slated to open very soon, compared to the CPSC's current laboratory. How will the new one enhance the work, and how will consumers ultimately benefit?

Ms. TENENBAUM. Thank you, Mr. Serrano. Our lab opens in May, and we would like for all of you to visit the lab with your staff, if you so choose. The lab is going from 37,000 square feet to 63,000 square feet, and we can now perform, in the lab, many more tests than we were able to perform. We have a new testing laboratory for fireworks, for example; we have our own chemical laboratory, toy testing laboratory, and it will be a huge improvement over the laboratory that we have been operating in for so many years. So we appreciate the funding that Congress has provided to us. It is

a $19 million project. We purchased a used building that was already built for a lab, and remodeled it to fit our needs, and we hope that you will come out and see it. It is in Rockville, Maryland.

Mr. SERRANO. Thank you. And that will launch when? In May, you said?

Ms. TENENBAUM. May of this year. And we would love for you all to come out.

Mrs. EMERSON. That would be a good field trip, I think we should do that.

Ms. TENENBAUM. Yes, please do.

Mr. SERRANO. We can bring some Republicans' items, some Democrats' items, have them tested.

Ms. TENENBAUM. You are right.

Mrs. EMERSON. Great idea.

Mr. SERRANO. We could bring the Federal Budget, test and see how much harm the cuts will cost.

Ms. TENENBAUM. Very clever.

Mr. SERRANO. I could not help that. Every so often, you see a perfect example of the differences around here. It seems there are a significant number of Members of Congress who would like to get rid of the searchable database. But the public likes it. What do we need to know about how it is working? What is, in your opinion, the strength? What is, in your opinion, the weakness? Only to be fair, I think there are no weaknesses. But if someone wants to say there is a weakness, we certainly will hear that. But it seems to me that the ability for someone to get on a website and know that there are items they should be looking out for, cannot hurt anyone. We put all our legislation up on the Internet and people comment on it; and some love it, and some hate it; and some love us, and some hate us; and that is fine; that is public information.

First of all, who is complaining about the database, other than Members of Congress? And what is the strength? And to be fair, if you want to comment on its weaknesses.

Ms. TENENBAUM. Well, we had a spirited debate when we were debating the rule on the public database. But I want you to know, even though we televise our debates and we have open and transparent meetings, 86 percent of all of our decisions are unanimous.

Mr. SERRANO. Eighty-six percent?

Ms. TENENBAUM. Eighty-six percent. But this is one where we had different views, and we argue our views passionately; and I think that is a good way to be. And once it is over, a lot of times we go to lunch, and we remain cordial to each other and friendly. But that was a very tough decision. And it was a spirited debate.

Let me give you a little background on the database. First of all, the CPSC has had a website where people report data to us for a number of years. In fact, we receive over 17,000 a year. However, that Website is not searchable by the public, nor do we have a portal so that manufacturers can go on and side-by-side and give us their comment on what someone said about their product. In fact, we are the only federal agency that has a manufacturers' portal. NHTSA does not have one, and the other agencies like Agriculture, who may have a website, do not allow manufacturers or people to comment side-by-side.

But let me give you some numbers, too. The database is a part of a risk-assessment system that Congress mandated that we create under the CPSIA. We have spent $23 million so far to create the risk-management system, and $3 million for the database. All the money that has been given to us has been spent because we launched the database in March.

We receive each year 458,664 reports from consumers. The majority of these come from emergency-room data. We purchase emergency-room data on injuries people sustained from products. That is 397,000 out of the emergency room. Like I said, the website yields about 17,000. We collect mortality data. We get 8,000 death certificates, 550 medical examiners reports or coroner's reports. We look at the newspaper every day. Commissioner Northup spoke about the daily reports; we find out through the newspaper who has drowned or who died because of a product, and that is 6,554 reports.

We also get a little over 163,000 reports on the hotline, but only 5,531 are actually reports of harm from a product. A lot of people just call and ask us questions. Retailers such as Wal-Mart, Target, Sears, Home Depot, Amazon: we get about 23,000 reports from them, because we have got a retailers' reporting program. If they have a problem, they call us and let us know immediately.

We also have a substantial product-entry hazard under Section 15 of our statute. If the manufacturer knows, or the importer knows, that their product has a defect, they have to call us. So we get thousands of reports, about 20,000 reports from them each year. So anyway, to make a long story short, you add all those up together, we get about a half a million reports every year on consumer products.

Now let's go to the publicly searchable database. Remember, I said we get about 17,000 each year from our website anyway, but it is not searchable and it does not have the manufacturers' portal. Since we started in March 11, we have 436 reports of harm in the database. Of those, we have notified 306 manufacturers. Of those, we only had 17 reports that the report was materially inaccurate, and most of the time, 13 of the 17, the manufacturer has said, We are not the manufacturer. We are the private labeler. And we keep a database on labels, so we are working very hard to track down who is the actual manufacturer.

And one thing that Commissioner Northup said was every three days a week our attorneys and everyone sit down to go over this data. The reason they scrub it so hard is they are making decisions now that will be our policy in terms of will we allow it on the database or will we not? We have 2,368 manufacturers who have registered: 2,368. Now, 2,115 have been processed so that we have notified them.

Mrs. EMERSON. Let me interrupt you just for a second. All right, let's just say I am John Q. Smith, and I have a complaint to make because my baby's zipper on their jacket caused a rash on the baby's neck; and so that might be something that I would think that the zipper could have caused. And so I can go on the database and I can fill all of that in. I went on there; I know exactly what you can put in, and all the things that you require because you only have red stars on certain things that are definitely required.

Anyway, it seemed to me, unless I just felt horribly guilty about sending a fake report in because I could not do that just because there was that little signature thing at the end, but there are people who could do that. If I made my complaint, does that immediately get popped onto the database? Because obviously, you could only search the recalls on the database, as of yesterday. I guess tomorrow is the launch date for all of the consumer types of reports. So if I put in that complaint about the zipper causing the rash on my baby's neck, would that automatically show up, or does it get sifted through by you all first?

Ms. TENENBAUM. First of all, we would look at that and make sure you filled out all the data points.

Mrs. EMERSON. But it would have kicked it back to me if I had not filled it out, right?

Ms. TENENBAUM. Right, and we would not put it on the database if you did not give complete information, and if you did not check that you verified that the information is accurate and to the best of your knowledge.

And then have five days after you put that in there to send that to the manufacturer. And the manufacturer could say, First of all, it is materially inaccurate because we are not the manufacturer, and here is who has manufactured it. It might be a private labeler, but anyway that is confusing it. You could say that you are not the manufacturer, and then we would not post the report if you were not the manufacturer. We would find out who was, and notify the manufacturer. But we would send it to the manufacturer, and the manufacturer said, You know, the zipper does not touch a child's neck if you wear it appropriately, and why do you have the zipper around the child's neck anyway?

Mrs. EMERSON. Well if it comes up and it is one of those types.

Ms. TENENBAUM. Okay, all right; you are right. Then they would say, We will take a look at it and see, or they could say, We tested it before we put it on the market. We tested it on 2,000 children, and no one had a rash. Maybe your child has a sensitivity.

Mrs. EMERSON. But my point is, or my question really is, if I make that complaint and I just made it up to cause harm to a competitor, would that get posted on the website?

Ms. TENENBAUM. Well, if it is a competitor, then it would not be a true.

Mrs. EMERSON. In other words, is it possible that false data could be put on the website?

Ms. TENENBAUM. If we find out that it is false data, we will turn it over to the Justice Department.

Mrs. EMERSON. Well I understand that. Is it possible that false data could be put on? Because I went through the whole thing; I could have made up anything on there last night and at least sent it, but that is what worries me. After I pushed the Send button, does it pop up on the database?

Ms. TENENBAUM. No, we have to send it to the manufacturer first.

Mrs. EMERSON. Right, but it is possible, though?

Mr. SERRANO. But the manufacturer would have a right, prior to posting it to say, This is not true.

Ms. TENENBAUM. Right, they would.

Mr. SERRANO. You know, we go through that. We have a meeting and people get up and say, You did this and you did that, and we say No we did not.

Ms. TENENBAUM. And anyway, if we find out that it is false, it is against a federal statute to give false information to an government agency.

Mrs. EMERSON. Well of course I know that, but there are some people who do not care.

Ms. NORTHUP. Well first of all, of course the manufacturer can say, We tested it, it did not happen. They would not say that they tested it on 2,000 people. I mean, you think they tested a sweatshirt on 2,000 people? So they would probably say it complies with all the norms, and that comment could go up if it wanted. But the point is, yes, it would go up on the database.

The problem with the database is a number of things. First of all, you do not have to have firsthand information about an incident in order to put information in. Now let me just say, as a mother of six children, I can tell you that many, many products over the course of my children's lives got altered. You know, somebody bumped into one of the kids bikes, and Oh, it bent it when we were trying to fix it, the screw broke, so we got another screw. I mean, you put things back together. So let's say the bike broke and my child broke their arm. I go to the hospital and the hospital reports it, and it goes in and it says the child broke their arm. I mean, I know that the bike was altered. I would be willing to tell the manufacturer that the bike was altered. But the incident on the database is not going to show that.

Mr. SERRANO. But are we not, in a way, Commissioner, being picky, perhaps? I mean, there is always that danger. There is a contradiction going around this country now. We have got to return government back to the people. We have got to give information to the people. The people, the people, the people. I am all on board with that. But yet in this particular case where the people have an opportunity to say something is wrong and then you have an opportunity to see if indeed that is correct, and yes you run the risk that some information is incorrect, I would think that this should fall right in line with this new belief, or this renewed belief to give more power to the people. I mean, here the people can go online and say, I was affected by this. Will you check it out?

Ms. NORTHUP. Well, Mr. Serrano, let me just say that as a matter of fact, I use that information all the time.

Mr. SERRANO. And one last point. Since it is one of those few agencies that allow the manufacturer to say, Not true, which I think is pretty fair, well, what is really the problem?

Ms. NORTHUP. Well, the problem, first of all, is that it does not require enough information that comes in. Right now, American people have all of that at their fingertips. If you go on Amazon.com and you say you want to order a Graco highchair, you will get a choice of over a hundred products. They will be from $55 to $148. And you can also check that you want to see what consumers say about it, and they will tell you whether it was hard to put together, whether they sent the wrong item, whether they thought it was overpriced, and yes, much of it is safety information. So there is already in the market, without us spending this enormous amount

of money, and we can talk about the amount of money later, there is all that information available to the American people. What is important about what comes into the Consumer Product Safety Commission is that we are expected to take action about products, and so it is important that we have accurate information.

Now, if you go on, let's say I buy that highchair, and then Amazon.com sends me an e-mail and says, Why do you not comment about this highchair? And if I click on that link, it takes me right back to the highchair I bought, so we know exactly what the product is. What comes into us, you say who the manufacturer is, Graco. You say it is a highchair. You do not have to say which one of the 120 items it is. Maybe you have not even thought about that, and you say the leg broke. Well, how does Graco know which one? Is it the $55 highchair, or is it the $148 highchair? How do we know which one it is?

The person putting in the incident has to give their name and address. That is fine. But we already have third-party groups putting in data. What if it is Consumer Reports? What if it is a trial lawyer trying to make a class-action suit? This is what is terrifying the manufacturing community, the fact that without enough information, how do they comment on it if they do not even know which highchair? And if it comes in through a third-party organization that does not know who the consumer is, they got the report, then we cannot even verify it ourselves if we want to do safety information. So the first problem with this is is that it does not require enough information.

Let's say a highchair broke at my Thanksgiving dinner. Is it the highchair I lugged up from the basement that is 30 years old? Or is it the one I bought last year when my first grandchild was born? Or is it the antique I have sitting next to the fireplace? None of that has to he given.

Mr. SERRANO. I understand. At the beginning, if I recall correctly, you said, Do not fund the database. Right? Now you are saying, Make the database better. I mean, I am not putting words in your mouth.

Ms. NORTHUP. Well, let me just say, I would say do not fund it until you can make it better. But having been on appropriations and knowing that you cannot legislate on appropriations, that is one of the problems. There are other problems with it too, but I think you can improve it. I actually wrote a rule that I thought would have made the database something really good for consumers, and really good for us.

Ms. TENENBAUM. And we used a lot of the points made in it.

Ms. NORTHUP. Not the big ones.

Ms. TENENBAUM. Well, here is another thing too. We do not require the model as a required field, as you saw yesterday. But we do have it as a field that we want people to provide.

Mr. SERRANO. Why did you not require the model?

Ms. TENENBAUM. The product might have burned up, it might have been destroyed. But 90 percent of the people are putting the model in, so we do have a lot of information on the model. It could have been a cause of a fire in a home. I turned on my microwave the otber day and flames shot out. Had I turned it on and walked outside, it could have caught the kitchen on fire.

Mr. SERRANO. This happened to you, you are saying?

Ms. TENENBAUM. Yes, it did.

Mr. SERRANO. Sue. No, I am only kidding.

Ms. TENENBAUM. No, I threw it away because I said, This thing is old, and I did not report it. So I just took it to the recycle place and did not let anybody use it.

Mr. SERRANO. Right, I understand. I was only kidding.

Mrs. EMERSON. My husband did it by putting silver foil or aluminum foil in the thing, and blew up a brand new, never used microwave. And it was time to get a new one.

Ms. NORTHUP. He did not want to cook, did he? Clever.

Mr. SERRANO. On behalf of men all over America.

So what are you hearing from manufacturers that are close with that? Because I know that there is a concern, but let me preface my comments by saying that I think this is one of the better items that we have in the federal government, the ability of the public, the consumers, to come and state their case, and the idea of having the manufacturer's side-by-side comment. Can it be fixed, can it be made better, can it be more efficient? Absolutely. But I am worried about your initial statement, Do not fund it. I like your later statement, Do not fund it until you make it better. I do not like the Do not fund it at any level, but this is a good thing and if it can be made better, of course. But this is one power we have given to the people that we should not take away.

Ms. TENENBAUM. Well, what I am hearing from manufacturers is that manufacturers are signing up for the business portal, 2,368, and they are taking this very seriously. Another thing is we had a workshop for manufacturers and all of our stakeholders before we even wrote the rule on the database, and that was extremely helpful. After the databases rule, we had a separate workshop for the manufacturers. We want manufacturers to feel confident that we are going to do everything to find the actual manufacturer, and that we are going to work with them to ensure that only truthful information is on the database. And as Commissioner Northup said, we are meeting every Monday morning for a few hours because the decisions we make now set precedent.

But if I could say about the entire IT modernization, that has been so important, because we had five different silos of data at the Consumer Product Safety Commission. The CPSIA required us to modernize our whole IT system so that all of the data can be tracked through the agency so that we can have case management, so everyone, whether you are in the legal department or in the laboratory or are in compliance, can look at the same cases at the same time. This will revolutionize and allow us to intervene early on emerging hazards. And so I wanted to please give that information, because our people have worked so hard to modernize our IT system.

Mr. SERRANO. Thank you.

Ms. NORTHUP. If I may, please do not interpret our meetings with manufacturers as saying that there is not universal angst over this. And I agree with you, information is powerful, but I would also tell you that if identifying, for example, let's say the Graco highchair. If that is given information to consumers to go buy a different kind of highchair that may be less safe, because

maybe Graco swamps the market, there are five billion of those out there. If accurate information is helpful, inaccurate information is not only unhelpful, it could be dangerous, and the idea that requiring the model number, and also the approximate date it was purchased so that is it something still on the market or is it something that was made 30 years ago? These were amendments that were offered by those of us, is ways to make this a more useful database, and they were turned down by the majority. So there is great disagreement about this.

And finally, if today, we get a comment from a manufacturer saying, We do not see how this could happen, this does not seem like a leg could have broken off the highchair, whatever they say, in other words, a question about materially inaccurate. How much chance of one of the incidents going up tomorrow? They have no transparency and no confidence that we will be able to resolve that material inaccuracy before tomorrow. And what this rule said is if we have not resolved the material inaccuracy, it goes up. So if I am GE, and somebody puts in something and we cannot resolve the material inaccuracy, it goes up. That is wrong. That is wrong.

Mr. SERRANO. All right, well my time has come up. Let me just make one comment. And we are not here knocking the business community, but I am still waiting for that day when the business community says, Why do you not regulate us on this? Why do you not supervise? Why do you not check into us? I suspect if tomorrow we said, Government will not issue one rule for the next year. You guys regulate yourselves on every subject, a year will pass, and probably not one rule will come out of the business community saying, We should not do this. And so we did not get to be the great country we are by just allowing everybody to do as they please. We set in place some things to protect people, and to protect workers, and to protect the consumer, and to protect the business community, and so on and so forth. Thank you.

Mr. DIAZ-BALART. Thank you, Mr. Serrano. Mr. Womack.

Mr. WOMACK. Are fewer recalls good or bad?

Ms. TENENBAUM. Well, for industry, fewer recalls are good, because it means that their brand is not called into question. And that is what we want to get ahead of. We want to make sure that we can work with industry to be proactive so that they understand what the requirements are, and they can build safety into the product so that they will have fewer recalls. For all products in fiscal year 2008, we had 564 recalls. In 2010 fiscal year, we had 428. For toys, 2008 was 172, and fiscal year 2010 was 44. So recalls are, we say, are declining. And most of our recalls are voluntary, the company calls us and says, We have a problem and we want to work with you to recall the product. Which we do. There is a fast-track. So, we work with industry when they have a problem to go ahead and get the product off the market. But we would like to see fewer recalls because it costs companies a lot of money.

Mr. WOMACK. Well, in previous administrations, like during a Republican administration, fewer recalls might be looked at, and probably were looked at, as a sign that we were not doing our jobs. And yet, we are going to ask for more people so we can push for fewer recalls. So which is it?

Ms. TENENBAUM. Well, what it is, is that we have put the new people, a large number of the staff, in import surveillance. And we are working with CBP so that we look at that pre-arrival manifest data, and we can target products before they are unloaded. But now we have an office in Beijing, and with our Office of Education, Global Outreach, and Small Business Ombudsman, we will be able to form partnerships and train more people in China, in Vietnam, and in other areas. When I went to Vietnam, the government of Vietnam was so appreciative of us visiting. I think if we could have stayed longer, they would have extended our visa, because they wanted to ask all kinds of questions, because they had government-operated labs. And if I could have had our staff stay there to make sure that their laboratories were running the tests that we were requiring that they ran, they would have appreciated it. So we are looking for ways to educate governments as well as educate businesses. Every time we go to China and meet with the Chinese, we put on a seminar. We did one on training on ATVs, and what the requirements are for ATVs. We had 150 people attend that seminar. American manufacturers who manufacture their products in China welcome the idea that we will work with them to educate manufacturers and their workers. So, where I am headed, is in prevention. I want to help manufacturers. I want to help them have fewer recalls.

Mr. WOMACK. Ms. Northup.

Ms. NORTHUP. Well, measuring whether or not we are effective by the number of recalls is just spin. I mean, when we had a lot of recalls—like I said, it happened in 2007; it happened under the lowest budget, but it happened because when they thought there was a pattern, the agency sprung into action, and so did all the businesses spring into action. This is similar to what our Chair has done with regard to cribs, with regard to strollers. When we see that a stroller cuts off a finger, what she has done, and she has really initiated this as part of the proactive work she has done, she immediately requires that we look at strollers that have exactly the same hardware to make sure we are not going to have more fingers being amputated tomorrow. And they end up being recalled. And so yes, we would like to decrease the recalls, and companies want to decrease the recalls, too. They are putting in place their own safety, and prevention, and tracking, and so forth. But the agency, here, is good and, I believe, has gotten better at being proactive about looking at something that is a real critical issue and immediately stretching out beyond that.

Mr. WOMACK. One of the concerns I have, as a new member of Congress and when I talked to people in advance of being elected, it was the concept of government underwriting risk. At some point in time, you just cannot eliminate all risk. It is just fundamental. It is part of life. You cannot write a code for every circumstance, and you cannot craft a law to prevent something bad from happening. And when you interject the human factor into our everyday lives, things happen. We had a case in northwest Arkansas this year involving a kid. It was a very unfortunate tragedy. A young man was crushed to death by a soccer goal that came over and hit him. It was very unfortunate; one of my constituents. But the answer on the state level was to change the law and require that all

soccer goals are made by a certain licensed company doing certain things, when we all know that the issue was not the construct, it was the anchoring. And so, fortunately, Arkansas got it right and changed the law to require anchoring.

But the point I am making is we just cannot eliminate all risk. The balance I am looking for, as a legislator, is: At what point do we get into diminishing returns in our desire to want to protect the public? Diminishing returns meaning that we are going so far into the regulatory process that we are killing jobs, ruining our economy, but boy, look at the things that we are doing to protect humankind from some things that are nothing more than just bad judgment and misapplication, a poor build out of the product, because they did not go by the complicated diagram that came with it—and I am the master at that—so I am philosophically saying that I want us to be very careful that we do not get into a situation where we are throwing the baby out with the bathwater. Now, for the record, I would like for your agency to provide the breakdown of additional personnel in your ramping up, and where those personnel are going to be assigned; to which office they are going to be assigned.

How many of them will go to the Chairman's office? How many will go to the Office of the Executive Director? How many will be in Public Affairs? The point here is that I want to see if the ramping up of personnel is going direct to the operational functions of the organization, deployed out to the areas where they actually can make a difference, and not just serve to add a few more layers of administrative, bureaucratic red tape within the agency. That is one of my concerns.

[The information follows;]

Response of Chairman Inez Tenenbaum to Question from the Honorable Steve Womack

CPSC Proposed 2012 FTE Requests

General Function	FTEs	Office and Position Description
Data Intake/Rapid Incident Review	+18	This includes 16 Program and Triage Analysts in the *Office of Hazard Identification and Reduction* to quickly input and triage the increasing number of incident reports received by the Commission, and two Attorneys in the *Office of the General Counsel* to support data intake, incident review, and investigations.
Incident Report Investigations	+6	The six Field Investigators in the *Office of Compliance and Field Operations* will provide additional support for field investigation of consumer incident reports.
IT Modernization	+4	The four Information Technology Specialists in the *Office of Information and Technology Services* will maintain CPSC's new safety information technology systems.
Global and Small Business Outreach/Education	+2	This includes a Senior Small Business Ombudsman and a Director for the *Office of Education, Global Outreach, and Small Business Ombudsman* to increase the agency's focus on providing additional support to businesses, especially small businesses
Finance	+3	This includes an Internal Controls Officer, a Budget Analyst and an Accountant, all in the *Office of Financial Management, Planning, and Evaluation*, to strengthen internal controls.
Inspector General	+1	One Attorney is sought for the *Office of the Inspector General* to provide independent legal counsel as required by the Inspector General Reform Act of 2008 (P.L.110-409).
Total 2012 Increase Requested	+34	

And then, finally, I want to ask this question: Madam Chairman, do you actually go to the toy manufacturers? Mattel has been mentioned already, and it has been a while since I have bought a lot of toys, but go to the shelf at Toys R Us. Do you go to those manufacturers as part of your outreach and sit down with the CEOs and the General Counsel of these organizations, and actually ask, What can we do better with our agency as it concerns your capacity to deliver goods to your consumers? What can we do better? And I am not talking about the Ombudsman's program. I am just talking about: What have you done, as the Chairman, what has your Commission done to go out here and see how we can create jobs in this country, making these products for the benefit of the people that are consuming?

Ms. TENENBAUM. Thank you for that question, Mr. Womack. And yes, I do sit down with CEOs. I recently went to China and met with the five CEOs of the largest Chinese toy manufacturers. And they are Chinese. I have met with them twice now since I have been Chair. And they were telling us, and told me personally, what their concerns were with certain rules. They were also very proud that they had created a chemical database so that they are going to track every chemical that goes into a child's toy, and they would have software that recorded that. I have been, personally, up to New York to visit with the CEO and the leaders of Hasbro. I have worked with Mattel. And in fact, Kitty Pilarz, who is in senior leadership at Hasbro, Chairs the Toy Standards Making Committee for ASTM. So we meet with them and have interaction with them regularly. When we put rules out, we provide for a period of comment, and we write down every question, and we provide an answer to every question we receive, and we have comments on rules. So we work closely with the industry to develop voluntary standards, as well as mandatory. And I do make it a part of my job as Chairman to meet with people.

Mr. WOMACK. Same for apparel and strollers?

Ms. TENENBAUM. Yes. Last year, when the American Apparel and Footwear Association had their meeting, they asked me to come over and speak. And they said, You are coming into the lion's den. And I said, That is fine. And I not only gave a speech, I answered questions. I have been to children's apparel companies in China as well as the United States, to their distribution centers. I have gone to China and watched the testing that companies do on strollers and that is what I said earlier. We ought to be telling the great stories of what our American companies do to ensure the quality and the safety of their products. It is extraordinary. When you see that a stroller gets on a treadmill and for days is run over and over again through that treadmill so that it is durable and before its release, it is remarkable what our companies are doing to ensure the safety of people and that is the good story we ought to tell.

And they are working hard to get the lead out. We had a hearing the other day on what would be the impact on industry when we, in August, go to 100 parts per million. We have asked that Congress change the law so it is only prospectively applied. We had one of the largest third-party testing laboratories testify that they had already tested 90,000 units of products and have found that over

90 percent, in fact, I think it was 94 to 95 percent already are of less than 100 parts per million.

And so the industries have complied, they are moving forward. I am person whose glass is always half full. My husband and his family were in the steel business for a number of years, and I know that steel had to meet many requirements, and I never heard them complain about the requirements that steel had to have, the standards. But I am also positive when I see what American companies are doing to ensure the safety and remove the risk for customers.

Mr. WOMACK. I just want to make sure when those conversations are taking place, it is not, I am from the government and I am the bad guy; or, I am perceived to be the bad guy, and there is a reason for that because we can be your worst enemy if you are not doing certain things. I want that to be a good open line of communication because I think that is the way back to get regulation out of the business of stopping this dilemma we have called lack of job creation. Mr. Chairman, I will give it back.

Mr. DIAZ-BALART. Thank you, Mr. Womack, and again, I apologize, but we are all kind of going back and forth to other hearings. I hope that some of these issues that I am going to bring up, maybe if they have already been addressed, just let me know. The IT modernization issue, when the private sector does IT modernization, they usually then are able to shrink the size of the personnel. How many less people are you going to need if you do go forward with the IT modernization?

Ms. TENENBAUM. Well, the IT modernization goes back to the fact that we had all of this data coming in. I do not know if you were here when I talked about the amount of data; it is almost half a million from various sources. And we had them in separate systems so that when we wanted to look across all these systems, our people had to manually go through system after system. And when Congress asked us to modernize our IT system, it wanted the CPSC to have one system that you would put all those systems in a data warehouse, and so that you could see emerging hazards. Everyone in the agency could pull up the same system and would have the data in there. IT modernization will go on into governance, case management, finances; our whole system will be modernized.

Mr. DIAZ-BALART. So it will be more efficient?

Ms. TENENBAUM. It will be more efficient.

Mr. DIAZ-BALART. Right, but if you are going to be more efficient, and you just mentioned about how right now people have to do it manually, that hopefully will not be the case.

Ms. TENENBAUM. Well, we do not want to just investigate 10 percent of all the claims we have. This is our investigation rate. These were projected even before the database, that these are the incidences that keep going up, the number of reports, and we are only able to investigate 10 percent. So we are asking for 24 new people this year to look at all this data that is coming in, to look at the incidents reports, and to do investigations. We are trying to keep people safer. This is a good return on our investment.

If you look at our little agency, $118 million, 500 people, and we have 300 ports of entry, we have 19 people at those ports. We are trying to create as many partnerships as possible through our Edu-

cation, Global Outreach, and Small Business Ombudsman. We are working with other agencies, but it is a huge investment, $118 million, this little tiny agency, and we have over 15,000 products. We have 80 percent of the toys coming from China, and you know that this is a global complex supply chain. It is a good investment; it is a good return.

Mr. DIAZ-BALART. I am not denying that, Madam Chairwoman, but again, just specifically about that issue. Usually when you get more efficient, you can then, since you are more efficient and you are investing in technology which costs money, you are able then be more efficient.

Ms. TENENBAUM. Well, we were tiny to begin with. Just in 2008, we had 393 people when we used to have almost 1,000.

Mr. DIAZ-BALART. So you are not going to then reduce that with IT technology?

Ms. TENENBAUM. We are trying to be more effective in spotting dangers early. We are trying to be more effective in keeping consumers safe.

Mr. DIAZ-BALART. Okay, let me ask you this, though, now. Mr. Serrano mentioned something which I think is accurate. He mentioned that obviously if whoever, right? You could tell people you regulate yourself. Unless you have a reason to regulate yourself, whether it is for business reasons, whatever, you are not going to do it. The flip side of that is that usually if government were allowed to say, Hey, what regulations would you get rid of? unless they are forced to, they do not voluntarily usually. I think on both counts, we could probably agree that that is the case.

Mr. SERRANO. If I may, I do not know if you were here, but I think I may have coined a new phrase which is, Do not over-regulate, but do not under-protect.

Mr. DIAZ-BALART. Sure. And I think that is the balance that we all try to reach, and there is disagreement on what that balance always is. But when, for example, CPSIA, the legislation that we have been talking about, when those regulations are taking place, is there an estimate as to, when you speak to the businesses that you are going to deal with either on the legislation or anything else, as to what those regulations are going to do as far as actual cost to the manufacturers, how much it is actually going to cost them dollars-wise, which then translates to jobs or not?

Ms. TENENBAUM. Yes, well, prior to the CPSIA and before we implemented our proposed rule, we had to do a cost estimate. Now, under the CPSIA, Congress decided that we needed to promulgate rules on durable nursery equipment: toddler beds, bassinets, slings, baby bouncers, baby bath seats, baby walkers. And Congress said, Under these rules, you do not have to do a cost estimate. We are going to put CPSIA rule making under the Administrative Procedures Act because Congress had testimony that children were killed in defective cribs, play yards, and Congress wanted us to work with industry and first of all, look at the voluntary standard. And most of the rules for consumer products are voluntary. Very few are mandatory rules.

So we work with industry on the voluntary standard and look to see if it is strong enough. And if it was not strong enough, we are to come back with our own rule. We have passed baby bath seats,

baby walkers, full size and non-full size cribs. And Congress required us to have two new rules every six months proposed. Two rules every six months of proposed rules. We will vote on next week, bed rails, portable bed rails on youth beds. We just had a briefing yesterday on toddler beds. We will also do bassinets this year. So we are keeping up with the schedule, but we do not have to do cost estimates on those. But, for example, if we do upholstered furniture, which we have been working on 16 years, we will have to do a cost estimate.

Mr. DIAZ-BALART. Yes, Commissioner, do you want to comment?

Ms. NORTHUP. Yes, we do these rules, but I should say the Regulatory Flexibility Act, just the one on youth beds and rails, showed that there would be substantial harm to businesses and that it would cause some of the small businesses, primarily small businesses, to get out of business. But that does not stop us from issuing the regulation; we go ahead and do it anyway.

Mr. DIAZ-BALART. Right. So, okay, let me just see if I understood that.

Ms. NORTHUP. We are required, as the chair said, we are required to take two durable goods every six months and issue a rule. And so if we look at youth beds and rails, there really is not a lot of injury on these. The injury data is very, very low. But we are required to consider how maybe these could be made so that even and so we issued new rules. And there is substantial product difference that we are making, that we are going to require. And so, businesses that have been in this business for years, that are small, that are not going to be able to cover these sort of changes, they, and our regulatory flex analysis said there will be substantial problems for some of them, some will go out of business. But it does not stop us from issuing the regulation.

Mr. DIAZ-BALART. Let me put it this way. If it does not stop you, then.

Ms. NORTHUP. Just to require that we do it. I mean, I know, it is, I mean——

Mr. DIAZ-BALART. However, that is not part of the decision making.

Ms. NORTHUP. It is not part of the decision making.

Mr. DIAZ-BALART. In other words, it is the consequences of the decisions?

Ms. NORTHUP. We are required to do a regulatory analysis. Not only that, the law does not say. We still have to issue, what would we do? It is the law there that requires us to address every single child's durable product on a certain pace, and to consider how we can make it safer. And every one of them comes with a regulatory analysis. Some of them, the changes are because they are a product that is more likely to cause injury, or there is more. The companies themselves have evolved over the years. But in some cases, the product, there is a low incident rate, but we still are required to consider how the product might be revamped, so that it would be safer, and to issue those as mandatory standards. We are required to do that.

Mr. DIAZ-BALART. That is because of the new law?

Ms. NORTHUP. Yes.

Mr. DIAZ-BALART. And you do not have flexibility there?

Ms. NORTHUP. No.

Mr. DIAZ-BALART. That is amazing, by the way. That is truly amazing. Particularly in this day and age.

Ms. NORTHUP. Yesterday's regulatory flexibility analysis was one that certainly caught my eye because of the number of companies that they thought it would impact negatively. If you are in multiple products, you will be able to spread your cost over more products, and so there will not be a problem. But, it said that, for businesses that only make youth beds, or that are smaller businesses, that it would have a negative effect, and may put them out of business.

Mr. DIAZ-BALART. And the flipside, what would be the positive effect? Do we know what the positive effect would be, how many less deaths? How many less, do we know that?

Ms. NORTHUP. You could say how many deaths there were over the last 20 years. Over the last 20 years, do you know that?

Ms. TENENBAUM. On the toddler beds, there were two.

Ms. NORTHUP. Over the last 20 years?

Ms. TENENBAUM. I do not know if it was 20 years, but there were two because they got between the railing and the mattress and were suffocated. But the rule, the reg flex language in the toddler beds said that if you are a responsible manufacturer, and you are already following the voluntary standards, you would be impacted far less than the people who are manufacturing toddler beds, are not following the voluntary standard. It did not say that they would go out of business; it said it would have a substantial impact because then you will have to follow what was already the standard. But if you are a responsible manufacturer already following, you will have less impact. It did not say anyone would go out of business. It just said it would have a substantial impact.

Mr. DIAZ-BALART. But, if you are doing it, two is a tragedy, I mean, one is a tragedy.

Ms. NORTHUP. The problem with youth beds is that the majority of injuries occur because people, you are not supposed to use a youth bed for a child under the age of two, and it is primarily when people put a six-month-old or an eight-month-old in a youth bed, that they have an injury. But we are required to consider use and abuse. And so, if it is foreseeable that people are going to put eight-months-old in there, we have no flexibility on this with the law, in terms of whether we decide to issue a mandatory standard. That is what the law requires us to do. And it has to include use and abuse.

Mr. DIAZ-BALART. I think that is one of those things that does not quite pass the logic test. I mean, I do not know what the stats are. And again, one tragedy is a tragedy for that family, as a parent we all know that that is an incredible tragedy. But I do not know if we have stats about how many kids may die because they fall downstairs. I do not know if there is, I do not know what those are, but I guess you could put Nerf stairs so that they bounce. You could, I mean, obviously.

Ms. TENENBAUM. Use a gate, you could use a gate.

Mr. DIAZ-BALART. Right. But I mean even then. And then are we going to require a gate that closes by itself with a motion detector. The bottom line is that we could always go to the extreme. And we would like that nobody ever dies and nobody ever gets injured, ob-

viously. As a parent, that is what we would all like. But it seems to me that if you are dealing with two tragedies, and they are tragedies, some of those may be because there is misuse. And then, we can lose jobs for that, which is a huge tragedy. Because those are probably jobs that, those people might have children as well. It seems to me that that does not pass.

Ms. TENENBAUM. Well, I do not know that anyone will lose their job.

Mr. DIAZ-BALART. Well we do not know if——

Ms. TENENBAUM. Well, the top, on the durable nursery equipment, what we were seeing was a trend, in that the materials used were flimsy and the hardware was not as strong as it needed to be. Particularly cribs. We had over 30 deaths in drop-side cribs. And that is because the drop-side, if you looked at the wood, it was not the strong wood that was required for a crib. We did not require a racking test, which we are now, that we borrowed from Canada. And the hardware was plastic.

Now, we had a baby bed in our family that everyone in the family passed around. But it was a stronger wood, and the hardware was made out of metal, so it slid up and down and did not come detached from the sides. So you are seeing a lot of products that are being made that are not as durable. And that is why, when Congress heard testimony about infants and children being killed, and hurt severely, they wanted the best product.

Look at car seats. Look how strong car seats are now. Look at the strollers. When I visited the stroller factory, it was amazing to see all the tests that they put that stroller through so that a child is not harmed. And so it really is the safety of the child. It is based on the best science. It is based on the best engineering that we know. And we have worked with the Standards Committee. And I want to point out that there are probably 1,000 standards-making committees around the world. Think about that. And most of the standards for products that you use are voluntary.

Mr. DIAZ-BALART. I understand.

Ms. TENENBAUM. It pales in comparison to mandatory rules. But Congress heard testimony and they said, We want you to work with the Standards Committee, look at what the standards are for toddler beds, and if you think they can be made stronger, make them stronger. And that is what we are doing for all durable nursery products.

Mr. DIAZ-BALART. But you could always make everything stronger.

Ms. TENENBAUM. Well, this is based on the best science.

Mr. DIAZ-BALART. How many people die in automobile accidents?

Ms. TENENBAUM. Well, look at the automobiles.

Mr. DIAZ-BALART. I know, but we can make them better.

Ms. TENENBAUM. How much they have changed?

Mr. DIAZ-BALART. But we can make them better. And we can make them stronger. We can make it so that nobody dies by literally wrapping people in bubble wrap, and putting in a nerf car. I mean, we could.

Ms. TENENBAUM. But we do not feel like we are doing that. We feel like we are really using the best science.

Mr. DIAZ-BALART. I understand that. I understand that. But there gets to a point where, then, the cost benefit analysis shows you that you are going overboard. And I, again, I am not talking about this specific case, I am just saying that there is a time when you go overboard, and where are we not reaching that case, particularly in the case where, again, two tragedies, horrible tragedies, when you are dealing with two tragedies, some of those may be misuse. And then you have the potential of hurting people's businesses who have kids, and that is a tragedy as well. Are we not potentially going overboard?

Ms. TENENBAUM. We are very sensitive to that. But we also are sensitive that our mission is to keep children and families safe, and we believe that we need to be.

Mr. DIAZ-BALART. I understand that, but every day we are losing more and more jobs overseas.

Ms. TENENBAUM. Well, I think that there are a number of factors.

Mr. DIAZ-BALART. There are.

Ms. NORTHUP. If I could just say, if I had been asked what sort of changes you might make in the rule, I might make mandatory standards for durable infant goods where there is a trend towards injury related to the product and how it is made. We were not given that, nor have we sent up that, as a recommendation, but the fact is that when we change something, when we tell somebody they have to re-engineer their product, and there has been a low incident rate on dangers to them, but never mind, we do not care, do it. And they either go out of business, or lose product, or cannot, or it is prohibitively expensive to re-engineer this. That is a question that Congress will have to consider. But it would be a recommendation that I would make.

Mr. DIAZ-BALART. And finally, and again, I will submit some questions on Chinese drywall.

Ms. TENENBAUM. We have a lot to tell you on that. If you want us to meet with you personally, we certainly will. We will even come to your district and have a public hearing.

Mr. DIAZ-BALART. Thank you. Just lastly, do consumers have any responsibility to check products for quality and safety, or really is it kind of government control to do that? In other words, should government be in a position to make sure that everything is safe, and so that consumers never have to worry about checking to see if one product is stronger? Because they are all going to be as strong, or checking that one product. Is there any responsibility that we as consumers should have, or really is it that frankly should government be taking care of those issues so that consumers should never have to worry about those things?

Ms. TENENBAUM. Well, philosophically I believe that everyone has the responsibility to use products responsibly. But I also feel like the government plays a key role in working with manufacturers in coming up with the best standard possible for products. I remember when I read *The Jungle,* which was about the meatpacking industry, years ago when I was in high school and how the meat was contaminated because we had not regulated the meatpacking industry appropriately. And I remember that book from years and years ago, and what an impression that made on

me. My first job in state government in South Carolina was licensing childcare facilities and going in to old buildings that could barely pass fire safety standards, and worrying about children dying in those facilities. I have been a child advocate all my life, and my job is to protect children who cannot protect themselves.

Every week, we see some product that is pretty incredible and we all say, Good gracious, why would anybody think that the use of that would be safe? We looked at one yesterday, and it is almost unanimously, Oh, that is so unsafe. So we have to balance that. You cannot over-regulate, but you also have to look at who your most vulnerable citizens are, and that is children and elderly people, and people who cannot take care of themselves.

So I think it is good that we have a rule that says you have to have a voluntary standard first, and the industry has to govern itself. And if you find that that standard's not effective in keeping people safe, then you can write a mandatory rule. I think that is the way it should be. And the great majority of rules are voluntary rules that industry makes themselves. And like I said, there are probably 1,000 standards-making bodies around the world, and they work very hard to make sure that the standards are the best that they know. It is our job if we have new scientific information to work with them to improve these standards. And that is basically my philosophy.

Ms. NORTHUP. First of all, we do not oversee products because they are flimsy. I mean, because a product is flimsy, because it breaks, we do not have any oversight of that. It is only if it has the potential to injure somebody that we have a responsibility for it. So, yes, somebody going in. But remember, there are plenty of families that are of modest income, and they go in and they look at a crib, and they are judging, What can I afford? And they have to presume that every crib there on the floor is going to be safe.

I remember as a mom myself thinking that was not what I was thinking. I was thinking would it last, sort of thing. And so if it is unsafe, that is where we have a responsibility. It is this law that required us to make mandatory standards that what the chair just said is exactly right. We should have voluntary standards, and when we see that there is a danger, and the voluntary standards are not sufficient to protect children, then we should make a mandatory standard. The law did not allow us to do that.

Mr. DIAZ-BALART. Thank you. Mr. Serrano. I believe you Ms. Northop.

Mr. SERRANO. Just a closing statement because I need to leave, myself. The database does exactly what you mentioned. It puts responsibility on the consumer to put forth information, and then it allows the manufacturer to say yes or no and defend themselves. Secondly, what role does the consumer play and should government play a role? Well, our colleague, Henry Waxman, I remember, I am old enough to remember this, asked the tobacco company over and over and over at public hearings for a series, for a number of years, How harmful are you? And each one said, Oh, we are not harmful at all. It is fine. And we now know differently.

And lastly, one of the attacks these days is on labor unions. Labor unions have too much power. Well, how did they gain some power? Because there is an HBO special running around now, sad

special, about 146 women who died at the shirt factory in New York because there were no rules and no regulations whatsoever. And so yes, we do not want to over-regulate, but as I said, we need to protect. And there is the balance.

But this knee-jerk reaction that we hear from some folks in this country, not necessarily Members of Congress, that everything is over-regulation, no. The commissioner is right. You go into the store to buy a crib, and the issue should not be because I cannot afford the more expensive crib, am I getting a bad crib unsafe for my child? That person should know that whether it is a $50 crib or a $500 crib it is safe for their child. And if their work is to make sure that happens, I do not think that is over-regulating. That is actually protecting the consumer. And I thank you for your testimony. It has been a wonderful hearing. But do not get up until the chairman.

Mr. DIAZ-BALART. Thank you, Mr. Serrano. You and I here do not have a philosophical disagreement. We may have a disagreement as to how much over-regulation there may be or not, but I think we have heard it from both of you today that there are some issues where we may have gone overboard, where they do not have flexibility.

Mr. SERRANO. Well, you are coming from a point that makes sense to me which is that you know that the big Yankees payroll was beaten by the Marlins team with a payroll of about $1.50, and so you say less is better. Well, maybe not.

Mr. DIAZ-BALART. Mr. Serrano, I still detect a little bitterness there on that one. I do. I just do. And I know you cannot help it, and it is okay. Let me just thank both of you. This has been, I think, one of the most really illuminating hearings that I have had the privilege of being with in a long time. You both have put issues on the table, you have done so straightforwardly and have taken our questions and answered our questions. I just cannot thank you enough. And we hopefully will continue this conversation, because both of you have just been wonderful today. Thank you so much.

Ms. TENENBAUM. Thank you so much.

House Committee on Appropriations
Subcommittee on Financial Services and General Government
Hearing on the Consumer Product Safety Commission FY 2012 Budget
March 31, 2011

Responses of Inez M. Tenenbaum, Chairman,
U.S. Consumer Product Safety Commission

Questions Submitted by Chairwoman Jo Ann Emerson

RECREATIONAL OFF-HIGHWAY VEHICLES

Mrs. Emerson: I understand that the Commission is moving forward with a mandatory safety standard for Recreational Off-Highway Vehicles. At the same time the industry continues to work to evolve the existing voluntary standard in consultation with the Commission.

Does the Commission believe they have an active partner in addressing safety concerns with the Recreational Off-Highway Vehicles manufacturers?

> **Mrs. Tenenbaum:** In my view, we have an active partner in addressing safety concerns with the Recreational Off-Highway Vehicles manufactures.

Mrs. Emerson: And does the Commission intend to pursue further mandatory safety standards beyond the voluntary standards being jointly developed?

> **Mrs. Tenenbaum:** If staff finds that the voluntary standard does not adequately protect consumers from undue risk of death or injury, or if there is not sufficient compliance with the voluntary standard, I believe the Commission will pursue mandatory safety standards.

BUDGET

Mrs. Emerson: The budget request proposes $400,000 for a new office of Education, Global Outreach, and Small Business Ombudsman.

Why does the agency need this office?

> **Mrs. Tenenbaum:** The need for this office has existed for some time but became even more apparent during the agency's recent strategic planning process. As the Commission explored implementing each objective within the new strategic plan, it had to assess whether any gaps currently existed that would restrain or prohibit it from achieving each of its objectives.
>
> The most pressing gap identified was the lack of any institutionalized, coordinated approach to education and outreach activities. The CPSC's current office structure does not allow for an easily coordinated approach to these activities, and its current service

and product offerings either did not accomplish the objectives or were insufficient to allow implementation of certain action items. The strategic planning process also highlighted the need for CPSC to be responsive to the changing realities of the global consumer product environment and this required an increased emphasis on education, coordination, outreach, collaboration, and other similar partnering initiatives.

To address these issues, the Commission created the Office of Education, Global Outreach, and Small Business Ombudsman. This new Office will absorb the existing personnel and infrastructure of the Office of International Programs and Intergovernmental Affairs and the Small Business Ombudsman. Accordingly, I anticipate that a maximum of four new full-time equivalent (FTE) positions will be added to the new Office, assuming funding is available.

Mrs. Emerson: How does the agency currently work with small business? Given their importance to our economy I hope this is something you are already doing.

Mrs. Tenenbaum: The Commission acknowledges the unique contributions that small businesses make towards growing and sustaining our economy. For over two decades, the Commission had a staffer that worked on small business outreach issues. However, this position was reduced from a full-time position to a part-time position due to budget cuts in recent years.

In September 2010, the Commission addressed this situation by creating the position of Small Business Ombudsman within the newly formed Office of Education, Global Outreach, and Small Business Ombudsman to further assist small businesses. With this position, the Commission realized that the agency needed to seek new, cutting-edge ways of reaching out and working cooperatively with small businesses to assist them in developing innovative products that are both safe and compliant with the agency's regulations.

The Small Business Ombudsman serves as a resource for the small business community in several ways. First, the Ombudsman has reached out to small business trade organizations to listen to their members' concerns and, in turn, to bring those concerns back to agency staff for serious consideration and action. The Ombudsman also has spoken at trade events, participated in interviews, and written articles for trade publications. Through these conversations and events, the Ombudsman serves as an important and informal way for agency staff to learn about what is happening in the marketplace in order to make better informed decisions.

Second, the Ombudsman maintains a website and a dedicated toll-free telephone number from which he fields a variety of daily inquiries from small manufacturers, importers, suppliers, and retailers, providing them with timely, easy to understand answers to their questions. The agency has received excellent feedback from these businesses about the clarity of answers and level of customer service provided.

Third, the Ombudsman is developing new educational materials to help small businesses of all levels of sophistication to gain more understanding of their responsibilities to comply with consumer product safety laws. For example, the Ombudsman has produced a new series of summaries titled, "How Does This Affect My Small Business?" and is rewriting the "Frequently Asked Questions" area of the Consumer Product Safety Improvement Act of 2008 (CPSIA) page on our website in accordance with the Plain Writing Act of 2010 (P.L.111-274), a project which the agency expects to rollout this summer with the full modernization of our website, CPSC.gov.

In addition to the Ombudsman, the Chairman, the Commissioners, and the agency's staff are often engaged with small business in providing compliance and technical answers to their concerns. Agency staff, many of whose phone numbers are available on our website, are widely recognized as being accessible to stakeholders, including small businesses, to address their concerns and questions.

I believe strongly in the importance of small businesses and fully support the Small Business Ombudsman position as an important and dedicated way to ensure that small businesses receive the guidance and information they require for their businesses to continue to grow and prosper.

Mrs. Emerson: Are the functions performed by this new office already being performed elsewhere within the CPSC?

Mrs. Tenenbaum: The primary function of the new office is to coordinate and provide education and outreach activities to various domestic and international stakeholders, including manufacturers, retailers, resellers, small businesses, foreign governments, and consumers. While some of the functions of the new office are currently being performed elsewhere within the CPSC, the current state does not allow for an easily coordinated approach to these identified activities. There are also a number of functions this office will perform that are not being performed currently by the Commission. These primary functions and stakeholders include:

- Manufacturers: In the current Commission office structure, there is no single source for manufacturer-related safety information. Consequently, many manufacturers either do not know where to turn for this information or experience difficulty in accessing the information they need to fully address safety in the manufacturing process. The new office is dedicated in part to addressing this issue, and will facilitate the transfer of knowledge to industry and ultimately create safer products through better educated manufacturers. The office also will consult with industry to address issues such as quality assurance in the manufacturing process to assist manufacturers in producing products fully compliant with all relevant safety standards and requirements.

- Retailers and Resellers: The office will benefit retailers and resellers through coordinated education and outreach activities. One of the largest issues this new office will address is developing a system by which retailers and resellers are

informed of product recalls and other important safety information, including instructions on how to respond to this information in a timely fashion.

- Small Businesses: With the passage of the Consumer Product Safety Improvement Act of 2008 (CPSIA), a part-time Small Business Ombudsman is no longer sufficient to meet the Commission's needs. The CPSC requires a full time individual dedicated to serving the nation's many small businesses in the area of consumer product safety. Additionally, the Small Business Ombudsman will be charged with developing and providing information and guidance specifically tailored to small batch manufacturers so that they can understand and comply with applicable safety standards and the CPSC's regulatory requirements.

- Foreign Governments/Regulatory Bodies: Foreign governments and regulatory bodies rely on the United States for assistance in developing their own regulatory standards, and the new office will serve as a coordinated business unit to assist with this activity. This will allow the CPSC to enhance its outreach to the international community. Working with these foreign bodies, the office will enable these organizations to increase their capacity to develop product surveillance strategies, product testing methods, and voluntary and mandatory product safety standards. Finally, given its interaction with the various domestic and international stakeholders, the office will be responsible for all CPSC harmonization efforts.

- Consumers: The CPSC already engages in numerous communication and outreach activities for consumers, which are the responsibility of the Office of Information and Public Affairs (EXPA). Although the new office will not assume this role, it is intended to be the primary supplier of education and outreach-related subject matter and expertise to other stakeholders. Consequently, the new office will work closely with EXPA to better educate all stakeholders on consumer product safety and to ensure message consistency and discipline across all stakeholder groups.

DATABASE

Mrs. Emerson: Can you tell me how much this database has cost up to this point, and how much it will cost to maintain it per year?

Mrs. Tenenbaum: In presenting its annual budget, the Commission has not separated the cost of the public database from the overall Consumer Product Safety Risk Management System (CPSRMS) information technology modernization costs. Below, however, is an estimate of the work done within the CPSRMS project to develop the public database and the projected cost to maintain the public database. These estimates have been established after reviewing workload associated with the public database.

Portion of the Consumer Product Safety Risk Management System Costs
Dedicated to the Public Database

	FY 2009	FY 2010	FY 2011	FY 2012	FY 2013	Total
Development	$1.450	$1.000				$2.450
Operations and Maintenance		$0.400	$0.050	$0.050	$0.050	$0.550
Total	$1.450	$1.400	$0.050	$0.050	$0.050	$3.000

Please note that the costs (in millions) above include contracted goods and services by fiscal year. Costs in fiscal years 2009 and 2010 are based on actual obligations. Costs in fiscal years 2012 and 2013 are for planning purposes. Costs in fiscal year 2011 are a combination of actual obligations and are for planning purposes.

Mrs. Emerson: Why has there been so much confusion over the cost of this database?

Mrs. Tenenbaum: Some have confused the fractional cost of the public database with the overall cost of the Commission's upgrade of its information technology (IT) systems to the Consumer Product Safety Risk Management System (CPSRMS). While the public database is a part of the CPSRMS, it is only small portion. The CPSRMS IT modernization includes:

- improving our internal operational processes to more efficiently identify emerging hazards regardless of the source of the information;
- putting all the information we receive (only about 20 percent of which are candidates for the public database) into a common database for better hazard identification. This includes information such as mandatory manufacturer reporting required by section 15, manufacturer responses to staff inquiries required by section 6(c), medical examiner reports, to name a few;
- bringing the way we interact with consumers and businesses into the modern age using an online portal rather than U.S. postal mail;
- improving data quality, reducing or eliminating manual and redundant processing, and making better use of the collective knowledge of the staff;
- modernizing the Commission's home page, www.cpsc.gov to improve public outreach and education. A critical component of this project is cleaning up thousands of published documents to help the consumers and businesses find what they are looking for faster; and
- making IT governance improvements, including improvements in IT contract management, IT budget management, Capital Planning and Investment Control, Enterprise Architecture, Information Assurance, Project Management, and Independent Verification and Validation.

CPSC has obligated approximately $23.2 million from the end of Fiscal Year 2009 to the end of April 2011 for the entire CPSRMS program. Of this, only $2.85 million has been

obligated to cover the public database portions of the CPSRMS program. As noted in the chart above, the Commission anticipates obligating approximately $50,000 annually in FY 2011, and in subsequent fiscal years, to operate and maintain the public database portion of CPSRMS.

Mrs. Emerson: How many new people are needed to administer the database?

Mrs. Tenenbaum: The CPSC has requested four additional personnel (FTEs) and four new contractors to administer the public database (data intake). This increase in personnel is necessary to meet the quick turnaround required of staff to process these reports. The CPSC also needs less than one FTE on the IT side to operate and maintain the public database.

Mrs. Emerson: Do you believe the number of FTEs requested is an accurate number?

Mrs. Tenenbaum: Yes, we believe the above number is accurate.

Mrs. Emerson: Do you have concerns regarding the accuracy of the information published on the database?

Mrs. Tenenbaum: No; the statute, and the Commission's final rule at 16 C.F.R. §1102, achieve the correct balance in providing accurate information to the public in a timely manner while also ensuring that manufacturers of consumer products have a reasonable chance to respond to reports about their products.

The law sets forth at least six provisions which help to ensure the accuracy and integrity of reports of harm published in the database:

First, reports must contain eight minimum requirements in order to be included in the database. This ensures that the quality of the report is sufficient to be helpful to others.

Second, the law requires that the submitter verify the truth and accuracy of the report. This verification applies to all information contained on a report, including the submitter's affiliation, name, and address.

Third, submitters must include their name and contact information for a report to be eligible for publication. If a question arises about the validity of a report, CPSC has the means to investigate these incidents.

Fourth, both the CPSC and manufacturers have the ability to post comments about a report, and to make a claim that a report contains materially inaccurate information (MII). The CPSC endeavors to make a decision on all timely submitted MII claims before a report is published in the database. Thus far, we have been successful at resolving these claims in a reasonably short time frame.

Fifth, both the CPSC and a manufacturer that receives the submitter's contact information can conduct further investigation into the incident described in the report, including the identity of the submitter. Many submitters are providing their contact information to manufacturers, but it is unclear whether manufacturers are taking advantage of the opportunity for follow up with the submitter.

Sixth, as the CPSIA requires, the Commission provides a clear and conspicuous notice that the CPSC does not guarantee the accuracy, completeness, or adequacy of the contents of the Publicly Available Consumer Product Safety Information Database.

Mrs. Emerson: Is it true that other persons, aside from those directly harmed, can submit complaints to the database?

Mrs. Tenenbaum: Yes. In the interest of public safety and our statutory mission to protect consumers from unreasonable risk of injury related to the use of consumer products, we have always accepted reports from any source. This is consistent with our experience in maintaining a database of consumer product incident reports that assists in our efforts to remove products from the marketplace that pose a substantial product hazard.

Our mission to protect the public would not be served by excluding reports based solely on the person that submitted it to us. Section 6A(b)(2)(B) of the CPSA reasonably relies on the nature and quality of the information provided to determine whether a report is eligible for publication in the database. Currently, in addition to those "directly harmed," parents, guardians, and family members are an important source of information collected for the most vulnerable segments of the population. In the most basic example, if the user of a consumer product is killed or seriously injured in the incident, or is an infant, he or she will be unable to enter the report. Parents, for example, may enter information related to consumer products used by their children, regardless of whether they personally witnessed the incident or purchased the product. Restricting reports to only those people directly harmed would ensure that all deaths and the vast majority of serious injuries would be excluded from the database.

Manufacturers have a means to publicly respond to reports in the database by submitting a general comment that will display with the report. For those few reports where a manufacturer believes that knowledge of the incident is lacking and detrimental to a basic understanding of the incident, it can state this in a comment on that report for the public to view and consider.

Mrs. Emerson: Why did the CPSC not require the submissions come from firsthand knowledge of incidents of harm?

Mrs. Tenenbaum: Congress did not write Section 212 of the CPSIA to require firsthand knowledge of incidents of harm. For instance, the statute permits medical and safety personnel — most of whom Congress recognized are unlikely to have firsthand knowledge of incidents — to submit reports of harm. To have attempted to require

firsthand knowledge not only would have undermined the safety purpose of the public database, but also would have been contrary to the plain language of the statute.

Mrs. Emerson: How will the CPSC handle information regarding complaints about one type of model of an item? For example, how will consumers know that the information posted is not regarding every model of an item that a company makes?

Mrs. Tenenbaum: Most of the reports submitted thus far contain helpful, product-specific detail, including model numbers where they exist. The report form instructs submitters to provide as much detail about the product as possible, including specific requests for the model number, serial number, and UPC code. As of April 11, 2011, 85 percent of database eligible reports submitted since the March 11, 2011, launch had a nonblank value for model or serial number.

Furthermore, a report without a model number does not necessarily mean that the product has been insufficiently described. Some products, such as certain types of imported drywall, do not have model numbers. In addition, model and serial numbers are often destroyed in serious product incidents, such as fires.

Mrs. Emerson: Does the database require specific model numbers be submitted?

Mrs. Tenenbaum: As mentioned immediately above, it would be counterproductive to require a model number before a report of harm may be published in the public database. Although the database does have a field for entry for model number, serial number, and any other product specific information, it is important to note that some products, such as certain brands of imported drywall, do not have model or serial numbers. Moreover, in serious product incidents the model number may have been destroyed, along with the product.

While we agree that it is better to have detailed product information in a report, we do not agree that there is one field that will always ensure that sufficient information for every consumer product is provided. Making the model field mandatory rather than simply optional as is the case today is not a practicable solution where such information does not exist. Most report submitters, however, are providing detailed product information, including the model number, when they have this information.

IMPACT OF REGULATION

Mrs. Emerson: Many of the CPSC's rules have an impact on manufacturers both large and small. It seems to me that these rules also have a large impact on consumers, giving them less choices and higher prices.

When promulgating rules, how does CPSC consider their impact on businesses and consumers?

Mrs. Tenenbaum: Consideration of a rule's potential impact on businesses and consumers often depends, in large part, on the nature of the rule itself. For example, we sometimes engage in technical amendments to our regulations to update them or to reflect

new technologies; the affected industry may bring to our attention the need to amend or modify a rule, and we then consider the issues raised before engaging in rulemaking.

Furthermore, the processes that apply to some regulations, such as our regulations on durable infant or toddler products pursuant to section 104 of the Consumer Product Safety Improvement Act of 2008, require us to consult various groups, including representatives of consumer groups, manufacturers, and others, as part of the rulemaking process.

Finally, for our proposed rules, as well as our interim final rules, we provide an opportunity for public comment, and this provides yet another avenue for our consideration of a rule's potential impact on businesses and consumers. It also bears mentioning that, in almost all cases, we provide an opportunity for public comment on our interpretative rules even though the Administrative Procedure Act does not require us to do so.

Mrs. Emerson: Does the Commission do cost benefit analyses before promulgating rules? If not, why not? If so, how comprehensive is the cost benefit analysis?

Mrs. Tenenbaum: The underlying statute determines whether the CPSC engages in a cost-benefit analysis for a particular rule. For example, section 9(c) of the Consumer Product Safety Act (CPSA) requires a description of the potential benefits and costs of a proposed rule, "including any benefits or costs that cannot be quantified in monetary terms, and an identification of those likely to receive the benefits and bear the costs." Section 9 of the CPSA establishes the procedure for consumer product safety rules. Section 3 of the Federal Hazardous Substances Act (FHSA) establishes the rulemaking procedures under the FHSA and contains language that is almost identical to section 9(c) of the CPSA.

In contrast, the Consumer Product Safety Improvement Act of 2008 (CPSIA) does not contain a cost-benefit analysis requirement for rules issued pursuant to the CPSIA.

However, for all rules that are published pursuant to the notice and comment rulemaking requirements of the Administrative Procedure Act or other laws, we engage in a Regulatory Flexibility Act analysis. This analysis requires us to evaluate whether the rule will have a significant economic impact on a substantial number of small entities.

Mrs. Emerson: Can you think of any rules currently in place that are redundant?

Mrs. Tenenbaum: If the rulemaking process suggests that a new rule would be redundant to an existing rule, we take steps to eliminate the redundancy. For example, section 104 of the CPSIA expressly mentioned full-size and non-full-size cribs as products to be addressed by rulemaking, yet the Commission already had regulations pertaining to such cribs. Consequently, when we engaged in rulemaking to adopt a new safety standard for full-size and non-full-size cribs, we simultaneously began the process to revoke the older crib regulations.

STOPPING HARMFUL PRODUCTS AT PORTS OF ENTRY

Mrs. Emerson: I am encouraged by the CPSC's Memorandum of Understanding with Customs and Border Protection. By stopping harmful products at our ports of entry, the CPSC is using resources to proactively stop harmful products from reaching the U.S. market. As I understand, once products are in the market, it is very difficult to recall a significant amount.

Is this program a priority for CPSC?

Mrs. Tenenbaum: The Import Surveillance program is one of my top priorities. I believe an effective approach to ensuring that harmful products never make their way into the hands of consumers is to stop them from entering our country.

To that end, I have taken a number of steps to add additional technological resources and personnel to the Commission's Import Surveillance Division. This Division works directly with the Department of Homeland Security (DHS) and Customs and Border Protection (CBP) to keep dangerous products out of the United States.

As you noted in your question, the CPSC recently executed two interagency Memorandums of Understanding (MOUs) with CBP that allow us to access more "real time" importer information and target the most dangerous incoming shipments. The first of these MOUs, signed in April 2010, allows CPSC personnel to work at CBP's Commercial Targeting and Analysis Center (CTAC) in Washington, DC, and access real time manifest entry data collected by CBP. This, in turn, allows Import Surveillance Division personnel at the ports to target high-risk shipments prior to their entry into the domestic stream of commerce.

The second MOU, signed with CBP in August 2010, gives the CPSC access to information in the Treasury Enforcement Communications System (TECS). This will assist CPSC Import Surveillance staff at the ports by providing them with additional information to improve local targeting and interdiction of dangerous products.

The CPSC is also actively involved in supporting the Importer Self Assessment – Product Safety (ISA-PS) initiative that is currently being piloted by CBP. The ISA-PS is intended as a partnership among CBP, CPSC, and importers to ensure product safety compliance. It is based on a voluntary approach that provides meaningful benefits to importers who demonstrate readiness to assume additional responsibility for managing and monitoring their own product safety compliance.

We have also taken steps to increase CPSC's physical presence at ports of entry. In FY 2008, the Import Surveillance Division had only five full-time employees (FTEs), and of those only three FTEs were actually stationed at ports of entry. Today, the Division has 25 FTEs, with 19 FTEs collocated at 15 different ports of entry.

AVOIDING DANGEROUS PRODUCTS

Mrs. Emerson: What advice can you give the parents of young children to avoid lead and other dangerous elements in children's products?

Mrs. Tenenbaum: First and foremost, parents can check for product recalls at CPSC's website (www.cpsc.gov) and subscribe to CPSC's email subscription list to receive recall notices and other consumer product safety information. Parents also can review recall information as well as the experiences of other parents with products (and share their own experiences if they wish) at www.saferproducts.gov.

In addition, parents should not allow young children to play with cheap metal jewelry that may possibly contain lead and other potentially toxic heavy metals.

Finally, we encourage parents to make sure their children wash their hands often, especially before they eat and before nap time and bed time.

Questions Submitted by Ranking Member Serrano

IMPORT SURVEILLANCE DIVISION

Mr. Serrano: The CPSC instituted the Import Surveillance Division in 2008, an effort to place CPSC investigators at major U.S. ports to reduce the number of unsafe products that make it to store shelves in the first place. I think we can all agree that this is a prudent use of taxpayer dollars - stopping the harmful products before they get to the store is the best way to prevent future harm and recall efforts.

Can you describe for us how this effort is progressing and what the CPSC has learned in the years since implementation?

Mrs. Tenenbaum: Since creating the Import Surveillance Division in 2008, we have learned that CPSC's resources to support import work are grossly underrepresented as compared with other agencies with similar missions, such as Food Safety and Inspection Service (FSIS) and Food and Drug Administration (FDA). Even with limited resources, CPSC continues to pursue valuable partnerships with Customs and Border Protection (CBP) to advance the import safety mission: including updating of information sharing agreements, performing joint inspections on importers with dual agency histories, and piloting the use of CBP labs to perform product testing for lab violations.

The current 19 port inspectors stationed at ports of entry, with support from CPSC compliance field investigators and scientists, are able to inspect approximately 7000 products per year and, of those inspections, about 1750 products are sampled from shipments that are held. These collocated staff, however, cover only 15 of the 327 ports where goods enter commerce.

In an effort to maximize interagency resources, we also have stationed two staff at the Commercial Targeting and Analysis Center (CTAC) located at CBP in Washington, D.C. This office is a fusion center of many health and safety agencies that work on stopping products with overlapping jurisdictional issues to avoid duplication of resources.

CPSC Import Staff, along with CBP, have prevented more than 13 million units of non-complying products from entering the U.S. market. As our targeting methodologies evolve, and we are able to further increase staffing in the Division, we hope to further reduce the number of violative and harmful products entering the marketplace.

Mr. Serrano: What percentage of imported products are currently tested and can we expect that someday soon every product sold on store shelves in America has been tested for safety?

Mrs. Tenenbaum: The percentage of imported tested products is impossible to state with complete accuracy. The vast majority of reputable businesses appear to be complying with the law and, in particular, the implemented testing requirements of section 102 of the CPSIA. CPSC strives toward the goal of having as many consumer

products as possible, particularly children's products, tested or examined for safety prior to importation into the U.S. stream of commerce.

Through developing the risk assessment methodology for identifying non-compliant imports, as directed by the CPSIA, CPSC will make strides toward that safety testing goal by becoming better at identifying the noncompliant importers who might attempt to bring in untested products.

COMMISSION STAFFING LEVELS

Mr. Serrano: The CPSC has seen a steady decline in staffing levels over the years. Staffing levels peaked at about 1,000 in 1980 and now stand at around 550. This year's request would allow the agency to hire an additional 34 people to fill areas of critical need.

Is there a target staffing level that you think the Commission needs to be at in order to successfully implement and enforce our consumer protection laws?

Mrs. Tenenbaum: Any target staffing level CPSC would provide today must be a short term target. This is because there are rapid changes occurring globally that affect the safety of consumer products and require action by CPSC. The volume of consumer product imports has skyrocketed, with the value of imports from China and Hong Kong quadrupling from 1997-2008, resulting in a record number of recalls in 2007 and 2008 (e.g., recalls for lead paint in children's toys, powerful magnets falling out of toys that could be ingested by children and dangerous cribs).

There also has been a shift in recent years to explosive growth in import volumes from the rapidly industrializing nations of India, Thailand, Mexico, Brazil and Malaysia. Manufacturers in these countries often lack the quality control systems that aid in the development of safe consumer products. Additionally, the complexity of global supply chains has increased so that today, a single product can contain safety-critical components provided by between 10 and 100 different suppliers.

At the same time, incidents reported to CPSC have increased by 66 percent from 2005 to 2010 and are forecasted to increase another 36 percent from 2010 to 2015. However, the percent of incidents we can investigate has decreased as our resources have not kept pace.

To address these developing trends, Congress mandated that the CPSC promulgate numerous new safety rules through 2015 under the Consumer Product Safety Improvement Act (CPSIA), adding significantly to the agency's workload. With the passage of CPSIA, rulemaking activities increased more than threefold, from seven rules per year from 2000 through 2008 to 26 per year for 2009, 2010 and proposed in 2011. Each new rule increases the need for long term enforcement throughout the nation and at the more than 300 U.S. ports of entry. Experience shows that enforcing a new rule takes considerably more resources than enforcing an existing rule that has been in place for a number of years.

While we cannot estimate a long-term target staffing level, we believe that future growth will be needed to staff our safety programs commensurate with the size and scope of the issues facing us. Our 2012 request includes 610 FTEs and we believe this staffing level to be justified to minimally meet challenges facing the agency. However, CPSC is charged with providing the only national consumer product safety program for over 15,000 types of consumer products, so it is likely that additional future growth will be needed.

Mr. Serrano: In what areas is the Commission in the greatest need of adding staff?

Mrs. Tenenbaum: With over $1.5 billion in container import shipments entering the U.S. each day, monitoring the safety and quality of all imported consumer products is an extremely challenging task. Investigators at the ports work hard on a daily basis to stop unsafe products from entering the country, as well as collect samples suspected of safety violations and verify third-party certifications. The port investigators send import samples to our laboratory staff and other scientists for in-depth testing and analysis, and to compliance officers for corrective action against bad actors.

As we look into the future, CPSC's greatest staffing need will most likely come in the area of import surveillance: requiring additional investigators at the ports, as well as additional staff to support their efforts, such as compliance officers and scientists. Ultimately, with a more visible investigative presence at the ports, we will be more proactive, and consequently more successful, in stopping harmful and violative consumer goods from ever entering the country.

Questions Submitted by Congressman Tom Graves

DATABASE

Mr. Graves: With the recent launch of the Consumer Product Safety Information Database in the past few weeks there is concern that reports of harm can be submitted by individuals that wish to do damage to their competitors by submitting erroneous information. If the database is to be effective the CPSC needs to ensure the utmost accuracy of those individuals that submit information to the database.

What specific steps are in place to validate the identity of individuals that are submitting the information for the database to make sure they "are who they say they are"?

> **Mrs. Tenenbaum:** Congress required protections against false information being submitted to the public database and the Commission has implemented those protections. One of the eligibility requirements for the public database is that the submitter of a report of harm verify that they have reviewed the report of harm and that the information in the report is true and accurate to the best of their knowledge.
>
> For reports submitted via the public portal, the user cannot submit the report until they attest to the following: "I certify that I have reviewed the report and the information provided in it is true and accurate to the best of my knowledge, information, and belief." A submitter's verification of the truth and accuracy of a report includes the submitter's affiliation, name, and address. Also, we explicitly state in our rules that we will take appropriate legal action against individuals who submit false information to the government through the database.

Mr. Graves: To date, have you found any instances of falsified individuals or actual individuals whose identities were stolen to submit information?

> **Mrs. Tenenbaum:** No. To date, the CPSC has not found any instances of falsified individuals or actual individuals whose identities were stolen to submit information.

Financial Services and General Government Subcommittee
Hearing on the Consumer Product Safety Commission FY 2012 Budget

Questions for the Record for Commissioner Northup
Submitted by Chairwoman Jo Ann Emerson

BUDGET

Commissioner Northup, I noticed that you did not sign off on the CPSC's fiscal year 2012 request. Can you tell the Committee why you did not approve the budget request and what your specific concerns are with the request?

I did not support the Commission's overall 2012 budget request of $122 million, because it calls for an increase of $3.8 million over current funding levels. I believe we could be doing much more with less. Given the imperatives of reducing the national deficit and controlling federal spending, as well as requests from the Commission's House and Senate oversight committees to reduce our spending, we as Commissioners have a responsibility where possible to cut, modernize or otherwise change our programs to ensure that we are using our resources efficiently and not straying from our core mission of safety. Where we are bound by statute to take actions we believe are not in the public interest, it is our responsibility to bring that fact to the attention of Congress so that it can devise a legislative solution. Notwithstanding the obvious importance of these responsibilities, I am unaware of any rule making decision of the Commission as currently constituted that has taken into account the impact on the agency's budget, and rarely has the outcome of any rule making been influenced by consideration of its impact on American consumers or businesses.

Since starting my job as Commissioner in August of 2009, I have seen ways in which the Commission uses its resources both effectively and ineffectively. As mentioned in my written testimony, I believe the Commission has used its resources effectively in expanding its coordination with the U.S. Customs and Border Patrol, increasing our enforcement capabilities at the border, and through creative uses of social media to educate the public about product hazards. Each of these activities demonstrates that if we target our resources appropriately, where we know consumers are at risk, and using the most effective means of responding to such risks, we can do a lot of good.

Unfortunately, a majority of the Commission's time and resources since I have been a Commissioner have been spent on implementing the CPSIA, a law that largely is not based on risk. Implementation of the law and its non-risk-based, costly, lead and phthalates standards, and testing and certification requirements have taken up most of the time of the agency's top staff and has required the Commission to delay or forego its traditional risk-based rulemaking priorities. For example, since 2008 there has been a significant delay in progress on actions to address safety hazards, such as promulgating standards to reduce the risk of death and injuries caused by cigarette lighters, table saw blades and portable generators. Instead, the agency spends time and resources debating such topics as the amount and degree of testing to impose as

part of the CPSIA's Testing and Certification rule – and enforcing the law's lead standard, which bans lead in books, bicycles and other products that do not present a harm to children.

My primary request to Congress would be to amend the CPSIA to allow the Commission to refocus its resources and expertise on what it does best—assessing risk. This change, in addition to the agency's new and improved enforcement efforts at the border, would free up agency resources and allow us to better target the funding Congress provides. Certainly, it would allow us to reduce our 2012 budget request. However, because this is primarily an authorizing issue, I would also suggest two immediate ways that the Appropriations Committees can effectively reduce the agency's budget in the coming fiscal year, while maintaining our commitment to safety:

1) First, prohibit continued funding for the new public database until the Commission's regulations ensure that the information contained in a report of harm is verifiable, and the Commission has established an effective procedure for resolving a claim of material inaccuracy before a report of harm is put on the Database. Otherwise, the Commission and manufacturers will continue to be unable to determine the accuracy of some incidents, and the database will continue to contain incident data that is inaccurate and unhelpful to consumers. A database full of inaccurate information is not only wasteful; it misleads consumers who will use the imprecise or erroneous information on the database to select less safe products for purchase. In one recent example, the Commission discovered on its own after posting an incident report to the public database that it inaccurately identified the product's manufacturer. The incorrectly identified manufacturer had not been given sufficient information even to make a claim of material inaccuracy. Now, the agency has submitted a budget requesting new FTEs whose primary function will be related to the database, including IT staff, investigators, compliance and legal staff to review incident reports. All of this could have been done much more efficiently had the rulemaking included protocols to reduce the submission of inaccurate information in the first place.

2) Second, prohibit funding for the Commission to implement any *new third-party testing and certification requirements* of the CPSIA. As discussed at the hearing, such requirements are clearly the most burdensome and costly of any of the CPSIA's non-risk-based requirements. Requiring that all components of all children's products (age 12 and under) be tested at third-party, CPSC-accredited labs is unnecessary to ensure safety and simply adds layers of costs for manufacturers—primarily small manufacturers, who cannot achieve economies of scale. Of course, the Commission would maintain its authority to impose such requirements on specific products if it were necessary to address a risk. This will ensure that our focus is on ensuring safety rather than on enforcing standards and paperwork requirements entirely unrelated to risk.

The budget request proposes $400,000 for a new office of Education, Global Outreach, and Small Business Ombudsman. Why does the agency need this office?

I have many concerns about this new office, and declined to support its creation. I believe the office's stated objective of having a "coordinated approach to industry education and outreach activities" can be achieved by existing Commission offices. I am also concerned that the office will follow the usual expansionist path of government. Whenever a new office or program is created by the federal government, it seldom shrinks or even maintains the same budget, regardless of whether the need for it exists or continues over time. For example, what began as a proposal to expand a part-time Small Business Ombudsman position at the Commission to a full-time position (in our fiscal year 2011 budget), later swelled to include the current proposal for "global" outreach, a new Director, and an unspecified budget and number of staff. However, now that both the President and Congress are calling for shrinking or freezing federal spending over the next several years, it seems particularly ill-advised to promote new spending on an office that we do not need.

When the Commission, by a 4-1 vote, created the new office, the office had no specified total number of staff or budget. Under the current plan, the new office will include the current Office of International Programs and Intergovernmental Affairs (EXIP), the addition of a full-time, Small Business Ombudsman, and a new Director. For now, the agency has reassigned existing employees to fill some vacancies. However, the 2012 budget requests two new FTEs to allow the Commission to hire a Director to develop the office and to fund a permanent Small Business Ombudsman. The new Director will then be authorized to develop the office as he or she sees fit.

Although the stated objective for the office is to have a "coordinated approach to education and outreach activities," I am concerned that creating a new office to govern these responsibilities to industry may complicate or even supplant the more effective outreach we already perform under other offices. Today, a small company wishing to determine if its product is subject to a particular regulation may call the Office of Compliance for advice. It is a key function of that office to assess products every day in the course of its enforcement responsibilities. By creating a new office in charge of "outreach" duties, we create unnecessary complications and risks in our communications with the public. For instance, the two offices could answer the same question differently. Or, as is more likely, the new office will seek advice from the more experienced Office of Compliance. In that case, the new office becomes merely an intermediary, with the added risk that the second hand advice will be misunderstood or miscommunicated by the new office. In addition, a new office tasked with responding to regulatory scope issues risks moving the agency away from its enforcement responsibilities and toward something akin to providing product pre-approval services. Adoption of the latter role could turn a relatively small CPSC into a behemoth similar to the Food and Drug Administration.

The "education and outreach" activities of the agency also fall to our Office of Public Affairs, which is responsible for our website, editing and posting fact sheets on new rulemakings, and providing other resources to stakeholders. Overall, the Office of Public Affairs is in charge of the Commission's messaging to the public, including ensuring that the agency's message is on point and consistent. In that regard, it is risky to put a similar "education and outreach" objective under the purview of a brand new office, which may provide a duplicative or contradictory message to the general public and our stakeholders.

Finally, I am concerned that the stated purpose of the office implies that it will solve the problems the CPSIA has caused stakeholders like small businesses. Small businesses are not clamoring for more information ("education and outreach") about how to comply with this law; they are asking for relief from this law because it is killing them. The solution for small businesses negatively impacted by the CPSIA is to repeal the portions of the law that impose tremendous costs without increasing safety. Furthermore, no matter how successful this new office may be, most small businesses will still need to hire lawyers to understand their obligations under the Commission's far-reaching and complex regulations.

To date, the Small Business Ombudsman has focused on responding to CPSIA-related questions posed by small handcrafters. This limited service to a small minority of manufacturers does not begin to assist the vast majority of small businesses – with greater numbers of employees and a much larger impact on the economy -- suffering under the CPSIA. If the Commission really wanted to help all small businesses, it would have used its rulemakings to mitigate the unintended consequences of the CPSIA, and propose meaningful legislative reforms to Congress. It is wasteful and counterproductive to instead create a new office to perform limited outreach to micro-businesses when at least two existing agency offices already perform similar services and could more easily assume any added responsibility that will be assigned to the new office.

Are the functions performed by this new office already being performed elsewhere within the CPSC?

Yes. The following offices perform education and outreach duties to Commission stakeholders:

- Office of Compliance: This office monitors and responds to incoming incident reports from a variety of sources and pursues enforcement action (recalls and corrective actions) against manufacturers or other parties. This office is key in responding to questions from manufacturers who may seek advice on whether they are in compliance with a regulation in advance of putting a product into commerce.

- Office of Public Affairs: Many of the duties of the Office of Public Affairs are listed starting on pg. 61 of our 2012 Budget Request. These duties include: monitoring the Commission's website, blog and Twitter account, responding to press calls, running safety awareness campaigns, issuing press releases on recalls and new regulations, posting key fact sheets for consumers and industry stakeholders regarding new regulations, and communicating with stakeholders, such as thrift stores, regarding recalled products and other safety awareness issues.

- Office of International Programs and Intergovernmental Affairs (EXIP): This office was designed to coordinate our interactions with the international community and other federal agencies. EXIP coordinates the Commission's international and intergovernmental efforts with respect to consumer product safety standards development, harmonization efforts, inspection and enforcement coordination, consumer education, and information dissemination. Some of the activities of EXIP can be viewed on the CPSC's homepage (www.cpsc.gov) by clicking "International" in the left-hand menu.

The newly proposed "Office of Education, Global Outreach, and Small Business Ombudsman" will now include all of EXIP and place them under a new Director.

How does the agency currently work with small business? Given their importance to our economy I hope this is something you are already doing.

Traditionally, the agency has worked with industry through the following activities: 1) staff meetings with industry (many of which are posted on the Commission's public calendar); 2) Commissioner meetings with industry (many of which are posted on the Commission's public calendar); 3) comments received during the rulemaking process; 4) Commission workshops for targeted stakeholders; 5) communications from the Office of Compliance or the Office of General Counsel with advice on compliance with Commission regulations; and 6) materials posted on the Commission's website, including fact sheets on regulations, regulation packets, technical guidance, enforcement guidance, and Commissioners' statements.

While the agency has an open line of communication with industry, including small businesses, these communications have not translated into more effective regulations for small businesses, particularly when it comes to the CPSIA. I believe that under the statute the Commission could have taken a number of steps to alleviate such burdens without impacting safety. In fact, the primary request I received from both Democrat and Republican Senators prior to my Senate confirmation hearing was that I "find flexibility" in the law wherever possible in order to mitigate its many unintended or unforeseen consequences. Despite my best efforts as a Commissioner, this has not happened. The flexibility that I found in the following rules was rejected by a majority of Commissioners:

a) ***Absorption exclusion***: I argued that the absorption ***exclusion*** under Section 101 was actually intended to exclude certain products from the lead limits (rather than be meaningless), and therefore that the term "any lead" in that section may be interpreted to mean a ***de minimis***, harmless amount of lead in a children's product. If the Commission had accepted my interpretation, lead in the substrate of ATVs, bicycles, and brass axels on toys would be legal—since lead in the substrate of these products is not harmful. This change would also have eliminated the requirement to third-party test and certify such products. Because the Commission rejected this interpretation, it voted to reject the petition of a manufacturer of toy cars, even though the car's brass fitting contained less absorbable lead than the Food and Drug Administration deems to be acceptable in a piece of candy.[1]

b) ***Civil Penalties Factors*** – In the Commission's interpretive rule on Civil Penalties Factors, I proposed a number of changes to provide more certainty for the regulated community and to ensure that, while the overall civil penalty ceiling was raised, "technical" violations, such as incorrect paperwork, would not be treated the same way as more serious violations, such as failures to meet safety standards. This is one area of the statute that was not too prescriptive, and a middle-ground could have been reached.[2] Unfortunately, a majority of the commissioners did not want to provide that leeway.

---

[2] http://www.cpsc.gov/pr/northup03102010.pdf

c) ***Definition of Children's Product*** – The CPSIA applies to all "children's products", statutorily defined as products "primarily intended for a child 12 years of age or younger." The comments that the Commission received following the proposed rule made clear that the parameters we had tried to set in the proposed definition were not helpful to most manufacturers that produce children's products intended for children aged 10-12, or for an age range falling both inside and outside the upper age limit of 12. The purpose of defining the term was to guide the manufacturers of such products in determining which of them fall under the purview of the CPSIA. After receiving these comments, the Commission had a chance to put a much narrower "fence" around the scope of covered products—or to at least define clearer boundaries. Unfortunately, the Majority chose to leave the definition vague whenever possible, which helped neither the CPSC staff,[3] nor the regulated community.[4]

d) ***"Children's product safety rules"*** – I offered a valid, alternative interpretation of the statute's requirement of third-party testing to all "children's product safety rules." A clear distinction can be made between "children's product safety rules" and more general "consumer product safety rules" promulgated well before the passage of the CPSIA. Unfortunately, because the Majority chose to view all consumer product safety rules of the Commission as potential "children's product safety rules," it imposed an unnecessary, additional layer of testing (at third-party labs) on manufacturers of carpets and rugs, vinyl, clothing textiles and mattresses—all of which are subject to consumer product safety rules. The Commission did not have to take this step, and there is no risk associated with these products that necessitates new third-party testing requirements.[5]

e) ***Database***: I proposed an alternative database rule that would have responded to a number of manufacturer concerns and made the database a more accurate source of information for consumers. Unfortunately, the Commission's Majority passed a rule that went well beyond the statute's requirements, allowing "anyone" to submit reports of harm—even advocacy groups, attorneys and random bystanders that may not have firsthand knowledge of the incident. The Commission Majority's database rule ensures that the database will be filled with inaccurate reports of harm that will be useful only to advocacy groups and trial attorneys, and will be time consuming and costly to manufacturers--particularly small businesses. Due to the inaccuracy of reports on the database, it will be a waste of taxpayer resources and will not be useful to the consumers it was intended to help.

Thus, small businesses do not need better education and outreach from the CPSC, or a new Office dedicated to these activities. They need a Commission that will meaningfully respond to their request for relief from the burdens of the CPSIA. And where statutory language limits our discretion to do so, we have a responsibility to apprise Congress of the need for a legislative solution.

Are you in favor of this office being created?

As mentioned above, I voted "no" on approving the creation of this new office.

DATABASE

There has been much concern over the CPSC's consumer complaint database. There have also been various reports on how much the database actually costs.

Why has there been so much confusion over the cost of this database?

I believe the confusion surrounding the cost of the database stems from the fact that it cannot be separated from the associated cost of the Commission's broader IT modernization program. As a result, efforts to do so have produced radically varying numbers, some of which seem designed more to serve the purpose of minimizing the cost rather than reflecting it accurately.

For instance, the Commission's FY 2012 Budget Request, dated February 2012, estimates the contracting costs of both the public database and IT modernization to be $29 million, and does not distinguish the funding for the two initiatives.[6] Moreover, the agency has long promoted its IT modernization and database plans as inseparable on the grounds that the former is essential to having a more efficient database. This argument was intended to reduce the risk that the Office of Management and Budget (OMB) or Congress would seek to cut the budget by eliminating funding for either IT modernization or the database. Since 2009, OMB has requested not only our Exhibits 300 and 53 on the database costs, but also a Spend Plan for the Consumer Product Safety Risk Management System ("Database Spend Plan") laying out in more detail the annual costs of the database. In none of these documents does the agency attempt to separate the funds allocated to IT modernization from those dedicated to the public database. On the contrary, a single combined figure has always been presented. The contracts the Commission has let to execute its IT modernization plan and to create the public database also do not distinguish between the two.

In late March 2011, I requested from the CPSC Budgeting Office figures reflecting the exact cost of the database. In response, our budget office was unable to separate funds allocated to "IT modernization" from those associated with the creation of the database. Notwithstanding this admission, a variety of other cost estimates for the database (or database plus IT modernization) have been provided by various sources, including:

- A statistic cited in Commissioner Bob Adler's January 14, 2011, Supplemental Statement on the Public Database: "In fact, according to CPSC staff, the cost of the database is only a small part of the $9 million spent on the first phase of the IT modernization."[7]

---

[6] Commissioners began their review of the 2012 Budget Request in fall 2010. The document states at Page 5: "By the end of 2011, the Commission will have spent $29 million in contracted work for the public database and IT modernization." http://www.cpsc.gov/cpscpub/pubs/reports/2012plan.pdf

[7] http://www.cpsc.gov/pr/adler01142011.pdf

- An estimate communicated orally by CPSC staff that the database might cost between eight and ten million dollars.

- An estimate reported by the Associated Press on February 25, 2011: "The database was ordered by Congress as part of a 2008 product safety law aimed at removing lead and other dangers from toys, and last April the commission estimated it would cost about $20 million. That estimate included a major technology upgrade of antiquated computer systems that the agency said at the time was essential to providing a foundation for the searchable database."[8]

- Chairwoman Tenenbaum stated during a February 17, 2011, hearing before the House Energy and Commerce Subcommittee on Commerce, Manufacturing and Trade, that the database was estimated to cost $3 million.

- A March 8, 2011, memorandum, prepared over two weeks *after* Chairman Tenenbaum announced the $3 million figure at the February 17, 2011, hearing, for the first time provides written documentation that the database has been estimated to cost $3 million. A copy is attached for your reference.[9]

The March 8 memorandum speaks for itself, but I find it to be an extremely confusing and loosely drafted post hoc justification for the $3 million figure. Its effort to separate the costs associated with creating the public database from expenses associated with other technology improvements is difficult to follow and unpersuasive. Indeed, before launching into its rationale for the precise delineation, the memorandum's author concedes that "[b]ecause modernizing the Commission's business processes and supporting IT systems is required in conjunction with deploying the public database, it is challenging to draw a bright line between these efforts." But the thrust of the argument appears to be that all of the funds used to create the database should not be included in its cost, because the accompanying IT modernization improvements and certain features of the database have uses beyond facilitating the public's submission and search of consumer product safety reports.

For example, the memorandum states at page 2 that "regardless of whether a report is a candidate for publication" the agency wants to: (1) drive the public from reporting incidents via the hot line or U.S. mail to an online form on the database; (2) change its standard communication method with businesses from paper forms to online forms via the business portal of the database; and (3) otherwise share with the public through the database valuable information in addition to the reports posted to the database by the public. Through this logic, the creation or upgrade of a public portal to facilitate consumer incident reporting and searching online is *not entirely* a cost of the public database, because the CPSC would have wanted *some* of this upgrade, regardless of the statute's requirements.

[9] CPSC Staff Memorandum, March 8, 2011, Subject line: "Estimated Costs of Public database Development."

While nicely supporting those who seek to minimize the apparent cost of the database, I believe this carve out is unwarranted. It amounts to writing off a portion of the database's cost simply because certain of its features can also be used to accomplish other agency goals. To illustrate this point, imagine a vacuum purchased for $500 with the intent to clean a floor. The vacuum is then used for cleaning blinds, removing cob webs, and even blowing leaves from the driveway. Does this mean that the vacuum actually cost $300 because $200 was saved that could have been spent to perform the additional work? The same faulty logic – formulated in hindsight to reduce the apparent cost of the database - underlies the reduction of the database's cost from $29 million to $3 million. The features of the database that serve functions beyond facilitating public reporting and searching, including much of the IT modernization work that was an essential prerequisite to the creation and functioning of the database, have been deducted from its cost. But the fact remains that none of the database's features and their uses, nor much of the underlying IT modernization, could have been achieved had the Commission not received and spent funding to design and program the database.

The fact that the agency's broader IT modernization efforts have only just begun also indicates that much of the money spent to date directly supported the database. The database became public on March 11, but the work necessary to achieve the IT modernization goals the Chairman discussed at the hearing will not be completed for several years, and for the most part has just begun. This includes integrating our different information silos, so that our staff can search across incident reports, field investigations and standards work, and perform more complex statistical searches. So far, we have standardized the way we intake data—a laudable accomplishment considering the agency's multiple internal databases. We have also begun a website redesign, and a plan to begin standardizing incoming data. However, the "IT modernization" piece, even if it could be broken out completely from the public database, is in the early stages -- even after incurring over $29 million in contract and other costs.

It should also be noted that even the $29 million figure assigned to both the database and IT modernization understates the real cost of the database. The $29 million figure represents only the estimated contracting costs through FY 2011. It does not include the hours CPSC staff dedicated to developing the database and preparing for its launch, including managing contracts. Agency projections for the future cost of the database are also misleadingly low. The FTE cost estimates in the CPSC's Database Spend Plan only account for IT employees, ignoring the additional staff needed for data intake, investigations, and legal work associated with the new public database. The Chair is in the process of setting up multidisciplinary teams to review each incident as it is submitted to the database. This will, of course, require new FTEs or pull incumbent employees off of their current assignments, requiring new FTEs to support the increased work load. The FTE cost estimates in the CPSC's Database Spend Plan also appear to discount the expected increase in incident reports, material inaccuracy and confidentiality claims, and other work likely to be generated by the existence of a searchable public portal for the reporting of product safety incidents and issues.

The Commission's 2012 Performance Budget Request also discounts these expenses. According to that document, the "New and Reallocated Resources" dedicated to "Data Intake, Incident Review, and Investigation" is derived from an extrapolation of the growth trend line for reported incidents and investigations dating back to 2003, long before the public database was even

conceived. If, as is likely, this projection is proved to be too low, the assigned staff will be unable to timely manage all of the information reported through the database. As a result, Commission staff will be even less likely to resolve claims of material inaccuracy within the ten-day period prior to the posting of unverified information. The Commission will then either request and be provided additional funding in subsequent years, or preside over an increasingly misleading database.

How many new people are needed to administer the database?

The official Commission position communicated to me by the agency's Executive Director (ED) is that the CPSC has requested four additional personnel (FTEs) and four new contractors to administer the intake of data into the database, and less than a single information technology FTE to operate and maintain the public database. The ED also explained that the increase in personnel is necessary to meet the quick turnaround required of staff to process the reports.

Do you believe the number of FTEs requested is an accurate number?

I believe that this official position underestimates the human resources that will be required to administer the database. First, the agency's 2012 Budget Request includes a considerably larger number of new FTEs that appear to be needed to administer the new database. Starting on pg. vii of the 2012 Budget Request, $3.075 million is requested for "modernizing the CPSC's information technology (IT) systems and implementing the public database through a mixture of new and existing FTEs and contractors." On pg. viii, this funding is explained as including "four FTEs and three contractors to maintain the new IT systems [and] . . . an increase of 24 new FTEs and contractors to conduct data intake, incident review, and investigations for a total of $3.075 million." On the following page, a chart (Table C) is included which breaks down most of the needed FTEs for data intake, rapid incident review, and customer service—all for the database. And pg. ix includes one sentence in the first paragraph explaining that an additional six new FTEs are requested "to continue to investigate the increasing number of incident reports"—again, all related to the Commission's database.

I agree that the agency needs the flexibility to determine where to assign the new employees as we learn more about how to manage this new public database. However, it seems disingenuous to characterize only the "Data Intake" employees as "needed to administer the database", while ignoring the other 27 new FTEs and contractors in our budget request under the headings "IT modernization" and "Data Intake, Incident Review, and Investigation." As I have previously discussed, I believe this is part of an effort to diminish the apparent cost of the public database by artificially separating the costs of database, IT modernization, and other related expenditures, when they are inseparable. As explained above, up until shortly before our Appropriations hearing, these distinctions had not been made in any funding justifications to Congress or the Office of Management and Budget. Rather, all funding for the database and all other facets of the Consumer Product Safety Risk Management System was sought as a single lump sum.

Notably, even the Budget Request underestimates the cost of the database and the employees needed to administer it. First, the staff's justification for some of the new FTEs (*e.g.*, the six new FTEs requested to continue to investigate the increasing number of incident reports) is based

solely on the expected organic growth in incident reports that the Commission would receive even without a new database. However, since the Commission's database will be made public for the first time, and because the Commission itself is promoting its use, it is almost certain we will receive a greater quantity of incidents than ever before – in addition to any organic growth. Also, the budget request does not take into account the time and resources that Commission senior staff, including legal and compliance staff, will continue to dedicate to the new database, which may take them away from other duties. If, as is likely, the projected number of staff is proved to be too low, the assigned staff will be unable to timely manage all of the information reported through the database. As a result, Commission staff will be even less likely to resolve claims of material inaccuracy within the ten-day period prior to the posting of unverified information. The Commission will then either request and be provided additional funding in subsequent years, or preside over an increasingly misleading database.

What concerns do you have regarding the accuracy of the information published on the database?

Several features of the database and the Commission's policies governing the posting of reports make it likely that inaccurate information will be published on the database.

To begin with, the database requires that submitters of reports include their own contact information, but does not require that a report submitter have any firsthand knowledge of the product, harm or risk of harm. Nor does it require submitters to provide the contact information of an individual with firsthand knowledge, such as the product owner or the person who used the product. As a result, requiring the contact information of only the submitter is not much different from permitting the submission of an anonymous report. In both cases, the Commission has no means to verify the alleged circumstances of the incident or to obtain supplemental information relevant to determining the existence and scope of an alleged product hazard. Without access to a direct witness to an alleged incident, the Commission may also be unable to determine whether a report contains a material inaccuracy. Where a lack of information and inability to contact the product owner or a witness prevents the Commission from determining the existence of a material inaccuracy, a dubious report will remain on the database.

Moreover, these concerns are not diminished by the requirement that submitters of reports verify "to the best of their knowledge" the accuracy of the report submitted. The honest, best knowledge of someone with no personal connection to an incident or product is of little value.

The rules governing the posting of reports that are subject to a manufacturer's claim of material inaccuracy also make it likely that inaccurate reports will be posted. Manufacturers are entitled to ten business days after a report of harm is sent to them before the report is posted on the database. During that time, they may present to the Commission a claim that a report contains materially inaccurate information. But in many cases, ten days is unlikely to be sufficient time for a manufacturer to determine whether a report identifying its product contains a material inaccuracy.

This is partly because the rule passed by the majority did not require reports to contain sufficient detail about the product and incident to guide a manufacturer's investigation. Information essential to this purpose that is not required to be contained in the report, includes: the model number of the product; the date it was purchased; the UPC code; and/or, any other unique identifying information that would distinguish one product of a particular type from the potentially dozens of others that are of the same general type but are materially different. For example, a recent search of Amazon.com for high chairs manufactured by one particular company produced a list of 137 different high chairs ranging in price from $54 - $148. Given the broad range of identically named, yet distinctive products available from the same company at a single snap shot in time, a report of harm relating to a particular manufacturer's high chair, with no reference to the model, date of purchase or other more specific identifying information, would not permit the manufacturer even to identify the specific product, let alone to gauge the accuracy of a report about the product.

Even a manufacturer provided with sufficient information to identify a specific product may not receive enough detail about an incident to understand the role its product played in causing an alleged injury. Moreover, there may be no way to ascertain the truth in those cases where the manufacturer is certain that its product could not have caused an injury in the manner alleged. This is because a third-person reporter is not required to identify the victim or product owner, and access to a firsthand observer of the incident is necessary to resolve issues of fact.

A manufacturer forwarded a vague report has few options. Even where a firsthand observer is identified in the report, the manufacturer is not entitled to such individual's contact information. Without the ability to follow-up with a witness, the manufacturer must base its assertion of material inaccuracy upon the content of the report. In many cases, the report may not contain sufficient information for the manufacturer to ascertain whether it contains a material inaccuracy.

Even with adequate information, 10-days will often be too little time. Obvious cases of manufacturer misidentification may be discernable within the available window of time. But many products of a more generic nature will be very difficult to distinguish without a much more extensive investigation. I have spoken with manufacturers who have needed over 30-days after receiving a consumer complaint to conclude that the subject product was not their own. And those were cases where the company had access to the product. Ten days will clearly be insufficient in many cases, and as a result, materially inaccurate information will remain on the public database well beyond that point.

Even where a manufacturer meets the 10-day deadline to submit an adequately supported claim that a report is materially inaccurate, if the Commission does not also complete its investigation of the claim within the 10-day period, the report is published on the 11th day. This policy guarantees that inaccurate reports will sometimes be posted. Moreover, the materially inaccurate information will remain on the site until the Commission completes its investigation and makes a determination. And because there is no fixed period within which the Commission must complete its investigation, inaccurate information can remain on the site indefinitely. Meanwhile, the Commission's efforts to investigate claims of material inaccuracy are hamstrung by its failure to require the identification of victims of harm or firsthand witnesses of incidents raising a risk of harm. There are therefore likely to be many cases where a manufacturer will

have good reason to believe a reported incident is either completely false or materially misrepresented (and companies routinely receive these types of mistaken or fraudulent claims), but neither the manufacturer nor the Commission will be able to obtain the information necessary to resolve the claim. Under those circumstances, the manufacture will be unable to meet its burden and the challenged, but unverified and unverifiable report, will remain on the database forever.

Further, the manufacturer has no right to inspect the product. In those cases where contact information for the product owner is neither provided nor obtainable from the third-party submitter, it would be impossible even for the Commission to inspect the product. Similarly, there would be no opportunity for the Commission to follow up with the consumer under those circumstances. The manufacturer is not entitled to the contact information of a product owner who chooses to remain anonymous.

All of these factors make it inevitable that inaccurate reports will be posted on the database, and that many will remain searchable by the public forever.

A recent example demonstrates that these are not idle concerns. A report was published on the public database in which a parent identified a particular company as the manufacturer of a toy kaleidoscope that injured her child. The report had been forwarded to the named manufacturer as required by the rule, but the report contained insufficient information for the named manufacturer to determine whether it had actually manufactured the product. The company therefore made no claim of material inaccuracy, but posted a comment explaining that it was uncertain whether it had manufactured the product. Subsequently, a CPSC compliance officer obtained the kaleidoscope from the parent as part of its investigation of the product's safety, and discovered that the parent had misidentified the manufacturer. The incident report was then removed from the database, the correct manufacturer was notified, and the report was reposted with the correct information. However, this outcome resulted from happenstance and not any protections built into the database. If the incident had not been one of the approximately 10% that lead to a follow-up investigation, the error would never have been discovered. In addition, the investigation would not have uncovered the mistake if, as the database rule permits, contact information for an individual with firsthand knowledge of the product and who retained it, was not provided. The fact that an error of this kind has already been discovered, given the short period that the database has been "live" and the small percentage of incidents that are investigated, suggests that this situation is probably not unique. Rather, it indicates that there are likely already a significant number of published incident reports that misidentify a manufacturer and that will never be corrected or removed.

Is it true that other persons, aside from those directly harmed, can submit complaints to the database?

Yes, even as properly construed, the CPSIA permits categories of persons who were not directly harmed to submit reports to the database. This includes emergency first responders and physicians, who are in a position to provide at least a degree of useful first-hand information

about an incident or injury. But I believe the Majority expanded the categories of persons entitled to submit information to the database well beyond those intended by Congress.

Section 212 of the CPSIA requires the Commission, subject to the availability of appropriations, to establish and maintain a public, web portal accessible Database on the safety of consumer products. The statute identifies five sources from which the Commission shall receive reports of harm. These are (1) consumers; (2) local, state, or Federal government agencies; (3) child care professionals; (4) child service providers; and (5) public safety entities. CPSIA § 212(b)(1)(A).

Each of these categories of submitters is likely to have first-hand knowledge of the harm reported. They can therefore be expected to provide accurate and reliable information that may be useful to consumers seeking product safety information.

Notwithstanding the statute's clear language, the Commission's Majority adopted a rule that greatly expanded the list of allowable submitters to the Database beyond those intended by Congress. For example, the Commission's regulation defines "consumers" to include "attorneys", and "public safety entities" to include "consumer advocates or individuals who work for nongovernmental organizations, consumer advocacy organizations, and trade associations." 16 C.F.R. § 1102.10(a). This expansion goes against the statutory purpose that the Database be "useful" for consumers and not disseminate erroneous information.[10] Indeed, the Majority has expanded the list of submitters to such an extent that ***anyone*** can submit reports of harm—thereby rendering meaningless the statutory language listing permitted submitters.

It is important that individuals with first-hand knowledge of incidents of harm involving consumer products be permitted to submit reports to the Public Database. However, groups or individuals with no direct knowledge of the incident, who did not see it happen or do not even know the person that was harmed, should not be permitted or encouraged to submit incident reports to the Database. There are several reasons why first-hand knowledge is essential, but the primary reason is ***accuracy***. A Database full of inaccurate reports from individuals who have second or third-hand information is not remotely helpful to consumers using the Database to determine which consumer product they should purchase.

Soliciting information from sources seeking to promote an agenda unrelated to simply sharing first hand information invites dishonest, agenda-driven use of the Database—diluting its usefulness for consumers. Trial lawyers, unscrupulous competitors, advocacy groups and other nongovernmental organizations and trade associations serve their own agendas and lack an incentive to prioritize accuracy in their reports of harm. Trial lawyers or other groups with self-serving motives will use the Commission's Database to look for potential trends and patterns of hazards. Under the Majority's Database rule, these same groups could also submit to the Database false and unverifiable reports to fuel a lawsuit. It is no coincidence that these groups are strongly in favor of this public Database and of the Majority's interpretation of the statute, which expressly allows them to submit reports of harm.

---

[10] On the Senate floor, during consideration of the CPSIA on March 5, 2008, Senator Pryor stated: "We have tried to find something that is balanced, that provides information, but also has some filtering so we make sure erroneous information is not disseminated. But the goal of this provision is that the public has the right to know when products are dangerous."

There are many advocacy groups and associations that serve a role in public policy, but may not have the incentive or ability to provide specific and accurate product identification information to the Commission's Database. For example, the National Fire Protection Association (NFPA) supports government-mandated sprinklers in new homes. One cause of house fires is the use of cigarette lighters, which are consumer products. Thus, the NFPA has a strong incentive to add all reports of house fires caused by lighters to the Commission's public Database. The more incidents in our Database, the better case they can make that new fire prevention technology – which some of their members sell—should be mandated in homes.

But it is not important to the NFPA whether it correctly identifies a brand of lighter in an incident report. A lighter may appear to be the branded product of a particular manufacturer, but instead be a cheap counterfeit. The NFPA is interested solely in reporting house fire incidents; the particular brand of lighter is not relevant to its goal of promoting sprinklers. Meanwhile, the company identified in the report as the manufacturer of the cigarette lighter must defend countless unverifiable and potentially inaccurate claims about its product. Such inaccurate and unverifiable information is of no value to a consumer seeking information on the safest type of lighter.

By inviting trial lawyers, consumer advocacy organizations and trade groups to input reports of harm, the Commission has all but guaranteed that the Database will be a tool for lawsuits, policy agendas and anti-competitive activity. Under those circumstances, it cannot also serve its intended function of providing a reliable resource for parents seeking useful information about product safety. A Database populated with such information will be no more useful than "Amazon.com", "Yelp.com", or any of the other hundreds of websites where anyone can submit comments on a product, and does not warrant tax payer funding.

Why did the CPSC not require the submissions come from firsthand knowledge of incidents of harm?

The issue was a topic of debate among the Commissioners. Without revealing confidential internal deliberations, the Majority's public position is explained in the published preamble to the rule:

> The plain statutory language does not require a submitter of a report of harm to have "firsthand knowledge." We have chosen an interpretation of "consumer" that comports with our experience in maintaining a database of consumer product incident reports. Historically, we have received reports of harm from any and all consumers in order to protect individuals who use consumer goods.[11]

75 FR 76835 (December 9, 2010).

---

[11] A separate statement by Commissioner Adler clarifies the Majority's view that "the term 'consumer' generally carries a broad meaning . . . we are, in fact, all consumers." Supplemental Statement of Commissioner Robert Adler Regarding the Publically Available Consumer Product Safety Information Database Rule (January 11, 2011), at 4-5. Thus, the Commission has a history of accepting reports from everyone and anyone.

In other words, the majority believes that because the Commission has long been willing to initiate product investigations based on secondhand reports, it should also publish such reports to the public. But there is no logical connection between the two circumstances. In the former case, there is no risk that the public will be mislead by inaccurate reports, and the Commission's investigation and internal deliberations remain confidential until it determines there is a real product hazard. Indeed, it is preferable that the Commission continue to absorb as much information on consumer products as it can—and this includes potentially inaccurate reports from advocacy groups, trial lawyers and trade associations. But the *publication* of inaccurate safety information will mislead the public – including in some cases toward the purchase of products that are less safe than ones falsely described as unsafe in posted reports. Notably, it is also not statutorily required that information which is neither accurate nor verifiable be posted on the public database.

But at bottom, I believe the Majority's willingness to populate the database with potentially inaccurate information stems from a fundamental difference in philosophy. The Majority apparently believes it is better to include potentially inaccurate information than to exclude any accurate information that might be reported only secondhand. They seem not to understand that the inclusion of inaccurate information diminishes the value of all of the information on the database, because there will be no way for a manufacturer or consumer to distinguish between accurate and inaccurate reports. As a result, manufacturers will not have the opportunity to improve the safety of their products, and consumers will have difficulty knowing which products to avoid and which to purchase. In other words, unlike the majority, I do not believe that casting a wider net to avoid missing any accurate information justifies the dissemination of inaccurate information. For when the two are indistinguishably combined, even the accurate information is of little value. The database is therefore no different than the many available internet blogs on which consumers contribute unverifiable comments about products, and it should not be supported with tax payer dollars.

How will the CPSC handle information regarding complaints about one type of model of an item? For example, how will consumers know that the information posted is not regarding every model of an item that a company makes?

If a report identifies as potentially hazardous a product that has numerous distinct models, but does not specify the model, the report will be posted and consumers will have no way of knowing which model is the subject of the report. That potential scenario serves to highlight once again the risk that, as currently conceived, the database is likely to lead to the posting of inaccurate or misleading information that will at best be unhelpful to consumers.

I have been informed that an analysis of reports submitted to the public database shows that approximately 85% of reports contain information in the non-mandatory field designated for the model number. Although no comprehensive review of these reports has been conducted, it has been discovered that in many cases, the information contained in the "model number" field is, in fact, not the model number of the product. The Commission is therefore still working to determine how useful "model number" information provided by consumers will be in

distinguishing among products and assisting in the determination of whether the correct manufacturer has been identified.

IMPACT OF REGULATION

Many of the CPSC's rules have an impact on manufacturers both large and small. It seems to me that these rules also have a large impact on consumers, giving them less choices and higher prices.

When promulgating rules, how does CPSC consider their impact on businesses and consumers?

The Commission conducts assessments required under the Regulatory Flexibility Act (RFA) and the Congressional Review Act (CRA). These include assessing whether or not a rule disparately impacts small businesses, particular geographic regions, prices, or the ability of domestic firms to compete. Such assessments are usually not comprehensive, because it is not required. For example, an RFA analysis may be a couple of paragraphs, depending on the rule.[12]

Under the CRA, when a rule is deemed "economically significant", the Commission sends a notice to the Office of Management and Budget (OMB) explaining how the determination was made. (Again, no cost-benefit analysis is required.) OMB has an opportunity to agree or disagree with the Commission's determination. Following that step, the Commission sends a one-page form to Congress and the Government Accountability Office letting them know the agency is issuing an "economically significant" rule---and that's the extent of the requirements imposed on the Commission by the CRA. Historically, the Commission has issued few "economically significant" rules. However, an increased number can be expected under the CPSIA.

Additionally, rules promulgated by the Commission generally are subject to the Paperwork Reduction Act (PRA), which requires notice and comment to the public and reporting to OMB. PRA analyses are usually perfunctory and do not influence the outcomes of Commission rule makings.

When required by statute, the Commission also considers the impact on businesses and consumers in the context of performing a cost benefit analysis, as discussed in the next response.

---

[12] The Regulatory Flexibility Analysis that accompanied the Commission's proposed rule governing testing and certification (75 FR 28366), issued under the CPSIA, was more lengthy than usual. The assessment provides hypothetical examples of testing costs and other anecdotal data. However, it does not provide the quantitative data on the impact to industry or consumers that would normally be included with a formal cost-benefit analysis. http://www.cpsc.gov/library/foia/foia10/brief/prodcert1.pdf

Does the Commission do cost benefit analyses before promulgating rules?

The CPSC's responsibility to perform a cost-benefit analysis depends upon the nature of the rule promulgated. Before issuing consumer product safety standards or bans under the agency's core statutes (Consumer Product Safety Act/CPSA, Federal Hazardous Substances Act/FHSA and the Flammable Fabrics Act/FFA),[13] the Commission is typically required to do a cost-benefit analysis examining the impact on both businesses and consumers. For example, the CPSA requires a finding "that the benefits expected from the rule bear a reasonable relationship to its costs", before the Commission may promulgate a "safety rule." 15 U.S.C. § 2058(f)(3)(E).

If not, why not?

A cost-benefit analysis is not required for CPSC regulations that are not typical standards or bans. This would include "interpretive rules," which are meant to provide guidance to the regulatory community regarding Commission's interpretation of a statute. Nonetheless, the Commission's interpretation of a statute through such rules could have a substantial impact on both industry and consumers.[14] A "Notice of Requirements" to accredit laboratories, which is a specific type of rulemaking established by the CPSIA, also does not require a cost-benefit analysis. The purpose of this type of rule is to establish the requirements under which labs may be recognized as accredited by the CPSC. The promulgation of a Notice of Requirements also triggers the underlying statutory requirement to *third-party test and certify* to the corresponding safety standard, and has a substantial impact on industry. Also, enforcement guidance issued by the Commission is not required to have any kind of impact assessment. Notably, the Commission is not *prohibited* from doing more than the statutes require and could do full cost-benefit analyses in these cases, but typically the agency only does the bare minimum. The Commission also has the authority to determine which type of rule (or guidance) would be most appropriate, depending on the circumstance.

No cost benefit analysis is performed on rules promulgated under the CPSIA, because the statute excepted from the normal cost-benefit analysis requirement standards and bans promulgated under it. The decision was ostensibly made in order to expedite the rulemaking process. Unfortunately, removing this requirement has minimized public and Congressional scrutiny of the costs associated with the CPSIA mandates. In fact, it has allowed the Commission to ignore the costs associate with our CPSIA rulemaking, potentially preventing the Commission from more timely bringing cost concerns to the attention of Congress.

Notwithstanding the absence of a statutory requirement, I believe the Commission should itself perform or contract for the performance of full cost-benefit analyses of all its rules, including interpretive rules and Notices of Requirements. Nothing in the law prevents the Commission from doing a cost benefit analysis. In particular, the Commission should contract with an outside

[13] The Poison Prevention Packaging Act (PPPA) is another core statute of the agency, but it does not require a cost-benefit analysis.

[14] Two examples of recent "interpretive rules" issued under the CPSIA which will have a substantial impact on industry and consumers, include: Definition of Children's Product; Civil Penalties Rule.

party or request that the Government Accountability Office perform a full cost-benefit analysis of the testing and certification rule it is currently finalizing under § 102(b)(2) of the CPSIA. The rule requires an in-depth analysis across multiple products, industries and regulations, and is beyond the capability of the CPSC.

If so, how comprehensive is the cost benefit analysis?

A cost benefit analysis performed on consumer product safety standards or bans under the agency's core statutes includes a description of the potential benefits and costs of the proposed rule, including any benefits or costs that cannot be quantified in monetary terms, such as the impact on consumer choice. However, impact on consumer choice is not a chief consideration when the Commission assesses the impact of our regulations on consumers. More commonly, Commission staff considers the impact on consumers in terms of safety, including the estimated reduction in injuries and illnesses. A cost-benefit analysis would also consider the impact of price increases for manufacturers and consumers.

Can you think of any rules currently in place that are redundant?

Yes. As you know, the CPSIA requires third-party testing and certification to all "children's product safety rules." The Commission's Democratic majority has interpreted as children's product safety rules many of the more general "consumer product safety rules" that the Commission has had in place since before the CPSIA. The decision has resulted in complicated, unnecessary, and redundant testing requirements for a number of products regulated by the Commission.

For example, the Majority voted to treat the flammability regulations for carpets, rugs, clothing textiles and mattresses as "children's product safety rules" under the CPSIA. As a result, manufacturers of these products that have long been required to adhere to a strict testing protocol to ensure compliance with flammability standards now must also do additional third-party tests to certify to the agency's flammability standards, whenever they create a ***children's version*** of a product.

These rules have been in place for decades and have done an effective job without third-party testing. For example, there have been no recalls of youth carpets and rugs in the entire 37 years of the agency's existence. There is absolutely no reason to change a system that has worked. Carpets already must meet the flammability standard, they already get tested in house, and they can obtain general conformity certificates on that basis. Third-party testing will not improve children's safety. Nor does it make sense to treat so-called youth carpets differently. No child stays entirely in his own room and crawls or plays exclusively on his own rug. Children's rugs do not need different flammability protection than adult rugs. Indeed, every other rug in the house is more likely to have a cigarette dropped or candle tipped onto it than the carpet in a child's room. If this testing made sense, why would we not also require third-party testing for all carpets being laid in elementary schools, day care centers or in babies' rooms? If a wall-to-wall carpet installer arrives at a job to find a crib set up in the room and a mother far along in

pregnancy, why should third-party testing turn on whether the carpet has a juvenile design or not?

There is no doubt that CPSIA regulations treating clothing textiles and mattresses as children's products disrupt a preexisting effective testing regime. The clothing textile rule involves a long-standing and successful guarantee program that is unlike any of the rules promulgated under the CPSA. That regime effectively splits responsibility for determining the compliance of certain fabrics in a way that is not readily amenable to third-party testing.

In particular, the agency recently revised the mattress rule in a painstaking process that carefully weighed the benefits and costs entailed in that regulation. As part of that process, the agency determined that the rule would have an impact of greater than $100 million on the economy, making it the rule with the single greatest economic impact in the history of the agency up to that time. Requiring third-party testing based on an overly literal interpretation of a part of the CPSIA—for which there is absolutely no evidence to suggest it applies to the mattress rule—upsets the careful balance struck by the mattress rule's design. The oddity of overlaying third-party testing and certification on this rule can be seen from the fact that the rule will now require the burning of a queen-sized prototype mattress in an accredited third-party lab to prove the inflammability of a crib mattress several times smaller.

Of all of the votes we have taken at the Commission, I had hoped that this would be an easy one. After all, it is unlikely that Members of Congress anticipated adding third-party testing requirements to the 2007 mattress standard, the 1970 standard for carpets and rugs, and others, when the CPSIA was passed. Unfortunately, because of the make-up of the Commission, I believe it will now take an act of Congress to reverse these requirements and to prevent future "consumer product safety rules" from being caught up in the CPSIA's third-party testing regime.

STOPPING HARMFUL PRODUCTS AT PORTS OF ENTRY

I am encouraged by the CPSC's Memorandum of Understanding with Customs and Border Protection. By stopping harmful products at our ports of entry, the CPSC is using resources to proactively stop harmful products from reaching the U.S. market. As I understand, once products are in the market, it is very difficult to recall a significant amount.

What are your thoughts on this program? Do you believe this program is an efficient use of CPSC's resources?

There is no doubt that the growing cooperation between the Consumer Product Safety Commission (CPSC) and the U.S. Customs and Border Protection (CBP) has expanded the Commission's ability to more efficiently and effectively prevent unsafe products from entering the United States.

The CPSC gained access to the International Trade Data System Automated Commercial Environment (ACE) in 2007, and since that time has expanded the number of ports at which

CPSC employees work side by side with CBP officers. ACE gives CPSC staff access to "entry summary" data for any shipment of products as soon as the data becomes available.

In 2008, CPSC created a new Import Surveillance Division. The team, in cooperation with CBP, is tasked with inspecting, detecting and stopping hazardous products from entering the United States.

While the ACE data is useful, it is generally not available before a shipment has arrived. That is why the CPSC's October 2010 MOU with CBP is so important. It gives CPSC access to CBP's Import Safety Commercial Targeting and Analysis Center (CTAC). CTAC provides CPSC staff with ship manifest data even before a product arrives at port, thereby allowing the CPSC to conduct risk assessments and target those shipments most likely to contain dangerous products.

The access to CBP's databases obtained through MOUs, combined with day-to-day cooperation between CBP and CPSC Import Surveillance Division personnel working side-by-side at United States ports, permits the CPSC to target, sample and detain, export or destroy a far greater number of unsafe products. Moreover, it is able to do so with only a couple dozen employees. I strongly support these efforts and will continue to work with the Chair to identify additional ways in which CPSC can cooperate with CBP to maximize the safety return on the CPSC's expenditure of resources.

AVOIDING DANGEROUS PRODUCTS

What advice can you give the parents of young children to avoid lead and other dangerous elements in children's products?

Based on my experience as a CPSC Commissioner and as a mother of six, I am keenly aware of the dangers children can face from consumer products. As with all of the hazards against which the CPSC protects consumers, parents can avoid products known to contain lead in paint or other dangerous elements by checking the Commission's www.recalls.gov website or signing up for recall updates through email. It is also important to provide age-appropriate gifts to toddlers and young children, to supervise their play, and to remember that most incidents can happen in a split second.

Parents should also learn about the common, everyday hazards children confront at home, and be vigilant to avoid them. For example, drowning is among the most common occurrences reported to the CPSC. Drowning can occur not only in pools, but in bathtubs, hot tubs, toilets and even buckets of water. Drowning prevention is an important focus of the Commission, and I am proud to have participated in one of the Chairman's Pool Safely Campaign events in Washington, DC. I also hope that the Commission's education campaign on drowning prevention may extend to settings beyond swimming pools. Choking hazards also present an all too common risk for children, including from coins and small batteries.

A child's sleep environment is also a potential source of risk about which parents should be aware. I therefore strongly support the Chairman's "Safe Sleep Campaign", designed to educate parents on crib safety and the potential safety hazards present in an infant's sleep environment.

For example, soft bedding placed inside of a crib is a significant hazard, because infants' neck muscles are not strong enough to help them to avoid suffocation. Soft bedding is not a consumer product hazard, per se, but it is a common danger that we hear of all too often at the Commission. That is why I continue to support efforts at the Commission to focus not only on the safety of the cribs themselves but also on all of the general hazards related to infant sleep.

Lead

I believe it is important to clarify the risks associated with lead, especially since the CPSIA has removed the ability of our agency to assess risk in this area, as we would for other hazards. Some advocates say that "there is no safe level of lead", implying that none of us can ever spend enough time and money to reduce or eliminate lead everywhere. But there is, in fact, an *unsafe* level of lead that has been established by our leading scientific agencies, the National Institutes of Health, the Centers for Disease Control and the Environmental Protection Agency. Only lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under.

In order to determine risk, it is necessary to make a distinction between lead that is absorbable and lead that is not absorbable in meaningful amounts. In many other laws relating to absorbable lead levels, standards exist to allow for such minimal absorption. For example, the Food and Drug Administration allows for 0.1 microgram of lead in a one-gram piece of candy.[15] The Safe Drinking Water Act declares "zero lead" to be the objective for the amount of lead in water, but pipes carrying the water are permitted to be 80,000 parts per million (8 percent) lead – allowing for negligible, trace amounts to exist in the water we drink.[16] California Proposition 65[17] as well as the European Union[18] allow for a negligible amount of absorbable (or soluble) lead in children's products. People often are surprised to learn that all children are born with a certain blood lead level, depending on the blood lead level of the mother. Some additional amount of lead (roughly one microgram per kilogram of body weight)[19] is then taken into the body every day through the food we eat and the air we breathe.

So what lead is actually risky? Lead is risky when it is absorbable into the bloodstream at greater than minimal levels. The experts at the CDC and NIH have found that lead paint in old houses and lead in dirt[20] near old gas stations are the main source of environmental lead presenting a

[19] Centers for Disease Control, Agency for Toxic Substances and Disease Registry, Toxic Substances Portal: Lead: http://www.atsdr.cdc.gov/PHS/PHS.asp?id=92&tid=22

[20] Although lead in dirt is a proven hazard for small children residing near old gas stations, it is notable that the Environmental Protection Agency standard for lead in soil is 400 ppm. http://www.epa.gov/lead/ This standard for

danger to small children (http://www.cdc.gov/nceh/lead/). In other words, the *risk of absorbability* from lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high.

In the same vein, a heavily lead-laden metal charm or piece of jewelry that can be swallowed presents a danger, because such an item could get caught in the stomach and absorbed. However, none of these agencies, including the CPSC, has ever found that a child touching a brass musical instrument or a vinyl lunchbox, or riding a bicycle, could ever rub off enough lead, day after day, year after year, to affect his or her health.

Consider the CPSIA's lead requirements in comparison to these known lead hazards in the environment today. The CPSIA's arbitrary lead content limits (currently 300ppm, and moving this August to 100ppm or the lowest achievable level between 100ppm and 300ppm) remove the ability of the Commission to assess risk, or the *absorbability* that exists for a particular product. Thus, the law's lead content levels dictate that the metal handle bars of a bike that pose ***no health risk*** to a child be outlawed right alongside lead paint or a solid-lead charm on a piece of children's jewelry that actually is dangerous.

The CPSIA has resulted in a ban on children's books published before 1985, because the ink in them is likely to contain lead above the allowable level. Some at the Commission and many Members of Congress have expressed dismay that books have been affected, because children are not likely to eat the pages of old books or ingest more than miniscule amounts of lead after touching their pages. Likewise, youth ATVs and bicycles are outlawed or must be reengineered even though the lead that is in the hood, handlebars, or hubcaps will not become ingested and absorbed at any discernable level (from hand to mouth touching where miniscule amounts of lead may rub off—not from actually eating the hood, handlebars or hubcaps). Other everyday products such as school lockers, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens are outlawed if they have a toy or game attached to them and are marketed to children, due to the brass found on the tip.

Finally, children do not live cooped up inside of their rooms surrounded only by "children's products"—the primary focus of the CPSIA. Children live throughout the house, run around outside, and play with adult products such as pots, pans, furniture knobs, door handles, appliances and TV remotes. For example, the new costs associated with this law will affect a young child's lamp (usually turned on and off by the parent) but not the lamp in the den or the living room that a child is as likely to turn on and off. These products do not threaten a child's health due to their lead content, because the lead in them is not absorbable. This further illustrates the absurdity of the CPSIA's requiring the unnecessary reengineering of children's products with lead, while children are just as likely (if not, more likely) to play with everything else in the house.

---

safety is less strict than the current lead content standard provided in the CPSIA for children's products, which is 300ppm and scheduled to fall to 100ppm in August of 2011.

Questions for the Record for Commissioner Northup
Submitted by Congressman Tom Graves

DATABASE

With the recent launch of the Consumer Product Safety Information Database in the past few weeks there is concern that reports of harm can be submitted by individuals that wish to do damage to their competitors by submitting erroneous information. If the database is to be effective the CPSC needs to ensure the utmost accuracy of those individuals that submit information to the database.

What specific steps are in place to validate the identity of individuals that are submitting the information for the database to make sure they "are who they say they are"?

The official Commission position is that the identity of individuals is validated by (1) the requirement that submitters verify that the information contained in a report – including the submitter's affiliation, name and address -- is true and accurate to the best of their knowledge; and (2) the threat that appropriate legal action will be taken against individuals who submit false information to the government through the database.

I believe neither of these putative safeguards is likely to discourage individuals from misrepresenting their identity when submitting a report, or lead to the discovery of those individuals who choose to do so. A person willing to misrepresent his or her identity in connection with the submission of a report is unlikely to be discouraged from doing so by a self-verification check box. Moreover, as the official Commission position reflects, no steps are taken beyond confirming that the self verification box is checked to confirm a submitter's identity.

I also do not believe the threat of legal action is much of a disincentive to those wishing to provide a false identity. As noted, the Commission apparently lacks a system of "specific steps" to verify a submitter's identity in the first place. The threat of prosecution carries little weight in the absence of a system for detection. And even if the Commission became suspicious of a submitter's stated identity, it can take no prosecutorial action independent of the Justice Department. Notably, between fiscal years 2004 and 2010, the Commission referred for criminal prosecution to the Department of Justice only one case that did not involve illegal fireworks. This reflects the fact that the Justice Department has many priorities that supersede litigating cases on behalf of the CPSC, and has historically agreed to do so only in cases involving severe and pervasive injury combined with repeated, intentional wrongdoing.

There is even less likelihood that a case would be brought based on a claim that inaccurate incident or product information was submitted through the public portal. To begin with, the difficulty of proving that a report is not "true to the best of [the submitter's] knowledge" makes it unlikely any action would be taken. Even a consumer advocacy group in the habit of submitting reports based on third and fourth hand information heard "though the grapevine" is still submitting a report to the best of its knowledge. Finally, assuming the Commission concluded that a report failed to meet this lax standard, the choice to prosecute would be made by the

Department of Justice. I would be shocked if the Department of Justice, overwhelmed by significant cases effecting the national interest, would exercise its discretion to dedicate resources to litigation over whether someone really didn't believe something they heard about a consumer product.

To date, have you found any instances of falsified individuals or actual individuals whose identities were stolen to submit information?

In response to your inquiry, Commission staff has informed me that the Commission is unaware of any instances where an individual submitted a report under either a fictitious name or the name of another individual without authorization. Notably, based on the response to the above question, it is unclear, in any event, how the Commission would become aware of such a falsification. Commission staff apparently make no effort to verify the identity of report submitters beyond ensuring that the "self-verification" box is checked.

FRIDAY, APRIL 1, 2011.

OFFICE OF PERSONNEL MANAGEMENT

WITNESS

HON. JOHN BERRY, DIRECTOR, U.S. OFFICE OF PERSONNEL MANAGEMENT

Mrs. EMERSON. The subcommittee will come to order.

Happy April Fool's Day.

I want to welcome Director Berry from the Office of Personnel Management. I do appreciate your service. You have a tough job. And I know that while today usually is reserved for practical jokes and pranks, I think it is only opportune for us today to consider the serious challenges of OPM's mission to recruit, retain, and honor our world-class Federal workforce to serve the American people.

OPM leads Federal agencies on personnel management issues for the country's 1.9 million Federal civilian employees. It designs, develops, and oversees compliance with workforce policies in areas of recruiting, selection, development and compensation. Also, OPM has the responsibility for managing tens of billions of dollars in retirement, health and life insurance trust funds for Federal employees.

For fiscal year 2012, the President's budget requests annual operating expenses of $258 million for the Office of Personnel Management, including the Inspector General, to carry out OPM's mandated responsibilities. This is an $18 million, or 7 percent, increase over fiscal year 2010.

As you know, our current spending levels are unsustainable and our committee is committed to fiscal responsibility. And Director Berry, I want to try to work as closely as we can to fund your highest priorities without adding anything additional to the Federal debt.

As the Federal Government transforms itself to address the country's most pressing needs, agencies must have the ability to recruit and retain talented and highly skilled employees. Over the next decade, the Federal Government is facing a huge retirement wave which will result in the loss of leadership and institutional knowledge across the government. So the Federal agencies really need your help to meet this challenge.

You have significant responsibilities, Director Berry, and I look forward to working with you to accomplish your goals and make sure we have the best workforce to serve the American public.

With that, I would like to recognize my friend, our subcommittee ranking member, Mr. Serrano, for any opening remarks he would like to make.

Mr. SERRANO. Thank you, Madam Chairman. And I did notice that Albert Pujols set a record——

Mrs. EMERSON. Zero for five.

Mr. SERRANO. Zero for five and three double plays in one opening day. That has never happened in the history of sports.

Mrs. EMERSON. So do you suppose that having a 10-year contract would have solved that?

Mr. SERRANO. Yes, he would have relaxed more and paid more taxes and maybe kept the shutdown from taking place.

Mrs. EMERSON. Well, there is that.

Mr. SERRANO. I would also like to welcome Mr. John Berry, who we have a lot of respect for.

OPM has a very challenging and important mission overseeing the employment and benefits for millions of Federal workers and millions of Federal retirees. We may disagree up here about the appropriate size of government, but we all agree that it is critical to have a personnel system that has the flexibility and resources to hire and retain a high-quality workforce to staff an efficient Federal Government.

In addition to the current workforce, you are responsible for retirees, a number that is expected to increase substantially in the coming years. Recently, there have been many failed efforts to modernize the retirement system. Despite repeated investment, we still have a system that is outdated and inaccurate, and therefore unable to accomplish its mission. I understand that you are planning a more incremental modernization of the retirement process, and I look forward to hearing about these efforts.

Finally, although we appear to be making progress, there is still an unfortunate possibility of a government shutdown. OPM will have an important role in making sure that the necessary parts of the Federal Government continue to function. I look forward to hearing how you are preparing agencies for this eventuality and making sure that Federal workers know their role in the event of a shutdown. I look forward to addressing these issues during the time for questions, and I would like to welcome you again, Director Berry.

Thank you.

Mrs. EMERSON. Thank you.

Now I would like to recognize Director Berry. Please, if you would keep your remarks to 5 minutes, that way we can get some extra questions in. And let me also say that I believe we are going to have votes called somewhere between 10:45 and 11:00. I am hopeful that we are going to just have a couple, and so we will perhaps have to recess just for a couple minutes. So thank you, and welcome.

OPENING STATEMENT

Mr. BERRY. Thank you, Madam Chair. It is an honor to be with you and Ranking Member Serrano. Thank you so much for having us today. It is great to be here and to discuss some of our priorities. I will try to keep it real short so we get to your questions right away.

Government is increasingly a knowledge-based enterprise where our people are our most important asset. To have a government

that delivers the best services to the taxpayers in the most efficient, cost-effective way possible, we can't avoid investing in our workforce.

Over the past 2 years, as directed by President Obama, we have led a government-wide initiative to reform hiring by making the process quicker and easier so that good, qualified candidates can apply. Our goal: Bring the best and the brightest into the Federal civilian service by making government the model employer for the 21st century. And we are trying to lead by example within the Office of Personnel Management.

In 2010, under President Obama's Veterans Employment Initiative, we hired 2,000 more veterans than in 2009, despite hiring fewer overall people across the government. I am very proud that at the Office of Personnel Management we hired the highest percentage of disabled vets in the government, more than DOD and VA.

We met Congress' 2004 goal to speed up security clearance investigations, eliminating a backlog that we inherited that was over a year in length. Now over 90 percent of investigations are done within 40 days. When we inherited it, it was 179 days. So you can see the improvement on that. And the GAO removed us from the high-risk list this year. A lot of things go on, very little comes off; this one came off. And our movement of this towards the 40 days was one of the primary reasons it was able to.

We are supporting agencies as they work to improve employee engagement and facilitate greater partnership between agencies and employee groups. We are increasing the strategic use of telework. Thank you all for passing and adopting the Telework Enforcement Act of 2010. We are on point in getting that implemented.

Our budget request for 2012 will build on these accomplishments. As part of the President's budget, it is a responsible plan to ensure that we live within our means while still investing in key areas for our future.

Our general funds request for basic operating expenses represents an overall decrease of almost $3 million from 2011 from the CR level. For the administration of civil service retirement and insurance programs, we are requesting a slight increase of $19 million from the annualized 2011 limitation on transfers, and it is to deal with some of the numbers that you all have reflected and talked about.

We are facing an increase in retirement claims. Even in the first third of this year, there is a 15 percent increase in retirements. The Postal Service has announced an additional group of retirements that they are going to pursue, and we also have retirements coming from the Base Closure Realignment Act, in addition to our normal rate of about 100,000 retirements a year. So you can see the demand that is going to put on our services.

To save money and to counteract some of the increases we are asking for, OPM has made the difficult decision to terminate the Retirement Systems Modernization Program. However, we can better achieve automation by now getting back to basics. We are conducting a full review, bottom up, of our systemic process and looking at what pieces make sense to automate that are the most com-

monly used and the most easy to automate. It is going to be almost impossible to automate the entire process. It is just too complicated and too individual in basis. And so what we are looking at is automating the key pieces of it instead. By eliminating that as a formal program, we don't have to provide the oversight, et cetera, that we would have to, which will produce a $2 million administrative cost savings for us by eliminating that program officially.

Also, we are eliminating the second phase of our financial systems, looking at the earned benefit trust fund, our CBIS Phase 2 approach. We have run into problems with CBIS Phase 1. We are working through those problems. We are working with the Comptroller General of the United States. We think we can work this out. Our problems aren't unique. Every agency that is using this system is having similar problems. We are probably having the fewest problems of anybody across government, so I think we have the best chance of making this work. But we certainly don't want to go any farther until we have worked the kinks out of Phase 1. So that will save $41 million from that project that would otherwise be spent.

The Affordable Care Act directs OPM to approve and oversee the multi-state health plans that will be offered to Americans on state insurance exchanges, a major new responsibility. We stood up the preexisting condition plan in less than 45 days. Our overhead is .08 percent, and we now provide primary coverage for that in over 23 States of the Union.

In addition, ACA opened the Federal Employees Health Benefits and Life Insurance Program to employees of tribes and tribal organizations. That is going to add another 1 million people to our workload. We have consolidated and reorganized our staff to better efficiently manage these responsibilities so that our request for increases is less than it would otherwise be.

Our budget proposal also includes several other long-term saving initiatives: A wellness program that I believe is going to have a long-term impact, that we can demonstrate through our agency that if we take this government-wide, will produce millions and millions of dollars in savings; a health claims data warehouse that will allow us to achieve greater savings in FEHBP and for our retirements. And we can assure you that we will maintain tight oversight on patient privacy.

Finally, we are seeking authority to streamline pharmacy benefit contracting within the FEHBP and to leverage enrollees' purchasing power to reduce cost. We estimate that we can save $69 million in the first year, and almost $2 billion in the ongoing years. Our 2012 budget helps ensure our ability to provide the best value to the American people by continuing to recruit, retain and honor our world-class workforce.

Thank you, Madam Chair, and I am happy to answer any questions.

[The statement of Mr. Berry follows:]

UNITED STATES OFFICE OF PERSONNEL MANAGEMENT

STATEMENT OF
THE HONORABLE JOHN BERRY
DIRECTOR
U.S. OFFICE OF PERSONNEL MANAGEMENT

before the

SUBCOMMITTEE ON FINANCIAL SERVICES AND GENERAL GOVERNMENT
COMMITTEE ON APPROPRIATIONS
UNITED STATES HOUSE OF REPRESENTATIVES

on

OFFICE OF PERSONNEL MANAGEMENT FY2012 BUDGET REQUEST

APRIL 1, 2011

Chairwoman Emerson, Ranking Member Serrano, and Members of the Subcommittee:

I appreciate the opportunity to testify before you today on the President's Fiscal Year 2012 Budget request for the Office of Personnel Management (OPM). This budget will help us achieve our vision to recruit, retain, and honor a world-class workforce to serve America. Our people are our greatest advantage. To have a government that delivers the best services to the taxpayers in the most efficient way possible, we need to invest in them.

Over the past two years, we have made significant progress toward making the Federal Government the model employer for the 21st Century. As directed by the President, we are spearheading a government-wide initiative to reform recruiting and hiring to bring the best and brightest into the Federal civilian workforce.[1] To that end, I am also committed to leading by example and making OPM a model employer.

We have moved from a complicated essay-based application process to accepting resumes and cover letters. We have reduced job announcements to a reasonable length and put them in plain language. We are contacting employees at four points in the process and reducing the time to hire so we do not lose good people. And in 2010, when government agencies hired fewer people overall, with help from President Obama's Veterans Employment Initiative, we hired 2,000 more veterans than in 2009.[2]

Statement of Hon. John Berry
Director of the U.S. Office of Personnel Management

April 1, 2011

I also want to note our success in meeting Congress's goal to speed up clearance investigations for individuals the Federal Government wants to hire. When OPM took over the Background Investigation Program pursuant to the *Intelligence Reform and Terrorism Prevention Act of 2004* (IRPTA), we inherited over a half million pending cases and a backlog of 133,095 cases that were over a year old. Now, we have cleared the backlogand the security clearance program has been removed from the Government Accountability Office's (GAO) 2011 High-Risk Series.[3]

We are supporting agencies as they work to improve employee wellness and engagement, and we are facilitating greater partnership between agencies and employee groups. We are also working to implement the provisions of the *Telework Enhancement Act of 2010*,[4] to help agencies update and implement their telework policies in order to establish a flexible and more efficient workforce, reduce agency overhead costs, and help ensure continuity of operations in the event of bad weather, disaster, or terrorist attack.

Our budget request for FY 2012 will help us build on these accomplishments and achieve our strategic goals to Hire the Best, Respect the Workforce, Expect the Best, and Honor Service.

FY 2012 Budget Request

The President's budget is a responsible plan for ensuring that we can live within our means while at the same time making critical investments to win the future. The budget makes tough choices to cut spending and cut the deficit by calling for a five-year non-security discretionary freeze, saving more than $400 billion over the next ten years and bringing domestic discretionary spending to the lowest it has been as a share of the economy since President Dwight D. Eisenhower.

OPM's budget makes tough choices as well, and recognizes challenges the agency faces in FY 2012. OPM's General Funds request for basic operating expenses totals $100,027,000, which represents a decrease of $2,944,000 below the annualized amount provided by the continuing resolution for FY 2011. For the administration of civil service retirement and insurance programs, OPM also requests a total of $132,523,000 in transfers from the three earned benefit Trust Funds, an increase of $19,786,000 above the annualized FY 2011 limitation.

In response to the financial challenges our Government is currently facing, OPM has made the difficult decision to suspend our retirement systems modernization (RSM) program. The full automation of the Federal retirement process is needed to bring better and more efficient services to current and future retirees and we have endeavored for many years to fully implement these changes. However, we can better achieve these goals by getting back to the basics of retirement services rather than managing improvements through a large scale project. Eliminating the RSM program as a formal budget item will save at least $2 million in administrative costs while we

[4] Public Law 111-292 was signed into law on December 9, 2010.

conduct a bottom up review of the Retirement Service process and maintain a focus on achievable goals to automate the retirement processing system.

Also, the planned second phase of OPM's financial system, Consolidated Business Information System (CBIS), to encompass the earned benefit trust funds has been placed on indefinite hold to address and remediate critical issues exposed during deployment of the system in FY2010. This will result in a savings of approximately $41 million over the lifetime of the project.

The enactment of the Affordable Care Act (ACA) designated OPM as the agency responsible for approving and overseeing multi-state health plans to be offered to the American public on the state exchanges.[5] In addition, the Act extended eligibility for participation in the Federal Employees Health Benefits Program and the Federal Employees Group Life Insurance Program to employees of Tribes and Tribal organizations.[6] OPM has consolidated its existing and new healthcare and insurance responsibilities into a new Healthcare and Insurance (HI) organization to help us carry out these responsibilities more efficiently while protecting the integrity of our existing operations.

Our budget proposal also includes several other initiatives to help us realize savings in the long-term. We have launched a wellness program with the General Services Administration and the Department of Interior that offers biometric screening, wellness classes, smoking cessation programs, and a health clinic. In addition, the Health Claims Data Warehouse (HCDW) project is an initiative to collect, maintain and analyze data from health claims under the Federal Employees' Health Benefits Program (FEHBP), including drug utilization from Pharmacy Benefit Managers (PBMs), the Pre-existing Conditions Insurance Program (PCIP), and Multi-State Plan options on an ongoing basis. And let me be clear that patient privacy is foremost in our minds and it will be vigorously protected.

The budget also proposes that OPM be given authority to streamline pharmacy benefit contracting within the FEHB program and leverage enrollees' purchasing power to reduce costs and obtain greater value for enrollees and the American people. We estimate this will save approximately $69,000,000 in the first year and $1,800,000,000 over ten years.

As this Administration's chief people person, I again want to express my appreciation for the opportunity to testify in support of this budget request which will help ensure that we are able to provide the best value to the American people as we continue to recruit, retain, and honor a world-class workforce to serve America.

Thank you, and I'll be glad to answer any questions that you may have.

BIOGRAPHY

John Berry

John Berry is the Federal Government's Chief People Person. As the Director of the United States Office of Personnel Management, he is responsible for recruiting, hiring, and setting benefits policies for 1.9 million Federal civilian employees. Calling this a new day for the civil service, he is reinvigorating the Federal workforce to meet the challenges of the 21st century.

John is working closely with partners both inside and outside of government to fulfill President Obama's charge to "make government cool again" by developing flexible, results-oriented HR policies and working to change how Americans view their public servants. His goal: build a workforce of dynamic innovators who put serving the American people at the heart of everything they do.

With over twenty years of experience in the Federal government, Berry is a passionate and aggressive advocate for public service and Federal workers. He first developed expertise in Federal employee and retirement issues during ten years as Legislative Director for Congressman Steny Hoyer of Maryland, now the Majority Leader.

During the Clinton Administration, Berry served as Deputy Assistant Secretary and Acting Assistant Secretary for Law Enforcement at the Department of the Treasury, where he had direct-line authority over 40% of the Federal law enforcement community, including the Secret Service and the ATF. He then served as Assistant Secretary for Policy, Management and Budget at the Department of the Interior.

From 2001 to 2008, Berry pursued his interest in conservation as Director of the National Fish and Wildlife Foundation and then as Director of the National Zoo, where John the Lion is named after him.

Mrs. EMERSON. Thank you very much, Director Berry. I appreciate very much your testimony.

BUDGET REQUEST

Under the budget request, you list a few things that you needed extra people for—interspersing it with savings, I might add, so it was harder to add it all up at the same time. Anyway, tell me now, your budget request is for 7 percent more, or $18 million, than the 2010 request. So the initiatives that OPM plans to spend they have proposed increase on are?

Mr. BERRY. The increase is getting ready to handle the multi-state exchanges under the ACA. That is the bulk; $12 million of the increase is for that to really staff up.

Mrs. EMERSON. And how many people is that, do you think?

Mr. BERRY. It is approximately 20. Am I correct on that? Twenty-six people.

Also, the Employee Viewpoint Survey, which we have done every other year, is proposed in this budget to go to an annual survey, and then every other year to survey every employee in the Federal Government. We used to just survey a random sample. So that has an additional cost of $1 million.

We have stood up a new Office of Diversity and Inclusion. That is a $1 million increase to allow us to continue forward progress there. And there is a request that is being made government-wide by the Office of Management and Budget that we would play a role in for improving our acquisition of $640,000. So those are the major increases in that.

Mrs. EMERSON. Okay. So if you went back to 2008 fiscal year levels, or let's say a 17 percent decrease, more or less, tell me how that would impact you all.

Mr. BERRY. I think we could make that work, Madam Chair, if you would work with us on flexibility on the trust fund side of the house. What we could work with you and your staff on developing is if we had to go back to the 2008 level, we can't avoid the additional burden, and I can't pretend that we can just eat the entire cost of getting ready for these multi-state exchanges. It is going to be a significant new responsibility for us. But I believe we could work with you on—as I said, we managed this with less than 1 percent of overhead cost. And I think that if you were to give us—we are not talking about a wild increase here. You are allowed under the law to go up to 2 percent to authorize this. So with a slight increase of taking us to 1 percent, for example, would allow us potentially to go back to a 2008 level and still maintain getting ready for these important new responsibilities.

MULTI-STATE EXCHANGE

Mrs. EMERSON. Let me ask you something; when you have to stand up the multi-state exchange, does that require more people at the outset, but then once you have it going then those people could be either shifted elsewhere or they could be temporary employees? I mean, is that how it works once you have things on a roll?

Mr. BERRY. I think the 26 that we are asking for, Madam Chair, is I believe going to be sort of a stable baseline. It is one that we

will build into over the course of—if you give us the authority. I don't see going much beyond that. In other words, I think that is a good, stable thing to be able to handle the millions of people that will have to come on in addition.

Mrs. EMERSON. So the FEHBP people wouldn't be able to perform a dual function?

Mr. BERRY. Right. First, let me say what the law requires. The law requires us to keep these absolutely separate. How I have done this though, so that we have the efficiency of being able to share, obviously, good information and training—because you want both to inform the other—is we have one Office of Health and Insurance that has two deputies, one for FEHBP, one for the ACA. That way, their staffs, the statistical analysis, the data warehouse, the information that we can share back and forth, that will inform both, but the actual management and policy direction that is required under the law we can keep separate. So we will be able to do that.

So clearly the FEHBP is going to continue to be the larger element of the staff. The numbers are larger and they will probably remain so. But there will be, we estimate, in the millions that will be an additional workload that we will have to manage through those exchanges that would be under the ACA section.

Mrs. EMERSON. I really do have to commend you for being able to keep your administrative costs to manage the FEHBP at .08. I mean, it is remarkable. And it certainly sets the bar for any—in the private sector, we know that they could then perhaps reduce their administrative costs as well.

FEDERAL HIRING

Let me ask you one other question during this round because this is a pet peeve of mine. If, for example, I found a job at the Department of the Interior in which I was interested, I was qualified, tell me what the process is for me to apply for the job, who reviews my application, and how that all works, if you would.

Mr. BERRY. Each agency controls their own hiring. So, for example, we don't hire for the Federal Government, we create the policies within which they work.

Mrs. EMERSON. Right. So I want to talk about the policy piece just for a second.

Mr. BERRY. So in that case, for example, Interior, we try to share to gain efficiencies in certain portions of the process, for example, advertising the positions. So all the agencies have come together with us and we have created USAJobs. So there is sort of a central, automated entry place for you to enter your resumes. But those resumes, in that case, would go to the Interior Department. They would screen and assess those resumes to create a pool of well-qualified candidates and then would select—and apply veterans preference. That is what we have set the policies to do all of that. The agency in Interior would then interview people from that well-qualified pool and make their selection to try to match the best skills with the position that they are hiring.

Mrs. EMERSON. So are HR managers within each of those departments making those decisions, or are the people for whom the applicants would be working doing the screening?

Mr. BERRY. The ultimate decision is made—and what the President wants to see done in the Executive order on hiring reform, we want to make sure that responsibility is put with the hiring manager, the person who is actually going to have to be managing the job because they know what they need and can match the chemistry of that job with the right skills set. The HR people are supposed to make sure that the policies are being followed so that veterans' rights are being protected, disabled vets are being protected, et cetera, and creating a legitimate, well-qualified pool that has open access for competition. They are making sure that box is checked, but the actual hiring decision is being made by the hiring manager who is going to be supervising the work.

Mrs. EMERSON. But the hiring manager is only given a select number of people from the pool, even if all of them are equally qualified?

Mr. BERRY. Now here is where we would love to work with you on improving this. One of the things the President's Executive order—that we could do within the law and we are allowing—is, let's say you were applying for an accountant position and you didn't get the job for the accountant but you have gone through a very arduous process, you have competed, you are in the well-qualified pool. Right now you would have to start all over again. To alleviate that, what we have done to try to make it easier is within that department, if they are hiring other accountants, you don't have to start over. They can interview and hire from the well-qualified pool of accountants anywhere in Interior.

Now I asked the obvious question: If Transportation is hiring accountants, why can't they hire from that pool? The law prevents us from sharing between departments now. We would obviously support changing that to allow us to share those positions governmentwide. Any company does this, we should do it too. Right now we have made it easier within departments; I would love to make it easier across the government.

Mrs. EMERSON. So what in the statute actually prevents it? What line? What does it say?

Mr. BERRY. We will get you the specifics, but it limits our authority to share those positions within the department, it says. And so we just essentially need to—we would have to change a word.

[The information follows:]

HIRING REFORM

We do not think there is a sufficient way to broadly interpret current statute to provide an authority for agencies to share competitive certificates across agencies with other appointing authorities. The authority to appoint employees lies with an agency head or with his or her designee.

During the earlier years of Civil Service, OPM (formerly the Civil Service Commission) was responsible for competitive examining within the Executive branch. Based on 5 U.S.C. 3317 and 3318, OPM certified individuals out to agencies for appointments within those agencies. That OPM authority has since been delegated to agencies through 5 U.S.C. 1104. Agencies are responsible and accountable for the appointments they make within their agencies. These appointments must be made in accordance with the merit system principles, veterans' preference and the statutory provisious regarding the proper order of making appointments. Executive Branch agencies have signed agreements with OPM that authorize them to appoint individuals to positions within their agencies using the rnles, regnlations, and processes that OPM would have used absent a delegation.

In September 2010, OPM transmitted to Congress a legislative proposal entitled the Federal Hiring Modernization Act of 2010, which, among other things, would have amended 5 U.S.C. 3317 to expressly permit agencies to share with each other the names and scores of candidates who have been assessed and found to be qualified. The other agencies could make selections from the same certificate for similar jobs for a period of 240 days, without having to post a new job announcement. This would reduce some of the time it takes agencies to fill jobs and would eliminate the need for applicants to snbmit multiple applications for the same types of jobs.

Mrs. EMERSON. Well, certainly for a position that is an accountant, an accountant is for the Interior Department or DOT, or whatever.

Mr. BERRY. I couldn't agree more. It would be a great commonsense advance. It would certainly reduce the frustration level of applicants because now they would have an opportunity to be considered across the government for those pools of jobs. So I think it would be a great step forward in terms of efficiency.

Mrs. EMERSON. Okay. I appreciate that. We may come back to that. Thanks.

Mr. Serrano.

Mr. SERRANO. Thank you so much.

INFORMATION TECHNOLOGY

Director Berry, you inherited several troubled IT systems when you came to OPM, including the Retirement Systems Modernization Program and the Consolidated Business Information System. In the fiscal year 2012 budget you propose to put both systems on hold to address and remediate issues with each system. We had a hearing 2 weeks ago about government IT, and OPM is now playing a bigger role in helping to get some of these systems back on track.

Are you working with OMB to address the problems in these systems.

Mr. BERRY. Absolutely, Mr. Serrano. It is one of our highest priorities. We also work very closely with OMB and Vivek Kundra there, who is the chief CIO, if you will, for the government. And I believe we are one of his cutting-edge practitioners in how to do IT acquisition. We have learned from the private sector here. We have met with CEOs who have advised us, avoid any RFP that is longer than 9 months; get away from the multi-year buys; go short; go for instant deliverables that you can turn on and bring it on in phases, as opposed to trying to do everything at once. And I think that is very wise counsel. And so we have been working in that direction, sir.

We are going to be overhauling USAJobs this fall. And we have been designing it in pieces, we have been testing it in pieces, and we will be turning it on in pieces. And the ultimate goal is to deliver success. I don't want to claim success before it happens, but we are on track, we are on schedule and on budget with that project. And so it is a good example of applying the new techniques to an IT acquisition. We are now taking that into retirement, into our accounting system, and the other IT acquisitions we will do, but that is sort of the approach we are taking, sir.

Mr. SERRANO. And what are your goals? Do you have a time by which you want things to run a certain way? And which way would you want them to go?

Mr. BERRY. Well, the first and the most important I think we can do is, one of the things we are again trying to lead by example on is setting a very tough performance standard for our employees and then asking them to step forward to meet it, and working closely with them in partnership to develop those goals so that there is good buy-in on the front, everybody understands what is being expected, but then people know they have to deliver.

RETIREMENT PROCESSING

So, for example, on the retirement processing, it is a very complicated, arduous process that is largely pen and paper right now and is going to be for many years to come. We can automate pieces of it, and that is what we are looking to do. So for example, where a calculation needs to be made, we can automate that calculation. And we are trying to electronically get all the data now. The good news is we have made some progress. Every applicant is now fully electronic. So all new hires, we won't run into this problem. For existing hires, we have reached about 3 to 4 years back of getting people who are eligible to retire. Our goal is everyone eligible to retire within 5 years will have their file fully automated, because if it is fully automated, it again increases the speed with which people can review documents, adjudicate them, and make sure people are getting the right calculation.

Mrs. EMERSON. Is it a matter of speed or is a matter of losing information? Was it that people who were around 20 years, 30 years, all of a sudden we didn't know they were around?

Mr. BERRY. RSM was killed just before I came into the job, the official acquisition, the contract that we had with a carrier. The best thing I would describe as why it died was they tried to take an off-the-shelf system and apply it to the Federal system, which doesn't have—each case is so unique. Let me just give you a hypothetical example. If you were a Federal employee and you worked at Commerce but you had military service and you were in the reserve and you served in Afghanistan, for the period of time that Congress will award a higher rate of pay for retirement, you get credit for those years that you were in a war zone in Afghanistan, in your case, but it doesn't necessarily apply to every action.

Mr. SERRANO. What do you mean to every action?

Mr. BERRY. For example, the treatment and formula that Congress has passed for Afghanistan is different from Iraq. And so our people adjudicating this have to go back and say, okay—and the days are assigned. It gets really sort of into details that you would be amazed. So they have to go back and verify, were they in the war zone during those days, and if they are, then they get a higher credit and a higher calculation. Well, there was no way the off-the-shelf system could go back in and say, okay, how do I handle this situation and that situation? And so how those cases are done now is we pull all that evidence together and we have a legal specialist who adjudicates those files and certifies that, yes, this employee worked at this period of time, they are eligible for this level of benefit, and then they apply the formula that applies to that unique person. But it is literally different for every employee, which is the problem. This is one, where together, if we could come up with—I know it would be too much to ask to expect Congress not to

award these unique benefits because I know that that political pressure is going to be there regardless of party, regardless of year. What I would love to do would be, wouldn't it be great if we could agree together on, let's agree on a basket of benefits and give you sort of a low, medium, high choice. You all could decide, okay, we want to award the high benefit to this one, or the low, but then we could get some sense of standardization. What happens is sort of with each event we end up with new rules, and that makes it really hard to administer. And so if maybe we could work together to sort of standardize this, we could have an easier life going forward.

MILITARY SERVICE CREDIT

Mr. SERRANO. Now there is a limit, right, X amount of years, of how much military time you can purchase, if you will?

Mr. BERRY. Yes. And I can get you that, sir, officially for the record.

[The information follows:]

MILITARY SERVICE CREDIT

In general, an individual cannot receive credit for any military service in his or her Civil Service Retirement System/Federal Employees Retirement System (CSRS/FERS) computation if they are receiving military retired pay (except if the retired pay is awarded on account of a service-connected disability or if the retirement is from a reserve component of the Armed Forces). However, the individual can elect to waive the military retired pay and make a deposit into the civil retirement system in order to have the military service added to his or her civilian service in computing the CSRS/FERS annuity. An individual may only make payments to capture service credit for military service after 1957, and deposit must be made prior to retirement.

Mr. SERRANO. Otherwise, Mr. Womack will purchase like 30 years or something, right?

Mr. WOMACK. Thirty years, 5 months and 19 days.

Mr. SERRANO. Which means that immediately he would be in the Federal Government much longer than I. I understand that.

RETIREMENT PROCESSING

So just finishing up on this issue, I mean, I even know of some folks who have considered retirement but won't retire because their paperwork is not in order for them to retire, they would be missing out on many years. When can this be in order? Or are there some people that have been lost through the system and can never be recovered, or their information cannot be recovered?

Mr. BERRY. Well, we definitely don't want to lose anybody; I mean, that would be a failure of our fiduciary responsibility. We do encourage employees who are thinking about retirement, we try to work with employees and agencies long in advance of their actual retirement date—sometimes even a year ahead—to say let's make sure we have copies of all of your file. Work with your HR professional in your agency—see, the files aren't with us, they are with the agencies. And let's take your Interior example. If you are at Interior, you would work with the Interior people to make sure you have gotten all your paperwork right. If you had military service, you would go back to DOD and you would get that paperwork in order.

When we have a full file, then we can adjudicate that file very quickly, where one of our problems, our biggest problems of delay is, we will receive a file from an agency and it will be missing the military piece or it will be missing—you had worked at FAA before you came to Interior and they won't have the FAA piece of paper. Well then we have to work to get that, and that obviously takes time as we try to get that.

So we encourage retirees—it is much easier for them, they know their record, they know where they were—to go back and get that all pulled together for us. And then the speed with which their file can be adjudicated is much, much faster. So we try to educate both employees who are coming into retirement as well as the agency HR officials to get those records complete because then we can adjudicate quickly.

Mr. SERRANO. Okay. Well, thank you, Madam Chair. I certainly encourage you to continue to move on this, and certainly in the area of veterans benefits. We hear a lot about "support of our troops." Well, I am a big believer that the support is not only when they are in uniform, it is later on as a national thank you for their service.

Mr. BERRY. I couldn't agree more, sir. Our strategic plan, one of its four goals, is honoring service. And I believe every day, when we are processing retirements, we are reflecting how the American taxpayers are thanking people for their service, both in uniform and in the civil service, for honoring their country. And so it is up to us to make sure we give them respectful treatment and fast, efficient treatment as well.

Mr. SERRANO. Thank you.

Mrs. EMERSON. Thank you.

Mr. Diaz-Balart.

Mr. DIAZ-BALART. Thank you, Madam Chair.

Good to see you, sir. You have kind of touched on this, but I just want to make sure that I got it right. And you talked about some of the issues. So is it 46,000 Federal retirees who basically will receive only about 60 percent of their annuity payments through errors; is that correct?

Mr. BERRY. No. I didn't mean to imply that, sir.

What we do, because we know it takes a while to get these files put together to make the correct adjudication, is if someone comes in, we pay what is called a partial payment. And now, because we know, because of the backlog, that we have a longer period of time to get these things adjudicated, we are paying 95 percent of what we estimate their payment would be. So I don't want to give the impression to any of the members of the committee that you are sitting there not getting paid in your retirement while we are waiting to adjudicate the file or waiting to get the paperwork from the FAA. You are getting your monthly check right from the beginning, and that is what we try to do, and up to what we estimate to be 95 percent of what you would get through the paperwork we have.

The only people that are complicated in that are folks who have court orders. Let's say, for example, a divorce, where a judge has said 50 percent of your retirement needs to go to your former spouse. In that case, you might be expecting X payment. We have to honor the court order and reduce—we can't pay you 90 percent

of your whole payment, we have to factor the court order in. And oftentimes that leads to tension, as you can imagine, resolving those cases. Many of them end up on your desks and we work those out with you. But I do want to explain that because it is an important distinction.

Mr. DIAZ-BALART. All right. Let me ask you then—so I got that; now how long does it usually take then to finalize the process so people can actually get their real number as opposed to the estimated 95 percent? In both cases, in the cases of the regular folks, and then how long does it usually take to adjudicate the cases where there are more complicated circumstances? And I am sure there can't be a one set answer for that, but roughly.

Mr. BERRY. We have 100,000 cases a year. Three to six months. Here it is. 100,000 cases a year. Right now we have a 45,000 case backlog, which is what we are wrestling with. And it takes, the average case—here, let me see. It might be better, if it would be okay for the record, to get you the details on the specifics of the average case. And we can break down sort of the entire case so you will be able to see the numbers of each one.

[The information follows:]

RETIREMENT PROCESSING

Currently, the average case will be processed fully in 117 days. If the case involves a disability, court order, service credit or survivor benefit, the longest it will take to fully process the case is 141 days.

But we usually have sort of about a 10,000 to 20,000 case carryover; that is sort of an average backlog. The 45,000 one now is sort of a function of increased postal retirements, getting ready for the Defense Department retirements under base closure that are coming. And some of what we are seeing is an increased retirement rate. Just in the first third of the year we are seeing about a 15 percent increase in retirements. And so that is what is driving this.

Mr. DIAZ-BALART. Thank you, Madam Chair.

Mrs. EMERSON. Ms. Lee.

DIVERSITY

Ms. LEE. Thank you very much. Good afternoon. Thank you for being here.

Let me reference your testimony where you indicated that, as directed by the President, you are spearheading the government-wide initiative to reform and recruit and hire the best and the brightest workforce. Of course we all want to see, as you said, OPM to become a model employer.

In the President's directive, in the memo, "Improving the Federal Recruitment and Hiring Process," was diversity an issue? And in terms of diversity, if it was included as one of the best and the brightest and diverse workforce, how you are recruiting people of color into the workforce? Do you have a plan to do that? And if you have the information in terms of what the demographics look like or the characteristics of your workforce look like now, I would like to know what it looks like.

Mr. BERRY. We definitely have a plan; it is one of my highest priorities. My Deputy Director, Christine Griffin, we recruited away from the EEOC. She is a lawyer, an attorney, one of the highest

ranking people with a disability in the Federal Government, along with Secretary Shinseki and others. She is a veteran of the United States and a phenomenal leader on this issue. She has been leading a working group across the government and agencies on this specifically. We have a working group on Hispanic employment, we have a working group on diversity throughout the government, and also people with disabilities.

Ms. LEE. How about African American, Latino and Native American?

Mr. BERRY. African American is included, and all of the groups are a part of this focus.

The good news is—and it is not great news, but it is good news, at least we are pointing in the right direction, let me give you some of the numbers. The numbers of minorities in the Federal workforce increased by 5 percent in 2010, or essentially 31,000 more employees. The Federal workforce is 17.7 percent black, 8 percent Hispanic, 5.6 percent Asian Pacific Island, 1.8 percent American Indian, and 66 percent white. Minorities constituted 33.8 percent, if you will, of the workforce.

Now we also are following and tracking senior pay in SES because I think it is important not just to look at overall hires. The number of minorities at senior pay levels increased 9.4 percent between 2009 and 2010; it went from 3,700 to over 4,000. Women represent 31.2 percent of senior-level positions. We can do better there. But again, we had an improvement. The proportion of women and minorities in GS Grades 13 through 15, the more senior-rank grades just before the SES, increased by 7.9 percent, and the SES by the 9.4. So you can see some good early starts, but nnw how do we keep that going? And we are looking at this from sort of a three-pronged approach. One is, we have stood up—and we are asking your support to keep funding to allow us to continue going—an Office of Diversity and Inclusion at OPM. We believe it ought to be not just assigned to EEO or HR, we have to merge and marry and break down those silos so that people see diversity as an asset.

I will give you a good example. I was talking with a FEMA Administrator in their planning for Katrina, and he said had we had a more diverse workforce, our plans, quite frankly, for Katrina would have been better. We had not thought through the impact of, in an emergency situation, sending all white officers into African American communities, knocking on the door saying you must leave your homes. We did not have the right mix of employees to think that through nor to implement it effectively in the event of an emergency. And so diversity is powerful not just in—it needs to pervade everything we do because it will produce better results at the end of the day.

So we are looking at this from student hiring, and our Office of Diversity is working with our Office of Student Outreach and Recruitment through minority institutions. And we are also looking at this from the SES. We have stood up an SES office at OPM that had been disbanded. And the three of them are carefully coordinating and tracking similar data. So this is one we are going to look at from every angle, recruitment, retention, training, and advancement.

So my commitment to you is we are not taking our eye off this ball just because we have had some good early progress in the first year. We are going to stay at this and hope it continues to get better.

Ms. LEE. Thank you very much. I appreciate that response and what you are doing because I ask this question of all of the agency heads; and some of the answers are very vague, but it sounds like you know what you are doing.

Mr. BERRY. Trying very hard.

Ms. LEE. And on track. Maybe you need to train some of these other agencies. Thank you very much.

Mr. BERRY. I did just speak this week to HR professionals and CHCOs and EEO. There was a convention up at the Wardman Park, and I was a keynote up there about doing that training, just what you talked about.

Ms. LEE. Good, thank you.

Mr. SERRANO. I want you to be aware that you got praise about what you are doing from Ms. Lee and you got praise from the chairwoman about the budget. That is pretty rare around here.

Mrs. EMERSON. How did I praise on the budget?

Mr. SERRANO. He said he had 1.8 percent in one of the areas—

Mrs. EMERSON. No, how they administered the FEHBP. They did a fabulous job on administering that.

Mr. SERRANO. Take it as praise.

Mrs. EMERSON. Praise is praise.

Mr. Womack.

Mr. WOMACK. Thank you, Madam Chairwoman. I will try to do my part to contribute to the love affair going on here today.

Mr. Berry, you have an impressive resume. I give you credit for your longtime service to our country.

As I looked at your resume, or your bio, I noted that perhaps the most qualifying aspect of your background must have been when you were Director of the National Zoo because my experience as a Mayor for 12 years in dealing in the HR arena, that is precisely what that arena is, it looks a lot like a zoo. I want to congratulate you for the work that you have done to streamline your processes to make what appears to be your organization much more user friendly and for your work and having come from a military background and knowing the real difficulty in background investigations and its relevance to what we do here in Washington. You are to be commended for that.

WELLNESS

The other thing that I noticed in your testimony was in regard to wellness programs, and I want to kind of drill down on that for just a moment because I am a huge believer that in this debate that we have—and have had now for quite a while—about health care and health care reform, that we have said some things and we have done some things, but we haven't done enough to put some of that emphasis back on the people that work for us. And look, the private sector is doing this stuff and they are doing it with great results. And so I want to congratulate you for your wellness program, and I want to know a little bit more about it.

Mr. BERRY. Well, Mr. Womack, thank you, I couldn't agree more.

Every CEO I mentioned, when you ask them, what do you think is the low-hanging fruit where we can save taxpayers money on this, and every one of them, first on the agenda is what you just described, wellness. They say it has produced bigger savings over the long run than they even anticipated. Now the hard part for an annual budgeting process is people want to see results in 1 year. And all of them will say you are not going to see it in year one, you won't see it in year two, but by four and five it starts to show up in a major way.

We brought on, in our little campus—we sit next to Interior Department and the General Services Administration, so we thought, let's work together and we hired a wellness company that has come in. We offer everything from—we have a Weight Watchers class that is fully subscribed; we have weight training, we have exercise classes. All of the screenings are free.

I do a monthly town hall meeting. And everything is religiously private and only the employee knows, so I don't get to see the data. But as a way to encourage the employees I have shared my data as saying you got to do this because it is free. And what I was so impressed with was the counselors. I wish my primary care doctor had spent as much time with me as this counselor did. They went through my results for 45 minutes. And I had been ignoring my triglycerides, I was 5 points above the goal. But the lady who was talking with me found out that my dad had had heart issues. And she said, because of your genetic predisposition, do you realize that those 5 points don't sound like much—my doctor had always just said, oh, it is five points—it is a 20 percent higher risk rate for a heart attack in your category; you have to lose 10 more pounds. So I had taken off 10 pounds already. I said, another 10? And I am going to do it, I am on my way.

And the interesting thing is this dialogue, what is so exciting to me, Mr. Womack, is people in the elevator—it is so invigorating to have people who are saying to me, Mr. Berry, I lost 14 pounds. Now people are talking about their weight efforts and commenting what they are carrying on the elevator, oh, shouldn't be doing those wings, got to get to the salad bar more. That is the stuff that is going to produce the millions—and if you can imagine, transferred out, billions of dollars in savings. This will have a huge impact in early cancer diagnosis, earlier treatments, healthier employees, and it is going to translate into direct savings for FEHBP, which is big dollars, over $11 billion a year. So you can imagine, if we can produce just 5 to 10 percent, we are talking hundreds of millions of dollars.

So it is one I am passionate about. I appreciate your interest and focus and experience on this and look forward to your counsel as to how we can do better.

Mr. WOMACK. Well, I won't use too much of my time to brag on the city where I came from, but we established a wellness center for our seniors because we recognized we had a growing senior population and we built a 55,000 square-foot facility with warm water therapy and light pools and those kinds of things.

Mr. BERRY. Great.

Mr. WOMACK. We charged a very nominal fee just so we could know who is there and have a little information on them. The first

year, Madam Chairwoman, we thought we would have 1,000 members in this organization, and we had 1,500 members in the first week, and now over 14,000 members, and average daily use of between 1,000 and 1,500 people in this facility in a small town in northwest Arkansas.

What you said a moment ago is correct about the savings on the health care side of the house, but here is the lost information, and this is what I want everybody to be mindful of, particularly as it concerns our Federal workforce. It is also a productivity issue.

Mr. BERRY. Absolutely.

Mr. WOMACK. And so when we have a healthier person, they are not going to be on sick leave as much, they are not going to be hospitalized, and they are not going to have to be resorting to all these tests and everything, medical procedures, and what have you, that come with a bad lifestyle. So from a control of health care costs standpoint and also from a productivity standpoint, it has worked where I was and it will work here.

Are you getting any pushback? In other words, are any of these programs mandatory, so to speak, or being forced on people? Are there any requirements? How are you going through that legal——

Mr. BERRY. Totally voluntary now, sir. And what we are finding very much tracks what we have heard from the private sector. It is interesting, when I met with the CEOs they said, well, there are two ways to do this, you can just make it totally voluntary or you can incentivize. They all encouraged us, there is enough data to show you you need to incentivize it because totally voluntary you are going to end up with about 20 to 30 percent participation rate. Well, now we are a year into this, guess what our participation rate is, without any incentive, just totally voluntary? It is like 24 percent. So we are right between where they told us we would be.

Where the private sector is making the big savings is their percentage rates run 80 to 90 percent participation in these programs. Well, how do they do it? They do it by incentivizing. So they will either lower a copayment, or you get a rebate or things like that. Each company will take an entirely different approach. I think the future of this—and it will be interesting to work, especially with your experience on this, and we would really welcome your ideas—how can we move from the 30 percent to the 80 percent? And I don't have a specific proposal for you other than to know we would have a lot more savings if we had 80 percent participation.

None of them recommended to make it mandatory. They all said you can reach the 80, 90 percent level if you do the right incentive structure. So maybe if we could work together, we could figure out how to do that.

Mr. WOMACK. I think it is a way forward, and I would certainly recommend that to the agencies. I do appreciate your testimony this morning and your leadership in the OPM.

I yield back, Madam Chairwoman.

Mrs. EMERSON. Perhaps we should have a Biggest Loser contest or something.

I am going to shift away from this discussion, given the fact that my doctor just told me to lose 10 pounds and I just can't seem to stay away from good food. But it is impressive what you are doing. And peer pressure is terrific, but certainly making it easy for some-

one to participate is even, I think, more important, and it is wonderful.

As far as what Mr. Womack was doing with the senior center, I find that sometimes it takes a little bit to get some of our seniors doing it, but once they do, then everybody wants to do it.

Mr. BERRY. Well, and it is also making it easier. So like in our cafeteria, for example, I went down yesterday, it is so easy, they have a Weight Watchers option. And it is already calorie counted for you—salmon, vegetables—everything is proportioned and so you don't have to do any of the thinking. And so you say, okay, give me the Weight Watcher option. What we have done, our salad bar used to be a pretty lame salad bar, now we have one of the best salad bars in the city, and it is a really good one. People are going to it because it is more interesting. So sometimes just making it more easily available is part of the solution.

Mrs. EMERSON. And Weight Watchers is a good thing; we will talk to the Mayor of Capitol Hill about that. But in the meantime, if you can invite our subcommittee down for lunch, that might be a nice thing to do.

PAY FOR PERFORMANCE

All right. I want to talk a little bit about Pay for Performance and step increases if we could. In 2009, only 737 out of more than 1.2 million employees were denied a regularly scheduled step increase and accompanying raise because of poor performance. That equates to about a, what, .06 denial rate, or less than half of 1 percent, which, despite being low, is still the highest rate in recent years. So just a couple of questions with regard to that.

In your opinion, under the current Federal pay system, are Federal pay and promotions correlated with performance? What does OPM do to monitor or give guidance to agencies on awarding performance pay increases? And do you think managers actually have the flexibility or the range of carrots and sticks to improve employee performance? And are there consequences at all for poor performance, not only for the employee, but for the manager?

Mr. BERRY. Let me begin by saying, we can do a lot better. I would not sit here and tell any of you that we have nailed performance management in the Federal Government. We have not. Our managers are too timid. We do not have regular—a good performance system would be managers regularly sitting down at least quarterly and having a very straightforward conversation with employees about what is being expected and is it happening? Right now it is done more on an annual basis, and it is given short shift, it is not given the attention it deserves. We are going to be working very hard this year to change that.

We have created a working group of the Chief Human Capital Officers Council on how we can do a better job on having managers and employees pay more attention, and use the authority—you give us broad authority in performance management, both to incentivize and to discipline. And quite frankly, the Federal Government has not done a good job in exercising the authority you have given us. I am going to try this year—that is one of my highest priorities this year—to move the needle on that. I am doing it with my own employees by example, but we are also going to do it across the gov-

ernment. So this CHCO Council is working on that. We are having it chaired by two career senior executives so that it is not seen as a political gotcha game, so that it will be something that can be professionally applied. We are working with the Partnership Council, with the unions to get buy-in to this.

Now more specifically to your question on the within grades. First, I agree we can do a much better job on performance, and we are going to try it, and I hope to have some really good results to bring back to you. This time next year I hope to be able to describe just what we are doing that is going to hold people more accountable. And quite frankly, if someone is not doing the job, we ought to fire them. I mean, we ought to give them a chance to correct—and obviously, if we are not giving them the right tools or training, then we ought to do that, but if after all of that they are still not doing the job, get rid of them. And we can get rid of them in the Federal Government; it is just that managers have not been doing that. And we are going to try to work to create a more rigorous system to apply that principle.

WITHIN GRADE INCREASES

Within grades, now it is kind of interesting. Let's discuss within grades for a second. Every company, private or public, has an approach of sort of a career advancement trajectory. What within grades do is there are 10 steps that take you 18 years to go through. And the principle that sort of both the private sector and the public sector use in terms of HR management is, you want to advance people to the midpoint of their range relatively quickly as a way to keep them because you are making a huge investment up front in training. And a lot of times what happens is if you train somebody, now another of your competitors will come in and steal them away, they save the money of not having to train them. So if you are not advancing people up front to sort of a midpoint of their career, then it is more slowly.

And so how it works in the Federal Government, building on that model, is for the first third of your career you get a step increase, which is 3 percent of your pay annually. For the second third of your career you get it every other year. For the third, the last percentage of your career you get it every 3 years. And what that does is it creates a natural trajectory if—and you only can be awarded this if you have acceptable performance. So you can see where we can—that is broadly defined. So through the performance management—and I think our unions are going to work with us on this—there has to be a natural trajectory.

So if you come in as a GS–12, step 1, it takes 18 years to get to step 10 just through a normal trajectory of that 1-year, 2-year, 3-year approach, and it is in 3 percent, a step equals 3 percent. We can, I think, through performance management, better define what acceptable performance is to ensure that if you are not performing well, a big stick can be we can withhold your within grade.

So we are going to be looking at that as part of this equation, but that gives you a little bit of an example.

Within grades aren't designed to really be performance pay, per se. They are designed to create a career trajectory that retains the training that you are making in that person over an 18-year period.

So there are performance elements—bonuses, awards and things like that—that are purely performance-based, but the within grades weren't ever designed in the law to be a pure performance base. There is a performance element, but it is really to create a career trajectory.

If that is a long answer, I apologize.

PERFORMANCE MANAGEMENT

Mrs. EMERSON. No, I understand. I mean, we all get caught up. Having worked many years in the private sector myself, in many cases I saw people who should have been fired be given promotions just to shovel them out of specific departments and the like. And I dare say I have seen that, having worked in my very first job for the Federal Government, but that was more years ago than I want to say.

Another thing that is frustrating to me is the process by which one would sever the relationship because I know that there are people, for example, who are involved with the Bernie Madoff scandal of the Securities and Exchange Commission who have not yet been terminated because of adjudication and all sorts of things.

I mean, we are not talking about some minor screw-up, they are talking about major lives that were ruined by people not being able to perform their jobs. And I don't understand why it takes so long for them to be terminated.

Mr. BERRY. As I say, we have the ability in the Federal Government right now to do something called a performance improvement plan. So if a manager has an employee like that, you can as the manager put 30, 60, 90 days and say this is what you are doing, this is what I want, you have X days to get there, you don't, you are fired. It can be that straightforward. And our managers don't exercise that.

Mrs. EMERSON. And they are not held accountable either; correct?

Mr. BERRY. It is a historic problem that we are going to wrestle with. But I believe that if we go after that it will have a huge productivity increase for the government, as Mr. Womack was mentioning. And it will serve the taxpayer better. And quite frankly, our labor unions and our employees will be grateful, because as a Federal manager I have removed people, and the people who have come back to thank me when I removed somebody have been their co-workers because they said thank God somebody actually had the backbone to deal with the situation. We have been carrying this deadwood. We have been doing their job for them. You weren't happy to come to work. Getting them out, I am happy to come to my job now.

And it is for the credibility of our managers we have got to he serious about this, and our employees want it. It shows up in our employee surveys. One of the highest things that people feel is we do not discipline poor performers. And it is our workers are telling us that. They feel it is unfair, and they are right. And we need to fix it. So we are going to go after it full force.

Mrs. EMERSON. And that hurts morale.

Mr. Serrano.

WELLNESS

Mr. SERRANO. Before I get to a couple of questions let me just say I was really very pleased to hear Mr. Womack speak of wellness. For a while in government it has been seen as a perk. If you have any exercise facility within a Federal place, that is a perk, even if people pay to join it.

But if you have a person come in and tell you about weight or about heart disease or whatever, it is a perk. And yet we have learned from many countries throughout the world, even some we don't like very much, that if you put up front wellness as an issue, if you put up front preventive medicine as an issue, at the end of the day you don't have the situation we have in this country. I was so pleased to hear that.

Mr. WOMACK. If the gentleman would yield on the subject, it says a lot about the employers. The employer demonstrates a concern for his or her employees' health. Because there is only one of those people, and if their health is in jeopardy, I think it is the employer's responsibility, the leader's responsibility to help that person look for success. So it is productivity. It is a sense of compassion for the well-being of the individual, and of course it is the cost of government. So it is all relative. And if you have been on our side of the table from the executive branch, you get that pretty quickly. The private sector get its completely.

Mr. SERRANO. But my praise with your comments was the fact that you don't hear that often enough, that you usually hear, that is a perk. Let these people go after work to their own place. Don't do it at the work site. Don't have any assistance. That is such a mistake.

So I hope we hear more of this. And I think that there is something happening in Congress that could help with that area, is that more and more of the people coming to Congress for some reason in the last 10 years, I have noticed, are people who are physically active and exercise. And you will see it in a couple of weeks when we have our annual race for charity when more and more and more House teams get together and run and participate. So that is a good thing.

VETERANS EMPLOYMENT INITIATIVE

Tell me about the Veterans Employment Initiative. You know, I have always felt there was a contradiction in this country in some areas, and that is you have people who are very gung-ho about our involvement in military actions, but are not supportive when the troops come home. And I have seen these bumper stickers that say "support the troops" and I wish you could add to that, yes, for the next 20 years, for the next 30 years, for all the time it needs to help them. I am the kind of guy you see voting against the military action and then voting for whatever they need when they come home. Whatever they need when they come home. Of course, it is not the troops that I have a problem with, it is the people who decided to send them there or the action itself.

So tell me about the initiative and tell me how closely you are working with the Veterans Administration.

Mr. BERRY. Well, Mr. Serrano, thank you for your leadership on so many veterans issues. You have been a stalwart over so many years. The President's Executive order I have to say is the thing if you were to ask me for my 2-year term what am I most proud of, it would be having recommended that Executive order to the President.

My father served in the 1st Division in Guadalcanal, and my name I earned from my uncle who was killed in the Pacific, my dad's brother. And so this is a close personal issue for me and I look at it as a way to honor the memory of my father.

The first thing I tackled was looking at veterans—the unemployment rate for returning vets right now from Iraq and Afghanistan is amongst the highest in the country. And knowing the difficult economic times they were coming back to and the competition they faced and we looked at it, and DOD and VA do a great job and so does OPM. Almost 30 percent of our new hires are vets. So we are in the highest category. But many civilian agencies I looked at weren't really carrying their weight. They were not doing a good job. Two to 5 percent of their hires were vets.

So we went to the President and made him aware of this and he said we have got to get everybody to row in the same direction. And he created an Executive order and a council that is chaired by Secretary Shinseki and Secretary Solis, so we have both Labor and VA as the heads and then I am the COO of the council. And we have met four times. What they do is we get every agency together, it is very high level, and people are tracked on their performance. For the first year we were just getting it set up and we just told everybody to do better. The good news is that every agency but two did better.

This year, not wanting to just count on that, we set up an accountability model to hold everybody in place. So if you were in the level of DOD, VA and OPM, above 25 percent in your hires, stay there. You are doing great, keep it up. If you are in the middle category, sort of 10 to 20 percent, do an additional 2 to 3 percent. If you are below 10 percent, that is kind of like the Weight Watchers thing, you have to lose some more weight, you have got to run faster, you have got to do 3 to 5 percent. And so for the lower performers we are expecting them to hire more and to move up faster.

And so every agency now has and knows exactly where they fall. I sit on the President's management council with Jeff Zients at OMB; all of the deputy secretaries come in addition to this council. Monthly. I share the data with every agency, here is where you are. You are either on track or off. It is regular, religious attention. And we are not going to take our eye off of this.

The first year results, like I said, 2,000 more vets hired across the government. Even though we hired less Federal employees it was an impressive step to get this out of the box.

The other thing, lastly, is that we are working with the VSOs, the veteran service organizations, the Legion, the VFW, the Student Vets are in sync with us and we are developing some innovative approaches. What we are looking at is jobs in the military that ought to be easily transferable to the civilian side.

Med techs. We have a desperate need for nurses. We can't hire enough. What if we train med techs to become nurses and guar-

antee them a job in the Federal Government when they come back. Now we are moving beyond from just tracking the data to looking how can we take jobs that are easily transferable and give them the training to do it.

Mr. SERRANO. Well, again, I think that that is a great initiative and a great approach and you should be proud of that Executive order because it is a good one.

Let me take you to a couple of places now where we would probably all like to go right now, to the American Territories.

Mr. BERRY. I volunteer, sir.

Mrs. EMERSON. Let's all go to Puerto Rico. Sounds awesome today.

RECRUITMENT IN THE TERRITORIES

Mr. SERRANO. So both in the area of hiring diversity, of hiring minorities, the Northern Mariana Islands, Guam, Samoa the Virgin Islands, Puerto Rico fit that category well. But also just in the area that I have always discussed with you and other agencies that they are members of our country. They live in Territories. They don't live in States, but they should be included.

And I call your attention to the fact that sometimes it works. For example, NASA has quite successfully recruited from the University of Puerto Rico at Mayaguez, my hometown, for many years now. In fact proudly we say that whenever a rocket goes up there are a lot of folks from Mayaguez on the ground that made it possible. It works for them. It should continue to work for the rest of the agencies. What are we doing to recruit?

Mr. BERRY. Well, we are doing a lot but we have to stay with it. It is one of these things it is not going to be a one-shot effort. I was very pleased and thank you for your support and helping us get the word out in Puerto Rico. The hiring event we did in last October there it was very well subscribed. And we did get a number of jobs, at least 36 that I know of, but it may end up being more now.

But the more important thing was in doing that event we also trained people on how to apply for other Federal jobs so they had a good learning that will I believe will increase their probability of success in future job searches. We need to do that regularly. We did that jointly with NASA, DOD and VA. And we are going to continue to look at how we can continue to outreach effectively through those. I think there are very powerful ways to do.

The other thing we have done specifically I think will help the Territories. We have included them on this specific focus area. The diversity data I was talking with Ms. Lee about. The Hispanic community is underrepresented relative to its numbers in the civilian labor force. It is probably the largest gap, if you will, of our diversity categories right now, 8 percent versus about 14 to 15 in the civilian side. And so we are at 8 in the Feds. There might be a lot of reasons for that. So we have got to make sure that our access points are open and we are reaching out in the right places and including the Territories in this.

We have created a Council on Federal Employment there that is chaired by my Chief of Staff, Liz Montoya and John Sepulveda, who is the H.R. Director at the VA, who understands this well, and

they have an agency group of 65 people across the government that are developing student outreach, training, mentorship, on boarding, the whole 9 yards on this on how to do better by outreaching to Latinos and Latinas and people from the Territories. And I think this is going to bear fruit. There is a lot of great brain power going on this and some very creative, initiative approaches to this that are going to build much more than the annual hiring fair. It is going to be an ongoing more consistent, religious approach that will get this into practice.

Mr. SERRANO. Let me say this, even in that issue there is a disconnect. We send dollars to the colleges throughout this country and then we recruit. Well, we send dollars, not equal shares, to the Territories and then traditionally we don't recruit in those universities. So even if you just are talking about, you know—I cannot believe I'm saying this—what the taxpayer deserves, if you invest, then go recruit some place. But I thank you for your efforts.

Mr. BERRY. Mr. Serrano, if I could, one closing point, and it circles back to your first question. Our effort to hire vets is also going to help on each one of these categories. Every one of those categories in the diversity is well represented in the military. They know that through the voluntary workforce.

We have already invested billions in training in these people. They are great leaders. They are great assets. I use the vet to be "valued, experienced and trained." We would be darn fools not to take advantage of this and by doing it not only we will get great skilled people but we will also increase our diversity numbers.

Mrs. EMERSON. Thank you, Mr. Serrano.

Mr. Diaz-Balart.

Mr. DIAZ-BALART. I don't know if I could read anything into when Mr. Serrano was talking about people being out of shape. He was looking in this direction.

Mrs. EMERSON. I am the only one out of shape up here.

Mr. DIAZ-BALART. Well, Madam Chairman, this is not all muscle, trust me. Years of working on that.

Actually still talking a little about aerospace——

Mr. SERRANO. He is still a great baseball player.

NASA WORKFORCE

Mr. DIAZ-BALART [continuing]. There are obviously going to be a lot of retirements because of NASA and the space shuttle. I know that you have been looking at that and you have been very proactive. Can you talk about how it is going and what you are looking at, please?

Mr. BERRY. I am also very excited. I am finally going to get to see a shuttle launch. I am going to go down with Secretary LaHood and NASA Administrator Bolden next week to see the shuttle launch. Hopefully I should say, if the weather and everything cooperates.

We are committed. Obviously there is going to be a major transition in this program and just like we did with Base Closure and Realignment and everything else, these are great employees. They have served their Nation, they are highly skilled, many of them engineers.

Mr. DIAZ-BALART. Literally rocket scientists.

Mr. BERRY. Literally. And we need to take full advantage of them. I am working with Administrator Bolden and Lori Garver, the Deputy. We have issued guidance and encouraged agencies and we are going to be working to hire these folks and to provide them opportunity and to give them every tool in our book that we can do to help them. And so my commitment to you is that we look forward to continuing to work on this and provide priority focus until we have them in good jobs. And to do everything we can to help. And so I am very open to suggestions or other ideas of how we can help in that kind of transition. Because like you say they are the best and the brightest and we need to keep them.

Mr. DIAZ-BALART. Thank you.

Mrs. EMERSON. Ms. Lee.

NURSING WORKFORCE

Ms. LEE. Thank you very much. You mentioned, Mr. Berry, the need for nurses, the nurse shortage, yet nurses are telling me they can't find jobs. We had a hearing last year——

Mr. BERRY. Send them to me. I will hire them. Let me tell you, we are having such a hard time, Mrs. Lee, that I have issued—we only do this in categories that every one of our attempts to try to solicit hires have failed so badly and our need is so great that we do something called direct hire authority, that I have given that authority to any agency in the Federal Government, that if they can hire a nurse directly they don't have to compete the position. So as long as they are certified, they can do the job, they can be hired immediately.

Ms. LEE. There are several organizations who represent nurses who have testified and indicated that they cannot find jobs for nurses in those who have just graduated from nursing school.

Mr. BERRY. It might require people to move obviously. In other words, in some areas they might not find it in the location they want, but we have got jobs for them. And they are well-paying jobs, they are in great places, they can work with our VA hospitals, our HHS hires. The nursing need is severe across the government.

The other category in desperate trouble is veterinarians. We are not competitive in that field. So this is a tough area, and so like I say, that is another direct hire thing that I have given out: Find one, hire them.

Ms. LEE. Okay, I am going to go back and have some more discussions on this. Appreciate that.

HIRING AND THE DIGITAL DIVIDE

Let me just ask you in terms of in the process of streamlining and modernizing the processes at OPM, have you taken into account the whole issue of the digital divide and how when people—I know many of our communities still, people of color, seniors, don't have access to computers. How do you apply for a job if you don't have access to a computer or do you have a variety of ways that you can do it?

Mr. BERRY. There definitely are a variety of ways and we do try to work, you know, not only with sort of traditional methods, we work with a lot of the retirement groups who help us get word out and work with that. But also sort of our libraries and other folks

who are great at making computers available so that people can come in and apply and get on to USAJobs and other things.

But we also are trying to help in sort of a—good case in point is I opened at OPM this year an office aimed at veterans, veterans hiring, that had all the specialized disability equipment so that sometimes it is not only a question of the digital divide. Even if they have access to equipment, it does not accommodate a disability. And so working with DOD, we got all the specialized equipment. So now vets with disabilities can come in and use that equipment. We are making that available to any agency on a space available basis. So we try to help in every way we can to make it fully accessible, you know, to as many people as possible.

Ms. LEE. It is not apply only through the web? I mean through the Internet?

Mr. BERRY. That is clearly the primary mechanism now, but it is not the only way. You can come in other ways.

Ms. LEE. If I wanted to apply for a job and did not have a computer, no library nearby, which is the case in many communities——

Mr. BERRY. You can use paper.

Ms. LEE. Do it the old-fashioned way still. As long as that option is there. So many private employers now won't even accept an application the old-fashioned way, and it is a barrier right there that excludes so many people. You still don't have for whatever reason access.

Mr. BERRY. My staff informs me that you can still do the old paper-pencil.

Ms. LEE. Thank you.

Mrs. EMERSON. We have such a slog of votes that there is no way—slog? We will be over on the floor for 2 hours almost. We will certainly not make you wait for us. And the only other question I just wanted to ask you briefly was with regard to the your request to hire an environmental manager. Don't you have somebody who already does that now?

Mr. BERRY. I'm sorry?

Mrs. EMERSON. I think there is a request here, let me find it. $100,000 for an environmental manager who is going to be responsible for ensuring that OPM is in compliance with all major environmental laws and regulations. I am assuming you already have somebody who does that.

Mr. BERRY. This is part of the Greening the Government Initiative that we are looking to make sure we can step up in a full way so that on everything we do, whether it be paper purchasing, our fleet management, our energy use, I believe it is an investment that will produce, just like the Wellness Initiative, significant savings. Because, for example, just on electricity alone, that person should hopefully pay for their job three times over if they help us to design and take advantage of all of the new technologies and energy monitoring and management systems that are out there. They have gotten very sophisticated.

And the reason that this is a specific request is this has become a specialty profession. It used to be okay, we are going to buy recycled paper. Now they need to have an engineering understanding to look at energy flow and water flow and other things, and that

is where this is generated from. I believe it is a request that will produce the savings that will more than pay for itself in the years ahead.

Mrs. EMERSON. It is with skepticism that I will close the hearing on that note. It was a wonderful hearing and you did a great job and your team does as well. And I think it is not always easy to be a Federal employee because they get bludgeoned by so many and it is hard work, and I thank you very much for your contribution.

Mr. BERRY. Thank you, Madam Chair, I appreciate you and it is an honor to be with you today.

[The information follows:]

Financial Services and General Government Subcommittee
Hearing on the Office of Personnel Management FY 2012 Budget

Questions for the Record Submitted by Chairwoman Jo Ann Emerson

RETIREMENT SYSTEMS MODERNIZATION (RSM)

Ms. EMERSON: In August of last year, OMB identified your Retirement Modernization Project as "high-risk" and in need of more scrutiny. GAO has done several reviews of this troubled project over the years and made many recommendations to improve its execution. OPM requested $1.5 million in fiscal year 2011 to develop a retirement calculator, but no funds are requested for the project in fiscal year 2012. What is the status of the project today?

Mr. BERRY: The Retirement Systems Modernization (RSM) program has been cancelled as a formal development project. Efforts to automate the retirement system are continuing with a "back to the basics" approach starting with incremental changes that can be piloted before obligating large amounts of resources. Funding will be used to continue imaging and scanning of incoming retirement records, upgrades to existing retirement systems, and other small-scale enhancements to retirement systems (i.e. on-line retirement application).

Ms. EMERSON: How close is the retirement calculator to completion?

Mr. BERRY: The retirement calculator was completed as of December 2010.

Ms. EMERSON: How was the decision made to halt this program and request no funding for RSM in fiscal year 2012?

Mr. BERRY: Based on an evaluation of the RSM investment and other alternatives, OPM decided to terminate the project and transfer future retirement investments toward other IT services in the retirement program. We believe the full automation of the Federal retirement process can be better achieved by getting back to the basics of retirement services rather than managing improvements through a large scale project.

Eliminating the RSM program as a formal development project in the budget will save at least $2 million in administrative costs in FY2012, while the agency conducts a bottom up review of the retirement service process and maintains a focus on achievable goals to automate the retirement processing system.

Ms. EMERSON: Accuracy remains a major problem in processing retiree claims with 23 percent of all claims missing one or more records. Additionally, 11 percent of claims are not received during the first 30 days of retirement causing further delay. What is OPM doing to address issues pertaining to the speed and accuracy in which agencies submit retiree claims?

Mr. BERRY: OPM is currently conducting a complete review of the Retirement Service process from the bottom up, to determine changes needed to improve business processes and increase speed and accuracy. There will be incremental technology changes where

appropriate, but the agency will not be able to identify broader technology changes until the review is completed.

FEHB COSTS

Ms. EMERSON: OPM manages the Federal Employees Health Benefits Program and you've made it your goal to be the innovation leader in employer-based health insurance. In 2007 and 2008, OPM was able to hold Federal employee health insurance costs to about a 2 percent increase despite rising health care costs. Now, it's been over a year since Congress passed the Affordable Care Act and we continue to see dramatic increases in health care costs across the country. In this past year Federal employee health insurance costs have increased by about 7 percent. Can you explain why costs are going up?

Mr. BERRY: There are a number of reasons for the premium changes. In general, FEHB rates reflect changes in the health care marketplace. The FEHB Program uses market competition and consumer choice to provide comprehensive benefits at an affordable cost to enrollees and the Government. In addition, we use firm negotiation with health insurance carriers to keep cost increases as reasonable as possible.

Following is a breakdown of the contributors to the 2011 FEHB premium increase:

Average 2010 Biweekly Premium	**$257.04**	**$113.89**	**$370.93**	
Utilization, Technology & Medical Inflation	$18.56	$8.11	$26.67	7.2%
Demographics (Age, Sex, etc.)	$0.52	$0.23	$0.74	0.2%
Benefit Changes	$1.90	$0.83	$2.73	0.7%
Enrollee Choice (Plan Movement)	($4.34)	($1.89)	($6.23)	-1.7%
Reserves, Financing, etc.	($1.33)	($0.58)	($1.92)	-0.5%
Other Factors	$3.56	$1.55	$5.11	1.4%
Average Biweekly Change	**$18.86**	**$8.24**	**$27.10**	**7.3%**
Average 2011 Biweekly Premium	**$275.90**	**$122.13**	**$398.03**	

*Totals may not add due to rounding.

The question notes that Federal employee health premium increases were held to about 2 percent in 2007 and 2008. For those years, OPM used its authority to use contingency reserve funds in order to defray increases in premiums, thus making the increases for those years smaller than what they otherwise would have been.

Ms. EMERSON: To what degree have you been able to control Federal employee health insurance costs and in future years will you negotiate better deals for Federal employees?

Mr. BERRY: For 2011, health care premiums were projected by some employers, consultants and others to rise at faster rates than FEHB premiums did. OPM attributes "choice" as part of the reason FEHB compares favorably to premium increases nationally and firmly believes choice helps promote healthy competition among carriers. FEHB has

important features, including a wide choice of health plans and competitive benefit packages as well as no pre-existing condition limitations or waiting periods. OPM's goal is to continue to find innovative ways to keep the FEHB Program affordable and to make sure premium dollars are spent on the benefits that customers want and need.

HEALTHCARE

Ms. EMERSON: For fiscal year 2012, OPM requests $12.3 million to fund management, development, design, and analysis activities for the Multi-State Option Plan. This is the first request that OPM has made to Congress for the new healthcare law. However, I understand you received funding in fiscal year 2011from the Department of Health and Human Services to help administer the Federally-run Pre-Existing Condition Insurance Plan. How much funding did OPM receive in fiscal year 2011 from the Department of Health and Human Services?

Mr. BERRY: As of May 4, 2011, OPM has received $10,236,821 in FY2011 through an Economy Act agreement with HHS as well as reapportionment of HHS funds. The total is broken down as follows:

$2,481,000 for Pre-Existing Condition Insurance Plan (PCIP)
$ 288,821 for State Appeals
$2,467,000 for External Review
$5,000,000 for Affordable Care Act implementation
$10,236,821 TOTAL

Ms. EMERSON: How much has OPM already obligated and how many employees worked on healthcare in fiscal year 2011?

Mr. BERRY: OPM expects to utilize all the funds provided by HHS for FY2011 healthcare reform implementation. About 20 current employees (to varying degrees) are working on healthcare reform activities. OPM is in the process of increasing staff levels to perform all of its responsibilities under the Affordable Care Act and to obtain expert consulting contracts to assist with key aspects of implementation.

Ms. EMERSON: Does the fiscal year 2012 budget include any funds from HHS?

Mr. BERRY: OPM's budget request does not include funds from HHS. However, we expect to receive approximately $2 million from HHS to operate PCIP in 23 states and the District of Columbia on HHS' behalf.

Ms. EMERSON: Can you provide more specifics on how your $12.3 million request for 2012 will be spent?

Mr. BERRY: The request will fund FY 2012 management, development and design, and analysis activities for the Multi-State activities. This will fund:

- **$6.2 million for OPM salaries and benefits to fund 26 FTEs.**

- **$2 million for partial support of the design and development of the Health Claims Data Warehouse Project, including funding for cost associated with the system integrator.**
- **$4.1 million for contracts providing specialized technical support (e.g., actuarial, demographic, economic, or statistical analysis) and institutional support (facilities, travel, training, equipment, etc.).**

HIRING REFORM

Ms. EMERSON: Director Berry, you have been put in charge of overhauling the way the Federal government recruits and hires our civilian workforce. In doing so, you have sought to streamline the USAJOBs process by eliminating the lengthy knowledge, skills and abilities questionnaires--and replacing them with more specialized assessment tools. I understand that as part of this streamlining process, HR officers must take on more responsibility in overhauling the hiring process. However, a study issued in August of last year by the Partnership for Public Service found that chief human capital officers are worried their HR staffs aren't up to the task. In fact, the study found that three out of five respondents feel their HR staffs don't have the skills to help their agencies transition to a new state of improved human resource operations and workforce management. What is OPM doing to help agencies' chief human capital officers come up with solutions to these problems?

Mr. BERRY: Pursuant to President Obama's May 11, 2010 memorandum, *Improving the Federal Recruitment and Hiring Process*, OPM has taken action to track agencies' performance in implementation of hiring reform and work with senior agency leaders, hiring managers, and human resources professionals to correct agency hiring problems. OPM is also identifying best practices across the Federal Government for improving the hiring process and provides policy guidance to agencies on implementation of reform efforts.

OPM has launched, in partnership with the Chief Human Capital Officers Council (CHCOC), the HR University (HRU), the Federal Government's one-stop training resource center for the Federal HR professional. Through the use of a web-based platform, the HRU provides a wide variety of training and development resources geared toward Federal HR professionals.

OPM has also developed and launched video training on veterans appointing authorities, military spouse employment, and hiring individuals with disabilities. These trainings provide HR professionals and hiring managers with the salient points on these authorities in a quick and entertaining way.

We are also developing a web-based training application that will train HR professionals and hiring managers on the special appointing authorities for Veterans and Veterans' Preference. The web-based training program will be launched in the summer of FY 2011. This training will be made available on the HRU as well as provided to agencies to allow for customization.

Also, on Veterans Hiring, we will be conducting a 2nd Veterans Employment Symposium in July 2011. The Symposium will focus on hiring managers to ensure they understand the special appointing authorities for Veterans and value of the America's Veterans.

Ms. EMERSON: How are you helping agencies to retool the people they already have in place?

Mr. BERRY: OPM has conducted Nationwide Hiring Reform Training Sessions, which have touched on all aspects of Hiring Reform. The statistics on our Training Session outreach breaks down as follows:

- **17,300 trained (HR professional and hiring managers)**
- **351 workshops**
- **31 states**
- **66 cities**
- **55+ agencies/organizations**
- **21 Federal Executive Board locations**

OPM has also provided "train-the-trainer" sessions for agency human resources practitioners on developing a strategic "on-boarding" program to maximize employee productivity, engagement, and retention. On-boarding is not limited to orientation or mentoring; it is an ongoing process that includes welcoming, training, and acculturating a new hire.

Ms. EMERSON: What action still needs to be taken to improve the timeliness and quality of the federal hiring process?

Mr. BERRY: More than two years ago, the Administration embarked on a broad initiative to reform the entire Federal hiring process. We have attempted to address broad systemic problems such as reducing long job announcements, allowing resumes and cover letters as applications, and contacting potential hires throughout the process.

In September 2010, OPM transmitted to Congress a legislative proposal entitled the Federal Hiring Modernization Act of 2010. Among other things, the proposal includes provisions to allow agencies to quickly increase their hiring to meet urgent and unexpected needs; give hiring managers a larger pool of qualified applicants to choose from; permit agencies to share with each other the names and scores of candidates who have been assessed and found to be qualified; and allow agencies to post targeted job announcements for certain jobs. These improvements would help agencies address ongoing challenges in meeting applicant's expectations for user-friendly procedures, clear communication regarding processes, and seamless transition into the Federal Government.

Questions for the Record Submitted by Congressman Yoder

USA JOBS WEBSITE

Mr. YODER: Last August, OPM announced that it would build the next USAJobs website in-house and no longer use a commercial vendor to supply these services. At the time, OPM insisted that it would not cost more than the use of a commercial vendor and that the site would be ready for launch in July of 2011. What is the anticipated savings by using internal resources to build and maintain this website?

Mr. BERRY: The anticipated savings are predominantly in the ongoing operations and maintenance (O&M) of the system. We have already added new features beyond the original which make it hard for a direct comparison; however, we predict the O&M in the out years will be fairly level yet provide more functionality and ease of use over the prior system. Estimated expenses, projected over a 5-year period, suggest that the system can be delivered for costs that are competitive with what is available commercially. The value added benefits of a non-proprietary solution that leverages economies of scale should result in long-term cost-savings across Government.

Mr. YODER: What did it cost OPM to outsource this project?

Mr. BERRY: The operating cost for FY2011 paid to the contractor is $6.1 million. Going forward, we are using a hybrid approach that capitalizes on internal OPM resources to build the core technology while leveraging both public and private sector methods and tools to produce a seamless, secure, cost effective, and flexible recruitment and staffing environment. The development and implemeotation of each phase of the project is using a collaborative approach with agency partners. The project is not completed yet, but the work is tracking to the predicted cost of $5.7 million.

Mr. YODER: Will this new website be ready for launch this July? If not, when do you anticipate it will be ready?

Mr. BERRY: We are on schedule to complete the development of the new USAJOBS in July 2011. In accordance with OMB and NIST requirements, an independent IT security review will be conducted to ensure appropriate security measures have been built into the new website before it is actually implemented in a production environment. After successfully completing all testing, the system will launch into production October 2011 with new features such as: improved search capabilities; enhanced security; improved account management; and common data standards to name a few. This system also includes an entirely new platform with many new features that streamline and enhance the applicant's experience while providing a more open architecture making it easier to leverage best practices and tools from the vendor community.

H.R. ———, LEGISLATION TO REVISE THE CONSUMER PRODUCT SAFETY IMPROVEMENT ACT

THURSDAY, APRIL 7, 2011

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCE, MANUFACTURING, AND TRADE,
COMMITTEE ON ENERGY AND COMMERCE,
Washington, DC.

The subcommittee met, pursuant to call, at 10:05 a.m., in Room 2123 of the Rayburn House Office Building, Hon. Mary Bono Mack (chairman of the subcommittee) presiding.

Members present: Representatives Bono Mack, Blackburn, Stearns, Bass, Harper, Lance, Cassidy, Guthrie, Olson, McKinley, Pompeo, Kinzinger, Barton, Butterfield, Dingell, Towns, Rush, Schakowsky, and Waxman (ex officio).

Staff present: Gib Mullan, Chief Counsel; Shannon Weinberg, Counsel; Paul Cancienne, Policy Coordinator; Brian McCullough, Senior Professional Staff Member; and Alex Yergin, Legislative Clerk.

Mrs. BONO MACK. Good morning. It is with a sense of purpose as well as a sense of urgency that we gather here today to consider some sensible ways to make the Consumer Product Safety Improvement Act, also known as CPSIA, work better for all Americans. There is bipartisan agreement that CPSIA, while well-intentioned, has created a number of serious problems for manufacturers and retails. Today, we will examine some ways to make a good law even better.

The chair will now recognize herself for an opening statement. You can start me back at 5. Thank you.

OPENING STATEMENT OF HON. MARY BONO MACK, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

In our first hearing of the year, we heard about many of the problems associated with passage of CPSIA. Today, we will focus on a preliminary discussion draft, which offers a range of possible solutions.

One major area for reform relates to the regulation of children's products. In this area, we have the benefit of five unanimous recommendations from the CPSC. We also have draft legislation from last year and other CPSC suggestions in response.

The discussion draft aims to reduce the regulatory burdens of the law without undercutting consumer protection. A fundamental premise is that the Commission can actually protect consumers far better when it is allowed to set priorities and regulate based on risk. Where possible, we should spare the Commission from having to make time-consuming, case-by-case determinations, and let it spend more time on its bigger problems. This is especially true in our current budget climate where we have to make the best use of agency resources.

We need to strike the right balance and that is seldom easy. The discussion draft points to areas where we must decide important policy questions. I hope our witnesses today will help us to make wise choices by shedding light on these issues.

In Section 1, for example, the draft leaves open the age for defining the term "children's product." At our last hearing, my friend and colleague Mr. Dingell, the chairman emeritus of the full committee, reminded us that a lot of the problems with CPSIA originated in the Senate, but this is one that did not. The Senate-passed bill applied the lead content limits to products for children ages 7 and under. That age would have kept the focus on children who are at greater risk when it comes to lead, because very young children, according to the CPSC, are much more likely to put things in their mouth. The House set the top age at 12 years old because of the so-called "common toy box" concern. But by pushing the age to 12, we ended up regulating a huge number of products that are never going to be mouthed or even handled by young children. These include not only the well-known examples of ATVs, bicycles, and books, but also band instruments, scientific instruments, and clothes for older children, among other things.

Another key area is third-party testing. Again, the discussion draft tries to strike an appropriate balance. It preserves third-party testing for lead paint, cribs, pacifiers, small parts, and children's metal jewelry, all priorities that Congress explicitly set in CPSIA. For other standards, however, it gives the Commission discretion to decide what standards should require third-party testing. And it gives the Commission new authority and flexibility to require testing for only some portions of a standard or only for certain classes of products. It also asks the Commission to make sure that the benefits of third-party testing justify the costs before making it mandatory.

Another major area of reform is the CPSC's public database, which just recently began to post complaints. The discussion draft addresses some of the more significant problems that were brought to light in our earlier hearing.

First, the draft spells out in greater detail who can submit reports of harm for the public portion of the database. Among consumers, only those who have suffered harm or a risk of harm—as well as members of their family, legal representatives, or any person authorized by the family—could make public reports.

Second, the draft sets forth a process for improving product identification. The database cannot help consumers if they don't know which products have problems. The draft enlists manufacturers to help consumers provide better descriptions.

Third, the draft gives CPSC more options for solving claims of material inaccuracy. The fundamental premise here is that the database may do more harm than good if it misleads consumers based on inaccurate information.

Finally, the draft would strengthen the Commission's authority to investigate complaints. While some consumers may benefit from the ability to see safety-related complaints, a lot more consumers will benefit if the Commission can investigate complaints more quickly.

Congress must move quickly, too, because the clock is ticking. Unless we act soon, the 100 parts-per-million lead limit will take effect retroactively in August, and once again, millions of dollars worth of products will become illegal to sell, donate, or export.

We have an opportunity and an obligation to make CPSIA a law that benefits all Americans.

[The prepared statement of Mrs. Bono Mack follows:]

PREPARED STATEMENT OF HON. MARY BONO MACK

The committee will come to order.

Good Morning. Today, we turn back to the subject of the Consumer Product Safety Improvement Act of 2008, also known as CPSIA. In our first hearing of the year, we heard about the many problems associated with this law. Today, we will focus on a preliminary discussion draft, which offers a range of possible solntions.

One major area for reform relates to the regulation of children's products. In this area, we have the benefit of five unanimous recommendations from the Consumer Product Safety Commission. We also have draft legislation from last year and other CPSC suggestions in response.

The discussion draft aims to reduce the regulatory burdens of the law without undercutting consumer protection. A fnndamental premise is that the Commission can actually protect consumers far better when it is allowed to set priorities and regulate based on risk. Where possible, we should spare the Commission from having to make time-consuming, case-by-case determinations, and let it spend more time on bigger problems. This is especially true in our current hudget climate, where we have to make the most of scarce agency resources.

We need to strike the right balance, and that is seldom easy. The discussion draft points to areas where we must decide important policy questions. I hope our witnesses today will help us to make wise choices by shedding light on these issues.

In section 1, for example, the draft leaves open the age for defining the term "children's product." At our last hearing, my friend and colleague Mr. Dingell, the Chairman emeritus of the full committee, reminded us that a lot of the problems with CPSIA originated in the Senate, but this is one that did not. The Senate-passed bill applied the lead content limits to products for children age 7 and under. That age would have kept the focus on children who are greater risk when it comes to lead, because very young children, according to the CPSC, are much more likely to put things in their mouth. The House set the top age at 12 years old, because of the so-called "common toy box" concern. But by pushing the age to 12, we ended up regnlating a huge number of products that are never going to be mouthed or even handled by young children. These include not only the well-known examples of ATVs, bicycles, and books but also band instruments, scientific instruments and clothes for older children, among other things.

Another key area is tbird-party testing. Again, the discussion draft tries to strike an appropriate balance. It preserves third-party testing for lead paint, cribs, pacifiers, small parts, and children's metal jewelry—all priorities that Congress explicitly set in CPSIA. For other standards, however, it gives the Commission discretion to decide what standards sbould require third-party testing. And it gives the Commission new authority and flexibility to require testing for only some portions of a standard or only for certain classes of products. It also asks the Commission to make sure that the benefits of third-party testing justify the costs before making it mandatory.

Another major area of reform is the CPSC's public database, which just recently began to post complaints. The discussion draft addresses some of the more significant problems that were brought to light in our earlier hearing.

First, the draft spells out in greater detail who can submit reports of harm for the public portion of the database. Among consumers, only those who have suffered harm or a risk of harm—as well as members of their family, legal representatives or any person authorized by the family—could make public reports.

Second, the draft sets forth a process for improving product identification. The database cannot help consumers if they don't know which products have problems. The staff draft enlists manufacturers to help consumers provide better descriptions.

Third, the draft gives CPSC more options for solving claims of material inaccuracy. The fundamental premise here is that the database may do more harm than good if it misleads consumers based on inaccurate information.

Last, the draft would strengthen the Commission's authority to investigate complaints. While some consumers may benefit from the ability to see safety-related complaints, a lot more consumers will benefit if the Commission can investigate complaints more quickly.

Congress must move quickly, too, because the clock is ticking—unless we act soon, the 100 ppm lead limit will take effect retroactively in August and once again millions of dollars worth of products will become illegal to sell, donate or export.

Mrs. BONO MACK. And now I would like to recognize the ranking member of the full committee, Mr. Waxman, for his 5-minute opening statement.

Mr. WAXMAN. Chairman Bono, thank you very much for recognizing me to give this opening statement and Mr. Butterfield to allow me to go ahead of him.

OPENING STATEMENT OF HON. HENRY A. WAXMAN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

I share your belief that some changes are needed to the toy bill that we passed in 2008. That legislation was an historic step forward for children's safety, but like most legislation, it was not perfect. It has had some unintended consequences and needs refinement. But the discussion draft before us, which is the subject of today's hearing, takes a wrecking ball to the law and would endanger young children. As the chair of the Consumer Products Safety Commission wrote us today, this draft would turn back the clock to an era when harmful products made their way into the stream of commerce and into the hands of innocent children.

In 2008 our committee led the way in passing a strong toy safety law. We held hearings at which we learned about children who died or were severely injured by lead in toys and small charms. We learned that other children suffered catastrophic internal injuries from magnetic toys that ripped through their intestines. And we witnessed record recalls and loss of confidence in the safety of children's products. Despite strong bipartisan support for the new law, implementation has not always been smooth. The ATV industry, the bicycle industry, the publishing industry, and makers of handcrafted toys have all raised valid compliance issues.

I know it is possible to address these concerns without gutting the law. When I was chairman of the committee in the last Congress, we initiated a stakeholders' process to produce the draft bill that gave targeted relief to industry while maintaining the most important health and safety protections in the new law. That draft legislation was supported by both industry and consumer groups. Although the Republican staff were consulted at every step in the process, Ranking Member Barton decided he would not support the bill and we never acted on it.

The discussion draft before us is a very different document. Democrats, consumer groups, and health experts were not consulted. The result is a one-sided proposal that provides relief to industry but sacrifices children's health and safety. According to the Consumer Federation of America and Consumers Union, this proposal undermines safety testing for children's products, undermines lead protections, undermines the effectiveness of the new crib safety standard, and undermines the new public safety product hazard database.

According to Chairman Tenenbaum and Commissioners Adler and Moore, this proposal would be a reversal of several of the core safety provisions in the law. Not only are they critical of the bill, but let me just state quite clearly, there is no chance that a bill this extreme could ever become law. It would not survive in the Senate, and if it did, it would be vetoed by the President. The result would be a lost opportunity. Many of the witnesses who will testify today have identified legitimate concerns but they will receive no relief if all we produce is a more partisan gridlock kind of legislation.

If we work together, I am confident that we can find a way to address most of industry's concerns without jeopardizing the important safety advances we made in the toy safety law. And I had a discussion with the chairman yesterday. I think there is an opportunity for us to work together and produce a product that will be a consensus product. I hope that after this hearing is over we can start fresh and we can produce a genuine bipartisan reform we all can support.

Madam Chair, I would like to yield the rest of my time and an additional 1 minute without any objection to Mr. Rush, who chaired this subcommittee in the last Congress and I think has an important statement to make.

Mrs. BONO MACK. Without objection, the gentleman is recognized.

OPENING STATEMENT OF HON. BOBBY L. RUSH, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ILLINOIS

Mr. RUSH. Thank you, Madam Chair, and I want to thank the ranking member for the full committee for yielding this time to me.

Madam Chair, consumer protection is one of the core functions of this subcommittee, and I want to commend you for convening this important hearing. However, I am surprised to see that instead of talking about improving safety for our children, making our new law's implementation possible, we are focusing on undoing one of the legislative achievements of this subcommittee historically. Demolition and destruction, not creative solution seems to be the policy agenda for our new Republican majority. I am still waiting to see when we will talk about real policy solutions, including the policy implementation issues as it relates to this bill for the American people.

Regulations are not a problem. It is the constant changes or the risk of changes that are difficult to manage for our manufacturers, our consumers, and for the American public. We need to agree once and for all and implement the laws that we have developed. We need regulatory predictability. There is a similar Product Safety

Improvement Act that the Republicans are attempting to revise today represents demolishing the most comprehensive overhaul of U.S. consumer protection oversight in a generation, one that established policies which repaired our Nation's broken product safety system.

And I must say, Madam Chairman, that I am very proud of what we did with bipartisan input, with input from all the stakeholders despite the political differences that we all shared. We were able to reinvigorate the CPSC with resources. We added additional commissioners. We authorized a shiny new testing lab. And Madam Chair, may I ask for an additional 30 seconds?

Mrs. BONO MACK. The clock——

Mr. RUSH. All right. Well, Madam Chair, I just want to conclude by saying that this hearing could be better spent if we were really trying to—maybe we could solve some of the problems——

Mrs. BONO MACK. All right——

Mr. RUSH [continuing]. That we have implementing the bill. Thank you.

Mrs. BONO MACK. All right. So the gentleman yields back. And now——

Mr. RUSH. I yield back the time I have.

Mrs. BONO MACK. Chairman Upton, in accordance with the committee rules, yielded me his 5 minutes, and as his designee, I would like to recognize the chairman emeritus of the full committee, Mr. Barton, for 2½ minutes.

Mr. BARTON. Well, Madam Chairman, I really can't do it in 2½ minutes. So you are going to have to give me at least 3 minutes or just go to somebody else.

Mrs. BONO MACK. Well, we were rather lenient with the other side, so that is not a problem. Go ahead.

Mrs. BLACKBURN. Madam Chairman, I will yield the chairman emeritus my time.

Mrs. BONO MACK. So the chairman emeritus is recognized for 3½ minutes.

OPENING STATEMENT OF HON. JOE BARTON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TEXAS

Mr. BARTON. There is an old joke about somebody trying to get somebody to vote for him and the guy says I would never vote for you if you were running unopposed. And the man goes back and says well, how do we put that voter down? He says put him down undecided. That is kind of what we need to put Mr. Waxman down after what he said.

I participated as the ranking member when this bill was passed. I participated in the last Congress when there was an attempt to amend it. When Chairman Waxman said that the Republicans and the staff were consulted, that is a true statement, but we weren't listened to. In the last Congress, Chairman Waxman and his allies were almost totally inflexible in trying to come to some common ground on changes to the law that was passed under Chairman Dingell's chairmanship back in 2008.

This discussion draft does not take a wrecking ball to the law. It is a good-faith attempt to reconcile the law that, in its current state, is literally unenforceable. We have that in testimony from

the Consumer Product Safety Commission. They have basically—I wouldn't even use the term basically—they have no flexibility at all. The discussion draft that Chairwoman Bono Mack has crafted does give flexibility. I think that is a good thing. It does change some of the principles or modify some of the principles from the law that was passed 2 years ago, but it keeps the core of the law together and it does give the Commission the flexibility and the industry that has to live by it the ability to actually use a little common sense in implementation. I think that is a good thing. I think this discussion draft is a vehicle that can be a bipartisan compromise. But a compromise means both sides have to come together. And Chairman Waxman's statement indicates to me that it is the bill or nothing. And I don't think that is a position to take when we are trying to do something that should be everybody's best intentions to actually protect the children of America, but also gives those that provide the products for our children the ability to provide them in a safe and effective fashion.

I am the father of a 5-year-old and the grandfather of five grandchildren that are under the ages of 13. There is no way in this world that I want to do anything that would put my 5-year-old child or my grandchildren in harm's way. So Madam Chairwoman, I think the discussion draft is a good starting point. It is a starting point. It is not an end point. And if Mr. Waxman and Mr. Rush and our friends on the minority side wish to work with us, we can come up with something that improves the bill that is now the law and gives the flexibility that is necessary.

So with that, I want to thank the Chairwoman for giving me some extra time and thank the vice-chairwoman, Ms. Blackburn, for giving me some of her time. And I yield back.

Mrs. BONO MACK. I thank the gentleman for his statement and yield 1 minute to Ms. Blackburn.

OPENING STATEMENT OF HON. MARSHA BLACKBURN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TENNESSEE

Mrs. BLACKBURN. Thank you, Madam Chairman. I am only going to take about 30 seconds because there are several individuals that would like to speak on this issue. I want to thank the chairman for bringing forward a discussion draft that will encourage us all to listen to the science and to use some common sense. I am a mother. I am a grandmother. I am an aunt. I am a sister. There is no way I would want to have products in the marketplace that are going to be harmful to children and grandchildren, no way at all. And I think it is important that we listen to the science. I think that it is important that we apply some common sense. I have also listened to a lot of the crafters and the small producers in my area and have had good discussions with them. Also, Mr. Howell, when we get to you, I am going to want to talk about this database that I think is seriously flawed. And I thank the chairman and yield back.

Mrs. BONO MACK. I thank the gentlelady and recognize the gentleman from Florida, Mr. Stearns, for 1 minute.

OPENING STATEMENT OF HON. CLIFF STEARNS, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF FLORIDA

Mr. STEARNS. Thank you, Madam Chairman. Let me echo what the emeritus chairman, Joe Barton, said. I was a conferee on this. We had lots of recommendations. We in fact specifically recommended what the CPSC did in January 2010 when they reported back to Congress and they identified some of the problems. There was no flexibility. And they recommended solutions. And we had these recommendations under Joe Barton's leadership to provide the CPSC with this kind of flexibility they need to grant exclusions to the lead limits but they didn't listen. So I think, Madam Chair, what you are doing here is the Lord's work. We need to have the flexibility. And we heard from Commissioner Northrup, who was a former Member of Congress. She also bought this out. And so I am pleased to be here and to support you and I appreciate what you are doing. Thank you.

Mrs. BONO MACK. I thank the gentleman. Last but not least, the gentleman from North Carolina, the ranking member of our subcommittee, Mr. Butterfield, is now recognized for his 5 minutes.

OPENING STATEMENT OF HON. G.K. BUTTERFIELD, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NORTH CAROLINA

Mr. BUTTERFIELD. Let me thank you very much, Chairman Bono Mack, and especially thank you to all of the witnesses who have come forward today to give us your testimony.

You know, Madam Chairman, my recollection—and I was simply a rank and file member of the subcommittee in the last Congress—but my recollection of this is somewhat different from my good friend from Texas, Mr. Barton. My recollection is that CPSIA followed a long and well-considered road to passage that included many, many hearings and extensive conference with the Senate from introduction to enactment. I recall that this legislation at all times remained a bipartisan effort, and I am surprised to hear today that it was not. The vote tally speaks volumes about the bipartisanship nature of this law. Much of the law was taken word-for-word from some of Mr. Barton's language that he had authored. The House passed the conference report with a vote of 424 to 1. And while I don't know it for a fact, I suppose Mr. Barton may be the 1, but the vote was 424 to 1. And the Senate passed it——

Mr. BARTON. Could the gentleman yield?

Mr. BUTTERFIELD. Yes.

Mr. BARTON. I voted for the bill.

Mr. BUTTERFIELD. You did vote, right.

Mr. RUSH. He voted for it, yes.

Mr. BUTTERFIELD. All right. And the Senate vote was 89 to 3. Today, however, it is apparent some portions of the law need to be refined. The ranking member of the full committee has acknowledged that and I do as well. Unfortunately, the discussion draft does not seek to refine the law. Rather, it seeks to undo nearly 2 years of close consultation and careful compromise with Members of Congress, industry—many of whom are here today—and consumer groups, and potentially puts consumers and children at risk. The minority was not consulted to my knowledge in the prepara-

tion of the draft legislation. And I am confident the language would look very different had we been invited to the table and had an opportunity to participate. The draft language would redefine what is considered a children's product to a yet-to-be-determined age, possibly exposing both those who would be classified as children and those who would not to potentially dangerous products.

I ask my colleagues about households with multiple children, if a 9-year-old has a toy intended only for ages 9 and older, is it not reasonable to expect that 9-year-olds with a preschool-age sibling would also want to and will find a way to play with that toy? But perhaps most alarming is rolling back the current lead content limits in favor of risk assessment. This is similar to the model that proved to be inadequate prior to CPSIA but with the twist of creating additional burdens for the Commission.

Since the model and the draft will require premarket risk assessment, CPSC will have to determine for each and every children's product how manufacturers should measure the risk. I am troubled that the draft eliminates independent third-party testing for all children's products with a very narrow exception for five categories. I remind my friends of the millions of toys that were recalled in '07 due not only to high lead levels but design-related safety defects as well. It was clear that manufacturers of children's products and their suppliers had fallen asleep at the wheel and their in-house safeguards were inadequate.

Finally, and I am going to yield to the gentlelady from Illinois in just a minute—CPSIA required the CPSC to create a Public Product Safety Information Database so that consumers would have a convenient way to report and learn about dangerous products. The draft language marginalizes the efficacy of the database by limiting who can submit information, as well as establishing a drawn-out process by which the submitter, the Commission, and the manufacturer are required to have ongoing contact. The more burdensome it becomes to make a safety complaint, the less likely consumers are to use the database. At this time I will yield my remaining time, Madam Chairman, to the gentlelady from Illinois.

OPENING STATEMENT OF HON. JANICE D. SCHAKOWSKY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ILLINOIS

Ms. SCHAKOWSKY. I thank the gentleman for yielding.

To say that I am concerned about the draft bill would be a vast understatement. Here we are in the Subcommittee on Commerce, Manufacturing, and Trade, and instead of looking at ways that we can create jobs, good jobs for the American people, we are examining a bill to undermine consumer protection, words that used to be part of the subcommittee's title. The draft bill is not a collection of small fixes. It would fundamentally gut key pieces of the CPSIA, including the provisions I authored to ensure that durable infant and toddler products are subject to rigorous testing requirements.

I want to read a letter I received from Danny Keysar's parents, which I hope to submit for the record, along with two other letters from parents who lost their children. Danny's mom wrote, "As parents who have paid the ultimate price for unsafe products, we know you don't want to see more children suffer as our son did."

Giving flexibility to the CPSC to enforce safety provisions is one thing, but this wholesale reversal of crucial safety provisions sends us back to a scenario we know leaves children at risk.

I yield back the balance of my time.

Mrs. BONO MACK. All right. And the chair inadvertently overlooked the last 30 seconds on our side, and I would like to recognize the gentleman from Texas, Mr. Olson, for 30 seconds.

OPENING STATEMENT OF HON. PETE OLSON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TEXAS

Mr. OLSON. I will be brief. I am pleased to be here, and I thank the Chair for her leadership in bringing forward this important draft legislation to fix the unintended consequences of CPSIA.

As a parent, nothing is more important to me than the safety and health of my children. I think this draft provides us with a balanced way forward that protects my children from harmful products without devastating our country's small businesses. If my children are protected, your children are protected.

I thank the Chair and looking forward to helping her advance a commonsense fix to this law. I yield back.

Mrs. BONO MACK. I thank the gentleman. And now all opening statements are concluded. And we have three panels before us today. Each of the witnesses has prepared an opening statement that will be placed in the record. Each of you will have 5 minutes to summarize that statement in your remarks. On our first panel we have, in reverse order, but we have Robert Howell, Assistant Executive Director of Hazard Identification and Reduction at the U.S. Consumer Product Safety Commission. That is a mouthful. And then Dr. Barbara Beck, a widely respected expert in toxicology and a former EPA region chief and fellow at the Harvard School of Public Health; and Dr. Dana Best, who is presenting on behalf of the American Academy of Pediatrics.

Good morning. I would like to thank you all for coming. You will each be recognized for 5 minutes. To help you keep track of time, the little clock in front of you, when it turns yellow, please recognize that is the 1-minute mark if you could start wrapping up and when the light turns red, your time is up. I would also ask you to remember to turn the microphone on before you begin. And now I would like to start with Dr. Best for your 5 minutes. Good morning and welcome.

STATEMENTS OF DANA BEST, MD, MPH, FAAP, AMERICAN ACADEMY OF PEDIATRICS; BARBARA D. BECK, PH.D., DABT, FATS, PRINCIPAL, GRADIENT; AND ROBERT JAY HOWELL, ASSISTANT EXECUTIVE DIRECTOR, HAZARD IDENTIFICATION AND REDUCTION, U.S. CONSUMER PRODUCT SAFETY COMMISSION

STATEMENT OF DANA BEST

Ms. BEST. Good morning. Thank you for this opportunity to testify today. I am a pediatrician and pleased to represent the American Academy of Pediatrics. The AAP is deeply concerned that the subcommittee is considering legislation that would profoundly alter the CPSIA and could reverse the progress towards safer toys and

children's products. Today I will focus on four areas: the scope of children's products, lead limits in children's products, risk assessment, and the need for third-party testing.

First, the scope of children's products should protect children up to age 12. The AAP recommended that the CPSIA cover products for children up to age 12 years based on developmental and pragmatic concerns. With regard to developmental issues, the mouthing behaviors that cause the most concern for exposure to hazards like lead peak in the toddler years and taper off throughout school age, although it is not unusual for school-age children to place toys and other objects in their mouths or to mouth or suck on items like jewelry and pens. For some groups, such as children with developmental delays, mouthing behaviors may persist until adolescence or later.

Another concern is that toys are often shared. While most parents work hard to keep toys for older children away from younger children, they may not always be successful. It is therefore important to ensure that toys are as safe as possible for all children in the household.

Second, the CPSIA's limits on lead in children's products should not be relaxed. In the judgment of the AAP, there is no scientific basis for establishing a de minimis level for lead in children's products. To date, science has not identified a threshold below which lead ceases to damage a child's brain or body. There is no known safe level of lead. During the development of the CPSIA, the AAP was asked to recommend a limit for lead in children's products. Following a rigorous scientific review, the Academy recommended that lead in children's products be limited to 40 parts per million. The rationale behind this level is explained in my written testimony.

The AAP is also concerned that the discussion draft proposes to distinguish between lead exposure due to sucking on an item from lead exposure due to licking an item. From a scientific perspective, there is no basis for making this differentiation. Both actions defined as "mouthing" in the pediatric literature are associated with lead ingestion.

The AAP urges Congress to resist calls to set differing standards for lead in children's products based solely on the likelihood of sucking, licking, or swallowing. Given the extreme toxicity of lead, its bioaccumulation, and the irreversible nature of the damage it causes, the concept of setting different levels of lead for various types of toys or children's products is troubling.

Third, risk assessment is not an appropriate method for limiting lead exposure in children's products. The draft before the subcommittee appears to shift from measurement of total lead in children's products to risk assessment frameworks. The AAP urges you to leave intact the straightforward, predictable total lead standard in the CPSIA. The fundamental premise of risk assessment is that some degree of risk is acceptable such as when the benefit of receiving a drug is compared to its side effects. In the case of lead, there is no benefit to exposure. While the harms are numerous and significant such as decreased IQ, if the CPSIA standard is altered, Congress would need to determine what level of IQ loss is considered acceptable.

In addition, standards should protect not only the average child, but also children at higher risk of lead exposure and its consequences. This is best accomplished using the lead limits currently in the CPSIA.

The AAP is deeply concerned that a risk assessment framework would require the CPSC to perform or confirm risk assessment on many different products. It is unclear who would bear the ultimate responsibility for determining risk or what the process would be for reconciling differences when risk assessments differ between the agency and the manufacturer.

Finally, third-party testing is necessary to ensure the safety of children's products. The discussion draft proposes significant changes to CPSIA's third-party testing requirements, dramatically reducing the number and types of products subject to independent testing. This would essentially return us to the pre-CPSIA state of affairs in which consumers were expected to guess which toys and children's products were really safe.

The AAP would like to make one more comment on another point made in the discussion draft and strongly recommend that noncompliant cribs not be permitted in childcare facilities.

In conclusion, the AAP urges you to not weaken the CPSIA's protections against lead and other hazards as you consider ways to improve the ability of manufacturers and businesses to comply with this important law. Thank you.

Summary of Testimony of Dana Best, MD, MPH, FAAP
on behalf of the American Academy of Pediatrics
Energy and Commerce Subcommittee on Commerce, Manufacturing and Trade
Discussion Draft of a Bill That Would Revise the Consumer Product Safety Improvement Act of 2008
Thursday, April 7, 2011

The American Academy of Pediatrics (AAP) strongly supported the provisions of the Consumer Product Safety Improvement Act of 2008 (CPSIA) that were designed to make children's products safer, primarily by reducing exposure to lead and other hazards, and requiring manufacturers to demonstrate safety before products could be sold. The AAP is therefore deeply concerned that the Subcommittee is considering legislation that would profoundly alter the CPSIA and could reverse the progress toward safer toys and children's products. As the Subcommittee considers these issues:

- The scope of children's products should protect children up to age 12 years.
- The CPSIA's limits on lead should not be relaxed.
- Risk assessment is not an appropriate method for limiting lead exposure in children's products.
- Third-party testing is necessary to ensure the safety of children's products.
- Non-compliant cribs should not be permitted in child care facilities.

The AAP has serious concerns that many of the concepts in the Discussion Draft before the Subcommittee would roll back important child health safety protections. The CPSIA was passed in response to significant deficiencies in our nation's product safety system, which had allowed for the widespread sale and distribution of products dangerous to children's health. The AAP urges Congress not to weaken the CPSIA's protections against lead and other hazards as it considers ways to improve the ability of manufacturers and businesses to comply with this important law.

Dana Best, MD, MPH, FAAP
American Academy of Pediatrics
April 7, 2011

Thank you, Mr. Chairman, for this opportunity to testify today before the Energy and Commerce Subcommittee on Commerce, Manufacturing and Trade about children's product safety. My name is Dana Best, MD, MPH, FAAP, and I am pleased to represent the American Academy of Pediatrics (AAP), a non-profit professional organization of 60,000 primary care pediatricians, pediatric medical sub-specialists, and pediatric surgical specialists dedicated to the health, safety, and well-being of infants, children, adolescents, and young adults. I am an Associate Professor of Pediatrics at George Washington University School of Medicine here in Washington, D.C. and served for six years on the AAP's Committee on Environmental Health, which is the primary body within the AAP that handles lead and other environmental health issues.

The American Academy of Pediatrics strongly supported the provisions of the Consumer Product Safety Improvement Act of 2008 (CPSIA) that were designed to make children's products safer, primarily by reducing exposure to lead and other hazards, and requiring manufacturers to demonstrate safety before products could be sold. The AAP is therefore deeply concerned that the Subcommittee is considering legislation that would profoundly alter the CPSIA and could reverse the progress toward safer toys and children's products.

My testimony will cover four areas under discussion by the subcommittee: the scope of children's products covered by the law; limitations on lead in children's products; concepts of risk assessment; and the need for third party testing.

The Scope of Children's Products Should Protect Children Up to Age 12

The CPSIA defines a children's product as "a consumer product designed or intended primarily for children 12 years of age or younger." The AAP recommended that this law cover products for children up to age 12 years based on both developmental and pragmatic concerns.

With regard to developmental issues, the mouthing behaviors that cause the most concern for exposure to hazards like lead are most prevalent among young children, peaking in the toddler years and tapering off throughout school age. However, it is not unusual for school-age children to still place toys and other objects in their mouths, and it may in fact be fairly common for them to mouth or suck on items like jewelry or writing instruments. For some groups of children, such as children with developmental delays, mouthing behaviors may persist even longer.

Another key concern was the fact that toys are often shared among multiple children in the same household, regardless of whether those items are age-appropriate. While most parents work hard to keep toys meant for older children away from younger siblings, it is inevitable that young children will at least occasionally gain access to toys meant for their older brothers and sisters. It is therefore important to ensure that toys are as safe as possible for all children in a household.

Lead is a Potent Neurotoxin

Lead has been recognized as a potent neurotoxin since the time of the Roman Empire, although the mechanisms by which it inflicts brain damage have only been explored and understood in the past century. The brain damage caused by lead exposure is permanent and irreversible. Few options exist for treating lead exposure at high levels, and these treatments have potentially dangerous side effects. No options exist for treating lead exposure at low to moderate levels.

Exposure to lead is amply documented to cause the loss of intellectual capacity. On average, children whose blood lead levels (BLLs) rise from 10 to 20 micrograms per deciliter (mcg/dL) lose two to three IQ points. More recent studies have shown an even greater impact on IQ of BLLs under 10 mcg/dL. Key studies reported a loss of 4 to 7 IQ points in children whose lead levels rose from 1 mcg/dL to 10 mcg/dL..[1,2] These studies suggest that "low" levels of exposure – meaning BLLs less than 10 mcg/dL – cause proportionately greater harm than higher levels.

In addition to these impacts on IQ, lead exposure has documented effects on behavior, with higher rates of behavioral problems reported in young children, teens and adults exposed to lead during childhood. Associations between lead exposure and increased aggression, commission of crime and antisocial or delinquent behaviors have been identified.[3,4,5,6] Children with elevated lead are more likely to have problems with attention deficit and reading disabilities, and to fail to graduate from high school. Other effects include abnormal balance, poor eye-hand coordination, longer reaction times, and sleep disturbances.[7,8,9]

With all of this information in mind, it is critically important to note that lead bioaccumulates. A percentage of lead will be excreted by the body, and the rate of clearance is dependent on a number of factors, including nutritional status. But a percentage of lead is also stored in the body, primarily in bone. These body stores persist over decades. When a woman becomes pregnant, her body draws upon its calcium stores to help create her fetus's bone structure. If lead has been stored in the bone, the developing fetus will be exposed to doses of lead throughout pregnancy.[10]

The costs associated with lead exposure are tremendous. Health economists estimate that every time average blood lead level increases by a small amount* across the children born in any given year, $7.5 billion is lost in potential earnings for those children.[11] Other studies have estimated the annual cost of lead poisoning in American children at $43.4 billion.[12] Costs are borne by our health care, education, and justice systems, among others.

Lead is naturally present in our environment at low levels. Human activities have raised those levels through contamination, whether by adding lead actively to products like paint or gasoline or producing it as a byproduct of activities like burning coal. Lead is present at low levels in our air, soil, and water, but often very difficult to remediate in those cases. It is therefore critical to restrict lead exposure in environments directly under our control, such as consumer products.

* "Small amount" is defined here as 1 mcg/dL increase in blood lead level.

The CPSIA's Limits on Lead Should Not Be Relaxed

During the development of the CPSIA, the AAP was asked by Congress to recommend a limit for levels of lead in children's products. The Academy engaged in a rigorous scientific process, including a review of the pertinent literature, and ultimately recommended that lead in children's products be limited to 40 parts per million (ppm). You will find attached to my testimony a letter to then-Energy and Commerce Committee Chairman Henry Waxman explaining the AAP's calculations in detail with appropriate references.

Briefly, the AAP's experts determined that the appropriate goal of a standard should be to prevent a child from losing one IQ point. For close to two decades, the U.S. Food and Drug Administration (FDA) has recommended a daily intake of no more than 6 micrograms (mcg) of lead per day for children age 6 years and younger.[13] Scientific models of lead ingestion indicate that daily consumption of 6 mcg of lead would increase a child's blood lead level by 1 mcg/dL. The medical and scientific literature are in substantial agreement that an increase of 1 mcg/dL in blood lead level is capable of causing the loss of approximately one IQ point in children whose blood lead level is under 10 mcg/dL.[14,15] It is important to note, however, that the FDA's recommendation refers only to dietary intake and does not take into account other potential exposures to lead, such as paint. FDA officials explicitly stated, "These numbers will need to be adjusted downward to allow for other anticipated exposures to lead."[16]

The Consumer Product Safety Commission's 2005 interim guidance on lead in children's jewelry states that an item with more than 600ppm of lead would be capable of raising a child's blood lead level from 2.2 to over 10 mcg/dL.[17] Given that the AAP's goal was to prevent an increase of 1 mcg/dL, the total of 600ppm was divided by 7.8 to reach 77ppm. Recognizing that most children are exposed to other sources of lead and that lead is bioaccumulative, the AAP recommended roughly a two-fold margin of safety and reduced the recommendation from 77 to 40ppm. The level of 40 ppm was also selected to fall above the naturally-occurring background levels of lead seen in most parts of the United States.[18]

It is the considered judgment of the AAP that there is no scientific basis for establishing a "de minimis" exposure level for lead in children's products. As one study summarized, "With the recent evidence demonstrating an inverse association between blood lead levels and cognitive function in children exposed to low levels of lead, there is no safety margin at existing exposures."[19] To date, science has not been able to identify a threshold below which lead ceases to damage a child's brain or body.

Risk Assessment Is Not an Appropriate Method for Limiting Lead Exposure in Children's Products

The discussion draft before the Subcommittee appears to contemplate shifting from measurement of total lead in children's products to a framework based around risk assessment. The AAP urges you to leave intact the straightforward, predictable total lead standard in the CPSIA rather

Dana Best, MD, MPH, FAAP
American Academy of Pediatrics
April 7, 2011

than introducing the considerable uncertainty and unpredictability that is often associated with risk assessment.

The fundamental premise of risk assessment is that some degree of risk is acceptable. For example, in medicine, the expected benefit of a given drug or device is considered against the possibility of side effects. In the case of lead, however, the known benefit is zero, while the known risk is significant. If the CPSIA's standard is to be altered, Congress would first need to determine what level of IQ loss is considered acceptable across the exposed population.

In addition, risk assessment should – but often fails to – take into account factors related to both the object and the subject, in this case the product and the child. It has been suggested that product-related risk assessment might consider the amount of lead in the product, its physical accessibility, and the size of the item involved. Factors related to the child should also be considered, such as the age and developmental stage of the child who may be reasonably expected to encounter the product. It is also critically important to note, however, that key groups of children will have additional vulnerabilities that risk assessment fails to take into account adequately. Children with poor nutritional status or certain genetic traits will absorb higher levels of lead. Children who already have an elevated blood lead level may lose IQ points more readily than those with no detectable blood lead level. Standards should protect not only the "average" child, but also those children at higher risk for the adverse consequences of lead exposure. This is best accomplished with the lead limits currently in the CPSIA.

The AAP is deeply concerned that a risk assessment framework would require the CPSC to shoulder an untenable burden in attempting to perform or confirm risk assessment on various products. It is unclear who would bear the ultimate responsibility for determining risk, or what the process would be for reconciling differences in risk assessment between the agency and a manufacturer. For all of these reasons, the AAP urges you to reject calls for risk assessment related to individual products and the amount of lead that should be permitted in them.

The discussion draft proposes to distinguish between lead exposure from items that can be sucked on versus licked, or which can versus cannot be placed in a child's mouth. The AAP urges you to avoid setting different standards for lead in children's products based on any such distinction. From a scientific perspective, there is no basis for differentiating between a child licking versus sucking on an object. Children demonstrate a marvelous ability to bring to their mouths and keep there all manner of objects. The preferred term would be "mouthing" and would cover all related behaviors.

The AAP urges Congress to resist calls to set different standards for lead in children's products based solely on subjective assessments of the likelihood of mouthing or ingestion. Given the extreme toxicity of lead, its bioaccumulation, and the permanent, irreversible nature of the damage it causes, the concept of setting different levels of lead for various types of toys or other children's products is troubling.

Third-Party Testing Is Necessary to Ensure the Safety of Children's Products

In 2007, the nation experienced a rash of product recalls that opened our eyes to the previously-unrecognized prevalence of lead in children's products. Numerous companies, including several that made some of the best-known and most-loved brands and children's products, were found to have sold items posing a range of hazards, from high lead levels to toxic chemicals to small, powerful magnets that could perforate the intestines if more than one was swallowed.

The voluntary system of product safety had failed in a very public and visible way. In response, the CPSIA required that all children's products undergo independent testing for safety before appearing on store shelves. Third-party testing was the solution designed to give parents the peace of mind that their children were not serving as test subjects for potentially unsafe products. It was also a necessary step to ensure that children's products imported from other countries compiled with U.S. safety standards.

The discussion draft proposes to make significant changes to the third-party testing requirements in the CPSIA, dramatically reducing the number and types of products subject to independent testing. This proposal would essentially return us to the pre-CPSIA state of affairs, where consumers were expected to make their best guess as to whether the toys and children's products they purchased were actually safe. Some have noted that recalls have dropped in recent years – a welcome trend, and one which the AAP applauds. Compliance with these still-voluntary standards is not, however, a justification for repealing those rules. The AAP urges the Subcommittee not to rescind requirements for third-party safety testing for children's products.

Non-Compliant Cribs Should Not Be Permitted in Child Care Facilities

The discussion draft proposes to permit child care facilities to continue using fixed-side cribs that do not comply with the recently-approved CPSC crib safety rule. Passed unanimously by the five bipartisan CPSC commissioners, this rule bans drop-side cribs and made several other important changes to the crib safety standard. The AAP is sensitive to the challenges this rule poses for child care providers who must replace noncompliant cribs and urged CPSC to provide a substantial phase-in period for crib replacement, which the agency did. We urge Congress not to alter this important rule and its implementation.

In conclusion, the AAP has profound concerns that many of the concepts in the discussion draft before the Subcommittee would roll back important child health safety protections. The CPSIA was passed in response to significant deficiencies in our nation's product safety system, which had allowed for the widespread sale and distribution of products dangerous to children's health. We urge you not to weaken the CPSIA's protections against lead and other hazards as you consider ways to improve the ability of manufacturers and businesses to comply with this important law.

The Honorable Henry A. Waxman
Chairman
Committee on Energy and Commerce
2125 Rayburn Office Building
Washington, DC 20515

Dear Chairman Waxman:

The American Academy of Pediatrics, a non-profit professional organization of 60,000 primary care pediatricians, pediatric medical sub-specialists, and pediatric surgical specialists dedicated to the health, safety, and well-being of infants, children, adolescents, and young adults, appreciates this opportunity to respond to your inquiry for more details on the development of our recommendations for limiting lead content in children's products.

Lead and Children's Health

There is no "safe" level of lead exposure. The vulnerability of children to lead poisoning during development of their brains and nervous systems has been amply demonstrated, and the literature is very consistent. On average, children whose blood lead levels (BLLs) rise from 10 to 20 micrograms per deciliter (mcg/dL) lose two to three IQ points. More recent studies have shown an even greater impact on IQ of BLLs under 10 mcg/dL. Key studies reported a loss of 4 to 7 IQ points in children whose lead levels rose from 1 mcg/dL to 10 mcg/dL.[1,2] These studies suggest that "low" levels of exposure – meaning BLLs less than 10 mcg/dL – cause proportionately greater harm than higher levels. The effects of lead on health do not stop once the child's brain and nervous system mature or the BLL falls. A recent study found that in a group of 7 year old children who had experienced a BLL of 20-44 mcg/dL around age 2 years, the concurrent BLL (i.e., BLL taken at age 7 years when the IQ test was administered), was more closely associated with IQ at age 7 years that BLL at age 2 or age 5 years.[3]

Another important lasting effect of lead exposure is on behavior, with higher rates of behavioral problems reported in teens and adults exposed to lead during childhood. Children with elevated lead are more likely to have problems with inattention and reading, and are at higher risk of failing to graduate from high school.[4] Investigators have identified associations between lead exposure and increased aggression, commission of crime and antisocial or delinquent behaviors.[5,6,7,8] Studies have suggested that several nations which began reducing lead exposure aggressively in the 1970s experienced corresponding decreases in crime rates two to three decades later.[9] Other effects include abnormal balance, poor eye-hand coordination, longer reaction times, and sleep disturbances.[10,11,12]

Lead is easily absorbed by ingestion or inhalation. The most common route of exposure of children is through ingestion, usually by putting hands and other objects in their mouths. Both hand-to-mouth exploration and playing on floors are typical behaviors for children, especially younger children. Studies using videos to record oral behaviors of young children report hand or object in mouth activities 20 or more times per hour.[13,14] If hands or objects placed in the mouth have lead, these usual childhood activities deliver doses of lead.

Once lead enters the body it remains there for years. Lead is similar to calcium from the elemental perspective. This means that our bodies "see" lead as calcium, absorb it into blood and then store it in bone. These stores of lead can be released years later, when bone changes occur or demands on calcium stores are made.[15] Another consequence of storing lead in bone is that exposures separated by months or years have an additive effect on the body's burden of lead and can exert effects over decades. Acquisition of lead in the body even in small amounts (i.e., amounts that result in BLLs less than 10 mcg/dL) contributes to this accumulation of lead. This means that even short term or small cumulative exposures can have lasting negative effects.

Over the past 30 years, average BLL has declined dramatically in the U.S., due largely to the elimination of lead from gasoline and mandated restriction of lead content in paint. At the same time, however, elevated BLL is still not uncommon. Eliminating elevated blood lead levels was established as a key goal under the federal Healthy People 2010 initiative.[16] The AAP believes firmly that our nation must continue efforts to reduce childhood lead exposure and its pernicious impacts. In the past three years alone, the AAP has pushed the Environmental Protection Agency to reduce airborne lead emissions under the National Ambient Air Quality Standards; urged the Food and Drug Administration to eliminate lead in imported candies and their wrappers; and continued our long-term engagement with the Department of Housing and Urban Development to reduce children's exposure to lead paint in older housing and through home renovation activities. We intend to sustain these efforts to ensure that children's potential for exposure to lead is reduced as much as possible and new avenues of exposure are not created.

Lead in Children's Products

As you know, prior to the passage of the Consumer Product Safety Improvement Act (CPSIA), our government had never set limits for acceptable lead content in children's products, with the exception of lead in surface paint. The restriction of lead content to 600 parts per million (ppm) dates back to 1978 and does not apply to any other material or component in toys or children's products. As a result, toys and children's products could have unlimited amounts of lead in areas other than surface paint without violating any mandatory standard. Further, the 600 ppm limit for paint does not represent a health-based standard.

Lead can find its way into toys and children's products as a naturally-occurring component of materials used or as a deliberate or incidental additive. Lead is used

directly in certain materials, such as to stabilize some vinyl compounds and in lead crystal. Lead may also be a contaminant in air, water or soil that comes into contact with materials or components during the manufacturing process. Regardless of its source, however, lead's toxic effect on the developing brain requires us to examine these processes and minimize exposure whenever possible. Because there is no "safe" blood lead level in children, the AAP focused attention on limiting lead to trace amounts that would not represent "added" lead to products.

Development of the AAP Lead Recommendation

In September 2007, the AAP was asked by the House Committee on Energy and Commerce to testify about the hazards of lead and to make specific recommendations for lead content that would be used in the development of product safety legislation. While the AAP had published guidelines on lead exposure prevention, detection and management in the past, we had never attempted nor been requested to provide specific targets for lead content in products. The recommendation delivered to Congress was an ancillary effort that builds upon but is not inconsistent with or contradictory to our previously published statements.

The AAP's recommendations were developed by our Committee on Environmental Health (COEH), which comprises 9 top pediatric environmental health experts serving in a volunteer capacity. While child health issues were their guiding principle, the COEH also went to great lengths to examine the associated practical issues involved to ensure that the final recommendations would be pragmatic and feasible. The primary considerations were: 1) no "safe" threshold for blood lead levels for children has been identified;[17] 2) lead negatively affects health and development at levels well below 10 micrograms per deciliter (mcg/dL) blood lead level;[18] and 3) lead is a naturally-occurring element and may therefore be present is a wide array of materials so "lead-free" status may not be achievable in some products. Therefore, children's exposures to lead in products should be severely limited, but some low level of exposure, a "trace" amount, could be expected.

The primary goal of the COEH in developing these recommendations was to establish a guideline based directly on child health issues, rather than the selection of an arbitrary number. After much discussion, the committee agreed that the appropriate benchmark for its recommendation should be the loss of 1 IQ point. Using California Office of Environmental Health Hazard Assessment analysis that evaluated the upper 97.5% confidence level of blood lead level associated with this effect, a 1 IQ point loss would be prevented by limiting a child's BLL increase to no more than 1 mcg/dL.[19] Supporting a rationale on 1 mcg/dL rise is the FDA upper limit for lead in food at 6 mcg/lead/day for children aged <6 years, which is expected to cause a child's BLL to rise by 1 mcg/dL.[20] There is no logical reason to accept a higher rise in blood lead level from product exposure than from food exposure.

The COEH's next task was to determine the amount of lead that would result in a child's BLL increasing by 1 mcg/dL from exposure to a child's product. This evaluation focused on information posted by CPSC evaluations.[21] The committee determined as follows:

- Based on the 1999-2000 National Health and Nutrition Examination Survey (NHANES), the average blood lead level of a child aged 1-5 years in the US in 1999-2000 was 2.2 mcg/dL.
- In developing its recommendation for lead in toy jewelry, the CPSC calculated that an extractable lead content of 175 mcg would cause an average child's BLL to rise to 10 mcg/dL over a 1 month exposure period. The agency determined that this level of exposure occurs at a level of 0.06% lead by weight (600 ppm, coincidentally, the same limit as the 1978 lead paint ban).[22]
- As noted above, however, the COEH had already determined that waiting for BLL to rise to 10 mcg/dL was not acceptable due to the neurological damage that would occur. In order to limit the BLL rise to 1 mcg/dL, the CPSC figures were divided by 7.8, which represents the rise in BLL from 2.2 mcg/dL to 10 mcg/dL, to obtain the figure that would correlate to a BLL increase of 1 mcg/dL. Accordingly, 600 ppm lead divided by 7.8 equals 77 ppm lead being capable of causing a BLL increase of 1 mcg/dL.

In its next step, the COEH took into account the fact that most children are exposed to lead from a variety of sources, which may include lead paint hazards in the home, airborne lead emissions, contaminated soil, and other consumer products. Since lead is bioaccumulative and highly persistent in the body, it is important to provide a margin of safety to ensure that exposure to a single toy or children's product cannot cause BLL to increase 1 mcg/dL.

In determining how to set this margin of safety, the COEH examined the practical issues associated with lead exposure. Lead occurs naturally in the environment, so setting lead content at zero was not deemed to be a feasible recommendation. The committee examined data from a variety of sources to learn about the natural geological occurrence of lead in the United States. The U.S. Geological Survey provides nationwide data on lead exposure, which illustrates that naturally occurring lead levels generally top out at 30 ppm.[23] The AAP confirmed this data with Geological Survey and independent geologists. Given this evidence, the COEH recommended a two-fold margin of safety for lead content in children's products, dropping the recommendation from 77 ppm to 40 ppm. You may note that this is considerably lower than the margin of safety mandated under other federal laws; for example, the tolerance for pesticide residue on food requires a ten-fold margin of safety (i.e., limit set at one tenth of the amount estimated to cause the negative effect) for vulnerable populations, including children.

Development of the CPSIA Standard and Exceptions Clause

Over the year that Congress spent working intensively on this legislation, the AAP engaged in a detailed dialogue with both House and Senate offices regarding the merit of various possible exemptions to the lead guidelines. In partnership with these offices, the

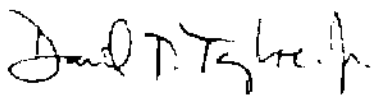
AAP collaborated on the development of legislative language that empowers the Consumer Product Safety Commission (CPSC) to accept and evaluate applications for such exemptions. This process will include possible exemption for inaccessible lead, although the definition of inaccessibility was the subject of much debate. For example, it was questioned whether lead would be considered inaccessible if it were covered by paint or electroplating, or included in a compound such as vinyl or lead crystal. In each of these cases, the COEH advised that lead was not inaccessible because barriers like paint and electroplating can be breached, vinyl deteriorates with time and use, and lead leaches from crystal in the presence of acid (including stomach fluids).

In the final legislation, the CPSC is specifically directed to examine the application of the lead standard to electronic products, including batteries, and to develop guidelines for minimizing children's exposure to lead that cannot be eliminated from these products. The AAP supported these proposals, which will allow for the transparent, science-based evaluation of proposals to permit lead in certain components of toys and children's products. The AAP anticipates offering our views and guidance to the CPSC as such applications are submitted and examined.

The AAP is acutely aware of the impact our recommendations can have, and we strive to ensure that all AAP recommendations are based on science and practical to implement. Led by the COEH, the AAP engaged in a thorough, evidence-driven review to develop our lead recommendations. Following that, AAP members and staff spent countless hours engaged with numerous Congressional offices to explore the issues associated with lead in children's products and to assist in crafting a final bill that would protect children's health through pragmatic, feasible standards. The AAP strongly supported this legislation and looks forward to working with the Consumer Product Safety Commission on its implementation in the coming years.

I hope this letter satisfies your request for information and gives you confidence that the AAP's recommendations represent an empirically-based solution grounded in science. If the Academy may be of further assistance, please contact Cindy Pellegrini in our Washington, D.C. Office at 202/347-8600.

Sincerely,



David T. Tayloe, Jr., MD FAAP
President

Mrs. BONO MACK. I thank the gentlelady and recognize Dr. Beck for 5 minutes. Can you make sure your microphone is on and close to your mouth, please?

Ms. BECK. Sorry.

Mrs. BONO MACK. Thank you.

STATEMENT OF BARBARA D. BECK

Ms. BECK. My name is Barbara Beck. I am a toxicologist risk assessor at Gradient, an environmental consulting company and I have worked on issues of lead exposure, toxicology, and risk for over 20 years, starting from my time at EPA Region 1 where I was involved in development of one of the first clean up levels for lead in soil that I am aware of. I have evaluated exposures, toxicology of lead in products, workplace, and in the environment.

In its present version, the CPSIA Act has established a concentration limit of 300 parts per million for lead, which will go in August to 100 parts per million unless it is not feasible. This is going to be problematic and is problematic at present, especially for metallic alloys that contain lead such as tire stem valves. My concern with the present approach is that it doesn't consider the actual exposure, the intake, the absorption, and the impact of lead releases from such products on blood lead levels. Blood lead levels are typically considered the appropriate metric for evaluating exposures to lead.

Risk-based approaches have been used to establish limits for lead for decades. It has been used to establish limits for lead in air, water, and soil. Such approaches have been beneficial. Blood lead levels of children in the U.S. have declined by over a factor of 10 over the past 20 years as lead has been removed or reduced from air, from food, and from paint.

The proposed changes represent a step in the right direction. Determination of a de minimis level of lead exposure is consistent with what has been conducted with other types of materials such as soil, air, and water, and it also proposes the use of a methodology to identify how much lead is released, what the actual exposure would be from a children's product. This approach is not only consistent with regulatory policy in other settings, but with fundamental principles of toxicology. The dose is what matters. The dose of a chemical—whatever the chemical is, how hazardous it is—is really critical in determining whether there would be a risk or no risk.

I am not here to propose a specific model or a specific de minimis limit, but I do note that the approaches should consider the age of the child: mouthing behavior peaks at age 2 to 3, absorption of lead from the gut peaks around that age, and choosing a value of, say, 7 years old would be protective of younger children. The method that is considered should consider how a child actually interacts with the product and risk-based methods are available to evaluate mouthing behavior, contact by hand with products, hand-to-mouth, as well as the potential swallowing of a product and the impact that contact on blood lead. That can be modeled.

My comments that are provided to the committee provide a hypothetical example of how such an analysis could be conducted. It is not meant to propose specific de minimis values or the specifics of

an approach but to demonstrate that there are methods. In my particular example, I demonstrate how a release of 1 microgram of lead from a product per day every day for a 2- to 3-year-old child would not have a discernible impact on blood lead. Some people may consider that de minimis.

In conclusion, I strongly encourage the committee to consider the use of such risk-based approaches in proposing amendments to the CPSIA. Such approaches will allow for health-protective risk-based limits that would be sound public health policy, as well as sound risk management policy. Thank you.

[The prepared statement of Ms. Beck follows:]

Testimony of Barbara D. Beck, Ph.D., DABT

Regarding "Discussion Draft of H.R.___, a Bill that would Revise the Consumer Product Safety Improvement Act"

Prepared for the
Subcommittee on Commerce, Manufacturing, and Trade Hearing
April 7, 2011
at the
Committee on Energy and Commerce

Table of Contents

Executive Summary

The lead limits stipulated by the Consumer Product Safety Improvement Act (CPSIA) of 2008 have forced many manufacturers to stop selling certain products, because the products contain components exceeding the current 300 ppm total lead standard of the Act. The difficulty with this approach to regulating lead in products is that it does not consider the *actual* exposure of children to lead. This is because the presence of lead in a product, as reflected by the concentration of lead, does not necessarily mean that there will be a significant exposure to lead. If the exposure to lead is very small, there will not be any health effects. Unfortunately, the present version of the CPSIA does not support consideration of exposure. Risk-based analyses that take into consideration age of child, exposure frequency and duration, exposure route, and dose represent a scientifically supportable approach to determine exclusions from the lead standard. In 2009, I recommended at a Congressional Briefing that that such risk-based analysis be allowed under the auspices of the Act. The "Discussion Draft H.R. ." dated March 29, 2011, proposed by the Subcommittee on Commerce, Manufacturing, and Trade to amend the Act, suggests just such an approach. Although details need to be worked out with respect to the testing method and specific criteria (*e.g.*, allowable lead exposure limits), conceptually the proposal, by focusing on *actual* exposure of young children to lead from a product, rather than concentration of lead in the product, represents an improvement over the present version of the CPSIA, while remaining health protective.

1 Introduction

Good morning and thank you for this opportunity to testify regarding the CPSIA and the need for a risk-based approach for lead in children's products. I am Barbara D. Beck, Ph.D., diplomate of the American Board of Toxicology (DABT), and fellow of the Academy of Toxicological Sciences. For 24 years I have been a toxicologist and Principal with Gradient, a firm specializing in human health exposure and risk assessment, and located in Cambridge, Massachusetts. Prior to Gradient, I held positions at the Harvard School of Public Health, US EPA Region I, and Tufts University School of Medicine. I am past president of the Academy of Toxicologists, and have been a DABT for 20 years.

Over my 30+ year career in toxicology and public health, I have worked extensively on projects involving lead. More than 20 years ago, while at US EPA Region I, I developed the first target action level for lead in soil. During my tenure at Gradient, I have worked for the private and the public sector on many projects involving lead exposure, toxicology and risk. These projects have included refinery and mining sites, children's toys, consumer products, and automotive vehicles. I was also significantly involved in providing regulatory comment for the lead National Air Quality Standard (NAAQS). On April 1, 2009, I testified at the CPSIA Rally and Congressional Briefing regarding lead and the CPSIA.

I would also like to emphasize that I am presenting my testimony this morning on my own behalf as an independent scientist. I am not being compensated for my travel expenses or any of the time I have spent preparing for today's testimony. In addition, I am not representing myself under any Federal contract or grant.

2 Consumer Product Safety Improvement Act (CPSIA) of 2008

The Consumer Product Safety Improvement Act (CPSIA) of 2008 stipulates that, as of August 14, 2009, children's products that contain more than 300 ppm (mg/kg) lead may no longer be sold in the United States (US Congress, 2008). The limit will be reduced to 100 ppm on August 14, 2011, unless the Commission determines that this lower limit is not technically feasible. Based on the current language, while manufacturers may petition for exclusion from these standards, exclusions are allowed only if the manufacturers can demonstrate that no lead can be absorbed by children.

The scientific community understands that, based on multiple lead-related recalls occurring in 2007, Congress was motivated to write the Act to be protective of our children's health, and, in the case of lead, to eliminate lead risk to children. However, there have been untoward consequences of the Act, as some manufacturers and businesses have suspended sales of their existing inventory. The act has been particularly burdensome for manufacturers of steel, copper, and aluminum alloys, as components made from these materials typically contain fairly high concentrations lead. The end result is that certain individual components in the products exceed the current lead standard – even though exposure to lead in those components is, because of the nature of the way children come into such components, unlikely, and would not result in health effects. Thus, the Subcommittee on Commerce, Manufacturing, and Trade has responded with a proposed bill that would amend the CPSIA to allow for a risk-based approach, that is protective of public health, and to relieve the burden to manufacturers.

As I explained during my testimony at the Congressional Briefing in 2009, a risk-based approach focuses on *actual* exposure and the health significance of that exposure. Such an approach can be extremely effective in protecting a child's health. Consider, for example, how average blood lead levels in children have been reduced by nearly 10-fold, from 15 µg/dL in 1976 to 1.5 µg/dL in 2007-2008 (CDC,

2011), an important public health success story. This was accomplished by focusing on *important* sources of lead exposure (*i.e.*, sources that had a significant impact on blood lead levels), specifically lead in air (from leaded gasoline), in food (primarily from lead solder in cans), and in paint, to the general population of children. Indeed, risk-based approaches are widely used and considered appropriate in other sectors, for example, in human health risk assessment for lead in soil performed for Superfund sites (US EPA, 1997).

3 Lead Standards and Permissible Intake

Regulatory agencies develop standards to prevent harmful health effects. In general, the agencies purposely over-estimate exposures to and the toxicity of chemicals in order to be certain that human health is protected. This means that standards have a margin of safety (*i.e.*, the permissible dose of a chemical is well below the dose that causes harmful health effects). This provides confidence that regulatory limits will be sufficiently protective for all individuals, even those who might especially sensitive to the chemicals of interest. In the case of lead, children are typically considered to be more susceptible than adults.

A permissible level of lead in a toy or another children's product must be based on an understanding of how lead is released from a toy, the amount of lead potentially ingested by a child, and the quantitative impact of that ingested lead on blood lead. Lead that cannot be released from a toy or other product because the lead is in an inaccessible location or bound in a matrix would not constitute a risk potential because the lead would not be ingested by the child. Thus, to be meaningful, a standard should be linked to the amount of lead released from the toy. A standard based on soluble lead [*e.g.*, the 90 ppm standard specified for soluble lead in ASTM F963-07e1 (ASTM, 2007)] would, in general, be

preferable to a standard based on total lead (unless a robust relationship between total lead and soluble lead has been determined).

Thus, a standard could be developed by setting a target blood lead increment and then calculating the amount of lead released from a toy or other product that would result in an impact at or below the target blood lead increment. Conceptually, health-based limits for lead in other media, such as air, water, or soil, have been developed in this manner, using exposure parameters specific to that medium (see, for example, CPSC, 1977; US EPA, 2001, 2002).

4 Proposed Change to the CPSIA: *De Minimis* Exemption

The new bill proposed by the Subcommittee on Manufacturing, Trade, and Commerce proposes a *de minimis* exemption for lead released from children's products, specifically stating that:

> The limits established under subsection (a) shall not apply to any component part of a children's product if, under reasonably foreseeable conditions of use and abuse, it is unlikely that a child who is exposed to the product would ingest more than a *de minimis* amount of lead. (Subcommittee on Manufacturing, Trade, and Commerce, 2011)

In terms of implementation, the proposed amendments state:

> The Commission shall, by regulation, establish a methodology for estimating the amount of lead a child would likely ingest from exposure to a component part. Such methodology shall distinguish, at a minimum, between parts that can be placed in the mouth and parts that cannot be placed in the mouth. (Subcommittee on Manufacturing, Trade, and Commerce, 2011)

Moreover, until such methodology is defined by the US Consumer Product Safety Commission (CPSC):

> [A] manufacturer may use any reasonable methodology to estimate the amount of lead a child would ingest from exposure to a component part. (Subcommittee on Manufacturing, Trade, and Commerce, 2011)

Although details on implementation (*e.g.*, testing method and definition of the *de minimis* lead exposure limit) need to be worked out, the proposal focuses on *actual* exposure of young children to lead from a product, and considers the impact of that exposure in terms of health. This is an important improvement over the present version of the CPSIA.

The following sections provide scientific support for the use of a risk-based approach, including a hypothetical example that describes an approach to assist in the definition of a *de minimis* level. The sections also contain information on application of such a risk-based approach to children's products, including a discussion of possible extraction methods for product testing and the use of blood lead modeling.

5 Consideration of Exposure: Risk-Based Approach

The mere presence of lead in a children's product or component does not mean that there is an exposure hazard to a child. Moreover, a component with a high concentration of lead does not necessarily mean that a child will subsequently be exposed to a high concentration of lead. Several exposure factors, described below, must be considered to determine whether the lead in a particular product constitutes a health risk to a child contacting that product.

5.1 Dose Response

The most fundamental concept in toxicology is the dose-response relationship, commonly summarized as "the dose makes the poison" (Eaton and Gilbert, 2008). All substances show a dose-response relationship. For example, small amounts of salt may be consumed without adverse effects, but ingestion of much larger quantities can result in adverse effects, such as elevated blood pressure (Braunwald *et al.*, 2001, p. 1415). As another example, at the recommended dose of two tablets,

aspirin yields pain relief from headaches or other minor aches, and even lower doses can be used to prevent and manage cardiovascular disease. However, taking more than the recommended dose can lead to increasing levels of toxicity, including death (Roberts and Morrow, 2001). Similarly, lead exhibits a dose-response relationship, with the likelihood and nature of effects being greater with increasing dose, typically expressed as blood lead levels.

5.2 Exposure Duration and Frequency

The dose of a chemical is affected by a number of factors. For example, how long and how often someone comes into contact with a chemical will affect the dose. In the case of a children's consumer product, it is important to know whether the child comes into contact with the product every day, or only occasionally. It is also important to know how many hours or minutes of each day a child contacts the product. For example, daily or infrequent contact with the product may be possible. With less time of contact, exposure will generally be less. One-time acute exposure (*i.e.*, accidential ingestion) is also possible; appropriate science-based assessments are available to account for such potential acute exposure, if that is a plausible exposure scenario.

5.3 Exposure Route

The manner in which a person comes into contact with the chemical (for example, through the skin *versus* taking the chemical in through the mouth) is also important. The chemical also must be accessible to the child in order for an exposure to occur. While some chemicals can be taken in through the skin, others are not taken in through the skin very well, if at all. In the case of children's products, a young child might possibly chip or bite paint off a painted product, or, if the paint is loose, take paint off by sucking on the children's product. If the paint contains lead, these activities could result in some lead taken into the body through the mouth; this is termed "ingestion." Because lead is not taken up through

the skin, just handling the children's product will not result in a dose of lead. Another possible exposure scenario is surface-to-hand transfer and subsequent transfer from hand to mouth. Considerations for this scenario include the surface area of the hand/fingers touching a component, the transfer of lead to the hand/fingers, the frequency and duration of the contact, the transfer of lead from hand/fingers to mouth, and subsequent intake of the lead into the body. Methods are available to quantify the transfer of metals, such as lead, from components to hands *via* use of wipe tests (see, for example, Dubé *et al.*, 2004).

5.4 Lead Intake *versus* Uptake

Intake is generally expressed as the amount of a chemical at the skin, lungs, gastro-intestinal tract that is available for absorption. Intake, while necessary to yield a "dose," is not equivalent to absorbed dose (uptake), the amount of a chemical absorbed into the blood stream. Lead intake (particularly from children's products) is primarily through ingestion (*e.g.*, through direct mouthing of a children's product or through hand-to-mouth contact).

How much lead a child actually absorbs, after lead is ingested, is an important consideration in a risk-based approach. Bioavailability (*i.e.*, the fraction of ingested lead that is solubilized in the gastro-intestinal tract) determines the amount of lead that can be absorbed into the body (uptake). Bioavailability should be considered when evaluating exposure using a risk-based approach. The bioavailability of lead in the digestive tract depends on the physical (*i.e.*, particle size) and chemical form of lead, and can vary by more than 10-fold. This is clearly an important determinant of the amount of lead uptake into the body.

5.5 Blood Lead Modeling

In order to evaluate the impact of lead exposure to the body, the amount of lead absorbed must be converted to a blood lead value. Models such as the *Integrated Exposure Uptake Biokinetic (IEUBK) Model for Lead in Children* (US EPA, 1994), or the O'Flaherty model (1997) are widely accepted risk-based approaches that have been used in a number of circumstances to quantify the impact of lead uptake on blood lead. These models can be and have been applied in risk-based approaches to evaluate the impact on blood lead of different types of exposures of lead, from soil, air and products.

5.6 Consideration of Age of Child

The Act considers products manufactured for children up to age 12. However, it is important to note that there is a significant difference between a 2- to 3-year-old toddler and a 12-year-old, and how they will interact with a children's product. The 2- to 3-year-old will have much more frequent hand-to-mouth contact than the 12-year-old and will contact products in a different manner than a 12-year-old (US EPA, 2006; RIVM, 2008). The 2- to 3-year-old absorbs more ingested lead and is more susceptible to the developmental effects of lead than older children (US EPA, 2006; O'Flaherty, 1998). Recognition of the important behavioral and physiological differences between the young child and older children would represent a significant improvement in the CPSIA. Although the proposed amendment does not specify the age group under consideration, it appears to be reducing the target group to younger children (*versus* as old as 12 years).

6 Appropriate Extraction Methods

The new amendment is written in such a way that approaches beyond the testing procedures defined in ASTM Method F963-7e1 (ASTM, 2007) toy safety standard might be considered appropriate

for evaluating lead exposure. The use of extraction methods is one accepted approach to evaluating exposure of lead and other constituents from products. Some of the methods evaluate chemicals leaching in acidic solutions that mimic gastric fluid [*i.e.*, the solubility extraction procedures in ASTM Method F963-7e1 (ASTM, 2007)]. As another example, CPSC recently released an updated 24-hour acid extraction test procedure to address acute exposure and mimic accidental ingestion of metal jewelry; the method was designed to evaluate cadmium leaching from swallowable small parts (CPSC, 2011). These methods, while appropriate for the scenario where a small part is likely to be swallowed whole, would potentially overestimate exposure in certain cases, such as mouthing or sucking scenarios. However, protocols have also been developed and used to assess chemical leaching in saliva. For example, CPSC developed a method to assess migration of diisononyl phthalate (DINP) from polyvinyl chloride (PVC) children's products (CPSC, 1998), a method that has also been adapted by CPSC to assess lead leaching from objects due to contact with saliva. This method involves shaking the sample for 6 hours in a simulated saliva solution at a neutral pH of approximately 7.2 and at a temperature of 37°C. A similar method was adapted and used by Duke University to evaluate lead leaching from brass ball point pen tips (Baker, 2009). CPSC has used a saline extraction method to evaluate cadmium leaching from metal jewelry during a mouthing scenario (CPSC, 2010). Depending on the nature of the product and how young children interact with that product, a saline extraction method would be more appropriate than an acid extraction method in a number of cases.

7 Use of Blood Lead Modeling in Developing Permissible Lead Limits

Blood-lead modeling is an important tool used to calculate the impact of exposure on blood lead. It has been used to set permissible limits for lead in other media, such as air, water, and soil (for example, US EPA, 2008, 1988, 1998, respectively). Various blood lead targets may be considered for determination of the *de minimis* amount of lead extracted from a product. For example, in developing the

National Ambient Air Quality Standard for Lead. US EPA used a 1-2 µg/dL increment in blood lead as the target to establish a permissible air lead limit (US EPA, 2008). In the case of lead in soil, US EPA (1998) focuses on a modeled distribution of blood lead for a hypothetical child. Another consideration is whether the modeled impact of the extractable lead could have a detectable incremental impact on blood lead.[1]

While the proposed amendment does not define a *de minimis* daily intake of lead, I provide here a hypothetical example using a value of 1 µg/day intake of lead, every day for a 2- to 3-year-old. Using blood modeling, specifically US EPA's IEUBK model, this amount of ingested lead would result in a mean blood lead change of 3.0 µg/dL to 3.1 µg/dL. As presented graphically below, such an increment would be negligible.[2]

Specifically, Figure 1 compares the blood lead impact based on a 1 µg/day intake of lead. In this example, I assumed that a 2- to 3-year-old child would take in this amount of lead in a soluble form, every day for two years.[3] Alternate assumptions may, depending upon the product and the plausible ways in which a child might interact with that product, also be appropriate. In this calculation, it can be seen that the contribution of lead from 1 µg is indiscernible as the blood level remains the same.

[1] It should be emphasized that my description of these approaches is meant to be illustrative. I am not proposing a specific increment to blood lead as a target under the CPSIA, but rather describe approaches whereby a permissible limit may be developed.

[2] An impact of approximately 2 µg/dL or less of a lead release would not be reliably and routinely detectable in an individual child. For example, in a study by Chandramouli *et al.* (2009), the majority of quality control results were within a range of +/- 2 µg/dL. These findings are generally consistent with recommendations from the US Centers for Disease Control that, for investigative actions, laboratories set their internal quality control limits to +/-2 µg/dL or ±10%, whichever is greater (Parsons and Chisolm, 1997).

[3] I do not provide these exposure assumptions as ones that ought to be used under amendments to the CPSIA, but to illustrate a process.

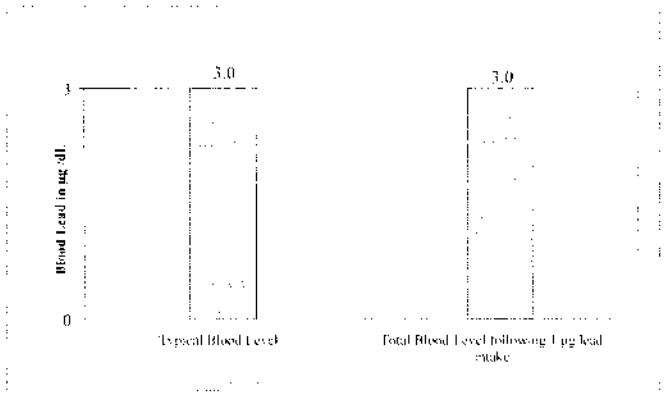

Figure 1. Comparison of Blood Lead Levels in µg/dL Before and After a 1 µg Intake by a 2- to 3-Year-Old Child

8 Recommendation

In conclusion, in order to appropriately evaluate exposure to lead in children's products, I recommend use of a risk-based approach that incorporates methods such as saliva extraction and blood lead modeling. This approach would reasonably mimic exposure scenarios relevant for a young child, while also emphasizing prevention of significant increases to blood lead. While many details remain to be worked out, I urge Congress and CPSC to seriously consider the new bill proposed by the Subcommittee on Manufacturing, Trade, and Commerce, which would amend the CPSIA to allow a health-protective risk-based approach.

Mrs. BONO MACK. Thank you, Dr. Beck. Mr. Howell, you are recognized for 5 minutes.

STATEMENT OF ROBERT JAY HOWELL

Mr. HOWELL. Good morning, Chairman Bono Mack, Ranking Member Butterfield, and members of the subcommittee. My name is Robert Howell. I am the assistant executive director for the Office of Hazard Identification and Reduction at the Consumer Product Safety Commission. I appreciate the opportunity to testify before you this morning regarding certain technical aspects of the discussion draft of legislation that would revise the Consumer Product Safety Improvement Act. The testimony that I will give this morning represents my personal views and has not been reviewed or approved by the Commission and may not necessarily reflect the views of the Commission.

In my role at CPSC, I oversee the technical work of the Agency within the Office of Hazard Reduction's directorates for Engineering Sciences, Epidemiology, Economic Analysis, Health Sciences, and Laboratory Sciences. My office is responsible for the collection and analysis of death and injury data associated with consumer products, the evaluation of consumer products for potential safety hazards and regulatory compliance, and the development of technical solutions to product safety concerns.

Prior to joining CPSC in 2006, I served as vice-president of manufacturing and operations for a multinational corporation with responsibility for the management of global manufacturing and logistics.

On January 15, 2010, the five members of the CPSC issued a report to Congress regarding possible improvements to the CPSIA. In suggesting those improvements, the commissioners noted that the recommendations were focused on maintaining the "safety and welfare of consumers while minimizing administrative burdens on the Agency or significant market disruptions caused by the implementations of specific provisions of the CPSIA."

Specifically, the Commission listed the following recommendations for improvement of the statute: that the Commission "needs additional flexibility within Section 101 to grant exclusions from the lead content limits in order to address certain products, including those singled out by the conferees;" that "Congress may, with some limitations, choose to consider granting an exclusion for ordinary children's books and other children's paper-based printed materials; the Commission believes that a prospective application of the 100 parts per million lead limits would be helpful for our continued implementation of the law;" and that the "Commission remains committed to working with Congress to explore other ways to address the concerns of low-volume manufacturers" with regard to the testing and certification requirements in Section 102 of the CPSIA.

From my perspective, the CPSIA has improved the health and safety of consumers, particularly children. In additional, industry has made substantial progress over the past 2½ years adapting to the requirements of the law. For example, the children's product industry has made progress in reducing the levels of lead since the enactment of CPSIA. In a recent Commission hearing on the tech-

nological feasibility of reducing the lead limits to 100 parts per million, a representative of SGS—a global inspection, verification, testing, and certification company—presented a statistical analysis of lead content testing data with close to 90,000 data points collected primarily from its Shenzhen laboratory that specializes in the testing of children's toys and other children's products.

In its analysis, SGS found that 96.3 percent of metal components tested at or below 100 parts per million. The analysis also determined that just over 97 percent of glass and ceramic components tested at or below 100 parts per million. Concerning plastic components, SGS found that 99.4 percent of those components tested at or below 100 parts per million. However, there are certain provisions of the CPSIA such as the current exceptions to the Section 101 lead limits that can be improved in such a way as to reduce the burden on the regulated community while maintaining an appropriate level of safety for America's consumers. I personally believe this balance is necessary to ensure efficient and effective implementation of the CPSIA from the perspective of both the regulated community and the regulators.

There are several approaches that could allow the CPSC to address the unintended consequences of certain regulatory requirements in the CPSIA. For example, the Commission has heard from a number of Members of Congress that they did not intend to cover all-terrain vehicles under the provisions of Section 101. Accordingly, Congress could permit the Commission to exempt certain products like ATVs from the lead limits. This will allow the CPSC to weigh the risk of possible lead exposure to a child riding a youth-sized ATV against the risk to the child from riding a larger and more powerful adult ATV.

Assuming that the exceptions would be made on a notice-and-comment basis, the underlying analysis and support for any exceptions would be public, allowing for transparency and accountability for all stakeholders involved in the process.

Finally, allowing the Commission to regulate on a timetable influenced by the seriousness of the actual risk would allow for better priority-setting that will permit Commission resources to be put towards the most serious health risk.

Mrs. BONO MACK. If you could please sum up now.

Mr. HOWELL. Madam Chairman, thank you.

[The prepared statement of Mr. Howell follows:]

Statement of
Robert J. Howell
Assistant Executive Director
Office of Hazard Identification and Reduction
U.S. Consumer Product Safety Commission

Before the

House Energy and Commerce Committee

Subcommittee on Commerce, Manufacturing and Trade

Legislative Hearing: "Discussion Draft of H.R. ____, a bill that would revise the Consumer Product Safety Improvement Act."

April 7, 2011

Good morning, Chairman Bono Mack, Ranking Member Butterfield, and Members of the Subcommittee on Commerce, Manufacturing, and Trade. My name is Robert J. Howell, and I am the Assistant Executive Director for the Office of Hazard Identification and Reduction at the U.S. Consumer Product Safety Commission ("CPSC").

I appreciate the opportunity to testify before you this morning regarding certain technical aspects of the discussion draft of legislation that would revise the Consumer Product Safety Improvement Act (CPSIA). The testimony that I will give this morning represents my personal views.[1]

In my role at CPSC, I oversee the technical work of the agency within the Office of Hazard Reduction's directorates for Engineering Sciences, Epidemiology, Economic Analysis, Health Sciences and Laboratory Sciences. My office is responsible for the collection and analysis of death and injury data associated with consumer products, the evaluation of consumer products for potential safety hazards and regulatory compliance, and the development of technical solutions to product safety concerns.

In addition to these responsibilities, I served as Acting Director of CPSC's Office of Compliance and Field Operations from July 2010 through February 2011. Prior to joining CPSC in 2006, I served as Vice-President of Manufacturing and Operations for a multinational corporation, with responsibility for the management of global manufacturing and logistics.

I. Past Commission Statements on Possible CPSIA Changes

On January 15, 2010, the five members of the CPSC issued a Report to Congress regarding possible improvements to the CPSIA.[2] In suggesting those improvements, the Commissioners noted that the recommendations were focused on maintaining the "safety and welfare of consumers while minimizing administrative burdens on the agency, or significant market disruptions, caused by the implementations of specific provisions of the CPSIA."

Specifically, the Commission listed the following recommendations for improvement of the statute:

1) that the Commission "needs additional flexibility within [section 101(b)] to grant exclusions from the lead content limits in order to address certain products, including those singled out by the Conferees;"

---

[1] The testimony has not been reviewed or approved by the Commission and may not necessarily reflect the views of the Commission.

[2] A copy of the January 15, 2010, "U.S. Consumer Product Safety Commission Report to Congress Pursuant to the Statement of Managers Accompanying P.L. 111-117," is available at: http://www.cpsc.gov/ABOUT/Cpsia/cpsiareport01152010.pdf.

2) that "Congress may, with some limitations, choose to consider granting an exclusion for ordinary children's books and other children's paper-based printed materials;"

3) "the Commission believes that a prospective application of the 100 ppm lead limits would be helpful for our continued implementation of the law;" and

4) that the "Commission remains committed to working with Congress to explore other ways to address the concerns of low volume manufacturers" with regard to the testing and certification requirements in section 102 of the CPSIA.

II. Staff Comments on the Discussion Draft

In general, the CPSIA has improved the health and safety of consumers, particularly children. In addition, industry has made substantial progress over the past two and a half years adapting to the requirements of the law.

For example, the children's product industry has made significant progress in reducing the levels of lead since enactment of the CPSIA. In a recent Commission hearing on the technological feasibility of reducing the lead limits to 100 ppm, a representative of SGS, a global inspection, verification, testing, and certification company, presented a statistical analysis of lead content testing data (89,273 data points) collected primarily from its Shenzhen laboratory that specializes in the testing of children's toys and other children's products.[3]

In its analysis, SGS found that 96.29 percent of metal components tested at or below 100 ppm lead. Of those components exceeding 100 ppm, 2.22 percent tested greater than 600 ppm lead, 0.8 percent tested between 300 ppm and 600 ppm for lead, and 0.69 percent tested between 100 ppm and 300 ppm for lead. The analysis also determined that 97.46 percent of glass and ceramic components tested at or below 100 ppm lead. Of those components exceeding 100 ppm, 1.39 percent tested greater than 600 ppm lead, 0.81 percent tested between 300 ppm and 600 ppm for lead, and 0.34 percent tested between 100 ppm and 300 ppm for lead. Concerning plastic components, SGS found that 99.4 percent of plastic components tested at or below 100 ppm lead. Of those components exceeding 100 ppm, 0.37 percent tested greater than 600 ppm lead, 0.17 percent tested between 300 ppm and 600 ppm for lead, and 0.06 percent tested between 100 ppm and 300 ppm for lead.

However, there are certain provisions of the CPSIA, such as the current exceptions to the section 101 lead limits, that can be improved in such a way as to reduce the burden on the regulated community while maintaining an appropriate level of safety for America's consumers. I personally believe this balance is necessary to ensure efficient and effective

[3] A copy of the presentations and written comments from the February 16, 2011, Public Hearing, including the SGS presentation, can be found at http://www.cpsc.gov/library/foia/foia11/pubcom/lead100pres.pdf.

implementation of the CPSIA from the perspective of both the regulated community and the regulators.

There are several approaches that could allow the CPSC to address the unintended consequences of certain regulatory requirements in the CPSIA. For example, the Commission has heard from a number of Members of Congress that they did not intend to cover all-terrain vehicles (ATVs) under the provisions in section 101. Accordingly, Congress could permit the Commission to exempt certain products, like ATVs, from the lead limits. This would allow the CPSC to weigh the risk of possible lead exposure to a child riding a youth-sized ATV against the risk to the child from riding a larger and more powerful adult ATV.

Assuming that the exceptions would be made on a notice and comment basis, the underlying analysis and support for any exceptions would be public, allowing for transparency and accountability for all stakeholders involved in the process. Finally, allowing the Commission to regulate on a timetable influenced by the seriousness of the actual risks will allow for better priority setting that will permit Commission resources to be put towards the most serious health risks.

* * * * *

Madame Chairman, thank you again for the opportunity to testify regarding certain technical aspects of the discussion draft.

I would be happy to answer any questions at this time.

Mrs. BONO MACK. Thank you. Oh, perfect. Thank you. That worked out just well. I want to thank our panel of experts. And now the chair will recognize herself for the first 5 minutes of questioning.

And Mr. Howell, the first question to you. How does the CPSC staff go about deciding whether a substance or a product poses a risk to children? And briefly, what factors are important?

Mr. HOWELL. As CPSC staff evaluates potential risk to children, it involves several different teams within CPSC. We have a human factors team that will actually age-grade the product and determine what particular product characteristics are important in age-grading to ensure that the product is targeted to the correct group of children. If, for example, we are evaluating that product with regards to lead, for example, a complete risk assessment would be conducted taking into account not only the intended consumer but any other children that may be attracted to that particular toy based on characteristics of the toy.

Mrs. BONO MACK. Thank you. Does the Commission have information on the cost of third-party testing? For example, do you know how much it would cost to have a bicycle tested by a third-party lahoratory to all the applicable standards?

Mr. HOWELL. We have heard from the bicycle industry that the cost to test a $50 bicycle for all the applicable standards would run somewhere in excess of $10,000.

Mrs. BONO MACK. Wow. Thank you. And the focus of a lot of our attention, especially on this side of the aisle and again, Mr. Howell, is the database. I actually think the database is helpful and useful, but I think it has problems and we should talk about it a great deal. My thinking is that it is 100 percent negative derogator and that if the manufacturer can respond that they are seen as defensive. There must be a way—if you buy anything anywhere on the internet now, Amazon, I mean even Zappos.com, you know, there are comments on both sides. People can give the good and the bad of a product. Yet this database is 100 percent negative. Can it not be refined so that there is a more accurate depiction of a product?

For example, if I complain about something potentially hurting my child but this is one example out of 10,000—but nobody else would have any way of knowing that—can't the database be refined to be a more accurate depiction about a product in society?

Mr. HOWELL. Chairman Bono Mack, I am quite certain that either Congress or the Commission could—within CPSIA as written—make modifications. But that is certainly more of a policy matter and is beyond my responsibilities at CPSC.

Mrs. BONO MACK. Well, thank you. I think I made my thoughts pretty clear there in my questions. So also, to you Dr. Best, you state from a scientific perspective that there is no basis for differentiating between a child licking versus sucking on an object. In CPSIA however, Congress drew that very distinction for purposes of phthalate limits. Do you see a reason why this is changed? And I always do that on that word. Do you see a reason why this distinction makes sense for phthalates but not for lead?

Ms. BEST. We didn't actually work on the phthalates issue, and so I can do some research and perhaps offer you a response. But again, I am an expert on lead, not on phthalates.

Mrs. BONO MACK. All right. Thank you. And you mentioned also that older children sometimes put ballpoint pens or jewelry in their mouths. You also mentioned that toys may be shared among multiple children in the same household. But aren't there many other items which older children do not mouth and to which younger children rarely, if ever, have access?

Ms. BEST. Of course. But we are talking about the harms to children from lead-containing objects. And so, you know, our focus is on those lead-containing objects that may be dangerous to younger children.

Mrs. BONO MACK. But common sense would say, as a parent—my kids are now 23 and 20 and my step-kids are 8 and 11—common sense would say to a parent their children don't only come in contact with children's products whether it is a 2-year-old toy, a 10-year-old toy or an adult, say, electronic component of some sort. Is that not a problem as well? Is it common sense that we are trying to say that a—from what I understand—a Hannah Montana DVD is under one category and a Miley Cyrus DVD is on another category and then a DVD player is entirely exempt? So parents ask themselves these questions all the time. It is one of these things, what are they thinking in Washington? Because it makes no sense at all. As a pediatrician, how do you address that?

Ms. BEST. I am having trouble understanding the question. So yes, there are products in the house that are not intended for children that do not come under the CPSC's purview in this context. And while there are other safety groups that may work with those products, we are focusing on the safety of children's toys here and products intended for children. And that is our focus.

Mrs. BONO MACK. We are out of time. Just to make a little more clear that it is common sense, sometimes, that you can't protect from everything here. And that is the question. Is the Commission focused on its highest priorities? So I am sorry, but I need to yield now to Mr. Butterfield for his 5 minutes of questioning.

Mr. BUTTERFIELD. Thank you, Chairman. Prior to the enactment of this legislation, the Consumer Product Safety Commission assessed the risk posed by children's products containing lead by estimating the amount of lead intake from the product and the subsequent effects of exposure on blood lead level. For the most part, this was what I call an after-the-fact assessment. That is the Commission mostly looked at products for exposure to and risks from lead after products had entered the marketplace and been put into the hands of children. The discussion draft seems to create a de minimis exception that makes the total lead content limits in CPSIA more meaningless. Basically, any component part that cannot be swallowed can contain any amount of lead so long as a child isn't expected to ingest more than some amount to be determined amount of lead. So rather than determining the total amount of lead contained in a product, the discussion draft would call on manufacturers to estimate the amount likely to be ingested and takes it as a given that it is oK for kids to take in some amount of lead from their toys.

Ms. Best, the de minimis exception in the discussion draft is essentially a return to the approach that the commission used prior to the legislation. As I read it, any component part of a toy or other

children's product such as a crib would be allowed to release a de minimis amount of lead, say 6 micrograms per day. Can you please explain what would happen if a child played with more than one toy in one day? Even a child who has one special toy plays with dozens of toys in a day. Could that child be exposed to 6 micrograms per day per toy? I do not read the de minimis standard as requiring the consideration of other exposures to lead in a given day. Can you help me with this?

Ms. BEST. Well, the Academy is very much against the de minimis standard for many of the points you raised. Lead exposure doesn't come just from one individual product. It comes from the environment. It can be found in our food, in our air, certainly on paints, certainly in the water in Washington, D.C., in the past. And so we are very concerned about the bioaccumulation of lead through all these different sources. Because lead doesn't immediately get passed out through your body, you can actually store it. Some of these stores persist for years, if not decades. And that is one of the things we are very much concerned about.

Mr. BUTTERFIELD. Thank you. Many of us agree that there are specific products that can't meet the lead content limits and can't be made without lead—we acknowledge that—and that some form of relief should be provided for the narrow universe of products. We agree, some of us, that this relief should be as simple to understand and apply as possible while remaining protective of children's health and safety. So far as I can tell, the proposed de minimis exception in the draft fails on all of these counts. Implementing the de minimis exception will require taking into account very product-specific considerations, and on a good number of instances, it will require applying varying lead requirements for differing parts of the same product.

For example, say I manufacture a toy truck that contains plastic and metal, some large enough not to be swallowed and others that can be swallowed. For each plastic component, I would have to ask is this small enough to be swallowed? If the answer is no, then I would have to ask how do I expect a child to interact with this component? Is lead likely to be ingested from the interaction? How much lead can I expect to be ingested from the interaction? What age is the child doing the interacting? For the metal components, the manufacturer would then have to ask, can I meet the alternative 600 parts per million total lead count standard in the draft? If the answer is no, the manufacturer would again have to run through the analysis as I described. Can it be swallowed? So forth and so on.

Mr. Howell, let me ask you this yes or no, sir, and I am going to be out of time momentarily. Would the Commission have to develop multiple methodologies given that children interact differently with different products?

Mr. HOWELL. Yes.

Mr. BUTTERFIELD. Would requiring the Commission to develop multiple methodologies to account for the different ways children can interact with different products and parts require substantial investment of the Commission's limited resources?

Mr. HOWELL. No.

Mr. BUTTERFIELD. In your experience, sir, do retailers and manufacturers prefer clear lines for compliance over estimating the likelihood that their product might behave in a certain way?

Mr. HOWELL. Many do.

Mr. BUTTERFIELD. Under current law, sir, enforcement is simply the product meets the standard or doesn't meet the standard. Under the draft that we have in front of us, the Commission's enforcement seems to be more complicated. For each product at the border where there might be a problem, the Commission will have to do complicated testing. Couldn't this slow down products and have them retain longer at some of our ports?

Mr. HOWELL. Yes.

Mr. BUTTERFIELD. All right. Thank you very much. My time is out.

Mrs. BONO MACK. All right. The chair recognizes the vice chair of the subcommittee, Ms. Blackburn, for 5 minutes.

Mrs. BLACKBURN. Thank you, Chairman, and thank you to our witnesses.

Mr. Howell, I would like to start with you if I may, please. As I mentioned in my opening statement, the database—as we hold our initial hearing on this issue, we are very much aware that the database is incomplete; it has problems. The chairman mentioned some of the problems that are there with how information is recorded. And I want to know two things from you if you would, please, sir. Number one, would we be better off to take that thing down until the problems are worked out? And number two, what needs to he done to correct the problems that are around the database? Very quickly, please. I have got other questions.

Mr. HOWELL. Ms. Blackburn, because the problems that you cite are not clearly defined, I am going to respond to your question clearly in a very broad way. Certainly the decision whether to keep the database up or down becomes a policy decision. It is not one that my technical staff necessarily are the appropriate ones to make. The challenges of implementing anything that is new certainly will require the attention of staff in order to get it right. Many of the things that we see in the database, regardless of the nature of the reports of harm, would require resources to get a handle on the appropriate way to respond.

Mrs. BLACKBURN. OK. And I will help you with that definition. The prior hearing that we had we heard from the commissioners that if there is a complaint against, say, Graco cribs, then all Graco cribs are—you know, you don't define between that. So I would ask you to submit to us in writing with a little bit more detail what you think needs to be done. Because I think we need to take the thing down and bring it offline, work out the kinks, and then bring it back so that it is understandable to consumers so they know exactly what the product is and so there is a method for them to evaluate what actually is the problem and then if they do or do not want to purchase that product. At this point right now, people can just rail against a brand and not necessarily a specific product or a part. And there is that problem of definition within that use.

I want to come to Dr. Beck. Mr. Vitrano, who is going to testify on the next panel, submitted testimony. And thank you all for submitting your testimony in advance. And in there he talks about the

lead intake from children's interaction with ATVs is less than the intake from drinking a glass of water. And I would like to know in your opinion do you agree with that? Do you find that to be an accurate statement and a little bit of definition around that and see if—what I am looking at is if the metal parts on an ATV contain higher lead than are permitted by the EPA for drinking water standards, I am sure you can understand our confusion with that issue.

Ms. BECK. Yes. His statement is correct. It is based on analysis that we did in which we had wipe samples. Because the question is how does a child interact, say, with the valve stem? We had samples of wipes that rubbed the valve stem, and that was to mimic a child touching a valve stem when they fill their——

Mrs. BLACKBURN. OK. So Dr. Beck, it would be true that a child gets more lead content in drinking a glass of water than from playing with an ATV?

Ms. BECK. They would get more lead from what is commonly found in drinking water but is permissible under EPA than they would get from contacting their hands with the valve stem on an ATV or from touching the handles.

Mrs. BLACKBURN. OK, now, let me ask you this. Do you find this with other products? Have you found this same association in other products that you have tested, maybe with the wipe test?

Ms. BECK. We have also done wipe tests on scooters and we had similar results, that what came off in a wipe was relatively small, less than what a child might typically get from drinking water.

Mrs. BLACKBURN. OK. Thank you very much. I appreciate that. And I will go ahead and yield back.

Mrs. BONO MACK. I thank the gentlelady. The chair recognizes Ms. Schakowsky for 5 minutes.

Ms. SCHAKOWSKY. Thank you, Madam Chairman. Mr. Howell, in your testimony you note that an independent testing lab, SGS, has found that almost 90 percent of toys tested by it recently comply with the 100 parts per million lead limit. While I realize this is data from only one entity, it seems to provide at least some evidence that the children's product marketplace has largely adapted already to the 100-parts-per-million limit. Would you say that is true?

Mr. HOWELL. Yes, I would. I would also add to that, though, that it may also indicate that we are rapidly approaching a point of diminishing returns in that the effort to achieve the final reduction in lead may be much more costly than the incremental cost of getting to where we are today.

Ms. SCHAKOWSKY. Certain members of industry have been very critical of fixed parts-per-million limits for lead in children's products and have advocated a move back—as we heard from Dr. Beck today—to risk-based standard. However, the American Society of Testing and Materials, ASTM's F–963 toy standard, which has been drafted through a consensus process and is now a mandatory rule under the CPSIA, contains fixed parts-per-million limits for certain toxic metals and surface coatings of toys like cadmium—is it antimony?—and barium and in those areas—well, so I am asking why not lead? If they could go to a PPM for other things, why not

lead? And let me pose the same question to Dr. Best. But Mr. Howell?

Mr. HOWELL. Certainly you can regulate lead either on a fixed-content limit or on the extractable amount. That becomes, basically, not only a policy choice but a choice of economics and ease of test, if you will, that would facilitate compliance.

Ms. SCHAKOWSKY. So would you say that it is easier to administer for many companies and for the Commission to go on a parts-per-million basis?

Mr. HOWELL. Certainly, there are advantages to testing by content in the fact that it is that time is much faster. It certainly doesn't generate the level of hazardous waste than what chemistry does. But at the same time I believe another way to look at the problem, perhaps, would be a balance between both the parts-per-million content at some prescribed level and then a risk-assessment approach at levels above that to deal with, perhaps, products such as ATVs and bicycles where the exposure is, perhaps, much, much less of a concern than you might have in something that is mouthable or swallowable.

Ms. SCHAKOWSKY. Thank you. Dr. Best, I wonder if you would comment on these issues.

Ms. BEST. One of the big differentiations between the CPSIA and the ATSM—or MS, whatever—their levels is that the ATSM's levels are soluble lead. And we are concerned not only about the surface coating but as the product wears, the surface coating may be worn off and so then you are getting deep into the content of whatever product we are talking about, and again, the swallowing question comes into play.

Ms. SCHAKOWSKY. Right. But my question is if the toy manufacturers could go to a parts per million for these other things, why not with lead?

Ms. BEST. Well, we believe that they can go to a total lead content level and achieve that reasonably. And as some of these data have shown, many manufacturers——

Ms. SCHAKOWSKY. OK. One other question on lead content. You had mentioned that children with disabilities sometimes continue mouthing, you know, well past a little kid and yet products designated as—I am looking what it is called—special products for the disabled are not in the category that would require a mandatory third-party testing for almost all children's products. Do you think that is a mistake?

Ms. BEST. I can't say I know all of the definitions of special products for the disabled. Certainly, you know, I wonder if some of them are more adapted products such as adaptive listening devices and adaptive hearing devices, so they are not toys. And so we have been very focused on the toys and so that is where, you know, all of our evidence has been based.

Ms. SCHAKOWSKY. Thank you.

Mrs. BONO MACK. All right. The chair recognizes Mr. Barton for 5 minutes.

Mr. BARTON. Thank you. Mr. Howell, my recollection is that in the Congress and the hearing in this Congress that the commissioners who testified, testified that the current law doesn't give

them the flexibility that they need to implement the law. Is my recollection correct?

Mr. HOWELL. I recall the same thing.

Mr. BARTON. You recall the same thing? So that is a yes?

Mr. HOWELL. That is a yes.

Mr. BARTON. OK. Dr. Best, what is wrong with giving the CPSC some flexibility to implement the law?

Ms. BEST. It is my understanding that they already have some flexibility to——

Mr. BARTON. That is not their understanding.

Ms. BEST. Well——

Mr. BARTON. I mean they testified at least twice——

Ms. BEST. Right.

Mr. BARTON [continuing]. That they need more flexibility. So let us stipulate that they don't have flexibility. Why, then, would it not be prudent for Congress to give them some flexibility?

Ms. BEST. Well, the stipulation I would have to look at. But the concern we have is that children's health is not something that should be negotiated based on manufacturers' profit.

Mr. BARTON. Well, nobody is saying that the stipulation should be based on profit. That is a fairly obnoxious comment to make in reply to my question.

Ms. BEST. When we do a risk-based assessment or we allow great freedom in terms of how safe toys are, we go back to the days where children——

Mr. BARTON. OK, well, look, I don't have time for a 5-minute longwinded non-statement. Do you support any flexibility at all for the Commission? Yes or no?

Ms. BEST. I will support some——

Mr. BARTON. So that is a——

Ms. BEST [continuing]. Very defined, limited——

Mr. BARTON. Thank you.

Ms. BEST. [continuing]. Carefully protective flexibility.

Mr. BARTON. You do support some flexibility. That is a good thing. Let me go back to Mr. Howell. The House bill, when we actually passed the bill under Chairman Dingell's leadership, had a 12-year-and-under standard. The Senate bill had a 6-year-and-under standard for children. The Senate receded to the House to the 12-year. That is one of the changes in the draft before us is that we leave the age as undefined. If you split the difference between the Senate and the House, obviously it would be 9 and under. Is that a reasonable compromise or is that unfeasible in your opinion?

Mr. HOWELL. To some degree it depends on the risks that you are trying to manage. I will say in that some work done several years ago in establishing lead limits for children's jewelry, which the work was terminated because of the CPSIA, staff had determined that 9 and under would be an appropriate age based on how children interact with a product such as jewelry.

Mr. BARTON. Let me ask that same question to Dr. Best. Is there some middle ground between 6 and 12?

Ms. BEST. We carefully reviewed this in 2007 and we believe 12 is the right age.

Mr. BARTON. OK. What about Dr. Beck?

Ms. BECK. I think that it is somewhat of a science policy decision that there really is no bright line. I do think what Mr. Howell has proposed, 7, 9, that they are reasonable compromises. Obviously, a young child might play with toys of an older child, but it will be less frequent. But as I said, ultimately, I think that there is need for some judgment in determining what the actual age should be.

Mr. BARTON. OK. Mr. Howell, on third-party testing, the draft preserves third-party testing for certain priority standards and priority products and it gives the Commission the flexibility to require third-party testing for other standards. Is that something you think the Commission would support in this draft, the third-party testing amendments?

Mr. HOWELL. Sir, I am unable to speak for the Commission.

Mr. BARTON. You work for the Commission. You are the only Commission representative we have.

Mr. HOWELL. I work for the Commission but the question was do I believe the Commission would buy into this proposal,and I cannot predict what the Commission might accept or not accept.

Mr. BARTON. So you just walk around in a daze when you are at the Commission even though you are the——

Mr. HOWELL. No, sir, but I do not control the votes of the commissioners.

Mr. BARTON. Well, but you can have an opinion about what their position might be. You have got a better opinion than I do.

Mrs. BONO MACK. The chair would recognize that we are out of time and, with all due respect to my dear colleague, but recognize now for 5 minutes Mr. Towns.

Mr. TOWNS. Thank you very much, Madam Chair. Let me ask discretion, first of all, I guess to you Dr. Best. Can you explain how lead buildup in bones throughout a lifetime can impact pregnant women and developing fetuses and why children are born with lead in their blood?

Ms. BEST. Yes. Lead is similar to calcium in that our bodies see lead as if it was a calcium molecule and then absorb it into our bones throughout our lives. And so if you are exposed to more levels of lead as you are developing bones or remodeling bones, which goes on throughout life, you are likely to absorb and store lead in your bones to a greater extent.

During pregnancy, there is a very high calcium demand on the mother's body and the fetus actually steals calcium from the mother. And if the mother doesn't have enough daily dietary intake from calcium, the bones will be resorbed and calcium from the bones will then be used to help the fetus develop. And so if there is calcium being released from the bones and there is also lead in the bone, the lead is released at the same time and then transferred to the fetus.

Mr. TOWNS. Thank you very much. Let me ask you this, Mr. Howell. When can a product that has shown consistent compliance, you know, through a third-party testing be relieved from testing? How many years?

Mr. HOWELL. If the objective is to establish a prevention-based program, the answer to that would be that while the frequency of testing could certainly be extended, I would suggest that perhaps it could never be terminated if you will but just longer periods of

time between third-party testing. In the industry that would be a skip-lot quality approach.

Mr. TOWNS. Even if you test it and there is consistency and you still feel that you can't say 2 years, 10 years, 20 years? You just would have to continue?

Mr. HOWELL. Well, the assumption there is that things never change in the manufacturing process. And, for example, the lead in paint that some say was the beginning of the CPSIA discussion was a total surprise to the manufacturer. They thought they had their process totally under control and they had a supplier who brought material into their factory, they assumed it was correct—and, in fact, it was loaded with lead. So if indeed the goal is to measure compliance to assure the American public that the product is safe, I would suggest that while you could increase the time between testing that you might be accepting some risk if you chose to terminate the testing until such time as you determine there was another problem and then reinstitute the testing.

Mr. TOWNS. Right. Thank you. Is there sufficient flexibility for the Commission to allow for—I am trying to see if there is anything on this side that we need to do.

Mr. HOWELL. In my opinion and, of course, as has been stated many times by the Commission itself, there is certainly a need for additional flexibility for the Commission to act appropriately to implement the law and safeguard consumers.

Mr. TOWNS. Dr. Best, is there anything that we need to do on this side as Members of Congress? Let us switch roles for a minute.

Ms. BEST. Besides pass a budget? Sorry. I think we need to remember that toys are not a requirement for life and we want children to have the best opportunity that they can possibly have. And, you know, the option is not between a drug that has side effects for a child. The option is between a toy that is safe and a toy that may not be safe. And so we need to remember that, you know, every toy is not a required product to help a child grow. They need toys but they need to know that those toys are safe. And we need to continue to remember that lead is dangerous at small levels. Even very small levels it causes IQ loss and the more we find out about the low levels of lead, the more harms we discover.

Mr. TOWNS. Thank you. I see my time has expired, Madam Chair. Thank you very much.

Mrs. BONO MACK. I thank the gentleman and recognize the gentleman from New Hampshire, Mr. Bass, for 5 minutes.

Mr. BASS. Thank you very much, Madam Chairman, and I appreciate your holding this important hearing to discuss a piece of legislation which corrects a response to a problem which was clear and understandable and necessary which occurred during the period of time that I was not serving in the Congress. And I was thinking of saying I am not surprised that the response that was passed by Congress essentially endeavors to use a Howitzer to kill a mosquito and so here we are trying to make this necessary new law work better.

However, my questions are for Mr. Howell, and they don't deal with the central controversy of the bill but rather with some equipment that the CPSC is using and whether or not its use should be expanded. I understand that the Consumer Product Safety Com-

mission uses several dozen handheld x-ray fluorescence analyzers and they are used both in the laboratory and also in ports of entry. They quickly, effectively, non-intrusively, and accurately determine whether and how much lead is in a product. Can you give us a brief description of your experiences using this equipment and enforcing limits on lead?

Mr. HOWELL. Certainly. The XRF scanners have certainly helped the efficiency and effectiveness of implementing the law. There initially were some limitations. The XRF is a good tool for detecting lead and other potentially toxic heavy metals in homogenous materials like plastics. However, there were some limitations early on in checking for lead in surface coatings, as in paint.

Mr. BASS. Um-hum.

Mr. HOWELL. However, just recently CPSC issued a Notice of Requirements recognizing that HD XRF technology had been developed, a testing protocol had been developed under ASTM and that is now an approved method to test for lead in paint. So it certainly is an efficient technology.

Mr. BASS. As the lead individual for hazard reduction's support expanded use of these XRF devices by manufacturers, retailers, and porters as a means to ensure compliance with lead limits?

Mr. HOWELL. I believe the cost savings, in my experience, has been motivation enough. Certainly, most manufacturers who can afford a unit, to my knowledge, have acquired one.

Mr. BASS. So the expanded use of this equipment would, in your opinion, improve the safety and quality of the products on the market today?

Mr. HOWELL. It certainly is an effective way for a manufacturer to monitor his incoming materials and his outbound materials.

Mr. BASS. OK. And lastly, as you may know, the EPA and HUD have used handheld XRF for decades to test for lead in homes and they are obviously protecting children. CPSIA includes a limit for lead in small painted areas on children's products. I think it is 2 micrograms per square centimeter of paint. Do you support making this limit applicable to larger painted areas as well?

Mr. HOWELL. If you would allow me to respond to that question in writing, I would like to get with our chemist and give you an appropriate response.

Mr. BASS. OK. Fair enough. Thank you very much. And I thank the chairlady. I yield back.

Mrs. BONO MACK. I thank the gentleman. And the chair recognizes we have a series of votes on the floor so it is my intention to have Mr. Dingell as his 5 minutes of questioning and then we will break and return to resume questioning after the series of votes. So Mr. Dingell, you are recognized for 5 minutes.

Mr. DINGELL. Thank you, Madam Chairman. To the witnesses, these questions will require a yes or no answer only because of time.

The draft legislation requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given child's product. However, while the Commission establishes such procedures, the draft legislation would permit the manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component

part." Question: Is there any such reasonable methodology in use by manufacturers today for testing children's products? Starting with Dr. Best.

Ms. BEST. I am not familiar with what manufacturers can do.

Mr. DINGELL. Ms. Beck?

Ms. BEST. Oh, I am sorry.

Mr. DINGELL. Yes or——

Ms. BECK. There is methodologies. I don't know if the manufacturers know about them.

Mr. DINGELL. Thank you. And if you please, Mr. Howell, yes or no?

Mr. HOWELL. I am not aware.

Mr. DINGELL. Now, starting again, Dr. Best, is it possible the ambiguity of the term "reasonable methodology" would lead to a wide variance in test results across the manufacturers of similar products? Yes or no?

Ms. BEST. Yes.

Mr. DINGELL. OK. Dr. Beck?

Ms. BECK. I don't know.

Mr. DINGELL. Mr. Howell?

Mr. HOWELL. I do not know.

Mr. DINGELL. Could this—well, I will just defer on that particular question. Now, Mr. Howell, the draft legislation would allow CPSC, subject to conditions, to require a third-party testing of children's products. Under the draft bill, CPSC would require a third-party testing only if the Commission first verifies the testing capacity of "accredited third-party conformity assessment bodies," as well as establishes and publishes Notice of Requirements for such accreditation of such assessment bodies. Does this include both national and international or domestic and international bodies? Yes or no?

Mr. HOWELL. I believe it does, yes.

Mr. DINGELL. OK. Now, if so, how many such assessment bodies are there worldwide?

Mr. HOWELL. CPSC recognized conformity assessment bodies are currently in excess of 300 I believe.

Mr. DINGELL. OK. Now, further, does the Commission have the resources with which to verify the testing capacity of all third-party conformity assessment bodies? Yes or no?

Mr. HOWELL. I can't answer that question yes or no.

Mr. DINGELL. It means that you do not know they do have such capacity. Now, moreover, is it your understanding the draft legislation, the Commission would have to accredit all third-party conformity assessment bodies? Yes or no?

Mr. HOWELL. No.

Mr. DINGELL. If so, do you believe the Commission has the resources with which to accomplish this purpose? Yes or no?

Mr. HOWELL. Yes.

Mr. DINGELL. In summary, do you believe the practical effect of these requirements would be that the Commission would seldom, if ever, require third-party testing of children's products? Yes or no?

Mr. HOWELL. No.

Mr. DINGELL. Now, Mr. Howell, CPSIA defines a children's product as one "primarily intended for a child 12 years of age or younger." The discussion draft would change this definition to "intended for use by a child," then it leaves a gap, "age to be determined—years younger." Would these words "for use by" limit the number and type of products covered by this definition? Yes or no?

Mr. HOWELL. Yes.

Mr. DINGELL. Now, to Drs. Beck and Dr. Best. Would you care to comment briefly on Mr. Howell's response to the last questions? Starting with Dr. Best.

Ms. BEST. No.

Mr. DINGELL. You can if you wish. Ms. Beck?

Ms. BECK. If the age decreases from 12 to some number less than 12, then the number of products to be tested, of course, would diminish because the products are defined for different age groups.

Mr. DINGELL. Ladies and gentleman of the panel, thank you. Madam Chairman, I thank you for your courtesy.

Mrs. BONO MACK. I thank the distinguished gentleman. And it is my intention that we recess now for this series of votes and we return at high noon. So we will see you all at high noon if we are quick on the floor with votes. If not, a little wiggle room. See you guys at noon. Thanks.

[Recess.]

Mrs. BONO MACK. All right. The chair will recognize Mr. Pompeo for 5 minutes.

Mr. POMPEO. Great. Thank you, Madam Chairman. Thank you, panelists, for hanging with us through the vote.

You know, I heard Mr. Waxman say this was a wrecking ball and I heard somebody say we were comprehensively demolishing the CPSIA. I think there is lots more to do. I think this is a very good first step, but there is a lot more work to do.

I wanted to ask you, Mr. Howell, just a couple questions about the database. We have been live now for almost a month, right? How many reports have we received since March 11 under the database rule?

Mr. HOWELL. The number is approximately 1,500 at this point.

Mr. POMPEO. And other than those—so there is a 5-day period before it goes out to the manufacturer. How many of those have been sent on to the manufacturer of those 1,500?

Mr. HOWELL. I would like to respond in writing with precise numbers. But at this point of those that we have received, I think approximately 50 percent at this point have been sent to manufacturers.

Mr. POMPEO. And so how many of those are past the required time period to send on to the manufacturer approximately?

Mr. HOWELL. Actually, once they pass the CPSIA check, which is the eight requirements to be considered, at that point they would be passed to the manufacturer and we are not late in sending the initial notice to the manufacturer. Those are happening on time.

Mr. POMPEO. So everything is on time. Everything is good. You have got the resources to respond at the level of the reports that have come in so far and you are making all of the deadlines that were imposed by the rules that CPSC put in place?

Mr. HOWELL. I believe for the most part, yes.

Mr. POMPEO. And how is this being conducted? How do these come in? Who is reviewing them? Are you reviewing them along with staff and a committee? What kind of resources are being dedicated to that project?

Mr. HOWELL. At this point in time, there are several different staff members involved in the review, part of that because it is a brand new process and we are trying to understand what we are getting in, making the appropriate decisions regarding reports of harm to ensure that they do, indeed, meet the qualifications. It is roughly a team of 10 to 12 with representatives of technical staff, legal staff, and IT.

Mr. POMPEO. Wow. 10 to 12 people. Wow, for 1,500 across 30 days. So what do you have? 35 a business day, 50 a business day, something like that?

Mr. HOWELL. Probably somewhere in the neighborhood of 50 a business day.

Mr. POMPEO. Yes. Can you keep up with it?

Mr. HOWELL. At this point yes, but we are in a learning curve and we understand that as we get a better handle of the nature of these incoming reports, we expect efficiencies to increase.

Mr. POMPEO. Why would you go through a learning curve when you have had this database running without it being public for such a long time? Why wouldn't we have done the learning curve before we went live?

Mr. HOWELL. When we were in the soft launch, not every manufacturer necessarily felt compelled to respond knowing that those reports would not necessarily go live. Now that we are live, we are getting many more responses from manufacturers.

Mr. POMPEO. My first question focused on the process internal to CPSC before forwarding on. Tell me how the process is going in getting a response from manufacturers to date that have had the deadline arrive for their response to be due?

Mr. HOWELL. You know, the manufacturers receive notification that there has been a report of harm. Manufacturers can file a claim of material inaccuracy.

Mr. POMPEO. How many have done that so far?

Mr. HOWELL. I believe there has been less than 10 percent have filed claims for material inaccuracy. They can also file claims for confidentiality, which is extremely rare at this point in time. And they are certainly free to file a comment without necessarily filing a claim of inaccuracy or confidentiality.

Mr. POMPEO. How many have said "not me, not my stuff?"

Mr. HOWELL. The vast majority of the material inaccuracy claims tend to be just that nature. "It is not my product."

Mr. POMPEO. And are those still online readily accessible to the public? So you all send it to the manufacturer and they say it is not my stuff, are you then putting it online?

Mr. HOWELL. No, if they claim that it is not their product, that is a valid claim of material inaccuracy. And until such time as that is resolved and the problem clearly identified, it does not get posted.

Mr. POMPEO. Thank you, Mr. Howell. Ms. Best, you talked about—she is not here. Let me ask you one more question, Mr. Howell. How many items from the punch list that Commissioner

Tenenbaum gave me on the database have you all been able to work through since she was here? That is what is still left to fix?

Mr. HOWELL. I am not familiar with that punch list. I will certainly respond to that in writing.

Mr. POMPEO. Thank you. Madam Chairman, I yield back the balance of my time.

Mrs. BONO MACK. I thank the gentleman and recognize Mr. Butterfield to explain the absence of the witness.

Mr. BUTTERFIELD. Thank you, Madam Chairman. You will notice that Dr. Best is absent this afternoon. I want the record to show that she had prior obligations this afternoon and had to leave. I am told that she is seeing patients today and has scheduled those appointments with the understanding that we would convene this morning at 9:00 a.m. instead of 10:00 a.m. But please be assured that she will be available to answer any questions that any of the members may have. Thank you.

Mrs. BONO MACK. I thank the gentleman and would remind the committee that we did delay the starting point of today's hearing to accommodate the Democrats. And it is unfortunate that the witness had to leave but remind members, too, you can submit further questions to her in writing later. And at that point, we will be happy to recognize Mr. Harper for 5 minutes.

Mr. HARPER. Thank you, Madam Chair. Mr. Howell and Dr. Beck, thank you for being here today. I am sure you can come up with a list of a dozen things you would rather be doing or mayhe 100 things, but we welcome your attendance and appreciate what you are sharing with us.

And Mr. Howell, just a couple of questions on some issues involving this. And I know that when we are talking about the common toy box theory applying, of course, to toys, it seems like there are a lot of other products that it really makes no sense at all. For example, infants and toddlers are not going to have access to motorized products like ATVs or at least we hope they are not. What is the situation with, say, ATVs and other things like that when it comes to these regs?

Mr. HOWELL. One would certainly not expect that small children would have frequent access with those type of outdoor products, certainly.

Mr. HARPER. OK. When we talk about, say, electronics, you know, the Commission set much higher lead limits for certain metal alloys. When the Commission granted a stay of the lead content limits for ATVs and bicycles, it set temporary limits at the same or very low or similar levels I mean. Why does the CPSC consider them to be safe or at least safe enough for now? What is the rationale for that?

Mr. HOWELL. When the Stay of Enforcement was issued, it was simply a stay from the testing and certification requirements. There was not a stay of the requirement to conform to the law as written. So the limits that are established are the limits that were prescribed in law.

Mr. HARPER. Got you. Now, I will ask if the Commission is aware of any deaths in fixed-side cribs in daycares?

Mr. HOWELL. Would you repeat that, please?

Mr. HARPER. Sure. Yes, sir. Is the Commission aware of any deaths involving fixed-side cribs in daycares?

Mr. HOWELL. I am not aware of any but I will certainly take that question back and have our epidemiologist do a data-pull.

Mr. HARPER. In your testimony, Mr. Howell, you have suggested the Commission be allowed to regulate on a timetable influenced by the seriousness of the actual risk to allow for better priority-setting. Do you have specific suggestions that you can share on how you can do this or how we can do this?

Mr. HOWELL. I believe any organization that has finite resources needs to ensure that they are allocating those resources to the highest priorities. You know, certainly there are various ways to rank those within the Commission. One might suggest that frequency and severity at-risk populations are all criteria that would help identify higher-priority projects versus those that might fall lower on the list. And it is really all about managing finite resources in a way that provides the greatest return on those efforts.

Mr. HARPER. OK. Dr. Beck, Mr. Vitrano, who will testify on the next panel, submitted testimony that says you estimated the lead intake from children's interaction with ATVs is less than the intake from drinking a glass of water and I ask if that is true nr any info on that statement.

Ms. BECK. Yes, we did an analysis in which we used wipe tests from ATVs so we had actual data and we compared how much children would get from that scenario versus what a child might drink in a typical glass of drinking water, which may contain small amounts of lead. So that is a correct conclusion from our analysis.

Mr. HARPER. And when was that analysis done? How recently?

Ms. BECK. It was, I believe, either 2008 or 2009.

Mr. HARPER. All right. But wouldn't it be true, though, that the metal parts of the ATVs contain much higher lead than permitted by EPA drinking water standards?

Ms. BECK. It is a little bit apples and oranges because the drinking water standards based on what is in the water——

Mr. HARPER. Right.

Ms. BECK [continuing]. That is a very low concentration in the water. And then if you were to say what does that mean in terms of—you could compare it to PPMs in a valve and, of course, that would be much, much higher. But it is a little bit of an apples-and-orange comparison.

Mr. HARPER. But based on that analysis, your concern about ATVs as it concerns infants and toddlers, you would not be overly concerned with that at all, would you?

Ms. BECK. No, because it is really not a plausible scenario.

Mr. HARPER. Sure. OK. I yield back.

Mrs. BONO MACK. I thank the gentleman and recognize Dr. Cassidy for 5 minutes.

Mr. CASSIDY. I really enjoyed this panel. All of you attempted to be very fact-based and referenced-based. So let me just first compliment you. And my compliments to Dr. Best, who is no longer here.

First you, Mr. Howell. Clearly it is common sense that a kid is not going to chew on an ATV and probably not on the stem of a bicycle. On the other hand, I can understand that if there was

some other product that the varnish wore off that the child could gnaw down to and actually have some lead exposure. So I guess my question to you is are we able to come up with a definition that which is absurd that the kid would ever chew on is moved over here and that which it is plausible is moved over there? Is that something within the Commission's ability to accomplish?

Mr. HOWELL. Certainly in the Commission's traditional risk-based evaluation of consumer products, that would be an evaluation that would be conducted. How a child interacts with the product is important in determining the level of risk that that child may be subjected to from that certain product. In the case of ATVs, we would find it less likely the child would swallow or mouth an ATV. Certainly you would expect that there could be some migration of lead from contact with the hand on an ATV.

Mr. CASSIDY. Now, I gather from Dr. Best—and I am sorry she is not here because I just wanted to explore this because all three of you know so much more about this issue than I. That is why you are the panel members and I am not—that there was some dissatisfaction from the risk-based assessment. So now I am sure there are many aspects of risk-based assessments, but was one of the areas that folks were unhappy with, did that include your ability to differentiate lead paint peeling off a wall from an ATV, one is a great risk, one is a minimal risk for lead exposure?

Mr. HOWELL. I have certainly heard the arguments against risk-based but I am not fully aware of all the underlying rationale behind that criticism.

Mr. CASSIDY. So it sounds like you feel like risk-hased is a practical thing for the Commission to implement?

Mr. HOWELL. The Commission has been using a risk-based approach for decades now.

Mr. CASSIDY. Now, you mentioned in response to Mr. Harper, the last line of your testimony to "effectively prioritizing Commission resources towards those of the most serious health risk." Now, I have learned in life that if you attempt to monitor everything, you end up monitoring nothing. But on the other hand, if you monitor a few things, you often can monitor them well. And I have also learned that there is oftentimes, you know, 99.9 percent risk with this subset of activities and .1 percent with this subset. Is that so clearly broken out in lead exposure? Can you say, listen, this is really high-risk stuff. We need to focus our resources even more so than now if we were so allowed, as opposed to this, which is incredible low-risk. We are kind of killing our time over here.

Mr. HOWELL. Certainly, the Agency is extremely concerned with those lead-bearing items that can be swallowed. Acute exposure to lead is certainly a very serious, serious thing. One would expect that the risk decreases as you move from swallowing to mouthing, from mouthing to touching. And the management of that risk at that point then becomes a decision on how the child interacts with the product and what you——

Mr. CASSIDY. So you mean by risk-based would make some differentiation between high- and low-risk and it would all be upon how the child interacts and the relative amount, et cetera, et cetera?

Mr. HOWELL. Yes, that is a basis of——

Mr. CASSIDY. Now, the other thing occurs to me is that we have heard last time from a previous panel about the craft-makers and you know, somebody in Oregon who makes these nice little airplanes that apparently needs a—I shouldn't laugh—but you know, it would make probably 100 planes a year, sells them out of their shop and now has to get a third-party assessment as to the lead content of the paint. Now, in your risk assessment, do you also say listen, if it is below a certain production value or quantity per year—I mean the ability of something that is produced on the scale of 100 a year, as one example, is really unlikely to have a significant impact, do you have any such sort of evaluation like that?

Mr. HOWELL. Our evaluation is from a risk approach is a product evaluation and the consideration of the volume of the product produced is not relevant to the assessment of the risk that that particular product may present to the consumer who is using that product.

Mr. CASSIDY. Yes, it wouldn't be for the particular consumer, but it would be for the epidemiology of it in terms of a population issue, correct?

Mr. HOWELL. Absolutely. And when it comes to prioritizing the Agency's work, that is where the frequency severity factors come into play.

Mr. CASSIDY. So you do incorporate the population aspect to it. OK. Well, thank you. Ms. Beck, I am sorry, no questions for you. It was just mine were more oriented to Mr. Howell. Thank you.

Mrs. BONO MACK. The chair recognizes Mr. Kinzinger for 5 minutes.

Mr. KINZINGER. Let me see if I can get this to work here. Well, maybe. Well, how are you doing today? Hopefully well. I don't need to take a lot of time because I think you guys have been very good at answering the questions. I appreciate your time and I appreciate the chairwoman for organizing the hearing.

You know, one of my concerns when we get to government involvement in areas is something that I affectionately refer to—as many other do—as the law of unintended consequences. You know, it is obviously when somebody does something that looks great on paper and then in actuality has a completely different effect.

So Mr. Howell, my question, speaking in terms of the law of unintended consequences to you, do you agree with the past-acting Chairman Nord's statement of April 3, 2009, that the "application of the lead content mandates of this act may have actually the perverse effect of actually endangering children by forcing youth-sized vehicles off of the market" and in a result actually children riding vehicles that are bigger or, in essence, too big for them, adult-sized ATVs if you will.

Mr. HOWELL. I agree with that statement.

Mr. KINZINGER. OK. So you do agree with that. Madam Chairwoman, I would like to ask unanimous consent to insert two documents into the record.

Mrs. BONO MACK. Without objection.

Mr. KINZINGER. The first, a statement from acting Chairman Nancy Nord of the CPSC from April 2009 requesting exclusions from the lead-content limits of the Consumer Protection Safety Improvement Act of '08. The other is a letter from Edward Moreland,

Senior Vice President of the American Motorcyclists Association to Chairwoman Bono Mack and Ranking Member Butterfield regarding the discussion draft.

[The information follows:]

U.S. CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

STATEMENT OF ACTING CHAIRMAN NANCY NORD
ON THE REQUEST FOR EXCLUSIONS FROM THE LEAD CONTENT LIMITS OF THE CONSUMER PRODUCT SAFETY IMPROVEMENT ACT OF 2008
April 3, 2009

In considering exclusions, consumer safety must direct the outcome of our deliberations. Therefore, it is with extreme reluctance that I am voting today to deny the petition, filed by companies and associations representing the ATV and motorized bike industries, for an exclusion from the lead content limits found in Section 101 of the Consumer Product Safety Improvements Act (CPSIA). I do this because the clear language of the law requires this result, not because it advances consumer safety. To the contrary, application of the lead content mandates of the CPSIA to the products made by the petitioners may have the perverse effect of actually endangering children by forcing youth-sized vehicles off the market and resulting in children riding the far more dangerous adult-sized ATV's.

For this reason, in my capacity as chairman, I am directing compliance staff to stay enforcement of Section 101 and related provisions of the CPSIA to this category of products for twelve months and hope my colleague, Commissioner Moore, will join me in making this a unanimous decision by the Commission. During this time-out, it is my hope that Congress will consider how the law needs to be fine-tuned to address this serious child safety dilemma. This enforcement hiatus will also give industry the opportunity to examine what reasonable changes can be made in their products to bring them closer to the requirements Congress set out in the CPSIA. Staff will meet with industry to do more testing to determine how their products can meet the 300 ppm threshold Congress set and determine what is possible. I will expect periodic status reports on progress to this plan.

It is clear that the law does not give the Commission the flexibility to grant an exclusion for petitioners' products. Congress wrote Section 101(b) in such a way as to leave little discretionary power with the agency to grant common sense exclusions. This lack of flexibility was brought to the attention of Congressional staff working on the legislation during the conference process and it was confirmed this is what was intended. As our career staff has discussed on many occasions and as we now have been formally advised by staff, we do not have the statutory authority to grant the exclusion requested in this case.

Even though the career staff of the agency has concluded that we cannot grant the exclusion, they have NOT concluded that petitioners products present a health risk to children because of exposure to lead. To the contrary, staff states "a bigger safety concern than lead exposure is that the elimination of youth ATV sales will most likely increase the number of adult ATV's purchased to be used by younger children; therefore increasing their risk of injury and death."

The issues presented to us in the petition are much more complex than just ordering petitioners to "get the lead out" of their products by a certain date. Petitioners have presented persuasive evidence that lead serves

a purpose in the structural integrity of the metals used in the products and that suitable substitutes are not available. They point out the impracticality of using virgin materials for these products, including issues dealing with the recycling of metals. They point out that the approach in the CPSIA is contrary to the approach taken in the rest of the world, e.g. the European Union which has looked at these issues rather extensively and made allowances. These are all issues that the Commission should have the authority to consider but under the rigid language of the CPSIA, we cannot.

The effect of denying the petition is to make Section 101(e) of the CPSIA, which limits the Commission's authority to stay enforcement during rulemaking, no longer applicable. Therefore, during the pendency of a stay of enforcement, ATV's and motorized bikes appropriately sized for children twelve and younger can again be available and the Commission will not seek penalties for violation of Section 101 and related provisions of the CPSIA against those who sell them. I hope that the state attorneys general will follow the lead of the agency on this matter.

All stakeholders – industry, users, Congress, and the Commission—need to come together to fix the statutory problems that have become so apparent, in a common sense approach that does not unnecessarily burden those regulated, yet provides safety for American families.

April 6, 2011

The Honorable Mary Bono Mack
Chairman
Subcommittee on Commerce
Manufacturing & Trade
House Committee on Energy & Commerce
U.S. House of Representatives
2125 Rayburn House Office Building
Washington, DC 20515

The Honorable Cliff Stearns
Ranking Member
Subcommittee on Commerce
Manufacturing & Trade
House Committee on Energy & Commerce
U.S. House of Representatives
2257A Rayburn House Office Building
Washington, DC 20515

Dear Chairman Bono Mack and Ranking Member Stearns:

On behalf of the American Motorcyclist Association (AMA) and the All-Terrain Vehicle Association (ATVA), we are writing the hearing on April 7, 2011 regarding discussion draft of H.R. ___, the Consumer Product Safety Improvement Act (CPSIA) of 2008.

Founded in 1924, the AMA is the premier individual rider-based advocate on the motorcycling issues. Along with our sister organization, the ATVA, the Associations represent the interests of the Photo of riders and other off-way motorcyclists and ATV riders nationwide.

We commend you for your efforts to provide a congressional exclusion for youth-model motorcycles and all-terrain vehicles (ATVs) from the unintended effects of the CPSIA. A permanent exemption for youth-model off-highway vehicles (OHVs) is extremely sensible that will maintain the benefits of recreational activity from the powersports industry, create jobs and, above all else, preserve the safety of young riders. For all of these reasons, the AMA and ATVA urge the Subcommittee to move, debate and pass H.R. 412, the "Kids Just Want to Ride Act."

Authored by Representative Denny Rehberg and supported by five bipartisan cosponsors, H.R. 412 is the most promising and viable legislative remedy available to permanently exclude youth-model OHVs from the perils and unintended consequences of the CPSIA. H.R. 412 would provide relief for many of the worst-hit victims of the CPSIA: young riders and their families who enjoy the sport of off-highway motorcycling and ATV riding. Specifically, H.R. 412 would exempt youth-model motorcycles and ATVs from the lead content mandates of the CPSIA. It would allow the private sector to safely and responsibly produce youth-sized OHVs that are appropriately designed for young riders. Finally, H.R. 412 would ensure that youth-sized OHVs are not subject to the CPSIA's third-party testing requirements.

In a statement on April 5, Nancy Nord, then-Acting Consumer Product Safety Commission (CPSC) Chairman Nancy Nord commented that the implementation of the lead content mandates of the CPSIA "will have the perverse effect of actually encouraging children to ride [unregulated] adult-sized ATVs." Nord again addressed the issue on May 4, 2009, in her statement on *The Negative Consequences of the Youth Protection and Off-Highway Vehicle Safety Act*, stating that, "We have heard from the Members of Congress and they don't want to be the last to make your ATVs or this way."

For these reasons, the AMA and ATVA urge the Subcommittee to consider and pass H.R. 412, "the Kids Just Want to Ride Act," which provides the necessary categorical exclusion for youth-model motorcycles and ATVs from the CPSIA.

Again, thank you for the opportunity to provide comment on this important issue.

Sincerely,

Edward Moreland
Senior Vice President, Government Relations

CC: Chairman Fred Upton
Ranking Member Henry Waxman
Members of the U.S. House of Representatives Committee on Energy & Commerce

Mr. KINZINGER. The next question I have, common sense seems to support the notion that youth model OHV should not be subjected to the lead content provisions of this act. Would one of the solutions to this conundrum be an outright categorical exemption, like the one provided in H.R. 412? It is called the Kids Just Want to Ride Act. It is one I am a co-sponsor on.

Mr. HOWELL. As a policy decision, that certainly would be an option.

Mr. KINZINGER. OK. Well, like I said, those are basically my two big questions I had. You all have done a great job here in front of us today. I appreciate your time. And I would yield back my time.

Mrs. BONO MACK. I thank the gentleman. And at that point I am happy to thank our panelists for staying and for your expert testimony. We appreciate everything you have had to offer today and hopefully we will craft some great legislation. So thank you for your time and we will spend a quick 30 seconds or a minute seating the new panel and get started right away. Thank you again.

All right. Thank you. Our second panel is comprised of four witnesses. Welcome. And thank you for staying with us this morning. Our first witness, again, but not in the order of recognition, but to introduce Erika Jones. She is a partner at Mayer Brown here representing the Bicycle Product Suppliers Association. Welcome. Our second witness is Paul Vitrano, General Counsel for the Motorcycle Industry Council. Also testifying today is Sheila Millar, a partner at Keller and Heckman, LLP. And our fourth witness on this panel is Caroline Cox, Research Director for the Center for Environmental Health. Welcome to each of you.

You all know the drill now, the 5 minutes and the clocks and how they work. So if you could just pay attention to those, we appreciate it. We will have some floor votes again eventually, so if we can move it along, that would be terrific.

So now we are going to begin with our first witness and recognize Ms. Cox for 5 minutes.

STATEMENTS OF CAROLINE COX, RESEARCH DIRECTOR, CENTER FOR ENVIRONMENTAL HEALTH; SHEILA A. MILLAR, PARTNER, KELLER AND HECKMAN, LLP; PAUL C. VITRANO, GENERAL COUNSEL, MOTORCYCLE INDUSTRY COUNCIL; AND ERIKA Z. JONES, PARTNER, MAYER BROWN, ON BEHALF OF THE BICYCLE PRODUCT SUPPLIERS ASSOCIATION

STATEMENT OF CAROLINE COX

Ms. COX. Thank you very much for the opportunity to testify today. My message is that CPSIA, as written, has been an enormous success and I am really privileged today to be able to provide research data to document that success.

You heard earlier that health professionals agree that there is no safe level of exposure to lead for children. So I am discouraged to see the proposed revisions in the CPSIA that would weaken a law that has worked so well to protect American children from unnecessary lead.

For the last 15 years, my organization, the Center for Environmental Health, has worked to protect children and families from harmful chemical exposures. Our experience before and after pas-

sage of the CPSIA demonstrates that the law has been highly successful. Prior to adoption of the law, we found high lead levels in dozens of children's products sold to millions of American families by major retailers. At that time there was no federal law to protect children from lead so we relied on California State Law. Since the lead limits under CPSIA went into effect, our experience shows a dramatic change in the marketplace for children's products.

In the last year and a half, we purchased over 1,200 children's products from major national retailers and screened them for lead. These were stuffed animals, toys, games, lunch boxes, backpacks, jewelry, toy sporting equipment, lots of other things. As far as we know, it is the largest independent monitoring of compliance with CPSIA to date.

Out of these 1,200 products, we found only 46 that did not comply with CPSIA lead standards based on tests by a CPSIA-certified lab. In other words, more than 96 percent were in compliance. And because we intentionally purchased products that were likely to have lead problems, we believe overall compliance is even higher.

This data contrasts with what we found in 2007 and 2008. Our results show that over the 4-year interval, the prevalence of lead hazards in children's products was reduced by a factor of about 3. Given the immense size of the U.S. market for children's products, this is a major accomplishment.

We do understand that CPSIA requirements can be a hardship for small business and we would support amendments to help with that. We believe that the CPSIA has been effective because one, the lead standards are comprehensive. They cover virtually all children's products and all accessible parts of those products. And that has created a huge market for complaint materials and components.

The standards are straightforward, and because they are based on a total content standard, testing is accessible, consistent, and affordable. Lead content standards are the only kind of standards that allow materials and components to be tested upstream in a supply chain. When you have exposure-based standards or risk-based standards, the testing can only be done on finished products after it is already made.

And the third point I would like to make is that the lead standards apply to a really meaningful definition of "children," up to age 12. Because lead is a cumulative and persistent toxicant, it is particularly important to maintain this requirement. Protect children as they move into their teenage years and girls move into childbearing years.

I wanted to just give a quick visual demonstration of the success of the CPSIA. Here is Curious George from 2007. His face contains lead at a level 20 times the current CPSIA standard. Don't kiss this George. And I think most kids probably wanted to. Here is the current post-CPSIA George. George is lead-free and sold at the same price. I think this really shows how successful the law has been.

We respectfully recommend that this committee support the public health success that the CPSIA has been. Crucial support includes the lead content standards, as well as the definition of a child as 12 years old and younger. Thank you so much.

[The prepared statement of Ms. Cox follows:]

CEH

Committee on Energy and Commerce
Subcommittee on [illegible]
Thursday, April 7, 2011
"Demonstration of CPSIA Success"
Summary of Testimony from Caroline Cox
Research Director, Center for Environmental Health

My fundamental message today is that the CPSIA as written, has been an enormous success. I am privileged today to be able to provide research data to document that success. As you heard earlier today, health professionals agree that there's no safe level of exposure to lead for children. So it is discouraging to see proposed revisions in the CPSIA that would significantly weaken a law that has worked so well to protect American children from unnecessary lead exposures.

CEH's experience before and since passage of the CPSIA demonstrates that the law has been highly successful in promoting safer products for American children. Prior to adoption of the law, CEH found high lead levels in dozens of children's products sold to millions of American families by Wal-Mart, Target, Kmart, and other major retailers. But at that time, we were unable to point to any federal law to protect children from the lead hazards posed by these products.

Since the lead limits under CPSIA went into effect, our experience shows a dramatic change in the marketplace for children's products. Between September 2009 and December 2010, we purchased over 1200 children's products from major national retailers and screened them for lead. We purchased stuffed animals, toys, games, lunch boxes, backpacks, jewelry, toy sporting equipment, and other products. We believe that this is the largest independent monitoring of compliance with the CPSIA to date.

Out of these 1200 plus products, we found only 16 that did not comply with CPSIA lead standards, based on independent tests by a CPSIA-certified laboratory. In other words, more than 98% of the products tested were in compliance with the law. Because we intentionally purchased products made with materials that were previously known to have had lead problems, this suggests that overall compliance with CPSIA is truly even higher.

This data also contrasts with testing we conducted in 2007, before the law was developed, and in 2008, before its lead limits were in effect. Our results show that over the four-year interval, the prevalence of lead hazards in the children's products was reduced by a factor of approximately forty, suggesting a similar decrease in children's products in general. Given the immense size of the U.S. market for children's products, this is a major accomplishment.

We understand that CPSIA requirements can be a hardship for small business and would support amendments to help small business meet the testing and certification requirements of the law. But based on our compliance monitoring, we believe the CPSIA has been effective because:

- The lead standards are comprehensive and cover virtually all children's products.
- The standards are straightforward, and the total content basis means that testing is accessible, consistent, and affordable.
- The lead standards apply to a meaningful definition of "children" up to age 12. Since lead is a cumulative and persistent toxicant, it's especially important to maintain the 12 and under age requirement of the law, as this is the best way to prevent exposures as children move into their teenage years, and as girls move into their childbearing years.

When a law is working well, the best successful characteristics of the law should continue. We respectfully recommend that this committee support the public health success that the CPSIA has been since 2008. Crucial support includes continued support for the lead content standards passed in 2008, as well as support for the definition of a child as a person 12 years old and younger.

Committee on Energy and Commerce
Subcommittee on Commerce, Manufacturing, and Trade
Thursday, April 7, 201
"Demonstration of CPSIA Success"
Testimony of Caroline Cox
Research Director, Center for Environmental Health

The U.S. Public Health Service states, "No safe blood lead level in children has been determined." According to the U.S. Environmental Protection Agency, lead can affect children "at blood lead levels so low as to be essentially without a threshold." The Centers for Disease Control and Prevention has concluded that "no level of lead in a child's blood can be specified as safe."

So it is discouraging to see proposed revisions that would significantly weaken a law that has worked so well to protect American children from unnecessary lead exposures.

For more than fifteen years, the Center for Environmental Health has worked to protect children and families from harmful chemical exposures. We work collaboratively with major corporations, helping them identify ways they can reduce their use of toxic chemicals, often resulting in economic savings while protecting public health. In some cases, we use litigation to reduce the use of and exposure to toxic chemicals. For example, in a landmark 1997 study, CEH investigated the use of lead-containing brass pipes in home water filtration systems. By 2000, we reached legal agreements with major producers of home water filters, ending the industry's use of materials that were leaching lead into "filtered" water.

Use of a total content standard is more appropriate for lead limits than a limit based on presumed exposures. Total content standards are inexpensive, easy replicable, and not subject to interpretation. By contrast, exposure assessment testing is a subjective process open to interpretation and manipulation. Witness the case of lead-containing vinyl in children's lunchboxes. When CEH found high lead levels in many vinyl children's lunchboxes, the FDA initiated an investigation. FDA used the lead test data from CPSC's testing of lunchboxes, and based on this testing FDA warned lunchbox makers about their use of lead-containing vinyl, concluding that "some migration of lead to food as a result of such use may reasonably be expected." But CPSC interpreted their test data differently: explaining the agency's inaction on lunchboxes, an agency spokesperson stated, "The food that you put in the lunch box may have an outer wrapping, a baggie, so there isn't direct exposure."

Because its lead standards are content based, under the CPSIA, producers, consumers, and regulators all know and understand the standards. Reverting to subjective standards now would be a setback for American families, who expect Congress to take the most protective approach when it comes to our children's health.

Changing the law from a total lead content standard to a standard based on exposure would be detrimental to public health, regulatory and industry needs. Total content testing of materials used in children's products is consistent and objective; screening devices for total content are available and inexpensive; total content

standards allow companies to specify materials to meet the standard. The latter is one of the most important characteristics of a total content standard: with today's complex supply chains, retailers, distributors, and manufacturers need an objective way to specify the quality of products or materials when they commit to a contract. Measuring lead content is the only efficient way for the complete supply chain to document compliance.

By contrast, exposure assessment is inconsistent and subjective; there is no way for companies to screen products for any of the typical exposure assessment tests, so testing costs will increase; and it is not possible to specify standards for components or materials.

CEH's experience before and since passage of the CPSIA demonstrates that the law has been highly successful in promoting safer products for American children. Prior to adoption of the law, CEH found high lead levels in dozens of children's products sold to millions of American families by Wal-Mart, Target, Kmart, and other major retailers. Examples of some of the lead-tainted children's products we found before advent of the law include:

- Imported candies;
- Diaper rash creams;
- Children's anti-diarrheal medicines;
- Baby bibs and lunchboxes;
- Toys; and
- Dozens of items of children's jewelry, including many with components containing 90% or more lead.

In each case, we were unable to point to any federal law to protect children from the lead hazards posed by these products, and thus we relied on California law to address the problems.

Since the lead limits under CPSIA went into effect, our experience shows a dramatic change in the marketplace for children's products. Between September 2009 and December 2010, we conducted what we believe is the largest independent monitoring of children's products for compliance with the CPSIA lead standards. We purchased and screened over 1200 children's products for lead. We bought the products in California primarily from major national retail chains. Because our charge (under a grant from the California attorney general) was to identify non-compliant products, we did not purchase products at random, but rather selected products that were similar to, or made from similar materials as ones identified in the past with lead problems. We purchased stuffed animals, toys, games, lunch boxes, backpacks, jewelry, toy sporting equipment, and other products.

Out of more than 1200 products tested, we found only 46 products that did not comply with CPSIA lead standards, based on independent tests by a CPSIA-certified laboratory. This suggests that at least 96% of children's products are compliant with the CPSIA lead standards. Because we intentionally purchased products that were made from materials known to have had lead problems in the past, our results suggest that overall compliance with CPSIA lead standards is likely even higher.

We also have data from 2007 and 2008, and have used it to demonstrate the downward trend in lead-tainted children's products since the law took effect. Our results show that lead hazards are less prevalent post-CPSIA than either before the law was passed or just prior to implementation of the law. Of the 100 products we tested in 2007, 9 (9%) had components whose lead content exceeded 600 parts per million (ppm), the level that became the first CPSIA standard. Of the 400 products we tested in 2008, 20 (5%) had components whose lead content exceeded 600 ppm. These results show that over the four-year interval, the prevalence of lead hazards in the children's products we tested was reduced by a factor of approximately three, suggesting a similar decrease in children's products in general. Given the immense size of the U.S. market for children's products, this is a major accomplishment.

Based on our experience with monitoring CPSIA compliance, we suggest that the following characteristics of the CPSIA lead standards helped make them successful:

- The lead standards are comprehensive. They cover virtually all children's products, virtually all retailers, suppliers, and manufacturers, and virtually all accessible parts of those products. We believe that this provided assurances to manufacturers that compliant products would find a market.

- The way that the numerical standards are expressed is straightforward. With the exception of paint (90 ppm standards), all materials must currently meet the same standard (300 ppm). In addition, the standards are expressed in terms of lead content, a characteristic that can be measured at any point in the chain of commerce. This made it possible for retailers, vendors, and manufacturers to specify lead content in contracts with their suppliers and to be able to determine if those specifications were being met.

- CPSIA lead standards apply to a meaningful definition of "children," up to age 12. Based on the most recent research, doctors and scientists now say that pregnant women and therefore young women who intend to become pregnant may be the most important subpopulation to protect from lead exposure. Since lead is a cumulative toxicant that is stored in the body for years, lead exposure of 12 year olds is a serious concern.

  At this point I'd also like to speak briefly as a parent rather than as a researcher. Most parents have seen the strong attraction that their children have for toys and other items designed and used by older children. In order to protect young children we need to make sure that products designed for somewhat older children are made of safe materials.

- The lead standards, as written in CPSIA, apply to businesses of all sizes. We believe that the wide scope of the standards has been one of the important factors in making the law a success. However, we would support amendments that recognize the special needs of small businesses.

In conclusion, we respectfully recommend that this committee support the public health success that the CPSIA has been since 2008. Crucial support includes continued support for the lead content standards passed in 2008, as well as support for the definition of a child as a person 12 years old and younger.

Mrs. BONO MACK. Thank you, Ms. Cox. Ms. Millar?

STATEMENT OF SHEILA A. MILLAR

Ms. MILLAR. Thank you, Chairman Bono Mack and Ranking Member Butterfield, members of the subcommittee. I appreciate the invitation to appear here today.

As a longtime consumer protection attorney—and I think all of the members of the panel here and everybody in this room share the same view. We need and want a strong and effective CPSC that has both the authority and the resources necessary to adopt and enforce national consumer product safety standards. Where we differ is that some of us favor revisions to CPSC's arbitrary one-size-fits-all limits that apply irrespective of the type of product, material, age of the user, or actual risk of exposure, its illusory or nonexistent exemption scheme, its retroactive effect and burdensome testing requirements, which have cost money and jobs.

Based on my experience with many different federal agencies, if I have learned one thing over the years, it is that sound public policy should be based on facts and science and risk. So I want to focus on a few key points from my written testimony.

First, the lead and substrate limits were derived from the unfounded assumption that presence equals risk. It doesn't. And I think Dr. Beck illustrated that point carefully this morning. The CPSC's own research has demonstrated that materials that are high in lead may sometimes yield less migratable lead or about the same amount of migratable lead as products that comply with 600 or 300 parts per mission. Exposure is the key to risk. And so we do believe that revisions that are more targeted to exposure keying off of proven things that the CPSC has done for years makes a lot of sense.

In terms of the lead exemption process, the proposal here offers a good step forward but remains unnecessarily complex. In addition, the limited exemption scheme is coupled with a general provision that gives the CPSC new authority to adopt 600 ppm limits on older children's or even adult products. Because I support a risk-based approach, I favor neither the current exemption process as drafted, nor giving CPSC general authority to simply adopt the 600 ppm limit on any product, irrespective of risk.

In contrast, the phthalates provision offers an elegantly simple view that could be applied more generally. It tracks the CPSIA exemption for inaccessible component parts but gives the Commission authority to adopt health-based exemptions, exemptions from the prohibition that are not necessary to protect children's health. Why not adopt a consistent science-based exemption process for both lead and phthalates predicated on the simple basic rule: that the government should not be in the business of banning safe products.

I do want to spend a couple minutes talking about testing. Let me be clear. Testing has an important role in compliance. And as Mr. Howell referenced this morning, there may be ways to look at how to dovetail testing regimes with supplier assurances, self-certifications, and other proven techniques that help confirm safety.

Let us also be clear that the prospect of $15 million penalties offer very powerful incentives to comply to say nothing of the prospect that your products will simply be rejected by your customers.

From the standpoint of total content testing, I differ with Ms. Cox in that we have seen over and over again the total content lead tests are not so uniform as you might expect. There is considerable variability and the absence of any definitive inter-laboratory variability factor is a key problem, particularly as levels drop lower and lower. So when we look at these differences in terms of inter-laboratory variability, a material—which may have residual lead content, let us say, a plated piece of metal where you are building on a piece of tin coupled with a nickel-plating, a copper-plating, a silver-plating—at the end of the day, the addition of those added metals, each of which could have residually low total content, could put you above 100 ppm. And I think we have seen the need for exemptions to perhaps look at a broader array of material to address that naturally occurring problem.

I would also caution against assuming that component testing is the solution to all ills with certification testing here. I represent many raw materials suppliers of plastics, chemicals, and other materials, and they are simply not willing to subject themselves to the jurisdiction of the CPSC to provide component-test certifications in the rigid scheme required by CPSIA.

I strongly support a national safety net for consumers. I also strongly support reducing unnecessary burdens on the regulated community by restoring the CPSC its authority to make sound risk-based decisions. Thank you again for the invitation and I look forward to responding to any questions.

SUMMARY

The Consumer Product Safety Improvement Act of 2008 (CPSIA) includes some important updates to the Consumer Product Safety Commission's (CPSC) authority that generated considerable support from businesses and consumer groups alike. However, other provisions were and remain controversial because they depart from sensible risk-based decision-making designed to be protective of public health. CPSIA adopted an unduly proscriptive scheme of absolute limits on total lead and phthalates, setting standards inconsistent with risk-based measures commonly adopted by other regulatory agencies and indeed by CPSC itself. Those limits were coupled with 1) an exemption process that has proven to be meaningless, in the case of the lead limits, or non-existent, in the case of phthalates limits, 2) arbitrary reduction schedules for lead content, 3) retroactive effect, and 4) a confusing, burdensome testing scheme. The result is legislation that bars the CPSC from making common sense decisions about protecting the public, and thus results in bans on safe products, costing both money and jobs since the law went into effect. We need and want a strong and effective CPSC with both the authority and the resources necessary to adopt and enforce national consumer product safety standards based on science and risk. The draft legislation offers some positive steps towards this goal, but further revisions should be considered to advance a consistent public policy framework that assures that children are protected and that responsible businesses can continue to produce safe, affordable compliant products for children.

Chairman Bono-Mack and members of the Subcommittee, my name is Sheila Millar. I am a partner with the law firm of Keller and Heckman LLP. Thank you for the opportunity to appear before you today to discuss reform of the Consumer Product Safety Improvement Act of 2008 (CPSIA). I have represented manufacturers, importers, retailers, and trade associations who make consumer products, packaging, medical devices, and other products, as well as suppliers of raw materials used in these products, for over 30 years. My practice involves issues before many different regulatory agencies, often involving the intersection of law and science, so I will focus principally on the provisions relevant to children's products. My comments reflect my personal views, drawn from my years of regulatory experience, on how to advance a strong, national, uniform consumer product safety law that achieves the goal of protecting children without eliminating products that, by any reasonable and accepted objective health measure, are safe. The draft CPSIA reform bill offers some modest steps towards this goal.

1. **Defining a "child."** CPSIA defines "children" to be those 12 and younger. Children are not "little adults." Nor, however, should all children in this age group be treated identically. "Children under 12" have physical and developmental differences and interact with consumer products differently. This is reflected in current law, which establishes different requirements for particular hazards based on the age of a child. Adopting a risk-based policy framework will allow for the development of health-protective standards for children's products keyed to the actual intended user.
2. **Lead substrate limits.** The cornerstone of a sound health and safety public policy is risk-based regulation. This is reflected in laws administered by health and safety agencies such as the Food and Drug Administration (FDA), the Occupational Safety and Health Administration (OSHA), the Environmental Protection Agency (EPA), and the Consumer Product Safety

Commission (CPSC) pursuant to the Federal Hazardous Substances Act (FHSA). It is a well-acknowledged law of science that hazard is a function of toxicity plus exposure. Risk is the potential hazard posed by the exposure, which in turn requires an assessment of the type of material, the type of product, foreseeable handling and use, and age of the intended user. In enacting CPSIA's arbitrary total content limits on lead in substrate, Congress departed from well-established health risk management concepts. It first adopted a 600 ppm limit, then dropped to 300 ppm, with an impending 100 ppm limit coming up this summer unless modified. These limits are not related to actual risk, since the presence, existence or content of a substance in a product or component does not automatically result in potential harm to health. As a result, CPSIA imposes burdens beyond those needed to address the potential risk of harm through reasonably foreseeable handling and use, obsoleting products that are "safe" one day and banned the next. Although the revisions in the draft legislation are a positive step, they do not restore a risk-based framework. Consequently, the likelihood remains that safe products will be banned by the legislation even as revised. Other agencies, like FDA and EPA, have developed health-protective risk-based approaches to managing potential lead exposure which may offer useful alternatives to the current framework.

3. **The lead exemption process should be modified.** If CPSIA is not modified to establish a more sensible basic policy framework in regulating lead in children's products, the exemption process in Section 101(b) should be modified to allow for exemptions for materials or products that will not pose a potential health risk based on reasonably foreseeable use and abuse. The proposed legislation is an improvement to the current exemption process, which has resulted in no exemptions despite demonstrated *de minimis* risk of exposure. However, the new exemption process remains unnecessarily complex and restrictive. It establishes two

approaches for exemptions, one for certain specific metals (steel, copper and aluminum alloys), and one for materials that pose a *de minimis* risk, provided, in each case, that they are not small parts. The scientific rationale for this limited two-step exemption process is not apparent. Any product or material that does not result in anticipated adverse health effects based on appropriate science relevant to the reasonable worst-case anticipated exposure route should be exempt. In some cases that may be hand to mouth contact. In others it may be mouthing, and in still others it may be accidental ingestion. If a product or material is demonstrated to be reasonably safe, utilizing appropriate scientific methodology to assess exposure via the anticipated potential route of exposure, there is simply no health or policy reason to ban it. In contrast, the suggested phthalates exemption process in Section 6 of the draft bill authorizes the Commission to exempt from the phthalates limits products or materials where the Commission determines that compliance with the prohibition is not necessary to protect children's health. This is a more sensible way to address the issue, and we believe that you should create a consistent and scientifically appropriate path for all health-based exemptions.

4. **Phthalates provisions.** The proposed bill includes a much-needed exception for inaccessible component parts that contain phthalates, similar to the inaccessible component parts exemption from the lead limits, and allows the Commission to grant an exclusion when it determines that compliance with the limits is not necessary to protect children's health. This is a sound risk-based approach that could easily substitute for the more complex and restrictive lead exemption options offered in the draft bill. Inclusion of an accessibility requirement will also assure that the phthalates limits apply only to products that will result in direct exposure through interaction of a child. Again, the risk of actual exposure to children

in the age range of concern is key. Products like breast pumps and bottle warmers, among others, should obviously be exempt from the phthalates limits, as should toys or child care articles that realistically would not likely involve health risks to children.

5. **Lead and phthalates standards should be prospective.** We support clarifications to CPSIA to assure that limits apply prospectively to products manufactured after the effective date. The lost businesses and lost jobs that were the result of the earlier implementation schedule of CPSIA cannot be restored, but further adverse impact to businesses whose products comply one day but not the next, or are otherwise safe, can be avoided.
6. **Modify unduly burdensome testing requirements.** Manufacturers have an obligation to meet applicable standards and to take appropriate measures to assure that they do. Otherwise, they face recalls and possible penalties for non-compliance. Testing has an important and ongoing role in compliance. However, micromanaging the test process by statute is not the best way to achieve the most cost-effective compliance, nor does it allow companies to rely on other compliance strategies or to leverage existing federal and other regulatory requirements to assure compliance. The draft bill offers important modifications to the current burdensome CPSIA testing scheme, recognizing that a system of compliance must be predicated on the specifics of the product category and supply chain. A few additional suggestions include:
    a. **Allow for supplier self-certifications, including as a mechanism to establish a reasonable basis of compliance with chemical content limits for components and raw materials.** Manufacturer certifications are a proven legal method to establish compliance under many laws, including the Flammable Fabrics Act, for example. CPSC's proposed final testing rule suggests that component testing will

be a solution to the costs and burden of mandatory third party testing of children's products. However, to take advantage of component testing, the raw material supplier must agree to subject itself to the jurisdiction of the CPSC and meet the requirements of a "reasonable test program." Raw material producers often do not themselves produce a consumer product, and may not be willing to subject themselves to the jurisdiction of CPSC for this purpose, particularly the burdensome production testing approach. However, they can often offer assurances of compliance. For example, many consumer product companies specify FDA-compliant raw materials for use in children's products, sourcing materials from reputable third parties who can provide written supplier assurances of compliance with FDA requirements adequate to assure that the material meets lead limits. A company that is willing and able to offer low lead materials safe for use in contact with food surely offers adequate assurances of safety for use in a consumer product.

b. **If production testing is retained, refer to "representative samples" rather than "random samples" in Section 102(b).** The draft bill now allows the CPSC to prescribe reasonable testing programs to be used as the basis for certification for test requirements not yet in effect. However, further guidance on the parameters of a reasonable testing program in general may be needed. For example, with regard to production testing, the CPSC's proposed definition of the term "random samples" requires manufacturers to adopt a complicated statistical approach to the selection of samples. A better term to substitute for "random samples" is "representative samples," meaning samples that are selected in a

manner intended to assure that they are representative of actual production, avoiding preselected or "golden" samples, not implementation of a complicated and expensive statistical selection process.

c. **Direct the CPSC to issue public guidance on inter-laboratory variability in total lead and phthalate test results.** Many reports have been submitted to CPSC documenting inconsistent results from laboratory to laboratory on total lead and phthalate content when the same product or component is tested. Products that meet lead or phthalates limits based on tests by one laboratory may fail when the same product is tested by another laboratory. Many companies require that tests be conducted by "their" laboratory so that they have consistent results for just that reason. This adds cost to the process, defeating one of the purposes behind third party testing. Products tested by any party that do not meet the applicable lead or phthalates limits by even a small margin cannot be sold and will not be accepted by customers. By virtue of failing a test these products are treated as banned hazardous products, subject to reporting and recall, irrespective of any actual potential risk of harm to a child. The problem is exacerbated as small differences in inter-laboratory results can have an enormous impact as regulatory limits drop, even as manufacturers operate on tighter and tighter tolerances in an effort to assure compliance. Adoption of an inter-laboratory uncertainty factor is a much-needed step in addition to adopting a risk-based framework of regulation.

***

The revisions in the draft bill are a good start towards ameliorating some of the adverse impacts of CPSIA, but further changes along the lines I have outlined here will help maintain a strong national safety net for consumers and reduce unnecessary burdens on the regulated community by restoring to the CPSC its authority to make sound risk-based determinations. The result will be an improved CPSIA, grounded in a public policy framework that draws on proven health-protective approaches to risk. I appreciate the opportunity to appear here today and would be happy to respond to questions.

Mrs. BONO MACK. Thank you very much. Mr. Vitrano, 5 minutes.

STATEMENT OF PAUL C. VITRANO

Mr. VITRANO. Chair Bono Mack, Ranking Member Butterfield, and distinguished members of the subcommittee, thank you for the opportunity to testify. I am Paul Vitrano of the Motorcycle Industry Council, which represents nearly 300 manufacturers of motorcycles and ATVs, aftermarket companies, and allied trades. We appreciate the subcommittee's efforts to address the unintended consequence of the CPSIA, which has effectively banned the sale of youth ATVs, motorcycles, and snowmobiles. The act has actually created unsafe situations for young riders by reducing the unavailability of appropriately-sized speed-restricted youth models.

As you noted during the last hearing, Chair Bono Mack, the CPSC has made the judgment that the risk of lead exposure to children is outweighed by the risk that children face if youth ATVs are not available. The act also has cost manufacturing and dealership jobs.

We urge Congress to fix this unintended ban and appreciate the subcommittee has offered an initial draft reform bill. Within the framework of the draft bill, the only way to fix the ban on youth vehicles with certainty and without imposing further needless costs and burdens on our industry and its customers is to amend the range of children's products at least for these vehicles to age 6 and under.

Alternatively, we ask you to consider adding a categorical exemptinn to the bill. There already is widespread support for this approach. Representative Rehberg has authored the Kids Just Want to Ride Act, H.R. 412, which currently has 61 bipartisan cosponsors. And just last week, Senators Klobuchar and Tester offered a categorical exemption as an amendment to the small business bill currently before the Senate.

ATVs and motorcycles do not present any lead-related health risk to young riders and Congress has made it clear that it never intended the lead content restrictions for toys to apply to these vehicles. We ask that you keep in mind thc following points as you work to provide young riders in our industry with much-needed relief.

First, the lead content in metal parts of ATVs and motorcycles poses no risk to kids, as Dr. Barbara Beck testified earlier this morning. The estimated lead intake from kids touching metal parts is less than the lead intake from drinking a glass of water.

Second, everyone agrees that the key to youth safety on ATVs and motorcycles is ensuring they ride the right size vehicles. By reducing the availability of these vehicles, the CPSIA has created—in the CPSC's own words—a "more serious and immediate risk of injury or death" than any risk from lead exposure.

Third, in 2009 MIC estimated that a complete ban on youth-model vehicles would result in about 1 billion in lost economic value in the retail marketplace every year.

Fourth, motorcycles and ATVs are motor-powered machines, not toys or other articles kids wear or play with. So the extent and nature of the children's interaction with our vehicles is materially different. As you know, kids do not mouth tailpipes or swallow bat-

tery terminals. Young riders typically only touch a few parts of the vehicles like handlebars and clutch levers and often with gloved hands.

Finally, ATVs and dirt bikes are stored outside the house, usually in garages, sheds, or barns and thus are much less likely than household items to be touched by young children. In addition to being remotely located, the vehicles have keys and use is controlled and supervised by parents.

There are two commonsense ways to fix this problem once and for all and without imposing further unnecessary testing and certification costs and burdens on our industry and customers. We urge you to exclude these youth vehicles from the lead content provisions by lowering the age range to primarily intended age 6 and under or adding a categorical exemption.

We also support the recommended changes to the CPSIA database provisions. One of our members recently received a report of harm where a rider who had been drinking prior to riding rode off a cliff at night in the dark. Nothing in the report indicated any problem with the ATV, but because the CPSIA database on its face only accepts reports of "unsafe" products, the inclusion of this report will result in the ATV implicitly being classified as an unsafe product. Unless Congress acts, the database will become a repository of inaccurate information that defames manufacturers and misleads customers. We believe the modest changes proposed in the draft legislation will result in a more useful database with accurate and relevant information for consumers. Thank you. I am happy to answer any questions.

[The prepared statement of Mr. Vitrano follows:]

SUMMARY OF TESTIMONY OF PAUL C. VITRANO
Subcommittee on Commerce, Manufacturing and Trade
Committee on Energy and Commerce
United States House of Representatives
April 7, 2011

The CPSIA was intended to protect children from ingesting lead from toys. However, the lead provision has had unintended consequences and I am here to testify about what many believe is one of the most absurd of those consequences. The CPSIA has effectively banned the sale of age-appropriate youth ATVs, motorcycles and snowmobiles because of the tiny amount of lead content in certain components. As a result, the Act has actually created unsafe situations for youth off-highway vehicle riders by reducing the availability of appropriately-sized, speed-restricted youth models. As you noted during the last hearing Chair Bono Mack, "the CPSC has made the judgment that the risk of lead exposure to children is outweighed by the risks that children face if youth ATVs are not available and they ride adult-sized ATVs instead." The Act also has crippled key parts of our industry, costing manufacturing and dealership jobs across the country.

On behalf of our members, their thousands of dealers, youth off-highway enthusiasts and their families, the Motorcycle Industry Council urges Congress to fix this unintended ban. We appreciate that the Subcommittee has offered an initial draft reform bill and is holding this hearing to discuss it. Within the framework of the draft bill, the only way to fix the ban on youth ATVs, motorcycles and snowmobiles with certainty – and without imposing further needless costs and burdens on our industry and its customers – is to amend the range of "children's products" at least for these vehicles – to age 6 and under.

In the alternative, we ask you to consider adding a categorical exemption to the bill. There already is widespread bi-partisan support for a categorical exemption for youth motorcycles and ATVs. Rep. Rehberg has authored The Kids Just Want to Ride Act, H.R. 412, which currently has 60 bi-partisan co-sponsors. And just last week, Sens. Klobuchar and Tester offered a categorical exemption as an amendment to the small business bill which was on the Senate floor.

ATVs and motorcycles do not present any lead-related health risk to young riders, and Congress has made it clear that it never intended the lead content restrictions for toys to apply to these vehicles. It is time to correct this untenable situation by either lowering the age to 6 and under or adding a categorical exemption in the bill. The industry also strongly supports the Committee's recommended changes to the CPSIA database provisions.

TESTIMONY OF PAUL C. VITRANO
Subcommittee on Commerce, Manufacturing and Trade
Committee on Energy and Commerce
United States House of Representatives
April 7, 2011

Chair Bono Mack, Ranking Member Butterfield and distinguished Members of the Subcommittee on Commerce, Manufacturing and Trade, thank you for the opportunity to testify on the urgent need for amendments to the Consumer Product Safety Improvement Act. I am Paul Vitrano, General Counsel of the Motorcycle Industry Council. MIC is a not-for-profit, national industry association representing nearly 300 manufacturers and distributors of motorcycles and all-terrain vehicles; motorcycle, ATV and recreational off-highway vehicle parts and accessories; and members of allied trades such as insurance, finance and investment companies, media companies and consultants.

The CPSIA was intended to protect children from ingesting lead from toys. However, the lead provision has had unintended consequences and I am here to testify about what many believe is one of the most absurd of those consequences. The CPSIA has effectively banned the sale of age-appropriate youth ATVs, motorcycles and snowmobiles because of the tiny amount of lead content in certain components. As a result, the Act has actually created unsafe situations for youth off-highway vehicle riders by reducing the availability of appropriately-sized, speed-restricted youth models. As you noted during the last hearing Chair Bono Mack, "the CPSC has made the judgment that the risk of lead exposure to children is outweighed by the risks that children face if youth ATVs are not available and they ride adult-sized ATVs instead." The Act also has crippled key parts of our industry, costing manufacturing and dealership jobs across the country.

On behalf of our members, their thousands of dealers, youth off-highway enthusiasts and their families, the MIC urges Congress to fix this unintended ban. We appreciate that the Subcommittee has offered an initial draft reform bill and is holding this hearing to discuss it. Within the framework of the draft bill, the only way to fix the ban on youth ATVs, motorcycles and snowmobiles with certainty – and without imposing further needless costs and burdens on our industry and its customers – is to amend the range of "children's products" – at least for these vehicles – to age 6 and under.

In the alternative, we ask you to consider adding a categorical exemption to the bill. There already is widespread bi-partisan support for a categorical exemption for youth motorcycles and ATVs. Representative Rehberg has authored The Kids Just Want to Ride Act, H.R. 412, which currently has 60 bi-partisan co-sponsors. And just last week, Senators Klobuchar and Tester offered a categorical exemption as an amendment to the small business bill which was on the Senate floor.

ATVs and motorcycles do not present any lead-related health risk to young riders, and Congress has made it clear that it never intended the lead content restrictions for toys to apply to these vehicles. It is time to correct this untenable situation by either lowering the age to 6 and under or adding a categorical exemption in the bill.

It is estimated that over 13 million Americans enjoy riding off-highway motorcycles and over 30 million enjoy riding ATVs. Safety of our riders – particularly our youngest riders – is a top

priority of the powersports industry. Vehicles, helmets and other gear and accessories are specially designed for youth riders to allow them to safely enjoy this family-friendly form of outdoor recreation.

In February 2009, however, ATVs and motorcycles designed and primarily intended for youth riders aged 6 to 12 became banned hazardous substances under the CPSIA because small amounts of lead – that pose no risk to youth – are imbedded in metal parts of those vehicles to enhance the functionality of those components.

As you know, the CPSC concluded that the language of the CPSIA prevented it from making common-sense decisions and resulted in the CPSC denying the powersports industry's petitions for exclusion from the lead content provision. The exclusion was denied despite the fact that the CPSC's own staff acknowledged that there was no measurable risk to children resulting from lead exposure from these products.

As a temporary stop-gap measure, the CPSC issued a stay of enforcement of the CPSIA's lead content limits in May 2009. Unfortunately, this stay of enforcement has proven unworkable. Due to the risks, uncertainties and burdens of the law, many manufacturers and dealers are no longer selling youth model off-highway vehicles. Over half of the major ATV manufacturers are no longer selling the smallest youth models despite the stay, significantly reducing the availability of these vehicles for children.

The CPSC has acknowledged that the ban on youth off-highway vehicles creates a significant safety issue because it likely will result in children 12 years of age and younger riding larger and faster adult-size vehicles. CPSC studies show that almost 90% of youth injuries and fatalities occur on adult-size ATVs. In contrast, the CPSC's staff scientists acknowledge that the presence of lead in metal alloys in these youth models does not present a health hazard to children. The Commission also acknowledges that children riding these vehicles only interact with a limited number of metal component parts that might contain small amounts of lead, like brake and clutch levers, throttle controls, and tire valve stems.

We appreciate the Subcommittee's efforts to address the unintended consequences of the CPSIA. We ask that you keep in mind the following points as you work to provide young riders, their families and our industry with much-needed, long overdue relief.

First, the lead content in metal parts of ATVs and motorcycles poses no risk to kids. In 2009, Dr. Barbara Beck estimated that the lead intake from kids' interaction with metal parts is less than the lead intake from drinking a glass of water.

Second, everyone agrees that the key to keeping children safe on ATVs and motorcycles is by ensuring they ride the right-sized vehicles. The CPSIA has put kids at significant risk by reducing the availability of youth model vehicles. The CPSC has described this unintended consequence of the Act as a "more serious and immediate risk of injury or death" than any risk from lead exposure from these products.

Third, the CPSIA is needlessly harming the economy and costing jobs when everyone is trying to grow the economy and create jobs. In 2009, MIC estimated that a complete ban on youth model vehicles would result in about $1 billion in lost economic value in the retail marketplace every year.

Fourth, motorcycles and ATVs are motor-powered machines, not toys or other articles kids wear or play with or, so the extent and nature of children's interaction with our vehicles is materially different. Young riders typically only touch a few parts of the vehicles, like handlebars and brake and clutch levers, and often with gloved hands.

Finally, ATVs and dirt bikes are stored outside the house, usually in garages, sheds or barns, and thus are much less likely than household items to be touched by young children. In addition to being remotely located, the vehicles have keys and use is controlled and supervised by parents.

As Representative Rehberg stated when introducing his bill to exclude youth ATVs and motorcycles from the Act's lead content restrictions, "the original legislation Congress passed was meant to keep kids safe from lead content in toys. Ironically, the overreaching enforcement wound up putting kids at risk by forcing them to use larger more dangerous machines that are intended only for adults."

Everyone agrees that the lead content restrictions for toys were never meant to apply to youth model motorized recreational vehicles. There are two obvious, common sense ways to fix this problem once and for all, without imposing further unnecessary regulatory costs and burdens on

our industry and customers. We urge you to exclude youth ATVs and motorcycles from the lead content provisions of the CPSIA by lowering the age range to age 6 and under or adding a categorical exemption in the bill.

I also would like to express the powersports industry's support for the Committee's recommended changes to the CPSIA database provisions. Industry has already experienced requests for misleading reports of harm to be posted on the government-run database. Indeed, one manufacturer recently received a database entry where a rider, who had been drinking prior to riding his ATV, rode off a cliff at night in the dark. Nothing in the report indicated any problem with the ATV. But nevertheless, because the death was "related to use of [a] consumer product," the CPSC has indicated that the ATV should be classified as being "unsafe" in the database. With the Commission having implemented the database the way it did, the database likely will become a repository of inaccurate information that defames manufacturers and misleads consumers. A guiding principle before anything is posted should be accuracy, and we believe the modest changes proposed in the draft legislation would result in a more useful database with accurate and relevant information for consumers.

Thank you. I would be happy to answer any questions.

Mrs. BONO MACK. Thank you, Mr. Vitrano. Ms. Jones, you are recognized for your 5 minutes.

STATEMENT OF ERIKA Z. JONES

Ms. JONES. Good afternoon, and thank you for inviting me to be with you this afternoon. I am Erika Jones, and I am counsel to the Bicycle Products Suppliers Association, which represents most of the manufacturers and importers of children's bicycles and adult bicycles offered for sale in the United States.

The bicycle industry has taken very seriously the expectations of Congress when the CPSIA was enacted. The bicycle industry has made substantial progress toward reducing lead in children's bicycle products or making the lead inaccessible to children and appreciated the Stay of Enforcement that was enacted by the Commission and used that time productively to make these design changes and material substitutions in their products.

Nevertheless, the industry is facing another brink of uncertainty as later this year a new standard of 100 parts per million looms on the horizon and presents a number of feasibility and practicability challenges for the industry. The industry presented data to the Commission in February of this year and again last month in written comments providing data from testing of a bicycle that was specced by its manufacturer to be below 100 parts per million because retailers are beginning to demand that level of achievement. And despite this effort to reach that goal, over 38 of the over 100 parts that were tested by the laboratory exceeded 100 parts per million, and that is attributable to the variability that is present, inherent, and we think at this point, can no longer be worked out of the system. These were metal parts. The bicycle industry has solved the issue with respect to plastic and other non-metallic parts but continues to have a problem with those components on bicycles that are made from metal alloys.

A witness at the CPSC regulatory hearing last month, who was retained by the bicycle industry and who runs a CPSC-certified lab, testified that he has in his experience seen a shrinkage in the number of children's bicycle models that are offered for sale and the number of manufacturers willing to engage in this sector, which means a loss of choice for consumers. And this, we believe, is attributed to the cost of testing for the over 100 parts of a bicycle that are accessible and therefore have to be tested.

Bicycles provide safe, affordable, and environmentally friendly transportation. They provide children with an enjoyable means of outdoor exercise, which we think is far more important for the health of children than protecting them from the theoretical risks from touching metal bicycle components with their hands. If lead testing costs make children's bicycles too expensive for average families to afford or if affordable used bicycles are difficult to obtain, the health of America's children could be affected far more than from the presence of lead in a tire valve stem that they may touch only on occasion.

I would like to address a comment made by the previous panel, by Dr. Best, who made a comment that there is no benefit to lead and therefore it should be inherently unnecessary. We disagree with that. Lead in the quantities that we see it in metal alloys that

are used in bicycles provide a tremendous benefit. They provide corrosion resistance. Lead alloys provide strength and durability that is needed for appropriate performance of a bicycle. And it would not be socially useful or desirable to produce a bicycle that may meet a lead-free standard but which falls apart or which cannot be operated in an outdoor environment where it is intended to be used.

The industry applauds your subcommittee for convening this hearing today. We believe there is a need to reform the CPSIA to reverse these unintended consequences and eliminate the unnecessary regulatory requirements that are driving up the cost of children's bicycles making them less available and we urge prompt action on sensible reforms of the CPSIA. Thank you.

[The prepared statement of Ms. Jones follows:]

BEFORE THE
SUBCOMMITTEE ON COMMERCE, MANUFACTURING AND TRADE
COMMITTEE ON ENERGY AND COMMERCE
UNITED STATES HOUSE OF REPRESENTATIVES
APRIL 7, 2011

TESTIMONY OF
ERIKA Z. JONES
ON BEHALF OF
BICYCLE PRODUCT SUPPLIERS ASSOCIATION

SUMMARY OF TESTIMONY

- The Bicycle Product Suppliers Association supports reforming the CPSIA and believes that sensible reforms are needed to address practical problems in the market.
- BPSA supports revising the age threshold for the definition of "children's product" to a lower age, and recommends establishing the threshold at age six.
- BPSA agrees that any new lead substrate standard should be prospective only.
- BPSA supports the establishment of an alternative lead substrate standard for components manufactured of certain specified metal alloys.
- BPSA welcomes provisions that recognize that component parts not likely to result in the ingestion of more than a de minimis amount of lead should not be subject to the standard and the testing requirements.
- BPSA supports an exclusion for the resale of used and refurbished children's products by charitable organizations.
- BPSA supports the proposed changes to the public database to make the data submissions more useful and accurate.
- BPSA does not support conferring authority on CPSC to extend the 100 ppm lead substrate limit to adult products.
- BPSA urges prompt action on sensible reforms of the CPSIA.

SUBCOMMITTEE ON COMMERCE, MANUFACTURING AND TRADE
COMMITTEE ON ENERGY AND COMMERCE
UNITED STATES HOUSE OF REPRESENTATIVES
APRIL 7, 2011

TESTIMONY OF
ERIKA Z. JONES
ON BEHALF OF
BICYCLE PRODUCT SUPPLIERS ASSOCIATION

Chair Bono Mack, Ranking Member Butterfield, and members of the Subcommittee, I appreciate the opportunity to testify before you this morning on the important matter of the need for amendments to reform the Consumer Product Safety Improvement Act of 2008 ("CPSIA").

I am Erika Jones, counsel to the Bicycle Product Suppliers Association, an association of suppliers of bicycles, parts, accessories and services who serve the specialty bicycle retailer. BPSA has engaged actively and constructively with the U.S. Consumer Product Safety Commission since the enactment of the CPSIA. BPSA's efforts to work with the CPSC staff to find solutions to CPSIA implementation issues have included the following:

- BPSA met in the fall of 2008 with the staff to discuss issues related to the bicycle standard (Part 1512) and challenges that were presented by the requirement for certification to all provisions of that standard, in light of the fact that the standard had not been revised in many years and contained some provisions which were not applicable to some modern bicycle designs. Since that time, BPSA has worked with the staff to identify the bicycle standard provisions requiring clarification or modification.
- In early 2009, BPSA petitioned the CPSC for limited relief from the lead standard for children's bicycles on the grounds that the lead in the metal materials used for children's bicycles would not result in the absorption of any measurable lead in a child's body. The

BPSA petition was supported by the best available scientific evidence, including specifically the expert report of Dr. Barbara Beck of Gradient, who analyzed worst-case scenarios of exposure to BPSA's members' products and concluded that no measurable increase in the blood levels of children could be expected to result from their exposure to, and contact with, the metal materials for which the BPSA sought relief. As the Committee knows, the CPSC concluded that it was unable to provide the relief sought under the terms of the statute, but provided a limited stay of enforcement for the lead requirements.

- BPSA presented data at a public Commission meeting earlier this year regarding the imminent change in the lead substrate standard, which is scheduled to change from 300 ppm to 100 ppm in August of this year. BPSA advised the Commission that its test data documented the significant variability that exists in components manufactured of certain metal alloys, making it infeasible to certify compliance with a 100 ppm standard with any reasonable degree of confidence.
- BPSA also advised the Commission at that hearing that its members had been successful in identifying substitute materials for high lead-content metals and/or alternative designs that resulted in making the high lead-content materials inaccessible to children, but that these efforts came at high costs, and despite substantial investment, the industry has still not been able to identify suitable metal materials that can consistently meet a 100 ppm standard. Yet, the prospects for obtaining administrative relief from the Commission are unclear, particularly with respect to products that will be on retail shelves as of August 2011.

In short, BPSA members have taken seriously the expectations of the Congress in enacting the CPSIA, and have made substantial progress toward achieving the goal of reducing unnecessary lead in children's bicycle products. Nevertheless, despite these substantial efforts, BPSA members are facing yet another brink of uncertainty as the date for implementation of the 100 ppm standard looms on the horizon.

With respect to the requirements for third-party laboratory testing of children's products, BPSA has worked constructively with the CPSC staff to address issues related to laboratory capacity; however, some issues remain, particularly with respect to the costs of testing. BPSA presented information to the Commission at the recent public meeting on the feasibility of the 100 ppm standard about the shrinkage of the market in terms of the number of companies willing to market children's bicycles. While the total volume of children's bicycles sold annually has not diminished, the number of children's bicycle models in the market is reduced from the number that were offered for sale before CPSIA's enactment, and the number of manufacturers willing to participate in the children's bicycle market sector has diminished, according to BPSA's expert who participated in the recent public meeting at the CPSC regarding the technological feasibility of a 100 ppm lead substrate standard. We believe that these market impacts are directly traceable to the onerous requirements of the CPSIA, including specifically the testing costs that are required to certify compliance with the CPSC's regulations.

For all of these reasons, BPSA strongly supports the efforts of this Subcommittee to bring some sorely needed reform to the CPSIA.

BPSA is particularly supportive of the following proposals in the discussion draft:

- Reducing the age threshold for definition of a "children's product." BPSA supports lowering the age threshold for the definition of a "children's product," and recommends

that the appropriate age threshold for determining whether a bicycle is a "children's product" should be whether the bicycle is intended primarily for use by a child six years of age or younger. This change alone would relieve BPSA members of the need to expend scarce resources on lead substrate testing on those bicycles intended for use by pre-teens, for whom there is no reasonable prospect of being injured from exposure to lead, as documented in Dr. Beck's analysis supporting the 2009 BPSA petition.

- Specifying that any new lead substrate standard would be prospective only, and not apply to products on retail shelves. BPSA has provided the Commission with information as to why a 100 ppm standard is not technologically feasible for metal components on children's bicycle products, and urges this Committee to report legislation that will provide complete relief from this requirement for bicycles. Although BPSA members are not seeking relief from a 100 ppm lead substrate standard for non-metal components, such as vinyl handgrips, it is unfair and extremely disruptive to apply that standard, or any new performance standard for that matter, to products that were manufactured before the effective date of the new standard. Except in the rarest of circumstances, new government standards should apply prospectively to products that are manufactured after the effective date of the new standard.
- Establishing an alternative lead substrate standard for metal components made of steel, copper or aluminum alloys. BPSA supports this provision, and believes its enactment would be directly responsive to some of the practical concerns that BPSA members have identified, and documented in prior presentations to the CPSC; however, it is unclear whether this provision would provide any relief from the testing burdens associated with the requirement to certify compliance. BPSA suggests that one additional step that might

be helpful to small businesses that are struggling with the testing costs would be to direct the CPSC to establish a roster of those metal alloys (perhaps identified by grade or other recognized identifier) that would be identified as presumptively compliant with the alternative standard, thereby relieving the manufacturer of the obligation to test separately for lead substrate compliance if the manufacturer chooses to use one of the alloy grades specified on the roster. (Of course, a manufacturer would remain free to specify a different material and test components made of that different material for compliance with the lead substrate standard.)

- Establishing a de minimis exception for component parts that are not likely to result in ingestion of more than a de minimis amount of lead. BPSA welcomes any provision that acknowledges the fact that the mere presence of lead in certain components does not necessarily present a health or safety risk to children. BPSA believes that product regulations that effectively ban the use of certain materials should be based on scientific risk assessments and a thorough understanding of the societal trade-offs that arise from such effective bans.
- Creating an exclusion for the resale of used or refurbished children's products by charitable resellers. BPSA strongly supports the intention of this provision, which is to permit the distribution of used or refurbished children's products by charitable organizations. Particularly given the scientific evidence strongly supporting the conclusion that children's bicycles do not present a health or safety risk to children based on the presence of lead in certain components, there is no good public policy reason to deprive families of the option of obtaining affordable, second-hand bicycles.

- Revising the public database provisions to make the submissions more useful by ensuring that submitters have actually experienced harm or risk of harm and by requiring more verification of disputed reports.

* * *

BPSA does not support conferring authority on the CPSC to extend the 100 ppm lead substrate limit to adult products. No justification has been offered for the need for any such requirement for adult products. In the short time since this draft legislation has been made available for review, BPSA members have been unable to evaluate whether the materials substitutions and redesigns for inaccessibility that were done for children's bicycles are feasible or practicable for adult bicycles. Before conferring any such authority on CPSC, BPSA urges this Committee to allow more time to evaluate the need for, and consequences of, any such new authority to impose a new mandate.

Our collective experience with the CPSIA has reminded us all of the need for regulators to consider unintended consequences before moving to ban a product or a material. The CPSIA was enacted with the best of intentions, but has proven in practice to present some practical challenges for manufacturers. BPSA believes that the CPSC should maintain its traditional method of regulating potentially harmful products and substances on the basis of a scientific risk-based assessment of potential harm balanced against the costs and other consequences associated with the ban or other regulation.

BPSA members are very proud to serve the needs of American bicycle consumers of all ages. Bicycles provide safe, affordable and environmentally friendly transportation. Bicycles provide children with an enjoyable means of outdoor exercise, which is far more important for the health of America's children than protecting them from the theoretical risks from touching

metal bicycle components with low lead levels. If lead testing costs make children's bicycles too expensive for average families to afford, and if affordable, used bicycles are difficult to obtain, the health of America's children could be affected far more than from the presence of lead in tire valve stems.

BPSA applauds this Subcommittee for convening this hearing today to consider the need to reform the CPSIA to reverse the unintended consequences of that law and to eliminate unnecessary regulatory requirements that are driving up the costs of children's bicycles. BPSA urges prompt action on sensible reforms of the CPSIA.

Mrs. BONO MACK. Thank you, Ms. Jones. You get the record for coming in 45 seconds short, so I am going to recognize myself for the first 5 minutes of questioning and direct my question to you.

You made reference several times in your written testimony to the August time frame. What happens in August that this time frame is of such concern that we need to do something about it in this amendment that we are looking at?

Ms. JONES. On August 11 of this year the lead standard for substrate will drop to 100 parts per million, and under the current interpretation of the statute that will have immediate effect at the retail level, meaning it will really be retroactively applied to products that are on the retail shelves that are being built right now as we speak. And that has a devastating effect on product planning and as I testified a few minutes ago and as we have submitted data to the CPSC, the 100-parts-per-million standard is technically not feasible right now for the bicycle industry to meet.

Mrs. BONO MACK. Thank you. And you also state that "except in the rarest of circumstances, new government standards should apply prospectively to products that are manufactured after the effective date of the standard." Can you give us examples of circumstances in which new standards have been applied immediately and retroactively? And how do those examples differ from the instance we have before us?

Ms. JONES. Well, the best example is the one we were just discussion of the 100 parts per million, which will apply immediately on August 11, not to products built after that date but to products on retail shelves as of that date, the same process applied when the 300 parts per million standard took effect in 2009. And it had the same effect and disruptive effect at the retail level.

This is not the norm for product regulation in other government agencies where normally—even at the CPSC as well—normally, manufacturers are given lead time to plan for the new regulation, to redesign their products, to absorb the costs in a more orderly fashion, and to work out their inventory so that products sold after the effective date reach retail shelves in a compliant fashion. That is the proper, orderly way to regulate products for safety improvement, not to disrupt the market with these very abrupt changes that do not permit that kind of orderly transition.

Mrs. BONO MACK. Thank you. Ms. Cox——

Ms. COX. Could I make a brief comment there?

Mrs. BONO MACK. No, I would like to move on. I have limited time and I do have a question for you, though. And you do mention that the FDA's warning about lunchboxes containing lead claiming that FDA interpreted CPSC's data differently than CPSC itself. How many lunchbox recalls did FDA order after it reviewed CPSC's data?

Ms. COX. This happened a long time ago but my recollection is there were not recalls but just a warning letter sent to lunchbox manufacturers telling them to fix the problem.

Mrs. BONO MACK. I guess you mentioned this in your testimony that your discussion of lunchboxes suggests that FDA would disapprove of a risk-based lead standard and insist on a total lead content standard, but in fact they don't have any total content standard for lead, do they?

Ms. COX. I actually think the example of the lunchboxes shows that, you know, one of the big advantages of the total content standard, it provides a clear, consistent number which manufacturers, retailers, regulators, everybody knows what the threshold is. I mean one of the issues with the lunchboxes was that it occurred pre-CPSIA, and so different agencies interpreted the results of the risk-based testing in different ways. And what we have now with CPSIA is a clear standard and lunchboxes all across the country—I have tested a lot of them over the last couple of years, and they are great.

Mrs. BONO MACK. All right——

Ms. COX. They comply with the standards.

Mrs. BONO MACK. Thank you. Ms. Millar, why isn't a total lead standard as health-protective as an exposure-based standard?

Ms. MILLAR. The risk to a child or to any consumer is based on actual handling and use. One of the assumptions that is incorrect that is underlying CPSIA is the notion that 100 percent of lead and substrate will migrate out of the product. That is actually not true and the CPSC's own data demonstrates that actual migration rates are generally very low, even in worst-case, 24-hour acid ingestion test conditions. That is why we think that total content—and I think Mr. Howell expressed it this morning—can be useful as a benchmark screen, but absolute limits that ban products that actually don't result in exposure of the sort that Mr. Vitrano and Ms. Jones talked about this morning do serve to essentially ban products that are objectively safe because they don't result in significant harmful exposure to the consumer who is handling the product.

Mrs. BONO MACK. Thank you. Mr. Butterfield, you are recognized for 5 minutes.

Mr. BUTTERFIELD. Thank you very much. Let me go to you if I can, Ms. Cox. In your testimony you state that exposure assessment testing is a subjective process, open to interpretation and manipulation. Is that a fair characterization of your statement, that it is subjective as opposed to objective?

Ms. COX. It is definitely subjective, yes.

Mr. BUTTERFIELD. All right. And the gentlelady on the first panel, Dr. Beck, testified and supports the risk assessment, seems to provide support for your view as well. Her written testimony that she submitted indicates that assessing risk is highly contextual and hinges on a number of factors.

Dr. Beck testified that you would want to know a lot of different things. You would want to know what the product is, how frequently a child interacts with the product, the duration of the interaction, will the child likely bite or suck on the product, will the child touch the component, how large an area the child will touch, and so forth and so on. That is about seven separate pieces of information that Dr. Beck identified. And I can add a couple more. How old is the child and in what stage of development is that particular child? What is the nutritional status of the child? Does the child have certain genetic traits that will lead to greater absorption? And so forth. It seems to me that perhaps the only person who could know all of these things and come up with that type of risk assessment would be someone who is superhuman.

Let me start with one simple question. Is it correct that with a lead content limit, a manufacturer or a retailer only has to know the answer to one simple question, how much total lead is in the component?

Ms. COX. Yes, that is correct. And just to reinforce what I said earlier. That allows the manufacturer or anyone in the supply chain to specify to their suppliers the type of material that they need.

Mr. BUTTERFIELD. Dr. Beck also in her testimony asserted that a standard based on soluble lead is generally preferable to a standard based on total lead. And as I understand it, total lead is a measure of how much lead is in a component, period. This is the measure required by the legislation. Solubility, on the other hand, refers to the amount of lead released from a component under certain specified conditions. Is it correct, Ms. Cox, that the conditions for measuring solubility are not consistent? That is they could choose to vary the time, temperature, and the solution that is used, whether to agitate the solution and so on. Would you elaborate on that, please?

Ms. COX. I think I could just say that I have actually heard people in the laboratory and testing industry say that if something complicated like a solubility test or other exposure-based testing was required that there actually wouldn't be lab capacity enough to be able to do these tests because they are so much more complicated and time consuming than a simple test for lead content.

Mr. BUTTERFIELD. Will changing even one of these conditions affect the amount of lead that will be released during the test?

Ms. COX. I think—yes, I am not a lah specialist but that is my understanding, yes.

Mr. BUTTERFIELD. All right. My next question is—I guess I have time to do it. Let me try this. In your testimony, Ms. Cox, you point out that a total lead content limit allows companies to specify materials that meet the standards when contracting with suppliers. If I understand you correctly, a manufacturer can tell his or her metal supplier, I want to buy metal from you but only metal that contains no more than 300 parts per million and a supplier would be able to easily fill that order as specified. Could you respond?

Ms. COX. Correct. In the exposure-based testing you can't do until the product is completed, so that would happen at the very end of the manufacturing process, whereas with the total content, you can specify the content of all the materials and components that are used in a product. So it allows you to do it sort of premanufacture rather than having to potentially reject a product after it is already made.

Mr. BUTTERFIELD. All right. All right, Madam Chairman, I yield back.

Mrs. BONO MACK. Thank you, Mr. Butterfield. And now I would like to recognize Ms. Blackhurn for her 5 minutes.

Mrs. BLACKBURN. Thank you so much. And thank you all for your patience today.

Ms. Cox, I enjoyed listening to your testimony and especially that you used Curious George. I have got a 3-year-old and a 2-year-old grandchild and that is one of their favorites. Let me ask you some-

thing. Do you find more lead in products that we import or products that are domestically manufactured?

Ms. COX. I think probably everybody here is aware that virtually all the products on the shelves of major national retailers are products that are not made in this country. So, you know, when we find products that exceed CPSIA limits, it is not surprising that that is also true.

Mrs. BLACKBURN. OK. In listening to your testimony and the testimony of others, it has been kind of curious—and Mr. Vitrano and Ms. Jones, I will ask you. With motorcycles and bicycles, do you all find more lead in those that we import or those that are domestically produced?

Mr. VITRANO. All the major manufacturers of ATVs actually produce many of the models in the U.S. itself.

Mrs. BLACKBURN. OK.

Mr. VITRANO. Some models are made by those companies from outside the U.S. and——

Mrs. BLACKBURN. Well, maybe that they are domestically produced is one of the reasons we have less lead in a wipe test than in a glass of water. Ms. Jones, bicycles?

Ms. JONES. Most children's bicycles are not made in this country any longer.

Mrs. BLACKBURN. OK. And so you don't see that as being pertinent to what you all do?

Ms. JONES. We do not see that as being pertinent.

Mrs. BLACKBURN. OK. That is fine. You know, I have wondered if maybe since we have driven manufacturing out of this country is one of the reasons we are here having this hearing today and talking about the amount of metals that are there and some of the environmental litigation that has been brought forward and has driven manufacturing away from our shores. Maybe that is one of the reasons that we are here.

And I know, Ms. Cox, that the Center for Environmental Health uses litigation quite frequently under California's Prop 65 warning requirements. And I know that you all do some work and wanted to ask you, do you all get a bounty for identifying violations under Prop 65 labeling laws?

Ms. COX. Proposition 65, for those of you who don't know, was a ballot initiative in California in 1986——

Mrs. BLACKBURN. Yes, but you identify violations under that, so do you all get a bounty?

Ms. COX. The statute, as passed by the voters, provides for if the statute is violated, there are civil penalties that are paid to the State——

Mrs. BLACKBURN. Yes, I have got some of them in front of me——

Ms. COX [continuing]. And the plaintiffs who identify the violation is entitled to 25 percent of those civil penalties.

Mrs. BLACKBURN. OK. So I have got an exhibit in front of me that identifies some of these. So if one type of fashion accessory listed above is checked, it would be $45,000 in that identification. So you all would get 25 percent of that if you identified those.

Ms. COX. 25 percent of the civil penalties.

Mrs. BLACKBURN. OK. All right. So 25 of the 45,000. So, OK, is this a funding revenue stream for your organization?

Ms. COX. My organization has a diverse source of revenue. Like most nonprofit organizations, we receive grants from foundations. We also have a strong committed group of individual supporters who support us financially. And then we do get some money from our litigation as well.

Mrs. BLACKBURN. Is that with the Lexington Law Group? Is that under a consent decree?

Ms. COX. Could you repeat the question? Sorry.

Mrs. BLACKBURN. I said is that with the Lexington Law Group, your litigation? OK. Let us move on. So then you get some money that comes to you through identifying these violations and most of the product, I guess, that you are looking at is things that are imported and they are on the shelves of major retailers, is that correct?

Ms. COX. Yes.

Mrs. BLACKBURN. And how many lawsuits have you partnered with the Lexington Law Group?

Ms. COX. Let us see. There were a lot of questions there.

Mrs. BLACKBURN. Yes, let me help you out with this. My time is nearly out. What I would like to know—and you can submit in writing—I would like to know what percentage of your funding relates to litigation. I would like to know how many lawsuits you have partnered with the Lexington Law Group. And I would like to know how much money you have made, what your revenue stream is from Prop 65 lawsuits in violations since the passage of CPSIA. And with that, Madam Chairman, I yield back the balance of my time.

Ms. COX. Yes, I think it probably would be best for me to provide that information in writing since it is a lot of numbers.

Mrs. BLACKBURN. Yes, ma'am, I was asking for it in writing.

Ms. COX. I would be happy to do that.

Mrs. BLACKBURN. For the record.

Mrs. BONO MACK. Thank you. The chair is happy to recognize Mr. Pompeo for 5 minutes.

Mr. POMPEO. Thank you, Madam Chairman. Following up on Ms. Blackburn, would you submit all of the sources of funding for your organization when you put that in writing to us, not only that that you get for Prop 65 but other sources for funding for the center, the CEH?

Ms. COX. Yes, I would be happy to.

Mr. POMPEO. Thank you.

Ms. COX. And just to clarify, the work that I talked about in my testimony, monitoring for CPSIA compliance, that money came from the California Department of Justice, California Attorney General.

Mr. POMPEO. So governmentally funded, is that right?

Ms. COX. Sorry?

Mr. POMPEO. Government funding from the State of California?

Ms. COX. It went through a private foundation but the source of the money was the attorney general's office.

Mr. POMPEO. Thank you. Ms. Millar, this is fascinating to me. I am new here. This is all very fascinating. You, on the other hand,

you get paid by your clients and you are here today trying to avoid them paying you by reducing the regulatory burden. I find that fascinating to see the charitable effort you are making here today. Yes, no, I truly meant it that way. I meant it as a compliment.

Ms. Jones, you said that you have a problem with metal alloys in the bicycle industry?

Ms. JONES. Yes, sir.

Mr. POMPEO. Why do you use metal? Just why don't you stop using it?

Ms. JONES. Metal alloys add a great deal of important value to bicycles. They help the bicycle be corrosion-resistant, they help them be strong and durable, and we really couldn't make bicycles without them.

Mr. POMPEO. So there is no substitute?

Ms. JONES. Well, no, that is not true. There are substitutes, for example, carbon fiber. Some very high-end racing bikes for adults are made of carbon fiber but they would be way too expensive——

Mr. POMPEO. But I am not going to buy that for my son?

Ms. JONES. You are not going to buy that. It would be too expensive.

Mr. POMPEO. Yes. Yes, my son might like it but I am not going to buy it.

Ms. JONES. There is no affordable, practical substitute.

Mr. POMPEO. Thank you. That is what I figured. We were talking before about these different tests. Mr. Butterfield, Ms. Cox, asked you about some different tests and you said boy, the testing would just be really hard. He was describing these testing would be very difficult, soluble, non-soluble, it would be really hard and inconsistent. Is that right? And so you then said yes, that would be hard, so let us just take a simpler test that probably doesn't really accomplish what we are trying to do. So it is a proxy at best. The perfect testing would be hard and difficult so what everybody defaults to is this simple test that really doesn't get to the true risk of exposure to a consumer of a product. Did I understand your response correctly?

Ms. COX. I would prefer to phrase it as——

Mr. POMPEO. I am sure you would.

Ms. COX [continuing]. The goal——

Mr. POMPEO. I would prefer if you would not rephrase it but simply answer my question.

Ms. COX. The goal of CPSIA was to remove a toxic metal from children's products. And there had been a long history prior to CPSIA of risk-based approaches not being successful, and the lead content standard has been very successful at changing the marketplace and getting lead out of these products.

Mr. POMPEO. I have no doubt. And banning lots of things would make them successful, too. We can always create a test that is over-inclusive and solve a problem. But as you can see from Ms. Jones' comment earlier, we create another one. My son doesn't get to exercise on his bicycle. Ms. Millar, do you have a view on the testing that Mr. Butterfield asked Ms. Cox about?

Ms. MILLAR. Yes. As I said earlier—and I think Mr. Howell alluded to this as well this morning in his testimony—the ability to use total content as screening is an important tool. There is no

question about it. And I think it is true that people do try to target where they can meet a certain limit. It does help in the supply chain. It is not true that total lead tests are always uniform and never varied. We see a lot of different variability in total content test. And I think the problem becomes that when you establish an absolute ban, what we have seen for bikes, for ATVs, for certain, you know, pearlized buttons, for example, have agents in them that are metallic, you can have violations of total content limits where objectively applying standard accepted procedures that the CPSC uses, whether it is a wipe test, a saline test to mimic mouthing, which is a 6-hour-test procedure—they have an established procedure—or their updated 24-hour acid exposure test, you can establish whether or not that product is going to pose a risk. And so the manufacturers are going to always target to some objective limit where they can. The problem is that you are going to ban them where they exceed it where there is not a risk.

Mr. POMPEO. It makes sense. I have got one more question, just 20 seconds. Mr. Vitrano, Ms. Jones, have any of you had any experience responding to a CPS database complaint at this point? There has only been a month. Have any of you had experience responding to——

Ms. JONES. Yes.

Mr. POMPEO. How did it go?

Ms. JONES. We still have a couple in process but, you know, it is certainly something that people pay attention to. They take it seriously. In no case, however, has a client to date had a materially inaccurate incident report submitted to them.

Mr. POMPEO. But they have had to spend a bunch of money talking to you? Thank you. I yield back my time.

Mrs. BONO MACK. I thank the gentleman and recognize the distinguished chairman emeritus, Mr. Dingell, for 5 minutes.

Mr. DINGELL. Madam Chairman, thank you. The questions are to all witnesses and I would very much appreciate it if they would be answered yes or no.

First of all, beginning with Ms. Cox, are you aware of a uniform reasonable methodology in use by manufacturers of children's products to find what is the amount of lead in a product? Yes or no?

Ms. COX. Yes.

Mr. DINGELL. Ma'am, Ms. Millar?

Ms. MILLAR. Yes.

Mr. DINGELL. And you, sir?

Mr. VITRANO. Yes.

Mr. DINGELL. Ma'am?

Ms. JONES. Yes.

Mr. DINGELL. OK. Now, is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products? Yes or no? Ms. Cox?

Ms. COX. Yes.

Mr. DINGELL. Ms. Millar?

Ms. MILLAR. No.

Mr. DINGELL. Sir?

Mr. VITRANO. I don't know.

Mr. DINGELL. Ma'am?

Ms. JONES. No, we are not seeing that.

Mr. DINGELL. The next question, if it wouldn't lead to a variance, do you believe that this could pose a risk to the health of the children who use such products? Yes or no? In other words——

Ms. COX. I don't think I am able to answer that question.

Mr. DINGELL [continuing]. Is that variance going to put the children at risk? Well——

Ms. COX. Well, certainly, we need consistent testing.

Mr. DINGELL. Ms. Millar?

Ms. MILLAR. I don't see the variability, so my answer is no.

Mr. DINGELL. And you, sir?

Mr. VITRANO. It would depend on the variability.

Mr. DINGELL. Ma'am?

Ms. JONES. And we are not seeing the variability.

Mr. DINGELL. Ms. Cox, do you want to take another shot at it? All right. We will go to the next set of questions because time is very limited here.

We have the term "accredited third-party conformity assessment bodies." I assume that this includes both domestic and international bodies that would do this kind of testing? Am I correct? Yes or no, Ms. Cox?

Ms. COX. Yes.

Mr. DINGELL. Ms. Millar?

Ms. MILLAR. Yes.

Mr. DINGELL. Sir, if you please?

Mr. VITRANO. Yes.

Mr. DINGELL. Ma'am?

Ms. JONES. Yes.

Mr. DINGELL. All right. Now, if so, how many such assessment bodies are there worldwide? I don't expect you to know but give me a shot in the dark, the best count you can give. How many do you think there are? Ms. Cox?

Ms. COX. I don't know.

Mr. DINGELL. Ms. Millar?

Ms. MILLAR. A couple of hundred, I believe.

Mr. DINGELL. Sir?

Mr. VITRANO. For youth model ATVs there currently is 1.

Mr. DINGELL. Ma'am?

Ms. JONES. For bicycles there are only two in the U.S. and about a half-dozen outside of the U.S.

Mr. DINGELL. Thank you, my friends. Does the Commission have the resources with which to verify the testing capacity of all of these third-party conformity assessment bodies? Yes or no? Ms. Cox?

Ms. COX. I don't know.

Mr. DINGELL. Ms. Millar?

Ms. MILLAR. I don't know.

Mr. DINGELL. Sir?

Mr. VITRANO. I don't know.

Mr. DINGELL. Ma'am?

Ms. JONES. I don't know.

Mr. DINGELL. Now, is it your understanding of the draft legislation that the Commission would have to accredit all third-party conformity assessment bodies? Yes or no?

Ms. COX. I don't know.

Mr. DINGELL. In other words, would they have discretion under the legislation to decide who they would accredit and how and why they would accredit? Yes or no?

Ms. COX. I don't know.

Mr. DINGELL. Ma'am?

Ms. MILLAR. I don't know.

Mr. DINGELL. Sir?

Mr. VITRANO. I don't know.

Mr. DINGELL. Ma'am?

Ms. JONES. I don't know.

Mr. DINGELL. All right. Now, in summary, do you believe that the effect of these requirements would be that the Commission would seldom, if ever, require third-party testing of children's products? Yes or no?

Ms. COX. I don't know.

Mr. DINGELL. Ma'am?

Ms. MILLAR. I don't know.

Mr. DINGELL. Sir?

Mr. VITRANO. No.

Mr. DINGELL. Ma'am?

Ms. JONES. No.

Mr. DINGELL. Now, here are some questions about the database which are troubling us. And everybody, I think, is troubled. Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of the accuracy of the information? Yes or no? Ms. Cox?

Ms. COX. I don't know.

Mr. DINGELL. Ms. Millar?

Ms. MILLAR. Yes.

Mr. VITRANO. Yes.

Ms. JONES. Generally, yes.

Mr. DINGELL. Thank you. Now, should a manufacturer be given the opportunity to contest the accuracy of a consumer complaint before it is published? Yes or no? Ms. Cox, please? What is your opinion, just your best judgment on the matter, please?

Ms. COX. These questions are outside my expertise.

Mr. DINGELL. All right. Then I will not press you on it, ma'am. Ms. Millar?

Ms. MILLAR. Yes.

Mr. DINGELL. Mr. Vitrano?

Mr. VITRANO. Yes.

Mr. DINGELL. Ms. Jones?

Ms. JONES. Yes.

Mr. DINGELL. All right. Now, if a manufacturer is allowed to dispute the accuracy of the information in a consumer's complaint, how should the dispute be resolved and by whom? If you please, Ms. Cox?

Ms. COX. I don't know.

Mr. DINGELL. Ms. Millar?

Ms. MILLAR. I think the CPSC should resolve the inaccuracy before posting the complaint to the database.

Mr. DINGELL. Mr. Vitrano?

Mr. VITRANO. CPSC should resolve it before posting.

Mr. DINGELL. Ms. Jones?

Ms. JONES. CPSC should resolve it before posting.

Mrs. BONO MACK. The gentleman's time has expired.

Mr. DINGELL. I thank you, Madam Chairman. I have one more great question. Could I ask unanimous consent to ask it, please?

Mrs. BONO MACK. Yes, without objection.

Mr. DINGELL. Thank you. The draft legislation amends CPSIA to permit only persons directly harmed by a consumer product, their family, their legal representative, or another person authorized on their behalf to submit a complaint to the database. Previously, CPSIA permitted anyone to submit complaints about a consumer product. Do you believe that the draft legislation's narrowing of eligibility to submit the complaints is necessary? Yes or no?

Ms. COX. Not necessary.

Mr. DINGELL. OK. Ms. Millar.

Ms. MILLAR. Necessary.

Mr. DINGELL. Mr. Vitrano?

Mr. VITRANO. Yes, it is necessary.

Mr. DINGELL. Ms. Jones?

Ms. JONES. Yes, it is necessary.

Mr. DINGELL. Madam Chairman, you have been most courteous. May I have an additional unanimous consent request? I have a splendid statement that I have labored long and hard on.

Mrs. BONO MACK. I have nothing but fondness and admiration for the distinguished chairman, but we still have another member and another panel to go and votes on the floor. So I will——

Mr. DINGELL. I am not delaying——

Mr. BUTTERFIELD. Madam Chair——

Mr. DINGELL [continuing]. Madam, I have a statement I would like to put in the record.

Mr. BUTTERFIELD. Whenever the chairman emeritus talks like that, he has a pleasant surprise for us. I would ask unanimous consent to yield to the chairman emeritus.

Mr. DINGELL. Thank you very much. No, it is just a statement that I want to put in the record, Madam.

Mrs. BONO MACK. Of course. Without objection.

[The information follows:]

Statement of
Representative John D. Dingell
Committee on Energy and Commerce
Subcommittee on Commerce, Manufacturing, and Trade
Hearing on "H.R. __, a bill to revise the Consumer Product Safety Improvement Act of 2008"

April 7, 2011

Thank you, Madam Chairman, for holding this important hearing. My concerns about the impracticability of certain provisions in the Consumer Product Safety Improvement Act (CPSIA) are a matter of public record and need not be revisited here. I commend you, Madam Chairman, for circulating draft legislation meant to remedy these concerns. I hope the Committee's deliberations on this matter will yield bi-partisan legislation that maintains the tenor of CPSIA's landmark consumer protections, yet at the same time grants the Consumer Product Safety Commission greater administrative flexibility and facilitates compliance with the Act.

I wish to stress that my support of legislation to amend CPSIA is contingent to a great extent on such legislation's having bi-partisan support. Further, my interest with respect to this Act has always been to avoid intractability in the face of common-sense ways to make CPSIA workable. To that end, I urge my colleagues on both sides of the aisle to cooperate on this matter, engage stakeholders, and produce a bill – much like the House's Consumer Product Safety Modernization Act – that the Committee and House will unanimously approve.

I look forward to hearing our witnesses' thoughts about the legislation pending our consideration today, as well as their general advice for addressing what some consider CPSIA's apparent shortcomings.

Thank you for your courtesy, Madam Chairman, and I yield back the balance of my time.

Mr. DINGELL. And I do thank my good friend for his kindness to me. Thank you, Madam Chairman.

Mrs. BONO MACK. Thank you. And reminder, I am new at this chairmanship, so I appreciate the kindness of the distinguished chairman emeritus but will recognize Dr. Cassidy for 5 minutes.

Mr. CASSIDY. I don't know. I am sorry. I was out when you all were making testimony so I don't know if anyone can address what I am about to ask. As I look at the epidemiology of lead poisoning, it seems to be not generally distributed, but it seems to he in certain populations. Those which are recent immigrants, for example, appear to have a disproportionate amount of lead toxicity. And in fact I was looking at something from a hospital in Los Angeles that found even within the Hispanic community there, there was three ZIP codes which were particularly impoverished ZIP codes in which there was even more. Now, assuming that toys are generally distributed but that the people who have problems with lead toxicity are concentrated in certain areas, it suggested to me that the culprit for those children who have increased lead, it may be geographic or related to how recently they came from another country without standards than it is almost anything else.

I toss that out not knowing if anyone can answer that nr if these are just musings. Anybody want to take a crack at that?

Ms. COX. I will take a crack at it. Exposure to old lead-based paint in homes is the primary source of lead exposure to children, and that has been the case for several decades. Current statistics are about 70 percent of elevated blood lead levels in children are caused by exposure to paint. The other 30 percent are not. Further——

Mr. CASSIDY. Now, wait. I am sorry. Just so I understand, so if you have a blood level of 100, just to pick a number, does that mean that 70 percent of that 100 is related to paint exposure and 30 percent to another environmental factor or does it mean that 70 percent of the children that have elevated lead levels have it due to paint?

Ms. COX. 70 percent of the children with elevated blood lead levels, they are able to trace back that exposure to paint.

Mr. CASSIDY. So the 30 percent, is that those for whom no point source can be identified or those for whom another point source is identified?

Ms. COX. In general, when there is a child with an elevated blood lead level, there is a huge effort to identify the source. So the number of unidentified ones is really small.

Mr. CASSIDY. And so again, as I look at this concentration among recent immigrants, it suggests to me that recent immigrant status is a separate factor. I did my medical residency in Los Angeles and we used to see all these diseases from other countries in Los Angeles, very odd diseases that we wouldn't see in Washington, D.C., for example, even though this is also a place of immigrants. So I guess to what is the impact of immigrant status? Is there exposure to lead that is occurring south of the border that we are importing?

Ms. COX. I am not aware of any statistics about immigrant status and lead exposure. I do know that because the deteriorating paint is a factor, you know, living in older housing or housing——

Mr. CASSIDY. OK, I got that.

Ms. COX [continuing]. That is not well-maintained——

Mr. CASSIDY. The 30 percent of folks for whom paint is not a factor—and I should know this but I have been trying to track it down and I apologize—what percent of those have a point source identified and what are those point sources?

Ms. COX. The point sources tend to be lead in soil, lead in water, and then lead in various kinds of consumer products.

Mr. CASSIDY. What, for example?

Ms. COX. Examples of consumer products?

Mr. CASSIDY. With lead that have been identified as a risk for children.

Ms. COX. Jewelry, toys, there is some lead-containing makeup that has been a problem. There is lead-containing foodware that has been a problem——

Mr. CASSIDY. I assume that some of this, though, must be older stuff. I mean I can remember playing with lead when I was a kid. Obviously, my mother didn't care for me. I am assuming that much of what is now available with or without these regulations that lead is gone. Is that a fair statement? I am looking at all of you all now because I can only imagine that my pencil that I used to chew on in third grade probably had lead in it.

Ms. COX. The regulation of lead over the last 40 years has been, you know, one of the country's greatest public health successes. So removing lead from paint, removing lead from gasoline, and then removing lead from other consumer products has had a dramatic reduction in the number of children with elevated blood lead levels. The goal of CDC was to get that level to 0 by 2010. It hasn't quite happened but——

Mr. CASSIDY. And if it is true that immigrants are the cause of a lot of this, it will never happen. I just say that because our tuberculosis problem will never go to 0 as long as we have people immigrating from Mexico because it is just endemic there. I am just trying to understand to what degree can we attribute products, you know, toys for this as opposed to everything else? Thank you for your time. Thank you.

Mrs. BONO MACK. I thank the gentleman and that concludes the panel. And I would like to thank Ms. Cox and Ms. Millar, Mr. Vitrano, and Ms. Jones for your time and testimony today. And I am sure we will be working together in the future on refining this legislation.

Mr. BUTTERFIELD. Madam Chairman, may I be recognized before the panel leaves?

Mrs. BONO MACK. Yes.

Mr. BUTTERFIELD. Earlier Ms. Blackburn requested Ms. Cox, if she would furnish financial information for her nonprofit organization, and at first I had a little heartburn about that, but after I thought about it, it is an appropriate request. It goes to her credibility as a witness today. As a former judge I guess I should know that. But I was wondering if it would be appropriate to ask the other three witnesses if they would similarly furnish the sources of their revenue for their organizations that they represent.

Mrs. BONO MACK. Well, I will remind the gentleman that you can submit any question you would like to any witness and that you have 10 days to do so and remind the gentleman also that

Members of Congress are allowed to ask any question that they would like of any witness and again remind you that you have that prerogative to do that in writing to the witnesses. And with that, again, if the gentleman will yield back.

Mr. BUTTERFIELD. He will. Thank you.

Mrs. BONO MACK. I thank the panelists again and would call for the third panel if we can get seated. We are going to have votes shortly on the floor so we would love to get started and see how much progress we can make. So a short break and then we will roll into the third panel.

Thank you. That was a quick transition. Thank you, staff. So now the third panel, I would like to thank you all very much for being here. We have the final four witnesses. First up, we have Frederick Locker of Locker, Greenberg, and Brainin, P.C. Our next witness is Charles Samuels of Mintz, Levin, Cohn, Ferris, Glovsky, and Popeo, P.C. Also testifying will be Dan Marshall, Vice President of the Handmade Toy Alliance. And our fourth panelist today is Rachel Weintraub, Director of Product Safety and Senior Counsel for the Consumer Federation of America. Welcome everybody. You know the drill, 5 minutes, and you know where the lights are so we are going to begin, Mr. Samuels, with your 5 minutes. Thank you and welcome.

STATEMENTS OF CHARLES A. SAMUELS, MEMBER, MINTZ, LEVIN, COHN, FERRIS, GLOVSKY, AND POPEO, P.C.; FREDERICK LOCKER, LOCKER, GREENBERG, AND BRAININ, P.C.; DAN MARSHALL, VICE PRESIDENT, HANDMADE TOY ALLIANCE, AND CO-OWNER, PEAPODS NATURAL TOYS AND BABY CARE; AND RACHEL WEINTRAUB, DIRECTOR OF PRODUCT SAFETY AND SENIOR COUNSEL, CONSUMER FEDERATION OF AMERICA

STATEMENT OF CHARLES A. SAMUELS

Mr. SAMUELS. Thank you, Chair Bono Mack, and members of the subcommittee. Thank you for the opportunity to testify. I have the privilege of serving as general counsel of the Association of Home Appliance Manufacturers, as well as representing companies on product safety matters.

I support a fully resourced, focused, and effective Commission with the tools to protect Americans from unsafe products. I supported the revamping of the federal product safety laws and I respect the hardworking and dedicated officials at the Commission. Unfortunately, parts of the law are overreaching, over-prescription, and distort the Agency's mission to the detriment of consumers and industry. The discussion draft makes great strides towards remedying the imbalances and deficiencies in the current law without doing violence to the core public policies.

I will focus on the database provision. Technology should be used to disseminate good and easily accessible information to consumers about product safety. It makes no sense, however, for so much of the resources of the Commission to be invested in this effort unless it provides useful and accurate information to the extent feasible. We cannot expect perfection, but we now have a database that can

be manipulated for purposes other than that intended. Vague, useless, and incorrect information can be placed online. This not only harms manufacturers, retailers, and importers, but harms consumers who receive bad information and cannot focus on truly unsafe products. Discrete changes can be made to the law, which will greatly improve the operation, utility, and fairness of the program.

First, the intent of the law is that posted reports of harm will come from those who suffer the harm, their family and legal and medical representatives. The database should not be a platform for manufacturers, trade associations, trial lawyers, or consumer groups who are trying to make policy points or enhance their economic status.

I support the tighter definition of "consumers" to restrict it to the persons who actually suffer the harm related to the use of the product and their representatives. I also support revising the term "public safety entities" that make clear that you are referring to public safety officials.

The requirement that the Commission ascertain the location and availability of a product is important for the manufacturer to evaluate the complaint or for the Commission to look further at the allegations. The Commission also should know the identity of the person who allegedly was harmed.

A major deficiency of the database is the agency decision to publish the report regardless of whether a good faith, substantial claim of material inaccuracy has been submitted but has not been resolved within 10 days. This is unfair, a lack of due process and absolutely not what we should be expecting from our Federal Government. We have great freedom in this country to blog and publicly report bout almost anything without much legal restriction, but the government should show more prudence and responsibility.

The draft properly provides that if a manufacturer claims a material inaccuracy and the Commission determines that the claim is "potentially valid," the Commission must resolve that inaccuracy before posting by communicating with the reporter, investigating the incident, or providing the manufacturer a reasonable period of time to investigate. This does not need to be a lengthy process. It is likely the vast majority of database reports will receive little or no response and, at most, there will be a response suitable to be placed on the database along with the consumer report. But in those cases where a company has gone to the trouble to evaluate and provide proof that a report is materially inaccurate, that ought to be resolved before the report is posted. Once it is posted, pulling it from the database later is of very limited utility and great harm can be done.

The existing database also is deficient in that it allows reports which are so unspecific as to a particular model that the information is useless, even deceptive. I support the language in the discussion draft that a manufacturer may respond that the report is insufficient for determining which of its products are the basis of the complaint and that that must be determined before the complaint is posted.

The present 10-day limitation for companies to evaluate and respond to a report and the Commission to resolve any issues is extraordinarily short and unreasonable. Even well-organized compa-

nies will have difficulty dealing with this time frame. Therefore, I recommend that the 10 days be increased to at least 15 days, which will have no material impact on the timing of postings or the value of the database.

Also, there is an indication that the Commission may be limiting its review of material inaccuracy only to those situations where there has been a misidentification of the product. That is definitely not the extent of material inaccuracy. The Commission's regulations state that material inaccuracy includes all relevant facts which significantly impact a consumer's decision on whether to purchase a product and that includes causation.

Congress should make clear to the Commission that second- and third-hand reports do not constitute reports of harm eligible for the database. And simple consumer complaints of dissatisfaction about the quality or performance of the product which are not safety-related should not be posted.

I hope that these comments are helpful. I would be pleased to answer your questions. Thank you.

[The prepared statement of Mr. Samuels follows:]

Testimony of

Charles A. Samuels

Before the House Energy and Commerce Committee,

Subcommittee on Commerce, Manufacturing and Trade

Hearing on Draft Bill to Revise the

Consumer Product Safety Improvement Act

April 7, 2011

April 7, 2011

Summary

The CPSIA is an important contribution to consumer product safety. It has a number of defects, however, in that it is over-prescriptive, unduly restricts Commission discretion and lacks proportion and balance in dealing with safety risks. The draft legislation goes far in remedying these deficiencies while maintaining the strengthened and new authorities.

The concept of a publicly available database makes sense in the internet age as a tool for consumers. Unfortunately, this database, as prescribed by Congress and developed by the Commission, is not well designed to provide useful, accurate information to consumers or manufacturers. The existing database procedures do not comport with the original intent of the CPSIA which is that reports should only be posted from those who are harmed, their family or representatives or actual public safety agencies. Nor do the CPSC procedures require resolution of well-founded claims of material inaccuracy before reports are posted or require sufficient information such that manufacturers can respond to and evaluate the reports. The draft legislation resolution goes a long way to resolve these issues.

The legislation's tightening of the definitions of who may report on the database will improve and focus the database while retaining the important roles of consumer groups, trial attorneys, and industry representatives on CPSC matters. The legislation's requirements for resolution of claims of material inaccuracy before posting on the internet will add quality and fairness to the database, and the procedure for ascertaining specific models will enhance the value of the program to consumers, manufacturers and CPSC.

April 7, 2011

Testimony of
Charles A. Samuels
Before the House Energy and Commerce Committee,
Subcommittee on Commerce, Manufacturing and Trade
Hearing on Draft Bill to Revise the
Consumer Product Safety Improvement Act

Dear Chair Bono Mack and Members of the Subcommittee:

Thank you for the opportunity to testify on this important matter. Product safety regulation has been at the center of my professional interest for 25 years. I have the privilege of serving as General Counsel for the Association of Home Appliance Manufacturers and have represented many individual companies – manufacturers, retailers and importers -- before the CPSC and in Canada, Europe and elsewhere on product safety matters. Like my colleagues on this panel, I am a strong supporter of a fully resourced, focused and effective Commission which has the tools to protect Americans from unsafe products.

That is why I supported the revamping of the federal product safety laws which led to the Consumer Product Safety Improvement Act, and I believe that many of the provisions in the law were necessary and appropriate. The hard working and dedicated career and political officials at the Commission have been laboring to interpret and implement the new requirements.

Unfortunately, as well intentioned as it was, the legislation contains elements of over-reaching, over-prescription and distortion of the Agency's mission and obligations in ways that do not well serve consumers and are a great burden on regulated industry. There was a lack of appreciation that many of the issues that arose during the so-called "year of the recall" were mostly violations of existing law which simply needed full implementation and compliance.

The March 29, 2011 discussion draft makes great strides towards remedying the imbalances and deficiencies in the current law. Yet, the draft also does not do violence to the

core provisions of the law and, in my view, in some respects does not go far enough. Obviously, compromises and moderation are necessary to reach agreement and this draft is an excellent start. All the essential provisions of CPSIA would be intact and would be implemented as contemplated but in a more reasonable fashion. Like much legislation, 90 percent of the benefits of CPSIA are achieved with reasonable application of the core provisions and the more extreme or unreasonable provisions or interpretations of those provisions create great problems with little consumer benefit. This bill goes far to remedy that imbalance.

The Commission must remain capable of carrying out its mission and, where necessary, added authority and resources are appropriate. I support the expanded subpoena powers in Section 9 of the draft. Also, I support strengthening the provisions that make it unlawful for anyone, including industry, trial lawyers, consumers, or consumer groups, to make misrepresentations to the Commission regarding, but not limited to, the database. Our federal product safety system relies extensively on honesty and good faith reporting and where there are breaches of that obligation they should be penalized.

I will focus on the database provision. I support the policy that modern technology should be used to disseminate good and easily accessible information to consumers about product safety. Even under the law prior to CPSIA that type of database could have been created. In CPSIA, you instructed CPSC to build such a platform.

It makes no sense, however, for so much of the resources of this Commission to be invested in this effort unless it provides useful and quality information to the extent feasible. The database will never be perfect and it is unreasonable and not necessary that every piece of information placed on it be fully vetted beforehand by the CPSC. But, due to the over prescription in the legislation and some unfortunate interpretations by the Commission, we have

a database that can be manipulated for purposes other than that intended. Also, vague, useless and incorrect information can be placed on the database. This not only harms manufacturers, retailers and importers whose products are impugned but harms consumers who receive bad information and are not able to focus on those products where there are real safety problems.

Fortunately, discrete but significant changes can be made to the current law, as exemplified in this draft, which will greatly improve the operation, utility and fairness of the program while maintaining its essential characteristics to provide quick, useful information to consumers.

First, the spirit and even the letter of Section 6A(b) of the Consumer Product Safety Act requires that posted reports of harm should come from those who suffer harm or risk of harm, their family members, legal representatives and those in a position to directly know about the incident. Although they play huge roles in the activities of the CPSC, the database should not be a platform for the submissions of manufacturers, trade associations, trial lawyers or consumer groups who are trying to make policy or regulatory points, enhance their economic or competitive opportunities or advantages or simply provide third or fourth hand information. All of these folks, including myself, have important roles to play with the CPSC but not as reporters.

Therefore, in Section 8(a)(1)(A) of the draft bill, I support the tighter definition of "consumers" to restrict it to the persons who actually suffer harm or risk of harm related to the use of the product, their next of kin or members of their household, legal representatives or another person expressly authorized by any such person. The latter could be an advocacy group or anyone else.

I also support striking the term "public safety entities" which, unfortunately, the Commission has misconstrued, and making clear that you are restricting the reports to police,

fire, ambulance, emergency services, law enforcement and related public safety officials. Section 8(a)(1)(B) of the draft bill. Many of us consider ourselves to be representatives and advocates of public safety but this provision ought to be focused on governmental and health authorities and the like.

These revisions do not mean that the interest and information of competitors, trial lawyers and consumer groups are or should be irrelevant to the Commission. Certainly, those are sources of information that the Commission should gather and evaluate when considering whether there should be regulatory action or if there has been a violation of the law, a substantial product hazard or a defect, but such information, which is often indirect and biased, should not be presented to the public through the database. It, of course, may be disclosable through FOIA. Trial lawyers and consumer groups have sufficient means to present their views and do not need a government platform.

The requirement that the Commission attempt to ascertain from the reporter the location and availability of the product is an important requirement. Section 8(a)(2)(A) of the draft bill. For a manufacturer or retailer to attempt to respond and evaluate the complaint, or for the Commission to look further at the alleged incident, such information can be critical. We should all want the database to be used by manufacturers and retailers to consider whether there is a situation that needs to be remedied. Similarly, if the report is made by someone other than the victim, then the CPSC should know who the actual person harmed is. This is critical for follow up by the Commission and, where the identification is released, for follow up by retailers and manufacturers.

One of the major but unnecessary deficiencies of the database, as it has been implemented by the Commission, is the erroneous agency decision to publish the report

regardless of whether a good faith, substantial claim of material inaccuracy has been submitted but it has not been resolved within 10 days. This is unfair, a lack of due process and absolutely not what we should be expecting from our federal government. We have great freedom in this country to blog and publicly report about almost anything without much legal restriction, but the government should show more prudence and responsibility.

The draft properly provides that if a manufacturer notifies the Commission of a material inaccuracy in a report and the Commission determines that the claim is "potentially valid," the Commission must resolve that inaccuracy before posting. Section 8(b)(2)(B)(ii) of the draft bill. The Commission may communicate with the reporter, investigate the incident or provide the manufacturer a reasonable period of time to investigate and resolve the material inaccuracy claim. This should not be and does not need to be an endless process. It is highly likely, as was reported during the soft launch/pilot, that the vast majority of database reports will receive little or no response from the manufacturer and at most there will be a response suitable to be placed on the database along with the consumer report. But, in those cases where a company has gone to the effort to evaluate and provide positive proof that a report is materially inaccurate, that ought to be resolved before the report is posted. Once a posting is made, pulling it from the database later is of limited value given the realities of how the internet works and how it may already have affected consumers.

The database as now implemented also is significantly deficient in that it allows consumers to report allegations about products which do not specify a particular model of a product such that the information is useless, even deceptive, to the public and impossible for companies to evaluate. Under their corporate names and brands, many manufacturers and retailers have multiple -- dozens -- of models, which can be quite different, often manufactured

in different places. A database report that Brand A caused harm, when there may be many models and types of Brand A, makes meaningful response by the manufacturers, even putting explanatory material on the database, and internal evaluation often impossible. Therefore, I support the language in the discussion draft that a manufacturer may respond that the report is insufficient for determining which of the manufacturer's products are the basis of the complaint. Section 8(b)(1)(i) of the draft bill. But, a company must provide information to assist the person submitting the report to sufficiently identify or provide an adequate description of the report. If manufacturers sufficiently document this issue then the Commission should be able to work with the consumer to provide that information before the posting is made. Submitters should be required to provide a serial or model number where available and tracking label information for children's products.

I am confident that under these provisions a very high percentage of the reports still will go on the database very quickly, some with explanatory information from the companies. A small percentage -- where the product has been misidentified or where there is proof that the product did not or could not have caused the harm -- should be resolved in an expeditious way by the Commission which is experienced to do so. There should be a high but not impossible hurdle for companies to demonstrate why material should not be posted.

In this regard, the present 10-day limitation for companies to evaluate and respond to a report and for the Commission to resolve any issues is extraordinarily short and unreasonable. Even well-organized companies will have difficulty dealing with some of these reports, particularly where they are fragmentary and where no consumer identification is provided. I recommend that the ten days be increased to 15 days which will have no material impact on the

timing of postings or value of the database to consumers but provide some means or opportunity for companies to consider the information.

Also, there is an unfortunate and inappropriate indication from some at the Commission that, as a practical matter, the Commission is limiting its review of material inaccuracy in a narrow and cramped way to cover only those cases where there has been a misidentification of the product -- i.e., the Company does not make the type of product or the product related to the incident was another brand. Those cases are very important and will be often the simplest to resolve but that is definitely not the limit of material inaccuracy. The Commission's own regulations indicate an understanding that material inaccuracy includes all relevant facts that might significantly impact a consumer's decision on whether to purchase a product and therefore go to issues of causation. According to the CPSC, "materially inaccurate information is a report of harm" with "information that is false or misleading, and which is so substantial and important as to affect a reasonable consumer's decision making about the product."16 C.F.R. §1102.26(a).

It will often be impossible for the Commission to resolve causation issues and make a determination whether there is a material inaccuracy, but sometimes it will be clear and there will be sufficient proof that the product could not have caused the incident or the risk of harm. In those cases, inaccurate information should not be placed on a public database. Again, even if not in the public database, the report will be in the CPSC database for internal evaluative purposes which can lead to an investigation.

It does not require an amendment of the law, but Congress should make clear to the Commission that second and third hand reports do not constitute reports of harm eligible for the database. Also, consumer complaints of dissatisfaction about the quality or performance of the

product which do not relate to a report of harm should not be posted. These are concerning indications in these regards from the early database activities.

I hope that these comments are helpful, and I would be pleased to answer your questions. This important corrective legislation will rebalance the law while fully maintaining the benefits and protections to consumers.

Mrs. BONO MACK. Thank you. Briefly, we are going to go through Mr. Locker and then we are going to run to vote. So 5 minutes, Mr. Locker, please.

STATEMENT OF FREDERICK LOCKER

Mr. LOCKER. OK. Thank you. And I will try to make sure you don't waggle the gavel.

Chairman Bono Mack, Vice Chairman Butterfield, members of the subcommittee, thank you for the opportunity to appear before you on this important subject matter of practical, commonsense solutions—and I emphasize "solutions"—to unintended consequences involved in the implementation of the Consumer Product Safety Improvement Act of 2008, or as it has been come to be known as CPSIA.

Now, our firm works as safety counsel to the Craft and Hobby Association, Toy Industry Association, Juvenile Product Manufacturers Association, Halloween Industry Association, apparel makers, publishers and retailers. And for better and for worse, we have had a lot of experience in the last 2½ years with the problems with implementation of the law.

Now, we have been involved in developing product safety standards over many decades and we have also worked in collaboration with many foundations and consumer organizations to advocate the need for uniform product safety standards and initiatives, both in the United States and globally. We keenly recognize that sometimes in this rush to regulate, attention may be focused on relatively small risks associated with products while some very big risks remain unappreciated and unaddressed. In a world where perception is reality, where misinformation often drives perception, and where new, scary, and uncertain hazards can receive enormous amounts of attention very quickly, it is important to understand context for managing children's risks and for regulating them.

We understand, however, that there is no more important theme than protecting our population of consumers and in particular our children. As much work as we all do, there is always room for improvement in this regard. We may not always agree with everyone appearing before you today on how to achieve our common goals, but we always stand willing, ready, and able to work with everyone for the betterment of children's lives.

Now, in the past appearances before this committee, we have supported the legislative initiatives, including the concepts embodied in CPSIA. However, to the extent that implementation of provisions have resulted in regulations that depart from sensible risk-based decision-making, it has become clear to all involved on both sides of the aisle that Congress needs to act to restore a commonsense regulatory framework. The CPSC has strained under the burden, but despite admonitions from Congress that the agency was empowered with discretion to implement practical commonsense regulations on at least five or six separate occasions in the past, the Commission in a bipartisan fashion has readily acknowledged, as it has today, that its discretion has been limited without statutory changes.

CPSIA adopted an unduly prescriptive regime and as often happens, Congress can act with a sledgehammer instead of a scalpel

when trying to deal with issues. CPSIA adopted a set of absolute total limits on lead and phthalates. This House body, I note, didn't even consider the phthalate legislation that was grafted in the Senate and in conference. These wholesale limits were coupled with an exemption process that we all had hoped would work better but had proved to be impractical for lead and phthalates regulation.

In effect as a result and direct result of that, the stream of commerce and business suffered significantly as the imposition of these requirements was further deemed to apply in a retroactive manner to any previously produced goods entered into commerce when the laws and step-down levels went into effect. These confusing and burdensome testing schemes—which have yet to be fully and clearly enunciated as we sit here today—have resulted in additional marketplace confusion and cost.

So let me share just a few of the comments and proposals on the law that is before us today. Our comments are for the record—but in terms of the budget, it is clear that an era of restrained budgets and limited resources, the CPSC will need to allocate funds based upon risk/hazard analysis and sound scientific principles. In terms of lead, Congress recognized this approach when they adopted as a regulatory requirement, for example, the toy safety standard ASTM F–963 to which Congressman Schakowsky referenced. That standard, by the way, is a soluble migratable standard. It is not a total limits standard and has proved to be remarkably effective both in the United States—which is why Congress adopted it—Europe, and the rest of the world.

Exemptions for certain materials have been adopted by the CPSC but they have not gone far enough. So we favor the types of processes that have been adopted and proposed in the draft resolution in phthalates. In terms of phthalates, they need to have an inaccessibility recognized. There needs to be action on the Chronic Hazard Advisory Panel when they come to conclusions that action has to be quick.

[The prepared statement of Mr. Locker follows:]

STATEMENT OF

FREDERICK LOCKER

BEFORE THE SUBCOMMITTEE ON COMMERCE, MANUFACTURING AND TRADE

COMMITTEE ON ENERGY AND COMMERCE

U.S. HOUSE OF REPRESENTATIVES

PROTECTING CONSUMERS:
CURRENT ISSUES RELATED TO COMMON SENSE PRACTICAL PRODUCT SAFETY REGULATIONS & CPSIA REFORM

April 7, 2011

Frederick Locker
Locker Greenberg & Brainin PC
420 Fifth Avenue
New York NY 10018
Tel: 212-391-5200 XT 16
Fax: 212-391-2035
Email: fblocker@lockerlaw.com

Chairman Bono Mack, Vice Chairman Butterfield and members of the Subcommittee, thank you for the opportunity to provide comments about the important subject of practical common sense solutions to unintended consequences involved in the implementation of the Consumer Product Safety Improvement Act of 2008 (CPSIA) (Pub. L. No. 110-314). Our firm works as product safety counsel to the Craft& Hobby Association (CHA), Toy Industry Association (TIA), Juvenile Product Manufacturers Association (JPMA), Halloween Industry Association (HIA), Apparel makers, Publishers and Retailers of an array of children's products. I have been involved with developing product safety standards over many decades through relationships with the National Safety Council (NSC), National Bureau of Standards (NBS), American National Standards Institute (ANSI), ASTM International and International Organization for Standardization (ISO). We have also worked in collaboration with many foundations and consumer organizations and others to advocate the need for uniform product safety initiatives in the U.S. and internationally.

We keenly recognize that sometimes in the rush to regulate attention may be focused on relatively small risks associated with children's products while some very big risks remain underappreciated and unaddressed. In a world where perception is reality, where misinformation often drives perception, and where new, scary and uncertain hazards receive widespread attention, it is no wonder that policy makers can lack context for understanding and managing children's risks. Unfortunately, the net result is that we often collectively waste scarce financial resources at the expense of allocating them efficiently to make children's lives measurably safer. Further, this perpetuates a lack of coordination between groups that are all arguably committed

to helping children; focuses on individual issues and agendas instead of children themselves; and competition rather than cooperation for the resources to truly protect children. There is no more important theme than protecting our children. As much work as we all do, there is always room for improvement. We may not always agree with everyone appearing before you today on how to achieve our common goals, but we always stand willing and committed to work for the betterment of children's lives.

SUMMARY

In past appearances before this committee we have supported important legislative initiatives to expand the authority of the Consumer Product Safety Commission (CPSC) to effectively pursue it's mission of consumer protection. Along these lines, we believe that there are ways to make the Commission more effective and at the same time more efficient. Allow me to share a few proposals on ways the Commission can increase its effectiveness in protecting consumers while minimizing burdens on the manufacturing sector of this country.

CPSC's mission is to protect children and families against an unreasonable risk of injury and death from more than 15,000 types of consumer products from a wide range of product hazards. Their work is vital in that it addresses consumer product hazards through a framework of mandatory product safety standards; engagement in the voluntary or consensus standard-setting process; compilation of consumer injury data; issuance of safety guidelines; implementation of information and education programs in an effort to proactively avoid injuries; and product recalls and corrective actions when necessary. The agency is operating with a vastly improved budget as a result of the CPSIA. However, in an era of restrained budgets and limited resources CPSC will need to allocate funds based upon better risk hazard analysis and sound

scientific principles. Allowing them the same discretion afforded other agencies to do so, based upon real world public health risks, would be a step in the right direction. Statutory changes that permit the agency greater discretion as regards regulation of lead and phthalate exposure would allow the Commission to address unintended consequences of mandates imposed under the CPSIA. Adoption of consensus standards and deferral to existing ASTM product safety standard setting processes can efficiently result in flexible regulatory requirements that can more readily be adjusted based upon hazard data than historically stagnant standalone mandatory federal regulations. Congress should clearly provide for only prospective application of new rules and regulations under CPSIA.To assure that American Brands have access to foreign markets there will continue to be a need to support of increased coordination with other countries regarding alignment of standards with better inspection and enforcement coordination. In a global economy we can ill afford disparate requirements without reasonable basis or foundation. Similarly Congress should assure uniform standards apply nationwide. U.S. manufacturers in the consumer product industry presently face increasing global competition that is more intense than ever before. In such an economic environment, U.S. manufacturers (small and large) should not be disadvantaged by an unnecessarily intrusive and inefficient domestic and international regulatory regime.[1]

We supported many of the concepts reflected in the CPSIA to the extent effective good manufacturing standards and practices are recognized. However, to the extent that a myopic

---

[1] Congress intended this when it established a requirement that only identical standards uniformly apply to the same product risks regulated under the Sec. 18 of the Federal Hazardous Substances Act ("FHSA" 15 U.S.C. § 1261n) and Sec. 26 of the Consumer Product safety Act ("CPSA" 15 U.S.C. § 2075). Even the European Union proposed that trade between EU countries would be boosted by making it more difficult for member states to block imports of specific products on the basis that they do not meet a national product safety standard. *Procedures Relating to the Application of Certain National Technical Rules to Products Lawfully Marketed in Another Member State and Repealing Decision 3052/95/EC*.

implementation of provisions have resulted in regulations that depart from sensible risk-based decision-making Congress needs to act to restore a common sense regulatory framework. CPSC has strained under the burden of unrealistic timelines for implementation of imposed regulations.

Despite admonitions from Congress that the agency was empowered with discretion to implement practical regulations, the Commission in a bi-partisan fashion has determined that it's discretion is limited without statutory changes[2]. CPSIA adopted an unduly prescriptive scheme of absolute limits on total lead and phthalates resulting in standards inconsistent with risk-based measures commonly adopted by regulatory agencies. These wholesale limits were coupled with an exemption process that has proven to be impracical for lead and phthalates regulation. The stream of commerce suffered significantly as the imposition of such requirements was deemed to apply in a retroactive manner to any previously produced goods entered into commerce. Confusing, burdensome testing schemes (yet to be fully and clearly established as we sit here today) have resulted in additional marketplace confusion and cost. Notwithstanding a dedicated effort the Commission, continues to strain under the requirements imposed upon it. An efficient U.S. marketplace favors clear regulations and test methods and abhors chaos. Unfortunately, two and half years after passage legislation that bars the CPSC from making common sense decisions about protecting the public has had the unintended effect of banning safe products while imposing needless, costly burdens on small businesses. We appreciate that this Committee has elected to respond by drafting legislation that affords the agency the discretion that it requires to implement regulations that provide children protection from actual harm but that accords

[2] For example see STATEMENT OF COMMISSIONER NANCY NORDON THE PROPOSED AMENDMENT ENTITLED*CONSUMER PRODUCT SAFETY ENHANCEMENT ACT OF 2010* March 18, 2010; STATEMENT ON LEAD REGULATION UNDER THE CPSIA COMMISSIONER ROBERT ADLER January 22, 2010. Both statements make it clear that Congressional action is required to adjust the CPSIA.

responsible businesses the opportunity to distribute safe products without being unreasonably overburdened.

Prospective Requirements. We support clarifications to CPSIA to assure that limits apply only prospectively to products manufactured after the effective date of any regulation implemented. In the absence of a clear and unmistakable congressional intent to apply provisions of the CPSIA retroactively to products previously manufactured and placed in the stream of commerce, there is a strong presumption that "retroactivity is not favored in the law," and that, as a result, "congressional enactments and administrative rules will not be construed to have retroactive effect unless their language requires this result.[3]" Unfortunately, due to imposition of requirements on *any* products in commerce, regardless of when produced or imported, the provisions have been applied in a retroactive fashion that forced the destruction of hundreds of millions of dollars of safe goods, as they were swept off shelves, nothwithstanding the Commission's issuance of repeated stays of enforcement. This approach could also provide badly needed relief for charitable organizations and thrift stores.

We respectfully request that new standards developed under CPSIA apply *"only to product manufactured and introduced into interstate commerce after their effective date"*. In recent testimony before this committee the CPSC Chairman noted that all five Commissioners support changes to ensure prospective application of rules and regulations promulgated under CPSIA.We hope Congress will heed their call.

USI Film Products*, 511 U.S. 244 (1994); *Plaut v. Spendthrift Farm, Inc.*, 514 U.S. 211, 237 (1995); *INS v. St. Cyr*, 533 U.S. 289, 316 (2001); and *Martin v. Hadix*, 527 U.S. 343 (1999). Compare: National Resources Defense Council, Inc. v. CPSC., 597 F.Supp.2d 370 (S.D.N.Y. 2009), requiring Congressional clarification OF CPSIA to assure prospective application.

Lead Limits. We have always favored risk-based regulation of potential hazard posed by real world exposure to a substance. Congress recognized this approach under CPSIA Section 106 when it it adopted as a regulatory requirement *ASTM F-963 Standard Consumer Safety Specification for Toy Safety*, which in turn regulates toxic heavy metals in toys from paints and similar surface coating based upon soluble extractable limits. This approach is currently embodied in the regulatory approaches under the Commissions administered FHSA and by other agencies, such as FDA and EPA. These are based upon risk-based approaches to managing potential hazardous lead exposure in an alternative fashion from CPSIA's Section 101 banning approach and duly consider reasonably foreseeable handling, use, and routes of exposure from products. With imposition of total content limits on lead in substrate, Congress departed from well-established scientific based models related to actual risk of exposure. Exacerbating this approach, CPSIA language failed to provide the safety valve needed to assure the Commission with reasonable discretion to provide for exceptions to rigid requirements[4]. This resulted in positions that seem removed from common sense, when products which do not result in an appreciable risk of exposure are never-the-less banned. Although the CPSIA purported to allow for exemptions the contraining language used in CPSIA Section 101(b)(1)[5] created a legal nullity as an exception based upon such requirement became impossible to obtain in practice when reasonably likely exposure with adverse health consequences was not a qualifier for exemption.

[4] In relation to "safety valves" for example brass tire valves which are intended to be durable and corrosion resistant can't be used on children's products, even though there is no risk of hazardous lead exposure to a child.

[5] The Commission may, by regulation, exclude a specific product or material from the [banned lead levels] if the Commission, after notice and a hearing, determines on the basis of the best-available objective, peer-reviewed, scientific evidence that lead in such product or material will neither –
(A) result in the absorption of ***any*** lead into the human body, taking into account normal and reasonably foreseeable use and abuse of such product by a child, including swallowing, mouthing, breaking, or other children's activities, and the aging of the product; nor (B) have any other adverse impact on public health or safety.

Proposed legislation under consideration by this committee is a needed improvement, by providing time prior to further reduction limits and exemptions for certain metal materials certain metals (steel, copper and aluminum alloys) and materials that pose a *de minimis* risk, provided they are not small parts (as defined by widely used criteria under *16 CFR 1501, et seq*). Any product or material that does not result in anticipated adverse health effects based upon a reasonably likely exposure route should be exempt (as applicable under FHSA protocols already administered by the agency). The CPSC can establish a methodology to estimate the amount of lead a child would likely ingest, distinguishing between parts and substabnces that are reasonably likely to be placed in the mouth and those that cannot. A reasonable expansion in the amount of discretion granted to the Commission to provide exemptions from the lead bans in the CPSIA and allowance of time to *get it right* is justified.

We have long supported the limitations on lead in pain and note that the marketplace has met with great success in being able to achieve conformance to reduced limits tp 90 ppm under 16 CFR 1303, et seq.

Phthalates. The Commission should be directed and permitted to exempt from the phthalates limits under Section 108 of the CPSIA products or materials that are not reasonably likely to result in hazardous exposure. The proposed bill includes a much-needed exception for inaccessible component parts that contain phthalates, similar to the inaccessible component parts exemption from the lead limits, and allows the Commission to grant an exclusion when it determines that compliance with the limits is not necessary to protect children's health. We believe they have this authority, but clarification is needed to assure that they excercise it in a manner that reduces unreasonable test burdens on manufacturers. In practice the failure to make such requiremnet clear has resulted in needless costly phthalate testing of materials and parts to

which there exists no reasonble liklihood of exposure. The ban should be limited ban to accessible, ingestible parts and CPSC sholud be provided explicit authority to exempt certain products and materials from burdensome testing when it determines determines that compliance with the limit is simply not necessary to protect children's health. The definition of toys under the Section should be aligned with Section 106 requirements and scope definitions. Finally after requiring CPSC to expend funds to convene another Chronic Hazards Advisory Panel to assess health risks from exposure to restricted phthalates, the Commission should be required to act upon recommendations in a finite time or the bans should be subject to recission.

ASTM Standards. Adoption of consensus standards and deferral to existing ASTM product safety standard setting processes can efficiently result in flexible regulatory requirements that can more readily be adjusted based upon hazard data than historically stagnant standalone mandatory federal regulations. These standards are the bulwark of our national and even international safety system, and the Commission plays an important role in providing comments and proposals.[6] We believe the Commission can better manage staff input to standards organizations to prevent proposals which lack technical merit or otherwise cannot be justified as federal standards from incorporation in ASTM standards. We support greater deferral and adoption of effective ASTM standards for durable infant products in a manner similar to Section 106 of the act[7]. We also support updates to CPSIA Section 104 durable nursery product

---

[6] CPSC has worked with stakeholders to develop effective consensus standards completing approximately 10 times as many voluntary standards as mandatory standards.

[7] An excellent example is their work with industry to revise the ASTM consensus baby walker safety standard to address injuries from stair falls. There has been a decrease in walker injuries of over 84 percent since 1995, likely due in large part to the effectiveness of such standard requirements. The commission projected societal costs decreased by about $600 million annually from this one action. Similarly, there was an 89 percent reduction in crib-related deaths from an estimated 200 in 1973 and an 82 percent reduction in poisoning deaths of children younger than 5 from drugs and household chemicals from 216 in 1972. Recent collaborative efforts have also resulted in further enhanced crib safety regulations.

standards to provide relief for licensed daycare centers that meet appropriate rules related to inspection and operation of their facilities. In general we support the existing definitions that limit the definition of consumer products under the CPSA, so as not to require the Commission to expend scarce resources regulating products subject to the jurisdiction of other agencies such as the FDA and NHTSA.

Reduce burdensome testing requirements. In our experience manufacturer and importers take their obligation obligation to meet applicable standards seriously. The consequences of failure to do so have greatly increased since passage of the CPSIA. Most U.S. based businesses take extraordinary measures to assure compliance of they face recalls, reputational risk, harm to their brands and relationships with customers and possible penalties for non-compliance. We have often noted that testing plays an important and ongoing role in assuring compliance compliance. However, good manufacturing and procurement practices, adherence to quality assurance procedure in production and viglence in qualification of material sourcing play an even greater role in assuring the safety and integrity of consumer products. Manufacturers producing products test them in production and then sample production lots continuously prior to shipping them. Major retailers duplicate this process on product orders. Most U.S based manufacturers and brand owners have a vested interest in developing and maintaining reputations as "safety conscious" companies.

We agree with other witnesses that micromanaging the test process by statute is not the best way to achieve the most cost-effective compliance, nor does it allow companies to rely on other compliance strategies to assure compliance. The draft bill offers important modifications to the reduce burdensome CPSIA testing scheme, recognizing that a system of compliance must

be predicated on the specifics of the product category and supply chain. CPSC should determine that accredited third party laboratory testing provides sufficient added safety benefits to justify the cost in lieu of materials that could be subject to certifications of complaince based upon independent testing. Additional criteria related to other test burdens when impracticable based upon laboratory capacity and logistics involving material availability within supply chains should be a consideration in establishing product or material specific test requirements or alternate test regimes. Alternate test rules as contenmplated under CPSIA should be permitted as optional for products and must be flexible based upon product categories and should permit representative sample and composite testing when appropriate. Additional efforts should be required to recognize and "safe harbor" best paretices already used in the supply chain.
We have filed extensive comments with CPSC in support of permissable reliance on supplier certifications as a mechanism to establish a reasonable basis of compliance with substance content limits for both sub-components and raw materials. Manufacturer certifications are a proven legal method to establish compliance under many laws, including but not limited to use of FDA complaint materials, the toxicological certification under the Labeling of Hazardous Art Materials Act (LHAMA), and continuing guarantees under the Flammable Fabrics Act (FFA) already administered by the agency.

Database Accuracy. Other witnesses may provided more extensive comments on database issues. However in order to assure the integrity of it's Database CPSC should continue to assure that only authorized reports are filed, duplicative reports eliminated and reports unrelated to actual or potential injury are duly eliminated , as required. Congress should assure that the CPSC maintain, and not disclaims, it's responsibility to assure that potentially valid claims of

"materially inaccuracy" are investigated and resolved in a reasonable time prior to posting in the database. As was noted at this committees recent hearing improvements should be required as to the sufficiency of data (ie. make, model number, mandated tracking identifiers already required by law on children's products), in order to provide more meaningful data. Finally, CPSC should act to clarify that brand licensors to the extent they are niot manufacturers, importers orf record or private labelers of products distributed by them are not misclassified as such in the database. .

CPSC Needs To Allocate Resources Based Upon Hazard Data In spite of remarkable progress that dramatically improved the length and quality of children's lives in the U.S. over the past century, today's children still face significant, real risks. For example, often-avoidable unintentional injuries take the lives of more than 1 out of every 10,000 children in the U.S. annually. That may not sound like much, but this includes over 150 infants that die before their first birthday in motor vehicle accidents and nearly 50 who drown in bathrooms[8]. This is why we would support dynamic new partnerships between stakeholders and the Commission to promote safety and safe consumer practices. Consumer information and education does not substitute for the essential responsibility of manufacturers to provide safe products, but it can help with a large percentage of accidents due to improper or irresponsible conduct or lack of supervision of minors. The Commission is fully authorized to embark on such programs, but encouragement from Congress should be provided

[8] Kimberly Thompson, M.S. SCP, Assoc. Professor of Risk Analysis and Decision Science, Children's Hospital Boston, Harvard Medical School Co-Founder/Director of Research Center on Media and Child Health; Director HSPH Kids Risk Project.

Thank you again for the opportunity to provide these comments. We appreciate the efforts of this committee to improve the CPSIA and expand the discretion afforded the Commission as it seeks to develop practical efficient and effective regulations to enhance children's product safety.

Mrs. BONO MACK. That is the red light and we have to run to the floor for a vote. And we will recess and reconvene immediately following the last vote in the series.

Mr. LOCKER. OK. Sorry.

Mrs. BONO MACK. I don't have the time. I tried last time and I was off by 20 minutes. So immediately following the last vote, we will return. We have a five-vote series.

Mr. LOCKER. Thank you.

[Recess.]

Mrs. BONO MACK. We are ready to begin. So we left off with Mr. Marshall and so we will recognize you for your 5 minutes.

STATEMENT OF DAN MARSHALL

Mr. MARSHALL. Thank you very much. Hello. My name is Dan Marshall. I am the founder and vice president of the Handmade Toy Alliance. The HTA represents 644 small businesses affected by the unintended consequences of the Consumer Product Safety Improvement Act. I would like to mention also that we receive no outside funding whatsoever. We are funded entirely by our members and some small donations that folks have made along the way. We are kind of a shoestring operation.

My wife and I own Peapods Natural Toy Store in St. Paul, Minnesota. I am here today with my daughter Abigail and fellow HTA Board members Rob Wilson of Challenge and Fun in Massachusetts and Randy Hertzler of euroSource in Pennsylvania.

The HTA began in November of 2008 after I began to understand how the newly passed CPSIA will decimate the small-batch manufacturers who supply our store. Since then, I have been working with hundreds of other small business owners to save small-batch manufacturers from regulatory burdens of the CPSIA, the greatest of which is the cost of mandated third-party testing. These fixed costs, which are easily bourn by mass-market manufacturers, who make tens of thousands of units at a time, are simply impossible for small businesses that make toys, children's clothing and accessories in batches of a few dozen at a time, often in home-based studios.

These required tests are not limited to lead testing. Toys, for example, will be subject to mandatory ASTM F–963 testing, which requires the destruction of multiple units of each toy. The CPSC's current schedule would mandate ASTM testing as soon as this October. Unless the CPSIA is reformed, hundreds of small American toymakers will not survive that date.

Unlike similar product safety legislation such as the Food Safety Modernization Act, FDA food labeling rules, or California's Proposition 65, the CPSIA makes no allowances whatsoever for small businesses, nor does it allow the CPSC any discretion in how it applies third-party testing requirements to various types of products. Bicycles, books, hand-knit sweaters, and wooden toy cars are all tested the same.

As a result, the CPSIA, as it stands now, is basically unenforceable. Key provisions have been stayed numerous times. The CPSC is slowly being transformed from a public safety guardian into an enforcer of procedures and technicalities dictated by Congress at huge cost. Congressional action has dramatically undermined the

CPSC, an agency which has effectively protected the American public for almost 40 years.

Meanwhile, we have watched numerous trustworthy businesses fold because of the CPSIA. Untold others have decided not to pursue their dreams as toymakers or crafters. We have even begun to see secondary effects such as the end of Mothering Magazine, which closed this February after 35 years, citing reduced ad revenues due to the CPSIA's impact on their advertisers. If the CPSIA is not amended, hundreds more small family businesses will perish for no good reason.

Thanks to the work of this committee, we have a way forward. Our alliance endorses the draft amendment because of the relief it provides to our members. This bill requires either an exemption from third-party testing or alternate testing procedures, such as XRF screening for lead in substrates, for products that are produced in small quantities. This is exactly what we have been asking for since the formation of our organization. Small-batch manufacturers would be given a safety valve which was originally left out of the CPSIA.

We desire a thoughtful and measured reform worthy of meaningful bipartisan discussions. These issues deserve a full hearing to ensure that a high degree of consumer protection is maintained. We do not wish to create loopholes that would benefit the types of irresponsible companies that created the toy safety scare in the first place.

We urge you to reach out to your colleagues in the Senate to reach a bipartisan agreement. The CPSIA was the product of a strong bipartisan effort in 2008 and its reform requires the same effort. We believe this discussion draft is a suitable foundation for that discussion. We urge both Houses of Congress to set aside differences and find a way to see this reform process through. Our family businesses are watching the process closely and we are depending on you.

In conclusion, on behalf of our members, I would like to thank this committee for addressing this important issue and urge you to quickly pass meaningful reform of the CPSIA. Thank you.

[The prepared statement of Mr. Marshall follows:]

Hello. My name is Dan Marshall. I am the Founder and Vice President of the Handmade Toy Alliance. The HTA represents 644 small businesses affected by the unintended consequences of the Consumer Product Safety Improvement Act (CPSIA) of 2008.

My wife Millie and I own Peapods Natural Toy Store in St. Paul, Minnesota. I am here today with my daughter Abigail and fellow HTA Board members Rob Wilson of Challenge and Fun in Massachusetts and Randy Hertzler of euroSource in Pennsylvania.

The HTA began in November of 2008, after I began to understand how the newly-passed CPSIA would decimate the small batch manufacturers who supply our store. Since then, I've been working with hundreds of other small business owners to save small batch manufacturers from regulatory burdens of the CPSIA, the greatest of which is the cost of mandated third party testing. These fixed costs, which are easily bourn by mass market manufacturers who make tens of thousands of units at a time, are simply impossible for small businesses that make toys, children's clothing and accessories in batches of a few dozen at a time, often in home-based studios.

These required tests are not limited to lead content testing. Toys, for example, will be subject to mandatory ASTM F963 testing, which requires the destruction of multiple units of each toy. The CPSC's current schedule would mandate ASTM testing as soon as this October. Unless the CPSIA is reformed, hundreds of small American toymakers will not survive that date.

Unlike similar product safety legislation such as The Food Safety Modernization Act, FDA food labeling rules, or California's Proposition 65, the CPSIA makes no allowances whatsoever for small businesses. Nor does it allow the CPSC any discretion in how it applies third party testing requirements to various types of products. Bicycles, books, hand-knit sweaters, and wooden toy cars are all treated the same.

As a result, the CPSIA as it stands is basically unenforceable. Key provisions have been stayed numerous times. The CPSC is slowly being transformed from public safety guardian into an enforcer of procedures and technicalities dictated by Congress at huge cost. Congressional action has dramatically undermined the CPSC, an agency which has effectively protected the American public for almost 40 years.

Meanwhile, we've watched numerous trustworthy businesses fold because of the CPSIA. Untold others have decided not to pursue their dreams as toymakers or crafters. We've even begun to see secondary effects such as the end of Mothering Magazine, which closed in February after 35 years, citing reduced ad revenues due to the CPSIA's impact on their advertisers.

If the CPSIA is not amended, hundreds more small family businesses will perish for no good reason.

Thanks to the work of this committee, we have a way forward. Our alliance endorses the draft amendment because of the relief it provides for our members. This bill requires either an exemption from third party testing or alternate testing procedures, such as XRF screening for lead in substrates, for products that are produced in small quantities. This is exactly what we have been asking for since the formation of our organization. Small batch manufacturers would be given a safety valve which was originally left out of the CPSIA.

We desire a thoughtful and measured reform worthy of meaningful bipartisan discussions. These issues deserve a full hearing to ensure that a high degree of consumer protection is maintained. We do not wish to create loopholes that would benefit the types of irresponsible companies that created the toy safety scare in the first place.

We urge you to reach out to your colleagues in the Senate to reach a bipartisan agreement. The CPSIA was the product of a strong bipartisan effort in 2008 and its reform requires the same effort. We believe this discussion draft is a suitable foundation for that discussion. We urge both houses of congress to set aside differences and find a way to see this reform process through. Our family businesses are watching the process closely. We're depending on you.

In conclusion, on behalf of our members, I would like to thank this committee for addressing this important issue and urge you to quickly pass meaningful reform of the CPSIA. Thank you.

Mrs. BONO MACK. Thank you very much. Ms. Weintraub, your 5 minutes.

STATEMENT OF RACHEL WEINTRAUB

Ms. WEINTRAUB. Chairman Bono Mack, Ranking Member Butterfield, Representative Schakowsky, I am Rachel Weintraub, Director of Product Safety and Senior Counsel for Consumer Federation of America. I offer this testimony on behalf of CFA as well as Consumers Union, Kids In Danger, National Research Center for Women and Families, Union of Concerned Scientists, and the U.S. Public Interest Research Group. I thank you for inviting me to testify today.

The CPSIA institutes the most significant improvements to the Consumer Product Safety Commission since the Agency was established. The millions of recalls of toys for excessive lead and tiny powerful magnets, children's jewelry because of high lead levels, and cribs because of durability problems cause consumers to question the effectiveness of our Nation's safety net. The CPSIA has restored consumer confidence by requiring children's products to be tested for safety by banning lead and certain phthalates and toys and by creating a publicly accessible consumer complaint database and authorizing necessary resources to CPSC.

The consumer community has stated previously that any changes made to the CPSIA must not weaken product safety standards and must not weaken public health protections. The current discussion draft fails this litmus test unfortunately. This discussion draft is not narrowly tailored, but rather carves gaping loopholes in the consumer protections created by the CPSIA. It covers fewer children's products, undermines the lead and phthalate standards, substantially weakens the third-party testing requirements, and makes the consumer complaint database vastly less useful for consumers. I will highlight some of the most critical provisions of the discussion draft in my testimony.

We oppose an effort to weaken the scope of the protections of the CPSIA. The discussion draft implies that only those products for children of some younger age, we presume, should be afforded protections by the CPSIA. Congress embraced the belief that there is a shared toy box, which we know reflects the reality of what is true in many homes across this country. School-age children are at risk from lead exposure and from hazards posed by powerful magnets in toys, for example. If those toys are not required to meet any lead limit or meet the standard for magnetic toys, the potential for harm is large. Further, the voluntary standard for toys, ASTM F–963, covers toys intended for children under age 14 years of age.

The third-party testing provision of the CPSIA will be eliminated almost entirely by the discussion draft. Third-party testing is necessary to confirm compliance with safety rules and prevents hazards before they enter the marketplace. While the discussion draft preserves third-party testing for lead in paint, full-size cribs, non-full-size cribs, pacifiers, small parts, and children's metal jewelry, the fact that all infant durable products other than cribs will not be subject to third-party testing is untenable. And there is even ambiguity about the crib standard.

The provision makes it very difficult for CPSC to require third-party testing for other products. The rule-makings required in this section require a cost analysis while ignoring the benefits of lives saved, injuries avoided, or healthcare costs reduced as a result of the testing requirement. And no time frame is established for these rule-makings. This section lists products that can never be required to undergo third-party testing but fails to define them. While we understand that a narrowly-targeted exemption for third-party testing provisions may be the only solution for small-batch manufacturers, the lack of definition and an alternative testing mechanism to ensure safety makes it impossible to determine the appropriateness of this relief.

The discussion draft puts babies at risk in childcare facilities by allowing fixed-side cribs to remain in use if there is required supervision. Slowly removing the drop-side cribs misses numerous other hazards that the new crib standard addresses such as hardware failures, material integrity problems, mattress support failures, slat hazards, and corner posts. This provision drastically weakens the consumer protections of the CPSIA and will keep babies in known unsafe cribs.

The consumer complaint database will give consumers access to lifesaving information and will help CPSC to more nimbly identify and act upon safety hazards. CPSC's rule is responsive to the public interest needs for disclosure and protective of a manufacturer's effort to protect their brand and confidential business information. The database includes more checks on the information and more opportunities for a manufacturer to comment than other similar government agency databases.

The discussion draft tips the balance that the database rule has achieved by limiting who can report to the database, unnecessarily increasing the types of information consumers must report before their complaint can be considered for posting, requires consumers to unwittingly engage in a dialogue with a manufacturer about the reported harm rather than simply reporting the incident to the CPSC, stays the reporting of information until final decisions about the sufficiency and accuracy of the information are made, and will substantially increase the time it will take for information to be posted publicly. This will discourage reporting by consumers to the database and decrease the utility of this important consumer protection.

I thank you for your consideration and am happy to take questions.

[The statement of Ms. Weintraub follows:]

Consumer Federation of America

Testimony of

Rachel Weintraub

Director of Product Safety and Senior Counsel

Consumer Federation of America

Before the

Subcommittee on Commerce, Manufacturing and Trade

of the

House Committee on Energy and Commerce

Legislative Hearing – Discussion Draft CPSIA Amendments

Rayburn House Office Building 2123

April 7, 2011

Summary of Testimony

I. Introduction

II. CPSIA's passage was a significant step forward for consumer protection.

III. CPSC and CPSIA Successes

1. Only since passage of the CPSIA has there been an effort made to strengthen the voluntary and mandatory standards and require testing and verification of new cribs.
2. The consumer incident database will provide transparency and provide useful information about products.
3. Product Registration cards will inform consumers about recalls.

IV. Proposed Revisions in Discussion Draft

1. Definition of a Children's Product- Protections Must Remain for Children 12 and Younger.
2. Application of Lead Limit
    a. Alternative Limit and De Minimis Exception
        i. Alternative Limits will weaken current lead standards
        ii. The de minimis standard will require time consuming risk analysis for a known toxin.
    b. Lead limit exemption for used children's products is too broad.
3. Third party testing requirements are undermined significantly.
4. Cribs in child care facilities will be permitted to violate strong crib standard.
5. Phthalate standard is weakened considerably.
6. Exemption authority for tracking labels is too broad.
7. Database provision is significantly narrowed limiting its effectiveness.
8. We object to the provision making this Discussion Draft entirely retroactive.

V. Conclusion

Chairman Bono Mack, Ranking Member Butterfield, and members of the Subcommittee on Commerce, Manufacturing, and Trade. I am Rachel Weintraub, Director of Product Safety and Senior Counsel at Consumer Federation of America (CFA). The Consumer Federation of America is an association of nearly 300 nonprofit consumer organizations that was established in 1968 to advance the consumer interest through research, advocacy, and education. I offer this testimony on behalf of Consumer Federation of America as well as Consumers Union, Kids In Danger, National Research Center for Women & Families, Union of Concerned Scientists, and the U.S. Public Interest Research Group.

As organizations dedicated to working to protect consumers from unsafe products, I offer testimony today to articulate our serious concerns about the Discussion Draft that amends the Consumer Product Safety Improvement Act of 2008 (CPSIA).

I. Introduction

The bi-partisan CPSIA passed overwhelmingly in the House on July 30, 2008 by a vote of 424-1, in the Senate on July 31, 2008 by a vote of 89-3 and was signed into law by President Bush on August 14, 2008. Before this law passed, Congress undertook a year-long deliberative process to consider the implications of this act: there were approximately 15 hearings and markups in the House and Senate covering issues and products related to the CPSIA, and once each chamber passed its version of the bill, there was a conference in regular order between both Houses of Congress. This law institutes the most significant improvements to the Consumer Product Safety Commission (CPSC) since the agency was established in the 1970's.

II. CPSIA's Significance, New Requirements and Implementation

The CPSIA's passage followed a period of record numbers of recalls of hazardous products that injured, sickened, or killed children. Consumers had lost faith in the safety of consumer products, particularly children's products. The approximately 25 million toys recalled for excessive levels of lead paint, tiny powerful magnets, and other hazardous chemicals, the recalls of children's jewelry because of high lead levels, and the recalls of millions of cribs because of durability issues caused consumers to question whether our safety net was working to protect them.

The bill's passage was also in response to a weakened federal oversight agency, one without enough resources, which failed in its meager efforts to protect the public's health and safety.

In response to this dismal picture, Congress infused the CPSC with new authority and more resources. It has been almost three years since the CPSIA was passed. This law has already made products safer and when fully implemented will increase safety dramatically by requiring that toys and infant products be tested for safety before they are sold, and by banning lead and certain phthalates in toys (although implementation of the testing requirement has been delayed by the CPSC). The law also created a publicly accessible consumer complaint database and authorizes resources CPSC needs to protect the public, such as enabling it to hire additional staff.

III. CPSC and CPSIA Successes

1. Mandatory Crib Standard

There have already been important successes as a result of the CPSIA. One of the most notable examples is the mandatory crib standard that is required by section 104 of the CPSIA. Pervasive design flaws have lead to the recall of more than 10 million cribs over the past three and a half

years. It was essential that the CPSC place safe sleep environments at the top of their mandatory standards-setting list.

Recalls and corrective actions for cribs have been issued for non-compliance with safety standards; strangulation hazards; risk of head entrapment when side rails, spindles, and slats in side rails become loose or break; risk of suffocation; choking hazards; risk of falling; and danger of laceration when fingers become trapped in folding drop gates.[1]

While the previous voluntary crib standards effectively banned the drop-side design in new cribs, only since passage of the CPSIA has there been an effort made to strengthen the voluntary and mandatory standards and require testing and verification of new cribs. The final CPSC crib standard incorporates many provisions that consumer advocates have been supporting for years that replicate the real world use of cribs, such as durability tests, mattress support tests, and tests for the effectiveness of hardware. The resulting CPSC standard, that passed CPSC unanimously, is a strong one and is a successful outcome of the CPSIA. Section 104(c) of the CPSIA seeks to address hazards posed by older model cribs by removing them from the market. This section applies to cribs sold new and used, cribs used in child care facilities, and cribs used in public accommodations such as hotels and motels. The application of this provision means that older cribs that pose significant risks to children will be taken out of the stream of commerce. This provision is based upon laws already in existence in numerous states including Arizona, Arkansas, California, Colorado, Illinois, Louisiana, Michigan, Minnesota, Oregon, Pennsylvania, Vermont and Washington. This provision extends the protections previously offered in just these states to the entire nation to ensure that children sleep in cribs that meet the most recent and most protective crib safety standards.

2. **Consumer Incident Database**

Another success of the CPSIA is the implementation of the consumer product safety information database. CPSC was required by Section 212 of the CPSIA to establish the database. As a result of the CPSC staff's leadership and commitment to the effectiveness of the database, consumers will have access to lifesaving information and the agency will more nimbly be able to identify and act upon safety hazards. CPSC staff worked hard to formulate CPSC's final rule in a manner that is consistent with Congress' intent, responsive to the public interest need for disclosure, and protective of a manufacturer's effort to protect their brand and confidential business information. The database includes more checks on the information and more opportunities for a manufacturer to comment than other similar government agency databases.

Consumers have been in the dark about the dangers of products regulated by CPSC. CPSC has collected incident data from consumers in a manner similar to how it is collected as part of the new database. However, the difference is that prior to the launch of the database, when consumers went to CPSC's web site to look for information, it was hidden. All that they could find typically related to a previous recall. If the Commission had been alerted to the dangers of a product but has yet to conduct a recall, the product's hazard might never have been known to the public.

The database changed that. Public access to information is vital to safety. Simply allowing consumers access to the safety record of products will increase safety and encourage the speedy removal or redesign of unsafe products. Making it simple for consumers to report into a single database the problems they encounter with products also helps the Commission to do its job of

protecting the public from unsafe products more efficiently, which can help save government resources. Launched on March 11, 2011, the first reports were posted last week in the database.

3. Product Registration

The CPSIA requires that infant durable products, such as cribs, strollers and high chairs, include a product registration card in their packaging and provide an opportunity to register online. This will give manufacturers information necessary to directly contact consumers in the event of a recall or other product safety issue.

The requirements for the product registration cards and an online registration program are contained in Section 104 of the CPSIA, which incorporates the Danny Keysar Child Safety Notification Act. Danny, whose parents founded Kids In Danger, died in 1998 when the portable crib he slept in at a child care center collapsed and strangled him. The crib had been recalled five years earlier, but no one at the child care center, including the mom who donated the crib, had heard of the recall. Too many consumers never hear about a recall of a product that they have in their home. In fact, only 10 to 30 percent of product recalls receive a consumer response. This leaves most consumers in contact with recalled products. Registering products is an important step that will increase the number of consumers who hear about a recall.

IV. Proposed Revisions in Discussion Draft

We understand that the Discussion Draft was written in response to requests for flexibility and exceptions from many CPSIA provisions raised by various manufacturer and retailer entities, including micro businesses, large corporations and trade associations. The CPSC itself has requested additional discretion to implement certain CPSIA provisions, particularly regarding the lead requirements. We are open to discussions about finding ways to address the precise needs of

micro-businesses while also protecting public health. However, this Discussion Draft goes well beyond additional discretion and weakens, eliminates or alters significant provisions of the CPSIA, rendering them vastly less protective of the public health and consumers. The most significant successes of the CPSIA are weakened significantly by this Discussion Draft. This Discussion Draft is not narrowly tailored but rather carves gaping loopholes in the consumer protections created by the CPSIA. I will discuss our concerns with the Discussion Draft section by section.

1. **Definition of a Children's Product- Protections Must Remain for Children 12 and Younger**

We oppose an effort to weaken the scope of the protections in the CPSIA. The Discussion Draft rejects the current scope of CPSIA and instead implies that only those products for children of some younger age, we presume, should be afforded protections by the CPSIA. This approach of covering fewer children was rejected by Congress when it passed the CPSIA. Congress embraced the belief that there is a "shared toy box" in many families' homes. We agree with this view, as it reflects the reality of what we know to be true in many homes across the United States. Children of younger ages play with the toys of their older siblings. Younger children mouth their older siblings' toys. The implications of this change are significant. No matter how conscientious a parent, or how well educated the family is about segregating toys for each child, it is inevitable that younger children will obtain access to older children's toys. School aged children are at risk from lead exposure and from hazards posed by powerful magnets in toys. If those toys are not required to meet any lead limit, or meet the standard for magnetic toys, the potential for harm is large and the potential for consumer concern is also considerable.

Further, the voluntary standard for toys – ASTM F 963 includes an even broader scope to cover toys intended for children under 14. This means that many companies are already complying with voluntary safety standards that encompass toys intended for children under age 14. Thus, the reality that children's toys and products are often shared by children within a family, plus the fact that many within the industry are already complying with a higher age standard, requires the scope of the CPSIA to remain as it is.

2. **Application of Lead Limit**

Section 2(a) of the Discussion Draft extends the limit for compliance with the 100 ppm lead limit and technological feasibility analysis for an additional year. We oppose this provision. At a recent CPSC hearing on this issue, many organizations testifying stated that testing to 100 ppm was technologically feasible and that companies were already complying with that standard. Companies have also had almost 3 years to prepare for compliance with the 100 ppm standard. There is no justifiable reason to delay this standard.

Section 2(b) of the Discussion Draft reverses the CPSIA's requirement that all children's products meet the new lead limits, and then requires only certain categories of products, established by CPSC at their discretion, to be subject to any lead limit. Rather than applying the lead limits to all children's products and excluding only a select-few, this provision would establish a new, less protective standard for many categories of children's products. Except for the few categories that have to meet the current CPSIA lead limits, the rest would only have to meet a higher allowable lead limit of 600 ppm lead only if CPSC holds a hearing and makes a determination that lead in that product or class presents an unreasonable risk to children's health.

We oppose this provision for numerous reasons. First, the lead limit of 600 ppm is too high and children's products are already easily meeting the current 300 ppm standard; second, "unreasonable risk to children's health" is not defined; and third, CPSC has so much discretion as to what to cover in this section that it is unclear what in fact would be covered and in what time-frame. This approach gives neither adequate protection to public health nor assurance to parents and caregivers that they can trust the products they bring into their homes – a problem that helped spur passage of the CPSIA in the first place.

Section 2(c) of the Discussion Draft changes the current language to apply the lead limits to the date of manufacture (as opposed to the date of sale). Unfortunately, because this provision modifies section 101(a), it means that manufacturers are allowed to sell their stock of products that do not even meet the 600 ppm limit if their products were manufactured before February 2009. This provision goes too far in allowing products with dangerously high lead limits to be sold to consumers. Any gains that were made in re-establishing trust in the safety of children's products would be diminished. Consumers may have no way of knowing what lead limit a product on the shelf would meet, if any, further confusing consumers trying to protect their children from lead exposure.

a. <u>Alternative Limit and De Minimis Exception</u>

Section 2(d) rejects the previous bright line test for lead and eliminates section 101(b)(1) of the CPSIA by establishing new alternative limits for metal products and establishing a "de minimis" exception for all other materials.

i. Alternative Limits

The alternative limit for children's products made of steel, copper, or aluminum alloys would be some level yet to be determined that is measured in parts per million unless the product or part is a small part or can break and create a small part. For these small parts made of metal, the limit would be 100 ppm if found to be technologically feasible. Unfortunately, this language is problematic. While the 100 ppm standard is consistent with CPSIA and thus does not weaken current law, it is important to know what the lead limit is for non-small part metal products. Raising the amount of allowable lead in metal items that are not "small parts" is a concern, because children mouth larger products. In addition, this language would expose children to higher levels of lead and not seek to minimize exposure from other parts of that same product even if these products involve common hand-to-mouth interaction by children.

For all non-metal products, if the product is a small part or can break and create a small part, it would have to meet the 100 ppm standard if it is technologically feasible. This section does not change the current 100 ppm limit, but it only applies to small parts and not to other non-metal children's products such as vinyl books or bibs that are often mouthed by children.

The Discussion Draft also makes an unsupportable distinction between choking hazards and non-choking hazards. Under long-standing law, all products intended for babies, toddlers and young children cannot contain small parts, a provision that was not altered by this Discussion Draft. Thus, products designed to be mouthed by babies such as teething rings, baby spoons and sippy cups would fall outside of the 100 ppm test and fall under the "de minimis" standard unless they contained metal, which could expose children to higher lead levels. To protect children from

lead in such non-small-part containing products, the Discussion Draft requires CPSC to undertake extensive review—all for a well known, well documented neuro-toxin.

ii. De Minimis Standard

The definition of "de minimis" is not defined other than being measured in micrograms per day and requires a rulemaking by the CPSC to be revised. This would require a complex risk assessment to determine the exposure level and would require many assumptions to be made that could be incorrect. The testing for this type of exposure limit is time consuming, expensive and subject to inaccuracies, poor repeatability and reproducibility making compliance a challenge unwelcome by the CPSC, retailers, and industry alike. It puts CPSC in the position it was in before CPSIA passed—unable to direct its resources to protect consumers from known and significant hazards. The current requirement for measuring total lead content is a clearer, less expensive, and quicker method for determining compliance with lead limits.

Section 2 of the Discussion Draft also requires the CPSC, by rule, to establish a methodology for estimating lead ingestion. We see at least two problems with this approach: CPSC is not required to do this in a certain time period, which leaves rulemaking open to long-term delays; and CPSC is directed only to distinguish between parts that can be placed in the mouth and parts that cannot be placed in the mouth. In the absence of a methodology promulgated by CPSC, any reasonable methodology that is documented is acceptable to estimate lead ingestion. As a result, unless and until the CPSC establishes a new lead-ingestion limit, a manufacturer can use almost any test, no matter how weak, to assess the danger posed to a child who ingests lead in a component part. The lack of a time frame and the lack of a standard provided to estimate lead ingestion is not protective of the public health.

Finally, the "de minimis" provision also reverses the presumption for the safety of products and allows products to be sold and be exempt from testing for lead unless the CPSC finds otherwise. This would mean that the CPSC would not have to act until a child had been harmed by a lead-laden product or until an entity tested the product and brought it to the attention of the CPSC. This is a profoundly misguided approach because almost all lead exposure except for acute lead toxicity silently impacts victims - decreasing IQ points and affecting behavior. As we witnessed in the years before the CPSIA, the record number of lead-laden products that were sold and later recalled from the market proves that this approach resulted in an unreasonable risk of injury to consumers. The approach to lead-laden children's products proposed in this Discussion Draft will amount to a waste of Commission resources, has been rejected by Congress previously as not being sufficiently protective of public health, creates uncertainty for consumers and for manufacturers, and far exceeds the flexibility that the CPSC requested.

b. **Lead Limit Application to Used Children's Products**

This provision further weakens the lead standard by establishing that the lead limits do not apply to certain used children's products. While this provision is based upon language in the Consumer Product Safety Enhancement Act, (CPSEA) a bill introduced last year by Representative Waxman to narrowly address concerns raised by certain product safety stakeholders, it limits the consumer protections in the original language that exempted vinyl products from this provision and removes CPSC's discretion to add other products to this list.

3. **Section 3- Application of Third Party Testing Requirements**

The third party testing provision of the CPSIA will be eliminated almost entirely by the Discussion Draft. The Discussion Draft does preserve third party testing for lead in paint; full

size cribs; non full size cribs; pacifiers; small parts; and children's metal jewelry.[2] This provision makes it very difficult for CPSC to require third party testing for other products beyond this limited list of products. CPSC is permitted to issue a rule to require third party testing for a product, but that rule can only move forward if CPSC has completed an accreditation of conformity assessment bodies and determined the adequacy of the testing capacity of the accreditation bodies. Further, the rulemaking must consider the costs of the regulation and be limited by imposing the "least possible burden" of the costs of regulations while ignoring the benefits of lives saved, injuries avoided or health care costs reduced as a result of the testing requirement. Further, no time-frame is established for these rulemakings.

This section also enumerates those products that can never be required to undergo third party testing: works of art and one of a kind products; specialty products for the disabled (all are not defined); and products that are produced in such small quantities that the cost of testing by an independent third party is not "economically practicable." The definition of a small quantity is yet to be determined. This provision no longer requires CPSC to promulgate the "15 Month Rule." This so-called "15-month rule" is important because it ensures that manufacturers are continually testing their products to the most up-to-date standards, and that safety is not slipping through the cracks in later batches of product runs.

Independent third party testing is proactive, and is better for both consumers and manufacturers: it builds safety into the supply chain early on, with the intent of avoiding the need for expensive recalls *after* children have been injured or killed. We understand that a narrowly targeted exception to the third party testing provision may be the only solution for small batch

[2] Unfortunately, even within this small list there is ambiguity: for cribs, a robust standard was promulgated by CPSC in December 2010—a significant success of the CPSIA. This Discussion draft, however, at the end of this section, prohibits CPSC from enforcing standards that became effective after August 14th 2009 and further references a portion of the Code of Federal Regulations that has since been moved, rendering the status of the standard to which cribs would be tested in question.

manufacturers who make few products and cannot absorb costs of testing, and we are willing to have a discussion about this issue. However, with the definition of small batch manufacturer still undefined it is impossible to determine the appropriateness of this relief for truly small manufacturers. Further, it is unreasonable to provide exemptions for an undefined class of products, called "specialty products for the disabled." Children in the disability community are more likely to mouth products at older ages. Products for this community should be tested to prove compliance.

Further, this provision overreaches by eliminating third party testing for all but a few product categories. In particular, the fact that all infant durable products other than cribs will not be subject to third party testing is untenable.

Finally, third party testing is not a new concept. Many retailers rely upon third party testing results before stocking their store shelves. Some toy manufacturers have used third party conformity assessment laboratories for compliance testing for many years. The CPSIA appropriately applied a testing requirement to all children's products subject to mandatory standards, and created minimum testing criteria.

4. **Section 4- Application of and Process for Updating Durable Nursery Products Standards**

This provision requires cribs in licensed child care facilities to comply with the new crib standard but does not require these child care facilities to comply with revisions to this standard in the future. While we understand that the cost of replacing cribs can be a significant challenge, CPSC has already recognized this and has given child care facilities until late 2012 to comply

with this standard. CPSC should be given discretion to require compliance with future revisions to the crib standard in case there are significant changes that address emerging hazards.

Even more critical is the concern that fixed-side cribs in child care facilities will not be required to meet the new crib standard if certain state or local laws are in place. These laws that are purported to make up for crib dangers include: that a child cannot be in crib for substantial periods if awake; a child over 12 months of age cannot be in the crib; and a requirement that adults are present when an infant is in the crib. Unfortunately, the supervision required by state laws cannot prevent the often silent deaths and injuries when babies are in hazardous cribs. In addition, these state laws frequently vary for center-based versus family-based child care. Further, focusing solely on removing drop-side cribs misses many other hazards that the new crib rule addressed such as hardware failures, material integrity problems, mattress support failures, slat distance hazards and corner posts. This provision drastically weakens the consumer protections in the CPSIA and will put babies at risk.

The Discussion Draft includes a provision for updating infant durable safety standards. While it relies on the text of the CPSEA, it differs by eliminating a provision allowing CPSC to issue a standard that is more stringent and more protective of the public health than the revised voluntary crib standard. CPSC must be able to revise a standard in a way that best protects the public health. Tying the agency's hands in this way is not in the public interest.

5. **Section 6-Application of Phthalate Standard**

Section 6 amends the CPSIA's phthalate provision in a variety of ways. Most significantly, it creates large exemptions where, by rule, CPSC can carve out toys or child care articles from both the prohibition and interim bans where the Commission finds "compliance with the prohibition is

not necessary to protect children's health," and makes the provision prospective, allowing manufacturers to sell their non-compliant products. In contrast to every other rulemaking this Discussion Draft requires, this provision includes a very tight timeline, including a time by which a rulemaking must be started that makes a rule almost impossible to complete.

The phthalate provision in CPSIA protects our children from the cumulative risks of hormonal chemicals that affect genital development and have been associated with testicular cancer and other fatal diseases and serious conditions. Narrowing the definition of the scope of the products covered by the phthalate provision, creating large opportunities to exempt products from coverage and making a rulemaking difficult to accomplish successfully will undermine the health protection of the original phthalate provision of the CPSIA.

6. **Section 7- Exemption Authority for Tracking Labels Requirement**

Section 7 gives CPSC the ability to exclude products or classes of products from tracking label requirements if CPSC determines that it is not "economically practicable" to have tracking labels, and allows CPSC to establish alternatives for those products exempted. When a product poses a hazard to a consumer, a consumer needs information to notify CPSC and the manufacturer of the hazard and CPSC must be able to identify products. In fact, it is this type of information that manufacturers argue is necessary for filing "complete" reports to the database. When Liam Johns died in 2005, his crib, made by Simplicity, but labeled "Graco" went uninvestigated for two years because of confusion resulting from a lack of information on the product. At least two other babies died during this time. Especially because of the high rate of licensing in children's products, tracking labels are imperative, both to adequately identify a product involved in a hazard and to accurately report to the database or manufacturers. Tracking

labels provide critical information and this Discussion Draft creates a mechanism through which manufacturers may not have to comply with this provision.

7. **Section 8- Database**

The consumer incident database is a significant success of the CPSC. Yet this Discussion Draft goes far in limiting the utility and the benefit of the database. The flaws in this section are many: it limits who can report, unnecessarily increases the types of information consumers must report before their complaint can be considered for posting, requires consumers to unwittingly engage in a dialogue with the manufacturer about the reported harm rather than simply reporting the incident to the CPSC; stays the reporting of information until final decisions about the sufficiency and accuracy of the information are made; and will substantially increase the time it will take for information to be posted publicly. This goes much too far and will act to discourage reporting by consumers to the database.

Like other efforts to minimize the effectiveness of the database, this Discussion Draft narrows the definition of who can successfully report to the database, permitting essentially only those related to the person who suffered harm or else requiring authorization by that person, as well as changing the definition of a public safety entity to exclude consumer groups, among others. Among many other new confounding requirements, the provision now allows for another claim of "insufficiency of information," that is not defined and not necessary. This claim of "insufficiency" is ripe for abuse by manufacturers seeking to suppress information about their product. This provision fails to take into account a consumer's limited time to report such harm and a consumer's desire, especially one who suffered a loss as a result of a product hazard, to not want to engage in a conversation, which may or may not be respectful, with a manufacturer.

Finally, this provision makes it a prohibited act for a consumer to misrepresent information submitted in the database. This provision is unnecessary, given that the database already requires verification of the accuracy report by the submitter. This Discussion Draft clearly rejects the need for transparency and seeks to maintain the status quo by rendering the database imbalanced in favor of maintaining the secrecy of harms resulting from use of consumer products.

8. **Section 11- Effective Date**

The final provision of the Discussion Draft makes this entire bill retroactive to August 2008. We oppose this provision due to its vitiation of critical consumer protections that have already taken effect and rules already promulgated.

V. **Conclusion**

This Discussion Draft is a broad attack on the most important provisions of the CPSIA: it narrows the scope of products covered by the CPSIA; weakens the lead standard; drastically limits third party testing requirements; allows unsafe cribs to be used in child care facilities, limits the phthalate provision; preserves the secrecy of harms caused by consumer products by making the database less useful and more difficult for consumers; requires rulemakings while not requiring timelines except in one instance that makes compliance untenable and renders the entire Discussion Draft retroactive. Unfortunately, this moves back the clock on safety and puts children at risk.

Mrs. BONO MACK. Thank you very much. All right. The chair recognizes herself for 5 minutes for the first round of questions.

And I would like to ask Mr. Marshall, please, would you be willing to register with the Commission in order to qualify for this small-batch exemption to the third-party testing requirements?

Mr. MARSHALL. I think that would be a fair tradeoff so that the CPSC would know who the small-batch manufacturers are and it would be consistent with how the FDA approaches food labeling laws. So yes.

Mrs. BONO MACK. Thank you. And you also mentioned the other laws that have provisions to accommodate the different circumstances of small-batch manufacturers. Can you say more about the approaches that you believe are the best?

Mr. MARSHALL. Well, the issue with third-party testing is cost, so I think it makes sense to create exemptions based on the number of units produced per year. That seems like the most logical way to us to get at the cost versus the output of a particular manufacturer.

Mrs. BONO MACK. Thank you. Ms. Weintraub, first of all, your testimony—you and I have not read the legislation at all in the same way—but you testified that the CPSIA became law as a result of "a period of record numbers of recalls of hazardous products that injured, sickened, or killed children." What I remember most are the lead-in-paint recalls and no one here will ever argue that lead-in-paint restrictions should ever be loosened. "However, the most significant problems with this bill relate to lead in substrate." Putting aside metal jewelry, again, restrictions for which we do not intend to loosen, were there any children injured, sickened, or killed by lead in substrate, and if so, how many and can you provide verified statistics of those injuries?

Ms. WEINTRAUB. I can't provide verified statistics of those injuries because many of those injuries are silent. They could cause—and likely have caused but we just don't know—neurological impairments, decreases in IQ——

Mrs. BONO MACK. You are saying they are all speculative injuries that you——

Ms. WEINTRAUB. No, I wouldn't say that they are speculative——

Mrs. BONO MACK. But they are speculative?

Ms. WEINTRAUB [continuing]. But they are very difficult to document.

Mrs. BONO MACK. All right. And—again, you and I read the legislation entirely differently—contrary to what you said in your testimony, the discussion draft does not deprive consumers of third-party testing. It gives the Commission authority to decide what should be third-party tested. You know, what I have heard from the commissioners is that they need a little bit more common sense, the ability to apply common sense. You completely disagree with that notion and what I see in the legislation and what you see are entirely different?

Ms. WEINTRAUB. Well, I am not entirely sure what you see, but what I see is a system where there is a list of products that are subject to third-party testing, a list of products that can never be subject to third-party testing, and then a very rigorous rule-making

without any timelines that is required in order for other products to be third-party tested.

Mrs. BONO MACK. You are saying that there are products that can never be tested?

Ms. WEINTRAUB. My understanding was that there is a list in this discussion draft that includes——

Mrs. BONO MACK. Have you seen the discussion draft?

Ms. WEINTRAUB. Yes, I have seen it.

Mrs. BONO MACK. OK, but your understanding—I am sorry. You confused me right there. You said your understanding is that——

Ms. WEINTRAUB. Well, you are disagreeing with my interpretation so——

Mrs. BONO MACK. Well, and you disagreed with mine so I——

Ms. WEINTRAUB. Well, the way that I read the discussion draft is that there are a list of products which are undefined, products for children with disability, one-of-a-kind products, works of art, and products manufactured by small-batch manufacturers that would never be subject to——

Mrs. BONO MACK. Well, nothing is excluded from testing and the Commission can decide to impose the testing. But just moving on a little bit to Mr. Samuels.

You state that the Commission has made some unfortunate interpretations in implementing the database. What interpretations are you referring to and are they corrected by this legislation?

Mr. SAMUELS. Thank you very much. Two very troublesome interpretations is their unnecessary—in fact, I think really improper—increase of the number of parties that can make reports of harm. So that includes trial lawyers; it includes consumer groups that may not be direct representatives of someone that is harmed. It is totally improper and your draft limits it to those people really harmed and their representatives, which is what the database is supposed to be all about.

The second thing is a very unfortunate interpretation that even if a manufacturer has claimed a material inaccuracy in a report that it isn't even their product, that if the 20-day clock runs out, they are going to post it anyway, even if they have failed to resolve it. That is unfair and unnecessary and your draft does a very good job on dealing with that.

Mrs. BONO MACK. Thank you. I just want to finish my last 9 seconds by saying that I believe the database has room for improvement and we can do all of these things. But I also want to go on the record that I support the database. I think there is some consternation from the other side that I don't. But I think it is very flawed and we should make sure that it serves both the public and make sure that we continue to make "made in America" matter again. So with that I am happy to recognize Mr. Butterfield for his 5 minutes.

Mr. BUTTERFIELD. Thank you, Madam Chairman. Ms. Weintraub, well, you are probably well aware that the existing law that we passed a couple of years ago sets clear lines on total lead content that becomes increasingly stringent over time. The purpose of decreasing the amount of lead allowed in children's products over time was to gradually get these products closer to a total lead level that would not result in at least one form of neurological dam-

age, and that is the loss of IQ. Some manufacturers, however, have been complaining ever since the law went into effect, many of whom were at the table when the law was being written, that there is no way they can make their products without certain components that exceed the limits and that those components don't put children's health at risk.

The discussion draft that we have seen and that you acknowledge that you have seen attempts to give these manufacturers relief from the lead content limits. However, it does so in a very broad and far-reaching way that not only lets those who claim they need lead for their products to function properly to exceed the limits, but lets anyone who wants to continue using lead to do so as long as they are willing to play a game of risk with children's health.

The de minimis ingestion-based standard in the draft is available for any component part so long as it isn't a small part. And there is no consideration of whether lead needs to be in that particular component.

My question to you is to the extent there is bipartisan sentiment that Congress should grant manufacturers some form of relief from the lead content limits, do you agree or disagree that any such exception must, as a fundamental matter, consider whether that product needs to have lead in it to function properly?

Ms. WEINTRAUB. I agree.

Mr. BUTTERFIELD. Let me skip over a couple of questions. I will stay with you if you will. Tucked away at the very end of the Republican discussion draft is a one-sentence section regarding the effective date of the amendments in the draft. Although that section is at the very end and only one sentence long, what this section says is actually quite important. As I understand it from my staff, what this sentence says is that anyone who is currently in compliance with any part of CPSIA gets a free pass. Would you agree or disagree with that and would you elaborate for me, please?

Ms. WEINTRAUB. I do agree. I think that provision that you are referencing is truly retroactive provision of this law. I think the term "retroactivity" as it applies to other lead standards I think is legally not accurate. But in this case I think this is true retroactivity. The one sentence actually states that this draft will go back to the time that the CPSIA was passed in August of 2008.

Mr. BUTTERFIELD. OK. I want to get to the database in the few seconds that I have left and this is a rather long question. This is going to be too lengthy for me to complete in the time allotted, but would you speak to the database that we rolled out a few weeks ago and tell us your conclusions on it?

Ms. WEINTRAUB. Sure. The consumer complaint database is a very important consumer protection. It is so important because consumers have been in the dark about product safety. There is many incidents that we know about and obviously others that we couldn't possibly know where consumers were just completely in the dark, that manufacturers had information about a safety problem with the product. CPSC may or may not have known and consumers continued to use the product. They were in the dark. They were under a veil of ignorance and weren't able to make the right choices for their families because they just didn't know about inci-

dents that sometimes were pervasive and affected many, many people.

So what the database seeks to do is equal this playing field a little bit. It still requires CPSC to go to manufacturers outside of the database before they can release information about particular products. But it requires a very specific number of fields of information that really narrow the information so that information has to be very targeted to the type of harm, a description of the product, and really provide useful information to consumers.

And unlike other government databases, it provides a place where manufacturers can comment simultaneously. If you go on the database today, you will see a consumer filed a comment and then in the same page the manufacturer files a comment, which is significant.

Mr. BUTTERFIELD. Thank you. I yield back.

Mrs. BONO MACK. I thank the gentleman. And the chair now recognizes Mr. Olson for 5 minutes.

Mr. OLSON. I thank the Chair, and I thank the witnesses for your knowledge, for your patience, and your persistence.

And my first question is going to be for you, Ms. Weintraub. What is more dangerous, a product of 10,000 parts per million lead that does not leach enough lead to result in a measurable increase in a child's blood lead level, or a product that contains 100 parts per million lead that leaches enough lead to result in a measurable increase in a child's blood lead level?

Ms. WEINTRAUB. I think it depends on a number of scenarios, so I am not sure. I could get back to you.

Mr. OLSON. OK. So you can't tell me between 10,000 parts per million or 100 parts per million?

Ms. WEINTRAUB. I think, you know, there is many factors that go into that sort of analysis. So I would like to review the information and get back to you if I could.

Mr. OLSON. OK. Thank you. I would appreciate that. Is there a mechanism to aid CPSIA to prevent these safe products to be sold to children under age 12?

Ms. WEINTRAUB. I am sorry. Can you repeat that?

Mr. OLSON. I can, yes, ma'am. Is there a mechanism to aid CPSIA to prevent these safe products to be sold for children under age 12—safe lead products?

Ms. WEINTRAUB. Well, I am not sure that I agree with underlying assumption of the question, but products intended for children 12 and under have to meet the current lead standards, as well as the other mandatory standards that are relevant to those products.

Mr. OLSON. OK. Thank you for that answer. A couple more questions. You testified that Congress took over a year in a deliberate process to consider the implications of this law. Unfortunately, as much as we would like to think we are, we are not immune to error. We are not omniscient. I would bet the vast majority, if not all the Members of Congress, had no idea we would be essentially banning bicycles, jungle gyms, and golf equipment—in a time of a child obesity crisis—banning science equipment, like microscopes and organic geology sets—again, in a time when students are falling behind in the sciences—or banning musical instruments in a

time when our students are also falling behind in the arts. Did you know this law would ban those products?

Ms. WEINTRAUB. I think what is important to note is that lead is not necessary to be in products. And if it is in fact necessary, I think that should be part of any analysis that would give flexibility for any type of exemption, because the important thing to focus on from the consumer perspective is that when consumers are purchasing a product for their child, a toy, they don't expect that they will be exposing them to risk. And especially when it comes to lead, it is impossible for a consumer to identify whether there is lead in that product. So the consumer is really relying on the manufacturer and also relying upon Congress and the CPSC to make choices that will protect consumers.

Mr. OLSON. And we are doing that, ma'am, with all due respect. And one final question. You testified that CPSIA became law as a result of "a period of record numbers of recalls of hazardous products that injured, sickened, or killed children." What I remember most are the lead-in-paint recalls. And no one here will argue that lead-in-paint restrictions should be loosened. No one. However, the most significant problems with this bill relate to lead in substrate. Putting aside metal jewelry, again, restrictions for which we do not intend to loosen, were there any children injured, sickened, or killed by lead in substrate? How many and can you provide verified statistics of those injuries?

Ms. WEINTRAUB. I believe I answered a similar question previously and I will answer the same information that, unfortunately, I am sure that there were injuries, there were harms to public health, but it is very difficult to document because these harms and these injuries occur as neurological impacts to effects of behavior and decreases in IQ. So it is very hard to document. But to say that there has been no harm from lead in substrate I think is not accurate.

Mr. OLSON. I appreciate those answers again. I would submit to you that it is important we know those answers before we take action. We should be able to document it. I yield back my time.

Mrs. BONO MACK. Would the gentleman yield, actually, for your final minutes? I would like to ask a follow-up question if might to Mr. Locker and take the final minute. So you state the regulations have departed from sensible risk-based decision-making at the Commission and the law does not grant them the ability to make commonsense decisions—there are those words "common sense" again—but commonsense decisions that has resulted in banning safe products. How do you know the products are safe?

Mr. LOCKER. That comment related to the ability of the Commission to grant exceptions based upon data that was available to them. I mean the Commission is not going to act to grant exceptions if there was exposure—as Mr. Howell testified under the Federal Hazardous Substances Act—to any hazardous substance. So in that situation the problem is not that the Commission can't make that determination. The problem has been that the language in the statute, which you now seek to correct, provides the Commission cannot make the decision if there is any lead that comes from the product. And that creates a Catch-22. So what we are saying is that when the Commission can determine that there is no extract-

able lead from the product that presents a hazard, the examples of the ATV fender, the bicycle fender, brass latches on safety devices maybe in car seats and strollers, when there is no actual human health risk, they should be able to say that these are exempt or excluded products. So far they can't and the way, you know, many of our clients know they are safe is they do do testing. They do do extraction testing. They do do formulations. They avoid hazardous substances where possible because under the Federal Hazardous Substances Act for children's products, they have to.

Mrs. BONO MACK. Thank you. All right. The balance of the time has expired. I will recognize Ms. Schakowsky for 5 minutes.

Ms. SCHAKOWSKY. Thank you, Madam Chairman. I wanted to make it clear particularly to Mr. Marshall that Mr. Waxman, who at the time in April of 2010, who was chairman of the full committee, released a discussion draft that gave targeted relief to industry while maintaining important protections, which I am sure you agree are important for the health and safety of children brought about by this legislation. I was very involved in it. At the time Mr. Rush wasn't here for health reasons and I helped negotiate the bill and I worked with Chairman Barton and afterwards, you know, things happened. And you see some problems and so Mr. Waxman introduced this draft that would make some changes.

And at the time the draft was supported by the National Association of Manufacturers, the Retail Industry Leaders Association, the Motorcycle Industry Council, the Handmade Toy Alliance, and Goodwill Industries. And Chairman Tenenbaum wrote that the Waxman discussion draft would provide CPSC with the flexibility needed to implement the law. And then at that time the Republican minority refused to support the legislation and it didn't move forward in the 111th Congress. So I want to make the point that we understand that there are some things that need to be tweaked. We want to do it but we don't want to blow up the bill.

This has been an issue so dear to my heart, and I did want to ask Ms. Weintraub an important question. The draft bill exempts most children's products, including durable nursery goods—which I have been working on for many sessions—from third-party testing but then says that cribs will be tested. However, the current language remains ambiguous on cribs. Can you talk about this ambiguity? If the bill were to become law, could parents be assured that the crib they are using is safe?

Ms. WEINTRAUB. Sure. Yes, I agree that there is ambiguity. On the one hand, in the list of products that clarifies that there is third-party testing, cribs and non-full-size cribs are included, but yet there is a reference to a C.F.R. that seems to have moved. So it is a little bit confusing. But then further confusing there is another provision later on—I believe it is in the third-party section—which says that this would stay all standards having to do with third-party testing that were passed since some date in 2009. So there is definitely confusion about whether cribs would be required to be tested to the new robust crib standard.

Ms. SCHAKOWSKY. There is another part. The bill would eliminate the requirement that daycares and hotels in certain states use newer, safer cribs. And I have subsequently become friends with Linda Ginzel, mother of Danny Keysar, whose son died a really

tragic accident. And I had in my hand the letter from her that I wanted to read just one paragraph.

"We founded Kids In Danger in 1998 after the death of our beloved son Danny in a poorly-designed inadequately-tested and recalled portable crib. Danny was 16 months old when the top rails of the Playskool Travel-Lite crib he slept in at his licensed childcare home collapsed around his neck, strangling him. He was the 12th child to die in cribs of this design."

So, you know, is it necessary to eliminate that requirement?

Ms. WEINTRAUB. No, it is incredibly problematic. In terms of what the draft bill does for childcare facilities, it seems to be allowing all fixed-side cribs and the new robust crib standard does much more than eliminate drop-sides. It adds many important provisions that ensure the durability of the crib so that cribs can actually wear, reflecting how children use cribs has to do with slat integrity, has to do with mattress support, and the integrity of the hardware. So by just saying that all fixed-side cribs can be used in daycares, it unfortunately isn't capturing the universe of those cribs that we have reason to be concerned about.

Ms. SCHAKOWSKY. Let me just say in the seconds I have left, Madam Chairman, that I know that you care very much about the safety issues and just I for one would love to be able to work with you to address some of the problems that we are hearing and to work to come up with some kind of a compromise.

Mrs. BONO MACK. The gentlelady yields. I thank her very much for the spirit and I look forward to working with you and I acknowledge your expertise and your passion over the years in this and I can say, I think, just in listening to these past few seconds, I think there is some misinterpretation of this. But this is a draft discussion. Sometimes I feel it is almost like a Mad Libs when we were kids. There are blanks in here for this very reason. And I would never dream of doing this without working with you. So I thank you very much for your comment. And now the chair recognizes Mr. McKinley for his 5 minutes.

Mr. MCKINLEY. Thank you, Madam Chairman. Ms. Weintraub, I have got a couple questions for you. Apparently, the chairman and others on the committee, they asked you about substantiating the claims that children have been "injured, sickened, or killed" by toys with lead in its substrate. And you have responded that these injuries are, by and large, silent and undocumented. How do we know they exist if they are silent and undocumented? And could you provide us some documentation that supports this, how many people have and with names or circumstances?

Ms. WEINTRAUB. We know that lead exposure to children causes a range of neurological——

Mr. MCKINLEY. I am looking for some specifics because you made the statement. That is why I am just trying to——

Ms. WEINTRAUB. Yes, so first, the——

Mr. MCKINLEY. I don't want the generalities. That is what happens around here. I am new at this game and everyone likes to talk in the abstract. I am an engineer. I want to deal in details. So when you make that statement, I want you to prove it.

Ms. WEINTRAUB. Sure. Well, first, the statement that I made applied to a full range of products. And when I talked about the inju-

ries and deaths, I was also talking about magnet-toy deaths, as well as injuries from other toxic chemicals.

Mr. MCKINLEY. Can you document it?

Ms. WEINTRAUB. It is very difficult to document if a child——

Mr. MCKINLEY. Well, then you shouldn't be making that statement.

Ms. WEINTRAUB. I can provide you with scientific studies that will——

Mr. MCKINLEY. Let me go on my second question for you. Last week we had at the request, perhaps, or insistence of the administration and the Congressman from California, we included language in a broadband oversight bill to take care of the false and erroneous claims against people for waste, fraud, abuse, and precisely to protect these companies' reputations. We used Congressman Waxman's own language that he had inserted in a radio spectrum bill that he had produced last year. So we were using specifics. And then last year there was a data security bill that the Republicans were trying to put in to a consumers' right bill to protect access to databases, protect it for security for people's reputations. I have got a company in my area that has cried out on this. He has already had legal advice that is suggesting that he could be accused anonymously by people using false names put up there against him and he won't be able to clear his company name.

Shouldn't companies who manufacture consumer products not be provided the same ability to protect their reputations from erroneous or false claims as the companies who receive broadband like we just did?

Ms. WEINTRAUB. I think there are very similar protection that is not identical. But first of all, on the consumer complaint database, complaints cannot be anonymous.

Mr. MCKINLEY. Would you work with us on that? Is that something that you think we should be doing? Shouldn't we be protecting everyone and not just certain people?

Ms. WEINTRAUB. I think there are adequate protections already. And already in order for a claim to be filed and posted on the database, a consumer needs to verify that what they are saying is true.

Mr. MCKINLEY. Their counsel doesn't agree with you on that. That is why we need to do this language. We need to have something in there to be able to take care of that because we are looking for something that is consistent with it. But the last question I have——

Ms. WEINTRAUB. Well, I am happy to take a look at——

Mr. MCKINLEY [continuing]. Is, Mr. Marshall, if I could—back to you. You know, one of the things we were looking for in this hearing were some data because there are a lot of blanks. And you heard the chairman talk about it.

And on page 11 it says the term "produced in small quantities means not more than 'blank' number of units of the same product." What would you recommend is a number that we should use in that?

Mr. MARSHALL. I think that could be a range of numbers. I think on an outside I think 10,000 units per year would be the highest we would like to see.

Mr. MCKINLEY. One thousand?

Mr. MARSHALL. Ten thousand is the highest.

Mr. MCKINLEY. Ten thousand?

Mr. MARSHALL. Yes. But it has to do with——

Mr. MCKINLEY. And that maybe I am dealing more with your company, what you all produce.

Mr. MARSHALL. Well, I own a toy store and my wife and I, we buy from small-batch manufacturers.

Mr. MCKINLEY. OK.

Mr. MARSHALL. But that is a number that we are willing to discuss.

Mr. MCKINLEY. Ten thousand.

Mr. MARSHALL. As a high number. That would be the highest that we would want to see that number. It could be a range of numbers below that as well.

Mr. MCKINLEY. OK. I yield back my time.

Mrs. BONO MACK. I thank the gentleman. And seeing no other members present, I believe that we are now ready to wrap it up. I ask unanimous consent that these 16 letters be made a part of the record, all of which have been vetted previously by the minority. Without objection.

[The information follows:]

Statement on behalf of
American Apparel & Footwear Association

Congressional Hearing on Discussion Draft of H.R. ____,
a bill that would revise the Consumer Product Safety Improvement Act
April 7, 2011

Subcommittee on Commerce, Manufacturing, and Trade
Committee on Energy and Commerce
Unite States House of Representatives

The following comments are submitted on behalf of the American Apparel & Footwear Association (AAFA) -- the national trade association of the apparel and footwear industries, and their suppliers -- regarding the House Subcommittee on Commerce, Manufacturing and Trade's draft legislation to amend the Consumer Product Safety Improvement Act (CPSIA) of 2008.

AAFA and its members strongly support a product safety system that effectively ensures that safe and compliant products are designed, produced, marketed, and sold. Even before the passage of the CPSIA, AAFA has worked to educate the apparel and footwear industry on important product safety compliance initiatives. For example, for several years, we have published a Restricted Substances List (RSL), that is now translated into several languages, that helps companies understand international product safety standards and implement a chemical management program. The RSL is published on a semi-annual basis and is available to anyone without cost.

Furthermore, well before the CPSIA was conceived, AAFA staff and member companies have been active participants in many of the Consumer Product Safety Commission (CPSC) regulatory activities and have worked closely with the Commission's staff to ensure that the regulations were crafted in such a way that they address specific safety risks while not hindering the ability of companies to make safe and compliant products. As a result of this on-going partnership, some of the critical CPSIA implementation issues faced by textile, apparel, and footwear businesses have been addressed. Unfortunately, many problems remain, many of which cannot be fixed through the regulatory process.

The proposed amendment to the CPSIA is a significant step forward in the process to fix many of the unintended consequences of the CPSIA. These unintended consequences have caused considerable disruption to businesses over the past few years. Furthermore, the amendment preserves many of the CPSIA's much needed improvements to consumer product safety regulation and enforcement. The draft language, which we strongly support, represents a thoughtful balance that protects consumers without unduly burdening industry with unnecessary regulations and requirements. Below are specific comments on several provisions in the draft amendment and additional comments on areas of improvement not addressed by the amendment.

Section 1: Definition of Children's Product

By expanding the definition of a "children's product" to products intended primarily for children 12 years of age or younger, the CPSIA created a lot of confusion for products that were marketed to "tweens." Manufacturers are still unclear whether these products are children's products or not. Moreover, this expansive definition of children's product meant that regulations like the lead standard would be applied equally to all age groups even if the behavioral characteristics of the age groups are vastly different. For example, the lead standard applies equally to the sole of a baby's shoe as it does to the sole of a 10 year old's shoe – even though 10 year olds will not likely be putting their shoes in their mouths. AAFA therefore strongly supports the amendment's intentions to drop the age limit down to where the Senate had proposed during the drafting of the CPSIA – age 7 and under.

Section 2: Application of Lead Limit

Section 2 of the amendment addresses several key issues with the lead standard that have been extremely problematic for the apparel and footwear industries. Overall, the amendment helps tailor the lead standard to appropriately take into account risk. AAFA supports several key components including the extension of the deadline for lead limit, changing to a prospective application of the lead limit and the inclusion of an alternative limit and *de minimis* exception. These aspects are a good start in relieving the crushing burden on companies, while still ensuring consumer product safety but there are other concerns that must be addressed.

Changing the lead limit to be a prospective application is a change that AAFA and other industry groups have been requesting for many years. A retroactively applied lead limit has resulted in safe and compliant products that have been deemed safe one day and "banned hazardous substances" the next. Companies had to remove millions of dollars worth of inventory from shelves for minor problems such as non-compliant zipper stoppers on the bottom of the fly on children's pants. The result has been a huge unnecessary financial loss for companies that have diligently complied with CPSC regulations and have taken additional steps beyond regulatory requirements to ensure the safety of their products. As stated by CPSC Commissioner Adler, "Retroactivity imposes penalties for past behavior otherwise permissible at the time the behavior occurred – with no ability to modify the actions deemed impermissible. This is strongly disfavored in the law. In fact, the Consumer Product Safety Act expressly bars the agency from imposing safety standards retroactively."[1]

We further support language that postpones the application of the 100ppm lead content standard for a year to give the CPSC time to finish technological feasibility determinations. As the CPSC has not yet issued any determinations on whether products can or cannot meet the 100ppm lead content limit, manufacturers do not know whether they will need to comply with the standard. Consequently, manufacturers are destroying safe inventory even if tests have come back only slightly above 100ppm. As a general rule, regulations should be applied in a transparent, timely manner to be fair to businesses. Furthermore, we believe the amendment should apply the 100ppm lead content standard to specific products or materials *only if* the CPSC makes a determination that meeting 100ppm is technologically feasible and is necessary for public health and safety.

Making the 100ppm lead content limit applicable only if the CPSC determines that it is technologically feasible and necessary to protect public health and safety will provide significant relief to manufacturers whose products are not meeting 100ppm due to testing variances. Lead testing is *never* exact, a single product that is sent to three different laboratories will likely return with three different results. Moreover, companies are struggling with test results that come back just slightly above the 100ppm lead standard. Including a standard error that takes into account statistical error would save a company from having to destroy an entire product line because one test reached 101 ppm. It is our understanding that no test will ever give you a standard deviation of zero so including room for testing error is the only way to make "reasonable testing" just that, reasonable.

[1] http://www.cpsc.gov/pr/adler01222010.pdf

We are also very supportive of both the *de minimis* exception and the alternative limit for steel, copper and aluminum alloys. In particular, the apparel and footwear industries have been struggling with several issues that would be solved by a *de minimis* exception, from crystals to fabric being used as a barrier for inaccessible components. Under the *de minimis* exemption many items that ***do not*** pose a risk to children, like the soles of children's shoes, would be exempt due to the absorption of lead falling below any *de minimis* limit that is introduced.

In addition, the *de minimis* standard could solve some regulatory issues that the apparel and footwear industry has been facing. For example, the CPSC came out with a methodology for determining components inaccessible and therefore not covered by the lead standard. This methodology included language saying that fabric could act as a barrier for inaccessible components provided that the inaccessible component is not less than five centimeters in any one dimension. While the intent was to cover components that could be swallowed (like fabric covered buttons), the language of the regulation ended up making the fabric inaccessibility exception useless for the apparel and footwear industry as no component in the apparel and footwear industry is greater than five centimeters in all dimensions. Therefore, components like the shanks in children's shoes and the zipper stopper in children's pants (even if the fly has been bartacked over so a child could not touch the zipper stopper) are still covered by the lead standard even if a child could not touch let alone mouth the inaccessible component.

In addition to the *de minimis* exemption, we recommend the accompanying conference report address state regulations such as California Proposition 65. Proposition 65 has been a particular burden on industry. In the last few years alone, the apparel and footwear industry has been ensnared in costly and time consuming litigation brought by private litigants pursuant to Proposition 65. While industry is struggling to do the right thing and comply with Proposition 65, simply stated, there is no clear guidance on how to comply with the safe harbor limits (which are measured in micrograms per day) contained within Proposition 65. Instead, there has been regulation through litigation resulting in companies spending tens of thousands of dollars to buy into legal settlements that provide little to no improvement to public safety. Report language should clarify that any methodology that comes out of the CPSC to determine the *de minimis* standard should be applicable for state standard compliance as well. This will provide manufacturers a clear path to Proposition 65 compliance.

Section 3: Application of Third Party Testing Requirements

We are extremely supportive of the changes provided in Section 3 of the proposed amendment. AAFA and its members believe that testing is a crucial element of an effective quality control program and we strongly support provisions within the amendment that provide manufacturers with flexibility to implement their own testing programs. Prior to the implementation of the CPSIA, apparel and footwear manufacturers had in place long-standing quality control programs that have developed over time based on the unique circumstances of the product, production of the product and the manufacturer. These programs were effective and did not need to be changed. To demonstrate, in 2007 (the so-called "year of the recall") only 0.0424% of all apparel and footwear sold in the United States were involved in a recall.[2] Moreover, most apparel and footwear recalls were, and continue to be, drawstring violations – a compliance issue that results from lack of information and not a lack of testing.

While the amendment provides much-needed flexibility for third party testing requirements, it does not address any of the issues that non-children's product manufacturers are facing. Prior to the implementation of the CPSIA, all apparel was subject to the Flammable Fabrics Act (FFA) and FFA testing. 16 C.F.R. Part 1610 laid out testing and certification requirements for manufacturers. These rules were promulgated through significant discussion among industry, consumer product safety advocates, the CPSC, flammability experts and testing facilities who worked together to determine what test methods are appropriate to assess fabric compliance with flammability standards. Now, Section 14(a) paragraph (1) of the CPSA requires non-children's product manufacturers to issue a General Conformity Certification based on a "reasonable testing program" that certifies compliance with the applicable product safety standards. As the CPSC has issued two rulemaking that define what a "reasonable testing program"

[2] CPSC recall data, AAFA statistics http://www.apparelandfootwear.org/statistics.asp

entails, manufactures now have to comply with *three* different regulations.[3] Not only is this unnecessary as there was significant compliance with the testing requirements for FFA prior to the CPSIA, but this is extremely burdensome and an inefficient use of manufacturer resources.

Requiring compliance with multiple rulemakings will not make products safer. Instead, it diverts resources that could be more effectively spent on other quality control operations that may not be required by the proposed rulemakings. Therefore, we propose that Section 3(b)'s title (page 9 line 5) be amended to, "Testing Requirements" (as the amended Section 14(b) of the CPSA affects more than just third party testing, it impacts general testing requirements as well). In addition, we propose that the "Rulemaking Considerations" such as the cost-benefit analysis proposed in Section 3(b)(3)(D) (page 11, line 16) be applied to Section 3(b)(1) (page 9, line 9). Additional testing requirements should only be applied to consumer product safety standards if they are necessary. We therefore suggest that the "Rulemaking Considerations" proposed in Section 3(b)(3)(D) include the following, "that, on the basis of investigations or research, any testing requirements pursuant to this paragraph are needed to protect the public against unreasonable risk of injury."

Including this language will also prevent the CPSC from imposing the proposed "Testing and Labeling Pertaining to Product Certification" and requirements laid out in the "Condition and Requirements for Testing Component Parts of Consumer Products" to other long-established testing standards like the children's sleepwear standard and to children's products subject to FFA. As with adult apparel subject to FFA requirements, children's products subject to the children's sleepwear standard and the FFA have had testing requirements in place for many years – testing requirements that are effective because they are functional and appropriately tailored to the standards.

Requiring childrenswear manufacturers to comply with all three regulations simply to demonstrate compliance with the underlying safety standard is not only overly burdensome, but sometimes, the regulations can be contradictory and extremely confusing. For example, in the proposed "Testing and Labeling Pertaining to Product Certification" rulemaking, §1107.22 requires manufacturers to submit random samples for periodic testing so that, "each sample in the production population [has] an equal probability of being selected." However, according to the "Laboratory Test Manual for 16 CFR Parts 1615 and 1616: Standards for the Flammability of Children's Sleepwear," the normal sampling plan for fabric production unit testing requires the manufacturer to "take one sample from the beginning of the first fabric piece in the unit and the other sample from the end of the last fabric piece in the unit."

In another example, the CPSC Small Business Ombudsman's office issued a guidance document titled, "Lifting the Stay of Enforcement of Certification Requirements for Non-Children's Clothing Textiles, Carpets and Rugs, and Vinyl Plastic Film." The document sought to clarify how "continuing guaranties" (certifications of compliance allowed by the FFA which are similar to supplier-issued General Conformity Certifications) relate to General Conformity Certification. The document states, "For non-children's clothing textiles, carpets and rugs, and vinyl plastic film, manufacturers may rely on their suppliers' guarantees if furnished in good faith and with written assurances from the supplier that the product has been subjected to a reasonable testing program." Industry is still yet unclear as to whether continuing guarantees can be used for children's products. Furthermore, according to the CPSC FAQ on continuing guaranties, "The issuance of a guaranty must be based on reasonable and representative tests conducted in accordance with applicable flammability standards..." Therefore, a manufacturer has to certify that the continuing guaranty is based on a reasonable testing program when, in fact, a continuing guaranty can only be issued if it is based on reasonable and representative tests. As a result, in an effort to help clarify two conflicting standards, the FAQ created an additional compliance layer, an additional paperwork requirement and more confusion.

---

[3] Manufacturers will need to comply with 1) 16 C.F.R. part 1610, "Standard for the Flammability of Clothing Textiles," 2) proposed 16 C.F.R. part 1107, "Testing and Labeling Pertaining to Product Certification," and, for those suppliers who are using supplier certification, 3) proposed 16 C.F.R. part 1109 "Testing and Labeling Pertaining to Product Certification."

Finally, many consumer groups are concerned that without third party testing, manufacturers will not undertake the necessary steps to ensure compliance with such standards as the lead standard or the phthalate standard. We strongly disagree with these concerns. To start, the CPSC has not issued any recalls of children's apparel or footwear for violations the lead substrate standard since the passage of the CPSIA. Thus, industry has effectively ensured that only products compliant with the lead standard reach the marketplace. This is despite the fact that currently, third party testing and certification requirements for the lead substrate and phthalate standards have been stayed. However, during this stay of testing and certification, companies have implemented robust, efficient and effective testing programs throughout their supply chains to check production and ensure product compliance. Members use both third party testing facilities as well as various technologies at the production line to immediately test for a problem and, if they happen to encounter one, deal with it right away. We believe that implementing strict, one-size-fits-all testing requirements for thousands of types of consumer products and supply chains is an ineffective regulatory burden on companies. Companies know their supply chains best and know the most effective way to ensure product compliance. The stay of testing and certification has shown that regulatory flexibility is important so that companies can utilize the most effective and efficient testing methods available.

Section 6: Application of Phthalates Standard

In relation to Section 6, Application of Phthalates Standard, AAFA strongly supports the language in Section 6(c)(1) limiting the application of the phthalate regulation to accessible plasticized component parts in children's toys and child care articles. Unlike chemicals like lead, which is a naturally occurring element, phthalates are intentionally added to products. Therefore, as the CPSC recognized in the "Statement of Policy: Testing of Component Parts with respect to Section 108 of the CPSIA,"[4] testing should be limited to materials and components that could contain phthalates. Requiring testing for components that do not risk phthalate contamination is a wasteful and inefficient use of quality control resources. We also suggest the section be strengthened with either bill or report language that exempts manufacturers from the phthalate standard who have strong supply chain control and chemical management processes in place and know that phthalates will not be used in the production of their products.

In addition, the definition of a "child care article" and "children's toys" as it pertains to phthalate standards should be clarified in either bill or conference report language. The CPSC general counsel has declared that that footwear and most apparel are not covered by the definition of a "children's toy" or "child care articles" and therefore not subject to the CPSIA phthalate ban. Congress should include language to clarify that products such as footwear, apparel and fashion accessories are not considered children's toys and child care articles to strengthen this guidance.

Furthermore, report or bill language should be included to harmonize the definition of a child care article with pre-existing phthalate regulations such as the European Union Phthalate Directive which states, "The main purpose of pyjamas is to dress children when sleeping and **not to facilitate sleep.** Pyjamas should therefore be regarded as textiles and, like other textiles, do not fall under the scope of the Directive" (emphasis added).[5] Not only is harmonization of product safety standards important for businesses to be able to effectively conduct business, but quite simply pajamas are not child care articles. Children do not interact with pajamas in the same way as they interact with other child care articles such as teethers, pacifiers or bottles. Child care articles are actively handled and mouthed. While children may wear pajamas when asleep, pajamas are not likely to be mouthed – especially when the child is asleep. Therefore, pajamas do not pose a risk to children and should not be covered in the definition of child care articles.

[5] Guidance Document on the interpretation of the concept "which can be placed in the mouth" as laid down in the Annex to the 22nd amendment of Council Directive 76/769/EEC: http://ec.europa.eu/enterprise/chemicals/legislation/marketstr/guidance_document_final.pdf

Section 7: Exemption Authority for Tracking Labels Requirement

Overall, we are supportive of giving the CPSC the authority to create exemptions or alternative requirements to the tracking label requirement "if the Commission determines that it is not economically practicable for such product or class of products to bear the marks." We believe that in addition, the Commission should have the authority to make exceptions or alternative requirements if the CPSC believes sufficient information is already available on the consumer product. The predominant purpose of the tracking label requirement is to help consumers, retailers and manufacturers identify a product in the event of a recall. Prior to the CPSIA, in most, if not all cases a picture would sufficiently identify the product being recalled. In fact, most apparel and footwear recalls are drawstrings in children's upper outerwear – a hazard easily identifiable even without a picture. Therefore, requiring additional tracking information serves no purpose other than requiring manufacturers to comply with yet another regulation.

Section 8: Requirements for Public Database

The consumer database has the potential to provide consumers with meaningful information about the products that they purchase as long as this information is accurate and based on first hand reports and proper investigation. However, as it is currently implemented, the database does not have sufficient checks in place to ensure the accuracy of the information posted. Materially inaccurate information serves no one, is detrimental to businesses and can ultimately do more harm than good to public safety. We are strongly supportive of provisions of the amendment that we believe will improve the database for all stakeholders.

To start, we strongly support narrowing the definition of "consumers" and requiring verification that the submitter is "the consumer who used the product that gave rise to the harm, the user's next of kin, a member of the user's household, the legal representative of the user, or another person expressly authorized by any such person." Individuals posting to the database should have as much information as possible to ensure the accuracy of the information posted. Those who have not actually purchased the product, third parties and casual observers are much less likely to have specific information about the product or the incident itself. This information is also important so that consumers can easily identify products involved in the incident. Moreover, limiting the scope of submitters will help deter individuals who do not have a personal, vested interest in product safety and consumer protection and who may have improper motives.

To that end, we also support the inclusion of Section 8(c), "Misrepresentation Prohibited." Honest reporting is a vital element of the success of the database. Furthermore, a submitter who intentionally posts false information can cause a business irreparable damage. The amendment is necessary to discourage maliciously false information from being reported on the database.

In addition, the amendment's provisions to ensure the adequacy and accuracy of information posted takes significant steps to make the database a credible, useful and reliable resource for consumers. It is important for consumers using the database and for manufacturers to be able to specifically identify the consumer product referred to in the report of harm. Without this specificity, consumers may not be able to determine whether their product or a product they are considering purchasing is the same as the product named in the incident report. Moreover, the current strict timeline between when a manufacturer receives the report of harm and when the report of harm must be posted to the database does not give manufacturers and the CPSC sufficient time to review for material inaccuracies. The amendment gives all parties more time to collect necessary information to ensure the database entries are both accurate and complete.

The amendment should also remove "...***or any risk*** of injury, illness, or death as determined by the Commission, relating to the use of a consumer product" (emphasis added) from the definition of "harm." AAFA and its members strongly believe that "risk of harm" should be strictly determined by the CPSC. For example, reports of "risk of harm" could include reports of products "violating" inapplicable product safety standards. Someone could observe a child using a general use product, like a computer, test the computer for lead content, and make an unfounded determination that the computer's lead content presents a risk of injury – even if the computer is not subject to the lead standard. The Commission is in

charge of determining what is "safe" and "unsafe" – *not* the general public and any reports of risk of harm on the ".gov" database should come ***only*** from the Commission (through voluntary recall notices or other official Commission statements). However, the CPSC should be encouraged to collect reports of risk of harm for their own regulatory and investigation purposes and post the information to the database if they make a determination that there is an actual "risk of harm." Reports of risk of harm from other sources will likely result in additional burden on the CPSC, overpopulation of reports that are not in the public interest, and cause damage to both the database's and the Commission's credibility.

Preemption

The amendment does not address preemption issues and we strongly believe that the amendment should include language clarifying that the CPSIA fully preempts state and local product safety rules. Companies find it increasingly difficult to manage the conflicting and ever growing number of state regulations that are being promulgated. Companies labor to comply with the CPSIA only to find out – often after the fact – that they are not in compliance with a little known state standard. To comply with drawstring limitations, companies must meet conflicting standards established at the federal level and in the states of New York and Wisconsin. And this is just the tip of the iceberg, with new rules coming online in Washington State, Illinois, Connecticut, Maine, and elsewhere. With regard to CPSIA, California Proposition 65, in particular, has created significant difficulties because it relies upon different standards and product coverage, even though it purports to address product safety as well. We believe Congress made a mistake when it exempted out Proposition 65 from the CPSIA. We urge you to make federal preemption stronger so that it clearly preempts all state and local product safety related measures so we can achieve a single, harmonized national product safety standard.

Conclusion

Thank you for holding this extremely important hearing to discuss the much needed and well thought out amendment to the CPSIA. While it was absolutely necessary for Congress to reform consumer product safety regulations in 2008, many of the new requirements have caused a devastating economic impact to the apparel and footwear industry. We are pleased that Congress has recognized the need to amend the legislation to address implementation concerns and establish a strong, risk-based regulatory regime that protects public safety but does not unduly burden compliant companies.

U.S. House of Representatives
2322A Rayburn House Office Building
Washington, DC 20515

Dear Chairman Upton, Ranking Member Waxman, Chairman Bono Mack, and Ranking Member Butterfield:

As the majority of Commissioners of the U.S. Consumer Product Safety Commission (CPSC), we write to express our serious concerns with significant portions of the discussion draft circulated by the staff of the U.S. House Energy and Commerce Subcommittee on Commerce, Manufacturing and Trade (the Subcommittee), which would revoke key protections in the Consumer Product Safety Improvement Act of 2008 (CPSIA) and endanger the health and safety of American consumers, especially children.

Almost three years have passed since Congress nearly unanimously passed (424-1 in the House and 89-3 in the Senate), and President George W. Bush signed into law, the landmark CPSIA legislation. This legislation reinvigorated the CPSC and established a strong consumer product safety net that the American public demanded after the "Year of the Recall" in 2007, when millions of violative toys were recalled from American consumers. The Subcommittee draft bill seeks to reverse some of the significant steps made toward providing for a safer marketplace and would turn back the clock to the pre-CPSIA era when harmful products made their way into the stream of commerce and into the hands of innocent children.

Under the new protections established by the CPSIA, mothers and fathers now have more peace of mind knowing that during the day their young children play with toys that should no longer carry the same risks of harm. At night, those same boys and girls are likely to be in a much safer sleep environment. Moreover, on March 11, 2011, we ushered American consumers into a new era of government transparency and empowerment with the launch of the CPSIA-mandated publicly searchable consumer product database. Under this provision of the CPSIA, consumers can go online and search a centralized database for reports of actual harm or for reports of potential harm involving the consumer products they own or are considering purchasing.

We understand that Congress must be mindful of the effect of regulations on the business sector. However, the reversal of several of the core provisions of the CPSIA would likely diminish the health and safety of our nation's consumers. We cannot support such a reversal. Moreover, many responsible companies, especially here in the United States, have already taken the steps necessary to meet the law's requirements, built safety into their products, and proven that manufacturers and retailers can thrive under this new and improved consumer product safety framework. It would be unfortunate, indeed, at this time to penalize those who have come into compliance with the law and to reward those less conscientious by undoing these safety features of the CPSIA.

We recognize that some provisions within the CPSIA can be improved. In the past, the Commission has unanimously requested that Congress grant us flexibility to ease some of the administrative burdens the CPSIA has placed on manufacturers, particularly smaller businesses, without sacrificing safety. We continue to support those requested changes. The Subcommittee's draft bill, however, is not consistent with this approach. More specifically, although by no means an exhaustive list, certain provisions in the draft bill cause us great concern:

- Reducing Safety for Primary School Children: We believe that as children grow and age, the idea that they should continue to have access to safe products is—and should be—a noncontroversial one. Congress, through the CPSIA, made the policy judgment that all of our children ages twelve years and younger should be afforded greater protections. We agree with that policy judgment.

- Lead: The CPSIA set one of the most protective lead limits for children's products in the world. The public health community continues to hold its overwhelming consensus: There is no known safe level of lead. We oppose any change to the law that would lead to an increase in the doses of lead to which our children are exposed on a daily basis, particularly when the marketplace has for the most part already adjusted to lower lead levels and is well on its way to getting the lead out of children's products.

- Third Party Testing: The CPSIA requires that some objective oversight and safeguards be established for assuring that children's products meet all applicable safety standards. We have previously acknowledged the need for some targeted relief for small crafters and similar small businesses from some testing requirements and, where product safety would not be compromised, provided relief where we have been able to do so. Nevertheless, one simple fact remains: Parents should have some independent assurance that all products, whether made abroad or in the United States, are safe for their children to use.

- Cribs: The Commission spoke with one voice in 2010, when it unanimously approved the most pro-safety crib standard in the world and decided that whether an infant or toddler is at home or in a child care center, a crib should always be the safest place for a child to sleep. We cannot support a measure that places any child in a potentially life-threatening situation by allowing cribs that are decades past needing to be replaced to be used in many child care centers throughout the country.

- Database: For 38 years, the American public was kept in the dark with respect to crucial consumer product safety data that the CPSC possessed. The veil on this information was lifted on March 11, 2011, when the CPSC launched the public consumer product safety database (SaferProducts.gov). Saferproducts.gov serves as a resource for consumers to learn what other consumers already know about dangerous or potentially dangerous products and emerging hazards. We believe that consumers will be informed by the information in the database and empowered to make their own decisions to help keep their families safe. We are against any proposal that would shut the door on the open and transparent approach currently available through SaferProducts.gov and hide this vital consumer product safety information from the public once again.

We remain open to working with the Congress on adjusting aspects of the CPSIA. Nevertheless, while it is true that no one, including us, wishes to over-regulate, we similarly cannot support under-protecting the American consumer, particularly our nation's children.

Very truly yours,

Dear Madam Chair Ranking Member:

On behalf of Goodwill Industries International and its network of local Goodwill agencies throughout the United States, I am writing today to thank you and your staff for sharing recent discussion drafts of legislation that seeks to amend the Consumer Product Safety Improvement Act (CPSIA) and includes provisions that would address Goodwill's concerns about retroactively applying the CPSIA's sales ban on children's products manufactured before the law's implementation. Goodwill believes that the provisions pertaining to the selling of used children's products included in the most recent discussion draft (attached) would allow Goodwill stores to sell used children's apparel within the letter of the law and in good conscience.

Goodwill's first priority is the safety of its customers and the people it serves. Goodwill has a long history of working in good faith with the Consumer Product Safety Commission (CPSC) to prevent unsafe products from being sold in its stores. This commitment to protecting our customers is further demonstrated by Goodwill's continued partnership with the CPSC to educate the public, and inform and train our retail professionals to comply with CPSIA. Goodwill believes that this collaborative public awareness campaign has been extremely helpful in educating shoppers and employees about the hazards of certain products and proper recall procedures.

Goodwill looks forward to our continued work with the subcommittee and the full House Energy and Commerce Committee. Please feel free to contact me at (202) 333-5501 or Seth Turner, Goodwill's Senior Director of Government Affairs and Public Policy at seth.turner@goodwill.org or (240) 333-5508.

Again, thank you for your efforts to craft a solution.

Sincerely,

Jim Gibbons
President and CEO

EXCLUSION OF CERTAIN USED CHILDREN'S PRODUCTS.—

''(A) GENERAL EXCLUSION.—The lead limits established under subsection (a) shall not apply to a used children's product.

''(B) DEFINITION.—The term 'used children's product' means a children's product that was obtained by the seller for use and not for the purpose of resale or was obtained by the seller, either directly or indirectly, from a person who obtained such children's product for use and not for the purpose of resale. Such term also includes a children's product that was donated to the seller for charitable distribution or resale to support charitable purposes. Such term shall not include—

(i) children's metal jewelry; or

'(ii) any children's product for which the donating party or the seller has actual knowledge that the product is in violation of the lead limits in this section;

For purposes of this definition, the term 'seller' includes a person who lends or donates a used children's product.''.

April 1, 2011

Mr John "Gib" Mullan
2125 Rayburn House Office Building
Washington, DC 20515

Dear Mr. Mullan:

As President of the Hobby Manufacturers Association (HMA), I would like to personally thank the Republican Party for undertaking the clarification and re-definition of segments of the CPSIA as it relates to toy products. While not directly involved in the toy industry, hobby manufacturers must often operate under similar guidelines as those who manufacture toys, and therefore the clarification and re-defining of certain points of the CPSIA are of critical importance to the HMA and the hobby industry in general.

I have read the "discussion draft" suggesting proposed amendments to the CPSIA as written by the 1st session of the 112th Congress on March 29, 2011 and, on behalf of HMA member manufacturers, I wish to provide some commentary and input to some of the proposed amendments contained in the draft.

1) The draft contains language concerning lowering the age as to what is considered to be a toy used by children. The HMA proposes to amend from age 12 to age 7 based on the fact that by age 7 children are generally no longer chewing on or placing toys into their mouths. In addition, by age 7, many youngsters are already building snap-together model kits, flying model rockets at school or camp, and enjoying basic radio control cars and airplanes.

2) The HMA supports the proposed amendment to exempt products produced in small quantities from much of the testing which the original CPSIA required. It is apparent that the definition of "small quantities" is not yet defined in the draft. The HMA proposes that quantity be 7,500. The hobby industry is considerably smaller than the toy industry and our products are manufactured in low thousands, and not in hundreds of thousands or millions. In fact, a large part of the hobby industry consists of small manufacturers in small workshops or minimal manufacturing facilities producing short runs of products for modelers and collectors, often by hand or with basic tools and/or machines. The vast majority of these products are targeted to the adult modeler; however, under the original CPSIA guidelines, they could still fall within the "toy" category. One of the major concerns the HMA has regarding the CPSIA is that the required level of testing would be burdensome to the majority of small hobby product manufacturers and the costs of compliance would outweigh any potential profit to be made by producing the products. Revising this part of the CPSIA would enable those smaller companies to remain in business while still ensuring that the products are safely produced.

3) While the HMA agrees that tracking labels are of utmost importance in order to determine the origin of products, we maintain that in certain instances affixing tracking information directly on to products may not be practicable. A large percentage of hobby products are scale miniatures of real-life items such as houses and vehicles for model railroads, small collector cars and planes, and model kits. We are in favor of placing tracking information on the packages for these items if placing them on the product itself becomes unreasonable and impractical due to their smaller sizes.

On behalf of the HMA as well as the hobby industry as a whole, I offer my sincere thanks for your undertaking of the amendment of the CPSIA in order to make it more practical for hobby industry manufacturers to fully comply with the new regulations. I look forward to obtaining a copy of the final amendment so that members of the HMA may become aware of the changes and support them.

If you have any questions or if I may be of further assistance, please call me at (856) 435-1555.

Sincerely,

Michael S Bass

National Center for Healthy Housing

April 5, 2011

The Honorable Fred Upton
Chairman
Committee on Energy & Commerce
U.S. House of Representatives
Washington, DC 20515

Subject: Improvements to the Consumer Product Safety Improvement Act on Lead Testing

Dear Chairman Upton:

I am writing this letter to address a technical and scientific matter that can help protect children and increase the reliability and feasibility of testing under the Consumer Product Safety Improvement Act. As you are considering changes to the Act, the protections in this law should be fully preserved and implemented on schedule, because it has been a success in helping to prevent childhood lead poisoning.

For over 20 years, I have led scientific research on childhood lead poisoning prevention. From 1995-2004, I served as the Director of the HUD office that led the nation's efforts to address childhood lead poisoning from paint in housing. I was the principal author of the lead poisoning report from the President's Task Force on Environmental Health and Safety Risks to Children and the HUD Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (the seminal technical document in the field). I was also responsible for creating the quality control system to ensure that portable lead-based paint X-Ray Fluorescence (XRF) Analyzers can be used in a valid and scientifically defensible manner to enable residents and owners to have confidence in residential lead paint testing results.

The current CPSIA legislation seems to allow only laboratory-based destructive testing, making it practically impossible for parents to test their children's toys and other children's products in a non-destructive manner. It also unnecessarily limits the ability of manufacturers and others to conduct the large number of tests needed to protect children.

Years ago, HUD wrestled with a problem similar to that now facing the Consumer Product Safety Commission: how to test a massive number of items for lead in a way that effectively ensures child safety. Millions of homes, each one containing a hundred or more painted surfaces, needed to be tested to determine if lead-based paint hazards were present. Title X of the 1992 Housing and Community Development Act (also known as the Residential Lead Hazard Reduction Act) provided a lead-based paint

standard in two units of measure: loading (milligrams of lead per square centimeter of surface area - mg/cm^2) and concentration (parts per million by weight - ppm). While loading is the preferred measure, Title X (which I helped to craft) allowed both measures. Loading is independent of the number of non-leaded paint layers, avoiding a dilution problem. In other words, a layer of lead based paint covered by many layers of non-lead-based paint might not be detected using a laboratory test that reports only ppm, because the weight of the non-leaded layers would mask (dilute) the presence of lead paint. Loading does not suffer from this problem, because the amount of lead within a measured surface area does not change, regardless of how many layers of non-leaded paint there are. But loading does require accurate measurement of the surface area. As a practical matter, for some surfaces for which the surface area cannot be measured, ppm is the only reliable measure that can be used. Therefore, both units of measure are used.

When I was at HUD, we settled on a solution: portable X-Ray Fluorescence (XRF) technology and a quality control system that published the tolerance limits for each commercially available brand of XRF instrument on the market, combined with a laboratory quality control system. We tested the XRF instruments on hundreds of real-world paint samples on a variety of substrates and determined how well they worked. We published the results in "Performance Characteristics Sheets," for each type of XRF on the market. These are now in active use by thousands of licensed or certified lead-based paint inspectors and risk assessors across the country. It also stimulated the development of a new generation of instruments because we were able to create a level playing field in which instrument manufacturers could compete. Today, XRFs are widely understood to be reliable ways of determining the presence of lead-based paint in housing. They are typically used in conjunction with laboratory paint chip testing, for which EPA has established the National Lead Laboratory Accreditation Program. Both XRF and laboratory methods have their uses. Together, these actions have produced valid, reliable testing methods in which parents, building owners, inspectors and others have confidence.

As the CPSC looks for a way to test many thousands of products for lead content, the current law is unnecessarily limiting. While the CPSIA sets a standard of 2 micrograms of lead per square centimeter (2 $\mu g/cm^2$) for small painted areas that are less than 1 square centimeter, it does not allow this standard for larger areas. There is no scientifically valid reason to limit the size of the area for this standard. The important question is whether measurements (either by XRF or laboratory-based technologies), are reliable and supported by a good quality control/quality assurance system, such as that in place for lead-based paint testing.

Therefore, I suggest two actions for your consideration:

First, delete the current language requiring that 2 $\mu g/cm^2$ be used only for small surface areas and replace it with language that permits use of either the 90 ppm or 2 $\mu g/cm^2$ standard, regardless of the size of the surface being tested. If the materials being tested have lead at levels less than 90 ppm or 2 $\mu g/cm^2$, they would be deemed to be in compliance, regardless of the size of the area being tested. Second, CPSC (or possibly EPA and HUD) should be required to establish a quality control system to ensure that both laboratory testing and XRF testing for consumer products for children are both

10320 LITTLE PATUXENT PARKWAY, SUITE 500, COLUMBIA, MARYLAND 21044 • 410.992.0712 • FAX 443.539.4150
www.centerforhealthyhousing.org

accurate and precise for coatings, substrates and other components of children's products. Both laboratory and XRF technologies have their respective strengths and weaknesses that can be controlled. Such a quality control system would help to ensure that sampling and analytical error for both methodologies is minimized, increasing consumer and manufacturer confidence in testing results.

It is vital that this Act not be weakened. The current provisions and testing requirements can be implemented on schedule. I believe this technical improvement can help make the law even more effective in protecting children. While the nation has made considerable progress in childhood lead poisoning prevention, there are still far too many children poisoned each year and there are still far too many sources of lead exposure that can and should be eliminated.

Please feel free to contact me if I can be of additional assistance. I can be reached at 202-607-0938 or djacobs@nchh.org. I am happy to work with the committee on this language, as well as provide additional background on the reasoning behind it. Thank you for your consideration.

Sincerely,

David E. Jacobs

Re: Hearing on Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act

Dear Chairman Bono Mack, Ranking Member Butterfield, and Members of the Subcommittee:

Our undersigned groups write to you regarding our serious concerns about the Discussion Draft amending the Consumer Product Safety Improvement Act (CPSIA), which is the subject of a hearing before your Subcommittee tomorrow, April 7th. We have concerns that the approach in this Discussion Draft will undermine the critical public health protections provided by the CPSIA.

The CPSIA was passed with an overwhelming bipartisan majority in 2008. It was crafted over the course of a year of deliberations, and was the congressional response to the recalls of millions of toys and other children's products for excessive lead levels, ingestion hazards, and other health risks. The CPSIA created, for the first time, a requirement that children's products be tested for safety *before* they get to store shelves. It set into place limits on lead in children's products, set safety standards for infant durable products, banned certain phthalates, and created a public database where consumers could report product safety hazards they have experienced. The law revived the Consumer Product Safety Commission (CPSC), an agency that had neither the resources nor the authorities to adequately protect children from the hazardous products.

Since passage of the CPSIA, there have been calls for a modification of some of the law's provisions to address the needs of makers of handmade children's products. The Discussion Draft, however, goes far beyond that and reverses several key components of the CPSIA. Below are just some of the serious concerns that we have about this draft:

1) **Undermines safety testing for children's products:** It would reverse the requirement that all children's products be tested for safety, and would confine the requirement of pre-market testing to only a few select categories of products. Other products – such as strollers, high chairs, bath seats, and all toys -- would be safety-tested only if the CPSC undertook an extensive series of steps, including a cost benefit analysis that emphasizes the costs of testing while minimizing the benefits to public health and safety. Requiring independent third-party testing of all children's products builds safety into the supply chain early, and prevents costly recalls and unnecessary injury.

2) **Undermines lead protections:** It would dramatically weaken the lead limits of the CPSIA by only applying the law's current lead limits to paint on children's products and small parts that could be ingested. It would set a different, subjective standard (risk analysis) for all other children's products, including those that could be mouthed, such as vinyl bibs. We know that even small amounts of lead can cause a drop in children's IQ.

Lead is a known toxin, and we should have a single, strong standard that aims to keep it out of children's products.

3) **Undermines which children get the law's protection:** It would presumably lower the age scope of the CPSIA from its current protections for all children's products primarily intended for children age 12 and younger. This is inconsistent with the current ASTM toy safety standard, which covers toys intended for children under age 14, and it ignores the reality of the "shared toy box" – that young kids will, even with close parental supervision – play with the products that belong to their older siblings.

4) **Undermines the effectiveness of the new crib safety standard:** It would indefinitely delay, or possibly prevent, the implementation of the bipartisan, strong crib safety testing standards passed by the CPSC in December 2010 for cribs in child care facilities, and makes testing to that new standard uncertain.

5) **Undermines the phthalates ban:** It would allow large, undefined exemptions to both the prohibition and interim bans on phthalates in toys and child care articles. It would also, contrary to all other rulemakings in the Discussion Draft, require the CPSC to act within a very tight timeframe if the recommendations of the body assessing the safety of phthalates (the Chronic Health Advisory Panel, or CHAP) are to become law. This requirement is needless since the CPSIA already requires the CPSC to quickly act on a rulemaking; its only effect would be to make it difficult to permanently ban additional phthalates in toys and child care articles.

6) **Undermines life-saving tracking information:** It creates potentially large exemptions from the requirement that children's products have tracking labels, which will limit a consumer's ability to know whether their product is the subject of a recall, and to report vital product information to the CPSC database and manufacturers. Tracking labels can help save lives: When Liam Johns died in 2005, his crib, made by Simplicity, but labeled "Graco" went uninvestigated for two years because of confusion resulting from a lack of information on the product. At least two other babies died during this time.

7) **Undermines the new, public safety product hazard database:** The brand-new CPSC database for the first time allows consumer complaints about product safety problems to be posted publicly, after a screening process, while also giving manufacturers and private labelers ample opportunity to view and comment upon these reports before they are posted. This database will help consumers research products they are considering purchasing, will help the CPSC more efficiently identify emerging hazard trends, and can help prevent unnecessary deaths and injuries. However, the provisions in this Discussion Draft would place onerous burdens on the person making the complaint, thereby discouraging parties with valuable safety information from reporting. It would also remove the ability of consumer groups to report to the database. These changes would in turn keep valuable safety information out of the hands of parents and caregivers.

We urge you to reject the approach proposed by the Discussion Draft. It goes too far and will not adequately protect children from product safety hazards.

Dear Chairman Bono Mack, Ranking Member Butterfield and members of the House Subcommittee on Commerce, Manufacturing and Trade,

We founded Kids In Danger in 1998 after the death of our beloved son Danny in a poorly designed, inadequately tested and recalled portable crib. Danny was 16 months old when the top rails of the Playskool Travel-Lite crib he slept in at his licensed child care home collapsed around his neck, strangling him. He was the 12th child to die in cribs of this design.

We have worked tirelessly from that time to improve our broken children's product safety system. This was a system where untested and dangerous children's products make it easily into the marketplace, their flaws tragically discovered by our children. After years of effort, we rejoiced in 2008 when **the Danny Keysar Child Product Safety Notification Act** was included in **the Consumer Product Safety Improvement Act** and signed into law.

This portion of the CPSIA assured parents that for the first time, cribs, strollers, high chairs and other juvenile products had to be independently tested for safety before we brought them into our homes to use with our

116 W. Illinois, Suite 5E

312.595.1e29 Phone
312.595.1e30 Fax
www.KidsInDanger.org

children. Strong new standards would be adopted for juvenile products that would assure that the required testing would find potential flaws and make sure the products were safe for use. Very dear to our hearts were the provisions that ensured that child care facilities and other public accommodations could only offer children safe cribs that met federal standards. Danny died in a licensed child care home that had just been inspected by the state days before. And finally, parents would be given the opportunity to register their products with the manufacturer either through a postage paid card or online – making sure they would learn of recalls.

We are so disheartened to learn that this committee is considering erasing many of these gains.

In addition to many other onerous changes that reduce the safety of all products our children use, we ask you to reconsider this assault on the Danny Keysar Act.

This proposal strips the requirement for independent testing from all infant and toddler products, except for testing cribs to the old standards that eliminated gaps between slats, but little else. But for strollers, high chairs, play yards and more, our children will again be the test dummies for safety. Companies may say they employ their own testing, but we saw where that got us with the 10 million cribs recalled in the last four years and dozens of deaths each year in nursery products.

We are not opposed to allowing child care facilities that replace their older cribs to meet the mandatory standard passed in December, to avoid replacing those cribs every time a change is made to the standard. But combined with a requirement that allows many child care facilities to continue to use older model, possibly unsafe fixed sided cribs, these provisions erase the safety we so hoped the Danny Keysar Act would provide. First, a state requirement of supervision doesn't always equal optimum supervision in the field, and secondly, we all know supervision is no match for dangerous cribs. Danny died in a loving, licensed child care – not from lack of supervision, but because his crib was deadly. When a baby suffocates or strangles, it is usually with little or no noise. Babies have died when parents have been in the same room.

Will you take our concerns into consideration as you look to roll back these safety provisions? We feel strongly that all products in section 104 of the CPSIA (infant and toddler durable products – cribs, strollers, high chairs, etc) should be subject to third party testing with no exceptions. These are products parents and caregivers buy to keep their children safe. They involve many parts and hardware and can be very dangerous if defective. Let's not go back to the days of baby test dummies – let's make sure the products are safe before we use them for our children.

While it may not be reasonable to ask child care providers to replace all cribs every time there is a minor change to the crib standards, there should be a means by which CPSC can require that if necessary. If another flaw in cribs erupts as the drop-side issue did

over the past few years, CPSC should have the ability to require safe cribs in child care settings.

The new mandatory crib standard does so much more than ban drop-sides. In fact, it is unlikely that the drop-side cribs on the market over the past decade that led to millions of products being recalled and dozens of deaths could meet this standard – thereby eliminating the need to even officially ban them. The new standards will make sure crib hardware is sturdy, mattress supports and slats can stand up to real world use and that cribs, used to protect an unattended child, can keep a child safe. Allowing all matter of cribs, safe and unsafe, to remain in child care – just because they don't have a drop-side is a clear attempt to gut the safety improvements of the past few years. Child care is varied and diverse. It is unreasonable to have an exemption for fixed sided cribs without knowing the condition of the crib, when it was made and what standards it does meet.

Please, don't retreat on safety. As parents who have paid the ultimate price for unsafe products, we know you don't want to see more children suffer as our son did. Giving flexibility to CPSC to enforce safety provisions is one thing, but this wholesale reversal of crucial safety provisions sends us back to a scenario we know leaves children at risk.

Sincerely,

U.S. House of Representatives
104 Cannon House Office Building
Washington, DC 20515

Dear Chairman Bono Mack:

This letter is to provide comments for the record on the discussion draft amending the Consumer Product Safety Improvements Act (CPSIA). I believe that the draft legislation would solve many of the problems with the CPSIA that have become so evident, including what are clearly unintended consequences of the law. It is time to get our agency back on track and focusing on real safety issues, not imagined ones.

While the CPSIA gave the agency important tools for protecting the public, it also took away flexibility the agency needs to do its job in a sensible and rational way. For example, the lead provisions, the definition of "children's products" and the testing and certification provisions of the new law, working together, have directed the agency to results that impose unwarranted regulatory burdens while not resulting in an appreciable safety payback. In addition, we are aware of products that do not present a safety issue which have now been driven off the market because of this law. Consumers are not benefited by such a result.

I recommend that any final legislation include the following necessary changes to the current law:

- The lead exclusions need to be amended to give agency more flexibility to address unintended consequences.
    - The "Functional Purpose" language, suggested by some, does not provide adequate relief because it is subjective, costly, and favors big companies. It is also very resource-intensive for the agency.

- The amendment needs to recognize the expertise of the agency to define what is an unacceptable risk based on whether the child's interaction with the product results in measurable increase in blood lead levels.
- Migration of lead limit from 300 ppm to 100 ppm (effective in August, 2011) should be repealed. The Agency can set an appropriate lower level if dictated by safety.
- The scope of the lead provisions is too broad. The law treats all children – from infants to preteens – the same even though their product interaction is quite different and risks are different. The scope should be narrowed to apply to products intended for younger children (recognizing that the agency has inherent authority to deal with risks, regardless of source, to older children).

- The lead and phthalates provisions need to be amended so that the law applies prospectively, rather than retroactively. The retroactive provisions of the law have resulted in forcing billions of dollars worth of safe products off the market.

- The existing mandatory third party testing requirements for all children's products impose a significant burden especially on small businesses. Testing and labeling provisions need to be amended to minimize the damaging impact on product makers while protecting consumers. Rather than requiring third party testing in every instance, agency should be able to set reasonable and appropriate testing and labeling requirements that provide reasonable assurance of compliance with underlying safety standards.

- Regulations should be subject to cost/benefit analysis. Although historically the agency has followed the direction of the President in doing cost/benefit analysis, the current commission has chosen not to do this. Regulators need information on both the costs and benefits of proposed regulations to make sensible decisions. The quality of our regulations has suffered because we have not done the hard work to understand the impact of our actions.

- The Public Database provisions should be amended to include only complaints from consumers who bought or used the product or relevant public health or other public agencies; enhance the ability of businesses to respond to complaints; and include the duty of the agency to assure accuracy of any information made public.

The discussion draft would go a long way to solving the obvious problems with the CPSIA. Claims that the draft reverses progress are both wrong and deliberately misleading. The facts are that it brings some rationality back into the process. I hope that Congress will move swiftly to pass constructive legislation.

Sincerely,

Nancy A. Nord
Commissioner

G. K. Butterfield, Jr.
House Subcommittee on Commerce, Trade, and Manufacturing
Washington, D.C.

Dear Representative Butterfield,

On December 19, 2002, my 13-month-old daughter, Elizabeth (Ellie), died in a poorly and dangerously designed play yard. Recently, I wrote to committees, representatives, and senators in an effort to protect a database, required by the CPSIA, that plays an imperative role in keeping children safe by notifying parents of products that pose dangerous risks to children. Now, I am to learn that efforts to keep children safe are again threatened, this time by eliminating essential, deserved ***requirements*** that protect our children.

Specifically, I am referring to the committee's attempts to 1) eliminate the requirement for independent testing of children's products and 2) a measure that will weaken standards for cribs in daycare provider facilities. **Ladies and gentlemen of the committee, I am outraged at these propositions and you do a severe injustice to Danny Keysar's memory, as well as Ellie's and all other children whose lives were lost or bodies injured due to unsafe products, if you strip these imperative portions of the Danny Keysar Child Product Safety Notification Act.**

Eliminating the need for independent testing is in itself a death trap for children. Allowing companies to provide their own testing is erroneous and ineffectual. If a manufacturer's self testing and evaluation were adequate, we wouldn't have the thousands of recalls and warnings issued because their products failed to comply with standards or failed to keep a child out of harm's way. A manufacturer, whose goals are purely profit driven, cannot be trusted to efficiently and appropriately evaluate their own product safety without the risk of severe bias.

Had independent testing requirements been implemented prior to Ellie's death, I firmly believe Ellie would be bubbly, beautiful, nine-year-old girl, today because the product that took her life would never have made it to the store shelves without necessary modifications, like a locking mechanism and a less hazardous design. The manufacturer did not "find" the flaw, but several independent investors after the fact, certainly did. In fact, after her death, I was shocked to learn that this testing standard was never required!

Ask the parents of those children who died in cribs that were expected to be safe because cribs have required standards whether they feel that manufactures self analysis is a sufficient safe guard for product safety. The recent massive recall of drop-side cribs proves this to be otherwise. As parents, and as consumers we expect that all possible flaws have been researched and tested adequately. When we

buy a product, we have a right to expect that the particular product complies with a high quality of standards, given the products is designed and made for our precious child.

When we place our child in the trust of childcare providers, we maintain that same expectation. Daycare facilities require sufficiently trained and certified personnel as should the products they use in their facilities should require the same standard of safely and quality. The current threat to weaken requirements for cribs in use at childcare facilities is a dangerous risk that poses too many hazards. Only requiring drop side cribs to be eliminated from use in provider facilitates, implies that there aren't other dangerously designed cribs in use, and that is too risky an implication, allowing for too many dangerously gray areas. The cost childcare providers pay to replace unsafe products doesn't come close to the cost they will pay if a child dies in their care, due to an unsafe product they provided. The Danny Kesyar Child Product Safety Act not only provides protection for children, it protects the livelihood of child care providers by keeping them up to date with standards that parents expect of them.

There are too many of us parents whose children were injured or killed due to manufacturer carelessness and inadequate testing of their products. A child is priceless, beyond what any definition might attach itself to profit. Companies who make children's products should be held to the highest standards and accept accountability for their product at every moment. I can't ever escape from the pain of my grief, replace the permanent hole in my life that once was my toddling, smiling child. Manufacturers shouldn't escape the requirements of such instrumental standards.

I don't know whether Ellie was destined to be a ballerina or a professional race car driver. I also don't know what she might have looked like on her 9th birthday this past November, or what her laughter might sound like. What I do know is that Elizabeth's death lies in the hands manufacturers whose inadequate testing and attempts to cut costs resulted in the death of my little girl. Allowing these cuts to pass will then put the death of more children in your hands.

Sincerely,

Lisa L. Olney (f.k.a. Davis)

The Honorable Fred Upton
Chairman
Committee on Energy & Commerce
U.S. House of Representatives
Washington, DC 20515

By E-mail: Attention John Gibson Mullan gib.mullan@mail.house.gov

Dear Chairman Upton:

The Consumer Product Safety Commission Improvement Act was a major public health legislative accomplishment and has done much to protect the health of children and others. Our research was among the first to document the presence of lead in currently produced paints in a number of developing countries and to warn of the threat they represented as painted products were imported into the United States. We and others are continuing this research and have now found lead paint available in each of the twenty countries whose paints have been tested.

As you consider changes to strengthen the Consumer Product Safety Improvement Act, I would like to respectfully suggest a provision that has the potential to greatly expand the nation's capability to monitor compliance and thereby increase protection of the health of children and others.

For many years, colleagues and I have engaged in research to develop lead exposure assessment procedures using a variety of portable X-Ray Fluorescence (XRF) analyzers and other technologies and to develop and evaluate lead-based paint hazard reduction programs. The research with XRF use laid the groundwork for the development of an official method for the measurement of airborne lead by field portable XRF analysis. Other research demonstrated that analysis of soil by XRF produced results comparable to those by laboratory methods. Our current research on analysis of new paint indicates that modern XRF analyzers are capable of measuring lead at the two micrograms of lead per square centimeter level (2 $\mu g/cm^2$) as permitted in the current law for small areas. XRF analysis can measure lead in these units at this level for surfaces of any size, not just small areas where that standard is allowed by the current law.

UNIVERSITY OF Cincinnati

Department of Environmental Health
Division of Environmental and Industrial Hygiene
University of Cincinnati
PO Box 670056
Phone (513) 558-1747
Fax (513) 558-2722
3223 Eden Avenue
Cincinnati OH 45267-0056

The CPSC could help achieve its goal of expanding the testing of painted products in a major way if the current law was modified to permit the use of a standard of 2 micrograms per square centimeter (2 $\mu g/cm^2$) for areas of any size.

The current CPSIA legislative and regulatory structure seems to allow only laboratory-based destructive testing for other than small areas, making it practically impossible for parents to test their children's toys and other children's products in a non-destructive manner. It also unnecessarily limits the ability of manufacturers, health departments and others to conduct the large number of tests needed to protect children. Many health departments, importers, consumer goods wholesale and retail establishments and others could use trained individuals to screen for compliance using hand held portable XRF technology if this change was made. This would greatly expand the protection offered to children and others by the CPSCIA.

I would be happy to assist the Committee in any way possible to make some improvements in this excellent legislation.

Thank you for your consideration.

ThermoFisher
SCIENTIFIC

The world leader in Serving Science

April 6, 2011

The Honorable Fred Upton
Chairman
Committee on Energy & Commerce
U.S. House of Representatives
Washington, DC 20515

Dear Chairman Upton:

On behalf of Thermo Fisher Scientific Inc., thank you for taking a leadership role in considering changes to the Consumer Product Safety Improvement Act (CPSIA). I would like to respectfully suggest a way to improve manufacturers', retailers' and importers' ability to inspect consumer goods for lead content, while providing a level of protection for children that we all seek. Handheld X-Ray Fluorescence (XRF) is portable, cost-effective, non-destructive, accurate and widely accepted as a tool to test for lead in both substrate and paint. **Allowing broader use of XRF by industry will ensure that more children's products are tested and proven to be compliant.**

Thermo Fisher is the world leader in serving science. The company enables its customers to make the world healthier, cleaner and safer by providing analytical instruments, equipment, reagents and consumables, software and services for research, analysis, discovery and diagnostics. Our analytical products include instruments that use XRF technology to analyze and detect the elemental composition of materials.

Lessons from EPA & HUD's Effort to Make Homes Safe from Lead Paint

The original ban on lead in paint became U.S. law in 1978, setting a limit for lead in units of "ppm" (parts per million). This is a common unit of measure for laboratory-based analytical methods. But lab-based techniques are not portable and, therefore, not well suited to inspect homes, schools, offices and public buildings. Recognizing this, EPA and HUD partnered with the scientific instrument industry in the early 1990's to develop the first handheld XRF spectrometer for the inspection of lead paint in the field.

In order to truly enable field-deployable XRF technology, **EPA and HUD wrote enforcement regulations for lead in paint that allowed an alternate standard of lead**: 1 milligram per square centimeter. Nearly 20 years ago, EPA and HUD recognized that they could drive far more testing for lead paint by setting this *parallel – and equally protective standard* and thus enabling use of portable, cost-effective, accurate and non-destructive XRF testing in buildings nationwide.

The core technical hurdle behind the CPSIA's lead limit for painted surfaces on children's products is similar to that faced by EPA and HUD decades ago. Today, Congress and the CPSC want to encourage extensive testing to ensure that lead is not present in products given to children. In order to solve the testing conundrum, **Congress can take a simple, small step to allow a parallel – and equally protective – standard for lead that is as safe as the parts per million limits.**

Thermo Fisher Analyzers LLC | 300 Middlesex Turnpike Building 9 | Billerica, MA 01821 USA | +1 978-670-7460 +1 978 670-7430 fax | www.thermo.com/niton 800-875-1578 (toll free)

Thermo Fisher
SCIENTIFIC

CPSC Experience with Handheld XRF for CPSIA Compliance

The CPSC and Customs and Border Protection (CBP) are using handheld XRF for inspection of goods at the CPSC's lab and U.S. ports of entry. They understand that the technology is capable of quickly testing products – including painted products – for lead, allowing scientifically accurate yet quick decisions about whether to clear a shipment.

It is my firm belief that virtually every children's product found to violate lead limits over the past several years would have been – or in fact was – caught by a handheld XRF scan in less than one minute. This is the kind of technology required to protect children from lead exposure in the millions of consumer products that must be inspected each year.

CPSIA XRF-related Language

In considering original passage of CPSIA, Congress understood the lessons from EPA and HUD's efforts many years before. And, as such, the CPSIA sets a limit for lead in small painted areas of 2 micrograms per square centimeter (2 ug/cm2). However, limiting this standard to "small" areas is unnecessary, arbitrary and without scientific basis. And, the limitation creates an opening for problematic products to reach the marketplace. As such, **I encourage you now to apply this same 2 ug/cm2 standard to any painted surface.**

Taking this simple, practical step will enable a significant increase in testing and result in more safer products. This additional testing can be performed by handheld XRF, which has already gained wide acceptance as an integral part of reasonable testing programs across industry. **Manufacturers, retailers and importers seek a practical, cost-effective and defensible method to test their products accurately and efficiently. Handheld XRF provides that answer.**

With over 15 years of experience in applying XRF technology for the testing of environmental toxins, I want to assure the committee and the Congress of the efficacy and validity of what is proposed, namely allowing broad use of a lead standard in micrograms per square centimeter. Additionally, please consider the experience of the EPA and HUD and the success the U.S. government has had by enabling maximum testing of homes and other buildings to reduce lead hazards.

In closing, I appreciate your consideration and would be pleased to discuss this issue directly with you, the committee, your staff and others who are interested in protecting children from the hazards of lead and other heavy metals.

Sincerely,

Bob Wopperer
Senior Director, Marketing and Business Development

RE: Independent testing on infant and toddler products

Dear Chairman Bono-Mack and Ranking Member Butterfield:

All products in section 104 of the CPSIA (infant and toddler durable products – cribs, strollers, high chairs, etc) should be subject to independent, third-party testing with no exceptions. If a simple, independent "shake" test was done before the distribution of the Child Craft crib I bought for my children, the flaw within the crib design that is responsible for the death of my first born son would have been detected and corrected. When I woke up on the morning of December 12th 1997, I found my son, Tyler Jonathan, with his neck caught between the side rail and headboard of his drop side crib. Sometime after his one am bottle, a single screw became loose creating a gap wide enough to entrap his neck. When this happened, the side of his crib became a spring-loaded vice, strangling him to death instantly. The very last image I have of my precious son is that of him trapped and killed by a crib that I thought was his one and only safe haven.

Tyler's crib was purchased new, meeting CPSC standards, and had the JPMA seal of approval. This enrages me. When my mother first announced that she wanted to buy a crib for her first grandchild I was so excited. We went from store to store searching for the perfect crib. My mother spent hundreds of dollars on a very pretty crib that matched the paint in my nursery and had the convenience of a side that lowered. I am not very tall. When we decided on that particular crib I falsely believed that I was making an informed decision to purchase a safe crib that looked pretty and was convenient. If I knew that the crib I purchased was built with hardware that a ten month old could shake loose, suffocating and strangling babies in the middle of the night, I would NOT have purchased the death trap that is responsible for the death of my Tyler. Tyler's crib was not tested for safety and I, as a consumer, assumed it was because of that JPMA seal and the fact that the crib was falsely advertised as "#1 in safety."

My family and I went to Washington, DC this past December near the anniversary of my son's death. We were there to celebrate. The CPSC was to announce the fact that it unanimously voted YES to new crib regulations that would ban the distribution of cribs like my son's: cribs that are unsafe for our littlest consumers. Finally, standards will be in place that will force manufacturers to sell child products that meet and exceed new and improved safety standards. To think that if these standards were in place in the 1990s my son would be alive today, arguing with his siblings about who gets the last portion of mashed potatoes. Our lives were torn apart when Tyler died. It is horrific that simple testing and stronger hardware could have saved him. I urge this subcommittee to protect children like Tyler and allow the CPSIA regulations to assure child product safety.

Sincerely,

Michele Witte

FULFILLING CPSIA'S MISSION – YKK'S STATEMENT IN SUPPORT FOR A MORE EFFICIENT STATUTORY SCHEME

APRIL 6, 2011

INTRODUCTION

My name is Jim Reed, and I am the Chief Legal Counsel for YKK Corporation of America. YKK Corporation is a leading manufacturer of zippers, buttons, snaps, webbing and other fastening components. YKK has supplied these components to the apparel industry for more than 50 years. YKK is a family owned business that has grown into a global operation through its commitment to quality, innovation and customer service.

YKK'S COMMITMENT TO THE U.S.

We opened our first U.S. office in New York in 1960, and opened our first U.S. manufacturing facility in Georgia in 1973. YKK now employs over 1,800 people in the U.S. in its plants and offices in Alabama, California, Florida, Georgia, Illinois, Kentucky, Maryland, Massachusetts, Michigan, New Jersey, New York, Ohio, Texas and Washington.

YKK'S FAMILIES IN THE U.S.

"YKK" is best known as those three initials on zipper pulls, but we are much more than that. We are American workers, and, more importantly, we are parents, as fiercely protective of our children as other parents.

YKK's Tape Craft Corporation has 180 employees in Oxford, Alabama, making webbing of all kinds since 1946. They have struggled over the last several years due to the recession, but through the incredible effort of the employees in the plant, they are returning to profitability.

YKK Snap Fasteners America Inc., formerly known as Universal Fasteners, has been making buttons for over 100 years. Its 200 employees in Lawrenceburg, Kentucky, are competing with foreign manufacturers with much lower labor costs. The YSU team succeeds through the quality of their products, their innovation and their manufacturing know-how.

YKK (U.S.A.) Inc.'s home base is in Macon, Georgia, where they have more than 700 employees making zippers. It is one of the largest YKK production facilities in the world, where a great number of our employees have over 20 years' experience. They are very much a family business there, where they can boast of a multi-generational employee base.

YKK's families have made safe products for decades. We are proud of the work we do, and believe we have earned the right to continue making safe products without the crushing weight of excessive regulation.

YKK SUPPORTS THE CPSIA

As parents, YKK's employees support the mission of the Consumer Product Safety Improvement Act. We support the lead levels imposed by the law, and our products have always been below those federally mandated levels. In fact, we have already reduced the lead levels in our substrate to less than 90 ppm, well ahead of the August 2011 target date. We are not seeking exemptions from or exceptions to these requirements.

We feel the CPSIA has already made noteworthy contributions to overall product safety. The increased penalties imposed by the CPSIA, for example, seem to have had a significant impact on manufacturers and importers. The threat of a $100,000 fine per product (with the potential to rise to $15,000,000) and potential criminal liability have a powerful deterrent effect. In addition, the powers granted State Attorneys General, whistleblowers and consumers to bring their own claims greatly increase the range of potential enforcers. From a manufacturer's perspective, noncompliance is simply no longer an option. To this extent, the CPSIA has already succeeded in its mission to ensure the safety of children's products.

CPSIA'S CONTINUING CHALLENGES AND OPPORTUNITIES

For any important piece of legislation covering a broad range of products, it takes time to determine what the unintended consequences are and where adjustments may be necessary. The objective of the CPSIA is to make children's products safer, but it will have the unintended consequence of putting manufacturers out of business. Congress, the CPSC and other stakeholders have thoroughly examined the issues of the law over the last three years. The time has come for us to make the necessary adjustments to the CPSIA. We at YKK applaud this latest draft amendment by the House Subcommittee and feel it makes tremendous strides in resolving the toughest issues around the CPSIA.

THE CHALLENGE OF THIRD PARTY TESTING

Of all the useful provisions in the amendment, YKK believes the changes to the third party testing requirements does the most to resolve the greatest challenges of the CPSIA. The third party testing requirements of the law in its current form are devastatingly burdensome. This latest proposed amendment strikes the appropriate balance by focusing third party testing on those most critical areas previously highlighted by Congress and the CPSC, such as lead paint, metal jewelry and cribs. The amendment also gives the CPSC the ability to expand third party testing to other areas as necessary.

The current requirement imposing third party testing on all children's products, no matter how fundamentally safe, will put manufacturers out of business without adding significant value to the underlying safety of children's products. YKK, for instance, is not seeking to exempt its products from the lead standards, and is not shying away from those increased responsibilities. YKK's products can meet the underlying safety requirements of the law, but we have not been able to "certify" our components under the law because of the current excessive third party testing requirements.

It is hard to understand the extent to which excessive third party testing creates problems for manufacturers like YKK without understanding a little bit about the complexity and scope of the manufacturing process. We offer over 375,000 different types of zippers. We offer these zippers in 578 different stock colors, but we also make zippers in thousands of different custom colors each year in order to meet our customers' seasonal requirements.

On an average day, our team in Macon, Georgia, will manufacture 4.5 million sliders in 50 different styles, and this is before they add unique zipper pulls or apply some of the 4,000 different custom colors we offer. On that same day, they will make 300,000 different cut zippers in 100 different styles. They will also produce 180,000 meters of zipper chain, and 40 tons of brass wire.

Our team in Lawrenceburg, Kentucky, currently offers more than 10,000 different types of buttons. During the course of the average workday, this team will make almost 200 different types of buttons. To further complicate the process, the button designs they offer are continuously changing. They develop up to 150 new designs each week to keep up with customers' demands for new and unique looks.

For the most part, the components YKK manufactures are not child-specific; the same zipper going into an adult's pair of jeans will also go into a child's pair of jeans. Although only a small portion of YKK's products will actually end up in children's products in the U.S. (we estimate less than 2%), we will not know which ones they are. As a consequence, YKK has no choice but to treat ALL of its components as if they were going into children's products, compounding the impact of excessive third party testing requirements.

The burden of excessive third party testing is all the more frustrating when one considers that YKK has a decades-long track record for making safe products. YKK's commitment to quality and safety is widely recognized in the industry, and is a primary reason for our success. We stand behind these commitments with rigorous internal testing protocols. In a single year, our Macon quality team will conduct over 5,000 lead tests. We believe these processes are sufficient to ensure the safety of our products, and our record supports this position.

THE COST OF EXCESSIVE THIRD PARTY TESTING

YKK's products meet the underlying safety requirements of the CPSIA, but we cannot certify these products as "CPSIA compliant" because of the excessive third party testing requirements. The enormous complexity of the global supply chain and the tremendous variables in the manufacturing process make third party testing of all products and components in all their variations impossible. YKK has therefore been forced to tell its customers "no" when it comes to CPSIA certification. The fact that there is no underlying safety problem with the products makes the dilemma all the more frustrating.

Our ability to maintain manufacturing in the U.S. requires a focus on those things that make U.S. manufacturers competitive: (1) total customer service (meeting all the needs of the customer, no matter how complex), (2) customization, (3) speed to market and (4)

innovation. Telling our customers "no" to CPSIA certification will push them away from us, which will in turn reduce our orders. Lost orders will lead to lost jobs, and a race to the bottom through pricing wars. These pricing wars are best fought in low cost labor markets like Mexico, Vietnam and Bangladesh. The bottom line is that the excessive third party testing requirements of the CPSIA add little underlying safety value, but will put manufacturers in the U.S. out of business.

CONCLUSION

YKK is confident in the ability of its products to meet the substantive underlying safety requirements of the CPSIA. YKK's testing procedures have been developed over the decades to fulfill the specific requirements of our products and the industries we serve.

We think the change to the third party testing requirements under the proposed amendment is the right way to ensure our children are protected, while avoiding putting manufacturers out of business with overly burdensome regulation.

YKK is here in the U.S. to attest to the fact that American manufacturing is not dead. We have been to the brink, and are fighting our way back, but the recovery is tenuous. Please do not push us back down with untenable regulatory burdens such as excessive third party testing.

Mrs. BONO MACK. All right. And as we wrap things up again, I want to thank our panelists for your patience today, your indulgence certainly through those long series of votes. I would like to thank you for your commitment to this very important issue. I look forward to hearing your thoughts further as we move this legislation forward.

But I would like to be perfectly clear. Our only goal is to correct the unintended consequences of CPSIA. This draft does not undermine the current law. Again, we are trying to fix the problems that we know of in CPSIA, hopefully get some common sense back into this thing. We are simply working to make it better for all Americans and to provide the Consumer Product Safety Commission with the flexibility that it is asking for.

As the mother of two children and three stepchildren, I am completely committed—like everybody in this room is—to the safety of children everywhere. So I hope we can put these political differences aside and pass a bill that will make them prouder and safer. The ranking member and I continue to have discussions about our hope and willingness to work together to get a good bill through Congress that not only we can be proud of but the American people can as well.

So I remind members they have 10 business days to submit their questions for the record and I ask the witnesses to please respond to any questions they receive. And the hearing is now adjourned. Thank you again.

[Whereupon, at 3:55 p.m., the subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

Statement of Rep. Ed Towns (NY-10)
Before the US House of Representatives
Energy and Commerce Committee
Sub Committee on Commerce, Manufacturing and Trade.

Thank you Chairman Bono-Mack and Ranking Member Butterfield for holding this hearing today on the discussion draft to the Consumer Product Safety Improvement Act. CPSIA was passed in the 110th congress to help protect consumers against dangerous products that may do them harm. This legislation affects a broad spectrum of our economy, from the manufacturers of toys to the children that play with them. Our constituents want to know that we are doing everything in our power to make sure their children are kept safe. This is why I am seriously troubled by the proposed fixes to the legislation

that was passed during the 110th congress by a large bi-partisan majority.

Safety should be the number one goal of this committee. When we set aside the needs of our constituents to lift up the needs of special interests, we as members of congress must reevaluate what we hold dear. Consumers must be assured that children's products sold on the open market are safe. The proposed legislative fixes to CPSIA fall well below the safety standard set by the original legislation. I urge my colleagues to consider the consequences of this legislation because it will not ensure the safety of our children. I also understand that the original legislation had unintended consequences for manufacturers and small businesses however the legislation before us today is misguided in its approach.

During the 111th congress the Democratic majority had several months of consultation with industry officials to alleviate the burden placed on them by CPSIA's new standards and regulations. These common sense reforms such as allowing flexibility for the CPSC to exempt specific products and exclude for certain used children's products were supported by many of the stake holders that are here today but unfortunately these common sense reforms were not able to garner the support needed to move forward.

The draft legislation we are considering today will have a serious affect on the safety of our children and I urge my colleagues to work together to protect the standards of safety that our constituents demand of us.

Thank you Madam Chair, I yield back my time.

[DISCUSSION DRAFT]

MARCH 29, 2011

112TH CONGRESS
1ST SESSION

H. R. _____

To amend the consumer product safety laws...[*to be provided*]

IN THE HOUSE OF REPRESENTATIVES

_____ introduced the following bill, which was referred to the Committee on _____

A BILL

To amend the consumer product safety laws...[*to be provided*]

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. DEFINITION OF CHILDREN'S PRODUCT.

(a) DEFINITION.—Section 3(a)(2) of the Consumer Product Safety Act (15 U.S.C. 2052(a)(2)) is amended—

(1) in the matter preceding subparagraph (A)—

(A) by striking "intended primarily for children 12 years of age or younger" and in-

serting "primarily intended for use by children [ ] years of age or younger"; and

(3) by striking "intended for a child 12 years of age or younger" and inserting "intended for use by a child [ ] years of age or younger";

(2) in subparagraph (B), by striking "children 12 years of age or younger" and inserting "children [ ] years of age or younger"; and

(3) in subparagraph (C), by striking "child 12 years of age or younger" and inserting "child [ ] years of age or younger".

(b) TECHNICAL AMENDMENT.—Section 101(a)(1) of the Consumer Product Safety Improvement Act of 2008 (15 U.S.C. 1278a(a)(1)) is amended by striking "(as defined in section 3(a)(16) of the Consumer Product Safety Act (15 U.S.C. 2052(a)(16)))" and inserting "(as defined in section 3(a) of the Consumer Product Safety Act (15 U.S.C. 2052(a)))".

SEC. 2. APPLICATION OF LEAD LIMIT.

(a) EXTENSION OF DEADLINE FOR LEAD LIMIT.—Section 101(a)(2) of the Consumer Product Safety Improvement Act of 2008 (15 U.S.C. 1278a(a)(2)) is amended—

(1) in subparagraph (C), by striking "3 years" and inserting "4 years"; and

(2) in subparagraph (D), by striking "3 years" and inserting "4 years".

(b) AUTHORITY TO APPLY LIMITS TO OTHER PRODUCTS.—Such section is further amended by adding at the end the following:

"(F) AUTHORITY TO APPLY LIMITS TO OTHER PRODUCTS.—The Commission may, by regulation, apply the limit set forth in subparagraph (A) to any consumer product other than a children's product (as such terms are defined in section 3(a) of the Consumer Product Safety Act (15 U.S.C. 2052(a))) that is designed or primarily intended for use by children 12 years of age or younger, or to any class of such consumer products, if it determines after a hearing that the lead content in such product or class of products presents an unreasonable risk to children's health.".

(c) PROSPECTIVE APPLICATION OF LEAD LIMIT FOR CHILDREN'S PRODUCTS.—Section 101(a) of the Consumer Product Safety Improvement Act of 2008 (15 U.S.C. 1278a(a)) is further amended by adding at the end the following:

4

"(3) APPLICATION.—Each limit set forth in paragraph (2) shall apply only to a children's product (as defined in section 3(a) of the Consumer Product Safety Act (15 U.S.C. 2052(a))) that is manufactured after the effective date of such respective limit.".

(d) ALTERNATIVE LIMIT AND DE MINIMIS EXCEPTION. Section 101(b) of such Act (15 U.S.C. 1278a(b)(1)) is amended—

(1) by redesignating paragraphs (2) through 5 as paragraphs (3) through (6), respectively; and

(2) by striking paragraph (1) and inserting the following:

"(1) ALTERNATIVE LIMIT FOR CERTAIN MATERIALS AND DE MINIMIS EXCEPTION FOR CERTAIN PARTS.—

"(A) ALTERNATIVE LIMIT.—For a component part of a children's product that is made of steel, copper, or aluminum alloys, the limit referred to in subsection (a)(1) shall be [ ] parts per million unless—

"(i) the product into which such part is incorporated fits entirely within the small parts cylinder described in section

1501.4 of title 16, Code of Federal Regulations; or

"(ii) after any necessary assembly of the product and after the product has been subjected to reasonably foreseeable conditions of use and abuse, the part or any portion of the part becomes detached from the product and such part or portion of the part fits entirely within such cylinder.

"(B) DE MINIMIS EXCEPTION.—

"(i) IN GENERAL.—The limits established under subsection (a) shall not apply to any component part of a children's product if, under reasonably foreseeable conditions of use and abuse, it is unlikely that a child who is exposed to the product would ingest more than a de minimis amount of lead, unless—

"(I) the product into which such part is incorporated fits entirely within the small parts cylinder described in section 1501.4 of title 16, Code of Federal Regulations; or

"(II) after any necessary assembly of the product and after the prod-

met has been subjected to reasonably foreseeable conditions of use and abuse, the part or any portion of the part becomes detached from the product and such part or portion of the part fits entirely within such cylinder.

"(ii) METHODOLOGY FOR ESTIMATING AMOUNT OF LEAD INGESTED.—

"(I) ESTABLISHMENT BY COMMISSION.—The Commission shall, by regulation, establish a methodology for estimating the amount of lead a child would likely ingest from exposure to a component part. Such methodology shall distinguish, at a minimum, between parts that can be placed in the mouth and parts that cannot be placed in the mouth.

"(II) INTERIM METHODOLOGY.—Until the Commission has issued a final rule under subclause (I), a manufacturer may use any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part.

The manufacturer shall document the methodology used.

"(iii) DE MINIMIS AMOUNT DEFINED.—In this subparagraph, the term 'de minimis amount' means [ ] micrograms per day. The Commission may revise such amount by regulation.

"(2) EXCLUSION OF CERTAIN USED CHILDREN'S PRODUCTS. –

"(A) GENERAL EXCLUSION.—The lead limits established under subsection (a) shall not apply to a used children's product.

"(B) DEFINITION.—The term 'used children's product' means a children's product that was obtained by the seller for use and not for the purpose of resale or was obtained by the seller, either directly or indirectly, from a person who obtained such children's product for use and not for the purpose of resale. Such term also includes a children's product that was donated to the seller for charitable distribution or resale to support charitable purposes. Such term shall not include—

"(i) children's metal jewelry; or

"(ii) any children's product for which the donating party or the seller has actual knowledge that the product is in violation of the lead limits in this section; or

For purposes of this definition, the term 'seller' includes a person who lends or donates a used children's product.".

SEC. 3. APPLICATION OF THIRD PARTY TESTING REQUIREMENTS.

(a) APPLICABLE CHILDREN'S PRODUCTS.—Section 14(a) of the Consumer Product Safety Act (15 U.S.C. 2063(a)) is amended—

(1) in paragraph (2)—

(A) in the matter preceding subparagraph (A), by inserting "described in clauses (i) through (iv) of paragraph (3)(B)" after "a children's product safety rule";

(B) in subparagraph (B), by striking "the children's product safety rule" and inserting "such children's product safety rule"; and

(C) by striking the flush sentence following subparagraph (B); and

(2) in paragraph (3)—

(A) in subparagraph (A), by inserting "described in clauses (i) through (iv) of subpara-

graph (B)" after "a children's product safety rule"; and

(B) in subparagraph (B), by striking clauses (v) and (vi).

(b) THIRD PARTY TESTING REQUIREMENTS.—Section 14(b) of the Consumer Product Safety Act (15 U.S.C. 2063(b)) is amended to read as follows:

"(b) TESTING PROGRAMS.—

"(1) IN GENERAL.—The Commission may, by rule, prescribe reasonable testing programs to be used as the basis for certification under subsection (a).

"(2) TESTING BY AN INDEPENDENT THIRD PARTY.—Any test or testing program on the basis of which a certificate is issued under subsection (a) may, at the option of the person required to certify the product, be conducted by an independent third party qualified to perform such tests, unless the Commission, by rule and in accordance with paragraph (3), requires testing by an independent third party for—

"(A) a particular rule, regulation, standard, ban;

"(B) any portion of a particular rule, regulation, standard, or ban; or

"(C) a particular class of products.

"(3) REQUIREMENTS FOR TESTING BY AN INDEPENDENT THIRD PARTY.—The Commission may not require testing by an independent third party under paragraph (2) until the Commission has completed each of the following:

"(A) ACCREDITATION OF CONFORMITY ASSESSMENT BODIES.—Established and published notice of the requirements for accreditation of third party conformity assessment bodies who are determined to be qualified by the Commission to conduct such testing.

"(B) TESTING CAPACITY.—Determined that the testing capacity of the accredited third part conformity assessment bodies is sufficient to prevent unreasonable delays due to testing.

"(C) EXEMPTIONS AND ALTERNATE TESTING PROCEDURES.—

"(i) IN GENERAL.—Established, by rule—

"(I) exemptions for works of art and other one-of-a-kind products; and

"(II) exemptions or alternative testing procedures for the certification of specialty products for the disabled,

and products that are produced in small quantities such that the cost of testing by an independent third party is not economically practicable.

"(ii) PRODUCED IN SMALL QUANTITIES DEFINED.—In this subparagraph, the term 'produced in small quantities' means that not more than [ ] units of the same product (or substantially similar products) are produced in one year by a manufacturer and any affiliated manufacturer. A manufacturer may not subdivide the production of such manufacturer into small quantities in order to evade third party testing requirements.

"(D) RULEMAKING CONSIDERATIONS.—Made a reasoned determination—

"(i) that the benefits from requiring third-party testing justify the costs (recognizing that some costs are difficult to quantify); and

"(ii) that any rule issued pursuant to this paragraph is tailored to impose the least possible burden, taking into account

to the extent practicable, the costs of cumulative regulations.

"(4) REVIEW OF PREVIOUS RULES. The Commission may not enforce a third party testing requirement that became effective during the period after August 14, 2009, and before the date of the enactment of the [Act of 2011] (or that was stayed by the Commission during such period) until the Commission has reviewed such requirement and promulgated any revisions as necessary to ensure compliance with the requirements of paragraph (3).".

(c) CONTINUING TESTING. Section 14(d)(2) of the Consumer Product Safety Act (15 U.S.C. 2063(d)(2)) is amended—

(1) in the matter preceding subparagraph (A), by striking "Not later than 15 months after the date of enactment of the Consumer Product Safety Improvement Act of 2008, the" and inserting "The";

(2) in the matter preceding subparagraph (A), by striking "shall";

(3) in subparagraph (A), by striking "initiate" and inserting "not later than 15 months after the date of enactment of the Consumer Product Safety Improvement Act of 2008, shall initiate"; and

(4) in subparagraph (B), by striking "establish" and inserting "may establish".

SEC. 4. APPLICATION OF AND PROCESS FOR UPDATING DURABLE NURSERY PRODUCTS STANDARDS.

(a) APPLICATION OF STANDARD.—Section 104 of the Consumer Product Safety Improvement Act of 2008 (15 U.S.C. 2056a) is amended—

(1) in subsection (c), by redesignating paragraph (3) as paragraph (4) and inserting after paragraph (2) the following:

"(3) APPLICATION.—

"(A) IN GENERAL.—Paragraph (1) shall not apply to any revision of the standard promulgated under subsection (b)(1)(B) subsequent to the initial promulgation of a standard under such subsection.

"(B) SPECIAL RULE FOR FIXED-SIDE CRIBS SUBJECT TO CERTAIN STATE OR LOCAL LAW REQUIREMENTS.—Paragraph (1) shall not apply to a fixed-side crib offered or provided for use in a licensed child care facility that is subject to the following requirements under the law of a State or a political subdivision of a State:

"(i) The facility may not allow a child to remain in a crib for any significant amount of time while the child is awake.

"(ii) The facility may not place in a crib a child over the age of [12 months].

"(iii) An adult must be present whenever a child is in a crib.".

(b) UPDATING STANDARD.—Section 104(b) of the Consumer Product Safety Improvement Act of 2008 (15 U.S.C. 2056a(b)) is amended by adding at the end the following:

"(4) PROCESS FOR CONSIDERING SUBSEQUENT REVISIONS TO VOLUNTARY STANDARD.—

"(A) NOTICE OF ADOPTION OF VOLUNTARY STANDARD.—When the Commission promulgates a consumer product safety standard under this subsection that is based, in whole or in part, on a voluntary standard, the Commission shall notify the organization that issued the voluntary standard of the Commission's action and shall provide a copy of the consumer product safety standard to the organization.

"(B) COMMISSION ACTION ON REVISED VOLUNTARY STANDARD.—If an organization re-

vises a standard that has been adopted, in whole or in part, as a consumer product safety standard under subparagraph (A), it shall notify the Commission. The revised voluntary standard shall be considered to be a consumer product safety standard issued by the Commission under section 9 of the Consumer Product Safety Act (15 U.S.C. 2058), effective 180 days after the date on which the organization notifies the Commission (or such later date specified by the Commission in the Federal Register) unless, within 90 days after receiving that notice, the Commission notifies the organization that it has determined that the proposed revision does not improve the safety of the consumer product covered by the standard and that the Commission is retaining the existing consumer product safety standard.".

SEC. 5. APPLICATION OF SECTION 106 TO FDA-REGULATED PRODUCTS.

Section 106(a) of the Consumer Product Safety Improvement Act (15 U.S.C. 2056b(a)) is amended by inserting "or any provision that restates or incorporates a regulation promulgated by the Food and Drug Adminis-

tration or any statute administered by the Food and Drug Administration" after "or by statute".

SEC. 6. APPLICATION OF PHTHALATES STANDARD.

(a) PROSPECTIVE APPLICATION, ACCESSIBLE, PLASTICIZED COMPONENT PARTS.—Section 108 of the Consumer Product Safety Improvement Act of 2008 (15 U.S.C. 2057c) is amended—

(1) by redesignating subsections (c) through (e) as subsections (d) through (f), respectively; and

(2) by inserting after subsection (b) the following:

"(c) APPLICATION.—

"(1) ACCESSIBLE COMPONENT PARTS.—Subsections (a) and (b)(1) and any rule promulgated under subsection (b)(3) shall apply to any children's toy or child care article containing any accessible, plasticized component part that is manufactured after the respective effective dates in each such subsection and any such final rule.

"(2) COMMISSION AUTHORITY.—The Commission may, by rule, exempt any children's toy or child care article described in paragraph (1) or any class of such products or materials used in such products from any of the prohibitions under subsections (a) and (b)(1) and any rule promulgated under sub-

section (b)(3) where the Commission determines that compliance with any such prohibition is not necessary to protect children's health.".

(b) EFFECT OF CONCLUSIONS OF THE CHRONIC HAZARD ADVISORY PANEL.—Section 108(b)(3) of such Act (15 U.S.C. 2057c(b)(3)) is amended—

(1) by striking "Not later than" and inserting the following:

"(A) RULEMAKING REQUIRED.—Not later than";

(2) by redesignating subparagraphs (A) and (B) as clauses (i) and (ii), respectively;

(3) in clause (i) (as so redesignated), by inserting "or terminate such prohibition" after "margin of safety"; and

(4) by adding at the end the following:

"(B) DEADLINE AND EFFECT ON PROHIBITION.—If the Commission does not commence a rulemaking proceeding within 90 days after receiving the report required by paragraph (2)(C) or does not issue a final rule as required by subparagraph (A) within [_____] after receiving such report, the prohibition in paragraph (1) shall terminate.".

(c) DEFINITIONS.—Section 108(f) of the Consumer Product Safety Improvement Act of 2008 (15 U.S.C. 2057c(f)) (as redesignated by subsection (a)) is amended—

(1) in paragraph (1)—

(A) in subparagraph (B), by striking "consumer product" and all that follows and inserting "children's product that is subject to the standard made mandatory by section 106(b) or any successor standard";

(B) in subparagraphs (C), by striking "consumer product" and inserting "children's product"; and

(C) in subparagraph (D)—

(i) by striking "consumer product" and inserting "children's product";

(ii) by striking "section 3(a)(1)" and inserting "section 3(a)"; and

(iii) by striking "2052(a)(1)" and inserting "2052(a)"; and

(2) by amending paragraph (2) to read as follows:

"(2) DETERMINATION GUIDELINES.—For purposes of this section, a toy can be placed in a child's mouth if any part of the toy can actually be brought

to the mouth and kept in the mouth by a child so that it can be sucked and chewed. If the children's product can only be licked, it is not regarded as able to be placed in the mouth. If a toy or part of a toy in one dimension is smaller than 5 centimeters, it can be placed in the mouth.".

SEC. 7. EXEMPTION AUTHORITY FOR TRACKING LABELS REQUIREMENT.

Section 14(a)(5) of the Consumer Product Safety Act (15 U.S.C. 2063(a)(5)) is amended—

(1) by striking "Effective 1 year" and inserting "(A) Effective 1 year";

(2) by redesignating subparagraphs (A) and (B) as clauses (i) and (ii), respectively; and

(3) by adding at the end the following:

"(B) The Commission may, by regulation, exclude a specific product or class of products from the requirements in subparagraph (A) if the Commission determines that it is not economically practicable for such product or class of products to bear the marks required by such subparagraph. The Commission may establish alternative requirements for any product or class of products excluded under the preceding sentence consistent with the purposes described in clauses (i) and (ii) of subparagraph (A).".

SEC. 8. REQUIREMENTS FOR PUBLIC DATABASE.

(a) REQUIREMENTS FOR SUBMISSIONS TO THE DATABASE.—Section 6A(b) of the Consumer Product Safety Act (15 U.S.C. 2055a(b)) is amended—

(1) in paragraph (1)(A)—

(A) in clause (i), by striking "consumers" and inserting "persons who suffer harm or risk of harm related to the use of a product, their next of kin or members of their household, their legal representative, or another person expressly authorized by any such person"; and

(B) in clause (v), by striking "public safety entities" and inserting "police, fire, ambulance, emergency medical services, Federal, State, and local law enforcement entities, and other related public safety officials"; and

(2) in paragraph (2)(B)—

(A) in clause (i), by inserting "and its location and availability" after "concerned";

(B) in clause (iv), by inserting "and if such person is not the person harmed by the product, the name and contact information of the person who suffered the harm or risk of harm related to the use of the product" after "report"; and

(C) in clause (v), by inserting "that such person is the consumer who used the product that gave rise to the harm, the user's next of kin, a member of the user's household, the legal representative of the user, or another person expressly authorized by any such person and" after "person submitting the information".

(b) ADEQUACY AND ACCURACY OF INFORMATION REPORTED TO THE PUBLIC DATABASE.—Section 6A(c)(2) of the Consumer Product Safety Act (15 U.S.C. 2055a(c)(2)) is amended—

(1) in subparagraph (A), by striking "to submit" and all that follows and inserting "to—

"(i) notify the Commission within [___] days after receipt of the report that the information provided in the report is insufficient for determining which of the manufacturer's products is the subject of the complaint, in which case the manufacturer shall provide the Commission (and the person submitting the complaint, if that person has consented to disclosure of contact information) with information to assist the person submitting the report to

sufficiently identify or provide an adequate description of the product;

"(ii) notify the Commission within [____] days after receipt of the report that the information provided in the report is materially inaccurate and to provide the Commission with any additional information supporting the manufacturer's claim of inaccuracy; and

"(iii) submit other comments to the Commission on the information contained in such report."; and

(2) by redesignating subparagraphs (B) and (C) as subparagraphs (C) and (D), respectively, and inserting after subparagraph (A) the following:

"(B) ACTION BY THE COMMISSION.—

"(i) INSUFFICIENT INFORMATION.—If a manufacturer notifies the Commission of the insufficiency of the information in a report pursuant to subparagraph (A)(i), the Commission shall provide the information provided by the manufacturer to the person submitting the report (unless such information has already been provided directly by the manufacturer) and seek to

obtain from such person an adequate description of the product.

"(ii) MATERIALLY INACCURATE INFORMATION.—If a manufacturer notifies the Commission of a material inaccuracy in a report pursuant to subparagraph (A)(ii), and the Commission determines that the claim is potentially valid, the Commission shall seek to resolve the inaccuracy by any of the following:

"(I) Obtaining from the person submitting the report such additional information necessary to correct the inaccuracy.

"(II) Investigating the incident giving rise to the report in order to correct any such inaccuracy.

"(III) Providing the manufacturer a reasonable period of time to investigate and provide additional information to correct any inaccuracy.

"(iii) STAY ON INCLUSION IN DATABASE.—The Commission shall not include in the database a report described in clauses (i) or (ii) until the product can be

specifically identified and any material inaccuracy corrected.".

(c) MISREPRESENTATION PROHIBITED.—Section 19(a)(13) of the Consumer Product Safety Act by inserting "related to a submission of information to the database established under section 6A, or" after "misrepresentation to such an officer or employee".

SEC. 9. SUBPOENA AUTHORITY.

Section 27(b) of the Consumer Product Safety Act (15 U.S.C. 2076(b)) is amended—

(1) in paragraph (3), by inserting "and physical" after "documentary";

(2) in paragraph (8), by striking "and";

(3) by redesignating paragraph (9) as paragraph (10) and inserting after paragraph (8) the following:

"(9) to delegate to the general counsel of the Commission the authority to issue subpoenas solely to Federal, State, or local government agencies for evidence described in paragraph (3); and"; and

(4) in paragraph (10) (as so redesignated), by inserting "(except as provided in paragraph (9))" after "paragraph (3)".

SEC. 10. AVAILABILITY OF CERTAIN PERSONAL AND MEDICAL INFORMATION TO THE CPSC.

Section 5 of the Consumer Product Safety Act (15 U.S.C. 2054) is amended by adding at the end the following new subsection:

"(e) AVAILABILITY OF PERSONAL AND MEDICAL INFORMATION UNDER HIPAA.—In order to carry out its investigative and enforcement activities under this Act and under any of the Acts enforced by the Commission, the Commission shall be deemed a public health authority within the meaning of section 164.512(b)(i) of title 45, Code of Federal Regulations, for purposes of permitted disclosures of protected health information authorized under such section. For purposes of such section information about deaths, injuries, diseases, and other health impairments possibly relating to consumer products shall be deemed protected health information authorized to be disclosed to such public health authorities under such section.".

SEC. 11. EFFECTIVE DATE.

The amendments made by this Act shall be treated as having taken effect on the date of enactment of the Consumer Product Safety Improvement Act of 2008.

June 8, 2011

The Honorable Mary Bono Mack
Chair
Subcommittee on Commerce, Trade and Consumer Protection
Committee on Energy and Commerce
Washington, D.C. 20515

Dear Chairwoman Bono Mack:

Thank you for the opportunity to answer additional questions related to my testimony before the Subcommittee on Commerce, Manufacturing, and Trade on April 7, 2011, at the hearing entitled "Discussion Draft of H.R. ..., a bill that would revise the Consumer Product Safety Improvement Act."

Attached you will find responses to the questions submitted by members of the Subcommittee. If you require further information, please contact Kristen Mizzi with the American Academy of Pediatrics at 202/347-8600.

Sincerely,

Dana Best, MD MPH FAAP

Attachment

cc: The Honorable G. K. Butterfield, Ranking Member,
Subcommittee on Commerce, Manufacturing, and Trade

The Honorable Mary Bono Mack

1. ***You have testified that your analysis became the basis for choosing the lead levels in CPSIA. Was your analysis ever published in a peer-reviewed journal?***

The American Academy of Pediatrics' recommendations on lead limits for children's products were developed by the environmental health pediatricians who serve on the AAP's Committee on Environmental Health and reviewed and approved by the AAP leadership. As testimony, it is considered official AAP policy and given equal weight to our policy statements. AAP policy statements are developed by board-appointed expert committees and then published in the AAP's scholarly journal, *Pediatrics*. Publication in *Pediatrics* would have been redundant because the recommendations had already been reviewed extensively by experts and were approved as policy by Academy leadership.

2. ***On page 5 of your written testimony, you state that children who already have an elevated blood lead level may lose IQ points more readily than those with no detectable blood lead level. How do you reconcile this with the "key studies" you mention on page 3 of your testimony, which you interpret as showing greater IQ loss from one to ten micrograms per deciliter than for a change from ten to twenty micrograms per deciliter?***

Neurological damage from lead exposure does not take place on a strictly linear dose-response curve. The impacts of lead exposure on children with no detectable lead level are currently unknown; lead exposure at the lowest levels may cause some loss of IQ points, or it may not begin to cause harm until blood lead levels reach at least 3 micrograms per deciliter (mcg/dL), the level at which studies now confirm that IQ loss begins to take place. As blood lead levels increase from 3 to 10 mcg/dL, approximately 1 IQ point is lost for every increase of 1 mcg/dL. Above a blood lead level of 10 mcg/dL, the loss of IQ points proceeds less rapidly. When a blood lead level of 10 mcg/dL is reached, the child is expected to have lost approximately 7 IQ points; as blood lead level rises further, the IQ loss continues to accumulate but at a slower rate.

3. ***You mentioned that the Food and Drug Administration has long had a recommendation that daily intake of lead be no more than 6 micrograms per day for children age 6 and younger. Does the FDA have a different recommendation for older children? What is the recommendation for adults? Is there a separate recommendation for pregnant women?***

The Food and Drug Administration (FDA) issues a range of recommendations for daily tolerable lead intake. It should be noted, however, that these are daily intakes for food only, which do not take into account other possible exposures from sources like air, dust, and consumer products. These intake levels recognize the fact that it is impossible to

remove lead from food in cases where, for example, a plant absorbs lead from the soil. The FDA's current daily tolerable intake levels for lead are as follows:

Provisional Total Tolerable Intake Levels for Lead (Pb)

Population Group	PTTI (µg Pb/day)
Young children (0-6 years)	6
Older children (7+ years)	15
Pregnant or lactating women	25
Adult women	75

4. ***You mentioned that older children sometimes put ballpoint pens or jewelry in their mouths. You also mentioned that toys may be shared among multiple children in the same household. But aren't there many items which older children do not mouth and to which young children rarely, if ever, have access?***

It is likely that there are children's products which older children do not mouth and to which younger children rarely have access. Older children may, however, still be exposed to lead from hand-to-mouth contact (i.e. touching an object and then putting their hands in their mouths or eating with their hands). Given that lead exposure poses a significant hazard and usually can be replaced by safer alternatives in children's products, the AAP recommends ensuring that all children's products contain the lowest possible levels of lead.

5. ***Are you familiar with the studies claiming that eating junk food can cause the loss of IQ? Did the IQ studies on lead control for junk food?***

In February 2011, Northstone et.al. published a study in *the Journal of Epidemiology & Community Health* titled, "Are dietary patterns in childhood associated with IQ at 8 years of age? A population-based cohort study." The study concluded, "There is evidence that a poor diet associated with high fat, sugar and processed food content in early childhood may be associated with small reductions in IQ in later childhood, while a healthy diet, associated with high intakes of nutrient rich foods described at about the time of IQ assessment may be associated with small increases in IQ." In essence, poor diet and lower IQ tend to be found together, but the study designs examining "junk food" have not been robust enough to determine specific dietary nutrient differences causing IQ changes in the children.

It should not come as a surprise that poor nutrition during key periods of early brain development would cause IQ loss. Other studies have demonstrated the importance of balanced nutrition on children's developmental abilities. Poor nutrition can also contribute to a child's vulnerability to lead exposure. Children with nutritional deficiencies, particularly with regard to iron, are known to absorb lead into their bodies at a higher rate and therefore suffer a greater degree of associated harm.

6. ***How many "potent neurotoxins" are known to science?***

"Potent neurotoxin" is not a term of classification for hazardous substances. The Environmental Protection Agency publishes a consolidated list of approximately two thousand chemicals and other substances subject to the Emergency Planning and Community Right-to-Know Act, Comprehensive Environmental Response, Compensation and Liability Act, and Section 112(r) of the Clean Air Act that includes lead and numerous compounds of lead. These substances are not, however, further classified based on the body systems or functions they impact.

6. Has science been able to identify a safe level for most toxins, lead being exceptional?

Many known toxins are poorly studied, particularly in sensitive populations like children and pregnant women. This lack of data should not, however, be interpreted as evidence of safety. For some substances, science has identified a level below which no human health harm can be identified or detected with current research techniques. For example, the Food Quality Protection Act of 1996 (FQPA) sets a health-based standard of "reasonable certainty of no harm" that requires EPA, when setting tolerances for pesticide residue, to take into account cumulative sources of exposure (e.g., occupational, drinking water) as well as exposure to other pesticides with a common mechanism of toxicity. FQPA also requires an explicit determination that a given tolerance is safe for children and imposes an additional safety factor of up to tenfold to account for uncertainty in data relative to children.

7. You testified before the CPSC regarding the technological feasibility of the 100 parts per million standard. You testified that lead affecting one half of one percent of all children – even those older than age 12 – could potentially affect 3.75 million children. How did you reach that conclusion? You also stated that swallowing an object containing 300 parts per million lead would raise a child's blood lead level enough to lower his IQ 4 points. Could you please explain? How much lead were you assuming the child ingested?

My testimony before the Consumer Product Safety Commission on February 16, 2011 stated:

Based on the AAP's previously-noted calculations, an object containing 77ppm of lead is capable of raising a child's blood lead level to a level that would result in the loss of one IQ point. Please note that this is not meant to be interpreted as a definitive statement for each exposed individual; rather, it is a public health statement representing what will be true for the majority of children. Individual children will have factors that either increase or decrease their vulnerability.

For the majority of children, ingestion of an item containing 300ppm of lead would result in the loss of almost 4 (3.9) IQ points. Ingestion of an object containing 100ppm lead would result in the loss of just over one (1.3) IQ points.

Given that the ingestion of an item containing 300ppm of lead will cause the loss of 1 IQ point for each 77ppm of exposure, an object weighing one gram (about one standard paper clip) could cause the loss of almost 4 IQ points (300/77=3.896).

If one limits calculations only to the roughly 50 million children under the age of 12, one-half of one percent of all such children would mean that approximately 250,000 children would be affected – the equivalent of the entire population of Olympia, Washington.

8. ***When you testified before the Committee on the original introduced bill in November 2007, the legislation contained a lead standard that was similar to the current total lead standard with a final total lead standard of 100 ppm, but also provided an alternative soluble lead standard if any part did not exceed 90 ppm. You testified in support of the standard:***

> *H.R. 4040 allows manufacturers to choose between satisfying one of two standards for lead content in children's products. Manufacturers may choose to limit total lead content to a level that is initially set at 600 parts per million and is reduced to 250 parts per million after two years, then to 100 parts per million another two years later. Alternatively, manufacturers may choose to limit soluble lead content to 90 parts per million.* ***"The standards of 90 and 100 parts per million are significant goals which, if met, will measurably reduce exposure to lead in children's products.***

Your only comments seemed to have been to ensure the solubility standard was set by the CPSC to be rigorous. Would you still support a solubility standard? Is solubility a more accurate calculation of potential lead exposure? Isn't the "dose make the poison" more applicable to a soluble standard than a total lead standard? Is there any difference between a solubility standard and the de minimis exposure standard in the legislative draft?

Given that no standard existed to limit lead in any part of a children's product except paint prior to 2008, the limits in the original draft of H.R. 4040 were indeed a major step forward. The AAP's November 2007 testimony also noted, "The results of lead tests on products can vary considerably depending upon the methodology used to assess solubility. Further, the relationship of solubility to bioavailability and absorption will

vary by method used to determine solubility. … the lead standard that drops from 600 to 100 parts per million should state explicitly that it refers to total lead."

Based on a thorough exploration of the issues over the past four years, the AAP considers a total lead standard to be superior to a soluble lead standard. Individual children have factors that either increase or decrease their vulnerability to lead exposure; the federal standard should be protective of all children, including those most vulnerable.

As noted in a question above, the health effects of lead do not adhere to a linear dose-response relationship, meaning that "the dose makes the poison" is not necessarily an accurate representation of its health effects.

There could be a significant difference between a solubility standard and the 'de minimis' exposure standard proposed in the legislative draft. The discussion draft failed to provide any definition of what constitutes a 'de minimis' risk. The National Institutes of Health Toxicology Glossary defines risk de minimis as, "Risk that is negligible and too small to be of societal concern… can also mean 'virtually safe.'" There is no scientific basis for deeming any level of lead exposure to be 'virtually safe.' If such a level of lead exposure exists, research has not identified it to date.

The Honorable G. K. Butterfield

1. ***Please provide a discussion of the relationship between the hand-to-mouth behavior of children and lead ingestion. In particular, address the following:***

   a. ***Is hand-to-mouth behavior the primary route for lead ingestion by children?***

   b. ***Please explain how lead is ingested from hand-to-mouth behavior.***

   c. ***Please discuss any research regarding the relationship between hand-to-mouth behavior and blood lead levels.***

Children engage in a range of normal mouthing behaviors from infancy through school age and sometimes into adolescence. Exposure to lead can take place through ingestion of objects containing lead (such as paint chips), hand-to-mouth behavior, breathing airborne lead, and consumption of lead in food and drink, including water. Lead is ingested from hand-to-mouth behavior when lead gets on the child's hands and the child then puts his hands in his mouth or eats with his hands.

A voluminous literature exists documenting children's mouthing behaviors, some of which also explores the impact of those behaviors on blood lead levels. One particularly high quality study involved observation of children playing in a yard; researchers video-observed their hand-to-mouth behavior and then evaluated relationship of oral behaviors to children's blood lead levels. Children with higher hand-to-mouth occurrences had correspondingly higher blood lead levels. Investigators video-observed children ages 1-5

years putting a hand in their mouth 7 times hourly (maximum 67 times/hour) and an object or food in their mouth 17 times hourly (maximum 125 times/hour).[i]

2. Please provide a discussion of any research regarding the mouthing behaviors of older children, in particular those between ages 6 and 12.

A review of reports that describe children's mouthing was published by the U.S. Environmental Protection Agency (EPA) in 2009.[ii] The EPA report has a significant quantity of similar data, with frequency of oral behaviors and minutes/day of mouthing. The amount of lead that would be transferred to a child may depend on mouthing behavior (times/hour and minutes/day) and the transfer rate of lead from the object to the hand (if the object is touched and not directly mouthed). Children as old as 10-12 years put their hand in their mouth an average of 4 times hourly. This rate is much higher among younger children, and exposures from mouthing behaviors can be occurring for several hours daily per child. Even for adult workers, hand lead is associated with blood lead level.[iii]

In addition, the Centers for Disease Control and Prevention's Mortality and Morbidity Weekly Report (CDC MMWR) has published cases of lead poisoning not related to ingestion of objects. Most recently, the MMWR published a case study of a toddler poisoned by a metal charm on a necklace he wore and mouthed regularly.[iv] The MMWR has also published cases of lead poisoning from eating off lead-tainted dishware;[v] lead dust contamination of family vehicles;[vi] and exposure to lead at a firing range among adolescent members of a shooting team.[vii]

3. Please provide a discussion of any research regarding the mouthing behaviors of disabled children.

Children with certain developmental delays and other disabilities are known to be at risk for mouthing behaviors that persist in frequency and duration beyond those exhibited by non-disabled children. Given the wide array of different sorts of special health care needs, however, it would be difficult to craft a study that could accurately represent mouthing behaviors of all children with disabilities. The studies that exist in this area tend to focus on mouthing behaviors associated with specific disabilities and mitigation of these behaviors.

4. Robert J. Howell, the Assistant Executive Director for the Office of Hazard Identification and Reduction at the Consumer Product Safety Commission, in response to questioning from the Subcommittee contended that "one would expect that the risk [from lead-bearing items] decreases as you move from swallowing to mouthing, from mouthing to touching. And the management of that risk at that point then becomes a decision on how the child interacts with the product."

a. This seems to suggest that if a child cannot swallow the lead-bearing item, the child's risk of harm is inherently low. Do you agree? If not, please discuss the

harms associated with mouthing (i.e. sucking or licking) or touching lead-bearing items.

b. This concept also suggests that all children will play with that item the same way. Do different aged children play with the same item in different ways?

While the risk of lead exposure may be lower from mouthing than from ingestion, such exposure is not necessarily "inherently low." As noted in the response to the preceding question, significant lead exposures have been documented from a number of sources that would not have been obvious hazards. In addition, children of different ages will play or interact with the same item in different and sometimes unexpected ways.

5. The final statutory total lead content limit of 100 ppm set to take effect in August is more than double the 40 ppm recommendation that the American Academy of Pediatrics developed following a rigorous scientific review in response to a request from Congress to make specific recommendations regarding lead content in products. Nonetheless, some manufacturers, such as those of ATVs and bikes, have convincingly argued that they cannot make products that are durable and affordable without certain components that exceed the lead limits.

a. ***I understand the AAP would prefer to see lead eliminated from consumer products, but to the extent that there is bipartisan agreement that Congress should create an exemption process to provide targeted relief from the lead limits for the narrow universe of manufacturers who contend they cannot reasonably comply, do you agree any exception process must, as a fundamental matter, consider whether a particular product needs to have lead in it?***

The American Academy of Pediatrics would urge Congress not to permit levels of lead in excess of the CPSIA's limits in any children's product for which safer, effective alternatives exist. The CPSIA's section 101(b) specifically provided for the exclusion of certain materials or products if it could be demonstrated that exposure to the lead involved would not adversely impact child health. If Section 101(b) has proven to be unworkable, it should be revised to serve the purpose that Congress intended.

6. ***I understand that some materials used in children's products can crack and degrade over time, and that this is particularly true of vinyl and plastic products. As this happens, the amount of lead and other substances available for ingestion is greater than when the product was new.***

a. Can you please confirm that vinyl and plastic products behave in this way and provide any additional information you think may be useful to understanding this degradation and exposure process?

b. Are you aware of any other materials that exhibit similar characteristics to vinyl and plastic (i.e. material that can crack and degrade over time and release more lead or other harmful substances than when new)? Please describe these materials and what happens as those material ages.

c. Assuming we applied the de minimis exception in the Republican discussion draft, should foreseeable use and abuse include degradation of a material? And if so, how would you account for that in the estimation of the amount of lead a child is likely to ingest from that material?

It is correct that many materials containing lead will deteriorate over time and liberate higher levels of lead than when they were new or first produced. While the AAP can provide some information in this regard, more detailed authoritative information can best be obtained from chemical or biomolecular engineers.

7. *During the hearing, the Subcommittee heard repeatedly that the traditional model for the regulation of lead and other harmful substances has been to use risk assessment, and that manufacturers should be allowed to apply this model to children's products. However, last year this Subcommittee in a hearing regarding the regulation of toxic substances received testimony arguing that the traditional risk assessment model is not appropriate for substances that are persistent, bioaccumulative and toxic (PBTs) because these characteristics affect how the environment and human body treat these substances and make exposure inevitable. I understand that lead is a PBT.*

a. Can you please confirm that lead is a PBT?

b. Can you please discuss the characteristics of PBTs that make the traditional risk assessment approach for limiting exposure an inappropriate model for dealing with lead?

c. Do you agree with the Centers for Disease Control's recommendation that the nonessential uses of lead in consumer products should be restricted or eliminated to prevent exposure to this harmful substance?

Lead is classified as persistant, bioaccumulative and toxic (PBT), and releases must be reported to EPA's Toxic Release Inventory. Traditional risk assessment tends to examine one-time exposures in isolation from other exposures. In the case of lead and other PBT substances, individual low-level exposures accumulate over time to reach harmful levels. Children may be exposed to lead through the air, water, soil, household sources like paint, and consumer products. As a result, these cumulative exposures may raise a child's blood lead level to a dangerous point even though no single exposure occurs at high levels. The AAP fully agrees with the CDC's recommendation that nonessential uses of lead in consumer products be restricted or eliminated to prevent exposure.

8. *The Republican discussion draft draws a distinction between lead-containing products and parts that can and cannot be swallowed, with items that can be swallowed remaining subject to the health-protective lead content limits in CPSIA. The basis for determining whether an item can be swallowed is the "small parts cylinder" described*

in regulations that I understand are aimed at preventing children under 3 from choking on or swallowing small objects.

a. ***Do you believe the "small parts cylinder" is an appropriate tool for determining whether children over 3 years old can swallow an object?***

b. ***Are you aware of any cases where children over 3 years old swallowed objects that likely would <u>not</u> fit into the small parts cylinder (and therefore not be deemed a small part capable of being swallowed and not subject to CPSIA's strict lead content limits)? Please describe those cases and provide any additional available documentation.***

The small parts cylinder is a widely-used and well-established tool for determining whether children *under* the age of 3 years can swallow or choke on an item. The small parts cylinder is not designed for determining choking hazards for children *over* the age of 3 years.

The AAP does not maintain individual case reports or conduct studies related to incidents of choking hazards or ingestion of non-food items.

9. ***The Republican discussion draft provides that manufacturers of "specialty products for the disabled" must either be excluded from any third-party testing rules CPSC may issue under the onerous process setup in the draft or be allowed to comply through alternative testing procedures. The draft provides no definition for the term "specialty products for the disabled." I understand that certain toys are recommended and marketed as particularly useful for engaging disabled children; however, these toys are available and appealing to all children.***

a. ***Are you aware of any toys or other similar children's products (i.e. <u>not</u> medical or other adaptive devices for the disabled) that are intended only for disabled children and that are not appealing or susceptible to being played with by all children?***

b. ***Are you aware of any toys or other similar children's products (i.e. <u>not</u> medical or other adaptive devices for the disabled) that the medical community recognizes as "specialty products for the disabled"?***

c. ***Assuming this Subcommittee or CPSC is capable of identifying "specialty products for the disabled," would it concern you if manufacturers of products specifically for disabled children were held to a lower bar or no bar at all with respect to assuring the safety of these products? Please explain these concerns.***

It is unclear what may be considered to be "specialty products for the disabled." The AAP does not closely monitor the marketplace of toys designed specifically for children with special health care needs. However, any products designed for children with special health care needs should be held to the same high safety standards as other children's products.

The Honorable John Dingell

1. ***CPSIA defines a "children's product" as one "(primarily) intended for a child 12 years of age or younger." The discussion draft would change this definition to "intended for use by a child [age to be determined] years or younger." What effect would the words "for use by" have on the number and type of products covered by this definition?***

It would appear that this change in wording could exclude from coverage products that are not specifically used by the child, but may be used by a parent or caregiver in caring for the child. Such products might include bathing products, changing table and diapering supplies, or décor items.

2. ***The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a de minimus amount of lead. The draft legislation further requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given children's product. However, while the Commission establishes such procedures, the draft legislation would permit manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part."***

   a. ***Are you aware of a uniform reasonable methodology in use by manufacturers of children's products?***

   b. ***Is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products?***

   c. ***If so, do you believe this is could pose a risk to the health of children who use such products?***

The CPSIA requires all manufacturers to comply with a limit on total lead in children's products, which does not vary based upon any estimate of the amount of lead a child would likely ingest from exposure to a component part. As a result, it would seem unlikely that any manufacturer is currently attempting to estimate exposure, since such calculations would be irrelevant to compliance. The term "reasonable methodology" is ambiguous; manufacturers could conceivably use a wide range of methodologies, which would in turn result in a significant variance in test results. Any practice that resulted in a child's exposure to elevated lead levels could pose a risk to that child's health.

Representative Mary Bono Mack
Chairman, Subcommittee on Commerce, Manufacturing, and Trade
Committee on Energy and Commerce
2125 Rayburn House Office Building
Washington, DC 20515-6115

VIA E-MAIL

RE: Responses to Member questions regarding Dr. Beck's April 17 2011 testimony at the hearing titled "Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act."

Dear Representative Bono Mack:

Attached are my responses to the Member questions submitted on April 27, 2011. As requested, I have included the full text of each question, followed by my response.

Please do not hesitate to contact me with any questions. Thank you again for the opportunity to provide testimony at the Subcommittee on Commerce, Manufacturing, and Trade Hearing.

Sincerely yours,

GRADIENT

Barbara D. Beck, Ph.D., DABT, FATS
Principal

email: bbeck@gradientcorp.com

Attachment A – Responses to Member Questions

The Honorable Mary Bono Mack

1. *Can children's products that have higher total lead content nevertheless pose a lower risk than products with lower total lead content? Please explain.*

Dr. Beck Response:

Yes, it is possible that some children's products that have a higher total lead content may result in a lower risk than products with lower total lead content. As I explained in my written testimony (Beck, 2011), the actual risk would be based on numerous factors, including the actual dose of lead, exposure duration and frequency, exposure route (for example, through the skin *versus* mouthing), lead intake (the amount of lead available for absorption by the skin, lungs, or the gastro-intestinal tract), solubility of lead, and subsequent uptake (absorbed dose).

2. *You state a soluble lead standard is generally preferable to a standard based on total lead because it more accurately reflects the amount of lead that could be released from the product.*

   a. *Does that mean the current total lead standard does not account for the amount of lead that can be released from a product? How then would you grade the effectiveness of a total lead standard in protecting health?*

Dr. Beck Response:

The effectiveness of the current total lead standard is uncertain because it is not directly linked to exposure. The current standard is therefore less relevant to health protection than a standard based on actual exposure. Rather than focus on the effectiveness of a total lead standard in protecting public health, it would be better to consider a standard that is more directly linked to actual potential exposures of the population of interest.

   b. *Why should exposure be taken into account instead of a simple numeric limit?*

Dr. Beck Response:

It is important to take exposure into account instead of a simple numeric limit. Simple numeric limits based on concentration are not directly linked to health. Thus, it is very difficult to evaluate their effectiveness. In contrast, a more effective approach would be to develop a standard by setting a target blood lead increment, then calculating the amount of lead released from a toy or other product that would limit any impact to be at or below the target blood lead increment. Health-based limits for lead in other media, such as air, water, or soil, have been developed in this same manner, using exposure parameters specific to that medium (see, for example, US EPA, 2001, 2002).

The Honorable G. K. Butterfield

For each project listed on the curriculum vitae you provided to the Subcommittee, please identify the specific law firm and client or specific entity for which you provided any services and the amounts paid to you or Gradient for these services.

Dr. Beck Response:

This is confidential business information. Thus, I am unable to meet this request.

The Honorable John Dingell

1. *CPSIA defines a "children's product" as one "(primarily) intended for a child 12 years of age or younger." The discussion draft would change this definition to "intended for use by a child [age to be determined] years or younger." What effect would the words "for use by" have on the number and type of products covered by this definition?*

Dr. Beck Response:

I am uncertain as to the intent of this question. Thus, I am unable to provide an answer at this time.

2. *The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a de minimus amount of lead. The draft legislation further requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given children's product. However, while the Commission establishes such procedures, the draft legislation would permit manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part."*

    a. *Are you aware of a uniform reasonable methodology in use by manufacturers of children's products?*

Dr. Beck Response:

I am not aware of a uniform methodology currently in use by manufacturers. However, in my written testimony (Beck, 2011), I do point to some possible methods to consider as a basis for developing such a methodology, including CPSC's saline extraction method for evaluating cadmium leaching from metal jewelry during a mouthing scenario (CPSC, 2010), or a modification of CPSC's method for assessing migration of diisononyl phthalate (DINP) from polyvinyl chloride (PVC) children's products (CPSC, 1998).

b. *Is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products?*

Dr. Beck Response:

Yes, the term "reasonable methodology" may be ambiguous and could lead to variance in test results. I recommend that the language of the Bill be revised to recommend the development of guidance and criteria for a reasonable and appropriate methodology for evaluating mouthing exposure to children's products. Sample extraction and preparation methods should be recommended with the objective of achieving comparable testing results. I would also propose that CPSC be tasked with oversight and development of the "reasonable methodology." As described in my written testimony (Beck, 2011), there are some existing saliva extraction methods that could potentially be used to evaluate mouthing exposure to children's products.

c. *If so, do you believe this is could pose a risk to the health of children who use such products?*

Dr. Beck Response:

If a reasonable methodology is clearly defined in the Bill, there should be no impact on risk or health.

Responses of Robert J. Howell to Questions for the Record

Questions from the Honorable Mary Bono Mack

1. **How does the CPSC staff go about deciding whether a chemical substance poses a risk to children? What factors are important?**

   For substances not regulated by specific statutory provisions, such as lead, the Federal Hazardous Substances Act (FHSA) generally requires assessment of exposure and risk, considering reasonably foreseeable handling and use. Assessments are generally conducted on a case-by-case basis, considering the specific characteristics of the product, the intended consumers of the product, and the interaction between the consumer and the product. The CPSC Health Sciences, Engineering Sciences Human Factors, and Laboratory Sciences Chemistry Division staff conducts these assessments.

   For a specific product, staff assesses the toxicity of the chemical, conducts a dose-response assessment, and derives limits for exposure that, if exceeded, could result in adverse health effects (acceptable daily intake). Staff also conducts testing of products to estimate the level of exposure to the chemical that could occur during use, and then evaluates whether a consumer might experience excess exposure during use of the product. CPSC Chronic Hazard Guidelines provide definitions and guidance for the analysis of toxicity and exposure information (http://www.cpsc.gov/BUSINFO/chronic.pdf).

   Many different factors may be important to consider in an evaluation of toxicity, dose-response, and exposure. Staff assesses the relevance and quality of available toxicity data for a chemical, including information on adverse effects in exposed people, when available, and whether certain populations of people, such as children, may be more or less susceptible to experiencing adverse effects. Staff then assesses whether the data are sufficient to describe the relationship between exposure or dose and the occurrence of adverse health effects. The analysis also considers whether a chemical poses a risk because of the likelihood that a child could be exposed to it from the use of the product.

2. **When the CPSC staff evaluates chemical substances in consumer products, is there a particular age it focuses on? How do you take children's age into account?**

   The scientific assessment of a product is generally a case-by-case evaluation of the product which considers the intended or likely consumer and the expected behaviors associated with the product (this is also known as Human Factors staff analysis). Excess exposure would be expected to be more likely to occur with certain conditions and behaviors. For example, children under three years of age have the highest rates of mouthing behaviors (i.e., placing objects in the mouth, or handing objects and then placing fingers or parts of hands in the

mouth) and accidental or intentional ingestion of objects. The rate of mouthing and swallowing objects decreases significantly through childhood.

Children's exposure to a chemical from a product tends to be the highest in situations involving ingestion of a product, compared to touching or handling a product, or inhalation, because of the action of stomach acid that could leach a chemical from the product. In adults, exposures to chemicals in products may be more likely to occur through routes other than ingestion of the product, and again are product-specific.

Certain product types might be more likely to be associated with excess exposure in young children. For example, small jewelry items may be frequently mouthed or even swallowed. Moreover, certain materials may result in more exposure than others may; e.g., metals tend to be more soluble in stomach acid than plastics.

Therefore, prioritization of staff project work may focus on products for younger children or on products with expected behaviors and exposure patterns that might result in excess exposure, or on both of these factors. Routine analysis of products obtained by CPSC is based on all of the considerations above, and is specific to the product being evaluated.

3. Does lead affect humans differently at different ages? If so, how?

Factors related to exposure to lead may be more important than the toxicity of lead in different populations. For example, children under three years of age have the highest rates of mouthing behaviors (i.e., placing objects in the mouth, or handing objects and them placing fingers or parts of hands in the mouth) and accidental or intentional ingestion of objects. The rate of mouthing and swallowing objects decreases significantly through childhood. Therefore, the youngest children have the highest exposures to lead (other than occupational exposures in adults).

With respect to lead toxicology, the scientific literature includes studies of children of all ages, but predominantly younger children, probably because of the knowledge of children's sensitivity to lead compared to adults. The susceptibility of children stems both from factors relating to physiology, such as their immature and developing nervous system, and rapid growth and development rate, and to common childhood behaviors that tend to increase exposure, such as mouthing, ingesting objects, and hand-to mouth activity. In addition, lead accumulates in the body, so that exposures at younger ages may result in adverse health effects later in life.

Among children of all ages, the relationship between a specific age and vulnerability to lead toxicity is not well understood, so that no specific window of exceptional susceptibility has been defined. Further, available information does not support a conclusion that there are populations not at risk to effects from lead exposure. Literature on the toxic effects of lead exposure in adults has expanded in recent years, showing consistent associations between lead exposure and increased risk of health effects involving the organs systems such as the cardiovascular system and kidneys, as well as neurocognitive effects. Thus, lead exposure can cause adverse health effects in people of all ages.

In general, children are susceptible to the effects of lead throughout childhood and beyond. While the specific effects and the relationship between the level of exposure and the outcome are likely related to the age of the exposed person, detailed information is not available to clearly separate vulnerable children by age.

4. **The Commission set higher lead limits for certain metal alloys in electronic products for children. When the Commission granted a stay of the lead content limits for ATVs and bicycles, it set temporary limits at the same or very similar levels. In the Commission's view, does the lead content allowed in these products pose a significant risk to children? Please explain why or why not.**

Section 101(b)(4) of the CPSIA provides that if the Commission determines that it is not technologically feasible for certain electronic devices to meet the lead content limit, the Commission must issue requirements or minimize the potential for exposure to and accessibility of lead in such electronic devices. Accordingly, by rule, the Commission established that it is currently not technologically feasible for certain component parts of electronics to meet the CPSIA lead limits (e.g., cathode ray tube glass) which are necessary for the proper electronic functioning of the component part.

The exempted parts of electronic devices and the parts of ATVs and bicycles with lead content that might exceed the statutory lead limits are generally parts of products that are not expected to be frequently contacted or to be mouthed or swallowed by children. Because exposure to the exempted parts would be minimal, very little, if any, exposure to lead that might be present in the part of product is likely.

5. **The Government of Canada is in the process of addressing lead in consumer products. How does Canada's new approach compare to ours? Does it treat different types of products differently based on exposure?**

A new regulation in Canada applies to what is referred to as "Group 1 products," which are products used in the mouth (other than kitchen utensils which are considered separately) or by children under three. The total lead content limit is 90 mg/kg (ppm) for accessible parts, but there is an exemption if the lead is necessary, cannot be substituted, and the migratable lead is no more than 90 mg/kg (based on the tests specified in the toy safety standard EN 71-3).

The regulatory analysis for this regulation includes the conclusion that stakeholders have no issue with the regulation after it was amended to apply only to accessible parts and to allow for exemptions based on lead migration. The analysis includes a discussion of component parts that are not expected to have a lot of contact by children and that therefore justify the exemption clause (e.g. wheel axles on toy cars/trucks, the heads of nuts, bolts, screws, and other fasteners, and the tips of inner tube valves on tricycle wheels).

Canada is also proposing regulations for "Group 2" products, which would include products for children ages 3-13 years. The proposal is also for a 90 mg/kg total lead content.

Information on the Canadian government website indicates that a consultation will begin this year, providing for stakeholder input.

In the U.S., the Consumer Product Safety Improvement Act of 2008 restricts lead in children's products to 300 ppm, based on the total lead content by weight, for any part of the product. As of August 14, 2011, the limit will change to 100 ppm, unless the Commission determines that the lower limit is not technologically feasible for a product or product category. A children's product is defined as a consumer product designed or intended primarily for children 12 years of age or younger.

The law exempts inaccessible component parts from the lead restrictions, and authorized the Commission to address the technological feasibility of certain electronic devices. With regard to electronic devices, the Commission has provided for exemptions and alternate requirements for certain electronic parts where use of lead is necessary for the proper electronic functioning of the component part.

The law also contains an exception for certain products or materials where the Commission determines, after notice and hearing, that lead in the product or material will not result in the absorption of any lead into the human body. To date, the Commission has not been able to make any exceptions under this provision.

6. **The Commission has approved the use of x-ray fluorescence (XRF) devices to measure lead content in homogeneous plastics. To what extent can these devices be used to measure lead content in metal parts of products?**

In addition to approving the use of x-ray fluorescence (XRF) for lead content in homogeneous plastics, the Commission also recently approved the use of high-definition XRF for determining compliance with the standard for lead (Pb) in paint and other similar surface coatings. *See Third Party Testing for Certain Children's Products: Notice of Requirements for Accreditation of Third Party Conformity Assessment Bodies – Lead Paint*, 76 *Fed. Reg.* 18,645 (April 5, 2011).

To date, CPSC has not approved any XRF method for testing the compliance of children's products to the limits for lead in metal substrate set forth in Section 101 of the CPSIA. While XRF technology has the potential to measure lead in metal products, *in situ* measurements of consumer products are made difficult due to the common occurrence of electroplating and other inhomogeneities. XRF has very limited penetration depth into metals, and lead in the base metal can be "hidden" by the coating layer.

CPSC staff has published guidance on this issue: Study on the Effectiveness, Precision, and Reliability of X-ray Fluorescence Spectrometry and Other Alternative Methods for Measuring Lead in Paint, August 2009, available at http://www.cpsc.gov/about/cpsia/leadinpaintmeasure.pdf. An update, "Update on Use of X-ray Fluorescence Spectrometry for Measuring Lead in Paint" (December, 2010) is also available at http://www.cpsc.gov/about/cpsia/leadinpaintmeasure_update.pdf.

7. **What methodology does the Commission use to measure the total lead content in metal alloys? How long does the process take? In general terms, what methodology would the Commission use to determine the amount of lead a child would be exposed to from a metal part that can be mouthed but not swallowed?**

The CPSC staff employ Test Method: CPSC-CH-E1001-8.1 Standard Operating Procedure for Determining Total Lead (Pb) in Metal Children's Products (including Children's Metal Jewelry), Revision June 21, 2010 [http://www.cpsc.gov/about/cpsia/CPSC-CH-E1001-08_1.pdf].

The general approach is to grind any accessible component part of a sample to a powder, digest completely in a combination of hot concentrated nitric and hydrochloric acids and analyze by Inductively Coupled Plasma – Optical Emission Spectroscopy (ICP-OES). Other analytical methods such as Inductively Coupled Plasma – Mass Spectrometry (ICP-MS) and Flame Atomic Absorption Spectroscopy (FLAA) and Graphite Furnace Atomic Absorption Spectroscopy (GFAA) may be used under appropriate conditions as an alternative to ICP-OES using applicable, recognized analytical techniques for the alternative method. The time required for testing one sample is more than the time required per sample when testing many, as there are economies of scale as a "production line" is set up. A single chemist can test one sample in one full day, with about one hour of hands-on work and the balance being waiting time while processes complete themselves. That same chemist could test 10 metal items in a full day with perhaps two hours of hands-on work. Analysis time may vary depending on the complexity of the results.

Under current law, CPSC staff rely on the regulations limiting total lead content of children's products. Were staff to evaluate possible lead exposure from mouthing but not swallowing objects, the test methodology would depend on the object and manner in which a child interacts with it. For a piece of metal jewelry, such as a large pendant, which is too large to be swallowed, but would fit inside the mouth, CPSC staff have historically relied on extractions using a saline solution of 0.9 percent sodium chloride in water. For these extractions, a weight of saline equal to 50 times the weight of the jewelry would be used to evaluate how much lead leached out in a period of time. For items of this type, staff has used a time of six hours for the extraction. The methodology is essentially that given in the Cadmium extraction method given at http://www.cpsc.gov/library/foia/foia11/os/cadmiumjewelrytest.pdf, with a 0.9 percent saline solution used in place of acid and with a duration of six hours.

For very large items that could have a portion placed in the mouth, staff has sometimes used only a portion that would correspond to a child's mouth size. For example, when looking at lead in vinyl bibs, staff used a 25 cm^2 portion of the vinyl sheeting, which is the approximate size of a child's mouth. For electroplated metal items though, cutting the sample to a smaller size exposes the base metal directly, which would alter the leaching of lead compared to an intact electroplated coating. The methodology for a sample like that could involve suspending the sample so that only a portion of it was wetted by the extraction solution, but with the item maintained intact.

8. In its rulemaking on continued compliance testing, does the Commission have a legal obligation to consider the costs of the testing programs it requires? Does the Commission have a legal obligation to consider the costs in relation to the benefits of such testing? Please provide citations or copies of any statutes, regulations, Executive Orders or other sources of law bearing on this issue.

The underlying statute determines whether the CPSC engages in a cost-benefit analysis for a particular rule. For example, section 9(c) of the Consumer Product Safety Act (CPSA) requires a description of the potential benefits and costs of a proposed rule, "including any benefits or costs that cannot be quantified in monetary terms, and an identification of those likely to receive the benefits and bear the costs." Section 9 of the CPSA establishes the procedure for consumer product safety rules. Section 3 of the Federal Hazardous Substances Act (FHSA) establishes the rulemaking procedures under the FHSA and contains language that is almost identical to section 9(c) of the CPSA.

In contrast, the general rulemaking authority for the Consumer Product Safety Improvement Act of 2008 (CPSIA) does not contain a cost-benefit analysis requirement for rules issued pursuant to the CPSIA. Because the rule in question was issued under the CPSIA, there was no legal obligation to consider costs or costs in relation to benefits.

Nevertheless, in developing the rule, staff was sensitive to cost concerns (as evidenced by the proposed rule's provisions regarding periodic testing and low volume production), and a related rule (pertaining to component part testing) was designed to reduce testing costs by allowing for the testing and certification of components. For example, if a manufacturer used the same component in two different products, the component part testing rule would enable the manufacturer to test the component once and apply the test results or certification to the two products rather than test the same component twice (once for each product).

Additionally, for all rules that are published pursuant to the notice and comment rulemaking requirements of the Administrative Procedure Act or other laws, we comply with the Regulatory Flexibility Act. This statute requires us to evaluate whether the rule will have a significant economic impact on a substantial number of small entities. While this analysis is not as comprehensive as a cost-benefit analysis, it does consider the potential beneficial and adverse impacts on small businesses.

9. Has the Commission ever postponed compliance with a third-party testing requirement due to concerns about whether there was enough available testing capacity? If so, please describe the circumstances.

Yes. The Commission has stayed enforcement for testing and certification of youth model ATV's because current testing capacity is inadequate to support industry demand.

10. Is the Commission staff aware of any deaths in fixed-side cribs in licensed child-care facilities? If so, did the Commission find evidence of a defect in the design or

manufacture of the crib? If the Commission conducted investigations of such cases, please provide a copy of all reports relating to the investigation.

Based on a review of the data going back as far as 1997, there are no reported fatal incidents known to have occurred in a total fixed-side crib that were attributed to a structural failure of the crib, in a child care environment. A fixed-side crib is defined as one without a movable side (i.e., a side that lowers or otherwise moves to provide easier access to the occupant).

However, CPSC staff is aware of five fatalities that were associated with a structural failure of a stationary (non-movable) side of a drop-side, drop-gate or unknown style crib. All five occurred in home day care environments, three of which were known to be licensed.

The three incidents involving a drop-gate crib were similar in that a folding side (used to collapse the crib for storage) separated from the corner post due to a missing screw. All three of these incidents involved the same make and style crib.

The incident involving a drop-side crib occurred when a bolted connection on the stationary side (opposite the drop-side) came loose.

The unknown incident has only one picture showing the detached corner of the crib where the incident took place. It is clear that detached side is not a movable side, but the picture does not provide enough information to determine whether the crib contains a drop-side or drop-gate.

Thus, no movable sides (either a drop side or drop gate) were directly involved in any the five deaths. All the crib failures were determined to be associated with missing hardware. Because of the construction and integrity of cribs containing movable sides, however, the presence of a movable side on these cribs cannot be ruled out as a contributory factor.

11. Has the Commission made a determination that all fixed-side cribs currently in use or currently for sale in commerce are unsafe unless they comply with the new crib standard? If so, does the Commission intend to order or negotiate recalls of those cribs?

In December of 2010, the Commission issued a safety standard for cribs as directed by section 104 of the CPSIA. 75 Fed. Reg. 81766 (Dec. 28, 2010). As required by section 104(b) of the CPSIA, CPSC's crib rule is substantially the same as the relevant voluntary standards, ASTM F 1169-10 (full-size cribs) and ASTM F 406-10a (non-full-size cribs). Both of these ASTM standards prohibit traditional drop side cribs. Because CPSC's crib rule incorporates by reference the ASTM standards, with some modifications, it also prohibits traditional drop side cribs. The Commission did not make a finding that all fixed side cribs are unsafe. Rather, it followed the statutory mandate to issue a mandatory crib rule substantially the same as or more stringent than the voluntary standards.

It should also be noted that the new mandatory crib rule contains numerous other provisions from the voluntary standard that improve crib safety, such as requirements for enhanced

hardware, mattress supports, and slats. Again, the Commission did not make a specific finding that cribs that do not conform to these requirements are unsafe, but recognized, in issuing the rule, that these enhancements addressed issues identified by the voluntary standards committee and will likely reduce the risk of injury.

The Commission has negotiated many recalls of cribs over the past several years. These recalls have been focused on particular cribs that may pose specific hazards and can be found on saferproducts.gov. The voluntary standards group, aware of the hazards addressed by these recalls, worked to ensure the standard also addressed those hazards, including the unreasonable risk of injuries presented by drop side cribs, hardware failures, and mattress support failure.

12. There have been conflicting press reports as to whether the Commission is resolving claims of "material inaccuracy" before posting "reports of harm". The Commission's proposed rule stated that it would not post reports until such claims were resolved but in the preamble to the final rule, it said that it lacked authority to postpone the posting beyond the tenth day. Nevertheless, some have said that the Commission does not post reports within 10 days where the manufacturer to which the report was sent indicates it did not, in fact, make the product. Can you please explain how these issues are being resolved? In particular, please clarify whether the Commission believes that the requirement to post in 10 days does not apply where certain claims of material inaccuracy are raised. If the requirement to post within 10 days does not apply in certain cases, does the Commission nevertheless have discretion to post the report of harm in such cases or does it believe that it legally must resolve certain types of claims before posting?

A claim that a report of harm (report) contains potentially materially inaccurate information (MII) is resolved by the CPSC as required by section 6A of the Consumer Product Safety Act (CPSA) and the Commission's regulation at 16 C.F.R. 1102.26 and 1102.28. Section 6A(c)(3)(A) of the CPSA requires the Commission to publish reports that meet statutory minimum requirements "not later than the 10th business day after the date on which the Commission transmits the report . . ." to the identified manufacturer, importer, or private labeler (collectively referred to herein as the manufacturer). Thus, the 10-business day report publication date is calculated based on the date CPSC sends a report that meets the minimum requirements for publication to the manufacturer of the consumer product.

If a manufacturer files an MII claim before the end of the 10 business days, there are two instances when the CPSC may withhold a report beyond this 10 business day report publication date: (1) CPSC makes a decision, within the 10 business days prior to posting a report, that the report contains materially inaccurate information (Section 6A(c)(4)(A) of the CPSA); or (2) CPSC is in the process of determining whether a Report meets the eight minimum requirements for publication (Sections 6A(b)(2)(B), 6A(c)(1), and 6A(c)(3)(A) of the CPSA).

MII claims received thus far can be divided into three types: (1) identification of a wrong manufacturer of the product; (2) submission of inaccurate information on the report, other

than the manufacturer; and (3) allegation that CPSC lacks jurisdiction over the product or that the submitter has failed to identify a harm or risk of harm related to the use of the product. The type of claim submitted bears on how the claim is resolved and whether it affects the report publication date.

For example, the identification of a manufacturer has both substantive and procedural connotations. Manufacturer name is a required field for a report to be published in the Database; if the name is removed, rather than corrected, the report is ineligible for publication. Moreover, the 10-business day report publication date is calculated based on the date a manufacturer is notified. If a manufacturer name is corrected, the report publication date must be re-calculated based on notice to the correct manufacturer. A description of the procedures related to each type of claim appears below.

MII claims alleging that the wrong manufacturer has been identified are generally made quickly by the business receiving the report, and can be handled quickly by the CPSC. A staff member verifies the information provided in the MII claim, and then replaces the incorrect business name with the corrected name. CPSC may lawfully withhold publication of such a report to correct the manufacturer name and to notify the corrected manufacturer of the report. Neither the law nor the CPSC's regulation requires the CPSC to post a report 10 business days after notifying an *incorrect* manufacturer. In fact, section 1102.28 of the final rule states that when the wrong manufacturer is notified, the 10-business day clock for posting a report will be reset when the correct manufacturer is notified, so that the correctly identified manufacturer has 10 business days to review and respond to the report before it is published. The law requires this result, because the report publication date is calculated based on the date the manufacturer of the consumer product is notified.

Similarly, with regard to MII claims that are not alleging a wrong manufacturer, if the CPSC makes a decision on an MII claim prior to posting the report and concludes that a report contains materially inaccurate information, it must correct the inaccuracy before publishing the report. If such correction extends the report publication date beyond the 10th business day, it is a lawful extension because the CPSC has already determined that inaccurate information in the report must be corrected. Although CPSC is not required by law to make MII claim decisions within the 10-business day period before a report is posted, CPSC attempts to resolve all timely made MII claims before a Report is published. If we cannot make a decision on an MII claim by the report publication date, the report will be published, as is, on the 10th business day after the manufacturer was notified. If CPSC determines that a report contains materially inaccurate information after it is published, the law requires us to correct the report within seven business days of such determination.

Finally, manufacturers have been using the MII claim function in the Business Portal to challenge more than just the accuracy of the information contained on a report. Some businesses have made claims that a report does not meet the eight minimum requirements for publication. Typically, these types of claims allege that the CPSC lacks jurisdiction over the product, or that the report does not describe a harm or risk of harm.

Unlike a true MII claim, the essence of these types of claims is not necessarily inaccuracy of the information on the report. Rather, these claims are essentially positing that even if all of the information on the report is true, the report fails to satisfy the statutory minimum requirements for publication. While we try to resolve any dispute of eligibility within the 10-business day time period before posting a report, when a credible claim is made that a report is ineligible for publication, the CPSC may lawfully withhold publication until a decision on whether CPSC has jurisdiction over the product, or whether the submitter has described a risk of harm, is made.

CPSC is considering whether to create another process in the Business Portal for firms to challenge the eight minimum requirements for publication, as these types of claims do not generally involve consideration of whether information in the report is materially inaccurate. Rather, such claims involve an assessment of whether the information in the report, if taken as true, is sufficient to meet eligibility requirements for publication.

13. How many reports of harm have been received by CPSC between the official launch of the database (on or about March 11, 2011) and April 14, 2011? How many reports have been transmitted to manufacturers? How many responses were received from manufacturers? How many claims of "material inaccuracy" were made? How many of the reports that were challenged as "materially inaccurate" were posted before the claim was resolved by CPSC?

During the period March 11, 2011, through April 15, 2011, CPSC received 2012 reports in submitter categories that are potentially eligible for the public database. Of these, 798 reports have qualified as reports of harm, which are eligible for publication in the database. The number of qualified reports of harm can be expected to rise slightly over time as additional consent and verification forms are returned for reports submitted through channels other than CPSC's public portal. 797 of the qualified reports of harm have been transmitted to manufacturers. To date we have received 331 manufacturer comments, 85 claims of materially inaccurate information, and no confidential information claims related to these 797 reports. Four reports were published before the claim of materially inaccurate information was resolved by CPSC and 11 claims were submitted after publication.

14. How many reports of harm relate to an incident that is more than one year old?

Fifty seven of the 798 qualified reports of harm received between March 11, 2011, and April 14, 2011, describe an incident that occurred more than a year before the report submission date.

15. How many reports of harm relate to an incident involving a product that has previously been recalled? Do any of them involve an incident occurring after the recall?

Our system does not yet link reports of harm to recalls, so it is not possible to determine how many reports of harm involve previously recalled products. We have received reports describing incidents occurring after a recall and in some cases, manufacturers have posted comments alerting the submitter and readers to the existence of a recall on the product.

Questions from the Honorable G. K. Butterfield

1. **In response to questioning from the Subcommittee, you contended that "one would expect that the risk [from lead-bearing items] decreases as you move from swallowing to mouthing, from mouthing to touching. And the management of that risk at that point then becomes a decision on how the child interacts with the product." Your response suggests that you believe risk assessment is an appropriate approach for regulating lead in children's products.**

   Last year, this Subcommittee in a hearing regarding the regulation of toxic substances received testimony that convincingly suggests that the traditional risk assessment model is not appropriate for substances that are persistent, bioaccumulative and toxic (PBTs) because these characteristics affect how the environment and human body treat these substances and make exposure inevitable. I understand that lead is a PBT.

   a. **Please discuss your familiarity, or that of your staff, with PBTs in general and the emerging school of thought that risk assessment is not appropriate for PBTs.**

      CPSC staff is aware of the challenges related to evaluating chemicals that are persistent and bioaccumulative, but believe that on a case-by-case basis, potential chemical exposures from products can be assessed using the tools available within the broad field of risk assessment. The Federal Hazardous Substances Act, one of the federal laws that provide CPSC the authority to regulate hazardous products, states the conditions under which a product can be deemed a hazardous substance or a banned hazardous substance. Such determinations require assessment of exposure and risk.

      Accordingly, staff applies appropriate risk assessment procedures to evaluations of products containing specific chemicals, although lead in children's products is regulated based on lead content as provided by section 101 of the Consumer Product Safety Improvement Act of 2008 (CPSIA). Approaches to risk assessment of persistent or bioaccumulative chemicals include assessing a specific consumer product exposure in the context of other sources of exposure, including potential changes in exposure over time.

   b. **Please discuss what consideration CPSC gives to whether a substance present in a consumer product is a PBT and whether it presents an unreasonable risk of injury to consumers.**

      One of the basic principles of toxicology is that there are conditions of exposure to chemicals, including the level of exposure, that determine whether the exposure could result in adverse health effects (i.e., not all exposures to a chemical are hazardous). When appropriate, CPSC staff considers "background" exposures and other specific exposure sources when evaluating a consumer product containing the chemical.

      In the case of lead, prior to the enactment of the CPSIA, staff evaluated lead in children's products based on a risk assessment that assessed the effects of lead exposure from

products in the context of the overall level of exposure to lead in the population from other sources, using blood lead levels as the measure of exposure.

c. **Do you agree with the Centers for Disease Control's recommendation that the nonessential uses of lead in consumer products should be restricted or eliminated to prevent exposure to this harmful substance?**

CPSC staff agree with recommendations to reduce wherever possible exposures to harmful chemicals. In many cases where the use of a product could cause substantial personal injury or substantial illness, the Commission has restricted uses of chemicals in products, using its regulatory authority under the Federal Hazardous Substances Act.

2. **In response to questioning from the Subcommittee regarding implementation of the de minimis exception proposed in the Republican discussion draft, you testified that CPSC would have to develop multiple methodologies for manufacturers to determine whether they qualify for the exception given the variety of children products and the different ways children might be expected to interact with those products. However, you stated that developing these several methodologies would not require a substantial investment of CPSC's limited resources.**

a. **Please explain why you believe developing multiple methodologies to account for how children interact with an unknown and ever changing universe of products would not require the investment of substantial resources by CPSC. In framing your response, please also account for the fact that CPSC generally applied its own risk assessment methods on a case-by-case and after-market basis, and not on a market-wide and pre-market basis.**

The proposed language calls for the Commission to establish, by regulation, a methodology for estimating the amount of lead a child would likely ingest from exposure to a component part. Developing multiple methodologies for manufacturers to determine whether they quality for the proposed *de minimis* exception would not require the investment of substantial resources by CPSC staff because the testing methodologies required to determine the amount of potentially toxic heavy metals that can leach from various materials have been in use at CPSC for many years.

For example, the general methodology outlined in CPSC's Cadmium extraction method, which can be found at http://www.cpsc.gov/library/foia/foia11/os/cadmiumjewelrytest.pdf, can be used to determine the amount of lead that would be extracted from a component part if ingested. Replacing the acid solution with a 0.9 percent saline solution, and adjusting the duration period to six hours, would be used to determine the amount of lead that would be extracted from a component part that is mouthed.

3. **In response to a question from the Subcommittee regarding the cost of third-party testing for a bicycle, you stated that "the cost to test a $50 bicycle for all the applicable standards would run somewhere in excess of $10,000."**

a. **Please clarify this response by providing a list of all standards applicable to a children's bike and that indicates whether a third-party testing requirement regarding that standard has been stayed by the Commission.**

Children's bicycles are covered by the bicycle safety standard, which is codified at 16 CFR Part 1512 – Requirements for Bicycles. The stay of enforcement for this standard has expired, except for bicycles with non-quill type stems. Bicycles with non-quill type stems are currently excluded from the requirement to certify compliance with the handlebar stem insertion mark requirement of 16 CFR Part 1512.

Any paint used on a children's bicycle must meet the lead-in-paint standard, which is codified at 16 CFR Part 1303--Ban of Lead-Containing Paint and Certain Consumer Products Bearing Lead-Containing Paint. The third-party testing requirement for lead-in-paint has not been stayed.

Each accessible component of a children's bicycle is subject to the requirements for children's products containing lead, Section 101 of the Consumer Product Safety Improvement Act. According to the owner of a bicycle testing laboratory, a typical multispeed children's bicycle will have 140 to 150 accessible parts that must be tested for lead content. The third-party testing requirements pertaining to this standard have been stayed through December 31, 2011.

b. **Please clarify this response by providing information, in general, about how many bikes you would expect to be part of a production run. How many of these do you believe are now being third-party tested to any applicable standards? How many of these would you expect to be third-party tested if all testing requirements were in effect?**

Our information about how many bikes would be expected to be part of a production run is limited. However, based on the available information, we expect annual production runs may range from several hundred (or even fewer) units for some models to several thousand or more for other models.

We would expect that all children's bicycles that are being manufactured or imported today would be third-party tested for compliance with the standards that are not currently subject to stays, which are the requirements for bicycles (16 CFR Part 1512) and the lead-in-paint standard (16 CFR Part 1303). Although the third party testing requirements for lead content have been stayed, CPSC has received testimony that some manufacturers are obtaining third party test results for lead content of their components to ensure that they meet the legal requirements of Section 101 of the CPSIA.

Questions from the Honorable John Dingell

1. **CPSIA defines a "children's product" as one "(primarily) intended for a child 12 years of age or younger." The discussion draft would change this definition to "intended for use by a child [age to be determined] years or younger." What effect would the words "for use by" have on the number and type of products covered by this definition?**

   The interpretative rule on the definition of "children's product" already considers the effect of the words "for use by a child." (75 FR 63067) In that interpretative rule, the Commission stated that a determination of whether a product is a "children's product" will be based on consideration of the four specified statutory factors. These factors include: 1) a statement by a manufacturer about the intended use of such product, including a label on such product if such statement is reasonable; 2) whether the product is represented in its packaging, display, promotion, or advertising as appropriate for use by children 12 years of age or younger; 3) whether the product is commonly recognized by consumers as being intended for use by a child 12 years of age or younger and 4) the Age Determination Guidelines issued by the Commission staff in September 2002 and any successor to such guidelines.

   Because the statutory factors incorporate the concept of "use" by the child, the Commission interpreted "for use" by children 12 years or younger generally to mean that children will physically interact with such products based on the reasonably foreseeable use of such products. For example, a diaper would be considered a children's product because a child will interact or have direct physical contact with the diaper, but a diaper bag would be used by the caregiver, and not considered a children's product. The words "for use by" by themselves would not have any impact on the number and types of products covered by this definition.

2. **The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a de minimus amount of lead. The draft legislation further requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given children's product. However, while the Commission establishes such procedures, the draft legislation would permit manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part."**

   a. **Are you aware of a uniform reasonable methodology in use by manufacturers of children's products?**

      CPSC staff is not aware of a uniform "reasonable methodology" currently in use by manufacturers of children's product.

   b. **Is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products?**

It is possible that ambiguity in the definition of "reasonable methodology" could lead to the use of different test methodologies, which would likely lead to some variance in test results across manufacturers of similar products.

c. If so, do you believe this is could pose a risk to the health of children who use such products?

The potential impact of the variance in test results on the health of children cannot be determined without knowledge of the level of variation and determination of the *de minimis* amount.

3. The draft legislation would allow the CPSC, subject to conditions, to require third party testing for children's products. Under the draft bill, the CPSC could require third party testing only if the Commission first verifies the testing capacity of "accredited third party conformity assessment bodies," as well as establishes and publishes notice of the requirements for accreditation of such assessment bodies.

a. Is it your understanding that the term "accredited third party conformity assessment bodies" includes both domestic and international bodies?

Yes. The term conformity assessment body for purposes of third party testing required by the CPSIA is more commonly known as a testing laboratory, and includes domestic and international bodies.

b. If so, how many such assessment bodies are there worldwide?

As of April 26, 2011, the CPSC has accepted the accreditation of over 300 testing laboratories (worldwide) and posted these laboratories on the CPSC website. There are many more testing laboratories worldwide, an unknown portion of which may have an interest in conducting testing for CPSC rules.

c. Further, does the Commission have the resources with which to verify the testing capacity of all third party conformity assessment bodies?

Verifying testing capacity may involve a detailed assessment of the market for the particular product in question and an assessment of the number and testing capacity of available laboratories that have an interest in conducting the testing. The resources are difficult to estimate and could depend on the product safety rule.

d. Moreover, is it your understanding of the draft legislation that the Commission would have to accredit all third party conformity assessment bodies?

The language of the draft legislation does not appear to require the Commission to accredit all third party conformity assessment bodies. Section 3(b) of the language of the draft legislation would not allow the Commission to require testing by an independent third party until two conditions have been met: (1) a notice of requirements has been

established and published for accreditation of third party conformity assessment bodies who are determined to be qualified by the Commission to conduct third party testing; and, (2) the Commission has determined that there is sufficient testing capacity by accredited third party conformity assessment bodies to prevent unreasonable delays due to testing.

The draft legislation appears to maintain the same process currently used by the Commission for accreditation of third party conformity assessment bodies. Currently, the Commission establishes the baseline criteria for accreditation of a third party conformity assessment body for a particular children's product safety rule when it publishes a notice of requirements.

Interested third party conformity assessment bodies submit applications under a particular notice of requirements to the Commission to demonstrate that they meet the criteria necessary to have their accreditation accepted by the Commission. The Commission accredits only third party conformity assessment bodies that submit applications for acceptance of their accreditation and that meet the requirements for accreditation.

e. If so, do you believe the Commission has the resources with which to accomplish this?

If the draft legislation allows the Commission to designate outside entities to conduct the accreditations and for the CPSC to recognize or accept those accreditations (as the CPSIA currently allows), then the resource burden is considerably less than if the CPSC itself had to conduct the accreditations. The CPSC by itself does not have the resources to conduct accreditations of conformity assessment bodies.

f. In summary, do you believe the practical effect of these requirements would be that the Commission would seldom, if ever, require third party testing of children's products?

Depending on the flexibility afforded by revised legislation in how the CPSC establishes third party testing and conformity assessment body accreditation rules (refer to answer above) the CPSC may consider third party testing after examining the risk associated with non-compliance, the history of non-compliance, the burdens and complexity associated with third party testing, and other factors. The detailed cost-benefit analysis findings required under section 3(b) of the draft legislation, however, make it highly unlikely that the Commission could ever impose third-party testing requirements beyond those specifically permitted under section 3(a) of the draft bill.

4. Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of such information's accuracy?

No, this is not an accurate statement of the law. Section 6A(c)(3)(A) of the CPSA requires the Commission to publish reports that meet the minimum requirements for publication "not later

than the 10th business day after the date on which the Commission transmits the report . . ." to the identified manufacturer, importer, or private labeler (collectively referred to herein as the manufacturer). One of the minimum requirements for publication is that the submitter verifies the truth and accuracy of the report. A report will not be published without that verification.

If a business receiving notice of a submitted report alleges that information in the report is materially inaccurate, they have the burden of proof to establish their claim. Information on the report is considered part of a verified report unless and until someone demonstrates otherwise. The CPSC endeavors to make a decision on all timely submitted "materially inaccurate information" claims before the report publication date. Thus far, we have been successful at resolving these claims in a reasonably short time frame.

If CPSC makes a decision on a materially inaccurate information claim after a report is published, the law requires that the CPSC correct the inaccuracy in the Database within seven business days. While the mere allegation of an inaccuracy cannot delay publication, manufacturers can, and have been, stating their position with regard to the report in their comment that displays in the database along with the report. Thus, regardless of the CPSC's determination on an MII claim, manufacturers have a way to allege inaccuracies in any report that can be seen and read by the public as soon as the Report is published.

Finally, the CPSC does not guarantee that every piece of information in the database is accurate. The statute requires that we post a clear and conspicuous notice to people using the database that the CPSC does not guarantee the accuracy, completeness, or adequacy of the contents of the Publicly Available Consumer Product Safety Information Database.

5. Is it your understanding that section 5 of the draft bill exempts FDA-regulated products from CPSIA's mandatory toy safety standards?

a. Are FDA-regulated products already exempt from CPSC regulations? If so, why is this exemption necessary?

While drugs, devices, cosmetics, and foods cannot be "consumer products" under section 3(a)(5) of the Consumer Product Safety Act, the draft bill would eliminate potential confusion over the provisions in ASTM F963 that are to be considered "consumer product safety standards."

ASTM F963 refers to various FDA regulations pertaining to food and cosmetics, and section 106 of the Consumer Product Safety Improvement Act of 2008 (CPSIA) declares that the provisions of ASTM F963, with certain limited exceptions, "shall be considered consumer product safety standards issued by the Commission under section 9 of the Consumer Product Safety Act." The omission of the FDA regulations from the limited exceptions in section 106 of the CPSIA creates uncertainty as to whether the FDA regulations are "consumer product safety standards" pursuant to section 106 of the CPSIA.

If the FDA regulations are to be considered "consumer product safety standards," then additional uncertainty exists as to CPSC's ability to enforce the FDA regulations and whether CPSC would need to engage in joint rulemaking with FDA whenever FDA revises those regulations. Furthermore, because children's products that are subject to a children's product safety rule are subject to third party testing under existing law, questions have arisen as to whether manufacturers need to have third party testing to demonstrate compliance with the FDA regulations.

b. Further, what types of products would section 5's exemption include, and why should they be exempted from CPSIA's mandatory toy safety standards?

The effect of the exemption would be to clarify that FDA retains authority over food, food additives, color additives, and cosmetics that are supplied with toys and that CPSC has authority over the toys covered by ASTM F963. For example, ASTM F963 states that food products supplied with toys must be manufactured and packaged in compliance with FDA's good manufacturing practice regulations that apply to food. If FDA's good manufacturing practice regulations for foods are considered "consumer product safety standards," then CPSC would need to enforce those regulations and also issue a notice of requirements to provide for third party testing to demonstrate compliance with those FDA regulations.

FRED UPTON, MICHIGAN
CHAIRMAN

HENRY A. WAXMAN, CALIFORNIA
RANKING MEMBER

ONE HUNDRED TWELFTH CONGRESS

Congress of the United States
House of Representatives
COMMITTEE ON ENERGY AND COMMERCE
2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515–6115

Majority (202) 225–2927
Minority (202) 225–3641

April 27, 2011

Ms. Caroline Cox
Research Director
Center for Environmental Health
2201 Broadway, Suite 302
Oakland, CA 94612

Dear Ms. Cox,

Thank you for appearing before the Subcommittee on Commerce, Manufacturing, and Trade on April 7, 2011, to testify at the hearing entitled "Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act."

Pursuant to the Rules of the Committee on Energy and Commerce, the hearing record remains open for 10 business days to permit Members to submit additional questions to witnesses, which are attached. The format of your responses to these questions should be as follows: (1) the name of the Member whose question you are addressing, (2) the complete text of the question you are addressing in bold, and then (3) your answer to that question in plain text.

To facilitate the printing of the hearing record, please respond to these questions by the close of business on Wednesday, May 11, 2011. Please also e-mail your responses to the Legislative Clerk in Word format at Alex.Yergin@mail.house.gov.

Thank you again for your time and effort preparing and delivering testimony before the Subcommittee.

Sincerely,

Mary Bono Mack
Chairman
Subcommittee on Commerce, Manufacturing, and Trade

cc: The Honorable G. K. Butterfield, Ranking Member,
Subcommittee on Commerce, Manufacturing, and Trade

Attachments

The Honorable Mary Bono Mack

1. **You state you prefer a total lead (concentration) standard rather than an exposure standard. Do you maintain that a concentration standard for total lead is always more health protective than a standard that regulates how much lead is actually available to a child?**

   Yes. There is no way to test accurately and consistently for "how much lead is actually available to a child." Thus, a total lead test, which is far more likely to be accurate and consistent, is also more health protective. Total lead testing is relatively inexpensive and can be done quickly, so it is easier for product manufacturers, vendors, and retailers to do comprehensive testing. This means that supply chain problems are corrected more quickly resulting in more health protective products.

2. **You mentioned FDA's warning about children's lunch boxes containing lead, claiming that FDA interpreted CPSC's data differently than CPSC itself. How many lunchbox recalls did FDA order after it reviewed CPSC's data?**

   At the time, there was no single federal rule on lead in children's products. Given this regulatory uncertainty, FDA took action by sending a strongly worded warning to lunchbox makers, alerting them to the lead problem and advising them that since "some migration of lead [from lunchbox interiors] to food…may be reasonably expected, we urge companies to refrain from marketing such lead-containing lunchboxes." We are not aware that FDA ordered recalls

3. Your discussion of lunchboxes suggests that FDA would disapprove of a risk-based lead standard and insist on a total lead content standard. Does FDA have any concentration-based total content standard for lead? Does FDA have any standards that control the amount of lead a child would actually be exposed to?

   We have not made any suggestions about what FDA's thinking is on the matter. FDA has total content standards for lead in food, including food for consumption by children, and has developed guidelines for total lead content of candy intended for small children. With respect to the lunch boxes made with lead-containing vinyl FDA stated, "According to the CPSC data, a small amount of the lead present in the interior linings of the lunchboxes is transferable by a swipe test. This implies that a small amount of lead may reasonably be expected to transfer to food that contacts the interior lining and could be deemed to be an unsafe food additive within the meaning of section 409 of the FD&C Act, and therefore adulterated within the meaning of section 402(a)(2)(C) of the statute."

3. **On page 2 of your testimony, you list six categories of products that you found before the law was passed. Are you aware that half of them are within FDA's jurisdiction?**

   Yes, we are aware of FDA's jurisdiction. Our work is based on California law, and in each of these cases the products were in violation of California lead standards.

4. **You mentioned that CEH has found some 46 products that did not comply with the lead limits applicable under CPSIA. Did CEH provide details of its findings to CPSC on each of these items? If so, how quickly does CEH typically notify CPSC after obtaining test results? Does CEH prvide samples? How many of the 46 products did CPSC recall?**

   Our compliance testing is administered under a grant from the California attorney general's office. Under the terms of the grant, we report our findings to their office. It is our understanding that the attorney general's office reports to CPSC and follows up with them regarding potential recalls when they feel it is appropriate. In our experience, CPSC does its own product research rather than relying on CEH-purchased products from California. CPSC cooperated with companies on recalls of six products that were identified by CEH.

5. **Has CEH ever sought a CPSC recall of a product based on lead in metal parts other than jewelry?**

   Between 1999-2001, CEH found high levels of lead in the metal outflow pipes in several brands of home water filters. The filter industry reformulated the pipes to eliminate the lead. Since it was several years ago we are not sure if there was communication with CPSC.

6. **Have you found x-ray fluorescence devices equally useful for screening plastics and metals?**

   Yes. With an experienced operator and attention to testing homogeneous samples. the XRF is equally useful for screening both plastics and metal.

<u>The Honorable G. K. Butterfield</u>

1. **During the hearing, the Subcommittee heard repeatedly that the traditional model for the regulation of lead and other harmful substances has been to use risk assessment, and that manufacturers should be allowed to apply this model to children's products. However, last year this Subcommittee in a hearing regarding the regulation of toxic substances received testimony arguing that the traditional risk assessment model is not appropriate for substances that are persistent, bioaccumulative and toxic (PBTs) because these characteristics affect how the environment and human body treat these substances and make exposure inevitable. I understand that lead is a PBT.**

   a. **Can you please confirm that lead is a PBT?**

Lead is identified by US EPA as a PBT chemical under the Toxics Release Inventory program. See http://www.epa.gov/tri/trichemicals/pbt%20chemicals/pbt_chem_list.htm.

b. Can you please discuss the characteristics of PBTs that make the traditional risk assessment approach for limiting exposure an inappropriate model for dealing with lead?

Risk assessment traditionally identifies the health hazards of the chemical of interest and the estimated exposure to that chemical. The risk assessment process compares the estimated exposure to the amount of the chemical that causes the relevant health hazard to determine a "safe" level of exposure. This is a challenging, or even impossible, process for PBT chemicals, because exposures of concern are not only current exposures, but exposures far into the future as the chemical moves through humans and the environment. Accurately predicting those exposures is beyond current scientific knowledge. For lead it is even more challenging to complete a risk assessment because, as EPA has stated, "There is no level of lead exposure that can yet be identified, with confidence, as clearly not being associated with some risk of deleterious health effects." In this situation, the only acceptable exposure is zero.

2. It is an established fact that lead occurs naturally at low levels in the environment, but it is also a fact that we have added lead to the environment by adding it to products like paint, gasoline, and even consumer products. It is also widely recognized that Americans produce large amounts of trash, including by throwing away products such as toys and other children's products. The result is that lead-laced toys and other children's products end up in landfills, where the lead can leach into soil and then into water and then into the food supply. From there, it is a straight route into the body.

a. Would you agree that use of lead in a child's product not only poses a direct threat to the health and safety of that child, but presents an ongoing and potentially more potent threat? Please explain.

The Agency for Toxic Substances and Disease Registry estimates that environmental lead levels are 1000 times higher than they were 300 years ago. The cause of this increase is "human activity," including past use of leaded gasoline and lead-based paint as well as current use of lead in consumer products. Once this lead is in the environment, children are exposed to it when they breathe air, drink water, eat food, play, etc. This lead exposure is to a certain extent cumulative because lead can be stored for long periods in bones. There is widespread agreement that prevention, reducing lead exposure by reducing the sources of lead exposure, is the best way to protect children.

The Honorable John Dingell

1. **The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a de minimus amount of lead. The draft legislation further requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given children's product. However, while the Commission establishes such procedures, the draft legislation would permit manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part."**

   a. **Are you aware of a uniform reasonable methodology in use by manufacturers of children's products?**

   Currently the ASTM toy safety standard describes a methodology for estimating ingestion of lead from paint and other surface coatings. CPSC has suggested methodology for estimating ingestion of lead from metal jewelry. Uniform methodologies for other materials and other children's products do not yet exist.

   b. **Is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products?**

   It is virtually certain.

   c. **If so, do you believe this is could pose a risk to the health of children who use such products?**

   Yes. The risk of lead-tainted products ending up in children's hands, and possibly in their mouths, would increase dramatically.

2. **The draft legislation would allow the CPSC, subject to conditions, to require third party testing for children's products. Under the draft bill, the CPSC could require third party testing only if the Commission first verifies the testing capacity of "accredited third party conformity assessment bodies," as well as establishes and publishes notice of the requirements for accreditation of such assessment bodies.**

   a. **Is it your understanding that the term "accredited third party conformity assessment bodies" includes both domestic and international bodies?**

   Yes.

   b. **If so, how many such assessment bodies are there worldwide?**

Each assessment body is certified for certain kinds of testing. There are 29 US labs and 124 international labs certified for at least one of the CPSC lead test protocols.

c. Further, does the Commission have the resources with which to verify the testing capacity of all third party conformity assessment bodies?

It seems unlikely.

d. Moreover, is it your understanding of the draft legislation that the Commission would have to accredit all third party conformity assessment bodies?

Yes.

e. If so, do you believe the Commission has the resources with which to accomplish this?

No. The Commission has in the past stated that it is under-resources already.

f. In summary, do you believe the practical effect of these requirements would be that the Commission would seldom, if ever, require third party testing of children's products?

That seems highly likely.

The Honorable Mary Bono Mack, Chairman
The Honorable G. K. Butterfield, Ranking Member
Subcommittee on Commerce, Manufacturing, and Trade
Committee On Energy and Commerce
2125 Rayburn House Office Building
Washington, DC 20515-6115

Re: Discussion Draft of H.R. _____, a bill that would revise the Consumer Product Safety Improvement Act; Response to Questions

Dear Chairman Bono-Mack and Ranking Member Butterfield:

Thank you for the opportunity to appear before the Subcommittee on April 7, 2011. I welcomed the opportunity to express my personal views about necessary revisions to the Consumer Product Safety Improvement Act of 2008 (CPSIA) to maintain strong protections for children's health and safety, consistent with recognized science-based approaches to managing risk used by many different agencies, while reducing unnecessary and costly burdens on regulated businesses. We provide responses to your additional questions below.

The Honorable Mary Bono Mack

1. **Does the FDA, CDC or other public health agencies recognize that humans can tolerate different amounts of lead at different ages?**

   Yes. The federal Food and Drug Administration (FDA) has adopted Provisional Tolerable Daily Intake (PTDI) limits[1] that vary depending on age for potential ingestion of lead through the diet. These levels are based on daily intake limits, which assume that these amounts will be consumed on a daily basis. The limits are:

   - children 0-6: 6 µg/day;
   - children over 6: 15 µg/day;
   - pregnant or childbearing women: 25 µg/day;
   - other adults: 75 µg/day.

[1] PTDI's are levels that are expected to give rise to a 1 µg/dL increase in blood lead levels in children and women of childbearing years, and a 3 µg/dL rise for others.

The U.S. Environmental Protection Agency's (EPA) Integrated Exposure Uptake Biokinetic (IEUBK) model predicts that low intakes of lead in the range of 1 – 2 µg/day would be difficult to detect because it is difficult to detect an impact of 2 µg/dL. The Centers for Disease Control (CDC) recommends that laboratories set internal quality control limits on blood lead measurements to +/- 2 µg/dL.[2]

2. What does "food grade" mean in terms of lead? Should items that are recognized by FDA as "food grade" be accepted by CPSC as having low lead?

Yes, materials safe for contact with food must be low in lead. Materials in contact with food used as, for example, food packaging (whether single or repeated use) are regulated as "food." "Food" is defined under Section 201(f) of the Federal Food, Drug and Cosmetic Act (FFDCA) as "(1) articles used for food or drink for man or other animals, (2) chewing gum, and (3) articles used for components of any such article."[3] In turn, a "food additive" is defined under Section 201(s) of the Act as "any substance the intended use of which results or may reasonably be expected to result, directly or indirectly, in its becoming a component … of any food …."[4] These provisions therefore establish that materials, and components of materials, in contact with food are subject to the requirements of the FFDCA.

Under Section 402(a)(1) of the FFDCA, a "food" is deemed to be adulterated if it "bears or contains any poisonous or deleterious substances that may render [the food] injurious to health." By virtue of Section 201(s), and its definition of "food additive," components of a food package are considered to be "food" subject to regulation by FDA if there is the potential for such components to migrate into food. FDA's Good Manufacturing Practices (GMP) regulation for food-contact materials requires that a food-contact material must be "of a purity suitable for its intended use."[5] Food-contact items that contain lead or other impurities that potentially migrate to food at unsafe levels would not be considered suitably pure under FDA's regulations because the lead could potentially adulterate the food.[6]

---

2 *Interpreting and Managing Blood Lead Levels < 10 µg dL in Children and Reducing Childhood Exposures to Lead*, Recommendations of CDC Advisory Committee on Childhood Lead Poisoning Prevention, November 2, 2007, available at http://www.cdc.gov/mmwr/preview/mmwrhtml/rr5608a1.htm.

3 21 U.S.C. §321(f).

4 21 U.S.C. §321(s).

5 21 C.F.R. §174.5(a)(2).

6 For these reasons, the Commission concluded that it would not make lead content determinations on foods used in consumer products. *See* 74 Fed. Reg 43031 at 43034 (August 26, 2009).

In addition to FDA regulations implementing the FFDCA, packaging products (both for foods and for non-foods) are subject to limits on total heavy metals, including lead, under the Coalition of Northeastern Governors (CONEG) Model Toxics in Packaging Legislation. These laws (1) prohibit the intentional use of *any amount* of lead, cadmium, mercury, and hexavalent chromium in packaging or individual packaging components, such as inks, adhesives, coatings, or labels,[7] and (2) restrict the total *combined* trace concentration level of unintentionally added lead, mercury, cadmium, and hexavalent chromium in packaging to no more than 100 parts per million (ppm) by weight. Nineteen states[8] have toxics in packaging laws based on the Model Legislation.[9] If regulated materials are unintentionally present, for example, as a contaminant in raw material feedstocks, the total concentration is limited to less than 100 ppm for the sum of all four metals in any package or individual packaging components. Thus, CONEG's standards require that total lead cannot exceed a maximum of 100 ppm lead, assuming that no other covered heavy metal is present. These limits are currently subject to enforcement by state authorities.[10] We are not aware of enforcement actions associated with food packaging under these state toxics in packaging laws. Materials that meet FDA requirements for food contact and/or CONEG requirements for packaging should be deemed low lead.

---

7 In particular, Section 3 of the Model Legislation defines "package" as containers providing a means of marketing, protecting, or handling a product and includes unit packages as well as intermediate packages and shipping containers, cross-referencing the packaging definitions found in ASTM D996 (American Society for Testing and Materials). The definition includes, but is not limited to, unsealed receptacles such as carrying cases, crates, cups, and other trays and wrappers. A "packaging component" is defined as any individual assembled part of a package including, but not limited to, any interior or exterior blocking, bracing, cushioning, coatings, closures, inks, and labels.

8 These states include California, Connecticut, Florida, Georgia, Illinois, Iowa, Maryland, Maine, Minnesota, Missouri, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, Virginia, Washington, and Wisconsin.

9 A copy of the Model Legislation is available at: http://www.toxicsinpackaging.org/model_legislation.html.

10 In August 2008, for example, retailer Forever 21, Inc. agreed to pay a total of $115,000 to the California Department of Toxic Substances Control (DTSC) to resolve allegations that the retailer had acquired and used plastic bags that failed to meet the state's restrictions on certain heavy metals, including lead. The final consent order is available at: http://www.dtsc.ca.gov/HazardousWaste/Projects/upload/Forever21_ENF_CO.pdf.

The Honorable G. K. Butterfield

1. **Please provide a list of every association or other entity that you have represented, consulted, or provided any other form of paid services with respect to any issues arising under the CPSIA in any forum and the amounts paid to you or your firm for these services.**

   I was asked by the Subcommittee staff to participate in the April 7 hearing in my capacity as an individual attorney with experience before a variety of different federal regulatory agencies, including the CPSC. I was not compensated for the preparation of my testimony or my appearance before the Subcommittee. I am a registered lobbyist on CPSIA matters only for the Fashion Jewelry and Accessories Trade Association; lobbying reports are on file and publicly available.

The Honorable John Dingell

1. **The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a de minimus amount of lead. The draft legislation further requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given children's product. However, while the Commission establishes such procedures, the draft legislation would permit manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part."**

   a. **Are you aware of a uniform reasonable methodology in use by manufacturers of children's products?**

   The CPSC and other health agencies use well-recognized techniques to evaluate potential exposures to chemicals and other substances in a variety of situations. Tests are available to assess surface migration, airborne migration, off-gassing, hand-to-mouth, mouthing, and ingestion exposures.[1] Specifically, CPSC has previously conducted lead migration tests to assess expected exposure conditions during reasonably foreseeable use and abuse conditions, such as wipe tests, simulating hand-to-mouth exposure; saliva tests simulating exposure by mouthing; acid extraction tests simulating exposure through accidental ingestion. Because CPSIA adopts a total content limit those tests are not currently used by the CPSC, but similar

---

[1] The log summary of a public meeting between CPSC, the Environmental Protection Agency, and the American Chemistry Council held on January 10, 2011 references some of these methods. See http://www.cpsc.gov/LIBRARY/FOIA/meetings/mtg11/epa01312011.pdf.

tests are done to evaluate exposure to phthalates and phthalates alternatives,[12] or to other substances. The CPSC recently updated a test method to simulate potential exposure to cadmium from ingestion of children's metal jewelry, for example.[13] Moreover, by adopting the toy safety standard, ASTM F-963, as a mandatory requirement, CPSIA requires testing of surface coatings of toys for heavy metals using a 2-hour extraction test. In short, a variety of scientifically acceptable methods to evaluate exposure using various migration tests suitable to the type of exposure and material are available.

b. Is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products?

No, within the limits of normal inter-laboratory variability. Extensive round robin testing of the migration procedure adopted under ASTM F-963 yielded information on specific statistical uncertainty factors that should be applied for particular metals subjected to the test. While experience has shown that there can be significant inter-laboratory variability in total lead or phthalate content tests, as the same materials do not yield identical results when tested in different laboratories, statistical uncertainty factors have not been adopted for total content tests. This issue could be addressed through round robin testing and additional method standardization by CPSC. Material variability could also be a factor as substances like lead may not always be evenly dispersed in the material tested.

c. If so, do you believe this is could pose a risk to the health of children who use such products?

No. Scientific approaches to establish inter-laboratory uncertainty factors are available and should be adopted for both total content and migration tests.

2. The draft legislation would allow the CPSC, subject to conditions, to require third party testing for children's products. Under the draft bill, the CPSC could require third party testing only if the Commission first verifies the testing capacity of "accredited third party conformity assessment bodies," as well as establishes and publishes notice of the requirements for accreditation of such assessment bodies.

a. Is it your understanding that the term "accredited third party conformity assessment bodies" includes both domestic and international bodies?

---

[12] See Staff Memorandum, Phthalates and Phthalate Substitute in Children's Toys, March 31, 2010, available at http://www.cpsc.gov/ABOUT/Cpsia/phthallab.pdf.

[13] Method CPSC-CH-E1001-11, Standard Operating Procedure for Determining Cadmium Extractability from Children's Metal Jewelry. See http://www.cpsc.gov/LIBRARY/FOIA/FOIA13/os/cadmiumjewelrytest.pdf.

Yes, provided they meet the accreditation criteria.

b. If so, how many such assessment bodies are there worldwide?

Information on the total number of third party assessment laboratories currently accredited by the CPSC is available at the CPSC website; however, not every laboratory is certified or accredited to conduct every test that may be required pursuant to CPSC laws and regulations. The searchable database of laboratories is available at http://www.cpsc.gov/cgi-bin/labsearch/.

c. Further, does the Commission have the resources with which to verify the testing capacity of all third party conformity assessment bodies?

I have no knowledge of the Commission's resources to undertake this task.

d. Moreover, is it your understanding of the draft legislation that the Commission would have to accredit all third party conformity assessment bodies?

The Commission must determine that the third party conformity assessment body has the technical ability to conduct the relevant test or tests for which accreditation is sought *and* has the capacity to handle testing before accreditation is conferred by CPSC under the draft legislation. Third-party conformity assessment bodies that do not meet these requirements cannot receive accreditation. Manufacturers may use only a CPSC- accredited laboratory where legislation or rules require third party testing to support a certificate of compliance.

e. If so, do you believe the Commission has the resources with which to accomplish this?

I have no knowledge of the Commission's resources to accomplish this task.

f. In summary, do you believe the practical effect of these requirements would be that the Commission would seldom, if ever, require third party testing of children's products?

I am unable to speculate on the frequency with which the Commission would require third party testing beyond categories already covered. It will depend on the specifics of the test requirements, qualifications and capacity of third party assessment bodies who seek to be accredited to conduct such tests, and other factors.

3. I have several questions concerning the public database mandated by CPSIA.

a. Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of such information's accuracy?

Yes.

b. Should a manufacturer be given the opportunity to contest the accuracy of a consumer complaint before it is published?

Yes.

c. If a manufacturer is allowed to dispute the accuracy of the information in a consumer's complaint, how should that dispute be resolved and by whom?

The CPSC should resolve the dispute by evaluating the facts presented to it.

d. The draft legislation amends CPSIA to permit only persons directly harmed by a consumer product, their family, their legal representative, or another person authorized on their behalf to submit a complaint to the database. Previously, CPSIA permitted anyone to submit complaints about a consumer product. Do you believe the draft legislation's narrowing of eligibility to submit complaints is necessary?

Yes. This change should help minimize duplicative complaints and assure that actual incidents, rather than speculative risks, are posted to the database.

I trust these responses are helpful.

Respectfully submitted,

Sheila A. Millar

Re: Reponses to Questions for the Record from The Honorable John Dingell
"Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act," April 7, 2011

Dear Chair Bono Mack:

Attached please find my responses to the questions for the record from The Honorable John Dingell.

Thank you for the opportunity to testify at the hearing entitled "Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act" on April 7, 2011.

Respectfully submitted,

Paul C. Vitrano
General Counsel

Responses to Additional Questions for the Record from The Honorable John Dingell

1. The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a *de minimus* amount of lead. The draft legislation further requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given children's product. However, while the Commission establishes such procedures, the draft legislation would permit manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part."

a. Are you aware of a uniform reasonable methodology in use by manufacturers of children's products?

No.

b. Is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products?

While some variation in test results from different methodologies is possible, with respect to methodologies that provide a reasonable basis for estimating the amount of lead a child would likely ingest from exposure to a component part during reasonably foreseeable use and abuse of a particular product, we would not expect a wide variance in test results across manufacturers.

c. If so, do you believe this could pose a risk to the health of children who use such products?

No. See response to b. above.

2. The draft legislation would allow the CPSC, subject to conditions, to require third party testing for children's products. Under the draft bill, the CPSC could require third party testing only if the Commission first verifies the testing capacity of "accredited third party conformity assessment bodies," as well as establishes and publishes notice of the requirements for accreditation of such assessment bodies.

a. Is it your understanding that the term "accredited third party conformity assessment bodies" includes both domestic and international bodies?

Yes.

b. If so, how many such assessment bodies are there worldwide?

Yes. Unknown. The CPSC website includes a list which currently contains more than 330 third party laboratories that have been accredited by the Commission for assessing conformity with various children's product safety rules.

c. Further, does the Commission have the resources with which to verify the testing capacity of all third party conformity assessment bodies?

Unknown. This question is better addressed to the Commission.

d. Moreover, is it your understanding of the draft legislation that the Commission would have to accredit all third party conformity assessment bodies?

Under the draft legislation, a manufacturer is required to use a third party conformity assessment body that has been accredited by CPSC to meet its testing and certification obligations with respect to specified children's product safety rules. A manufacturer could use an unaccredited third party to test for conformity with other product safety rules unless the Commission requires that manufacturers use an accredited third party to test for and certify conformity with particular additional safety rules or for particular classes of products.

e. If so, do you believe the Commission has the resources with which to accomplish this?

Unknown. This question is better addressed to the Commission.

f. In summary, do you believe the practical effect of these requirements would be that the Commission would seldom, if ever, require third party testing of children's products?

No.

3. I have several questions concerning the public database mandated by CPSIA.

a. Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of such information's accuracy?

The CPSC's final rule implementing the public database under the CPSIA provides that the Commission will publish a report of harm which meets specified minimum requirements for publication in the database not later than 10 business days after such report is transmitted to the manufacturer for review. *See* 16 C.F.R. Sections 1102.10(d) and 1102.28(a). This will be the case even in situations where there is a pending but as yet unresolved request by the manufacturer that materially inaccurate information be removed from the report or the report itself not be published because it is materially inaccurate.

b. Should a manufacturer be given the opportunity to contest the accuracy of a consumer complaint before it is published?

Yes. Fundamental due process requires that a manufacturer be given a reasonable opportunity to do so.

c. If a manufacturer is allowed to dispute the accuracy of the information in a consumer's complaint, how should that dispute be resolved and by whom?

A pending manufacturer request for removal of materially inaccurate information from a report of harm should be resolved prior to publication of the report. Such a request should be resolved in the first instance by the CPSC staff implementing the public database, with the manufacturer having the right to appeal an initial denial of the request to the CPSC General Counsel for a final agency decision with the right to seek further relief through judicial means.

d. The draft legislation amends CPSIA to permit only persons directly harmed by a consumer product, their family, their legal representative, or another person authorized on their behalf to submit a complaint to the database. Previously, CPSIA permitted anyone to submit complaints about a consumer product. Do you believe the draft legislation's narrowing of eligibility to submit complaints is necessary?

Yes. CPSC's rule implementing the database originally proposed an additional category of "others" that dramatically and improperly expanded the scope of persons who could submit reports of harm. In response to comments objecting to this improper expansion of potential reporters, CPSC simply folded the "others" category into the rule's definition of "consumers." This is not what Congress intended and must be corrected. As a point of clarification, the draft legislation amends the CPSIA to permit persons who suffer harm or risk of harm related to use of a consumer product, their next of kin or members of their household, their legal representative, or another person expressly authorized by them to submit a report of harm for publication in the database.

RESPONSES TO QUESTIONS FOR THE RECORD OF THE APRIL 7, 2011 HEARING BEFORE THE SUBCOMMITTEE ON COMMERCE, MANUFACTURING AND TRADE
COMMITTEE ON ENERGY AND COMMERCE

ERIKA Z. JONES
ON BEHALF OF
BICYCLE PRODUCT SUPPLIERS ASSOCIATION

The Honorable Mary Bono Mack

1. In your testimony, you state that there is too much variability in certain metal alloys to ensure that bicycles meet the next drop-down to 100 parts per million (ppm). Why is the lead content of alloys difficult to control?

   RESPONSE: Common alloys of aluminum, iron and copper used in bicycle manufacturing are sourced in Asia and typically have recycled metal content. Inevitably some lead finds its way into these alloys as a contaminant. Studies conducted by a CPSC certified third party laboratory have confirmed that the amount of lead in these alloys can vary above or below 100 ppm even within a single component part. The results of these studies have been submitted to the U.S. CPSC's docket on the 100 ppm issue. Use of virgin materials or other metal alloys such as certain grades of low-lead stainless steel is precluded by the high price of these materials, which would make the final product prohibitively expensive.

2. Under current law, how many different parts of a bike are accessible and need to be tested to the lead limits?

   RESPONSE: While the precise number varies from bicycle model to bicycle model, a typical bicycle has approximately 140 "accessible" component parts, as the term "accessible" has been defined by the U.S. CPSC.

3. Do you see other opportunities to reduce testing costs without undercutting the benefits?

   RESPONSE: Section 101 of CPSIA applies the lead substrate limits to all components of children's products except "any component part ... that is not accessible to a child through normal and reasonably foreseeable use and abuse of such product as determined by the Commission." The Commission has determined that all components that can be contacted by a specified probe are "accessible" for purposes of this requirement.

   In the case of bicycles and other outdoor recreational products, narrowing or modifying the definition of "accessible" to parts which are likely to be touched or mouthed during use of the product would narrow the list of component parts to those which are likely to

pose a risk of lead exposure to the child user. For example, contact points on a bicycle required for its use include the handlebars, brake levers, grips, and saddle. Most of the metal alloy parts are part of the structural frame or drive train of the bicycle and are likely to be touched only incidentally, if ever, during use.

The Honorable G. K. Butterfield

1. Dr. Best testified that "in the case of lead, there is no benefit to *exposure*." (Emphasis added.) In your testimony, you took issue with this statement, arguing: "I would like to address a comment made by . . . Dr. Best, who made a comment that there is no benefit to lead and therefore it should be inherently unnecessary. Lead in the quantities that we see it in metal alloys that are used in bicycles provide a tremendous benefit."

   Dr. Best's statement concerns the lack of any benefits to human health from exposure to lead, and not the benefits that accrue with respect to the affordability or durability of a product.

   a. Are you aware of any direct benefits to human health from exposure to lead?

   RESPONSE: In BPSA's view, there are many benefits to human health from the continued wide availability in the market of affordable bicycles for children. While BPSA strongly believes that there is no risk to human health from the extremely low levels of lead in metal alloys used in bicycles, the CPSC's current interpretation of CPSIA deems virtually all components of children's bicycles to be "accessible," and therefore subject to the lead substrate standard. Under this interpretation, the mere *presence* of lead has been equated to *exposure* to lead, even in minuscule quantities that cannot be measured in human blood. This is the reason why the CPSC denied the BPSA petition for a limited exclusion from the lead substrate standard in 2009, and it was in this context that Dr. Best's comment required a response.

2. In response to questioning from the Subcommittee, you argued that manufacturers have not been given enough time to comply with the 100 ppm lead content standard because it will apply "immediately on August 11[, 2011.]" You went on to state: "Normally, manufacturers are given lead time to plan for the new regulation, to redesign their products, to absorb the costs in a more orderly fashion, and to work out their inventory so that products sold after the effective date reach retail shelves in a compliant fashion. That is the proper, orderly way to regulate products for safety improvement, not to disrupt the market with these very abrupt changes that do not permit that kind of orderly transition."

   a. Is it correct that the text of CPSIA makes clear to manufacturers that three years from the date of enactment their products are expected to comply the 100 ppm lead content standard?

RESPONSE: No. The CPSIA requires the CPSC to lower the standard unless it makes a determination that application of the standard to a particular product or component part is "not technologically feasible." This provides no clear guidance for manufacturers of products who have struggled, so far unsuccessfully, to bring their products fully and consistently into compliance with a 100ppm lead substrate limit. If the manufacturer cannot now meet the standard, they have two choices as the August deadline approaches: (1) they can try and persuade the CPSC that this potential lack of compliance is because it is "not technologically feasible" to do so and wait for the Commission to rule and hope the ruling is favorable; or (2) they can cease making the products and suffer economic injury.

The Honorable John Dingell

1. The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a *de minimus* amount of lead. The draft legislation further requires the Commission to establish procedures for estimating the amount of lead a child would ingest from a given children's product. However, while the Commission establishes such procedures, the draft legislation would permit manufacturers to use "any reasonable methodology to estimate the amount of lead a child would likely ingest from exposure to a component part."

    a. Are you aware of a uniform reasonable methodology in use by manufacturers of children's products?

RESPONSE: BPSA's 2009 petition for a limited exclusion from the lead substrate standards relied on expert analysis of lead exposure, in which BPSA's retained expert (Dr. Beck, who also testified before this Subcommittee on April 7) used a reasonable methodology to estimate the increase in blood lead level based on means of exposure and absorption. BPSA is unaware of the extent to which this (or any other) methodology is uniformly in use by manufacturers of children's products.

    b. Is it possible the ambiguity of the term "reasonable methodology" could lead to a wide variance in test results across manufacturers of similar products?

RESPONSE: While use of different methodologies could lead to differing results, this would only be a temporary issue until the CPSC developed a uniform test procedure.

    c. If so, do you believe this could pose a risk to the health of children who use such products?

RESPONSE: No. Products that clearly pose the highest risk of lead ingestion (such as small items of jewelry or materials like leaded paints) will not be affected by the proposed changes to section 101(b), which address products with an inherently low risk of ingestion.

2. The draft legislation would allow the CPSC, subject to conditions, to require third party testing for children's products. Under the draft bill, the CPSC could require third party testing only if the Commission first verifies the testing capacity of "accredited third party conformity assessment bodies," as well as establishes and publishes notice of the requirements for accreditation of such assessment bodies.

   a. Is it your understanding that the term "accredited third party conformity assessment bodies" includes both domestic and international bodies?

RESPONSE: Yes.

   b. If so, how many such assessment bodies are there worldwide?

RESPONSE: The CPSC website lists all currently accredited third party conformity assessment bodies. BPSA does not have any additional information about the number of third party conformity assessment bodies.

   c. Further, does the Commission have the resources with which to verify the testing capacity of all third party conformity assessment bodies?

RESPONSE: BPSA is not familiar with the details of the resources available to the Commission for this task.

   d. Moreover, is it your understanding of the draft legislation that the Commission would have to accredit all third party conformity assessment bodies?

RESPONSE: No; the Commission would have to accredit only those third party conformity assessment bodies that meet the Commission's qualification standards for accreditation and the substantive standards set forth in the draft legislation. As is the case with the current law, the draft would require the Commission to accredit third party conformity assessment bodies before manufacturers could rely on tests performed by those bodies to support a certification of compliance.

   e. If so, do you believe the Commission has the resources with which to accomplish this?

RESPONSE: BPSA is not familiar with the details of the resources available to the Commission for this task.

f. In summary, do you believe the practical effect of these requirements would be that the Commission would seldom, if ever, require third party testing of children's products?

RESPONSE: No. Over the past few years, the testing industry has responded to the CPSIA and other international regulatory requirements by adding laboratories and capacity so that today the demand for testing resources for the bicycle industry is largely being met. However, whenever a new requirement is established or becomes effective, there needs to be sufficient time allowed for the testing industry to respond. When the testing entity is a third party laboratory, by definition manufacturers cannot control the finances or business decisions of those independent entities in deciding whether to apply for CPSC certification. The CPSC should have discretion to grant relief from the third party testing requirements when there are no certified labs or an insufficient number of certified labs to handle the testing requirements of the industry.

3. I have several questions concerning the public database mandated by CPSIA.

a. Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of such information's accuracy?

RESPONSE: Yes.

b. Should a manufacturer be given the opportunity to contest the accuracy of a consumer complaint before it is published?

RESPONSE: Yes.

c. If a manufacturer is allowed to dispute the accuracy of the information in a consumer's complaint, how should that dispute be resolved and by whom?

RESPONSE: The CPSC should be required to resolve disputes about accuracy before product complaints are posted on the public website.

d. The draft legislation amends CPSIA to permit only persons directly harmed by a consumer product, their family, their legal representative, or another person authorized on their behalf to submit a complaint to the database. Previously, CPSIA permitted anyone to submit complaints about a consumer product. Do you believe the draft legislation's narrowing of eligibility to submit complaints is necessary?

RESPONSE: Yes. This will avoid the filing of unfounded complaints by persons or organizations that lack direct knowledge of the circumstances.'

The Honorable Mary Bono Mack, Chairman
The Honorable G. K. Butterfield, Ranking Member
Subcommittee on Commerce, Manufacturing, and Trade
Committee On Energy and Commerce
2125 Rayburn House Office Building
Washington, DC 20515-6615

Re: Discussion Draft of H.R. _____, a bill that would revise the Consumer Product Safety Improvement Act: Response to Questions

Dear Chairman Bono-Mack and Ranking Member Butterfield:

Please find my responses to the questions by Mr. Dingell and Mr. Butterfield.

a. Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of such information's accuracy?

CPSIA has been interpreted, unfortunately, by the Commission to require the posting of information to the database even if the Commission has failed to resolve a timely and substantial claim of material inaccuracy submitted by the manufacturer. This is unfair and an inappropriate policy for a federal agency. There should be a higher premium placed by CPSC on valid, accurate, and useful information than could be found in blogs and other posts on the internet. Today, the Commission states that it is making these decisions within several days from the time the manufacturer replies so it is practical and there will be no hardship for the Commission to resolve these claims expeditiously.

b. Should a manufacturer be given the opportunity to contest the accuracy of a consumer complaint before it is published?

Yes, a timely and substantial claim by a manufacturer that a submission is inaccurate should be resolved by the Commission before any public posting. This is likely to occur only in a relatively few cases and can be resolved expeditiously by the Commission.

c. If a manufacturer is allowed to dispute the accuracy of the information in a consumer's complaint, how should that dispute be resolved and by whom?

The Commission has great experience in determining and evaluating the quality and accuracy of information. It is quite capable of quickly determining, for example, whether

a product has been misidentified or an alleged unsafe condition or injury causation is clearly incorrect. Other groups will continue to be able to communicate their concerns to the Commission outside of the database.

d. The draft legislation amends CPSIA to permit only persons directly harmed by a consumer product, their family, their legal representative, or another person authorized on their behalf to submit a complaint to the database. Previously, CPSIA permitted anyone to submit complaints about a consumer product. Do you believe the draft legislation's narrowing of eligibility to submit complaints is necessary?

The draft legislation properly refocuses the universe of database submitters to those Congress originally intended – injured persons, their family and their representatives, first responders or medical personnel who have direct and substantial knowledge of an alleged risk or event of harm. Other persons are entitled to their opinions and advocacy, but the purpose of the public database is not to create an opinion forum. That function is filled by many groups, media and internet sites

Mr. Butterfield

Q: Please provide a list of every association or other entity that you have represented, consulted, or provided any other form of paid services with respect to any issues arising under the CPSIA in any forum and the amounts paid to you or your firm for these services.

A: I was asked by the Committee to testify on my own behalf as an expert on CPSC law and procedure. As I stated in my testimony, I am General Counsel for the Association of Home Appliance Manufacturers, and I have registered as a lobbyist for that organization. There is no other entity for which I lobby on CPSC or related matters.

Sincerely,

Re: Response to Supplemental Questions re Discussion Draft of H.R. _____, a bill that would revise the Consumer Product Safety Improvement Act

Dear Chairman Bono-Mack and Ranking Member Butterfield:

Thank you again for your invitation of the Subcommittee to appear and provide testimony before the Subcommittee on Commerce, Manufacturing, and Trade on April 7, 2011, to testify at the hearing entitled "Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act." Please find my responses to the supplemental questions by Mr. Dingell and Mr. Butterfield.

The Honorable John Dingell

1. *I have several questions concerning the public database mandated by CPSIA.*

   a. *Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of such information's accuracy?*

   A. CPSIA has been interpreted by the Commission to limit its discretion to investigate the veracity and accuracy of complaints prior their posting to the database. The default presumption under the Commission database rule is that posting is required, without discretion, even if the Commission has failed to resolve a timely claim of material inaccuracy submitted by the manufacturer. The presumption under the rule is that CPSC is required to post within 10 business days of its mailing or making such complaint available to the affected manufacturer, importer of record or private labeler for comment. This limits the CPSC from asserting discretion as is customarily afforded independent federal regulatory agencies to reasonably investigate such claims. CPSC should be

afforded the discretion to assure that valid, accurate information is posted on a database put forth under the imprimatur of the U.S. Government, notwithstanding disclaimers and limitations of liability contained therein.

b. *Should a manufacturer be given the opportunity to contest the accuracy of a consumer complaint before it is published?*

A. Yes, a timely claim by a manufacturer that a submission is materially inaccurate, so as to be false misleading or unfair should be required to be affirmatively resolved by the Commission prior to public posting. Since such requirement is first predicated upon a legitimate claim of material inaccuracy, under penalty of law, if the claim itself is false the Commission can be required and should be afforded the opportunity to validate the complaint prior to posting. This seems fundamentally fair.

c. *If a manufacturer is allowed to dispute the accuracy of the information in a consumer's complaint, how should that dispute be resolved and by whom?*

A. The Commission already has experienced staff capable of reviewing hazard data, conducting investigations of hazards and discerning factual so as to screen data to assure reasonable accuracy of information. This was one of the very reasons for support of increased funding for the agency with the passage of the CPSIA.

d. *The draft legislation amends CPSIA to permit only persons directly harmed by a consumer product, their family, their legal representative, or another person authorized on their behalf to submit a complaint to the database. Previously, CPSIA permitted anyone to submit complaints about a consumer product. Do you believe the draft legislation's narrowing of eligibility to submit complaints is necessary?*

A. The draft legislation seeks to assure that duplicate complaints and issues related to "hearsay" complaints are resolved. We support database submissions by those persons reasonably intended by Congress to be eligible to submit claims namely injured person, their family and their representatives, first responders or medical personnel who have direct and substantial knowledge of an alleged risk or event of harm. Requirements that hew to the original purpose of Congress, yet provide a way for duplicative or hearsay information to be weaned from the database, will allow CPSC staff to better use their limited resources.

The Honorable G. K. Butterfield

1. Please provide a list of every association or other entity that you have represented, consulted, or provided any other form of paid services with respect to any issues arising under the CPSIA in any forum and the amounts paid to you or your firm for these services.

A. In my testimony I noted firm works as independent legal counsel to the Craft& Hobby Association (CHA), Toy Industry Association (TIA), Juvenile Product Manufacturers Association (JPMA), Halloween Industry Association (HIA), and individual companies.

These services include but are not limited to issues arising under the CPSIA. Indeed most of our legal services are unrelated to the CPSIA. Our client Associations employ independent or staff registered lobbyists. We have noted that our services are broader than just dealing with CPSIA issues. It was in my individual capacity that as a legal practitioner dealing with children's product safety standards and issues beyond the pale of the CPSIA that I was requested to appear and testify before this Subcommittee. I did not charge any client a fee for services to do so. In the aggregate I estimate that no more than $50,000. annually has been allocated in relation to fees providing member information, education, seminars, bulletins and specific client advice (subject to attorney client privilege) or in rendering technical and legal advice specifically related to CPSIA required rulemakings (conducted independently in accordance with due process requirements of the Administrative Procedure Act as part of the CPSC's rulemaking function).

2. *I understand that you represent the Juvenile Products Manufacturers Association (JPMA).*

   a. *Does JPMA have a third-party testing program for the durable nursery products for which the Republican discussion draft removes mandatory third-party testing requirements?*

A. Yes, the JPMA does have a Certification Program that includes testing by third party designated laboratories as part of the program. The program also will permit reliance on alternate test and component part test rules, related to selection and testing or representative samples from production and reliance upon component supplier certifications, to the extent permitted by the Consumer Product Safety Commission (CPSC). The revised discussion draft as currently being circulated would not eliminate such program or preclude the program's inclusion of testing requirements by independent third party internationally accredited testing laboratories. The CPSC is afforded the discretion to require such testing as part of a suitable quality assurance program under the current draft rules under discussion. As we understand the current draft third party testing as a component of such Certification program would not be eliminated.

   b. *Does JPMA support third-party testing for durable nursery products?*

A. First and foremost JPMA supports sound quality assurance programs and procedures as part of sourcing materials and in the production of products so that testing when the product is already entered into U.S. Commerce is obviated. Verification third party or firewalled laboratory testing as part of such production process is supported as part of its Certification Program. This is distinct from a requirement that the CPSC accredit laboratories performing such testing, if such accreditation process creates production bottlenecks or sourcing issues. CPSC should be afforded the discretion to recognize existing valid NIST recognized international accreditations for such laboratories; this could streamline the process and be used to avoid bottlenecks in sourcing, production and distribution of goods in commerce. JPMA supports affording the Commission the authority to prescribe reasonable testing programs, such as its Certification program, to be used as the basis for certification under CPSIA. In addition JPMA supports reasonable requirements that assure availability and capacity of internationally accredited, NIST recognized laboratories sufficient to timely conduct testing, so as not to impede the free flow of trade or create bottlenecks in the supply

chain. This is especially important to assure consumer supply and availability of new durable juvenile products that will be subject to increasingly stringent mandatory safety regulations under Section 104 of the Consumer Product Safety Improvement Act of 2008. We also support the flexibility needed by the Commission to assure that congressionally specified alternate test rules are recognized and implemented as part of this process.

Thank you for your additional inquiries.

Sincerely,

Frederick Locker

Mr. Dan Marshall
Vice President, Handmade Toy Alliance
Co-Owner, Peapods Natural Toys & Baby Care
2290 Como Avenue
St. Paul, MN 55108

Dear Mr. Marshall,

Thank you for appearing before the Subcommittee on Commerce, Manufacturing, and Trade on April 7, 2011, to testify at the hearing entitled "Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act."

Pursuant to the Rules of the Committee on Energy and Commerce, the hearing record remains open for 10 business days to permit Members to submit additional questions to witnesses, which are attached. The format of your responses to these questions should be as follows: (1) the name of the Member whose question you are addressing, (2) the complete text of the question you are addressing in bold, and then (3) your answer to that question in plain text.

To facilitate the printing of the hearing record, please respond to these questions by the close of business on Wednesday, May 11, 2011. Your responses can be emailed to the Legislative Clerk, in Word or PDF format, at Alex.Yergin@mail.house.gov.

Thank you again for your time and effort preparing and delivering testimony before the Subcommittee.

Sincerely,

Mary Bono Mack
Chairman
Subcommittee on Commerce, Manufacturing, and Trade

Re: Questions for the Record from the April 7 Hearing on Reform of the Consumer Product Safety Improvement Act (CPSIA)

The Honorable G. K. Butterfield

1. During your oral testimony you stated that the Handmade Toy Alliance endorsed the Republican discussion draft "because of the relief it provides to our members." You went on to suggest that the draft provides your members an exemption from third-party testing or that your members would be allowed to follow alternative testing procedures. My understanding, based on the advice of lawyers on my staff, and on Chairman Bono Mack's opening statement, is that the draft does not provide any relief to your members from the mandatory third-party requirements for five specific products or hazards: (1) lead paint; (2) lead in children's metal jewelry; (3) small parts; (4) compliance with crib standards; and (5) compliance with pacifier standards. Relief is only available to your members from any additional testing requirements that CPSC might require in the future through the rulemaking process outlined in the draft. Small crafters will still have to have their children's products third-party tested for lead in metal jewelry, small parts, and compliance with the crib standards. In addition, ASTM F-963 will remain a mandatory standard, so your members will still have to comply with all of ASTM F-963 and certify that they have done so.

a. Assuming my understanding is accurate, do you and your members still support the Republican discussion draft even though it does not provide full relief from compliance with CPSIA? If so, please explain why.

First and foremost, we wish to restate that our primary goal is the passage of meaningful CPSIA reform

as soon as possible. Although the discussion draft would provide relief for our members in key areas, we remain concerned about many other provisions of the CPSIA which unfairly disadvantage small businesses. These include retroactivity, labeling requirements, the 100ppm lead content standard, lack of harmonization with the European Union, and testing requirements for small parts and lead in paint. In the interest of expediency, we have chosen to focus our efforts on providing the most relief for as many of our members as possible.

Our ideal solution to the unintended consequences of the CPSIA is outlined in our platform located at http://www.handmadetoyalliance.org/Resources/TheHTAPlatform.aspx . The discussion draft proposes relief through CPSC rulemaking as you indicate, but with the protecting stipulations that the benefits of third party testing justify the costs; that rules impose the least possible burden; and that an exemption is provided by default in the absence of rulemaking. These stipulations make compliance achievable for our membership. However, our preference remains a legislative exemption for micro-businesses.

Our purpose from the beginning of our organization has always been to mitigate the costs of third party testing on small batch children's product manufacturers. The CPSIA established requirements for many types of tests for many different types of products. In speaking with our members, our analysis is that the greatest burdens we face are mandatory third party testing for lead in substrate and ASTM F-963 testing for toys, both of which are scheduled to be implemented by the end of this year. We are not seeking exemptions from the standards themselves, but from the third party testing requirements. In both cases, we believe that small batch manufacturers should be allowed to self-certify based on a reasonable testing program. The discussion draft would make this possible.

We are not pursuing exemptions from testing requirements for lead in paint, metal jewelry, or crib standards. In the case of the lead in paint and metal jewelry standards, we recognize two realities. First, these were the two areas which caused the majority of product safety concerns prior to the enactment of the CPSIA. Second, although we disagree with the need for testing American and European products for lead in paint violations because lead paint has been outlawed in those countries for over 30 years, we recognize that the damage to these companies has already been done. The lead in paint testing requirement has been in place for almost a year and a half. Several respected companies have already ceased operations as a result. The damage has already been done. We hope that component-based testing will mitigate the cost of lead in paint testing in the future.

We are not at this time concerned with the crib standard. None of our members manufacturer cribs.

As for the small parts testing requirement, we believe that the CPSC can and should develop alternative testing methods which would allow small-batch manufacturers to self-certify. This standard is very straightforward and relatively easy to test for. In a perfect bill, the small parts standard would not be excluded from the exemptions available to small batch manufacturers.

Once again, we urge the House and the Senate to work together to mitigate the overwhelmingly negative impact of the CPSIA on small businesses.

The Honorable John Dingell

1. The draft legislation amends section 101(b) of CPSIA to exempt components of children's products from the Act's lead limits if such components do not cause a child to ingest more than a de minimus amount of lead. The legislation would require the Commission to specify procedures for manufacturers to test and estimate this de minimus amount. Do you believe small manufacturers and handcrafters will

be able to afford and/or carry out such test procedures?

No. We do not believe that small batch manufacturers will be able to avail themselves of the *de minimus* exemption process. The costs involved in meeting the requirements of this process would be beyond the reach of our members. However, we hope that the CPSC will rule on *de minimus* applications made by larger companies in such a way that smaller businesses may benefit as well. For example, if the CPSC rules that a given company's leaded crystal rhinestones meet the *de minimus* standards, we hope that it will make its ruling categorically, so that *all* manufacturers which use leaded crystals may also benefit. We would hope that committee report language would communicate the expectation that *de minimus* rulings should be made as generally as possible and not limited to only a specific product made by a specific manufacturer.

Responses from Rachel Weintraub to Questions for the Record from Hearing on "Discussion Draft of H.R. ___, a bill that would revise the Consumer Product Safety Improvement Act," April 7, 2011

Questions from the Honorable Mary Bono Mack

Question

1. Which is more dangerous: a children's product containing 10,000 ppm lead that does not leach enough lead to result in a measurable increase in a child's blood lead level, or a product that contains 100ppm lead that leaches enough lead to result in a measurable increase in a child's blood lead level?

Answer

The first example is potentially dangerous and the second is definitely dangerous. If a child already has a moderately elevated blood level, exposure to a product that may not leach enough lead alone to measurably increase blood lead level could, in combination with other exposures, result in an increase in blood lead levels. Depending upon the composition of the item, it could leach higher levels of lead over time as the materials deteriorated. In addition, there are unexpected circumstances, such as a child ingesting a product, that can lead to higher absorption than expected. Given the long-established toxicity of lead to children's brains, the American Academy of Pediatrics strongly recommends eliminating all unnecessary sources of exposure.

Question

2. Do you think the Consumer Product Safety Commission should focus its efforts primarily on products where it can prevent the most harm to the public?

Answer

The Consumer Product Safety Commission should balance numerous factors when it prioritizes its work. The factors that should be balanced include: if the harm is preventable, how pervasive the harm is, and CPSC's resources and expertise available to address the harm. Importantly, as the only agency standing between consumers and potentially deadly products, as CPSC weighs numerous factors in determining what issues to address, CPSC cannot afford to completely ignore any hazard.

Question

3. You made a claim that the discussion draft will "keep babies in known unsafe cribs." Which cribs did you have in mind? What is your basis for claiming that they are unsafe? If they are known to be unsafe, why has CPSC not undertaken a recall (in which case, the costs of purchasing a new crib might be borne by the manufacturer of the unsafe product instead of the purchaser)?

Answer

Because the Discussion Draft will allow non-drop side cribs to be used in day care facilities if in compliance with state supervision laws, cribs that have other types of hazards could still be used. Cribs that have slats that are too far apart or corner posts are known hazards to babies. Cribs that have these elements have not been recalled by CPSC but rather voluntary standards have prohibited them over the years. CPSC has never recalled cribs because they do not meet the newer voluntary standard or even when they didn't meet the older mandatory standard.

Question

4. How does an inaccurate report aid a consumer in making a smart purchase?

Answer

This question presumes that there will be inaccurate reports in the database. I am not aware of data supporting the proposition that reports will not be accurate. The database includes criteria that require eight specific fields of information and allows manufacturers not only to place a comment on a posting but also to make a claim that the information in the report is materially inaccurate. We understand from the CPSC that manufacturers have been claiming material inaccuracy for about 20 percent of claims and that for more than half of them the claim involves a misidentification of the manufacturer. We understand that these claims are being resolved before they are being posted.

Question

5. How does an incomplete report aid a consumer in making a smart purchase? For instance, there are over 100 GRACO baby chair models. How does a report that identifies a product as GRACO, rather than by specific model, help a consumer?

Answer

First, the type of situation that this question presents is not reflective of the vast majority of information received in the database thus far. In fact, we understand from CPSC that over 80 percent of the reports submitted to the database contain model numbers.

Second, information such as this could help a consumer by confirming a similar hazard pattern that may have occurred to them or by reinforcing that steps should be taken to ensure against a potential hazard. For example, if the issue had to do with a tray breaking or not securing properly, it could remind a parent to always make sure that the tray is correctly latched, that the tray cannot be used as an effective restraint, and that the straps should always be used.

Question

6. You testified that "many organizations testi[ied] that testing to 100ppm was technologically feasible and that companies were already complying with that standard." The issue is not whether it can be tested but whether companies can consistently reach that very low level in metal-containing products and a number of organizations testified at that same proceeding that it is not feasible. Why are your organizations right when those that actually manufacture the products are wrong?

Answer

In my written testimony, I stated that, "At a recent CPSC hearing on this issue, many organizations testifying stated that testing to 100 ppm was technologically feasible and that companies were already complying with that standard." Further, Jay Howell who also testified before you on April 7, 2011, stated in his written testimony that,

> "In a recent Commission hearing on the technological feasibility of reducing lead limits to 100 ppm, a representative of SGA, a global inspection, verification, testing, and certification company, presented a statistical analysis of lead content testing data (89,273 data points) collected primarily from its Shenzen laboratory that specializes in the testing of children's toys and other children's products. In its analysis, SGS found that 96.29 percent of metal components tested at or below 100 ppm lead."

Thus, Mr. Howell's testimony expanded upon and confirmed my point that data is proving that compliance with the 100 ppm lead level is technologically feasible. This is the critical question since the CPSIA includes in section 101(a)(2)(c) that, the lead limit for children's products will be 100 ppm "unless the Commission determines that a limit of 100 parts per million is not technologically feasible for a product or product category."

Question

7. You criticize the phthalate provisions of this draft and I have a couple of questions on that.

   a. First, you disagree with the provision because the CSPC can carve out products where the prohibition on phthalates is not necessary to protect children's health. However, you also testified that the point of CPSIA is to protect children's health. If a prohibition does not exist to protect health – in what you consider a public health law - why should it remain on the books?

Answer

The phthalate provision in the Discussion Draft weakens public health by potentially reducing the number of products that would be required to meet the phthalate standard.As I stated in my written testimony, "The phthalate provision in CPSIA protects our children from the cumulative risks of hormonal chemicals that affect genital development and have been associated with testicular cancer and other fatal diseases and serious conditions. Narrowing the definition of the scope of the products covered by the phthalate provision and creating large opportunities to exempt products from coverage will undermine the health protection of the original phthalate provision of the CPSIA."

Question

   b. Second, you criticize the "tight timeline" in which this bill would require to act on the interim prohibition established in CPSIA once the Chronic Hazard Advisory Panel issues its report. However, this draft only requires that the CPSC commence its rulemaking in 90 days. What is your recommendation on a timeframe in which the CPSC should conclude its rulemaking on this matter? Begin in 90 days and end in 6 months…12 months…18 months?

Answer

The phthalate provision is the only provision in the Discussion Draft that contains a timeline at all. While the phthalate provision requires CPSC to begin a rulemaking in 90 days it also requires the rulemaking to be completed in a time yet to be determined. There is no clear reason why CPSC and industry should have to review the CHAP report and initiate a rulemaking within 90 days. As for the time frame in which CPSC should conclude its rulemaking, the CPSIA is already clear that the Commission must complete that within 180 days. The question is: how can Congress justify forcing the lifting of a ban of potentially toxic substances – regardless of what the science says- if the Commission doesn't conclude its rulemaking in 180 days?

Question from the Honorable Pete Olsen

1. Ms. Weintraub – the Chairman, myself, and Mr. McKinley all asked you during the hearing to provide us with verified statistics of the lead-in-substrate injuries you spoke of in your testimony. Because we did not receive an answer, I would like to ask you again - for the record - to provide us with verified statistics of instances where any children have been injured, sickened or killed by lead-in-substrate. Please substantiate these claims.

Answer

According to the CDC, "Approximately 250,000 U.S. children aged 1-5 years have blood lead levels greater than 10 micrograms of lead per deciliter of blood, the level at which CDC recommends public health actions be initiated. Lead poisoning can affect nearly every system in the body. Because lead poisoning often occurs with no obvious symptoms, it frequently goes unrecognized."[1] Since lead exposure often occurs without obvious symptoms, it is difficult to pinpoint the causes of the lead exposure. There are known symptoms of lead exposure. These include reduced I.Q., hyperactivity, behavioral problems, learning disabilities, health problems such as brain damage, and potential damage to the central nervous system, kidneys, and reproductive system."

CDC does not break down its data to identify whether children have been injured or killed by lead in the substrate of children's product but does list toys and children's jewelry as a source of potential lead exposure among other sources.

While chronic lead exposure is vastly more common, rare instances of acute lead exposure have been documented from consumer products, including a death to a child in Minnesota after swallowing a charm that was almost entirely lead,[1] and a report of a child suffering severe adverse health impacts in Oregon, after he swallowed a charm bought from a vending machine that was 38.8 percent lead.[2]

The goal of the lead provision in the CPSIA is to continue the successful work of the broad public health community that has reduced lead exposure to children and focus on known sources of lead in consumer products. The CPSIA seeks to help create a generation of safer children.

Questions from the Honorable G. K. Butterfield

Question

1. Prior to CPSIA, assurance for the safety of children's product safety relied on blind trust. Parents relied on what they thought were reputable and well-established companies to put only safe products into the marketplace. But those companies, in many cases, relied on the word of overseas suppliers to ensure the safety of their products. There was no mandatory system of independent verification. The recalls of 2007 and 2008 proved faith in manufacturers and suppliers to do the right thing was not an adequate safeguard for children's health and safety. I understand that the mandatory independent third-party testing required by CPSIA is all about independent verification of the safety of children's products.

    a. Please explain why a system that requires independent verification is particularly important when it comes to the safety of children's product.

Answer

The goal of independent safety verification is to prevent safety hazards before the product comes onto the market. The previous system in place before passage of the CPSIA relied upon a system that was essentially, "trust and maybe, possibly, verify" product safety recalls, and a hope that manufacturers were complying with existing voluntary standards. This system failed consumers. The recalls of 2007 and 2008 highlighted these failures and illustrated the need for a better more meaningful system in place.

Voluntary recalls were virtually the only method for CPSC to address product safety hazards before CPSIA passed. This was inadequate for two main reasons. First, the recall is reactive. The harm already

---

[1] http://www.cdc.gov/mmwr/preview/mmwrhtml/mm55d323a1.htm
[2] http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5323a5.htm

occurred, the product is already in consumer's homes and in children's hands. The recall process is a reaction to the known product hazards. Second, recalls aren't always effective. Recall compliance rates rarely exceed 20 or 30 percent. So, even when there is a reactive recall, not all the consumers who need to know about it actually find out about it and take the product out of their home.

Independent third party testing is important for children's products because it is proactive, it requires that manufacturers take efforts to ensure compliance with safety standards, and it seeks to prevent conflicts of interests that could emerge in non-independent testing. To best protect consumers from product hazards, products should be required to be tested for safety compliance with existing mandatory standards *before* they can enter the stream of commerce, and potentially pose risks to children. CPSC does not enter manufacturing facilities and is hard pressed, due to its budget, to police the marketplace even after products are in the stream of commerce. Therefore, to ensure that products meet the toy, lead, phthalate and infant durable product standards of the CPSIA, third- party testing is necessary.

The third-party testing requirement is proactive and helps ensure that products for vulnerable consumers, children, are safe from an earlier stage in the supply chain – as opposed to conducting costly recalls after consumers have been exposed to the hazard. This will save consumer lives and prevent costly recalls. For over 30 years, until the passage of the CPSIA, third-party testing was not required. In essence, the CPSC and consumers had to hope that products met the required standards. This wasn't happening and children suffered as a result. Relying on manufacturer assurances of safety has put children at risk: for example, CPSC relied upon assurances of magnet toy manufacturers that the toys they sold to the public *after* recalls would not pose the same hazards to children as the recalled toys. However, the same recalled toys continued to be sold without any changes to improve safety, because there was no third-party testing to check that manufacturers were following the law.

Question

b. Please explain why certification by manufacturers to mandatory safety standards – the system in place prior to enactment of CPSIA that still remains part of a manufacturer's compliance obligations – or even the increased civil penalties enacted under CPSIA are not enough to ensure that manufacturers comply with children's product safety rules.

Answer

Certification by manufacturers of mandatory safety standards and increased civil penalties are, alone, not enough to ensure that manufacturers comply with children's product safety rules because relying upon the manufacturers to ensure that their products will comply with the mandatory standards, of which there were very few before CPSIA was passed, failed to prevent millions of non compliant and potentially hazardous products from entering the marketplace. Certification is not necessarily a process conducted by an independent third party. In order to ensure that the product meets the standards, another entity without a financial interest in the sale of the product must be involved in ensuring compliance.

The increased civil penalties of the CPSC, just like product recalls, are reactive and occur much too late in the life cycle of a product, only after the violations have occurred and the safety hazard has exposed consumers to a risk of harm. While civil penalties need to be robust to deter wrongful conduct, it remains an important aspect of a robust product safety system. Civil penalties alone do not require specific actions to ensure compliance with safety standards.

Questions from the Honorable John Dingell

Question

1. I have several questions concerning the public database mandated by CPSIA.

a. Is it your understanding that CPSIA requires all information submitted to the consumer complaint database to be published online within 10 days of its receipt, regardless of such information's accuracy?

Answer

No, confidential business information will not be published in the database. Further, if reports are not complete, such that each of the all eight fields of information are not included, the reports are not posted, the time line is not yet started and CPSC works to complete the information provided. Once the fields are complete, the time clock begins to run.

Question

b. Should a manufacturer be given the opportunity to contest the accuracy of a consumer complaint before it is published?

Answer

Manufacturers already have the opportunity to contest the accuracy of a consumer complaint before it is published and the manufacturer has the ability to post a comment that would appear on the report indicating a concern about the accuracy of a report.

Question

c. If a manufacturer is allowed to dispute the accuracy of the information in a consumer's complaint, how should that dispute be resolved and by whom?

Answer

CPSC should resolve any dispute that arises based upon information provided by the manufacturer and by the consumer.

Question

d. The draft legislation amends CPSIA to permit only persons directly harmed by a consumer product, their family, their legal representative, or another person authorized on their behalf to submit a complaint to the database. Previously, CPSIA permitted anyone to submit complaints about a consumer product. Do you believe the draft legislation's narrowing of eligibility to submit complaints is necessary?

Answer

No. The draft legislation's narrowing of who can report to the database is not necessary.

THE VIEWS OF THE INDEPENDENT AGENCIES ON REGULATORY REFORM

THURSDAY, JULY 7, 2011

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON OVERSIGHT AND INVESTIGATIONS,
COMMITTEE ON ENERGY AND COMMERCE,
Washington, DC.

The subcommittee met, pursuant to call, at 10:35 a.m., in room 2322 of the Rayburn House Office Building, Hon. Cliff Stearns (chairman of the subcommittee) presiding.

Members present: Representatives Stearns, Terry, Burgess, Blackburn, Bilbray, Scalise, Gardner, Griffith, Barton, DeGette, Schakowsky, Castor, Markey, Green, Christensen, and Waxman (ex officio).

Staff present: Allison Busbee, Legislative Clerk; Stacy Cline, Counsel, Oversight; Todd Harrison, Chief Counsel, Oversight & Investigations; Brian McCullough, Senior Professional Staff Member, Commerce, Manufacturing, and Trade; Andrew Powaleny, Press Assistant; Alan Slobodin, Deputy Chief Counsel, Oversight; Sam Spector, Counsel, Oversight; Kristin Amerling, Democratic Chief Counsel and Oversight Staff Director; Michelle Ash, Democratic Chief Counsel, Commerce, Manufacturing, and Trade; Phil Barnett, Democratic Staff Director; Tiffany Benjamin, Democratic Investigative Counsel; Jocelyn Gutierrez, DOE Detailee; Karen Lightfoot, Democratic Communications Director, and Senior Policy Advisor; Felipe Mendoza, Democratic Counsel; Ali Neubauer, Democratic Investigator; and Roger Sherman; Democratic Chief Counsel, Communications and Technology.

OPENING STATEMENT OF HON. CLIFF STEARNS, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF FLORIDA

Mr. STEARNS. Good morning, everybody. The Subcommittee on Oversight and Investigation will come to order, and there will be an opportunity for each of us to give an opening statement, and I shall open with mine.

President Obama's Executive Order 13563 states that agencies must take into account the costs and benefits of proposed regulations; use the least burdensome methods to achieve regulatory goals; maximize net benefits; and evaluate alternatives to direct regulation.

The Order also requires agencies to conduct periodic reviews of significant regulations to determine whether they are outmoded, ineffective, insufficient, or excessively burdensome. These retrospective reviews have been required for more than 30 years, and

if conducted as intended, could be a crucial tool in reducing the burden of regulation on our economy today.

As chairman of this subcommittee, I have set out to ensure that these goals are simply achieved. Regulations cost money, and in today's weak economy, we cannot afford such burdens when they are totally unnecessary. During our June 3rd hearing, Mr. Cass Sunstein of OMB indicated that although independent agencies were not bound to comply with the Executive order, he believed that they should.

Unfortunately, none of the independent agencies under the committee's jurisdiction have to date complied with the Executive order.

We are holding this hearing today to ask the CPSC, the FCC, the FTC and FERC to explain why they did not submit a regulatory review plan to Cass Sunstein by May 18th, as they were asked to do. While each of these agencies engages in some degree of regulatory review, none of them conduct the kind of top-to-bottom, regular retrospective review that will help to unburden our economy.

The CPSC, perhaps more than any other agency today, seems determined, in our opinion, to pass regulations without even a hint of regulatory humility. Commissioner Northup will testify that CPSC regulations are estimated to cost industry billions of dollars with no cost-benefit analysis done to justify those regulations and no analysis done to show improved safety for our children. Commissioner Northup has also submitted for the record today a list of businesses that have closed their doors in part because of CPSC regulations.

Now, we realize many of the CPSC's most damaging regulations are required by the CPSIA, which has had a number of unintended consequences. Until Congress can act to reform that law, we would hope the CPSC would use its discretion where possible to comply with the President of the United States Executive order. Where CPSC doesn't have discretion, we would hope the CPSC Democrat commissioners would be cooperative in helping this committee identify where they need more discretion rather than sending last-minute partisan letters meant to derail the reform process.

Meanwhile, Congress asserted deregulatory goals in regard to the FTC decades ago, removing its authority to operate under the Administrative Procedure Act and instead instituting Mag-Moss procedures, created under a Democratic Congress to halt the agency from further significant rulemaking. Today, the agency resorts to rulemaking through orders and guidelines that do not undergo a notice and comment process.

Although FERC does not issue a large number of regulations, there is room to improve in its rulemaking and regulatory review also. FERC regulations call for broad ranges of data sets without a clear indication on how the agency utilizes this information. It has not conducted a top-to-bottom review of its regulations since the Clinton Administration. And it is unclear what, if any, cost-benefit analysis is done of the impact its policies have on the energy industry and consumers.

Now, as for the FCC, in drafting both the Communications and Telecommunications Acts, Congress emphasized the importance of deregulation. The FCC is required to review its telecommunications

regulations every 2 years and its media ownership rules every 4 years. But these reviews fall short of what the President and this committee have asked agencies to do. They only cover a narrow set of rules at the FCC and the commission can't seem to get these reviews done on time, and the commission hasn't repealed or modified any significant regulations in recent review periods. Perhaps that is because the commission is too busy taking conclusion-driven actions, such as the Net Neutrality Order and the Chairman's Section 706 report.

So my colleagues, I look forward to learning more about what each agency will do to adopt the principles of the President's Executive order. I hope the format of this hearing gives you all the opportunity to learn about what other agencies are doing to improve these processes.

[The prepared statement of Mr. Stearns follows:]

PREPARED STATEMENT OF HON. CLIFF STEARNS

President Obama's Executive Order 13563 states that agencies must take into account costs and benefits of proposed regulations; use the least burdensome methods to achieve regulatory goals; maximize net benefits; and evalnate alternatives to direct regulation. The Order also requires agencies to conduct periodic reviews of significant regulations to determine whether they are outmoded, ineffective, insufficient, or excessively burdensome. These retrospective reviews have been required for more than 30 years, and if conducted as intended, could be a crucial tool in reducing the burden of regulation on our economy.

As Chairman of this Subcommittee I have set out to ensure that these goals are achieved. Regulations cost money, and in today's economy we cannot afford such burdens when they are unnecessary. During our June 3 hearing, Cass Sunstein of OMB indicated that although independent agencies were uot bound to comply with the Executive order, he believed that they should. Unfortuuately, uone of the indepeudeut ageucies uuder the Committee's jurisdiction have to date complied with the Executive order.

We are holding this hearing today to ask the CPSC, FCC, FTC, and FERC to explain why they did not submit a regulatory review plan to Cass Sunstein by May 18, as they were asked to do. While each of these agencies engages in some degree of regulatory review, none of them conduct the kind of top to bottom, regular retrospective review that will help to unburden our ecouomy.

The CPSC, perhaps more thau auy other agency here today, seems determined to pass regulatious without eveu a hint of regulatory humility. Commissioner Northup will testify that CPSC regulations are estimated to cost industry billions of dollars with no cost benefit analysis done to justify those regulations and no analysis done to show improved safety for children. Commissioner Northup has also suhmitted for the record today a list of businesses that have closed their doors iu part because of CPSC regulations.

We realize mauy of the CPSC's most damaging regulations are required by the CPSIA, which has had a number of uuintended consequences. Until Congress can act to reform that law, we would hope the CPSC would use its discretion where possible to comply with the President's Executive order.

Where CPSC doesn't have discretion, we would hope the CPSC Democrat Commissioners would be cooperative in helping this Committee identify where they need more discretion rather than sending last minute partisan letters meant to derail the reform process.

Meanwhile, Congress asserted deregulatory goals in regard to the FTC decades ago, removing its authority to operate under the Administrative Procedure Act and instead instituting Mag-Moss procedures—created under a Democratic Congress to halt the agency from further significant rulemaking. Today, the agency resorts to rulemaking through Orders and Guidelines that do not undergo a notice and comment process.

Although FERC does not issue a large number of regulations, there is room to improve in its rulemaking and regulatory review. FERC regulations call for broad ranges of data sets without a clear indication on how the agency utilizes this information. It has not conducted a top to bottom review of its regulations since the Clin-

ton Administration. And it's unclear what (if any) cost-benefit analysis is done of the impact its policies have on the energy industry and consumers.

As for the FCC, in drafting both the Communications and Telecommunications Acts, Congress emphasized the importance of deregulation. The FCC is required to review its telecommunications regulations every two years and its media ownership rules every four years. But these reviews fall short of what the President and this Committee have asked agencies to do. They only cover a narrow set of rules at the FCC. The Commission can't seem to get these reviews done on time. And the Commission hasn't repealed or modified any significant regulations in recent review periods. Perhaps that's because the Commission is too busy taking conclusion driven actions, such as the Net Neutrality order and the Chairman's Section 706 report.

I look forward to learning more about what each agency will do to adopt the principles of the President's Executive order. I hope the format of this hearing gives you all the opportunity to learn abont what other agencies are doing to improve their processes.

Mr. STEARNS. With that, I yield to the ranking member, Ms. DeGette.

OPENING STATEMENT OF HON. DIANA DEGETTE, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF COLORADO

Ms. DEGETTE. Thank you so much, Mr. Chairman.

This is the fourth in a series of hearings examining the government's regulatory review process, and I frankly am pleased to hear you today embrace the President's Executive order that sets forth principles of regulation protecting public health, welfare, safety and the environment while at the same time promoting economic growth and competitiveness. I thought that Cass Sunstein was an excellent witness talking to us about how we can all agree on a bipartisan basis that we should eliminate unnecessary regulations at the agencies.

Now, today we have witnesses, and I am happy to welcome all of them, particularly our former colleague, Congresswoman Northup, and these witnesses represent four important independent federal agencies: the Consumer Product Safety Commission, the Federal Energy Regulatory Commission, the Federal Communications Commission, and the Federal Trade Commission. Now, Congress created these agencies as independent entities, and so therefore, as you noted, Mr. Chairman, they are not covered explicitly by the President's Executive order on regulatory review. But it is important, though, for the subcommittee and the public to understand whether the independent regulatory review processes at these agencies are effective and efficient.

I would like to correct the record. Mr. Sunstein when he testified, he said he had urged these independent agencies to conduct regulatory review processes but he did not say that they should submit reports to him like the agencies under the purview of the Executive order, so I was a little confused, Mr. Chairman, when you had said that somehow they should submit reports because not only are they not required to but Mr. Sunstein himself does not believe that these agencies are directly subject to the Executive order and that is an order to pervert any President, Democrat or Republican, from overreaching their authority.

Now, as we hear from these agencies on their regulatory review efforts, I think we need to keep a few thoughts in mind. First of all, these agencies were created originally as independent entities

to insulate them from political influence and we have given them decision-making flexibilities that other agencies do not have. Secondly, irrespective of the Executive order, as I mentioned, there are a number of statutory requirements concerning transparency and efficiency in the regulatory process that already apply to the independent agencies. For example, the Regulatory Flexibility Act requires federal agencies, including independent agencies, to analyze the impact of their rules on small organizations. The Administrative Procedure Act broadly lays out the scheme under which agencies propose and finalize regulations, and provides for public participation in the rulemaking process.

Finally, it is important to remember that the underlying mission of all of the agencies before us today is to ensure the safety and the health of all of our citizens. While we should make sure that the regulations they propose are well crafted and not overly burdensome, we should also acknowledge the importance of the work hey do and the regulations they promulgate. For example, this year, the FCC issued a report and order to adopt a rule requiring mobile providers to enter data roaming arrangements with other providers, allowing consumers to remain connected when they travel outside of their provider's coverage area. FTC recently established the Do Not Call registry, which lets consumers choose whether they want to receive calls from telemarketers. This is wildly popular with my constituents, by the way. And every day, FERC acts as a neutral adjudicatory body handling extremely complicated technical issues on the electricity market.

But I want to talk just in the last minute that I have about the recent proposals on the other side of the aisle that would undermine the Consumer Product Safety Commission and some of the other good work that they have done. Three years ago, this committee and this Congress worked hard in a significantly bipartisan manner to put meaningful reforms for consumers into the Consumer Product Safety Improvement Act. This has yielded unbelievable benefits. The CPSC has initiated a wide range of recent efforts to protect children from mandatory standards to cribs to the problem of dangerous toys to banning certain phthalates, and on and on. And this evidence shows that it is beginning to happen.

So I think it is important to notice that these reforms were worked out by this committee in one of the last great efforts that was completely bipartisan. We should embrace that. If there are problems with the way the regulations are being promulgated, we need to talk about that, but eliminating these important consumer product safety provisions is simply not an option.

Thank you, Mr. Chairman.

[The prepared statement of Ms. DeGette follows:]

PREPARED STATEMENT OF HON. DIANA DEGETTE

Today, we are holding the fourth in a series of hearings examining the Federal Government's regulatory review process. The Subcommittee has been focused in particular on President Obama's Executive order setting forth principles of regulation that include protecting public health, welfare, safety, and the environment while promoting economic growth and competitiveness; and providing for public participation and transparency.

The witnesses before us today represent fonr important federal agencies: the Consumer Product Safety Commission, the Federal Energy Regulatory Commission, the

Federal Communications Commission, and the Federal Trade Commission. Because Congress created these agencies as independent entities, they are not covered by the President's Executive order on regulatory review. It is important, however, for the Subcommittee and the public to understand whether the regulatory process employed by each of these agencies is effective and efficient.

As we hear from these agencies on their regulatory review efforts, we should keep a few thoughts in mind. First, Congress created these agencies as independent entities to insulate them from political inflnence and granted them decisionmaking flexibilities other agencies do not have.

Second, irrespective of the Executive order there are a number of statutory requirements concerning transparency and efficiency in the regnlatory process that already apply to the independent agencies. For example, the Regulatory Flexibility Act requires federal agencies, including independent agencies, to analyze the impact of their rules on small organizations. The Administrative Procedure Act broadly lays out the scheme under which agencies propose and finalize regulations, and provides for public participation in the rulemaking process.

Finally, it is important to remember that the underlying mission of all of the agencies before us today is to ensure the health and safety of our citizens. While we should make certain the regulations they propose are well crafted, we must also acknowledge the importance of the work that they do and the regulations they promulgate. For example:

o This year, FCC issued a report and order to adopt a rule requiring mobile providers to enter data roaming arrangements with other providers, allowing consumers to remain connected when they travel outside of their provider's coverage area.

o FTC recently established the Do-Not-Call registry, allowing consumers to choose whether they want to receive calls from telemarketers.

o CPSC has initiated a wide range of recent efforts to protect our children, from developing mandatory standards for cribs . to addressing the problem of dangerous toys . to banning certain phthalates in children's products.

o And every day, FERC acts as a neutral adjudicatory body handling extremely complicated technical issues concerning onr electricity market. Through its work the Commission limits regional disparities in electricity, natural gas, and oil pricing.

I am pleased that we have before us today Commissioners from both parties. One of the ways Congress ensured bipartisan input at these agencies was to provide that no more than three Commissioners at the agencies can be of the same party. I hope that the Subcommittee will use this opportunity to hear a variety of perspectives on how to hest ensure an effective regulatory process at the independent agencies, and that avoid focusing on policy or personality disagreements among Commissioners. I look forward to hearing from our distinguished witnesses.

Mr. STEARNS. I thank the gentlelady.

The gentleman from Nebraska, Mr. Terry, is recognized for 3 minutes.

OPENING STATEMENT OF HON. LEE TERRY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEBRASKA

Mr. TERRY. Well, thank you, Mr. Chairman. I appreciate you holding this important regulatory reform hearing.

I applauded the President when he issued his Executive order creating this cost-benefit analysis and look towards creation of jobs versus elimination of jobs by regulation, and I feel that it is time that the independent agencies adopt this and that is why I have introduced H.R. 2204, the Employment Act, which will require that all major regulations include a statement of the number of jobs created, lost, or sent overseas because of the new rules and regulations. Under this Act, all major federal action significantly affecting jobs and job opportunities require rigorous analysis compared to that given to the environmental impacts, and this legislation would establish a policy that jobs are important as is public health and the environment. And this would be an issue of, you could take into effect the jobs lost by certain American toy companies when we fig-

ure out that children don't eat ATVs but yet banning children ATVs could have an impact on jobs.

Now, we have already seen the problems caused by regulators not paying enough attention to the effect their actions have on jobs. In my own district, regulations enacted by the Consumer Product Safety Commission acting far beyond its authority or intent of this law, what I feel isn't one of the most important ones, it is important but I think it may be an example of one of the most poorly written bills too. For example, Wes and Willie's. I shouldn't have used their name but it is a local small business making children's clothes, some of which they have contracted to have done in China as well as Omaha. Does it really make sense that the same design has to be tested on every size of tee shirt, different color of tee shirts? Does it make sense that they have to add 10 tee shirts together assuming a child is going to completely eat 10 tee shirts in one sitting? None of this really makes sense.

So this type of system where it is one size fits all, Mattel versus Wes and Willie's, it really doesn't make a lot of sense. I have found out the irony is that many of these rules don't really protect the consumers but just make it more difficult to do their job, really putting small businesses in particular on the brink of extinction because of these unnecessary rules and regulations.

So I appreciate this hearing so we can protect, and I will give my time back to the chairman.

Mr. STEARNS. I thank the gentleman, and I yield 2 minutes to the gentlelady from Tennessee, Mrs. Blackburn.

Mrs. BLACKBURN. Thank you, Mr. Chairman, and welcome to our witnesses. We appreciate that you are here to talk with us about the President's Executive Order 13563 and its non-application to the independent agencies.

These agencies have refused to voluntarily comply with the order to require justification for the cost and the burdens of their regulations. Some agencies believe that their political ends justify their regulatory means and that their insulation from the traditional checks and balances is a blank check for them to pursue hyperactivist causes. Bureaucrats bolted a restrictor plate to our economic engine and they really have flagged private sector job growth to the pits and now they are resisting voluntary compliance with the Obama order because failing to justify their costly regulations means Congress and the American people are going to raise more questions instead of delegating more power and authority.

Now, these agencies don't know how to make the best individual decisions for us, what foods we eat, what toys we buy, what privacy settings we want on our mobile devices or what light bulbs we prefer to use in our homes. These agencies that use explicit regulatory intimidation and threats of government taking to impose voluntary regulations on job creators aren't even willing to hold themselves to the same standard. They refuse. We need to hold these agencies accountable. Let us ensure greater efforts are taken to balance the economic harms with the agencies that these agencies are causing on our economic growth and jobs, and I yield back.

Mr. STEARNS. The gentlelady yields back, and I recognize the distinguished ranking member, Mr. Waxman, for 5 minutes for his opening statement.

OPENING STATEMENT OF HON. HENRY A. WAXMAN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mr. WAXMAN. Thank you very much, Mr. Chairman.

This is the fourth hearing this subcommittee has had on the issue of regulations. The others have been on the President's Executive order, and the third focused on health regulations that were recently adopted. Now we are looking at the independent regulatory agencies. The President's Executive order applies to those agencies that are under the Office of Management and Budget. They are not independent. The agencies before us are determined by law to be independent. That doesn't mean they don't take into consideration costs and benefits when they issue regulations. They have to have notice and comment and get full input. I think that what we need to do is to make sure we don't have regulations that are unnecessary but these hearings that we have had devolved into forums for questioning health, environment, and consumer protection laws that my colleagues on the Republican side of the aisle find objectionable. I was struck by the comments of the last speaker that we don't want these independent agencies, they don't make good decisions, they don't know how to make the best decisions, they are using regulatory intimidation on jobs creators. I can think of no other expression of hyper view of all this. We shouldn't have a lopsided focus on the costs with no seeming consideration of the benefits, and we haven't had hearings that have resulted in any substantial legislation or important oversight findings.

Now, the four independent agencies have done a lot to make the lives of American citizens better. The Consumer Product Safety Commission recently launched a new consumer complaint database, which allows parents and concerned consumers to obtain important product safety information and which will improve CPSC's ability to identify trends in product hazards more efficiently. Just this morning, I released the first analysis of the product safety database. We found that in its first 3 months of operation, the database has already logged over 1,600 incident reports, including reports of almost 500 injuries or fatalities. And consumers visiting the online database have conducted almost 1.8 million product searches. Now, maybe some of these manufacturers don't want anybody looking over their shoulder but that is not the job of these agencies to do what the manufacturers want. Their job at the CPSC is to protect the consumers.

Mr. Chairman, I would ask unanimous consent that this report be included as part of the committee record.

Mr. STEARNS. Will the gentleman hold? I think we just have a copy of it.

Mr. WAXMAN. I will withdraw my——

Mr. STEARNS. Just withdraw until we have a chance to look at it.

Mr. WAXMAN. The FCC just proposed rulemaking to require cell phone companies to provide usage alerts that warn consumers of unexpected charges on their bills. Less than 7 months ago, the agency adopted a crucial rule to protect the openness of the Internet. I think these are two very important accomplishments, and Ms. DeGette pointed out others. The FTC has recently adopted

rules to protect homeowners from scams falsely promising relief from mortgage payments. In the last year alone, the FTC's Bureau of Consumer Protection filed over 60 cases to protect the rights of consumers. Is this intimidation? It seems to me these agencies are doing their job, and we want to keep them independent from the political pressure that you can see clearly in the comments of members of this committee. FERC protects consumers from price gouging in the electricity and energy markets.

These accomplishments are important. They save money for the American public, prevent fraud and improve public safety and public health. They may offend powerful companies that would like to take advantage of consumers, and which may have support by some members of Congress in carrying their water, but that is no reason for us to browbeat the agencies. The focus of our oversight should be to help these agencies advance the goal of enhancing the lives of the American family.

Our committee is responsible in the area of legislation in some key areas: health care for seniors, setting our Nation's energy policy, promoting telecommunications innovation and competitiveness, and ensuring appropriate consumer protections for American families and children. The oversight work of this subcommittee should shed light on how to best legislate in these and other important subjects.

That is why there are real costs when this committee focuses its time on partisan wheel spinning and messaging. We lose the opportunity to move legislation that will promote jobs, promote economic security and protect the health, safety and welfare of the American public.

I hope that we make good use of our time today with the commissioners, and I urge the chairman and all members to support their efforts on behalf of the American public, and I yield back the balance of my time.

[The prepared statement of Mr. Waxman follows:]

PREPARED STATEMENT OF HON. HENRY A. WAXMAN

Today, this subcommittee is holding its fourth hearing on regulatory reform. The first two hearings focused on the President's Executive order on regulatory review. The third hearing focused on the Administration's recent health regulations.

This time we are focusing ou four independent agencies—the Consumer Product Safety Commission, the Federal Communications Commission, the Federal Energy Regulatory Commission, and the Federal Trade Commission—which are not subject to the President's Executive order.

I support efforts to ensure that federal regulations are clearly drafted and narrowly tailored, and I believe in transparency and eliminating needless regulation. But the focus of the Subcommittee's hearings on regulatory review thus far has not been on improving the regulatory process. These hearings have devolved into forums for questioning health, environment, and consumer protection laws that my colleagues on the other side of the aisle find objectionable. These sessions also have been marked by a lopsided focus on costs with no seeming consideration of benefits. And they have not resulted in any substantial legislation or important oversight findings.

The four independent agencies before us have done a lot to make the lives of American citizens better.

The Consumer Product Safety Commission recently lannched a new consumer complaint database, which allows parents and concerned consumers to obtain important product safety information and which will improve CPSC's ability to identify trends in product hazards more efficiently. Just this morning, I released the first analysis of the product safety database. We found that in its first three months of

operation, the database has already logged over 1,600 incident reports, including reports of almost 500 injnries or fatalities. And consnmers visiting the online database have conducted almost 1.8 million product searches.

Mr. Chairman, I ask that this report be included as part of the Committee record.

The FCC just proposed a rule to require cell phone companies to provide usage alerts that warn consumers of unexpected charges on their bills. Less than 7 months ago, the agency adopted a crucial rule to protect the openness of the Internet.

The FTC has recently adopted rules to protect homeowners from scams falsely promising relief from mortgage payments. In the last year alone, the FTC's Bureau of Consumer Protection filed over 60 cases to protect the rights of consumers.

And FERC protects consumers from price gouging in the electricity and energy markets.

These accomplishments are important. They save money for the American public, prevent fraud, and improve public safety and puhlic health. They may offend powerful companies that would like to take advantage of consumers, but that is no reason for us to browbeat the agencies. The focus of our oversight should be to help these agencies advance the goal of enhancing the lives of American families.

Our Committee is responsible for forging legislation in key areas: providing health care for seniors; setting our nation's energy policy; promoting telecommunications innovation and competitiveness; and ensuring appropriate consumer protections for American families and children. The oversight work of this Subcommittee should shed light on how to best legislate in these and other important areas.

That is why there are real costs when the Committee focuses its time on partisan wheel-spinning aud messagiug: we lose the opportunity to move legislatiou that will promote jobs, promote the economic security, and protect the health, safety, and welfare of the Americau public.

I hope the Subcommittee makes good use of our time today with the Commissioners, and I urge the Chairman and all members to support their efforts on behalf of American families.

Mr. STEARNS. I thank the gentleman, and all opening statements are concluded.

I ask unanimous consent that the written opening statement of Mr. Upton and others who wish to provide opening statements for this hearing be made part of the record. Without objection, the documents will be entered into the record.

[The prepared statements of Mr. Upton and Mrs. Myrick follow:]

PREPARED STATEMENT OF HON. FRED UPTON

In January, President Obama issued Executive Order 13563 aud joined a goverument-wide dialogue about regulatory reform. While he is not the first president who has tried to tackle this challenge, his stated commitmeut to reiuing in overregulation was a hopeful first step this year. Regulatory relief is essential to a strong ecouomic recovery and boostiug job creatiou. That's why it plays a leading role in the GOP's Plan for America's Job Creators.

Five months later, however, I must say that I am disappointed with the Executive order's results. The President's stated goals are far from beiug realized aud nowhere is that more true than among the independent regulatory agencies.

The Office of Information and Regulatory Affairs estimates that independent agencies have a $230 billion a year impact on the U.S. economy—not au iusigmificant figure. Nevertheless, Executive Order 13563, like those which preceded it, does not expressly apply to these agencies.

According to a February guidance memo sent by OIRA Administrator Cass Sunstein, the independent agencies "are encouraged to give consideration to all [of the Executive order's] provisions. . .Such agencies are encouraged to consider undertaking, on a voluutary basis, retrospective aualysis of existing rules." Shamefully, at this Subcommittee's June 3, 2011 hearing, Mr. Sunstein confirmed for us that not one of the independent agencies under this Committee's jurisdiction had voluntarily submitted to his office such a plan.

In a June 1st letter to the editor printed in the Wall Street Journal, Nancy Nord, a Commissioner of the Consumer Product Safety Commission, noted that, under the Obama administration, CPSC has "ignored the recent direction to look for and eliminate burdensome regulations. We are just too busy putting out new regulations." Two of Ms. Nord's fellow CPSC Commissioners are here today, along with several other representatives from independent agencies. I hope they can provide us with

an update on their efforts to provide regulatory relief and answer troubling questions about what appears to be inaction until now in complying with the letter and spirit of the President's Executive order.

Independent regulatory agencies contribute their fair share of burdensome regulations that affect all aspects of our economy and stifle job creation. The President's push for regulatory reform is meaningless if independent regulatory agencies are left out of this effort.

PREPARED STATEMENT OF HON. SUE WILKINS MYRICK

I appreciate the Subcommittee's examination of how independent agencies are approaching the "Improving Regulation and Regulatory Review" Executive order issued by President Obama. As we're all well aware, regulations can create unnecessary burdens that hinder economic development and job creation.

An electric utility headquartered in my home state of North Carolina is tangled up in an ongoing hydropower relicensing problem which I think exemplifies the real world detriment that can result from a lack of coordination at the federal level.

As I understand it, Duke Energy is trying to relicense a set of dams in the Catawba-Wateree river basin in South Carolina. Working with local stakeholders and the local office of the National Marine Fisheries Service (NMFS), the Federal Energy Regulatory Commission (FERC) agreed to incorporate a set of recommendations to protect the endangered short-nose sturgeon as part of the project's Final Environmental Impact Statement for the project. Unfortunately, the regional NMFS in St. Petersburg, Florida ultimately recommended a different set of recommendations that continue to delay the relicensing process.

Not only does this seem to be a case in which two federal entities cannot agree on the appropriate path forward, it highlights a case in which two offices within the same agency cannot agree. A NMFS office several hundred miles away is substituting its judgment for a local office that has been involved throughout the process.

Aside from affecting utility rates paid by consumers in North Carolina and South Carolina, the provisions sought by the regional NMFS office could potentially jeopardize a carefully-negotiated water rights apportionment settlement.

Sadly, the Catawba-Wateree relicensing issue is just oue of many situations in which federal regulatory actions harm Americans. It is my hope that today's hearing will lead to improvemeuts in the regulatory enviroument.

Mr. STEARNS. Now it is my opportunity to welcome our distinguished panel. I don't remember in my experience in Congress where I have ever seen these many agencies collected together, and I don't think there ever has been, at least in my experience. So it is a very auspicious occasion to have this distinguished group here to meet, and we appreciate you coming.

I thought for the members I would just give you a brief bio of each of the witnesses. Commissioner Robert Adler, Consumer Product Safety Commissioner, is a commissioner at the United States Consumer Product Safety Commission. He was appointed in August 2009. Prior to assuming office, he served as a professor of legal studies at the University of North Carolina at the Luther Hodges Junior Scholars in Ethics in Law at Chapel Hill's Kenan-Flagler Business School. At the University of North Carolina, he served as the Associate Dean of the MBA program as Associate Dean of the school's bachelor of science in business. Welcome.

Commissioner Anne Northup is the honorable—in fact, she serves the 3rd Congressional District of Kentucky representing Louisville district in the United States House of Representatives as a Republican from 1997 to 2006. Before her tenure in Congress, she served in the Kentucky House of Representatives for 9 years from 1987 to 1996. On July 30, 2009, President Ohama nominated her to a seat on the Consumer Product Safety Commission and was confirmed by the Senate on August 7, 2009. Welcome, Anne.

Commissioner Robert McDowell was first appointed to a seat on the Federal Communications Commission by President Bush in 2006. He was reappointed to the commission by President Barack Obama in 2009. He brings over 16 years of private sector experience in the telecommunications industry to the commission. Welcome.

Chairman Jon Wellinghoff was named chairman of the Federal Energy Regulatory Commission, FERC, the agency that oversees wholesale electric transaction and interstate electric transmission and gas transportation in the United States by President Obama on March 19, 2009, a member of the commission since 2006. The U.S. Senate confirmed him to a full 5-year FERC term in December 2009. He is an energy specialist with more than 34 years experience in the field. Welcome.

Commissioner Philip Moeller is currently serving his second term on the commission of FERC, having been nominated by President Obama and sworn in for a term expiring on June 30, 2015. He was first nominated to FERC by President Bush in 2006 and sworn into office on July 24, 2006. From 1997 through 2000, he worked in Congress, serving as an energy policy advisor to Senator Slade Gordon, where he worked on electricity policy.

And then we have Chairman Jon Leibowitz from the Federal Trade Commission. He served as chairman of this commission since February 2009. He was appointed to the FTC as commissioner in the fall of 2004. Before coming to the commission, he had a long career in the public sector, working for the U.S. Senate Judiciary Committee for almost 10 years, and prior to that, in the office of Senator Paul Simon. Welcome.

Commissioner William Kovacic served on the Federal Trade commission since January 2006 and served as chairman from March 2008 to March 2009. He was the FTC's General Counsel from 2001 through 2004 and worked for the commission from 1979 until 1983. He has been a professor of law at George Washington University Law School and has also taught law at George Mason University School of Law. Welcome.

As you know, the testimony that you are about to give is subject to Title 18, section 1001 of the United States Code. When holding an investigative hearing, this committee has the practice of taking testimony under oath. Do any of you have any objection to testifying under oath? No? OK.

The Chair then advises you that under the rules of the House and the rules of the committee, you are entitled to be advised by counsel. Do you desire to be advised by counsel during your testimony today? If not, then if if you would please rise and——

Mr. BILBRAY. Mr. Chairman.

Mr. STEARNS. Yes?

Mr. BILBRAY. I hate to interrupt right now, but one thing I would ask, at least of one member here, is that pictures are not taken while they are being sworn in. I know this is done, but I just think that is unfair to the witnesses. I think it sends a message that it is not appropriate and I would ask the camera people not to take a picture of individuals with their right hand raised. I just think it is used to often to send the wrong message to the public. Everyone here is voluntarily participating and we should not be giving

a false impression to the public. That is just one member's statement but I think in the environment of fairness on both sides, I am going to raise this issue again and again, and I am doing that today, and I apologize.

Mr. STEARNS. I thank the chairman, and as you know, he and I are good friends. Unfortunately, I will have to overrule you. I think the press has a right to take pictures when they want, and I think that is probably what I have seen in my experience being involved with so many Oversight and Investigation hearings as well as others that it is customary to let the press have access, so I am sorry to have to overrule you. And if all of you would please stand up and raise your right hand?

[Witnesses sworn.]

Mr. STEARNS. Well, it is my pleasure now to start with the opening statements, and Mr. Adler, we welcome you and look forward to your statement.

TESTIMONY OF ROBERT S. ADLER, COMMISSIONER, CONSUMER PRODUCT SAFETY COMMISSION; ANNE NORTHUP, COMMISSIONER, CONSUMER PRODUCT SAFETY COMMISSION; ROBERT MCDOWELL, COMMISSIONER, FEDERAL COMMUNICATIONS COMMISSION; JON WELLINGHOFF, CHAIRMAN, FEDERAL ENERGY REGULATORY COMMISSION; PHILIP D. MOELLER, COMMISSIONER, FEDERAL ENERGY REGULATORY COMMISSION; JON LEIBOWITZ, CHAIRMAN, FEDERAL TRADE COMMISSION; AND WILLIAM E. KOVACIC, COMMISSIONER, FEDERAL TRADE COMMISSION

TESTIMONY OF ROBERT S. ADLER

Mr. ADLER. Thank you very much, and good morning, Chairman Stearns, Ranking Member DeGette and the members of the Subcommittee on Oversight and Investigations. Thank you for the opportunity to testify along with my colleague, Anne Northup, on behalf of the Consumer Product Safety Commission. My name is Bob Adler and I have been a commissioner at the agency since August of 2009.

I am honored to sit in the company of so many of my fellow independent agency commissioners, and I bring you regrets from Chairman Tenenbaum, who is not able to be here today.

In order for me to respond to the subcommittee's request for the agency's response to Executive Order 13563 and similar Executive orders, I briefly need to review a few critical points about rulemaking at the CPSC. I do so to make the point that we have undertaken the promulgation of regulations and their retrospective review in the full spirit of the policies incorporated in the Executive orders despite our being exempt from the orders, so I would like to make a few observations and I promise I will be brief.

First, since 1981, the CPSC has been required under amendments to the Consumer Product Safety Act and to the other acts that it enforces to conduct an exhaustive cost-benefit analysis when we write safety rules. Under these amendments, our cost-benefit approach is as comprehensive, if not more so, as that set forth in any Executive order issued by the Office of the President, and I think in the case of any other agency. In fact, over the years, in

part because of the detailed and lengthy cost-benefit procedures contained in our laws, the commission has actually promulgated very few mandatory safety rules under these procedures.

Now, I did a count, so I could be off by one or two, but by my count, in 30 years we have issued a grand total of nine mandatory safety standards, or about one every 3⅓ years, which has meant we have had to turn to alternative approaches, one of which is working with the voluntary standards sector to promulgate voluntary standards and to upgrade voluntary standards. The other thing that we have done is to work through a very successful corrective action recall program, and I think that has been successful.

With respect to regulatory review, you did note the passage of the Regulatory Flexibility Act in 1980. At that time, the CPSC choose to undertake a retrospective review of every safety rule under its jurisdiction from the very beginning, not just those identified as having a significant impact on a substantial number of small economic entities. Since this review, we have continued for the past 30 years to comply with the requirements for retrospective review of our regulations under the Regulatory Flexibility Act.

In addition to conducting a retrospective review of regulations under the RFA, the CPSC has voluntarily undertaken a comprehensive review of its regulations beginning in 2004 and temporarily suspended in 2007 in a spirit consistent with Executive Order 13563. In fact, in conducting our review, we have committed the agency to using OMB's assessment tool. The only departure from our approach arises because of the enactment of the Consumer Product Safety Improvement Act in 2008. In response to its grave concerns about the need to protect the lives of young children, Congress voted overwhelmingly, and in the House it was a vote of 424 to 1, to set a number of very tight guidelines for the commission to meet. Our general counsel did a count of the number of deadlines imposed on us. There were 42 separate deadlines imposed by the Consumer Product Safety Improvement Act.

But recognizing the difficulty of meeting these guidelines, Congress streamlined our rulemaking authority when writing these children's safety rules and limited the requirements in the CPSIA for economic analysis of the impact of the rules. The streamlined procedure directed to regulate hazardous children's products such as infant bath seats, baby walkers and cribs, all of which were associated with an unacceptable number of fatalities and serious injuries has, I believe, resulted in significantly more expeditious and protective safety standards that should save numerous lives in the coming years and could not have been accomplished otherwise.

I particularly want to note the commission's new crib standards, which was unanimously approved by all of our commissioners and became effective last Tuesday, June 28. This standard sets the most stringent safety requirements for cribs in the world and ensures that the place that infants spend the most time and the most time alone will be the safest place in their homes. Having noted that, I hasten to add that even with this new authority under CPSIA, the commission remains obligated to conduct economic analyses under the Regulatory Flexibility Act assuring that our most vulnerable small business sector is safeguarded along with safeguarding our most vulnerable young consumers.

The commission is well on its way to meeting the deadlines imposed under the CPSIA. We haven't met all of them, and we are going to miss a few more, but as we wind down the bulk of our CPSIA rulemaking, it is my understanding that Chairman Tenenbaum has directed staff to develop options to restart the retrospective review process.

In closing, notwithstanding that independent agencies do not fall under the direct purview of Executive orders like 13563, we at CPSC have always tried to implement the wisdom contained in those Executive orders and to coordinate our efforts in the spirit of such orders to the best of our ability.

Finally, I note that CPSC's jurisdiction is very broad. Roughly speaking, if you walk into a department store, a sporting goods store, a hardware store, a toy store or you go to a school, that is us. Those products that are in those institutions are the things we regulate. But we are an agency that has barely above 500 people and a budget just about $118 million. In other words, I am sitting at a table with agencies that are between two and a half and three times our size. But given these limits on our resources, I think we have done a good job in advancing consumer safety, and thank you very much.

[The prepared statement of Mr. Adler follows:]

U.S. CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

Statement of
Robert S. Adler
Commissioner
United States Product Safety Commission

Before the
House Committee on Energy and Commerce
Subcommittee on Oversight and Investigations

July 7, 2011
Rayburn House Office Building, Room 2322

"The Views of the Independent Agencies on Regulatory Reform"

Good morning Chairman Stearns, Ranking Member DeGette, and the members of the Subcommittee on Oversight and Investigations. Thank you for the opportunity to testify along with my colleague Anne Northup on behalf of the Consumer Product Safety Commission (CPSC). My name is Bob Adler, and I have been a Commissioner at the CPSC since August 2009. I am honored to sit in the company of so many of my fellow independent agency commissioners.

An Overview of CPSC and Regulatory Reform

In order for me to respond fully to the subcommittee's request for the agency's response to Executive Order 13563 and similar executive orders, I briefly need to review the history of the CPSC's rulemaking. I do so to make the point that we have undertaken both the promulgation of regulations and their retrospective review in the full spirit of the policies incorporated in the executive orders. So, I begin with several observations:

1. Since 1981, the CPSC has been required under amendments to the Consumer Product Safety Act (and the other acts it enforces) to conduct an extensive cost-benefit analysis when we promulgate safety rules. Under these amendments, our cost-benefit approach is as comprehensive, if not more so, as that set forth in any executive order issued by the Office of the President.
2. Over the years, the CPSC has promulgated extremely few mandatory safety rules requiring cost-benefit analyses, a grand total of nine in thirty years -- or about one every 3 1/3 years -- opting instead to work with the voluntary standards sector and to negotiate individual Corrective Action Plans for the recall of specific hazardous products.

3. Under the Regulatory Flexibility Act of 1980,[1] the CPSC chose to undertake a retrospective review of <u>every</u> safety rule under its jurisdiction from its beginning, not just those identified as having a substantial impact on a number of small entities (and, therefore, requiring a mandatory review).
4. In addition to the retrospective review of agency regulations mandated by the Regulatory Flexibility Act, the CPSC voluntarily undertook a comprehensive review of its regulations beginning in 2004 in a spirit consistent with Executive Order 13563 and anticipates continuing to do so in the future.
5. The only departure from the approach I've just described arises because of the enactment of the Consumer Product Safety Improvement Act in 2008. In response to its grave concerns about the need to protect the lives of young children, Congress voted overwhelmingly to streamline the CPSC's rulemaking authority when writing children's safety rules and to limit (but not eliminate) the requirements in our laws for economic analyses of the impact of CPSC rules.

I. <u>Cost-Benefit Analysis</u>

In 1981, Congress added a broad and comprehensive set of cost-benefit requirements to the Consumer Product Safety Act (and the other acts enforced by the CPSC) for consumer product safety rules promulgated by the CPSC. These provisions easily match, if not surpass, in their stringency and scope the cost-benefit provisions of the various executive orders on cost-benefit

[1] 5 U.S.C. §§ 601-12.

analysis recommended by the Office of Management and Budget. Among other things, prior to promulgating almost every safety rule,[2] they require the CPSC to:

- Make findings with respect to the degree and nature of the risk of injury the rule is designed to eliminate or reduce; the approximate number of consumer products, or types or classes thereof, subject to such rule; the need of the public for the consumer products subject to such rule, and the probable effect of such rule on the utility, cost, or availability of such products to meet such need; and any means of achieving the objective of the order while minimizing adverse effects on competition or disruption or dislocation of manufacturing and other commercial practices consistent with the public health and safety.[3]
- Prepare a final regulatory analysis of the rule containing the following information: a description of the potential benefits and potential costs of the rule, including costs and benefits that cannot be quantified in monetary terms, and the identification of those likely to receive the benefits and bear the costs; a description of any alternatives to the final rule which were considered by the Commission, together with a summary description of their potential benefits and costs and a brief explanation of the reasons why these alternatives were not chosen; a summary of any significant issues raised by the comments submitted during the public comment period in response to the preliminary regulatory analysis, and a summary of the assessment by the Commission of such issues.[4]

---

[2] While the 1981 changes to the acts enforced by the CPSC require the agency to undertake cost-benefit analysis with respect to almost every safety rule it promulgates, some labeling requirements under § 3(b) of the FHSA do not require the same regulatory analysis.

[3] 15 U.S.C. §2058(f)(1).

[4] 15 U.S.C. § 2058(f)(2).

- Find that the rule (including its effective date) is reasonably necessary to eliminate or reduce an unreasonable risk of injury associated with the product; that the promulgation of the rule is in the public interest; in the case of a rule declaring the product a banned hazardous product, that no feasible consumer product safety standard under the CPSA would adequately protect the public from the unreasonable risk of injury associated with the product; in the case of a rule which relates to a risk of injury with respect to which persons who would be subject to such rule have adopted and implemented a voluntary consumer product safety standard that compliance with such voluntary consumer product safety standard is not likely to result in the elimination or adequate reduction of such risk of injury; or it is unlikely that there will be substantial compliance with such voluntary consumer product safety standard.[5]
- Find that the benefits expected from the rule bear a reasonable relation to its costs and that rule imposes the least burdensome requirement which prevents or adequately reduces the risk of injury for which the rule is being promulgated.[6]
- Give interested persons an opportunity for the oral presentation of data, views, or arguments, in addition to an opportunity to make written submissions.[7]

Speaking from personal experience, I note that the analysis and findings contained in section 9 of the CPSA (and similar provisions in other acts the agency enforces) have resulted in rulemaking proceedings that span years of effort and cost the agency millions of dollars. I find it hard to

---

[5] 15 U.S.C. § 2058(f)(3).

[6] 15 U.S.C. § 2058(f)(3).

[7] 15 U.S.C. § 2058(d)(2).

believe that OMB or Congress could expect any more analysis by a regulatory agency, especially one that is directed to protect the lives and safety of young children.

2. Alternative Approaches to Protecting the Public

Both in response to the extremely detailed, time-consuming requirements in section 9 of the CPSA[8] (and our other laws) and because of its success in working with the voluntary standards sector, the CPSC has opted, wherever possible, to look to the promulgation and strengthening of voluntary standards as an alternative to developing mandatory standards. The Commission, of course, has always retained the option to undertake mandatory rulemaking where voluntary standards have proven to be inadequate. As I noted, the burdens of mandatory rulemaking have resulted in the Commission's promulgation of only nine standards in the 30 years since the 1981 amendments. In sharp contrast, the Commission has actively participated in the development or enhancement of hundreds of voluntary standards in that same time period. As I shall mention, the Commission's infrequent promulgation of mandatory rules and reliance on voluntary standards has not gone without criticism in Congress, especially when it comes to protecting the lives and safety of young children.

The Commission has also used its recall authority to great effect over the years. Under section 15(b) of the Consumer Product Safety Act, companies are required to notify the Commission whenever they obtain information that one of the products they have placed in commerce:

- fails to comply with an applicable consumer product safety rule,

[8] Section 9 specifically requires that, before CPSC promulgates a mandatory consumer product safety rule, the agency must determine that no voluntary consumer product safety standard would adequately reduce or eliminate a risk of injury. Where an adequate voluntary standard exists and is substantially complied with, the agency must defer to the voluntary standard.

- fails to comply with a voluntary consumer product safety standard upon which the Commission has relied,
- fails to comply with any other rule enforced by the agency,
- contains a defect which could create a substantial product hazard, or
- creates an unreasonable risk of serious injury or death.[9]

These so-called "15(b) reports" have become the basis upon which the Commission has taken action to negotiate Corrective Action Plans (CAP) with companies that have led to the recall of numerous dangerous products. The Commission has participated in thousands of recalls over the years involving hundreds of millions of potentially hazardous products. Although it is impossible to quantify the number of lives saved and injuries avoided through this program, they undoubtedly number in the millions.

There are limits both on the use of voluntary standards and recalls in protecting American consumers, but they have, of necessity, become important tools in CPSC's approach to product safety.

3. CPSC and the Regulatory Flexibility Act (RFA)

Section 610 of the RFA requires agencies to periodically review rules that have a significant impact on a substantial number of small entities.[10] Each agency is required to publish a plan demonstrating its approach to its review. Accordingly, on September 14, 1981, the CPSC

[9] 15 U.S.C. § 2064

[10] 5 U.S.C. § 610.

published its plan for reviewing existing rules under the RFA, as well as subsequent rules within 10 years of their publication.[11]

The CPSC went far beyond the requirements of the RFA in its plan. In fact, the agency not only solicited and reviewed comments for rules that we determined would have a significant economic impact on a substantial number of small entities, we actually conducted a review of every safety rule under our jurisdiction. In addition to soliciting comments from the general public in the Federal Register, we directly contacted affected parties and their trade associations through appropriate trade publications. Moreover, the Commission made an effort personally to contact those persons who submitted comments during the earlier rulemaking proceedings. Based on the information received in the comments, as well as other information available to the Commission, CPSC staff then conducted an assessment of the degree of economic impact on small entities and sought to identify appropriate actions required to minimize the impact on those entities consistent with the objective of the statute under which the regulations were issued.

Under section 610(b) of the RFA, the Commission sought comments on, and reviewed its rules according to, the following factors: (1) the continued need for the rule, (2) the nature of complaints or comments received concerning the rule from the public, (3) the complexity of the rule, (4) the extent to which the rule overlapped, duplicated, or conflicted with other federal rules (and the Commission also considered, to the extent feasible, the extent to which the rule overlapped, duplicated, or conflicted with state and local government rules), and (5) the length of

[11] 46 Fed. Reg. 45621.

time since the rule had been evaluated or the degree to which technology, economic conditions, or other factors had changed in the area affected by the rule.

Since 1981 and the passage of the RFA, our agency has carefully reviewed its regulations. This effort has continued over the last 30 years. On the whole, I believe these reviews have been good both for consumers and the regulated community. Under the RFA (and other provisions of the CPSA requiring rule reviews), the Commission issued reports involving 17 rules under the CPSA, as well as nine rules promulgated under the Federal Hazardous Substances Act (FHSA),[12] eight rules under the Flammable Fabrics Act(FFA),[13] and four rules under the Poison Prevention Packaging Act (PPPA).[14]

4. Voluntary Regulatory Review Efforts

In addition to the rule reviews required by the RFA, the Commission also has recently voluntarily undertaken efforts to review its regulations in a manner consistent with the spirit of Executive Order 13563 and similar executive orders. Specifically, on January 28, 2004, the Commission published a notice in the Federal Register announcing a pilot rule review program.[15] In the notice, the agency committed itself to using OMB's Program Assessment Rating Tool

[12] 15 U.S.C. §§ 1261-1278.

[13] 15 U.S.C. §§ 1191-1204.

[14] 15 U.S.C. §§ 1471-1477.

[15] *See Pilot Program for Systematic Review of Commission Regulations; Request for Comments and Information*, 69 Fed. Reg. 4095 (Jan. 28, 2004) (requesting comments on Commission regulations for walk-behind power mowers, electrically operated toys, standards for flammability of vinyl plastic film, and child resistant packaging for certain salicylate compounds).

(PART) to help provide a consistent approach to rating programs across the federal government.[16]

In the notice, the Commission listed four rules for review, and asked for public comment on each regulation. Specifically, the notice asked: (1) whether the regulation is consistent with CPSC program goals, (2) whether the regulation is consistent with other CPSC regulations, (3) whether the regulation is current with respect to technology, economic or market conditions, and other mandatory or voluntary standards, and (4) whether the regulation could be streamlined to minimize regulatory burdens, particularly those affecting small businesses.

Out of this pilot program, the Commission then conducted annual reviews that looked at four to six rules per year in 2005,[17] 2006,[18] and 2007.[19] Out of this review, the CPSC clarified its rules regarding standards for carpets, rugs and bicycles. In addition, the Commission also established projects to examine amendments to the electrical toy and cigarette and multi-purpose lighter rules.

---

[16] A description of the PART process and associated program evaluation materials is available at http://www.whitehouse.gov/omb/budintegration/part_assessing2004.html.

[17] *See Fiscal Year 2005 Program for Systematic Review of Commission Regulations; Request for Comments and Information*, 70 Fed. Reg. 18,338 (April 11, 2005) (requesting comments on Commission regulations for cigarette lighter and multi-purpose lighter safety standards, bicycles, surface flammability of carpets and rugs, and child resistant packaging for controlled substances).

[18] *See Fiscal Year 2006 Program for Systematic Review of Commission Regulations; Request for Comments and Information*, 71 Fed. Reg. 32,882 (June 7, 2006) (requesting comments on Commission regulations for matchbooks, toy rattles, baby bouncers, walkers-jumpers, and baby walkers).

[19] *See Fiscal Year 2007 Program for Systematic Review of Commission Regulations; Request for Comments and Information*, 72 Fed. Reg. 40,265 (July 24, 2007) (requesting comments on Commission regulations banning certain unstable refuse bins and safety requirements for pacifiers).

The voluntary rule review program was temporarily suspended in 2008 with the passage of CPSIA due to limited resources, tight deadlines, and Congress' specific directions for the Commission to review and revise many of its existing regulations as part of that legislation.

As we wind down the bulk of our CPSIA rulemakings, it is my understanding that CPSC Chairman Tenenbaum has directed staff to develop options to continue the voluntary review process. As part of this review, staff will be looking at ways to maximize openness and public participation, as well as ways to most effectively to target rules that may require revision, repeal, or strengthening to protect the public against the risk of unreasonable danger from consumer products.

5. The Consumer Product Safety Improvement Act of 2008

In 2008, Congress became concerned about the large number of violative toys and other children's products recalled by the CPSC in 2006 and 2007 as well as the slow pace of agency rulemaking under existing procedures. Accordingly, Congress enacted by overwhelmingly large bipartisan majorities (424-1 in the House and 89-3 in the Senate) the Consumer Product Safety Improvement Act (CPSIA). Focusing particularly on children's hazards, Congress added several new provisions to the agency's acts: (1) Congress legislatively imposed several safety standards for children's products,[20] (2) Congress set numerous deadlines within which the CPSC was obligated to write safety standards for children's products, and (3) Congress streamlined the rulemaking process that the Commission must follow, lifting some of the burdens of section 9 of the CPSA, and similar provisions in our other laws.

[20] Because these provisions were added by act of Congress, they automatically applied without the need for CPSC rulemaking.

The rationale behind Congress' action seems to be clear. Congress wanted to protect young children – society's most vulnerable and involuntary risk takers – as fully and expeditiously as possible. Congress did not eliminate economic analyses – the agency remains obligated to conduct such analyses under the RFA – but it did remove some of the more time-consuming procedures from the laws enforced by the CPSC. The result has been more expeditious drafting of new safety standards specifically designed to protect the lives and safety of young children. Among the new standards promulgated by the agency since passage of the CPSIA have been improved safety requirements for baby walkers, bath seats, and children's toys. Perhaps the most significant new standard advancing children's safety has been the Commission's safety standard for cribs, unanimously approved by the Commissioners and effective this past Tuesday, June 28. This standard sets the most stringent safety requirements for cribs in the world and should save numerous lives in the coming years.

Even with this new authority, however, the Commission has taken steps to insure that the economic impact of new rules and regulations is considered during the rulemaking process. In fact, other than regulations where Congress, by law, made an exception every substantive safety rule the Commission has written under the CPSIA has been analyzed under the RFA to determine the impact of that requirement on small businesses -- assuring that our most vulnerable business sector is safeguarded along with protecting our most vulnerable consumers.

Speaking for myself, I applaud the streamlined authority the Congress gave the agency to write standards for children's hazards. I think we all appreciate how critical it is to protect children – who can't read safety labels and who don't realize how dangerous some consumer products can

be to the greatest extent possible. Accordingly, I think Congress struck the proper balance between minimizing unnecessary costs imposed on businesses (and, ultimately, consumers) and safeguarding our most vulnerable consumers.

Conclusion

The CPSC's jurisdiction is very broad: roughly speaking we regulate most products found in a department store, sporting goods store, hardware store, toy store, or in a school (with the exception of items regulated by other agencies, such as food, drugs, cars, boats, planes, guns, and tobacco). Yet we are an agency of barely 500 people with a budget just over $118 million. Given these limits on resources, I believe that the agency has done a good job in advancing consumer safety with minimal disruption to the marketplace.

Mr. STEARNS. I thank the gentleman.

Ms. Northup, welcome. It is particularly nice to have a former member.

TESTIMONY OF ANNE NORTHUP

Ms. NORTHUP. Thank you. Chairman Stearns and Ranking Member DeGette, thank you so much for the opportunity to testify in front of you, and I am delighted to be back on Capitol Hill with you. I have great respect and appreciation for the challenges you face every day and the decisions you make. I do appreciate the opportunity to come and give you some idea of what it looks like from the other side, from a regulatory agency.

You just heard an excellent history of review of the Consumer Product Safety Commission and the past, the way they operated, primarily through the development of voluntary guidelines, through risk assessment and intervention when there were real risks based on science and the ability to intervene when they were dangerous products. However, all of what was said about the reviews of our regulations and the reasonableness of that changed in 2008 when the Consumer Product Safety Improvement Act went into effect, and in fact, very little of that would be present today. As a matter of fact, we no longer have the option to consider risk in most of the things we do. We are required to write rules based on numbers that were given to us in the CPSIA but that hasn't stopped us in the regulatory process of casting a wider net including maybe more toys and more children's products or more products than the law requires us to do to make steps where the testing is more rigid than required by the law. And so while the law is very difficult, it has been very hard for small businesses in particular to comply with it, we have at the agency, in my opinion, gone beyond what the law has required us to do.

Let me just give you some idea. In the time since the CPSIA passed, we have been involved in about 50 rulemakings if you include the statements of policies, the notice of requirements and lab accreditations, and by the way, lab accreditations are huge because any time we do a notice of requirements for labs to be accredited, within 6 months every product under that category has to begin sending every component and every part of their product to a lab for a third-party test and certify based on those tests and label their product to reflect what those certifications are.

So in truth, while I appreciated what Representative Waxman said about big companies complaining, it is actually the opposite. Very few of our largest companies complain. Most of them make products in such large numbers that they can spread their costs around, and what we have really done is put out of competition the smaller businesses that made things primarily in this country. Those are the people that we hear from because they cannot spread their costs over so many products.

You know, I hear so often people say oh, yes, that is the law we passed to decrease the number of things coming in from China or that is the law we passed to make the big companies comply, but in fact, the effect of the cost of these regulations has been the burden that has put many, many small businesses out of business. It has caused those smaller businesses to leave the children's product

market. We have the public that has fewer choices than they have ever had in the past and we are told that if we—our four, by the way, biggest rules are still to come. They are expected to come before December 31st or to take effect by December 31st.

I thought I would share with the committee one that I anticipate that we will agree on, the majority. I expect it to be a 3–2 vote, and that is allowing the parts per million of lead in any component of a child's product to reduce to 100 parts per million as of August 15th. This is what our economic team said about this: "Economic impacts are likely to occur. They are going to have to use more expensive low-lead materials rather than the non-conforming materials used today. The cost associated with the reengineering products to make the new materials, the cost to make leaded components that are inaccessible, the increased testing costs, the increased consumer products, the reductions in the types and quantities of the children's products available to consumers, businesses that are exiting the children's product market, manufacturers going out of business, reduction in the utility of products and the reduction in the durability of products." This is all for this one rule that we are about to—or this one step-down that we are about to take effect, and it says there is no anticipated benefit in health to children because of this. And so I would just point out to you that 10 out of 40 of the small manufacturers of bicycles left the market with the original step-down. We anticipate more will exit the market. And my question, I guess, is, what sort of regulation sort of rationalization can be brought to this process. I have proposed many times ways to within the limits of the law to lessen the impact of this, and I am disappointed that we haven't done more of that at the commission. Thank you.

[The prepared statement of Ms. Northup follows:]

Testimony of Anne M. Northup
Commissioner
United States Consumer Product Safety Commission

Hearing: "The Views of the Independent Agencies on Regulatory Reform"

Before the

U.S. House of Representatives
Committee on Energy and Commerce

Subcommittee on Oversight and Investigations

July 7, 2011

Chairman Stearns and Ranking Member DeGette, thank you for the opportunity to provide testimony to this Subcommittee on the response of our independent agency, the Consumer Product Safety Commission (CPSC), to the Administration's goal of regulatory reform.

Cass Sunstein, Administrator of the Office of Information and Regulatory Affairs, said recently in an op-ed for *The Wall Street Journal*: "This insistence on pragmatic, evidence-based, cost-effective rules is what has informed our [the Administration's] regulatory approach over the past two and a half years."[1] Unfortunately, this cannot be said for the CPSC. Although the Commission is a relatively small agency (FY 2011 budget of $114.8 million), the agency's actions over the last two and one half years to implement the Consumer Product Safety Improvement Act of 2008 (CPSIA) have substantially added to the economy's woes, causing small businesses to leave the children's product market, reduce jobs, and/or close.

Since the beginning of 2009, the Commission has focused its time and resources principally on implementing the CPSIA. My testimony today will focus on the devastating impact the law and its regulations are having on American business growth and competitiveness, all with little or no offsetting improvement in product safety. I will also discuss the opportunities the Commission's Majority has failed to take to reduce the law's burdens when the statute has allowed such flexibility.

Finally, I will also propose today, as I did before a hearing of the Commerce, Manufacturing and Trade Subcommittee, specific actions that this Committee and Congress can take to ameliorate the CPSIA's effects. With regard to Mr. Sunstein's and this Committee's calls for independent agencies to voluntarily review burdensome or outdated regulations for potential reforms, I am unaware that our Chairman has responded. I know that, notwithstanding my request to contribute to the formulation of any Commission views on the subject, she has not asked for my input. Thus, without a willingness on the part of our Chairman or the Commission's Majority to proactively seek cost-benefit analyses of our rules and/or to roll back unnecessary parts of our rulemakings put forth to implement the CPSIA, only Congress will be able to stop the damage.

I. The CPSIA:

Background

As you may know, the CPSIA was passed following a number of high-profile recalls involving lead in paint found on children's toys imported from China. While the law passed with broad support in 2008, its many unintended consequences have since led both Democrat and Republican Members of Congress to introduce bills reforming the law. In January 2010, the Appropriations Committees of the House and Senate requested

---

[1] Cass Sunstein, "21st Century Regulation: An Update on the President's Reforms," *The Wall Street Journal*, May 25, 2011.
http://online.wsj.com/article/SB10001424052702304066504576345230492613772.html

a Report from the five Commissioners on ways to amend the CPSIA. (*See the following link for the Report to Congress and the Commissioners' five statements: www.cpsc.gov/about/cpsia/cpsiareport01152010.pdf*). Most recently, the Commerce, Manufacturing and Trade Subcommittee voted to approve a bill to reform the CPSIA, which may soon be marked-up by the full Energy and Commerce Committee. Thus, the law no longer enjoys the broad support it received in 2008.

Unfortunately, neither the Commission's Democrats nor the law's original Democrat supporters in Congress have shown interest in any more than minor tweaks to the statute, which will not address small businesses' concerns. Democrats at the Commission acknowledge and even sympathize with the many requests for relief that we receive from small businesses, but have missed numerous opportunities to implement the statute in a less burdensome way. They blame the statute for being too inflexible, but do not request, even when asked, more than negligible relief from Congress. At the same time, the law's strongest supporters in Congress blame the Commission for not using the flexibility in the law. Meanwhile, nothing changes and the statute and its regulations continue to undermine the economic recovery.

It's not about safety: The CPSIA's non-risk based requirements

While the Commission's budget has grown substantially since the law's passage in 2008 (by nearly 44 percent), new and old resources have been shifted away from more risk-based priorities to implement the arbitrary, non risk-based mandates of the CPSIA, including the lead-in-substrate and phthalates bans, the Public Database, and the third-party testing, certification and labeling requirements. Over the last two and one half years, the Commission has issued an estimated 3,500 pages of regulations and guidance documents as a result of the CPSIA- a large portion of which must be read and understood by every affected company in order for them to grasp the law's complex requirements.

The diversion of the Commission's resources to CPSIA implementation reduces our focus on genuine safety hazards. Our agency is charged with "protecting the public from unreasonable risks of serious injury or death" from consumer products -but we cannot fulfill this mission if our time is spent primarily enforcing the CPSIA, including its complex, non-risk-based, testing and certification requirements.

Indeed, since 2008, there has been a significant delay in progress on actions to address many genuine safety hazards, such as promulgating standards to reduce the risk of death and injuries caused by cigarette lighters, table saw blades and portable generators. These issues would be front and center on the Commission's schedule if it were not for the CPSIA.

The new Public Database also will be a substantial drain on Commission resources, without any likely safety benefit, due to the Commission's flawed database regulation.[2] While consumers have always been able to report to the CPSC experiences of harm or risk of harm involving a consumer product, such reports were not made public unless the CPSC took reasonable steps to ensure accuracy. That is why this Committee's draft CPSIA reform bill has called for changes to ensure that incident reports published in the database are at least verifiable. Potentially inaccurate and unverifiable information on a public database is of no value to the Commission in its enforcement efforts, and useless to consumers seeking actionable product safety information. If this Commission is to have a public database funded by taxpayers, it should be ***different and better*** than any source of information that already exists in the public domain, such as websites like Amazon.com or Yelp.com. Many believe the Commission's ".gov" database, if left unchanged, will be useful only to trial lawyers or advocacy groups that will be able to populate it with unverifiable, second-hand information for their own purposes.

II. Economic Impact of the CPSIA

The lack of cost-benefit analyses

In March 2009, Commission staff reported that the economic costs associated with the CPSIA would be "in the billions of dollars range."[3] Industry associations representing manufacturers of furniture, mattresses, sports equipment, children's clothing and handmade toys, just to name a few, have all told us that they will be saddled with enormous costs, first to reengineer their products to satisfy the new standards imposed by the law, and then to third-party test every component of every product they make to demonstrate compliance with all of the applicable standards.

This Commission has received a considerable amount of anecdotal evidence from companies and trade associations regarding the costs to test at independent labs, as well as the cost of certification, tracking labels, continued testing, record keeping, testing to product standards, and the potential reputational and litigation costs that will result from the upcoming Public Database. **Attached** is a sample list of businesses impacted by the CPSIA, as well as other economic data. Our staff has compiled some sample testing costs for toys and bikes, as part of a Regulatory Flexibility Analysis for our Testing and

---

[2] The Commission Majority's database rule suffers from three major infirmities: 1) It interpreted the statute to allow *anyone* to report incidents to the database – even consumer advocacy groups, trial lawyers, and others with ulterior motives and who may not have firsthand knowledge of the incident; 2) the rule fails to require enough information from submitters so that reports are even verifiable; and 3) the rule requires that all reports will be made public on the 10th day following transmittal to the manufacturer, regardless of whether there's a pending, valid claim of material inaccuracy.

[3] Letter from Acting CPSC Chairman Nancy Nord to Representative John Dingell, March 20, 2009.

Labeling Rule. But the Commission has never conducted a full cost-benefit analysis of any regulation we have promulgated under the CPSIA.[4]

I believe such analyses would reveal that much of our CPSIA mandated regulation cannot be justified. To begin with, there is no scientific evidence snggesting there is any benefit from many of the law's requirements. For instance, no government health agency, including the CPSC, has ever concluded that the components of children's products containing either 300ppm lead content or the interim-banned phthalates pose a safety risk to children. It has long been established that the lead absorbed by children overwhelmingly comes from leaded paint or from lead in gasoline that got into the dirt and was tracked into homes near older gas stations. The Environmental Protection Agency (EPA) and the Centers for Disease Control (CDC) report that in 1978, about 13.5 million children ages 1-5 had elevated blood lead levels. However, by 2007-2008, this number had declined to about 250,000 children.[5] Similarly, 2007 data indicates that one percent of children selected nationwide for testing, who are targeted due to their higher risk profile, showed an elevated blood lead level as established by the CDC. This number was down from nearly eight percent in 1997,[6] and is likely attributable to the elimination of lead in gasoline, as well as lead paint education and abatement. The CDC and the EPA have issued guidance for reducing children's exposure to lead, and neither has ever suggested that parents take away a child's bicycle because of the lead in the substrate of the metal comprising the spokes, pedals or handlebars. Nor has it ever been argued that the CPSIA, with all of its costs, will lower the number of children reaching the "tipping point" of having an elevated blood lead level.

Burdensome testing and certification requirements on manufacturers

Given the tools available to manufacturers to determine compliance and our own improved enforcement methods, I do not believe the complex, third-party testing and certification requirements of the CPSIA are necessary or helpful to ensure compliance with the law's new requirements. In fact, relief from the law's testing requirements is the number one request of small businesses, many of whom may be able to comply with the law's lead and phthalates limits but still cannot afford the mandatory third-party testing.

By requiring all manufacturers of children's products to send their products to be tested at a third-party lab, regardless of risk, the law disproportionately hurts companies with robust in-house testing programs, those with more creative and effective ways of ensuring compliance internally, as well as domestic American companies who have never had a violation. The CPSIA's micromanagement of a company's testing, certification and tracking of each and every component of a product is entirely unnecessary – and in fact, will be less helpful than the sophisticated internal controls manufacturers are currently using and continue to develop and perfect. Furthermore, a "bad actor" with a

---

[4] Most of the CPSIA mandated regulations are **not required** to be promulgated under Section 9 of the CPSA, which normally would entail a cost-benefit analysis. However, the statute does not **prohibit** the agency from doing so, if the Commission recognizes a need for such analyses.

[5] http://www.epa.gov/opeedweb/children/body_burden/b1-graph.html

[6] http://www.cdc.gov/nceh/lead/data/national.htm

casual attitude toward safety standards compliance will be just as casual about maintaining accurate records to support CPSIA-mandated certifications.

The CPSIA also requires the creation of massive new paperwork and tracking systems, often without any safety enhancing product changes. A member of the American Home Furnishings Alliance reported that it spent $13 million dollars on tests, new systems and tracking processes, despite the fact that every single component it used on children's furniture already complied with the current lead standard. The company was therefore not required to change a single material used in its manufacture of children's furniture, and there was no corresponding benefit in the improved safety of its children's furniture to justify the costs.

Similarly, some industry associations have had very few, if any, safety violations; yet, they are required to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety. The American Apparel and Footwear Association writes in its public comments on the Component Parts rule:

> As the CPSC continues to issue specific compliance requirements, manufacturers become increasingly wrapped up in ensuring compliance over ensuring product safety. All AAFA members have had long-standing quality control programs in place that have developed based on the product, production of the product and the manufacturer's unique circumstances. These programs are effective and do not need to be changed. To demonstrate, only .0084% of all apparel and footwear sold in the U.S. in 2008 were involved in a recall. Moreover, most apparel and footwear recalls have been drawstring violations – a compliance issue that results from lack of information not lack of testing.[7]

The testing and certification requirements of the law have yet to be fully implemented. Therefore, I would continue to request that Congress intervene to prevent the Commission from enforcing these requirements, at least until a full cost-benefit analysis has been performed.

III. Commission Actions Have Made the Law's Impact Worse

I no longer believe that action by the Commission to alleviate the law's unnecessary burdens is likely. Before my Senate confirmation hearing, I was asked by both Democrat and Republican Senators to "find flexibility" in the law wherever possible, because the law had resulted in many unintended or unforeseen consequences. Once confirmed as a Commissioner, I took this request seriously.

However, the flexibility that I have found in the following rules was rejected by a majority of Commissioners:

---

[7] American Apparel and Footwear Association. Request for Comments. Docket No. CPSC-2010-0037 & CPSC-2010-0038. August 3, 2010.

- ***Absorption exclusion***: I argued that the absorption ***exclusion*** under Section 101 was actually intended to exclude certain products from the lead limits (rather than be meaningless), and therefore that the term "any lead" in that section may be interpreted to mean a *de minimis*, harmless amount of lead in a children's product. If the Commission had accepted my interpretation, lead in the substrate of ATVs, bicycles, and brass axles on toys would be legal since lead in the substrate of these products is not harmful. This interpretation would have allowed American standards to mirror European standards more closely and reduced the number of components that need to be tested. Because the Commission rejected this interpretation, it voted to reject the petition of a manufacturer of toy cars, even though the car's brass fitting contained less absorbable lead than the Food and Drug Administration deems to be acceptable in a piece of candy.[8]

- ***Civil Penalties Factors*** – In the Commission's interpretive rule on Civil Penalties Factors, I proposed a number of changes to provide more certainty for the regulated community and to ensure that, while the overall civil penalty ceiling was raised, "technical" violations, such as incorrect paperwork, would not be treated the same way as more serious violations, such as failures to meet safety standards. This is one area of the statute that was not too prescriptive, and a middle-ground could have been reached.[9] Unfortunately, a majority of the commissioners did not want to provide that leeway.

- ***Definition of Children's Product*** – The CPSIA applies to all "children's products", statutorily defined as products "primarily intended for a child 12 years of age or younger." The comments that the Commission received following the proposed rule made clear that the parameters we had tried to set in the proposed definition were not helpful to most manufacturers that produce children's products intended for ages 10-12 or for an age range falling both inside and outside the upper age limit of 12. The purpose of defining the term was to guide manufacturers in determining which of their products fall within the purview of the CPSIA. After receiving these comments, the Commission had a chance to put a much narrower "fence" around the scope of covered products---or to at least define clearer boundaries. Unfortunately, the Majority chose to leave the definition vague whenever possible, which helps neither the CPSC staff,[10] nor the regulated community.[11]

- ***"Children's product safety rules"*** – I offered a valid, alternative interpretation of the statute with regard to the requirement to impose third-party testing on all "children's product safety rules." A clear distinction can be made between "children's product safety rules" and more general "consumer product safety rules" promulgated well before the passage of the CPSIA. Unfortunately, because the Majority chose to view all consumer product safety rules of the Commission as potential "children's product

[10] Justin Pritchard, "Feds dismiss need to recall lead drinking glasses,"*Associated Press*, December 11, 2010. http://news.yahoo.com/s/ap/20101211/ap_on_he_me/us_cadmium_lead_glassware
[11] http://www.cpsc.gov/pr/northup09292010.pdf

safety rules," it imposed an unnecessary, additional layer of testing (at third-party labs) on manufacturers of carpets and rugs, vinyl, clothing textiles and mattresses—all of which are subject to consumer product safety rules. The Commission did not have to take this step—and there is no risk associated with these products that necessitates *new* third-party testing requirements.[12]

- ***Public Database***: I proposed an alternative database rule that would have responded to a number of manufacturer concerns and made the database a more accurate source of information for consumers. The Commission's Majority instead passed a rule that went well beyond the statute's requirements, allowing "anyone" to submit reports of harm—even advocacy groups, attorneys, random bystanders, and, as has actually occurred, people perusing the internet that may not have firsthand knowledge of the incident. In total, the Commission Majority's database rule ensures that the database will be filled with inaccurate reports of harm that will be useful only to advocacy groups and trial attorneys, and will be time consuming and costly to manufacturers--particularly small businesses.

- ***Cribs***: In December 2010, the Commission set a six-month effective date for a new mandatory, retrospective crib rule that it was required to promulgate under the CPSIA. Beginning in April 2011, the Commission received appeals from associations representing hundreds of small and medium-sized crib retailers asking for an extension of time to sell through crib inventory that did not comply with the new standard and therefore could not lawfully be sold after June 28, 2011. Data received by the Commission from a small fraction of all crib retailers indicated that as of May 2011, there were at least 117,800 noncompliant cribs, valued at approximately $32,000,000, still in retailer inventory. While I voted in favor of the new crib standard in December 2010 and the original six-month effective date for both retailers and manufacturers, I realized in hindsight that due to the chain of commerce, it was illogical to set the same effective date for both. Two weeks ago, the Commission held a public meeting to determine whether to extend by any amount of time the period during which retailers could lawfully sell new, non-drop-side cribs that satisfy the most recent voluntary standard. The Commission had previously given day care providers and the hospitality industry until December 2012 to meet the new mandatory standards, so there was no issue regarding the safety of the cribs that would have been the subject of the extended deadline. Nonetheless, the Commission decided on a 3-2 party-line vote not to extend the effective date by even 30 days, thus missing another opportunity to avoid unnecessary economic waste without sacrificing safety.

- ***Reduction to 100 ppm of Lead***: The CPSIA banned as a hazardous substance children's products containing over 300 ppm of lead. It also provides that children's products containing over 100 ppm of lead shall be treated as a banned hazardous substance beginning on August 14, 2011, "unless the Commission determines that a limit of 100 parts per million is not technologically feasible for a product or product category." The Commission is scheduled to decide by majority vote on July 13,

[12] http://www.cpsc.gov/pr/northup07122010.pdf

2011, whether reducing the lead limit to 100 ppm for any product or product category is not technologically feasible. Staff has prepared a public decisional package on the issue and presented its views during a public briefing held last week. During the briefing, staff acknowledged the common sense fact that the economic impact of reducing the limit to 100 ppm is a factor in determining the technological feasibility of doing so. In addition, staff has identified significant "economic impacts that are likely to occur", including: the need to use more expensive low-lead materials rather than the nonconforming materials used today; the costs associated with reengineering products to make use of new materials; the costs of making leaded components inaccessible; increased testing costs; increased consumer prices; reductions in the types and quantity of children's products available to consumers; businesses exiting the children's product market; manufacturers going out of business; reduction in the utility of products due to the substitution of materials; reduction in the durability of products due to the substitution of materials; and, the loss of the value of all inventory not satisfying the new standard. With respect to any potential counterweight to this economic harm, Commission staff concludes that the "overall contribution of" products with lead content between 100 ppm and 300 ppm "to lead exposure in children is minimal." Notwithstanding staff's acknowledgment that reducing the lead limit to 100 ppm will cause substantial economic harm with no offsetting improvement in product safety, I believe it is likely that the Commission's majority will still vote to reduce the standard.

IV. Lack of a Regulatory Review

To my knowledge, the Commission has not undertaken a retrospective review of its regulations since before passage of the CPSIA in 2008, and on-going small businesses analyses are minimal. The Commission's only evaluation of the impacts of its regulations on small businesses has been performed under the Regulatory Flexibility Act (RFA). Since I have been at the Commission, Regulatory Flexibility Analyses have been as perfunctory as one paragraph or as lengthy as a dozen pages – and the Commission seldom if ever bases its decisions on such analyses. As you know, the RFA also requires retrospective review of regulations, but only every ten years - and only if the Commission has deemed such rules to have a "significant" impact on small businesses.

Prior to the passage of the CPSIA, the Commission undertook a voluntary, annual review of certain regulations, including notice and comment to the public, in order to determine whether any should be rolled back or updated. From 2004 - 2007, the Commission reviewed 11 rules, standards and bans. I understand that those reviews resulted in modifications to only one of the rules – the flammability standard for carpets and rugs. In some cases, staff reviews of regulations produced recommendations for change, but the Commission never did the work necessary to implement them. Finally, a review of the bicycle standard done at that time also helped to inform some recent changes made to that standard, which were done principally to allow bicycle manufacturers to comply with the CPSIA's testing and certification requirements.

V. Going Forward - Recommendations to Reform the CPSIA:

Reforming the CPSIA to focus on risk would greatly relieve the strain on agency resources caused by implementing and enforcing non-risk based regulations and monitoring low risk products. It would also free the agency to redirect its limited resources toward more effectively fulfilling its safety mission. This can be accomplished in a variety of ways:

- Amend the law's Absorbability Exclusion §101(b)(1)(A) so that it is meaningful:

The CPSIA included three statutory exclusions from the lead limits. But the Commission has meaningfully interpreted only two of them. The law's third exclusion, based on the absorbability of lead in a product, has not excepted a single product from the CPSIA's scope. The CPSIA should therefore be amended to exclude products or materials with a level of absorbable lead that the CPSC determines not to be harmful to a child's health.

Drawing the line at the level of absorbable lead that is harmful to a child's health is consistent with the findings of our leading scientific agencies, the National Institutes of Health, the CDC and the EPA. Only lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under. Thus, the experts at the CDC and NIH have found that lead paint in old houses and lead in dirt near old gas stations are the main source of environmental lead presenting a danger to small children (http://www.cdc.gov/nceh/lead/). In other words, the *risk of absorbability* from lead in dirt that is tracked into a home or lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high. Notably, the EPA standard for lead in soil is 400 ppm (http://www.epa.gov/lead/). This standard for safety is less strict even than the current 300ppm lead content standard provided in the CPSIA for children's products, including bicycle handlebars where lead is embedded in the metal substrate and cannot be absorbed.

Unlike other Commission rules, regulations promulgated under the CPSIA, as interpreted by the Majority, have led to the banning or substantial reengineering of many products that pose no risk of harm from lead. For example, the CPSIA has led to a ban on children's books published before 1986, because the ink in them is likely to contain lead above the allowable level. But children are not likely to eat the pages of old books or ingest more than minuscule amounts of lead after touching their pages. Likewise, youth ATVs and bicycles are outlawed or must be reengineered even though the lead that is in the hood, handlebars, or hubcaps will not become ingested and absorbed in meaningful amounts. Other everyday products such as school lockers, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens are outlawed if they have a toy or game attached to them and are marketed to children, due to the brass found on the tip. Because there are still *negligible amounts of lead detectable by scientific equipment* that may be wiped off by touching a bicycle handlebar, the CPSIA

treats these items in exactly the same way it treats products that truly could hurt a child by increasing her blood lead level.

If the law is amended to unambiguously exclude products with a level of absorbable lead that is not harmful to a child's health, the scope of the CPSIA will be considerably narrowed, and the Commission can focus its limited resources on real risks to children.

- Lower the age-range of products impacted by the law:

Under the CPSIA, a "children's product" is any product intended primarily for use by children twelve years old or younger. The CPSIA thus treats all products intended primarily for use by children under thirteen the same, regardless of whether they are intended for one-year olds or twelve-year olds. Recognizing the substantial difference in risk presented by the same products to different age groups, CPSC staff have suggested to the Commissioners that lowering the age range of products impacted by the CPSIA would be one of the most efficient ways to amend the law in order to exclude those products which many believe should not be impacted.

The 12-and-under age range affects many products that are also used by teenagers, thus creating enforcement difficulties over marginal products. Producers argue that the products are primarily inteuded for children age thirteen and older, and the Commission examines marketing and other factors to assess the claim. Some blurring of the age lines will happen regardless of the age cut-off, but there are many more products subject to this uncertainty for "tweens" (*e.g.*, certain sporting goods, apparel, etc.)

In addition to enforcement difficulties, the benefits of the law are vastly reduced as applied to products for older children who are well past the age when they mouth things or constantly put their hands in their mouths. Thus, Congress could amend the statute to apply only to products primarily intended for children under age six, while giving the agency discretion to raise that age limit for particular materials or categories of products that are found in the future to pose a risk to older children. And in any event, the CPSC would retain the authority to issue a stop-sale order or to recall any product determined to pose "substantial product hazard" under the Federal Hazardous Substances Act.

- Eliminate third-party testing and certification requirements:

As stated previously, the law's third-party testing, certification, tracking and labeling requirements are the most burdensome for small manufacturers. They are also unnecessary for verifying compliance, particularly given the agency's improved traditional enforcement tools. As a result, Congress could eliminate current third-party testing and certification requirements all together, allowing manufacturers to test in-house and/or in the best way they know how to determine

compliance. The Commission would retain the discretion to impose third-party testing requirements on products whose risk justifies the cost.

- Public Database - require reforms to the Database Rule to ensure that incident reports are verifiable and useful.

Finally, the Commission's Database Rule could be revised in order to ensure that incident reports going up on the new, public database are verifiable. Potentially inaccurate and unverifiable information is of no value to the Commission in its enforcement efforts, and useless to consumers seeking actionable product safety information.

Several features of the Majority's rule guarantee a database populated by inaccurate information. The Majority has broadly defined the statutory categories of submitters to the Database to include groups and individuals with no direct knowledge of the incident or the person harmed. Such groups include consumer advocacy groups, trade associations and attorneys, for whom the accuracy of the incidents they report may be secondary to their own agendas, giving them no incentive to avoid the posting of false or misleading information.

The Database Rule also does not require sufficient information from the submitter to ensure that Commission staff or consumers can tell one type of product from another. Only the minimal amount of information is required, including manufacturer name and a "description of the product" which could include simply "baby stroller." But one company may have manufactured dozens of different models of baby strollers, some of which may no longer be in production. As a result, the limited product information required is insufficient to permit the Commission to investigate the claim, and of no value to a consumer seeking to identify a safe model of baby stroller.

The problems created by permitting inadequate product identification and allowing individuals and groups without firsthand knowledge to report alleged incidents of harm, are compounded by the rule's failure to require the identification of the victim or product owner who experienced the risk of harm. As a result, the Commission's staff may be unable to verify the accuracy of the report by speaking to the only party with actual knowledge of the product and incident. Moreover, because manufacturers bear the burden of proving a material inaccuracy, the Commission will publish a report that contains the minimal required information, even where inadequate product identification or the absence of victim contact information leaves the report unverified. There are therefore likely to be many cases where a manufacturer will have good reason to believe a reported incident is either completely false or materially misrepresented (and companies routinely receive these types of mistaken or fraudulent claims), but neither the manufacturer nor the Commission will be able to obtain the information necessary to resolve the claim. Under those circumstances, the

manufacture will be unable to meet its burden and the challenged, but unverified and unverifiable report, will remain on the database forever.

Inaccurate information will likely also be posted on the database - at least temporarily - even when there is sufficient information to eventually confirm the truth. That is because the Majority's rule requires the Commission to publish an incident report on the public database by the 10th day after sending notification to the manufacturer, notwithstanding that a manufacturer has adequately supported a claim that the report is materially inaccurate. Unless the Commission can conclude within 10 days that the report is materially inaccurate, it is published on the 11th day and remains on the Database while the Commission completes its investigation. And because there is no fixed period within which the Commission must complete its investigation, inaccurate information can remain on the site indefinitely.

Thank you, Chairman and Members of the Subcommittee for calling this hearing and for inviting me to testify today on the burden to the economy of the CPSIA's non-risk-based regulations. I look forward to your questions.

ECONOMIC IMPACT OF THE CPSIA - EXAMPLES
2009 - 2011

Costs associated with the CPSIA

1. In a letter from the CPSC to Representative Dingell in March 2009, Commission staff reported that the overall economic impact of the CPSIA would be in the "**billions of dollars range**." The Commission also acknowledged that the testing and certification costs will fall disproportionately on small-volume businesses. (*Letter from Acting Chairman Nancy Nord to Representative Dingell, March 20, 2009*)

2. **"MAJOR RULE"** - CPSC acknowledges in its FY 2011 Regulatory Agenda that its main rule pertaining to the CPSIA's testing requirements **([PDF] CPSC Docket No. CPSC-2010-0038)** is a "major rule" under the Congressional Review Act, resulting in, or likely to result in: 1) an annual effect on the economy of $100,000,000 or more; 2) a major increase in costs or prices for consumers, individual industries, government agencies or geographic regions; or 3) significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

3. In an article entitled "Makers Are Pushing Back on Toxic-Toy Law" (*Wall Street Journal*, March 5, 2009 http://online.wsj.com/article/SB123621357629835121.html), Joe Periera reported the following loss statistics:

    - Goodwill Industries to destroy **$170 million** in merchandise.
    - Salvation Army expects to lose **$100 million** in sales and disposal costs.
    - The Toy Industry Association estimates inventory losses at **$600 million**.
    - Members of the Coalition for Safe and Affordable Childrenswear lost **$500 million.**
    - The California Fashion Association estimates troubled inventory at **$200 million**.
    - The Motorcycle Industry Council expects to lose 50,000 motorized bikes and four-wheelers worth at least **$125 million**.

4. On March 11, 2009, *Playthings Magazine* reported updated data from the Toy Industry of America (see http://www.playthings.com/article/CA6643505.html), including:

- From a pool of nearly 400 manufacturers and 220 retailers, the TIA estimates **losses of $2 billion in retail value**.
- More than **$1 billion** in already shipped merchandise has been returned or is being withheld for return.
- More than **$800 million** in compliant merchandise is at risk of return.
- **40%** of all respondents plan to eliminate jobs to pay for the CPSIA, with more than 1200 jobs reported to be in jeopardy.

"TIA: Safety Act puts $2B crimp in toy biz"
3/11/2009

5. Separately, the Motorcycle Industry Council advised that total losses from disruptions in its members' businesses could total **$1 billion**. See: http://1st5ive.com/new-lead-rule-could-cost-motorcycle-industry-1-billion-annually.html

6. In May 2011, the Commission learned that there were at least 117,800 safe, but non-compliant, cribs nationwide that retailers possessed in inventory that would have to be disposed of by June 28th due to the retroactive effects of the CPSIA-mandated crib standard. The Commission could have modestly extended the effective date for retailers to avoid unnecessary, substantial economic losses from the disposal of safe, brand-new cribs; but it declined to provide such relief. The known potential losses at the time: 117,800 X $275 (estimated wholesale price/crib) = $32,395,000. http://www.cpsc.gov/pr/northup06272011.pdf

Killing Small Businesses:
CPSIA in the News, Letters and Public Comments

A MESS OF A LAW:
March 11, 2011

"President Obama has been on a campaign to shake his antibusiness reputation, so a good place to start would be to revisit the Consumer Product Safety Improvement Act, a mess of a law that has put new burdens on small businesses..."

http://online.wsj.com/article/SB10001424052748703408604576164510202890494.html "Get the Lead Out, Sir," *The Wall Street Journal*, March 11, 2011. Editorial.

HIGHER COSTS FOR SCHOOLS:
January 11, 2010

"NSSEA members sell educational supplies, equipment and instructional materials to schools, parents, and teachers...

... the costs to schools, municipalities, libraries, and others of identifying and replacing such books would be extremely high and there is no reason to impose such costs given the lack of identifiable risk.

...While we applaud the efforts the CPSC has made to find solutions for small businesses...we believe the CPSC could do more if given more discretion by Congress. The alternative is the elimination of many valuable educational toys and products, some manufactured in low volume for niche markets (such as the deaf, blind, or otherwise differently-abled children) and typically not supplied by the huge multi-national toy manufacturers."

Letter from the NSSEA (National School Supply and Equipment Association) to Commissioner Northup, January 11, 2010

HIGHER COSTS FOR PRODUCTS WITH NO LEAD RISK:
October 13, 2010.

"The government wants to regulate Hannah Montana CDs and DVDs. The bureaucrats at the Consumer Product Safety Commission (CPSC) insist that the discs marketed to children be tested for lead, but when the same young starlet churns out raunchier material under her real name, Miley Cyrus, they will escape scrutiny. Never mind that the same 10-year-olds will likely end up buying both products.

"…Never mind that Hannah Montana's fans aren't likely to eat their DVDs, the latest red tape makes no distinction between products where lead is likely to be consumed and those where it isn't."

http://www.washingtontimes.com/news/2010/oct/13/bureaucrats-way-out-of-tune/ "Bureaucrats way out of tune," *Washington Times*, October 13, 2010.

PUNISHING SMALL BUSINESSES, WHILE MATTEL AND THE BIG GUYS SQUEEZE OUT THE COMPETITION:

June 17, 2010

"Now Mattel is testing and making toys without any trouble at all, and those of us who were never the problem are in danger of losing our businesses," says Hertzler, who runs EuroSource, based in Lancaster, Pa., with his wife and two sons…

"Nearly two years after the safety law was enacted, Congress and the Consumer Product Safety Commission are still struggling to reduce its burden on small businesses while eliminating the risk of lead and phthalates in children's products."

http://www.usatoday.com/money/industries/retail/2010-06-17-productsafety17_ST_N.htm "Lead testing can be costly for mom and pop toy shops," *USA Today*, June 17, 2010

BORDERING ON RIDICULOUS:

June 17, 2010

…"What the law should be about is ensuring safe products," says Edward Krenik, a spokesman for the children's product alliance. "We've crossed over into ridiculousness."

http://www.usatoday.com/money/industries/retail/2010-06-17-productsafety17_ST_N.htm "Lead testing can be costly for mom and pop toy shops," *USA Today*, June 17, 2010

REGULATION FOR REGULATIONS' SAKE

November 8, 2010

"Regulation for regulations' sake, where there is no inherent change to a bill of materials, a process or a product indicated after extensive, statistically significant testing across multiple points of input and verification, is simply wasteful."

American Home Furnishings Alliance
November 8, 2010 – Letter to Commissioners

MATTEL FINDS CPSIA A CHALLENGE – HOW MUCH MORE FOR SMALL BUSINESSES?

November 9, 2009

"Officials of the toy manufacturer, Mattel, met separately with two CPSC commissioners November 3 to talk about how challenging it was for Mattel to comply with the CPSIA…

Peter Biersteker, a lawyer for Mattel with the law firm Jones Day in Washington D.C., said his client is finding the CPSIA difficult to decipher... "It's a lot of work. I don't know how smaller companies do it," Biersteker told Commissioner Robert Adler.

Despite Mattel's large team of in-house lawyers, he said, the company needed to hire outside lawyers to help understand the CPSIA. He said Mattel holds weekly conference calls on the issue, discussing how to comply with the act while remaining "cost competitive."

"Mattel Finds CPSIA to be a Challenge," *Product Safety Letter*. November 9, 2009.

COMMISSION ACTION ADDS TO CPSIA'S PROBLEMS:

August 16, 2010

"The latest dictates from the Consumer Product Safety Commission (CPSC) will drive up the cost of manufacturing products intended for children. The agency adopted a pair of new rules in July and August implementing the Consumer Product Safety Improvement Act of 2008, but as drafted, these regulations will force companies to waste time and money on redundant testing programs solely for the entertainment of bureaucratic busybodies.

… The redundant examinations, mostly checking flammability, can be prohibitively expensive. For instance, the regulations could require a manufacturer to build a queen-sized-bed prototype of a baby's crib just so it can be tested in an independent lab. Yet each of the component parts - the crib-sized mattresses, blankets and all other component parts - already are individually tested for the same hazards when manufactured."

Editorial: "The Red Tape Stimulus," *Washington Times*, August 16, 2010
http://www.washingtontimes.com/news/2010/aug/16/the-red-tape-stimulus/

EVEN THE NEW YORK TIMES SPOTLIGHTS THE UNINTENDED CONSEQUENCES OF THE CPSIA:

September 28, 2010

"… a new federal crackdown on dangerous toys has left some in the industry crying foul and not wanting to play."

"…Critics point to provisions in the law that they deem ludicrous. For instance, a paper clip that is included in a science kit for schoolchildren would have to be tested for lead. But a teacher can walk into any drug store and buy a box of paper clips that would not be subject to the same testing.

Similarly, a lamp that is festooned with cartoon characters would have to be tested, but a lamp without the characters would not."

http://www.nytimes.com/2010/09/29/business/29toys.html "Toy Makers Fight for Exemption From Rules," *New York Times*, September 28, 2010

SCIENCE KITS ARE "NOT BANNED" – BUT THE TOOLS USED INSIDE THEM ARE!

October 1, 2010

"The science kit makers had asked for a testing exemption for the paper clips and some other materials. On Wednesday, in a close 3-2 vote, the commission declined to give them the waiver they sought."

"…After the science kit vote, CPSC Chairman Inez Tenenbaum sought to reassure people that, "There is nothing in this rule that bans science kits."

Right. But while the commission vote doesn't ban the kits, manufacturers say it may crimp the supply of kits for elementary school children."

http://www.lvrj.com/opinion/goodbye-to-chemistry-sets-104139059.html "Goodbye to chemistry sets," *Las Vegas Review Journal*, October 1, 2010. Editorial.

FURNITURE MANUFACTURERS FACED WITH ADDED COSTS, ZERO SAFETY BENEFIT TO CHILDREN:

November 8, 2010

"…there has not been a corresponding benefit in the improved safety of children's furniture for children. All the representatives told you that their respective companies have not had to change a single material they use in the manufacturing of their children's product lines since they began testing to CPSIA in 2008.…The testing is simply being done to attempt to prove a negative."

American Home Furnishings Alliance

FURNITURE MANUFACTURERS FACED WITH ADDED COSTS, FORCED TO CUT JOBS:
November 8, 2010

"The majority of the annual costs will be in the record keeping requirements because none of the companies have the requisite IT infrastructure to handle the tracking of test reports per batch…Hooker estimates that it will cost them from $350,000 to $400,000 per year. Furniture Brands International said this will cost them over $4.5 million per year which is more than the profits from their best quarter in the last 2.5 years. In addition, this company must invest an additional $2 million in start up costs for setting up the production testing, programming computer systems to work with existing systems, and hiring and training employees for the administration of the CPSIA."

To offset these new costs, the company is forced to consider these choices: 1) shut down a small domestic plant which will mean the loss of 64 full time and 30 temporary US jobs; 2) shut down a larger domestic plant which will mean the loss of 384 US jobs; 3) significantly increase prices to offset the loss in revenue making them less competitive; 4) offer a lower quality product… or 5) shut down all domestic production which incorporates any finishing processes, which will mean the loss of approximately 460 US jobs."

American Home Furnishings Alliance
November 8, 2010 Letter to Commissioners

NO MORE MOM AND POP TOY SALES:
July 7, 2010

"The second program involves making wooden toys that are given to the church and other charitable organizations in the county for distribution to needy children throughout the year especially at Christmas. Last year we created over 700 toys. The idea that we now are required to have these handcrafted toys certified will bring the program to a halt."

Dupage Woodworkers, Downers Grove, IL (July 7, 2010, Public Comment, Testing rule)

Mr. STEARNS. Commissioner McDowell.

TESTIMONY OF ROBERT MCDOWELL

Mr. MCDOWELL. Thank you, Mr. Chairman and Ranking Member DeGette and all members of the committee for having me here today.

During my 5 years at the FCC, I have supported policies that promote consumer choice through abundance and competition in lieu of regulation whenever possible. I therefore welcome today's dialog on regulatory reform.

Fifty years ago, there were only 463 pages in the FCC's portion of the Code of Federal Regulations, the C.F.R. During this period, Americans only had a choice of three TV networks and one phone company. Today, over-the-air TV, cable TV, satellite TV and radio, and the millions of content suppliers of the Internet offer consumers with an abundance of choices. In other words, the American communications economy was far less competitive in 1961 than it is today yet it operated under fewer rules.

In contrast, by late 1995, the FCC's portion of the C.F.R. had grown to 2,933 pages, up from 463 34 years earlier. As of the most recent printing of the C.F.R. last October, it contained a mind-numbing 3,695 pages of rules. Even after Congress codified deregulatory mandates with the landmark Telecommunications Act of 1996, the FCC still managed to add hundreds more pages of rules.

To put it another way, the FCC's rules measured in pages have grown by almost 800 percent over the course of 50 years, all while the communications marketplace has enjoyed more competition. During this same period of regulatory growth, America's GDP grew by a substantially smaller number, 357 percent. In short, this is one metric illustrating government growth outpacing economic growth.

To be fair, some of those rules were written due to various congressional mandates and sometimes the FCC does remove regulations on its own accord or forbear from applying various mandates in response to forbearance petitions. But all in all, the FCC's regulatory reach has grown despite congressional attempts to reverse that trend. At the same time, Congress has given the FCC ample authority to deregulate. The legislative intent of key parts of the 1996 act such as sections 10, 11, 202H and 706, just to name a few, was to reduce the amount of regulation in telecommunications, broadcasting and information services. For instance, Congress ordered the FCC through section 10 of the 1996 act to forbear from applying a regulation or statutory provision that is not needed to ensure that telecom carriers' market behavior is reasonable and not necessary for the protection of consumers. Similarly, section 11 requires the FCC to conduct reviews of telecom rules every 2 years to determine whether any such regulation is no longer in the public interest as a result of meaningful economic competition and to repeal or modify any regulation it determines to be no longer necessary in the public interest.

Removing unneeded rules can liberate capital currently spent on lawyers and filing fees, capital that would be better spent on powerful innovations. Accordingly, it is my hope that the FCC stays faithful to Congress's intent as embodied in section 11 by promptly

initiating a full and thorough review of every FCC rule, not just those that apply to telecom companies but all rules that apply to any entity regulated by the commission. The presumption of the FCC's review should be that a rule is not necessary unless we find compelling evidence to the contrary.

The first set of rules I would discard of course would be the recently issued Internet network management regulatory regime, also known as net neutrality. As I have stated many times before, those rules are unnecessary at best and will deter investment in badly needed next-generation infrastructure at worst. No evidence of systemic market failure exists to justify these overly burdensome regulations.

Furthermore, the FCC has too many forms. To give you some examples, there is form 603, form 611T, form 175, form 601, form 492, form 477, form 323 and forms 396, 396C—I am not sure what happened to 396A and B—form 397 and 398, among many, many others. While a few forms may be necessary, many could be eliminated or simplified. Similar repeal initiatives should be on our plate soon. For example, as I noted in a speech in May, the so-called fairness doctrine is literally still codified in the C.F.R. The doctrine regulated political speech. Political speech is core protected speech under the First Amendment and the doctrine is patently unconstitutional, as the FCC found in 1987.

Chairman Genachowski recently informed your committee that he supports removing references to the doctrine and its corollaries from the C.F.R. and intends to move forward on this effort in August. I look forward to helping him fulfill that promise.

In the same spirit, it is time to eliminate the outdated newspaper-broadcast cross-ownership rule in the upcoming review of our media ownership regulations. Evidence suggests that the old cross-ownership ban may have caused the unintended effect of reducing the number of media voices, especially newspapers in scores of American communities. Overall, however, what is needed is a comprehensive and sustained effort to repeal or, where appropriate, streamline unnecessary, outdated or harmful FCC rules. All future regulatory proceedings should start with a thorough market analysis that assesses the state of competition in a sober and clear-eyed manner.

In the absence of market failure, unnecessary regulations in the name of serving the public interest can have the perverse effect of harming consumers by inhibiting the constructive risk-taking that produces investment, innovation, competition, lower prices and jobs. In sum, decreasing the burdens of onerous or unnecessary regulations increases investment, spurs innovation, accelerates competition, lowers prices, creates jobs and serves consumers.

I look forward to working with all of you in pursuit of these goals. Thank you, Mr. Chairman.

[The prepared statement of Mr. McDowell follows:]

SUMMARY OF TESTIMONY
COMMISSIONER ROBERT M. MCDOWELL
FEDERAL COMMUNICATIONS COMMISSION

JULY 7, 2011

My testimony will focus on four points: (1) FCC authority; (2) examples of ongoing proceedings that propose streamlining various regulations; (3) examples of regulations that are ripe for repeal; and (4) where we should go from here.

Congress envisioned that the 1996 Telecom Act would allow potential rivals, such as cable and phone companies and new entrants, to compete against each other. Added competition, lawmakers thought, would obviate the need for more rules. Unfortunately, over time, it does not appear that a net reduction of regulation has been the end result.

Chairman Genachowski has already initiated some proceedings in the past couple years that will help clear away some of the regulatory underbrush, and he should be commended for those efforts. For instance, in May, the Commission adopted a Notice of Proposed Rulemaking (NPRM) that proposed to eliminate certain reporting requirements for international telephone service. I look forward to continuing to work with my colleagues on this proceeding and others that the Chairman has initiated.

Much more work remains to be done, however. For example, I would discard the recently issued Internet network management regulatory regime, also known as "net neutrality." Also, while not as controversial, the "equal access" scripting requirements are still on the books. These rules require various phone companies to read aloud to new customers a list of independent long distance companies. Ironically, these rules no longer apply to the Baby Bells or their successors; they only apply to *smaller* phone companies. Additionally, as I noted in a speech in May, the Fairness Doctrine is literally still codified in the CFR. To his credit, Chairman Genachowski recently informed your committee that he supports removing references to the Fairness Doctrine (and its corollaries) from the CFR and intends to move forward on this effort in August. I look forward to helping him fulfill that promise. Similarly, it is time to eliminate the outdated newspaper/broadcast cross-ownership rule in our upcoming quadrennial review of our media ownership regulations. Evidence suggests that the old cross-ownership ban may have caused the unintended effect of reducing the number of media voices – especially newspapers -- in scores of American communities.

Going forward, instead of an ad hoc approach, it would be more constructive to initiate a *comprehensive and sustained* effort to repeal or, where appropriate, streamline unnecessary, outdated or harmful FCC rules. In addition to a review of current regulations, the agency should approach the adoption of any new rule with caution and humility. First, all future regulatory proceedings should start with a thorough market analysis that assesses the state of competition in a sober and clear-eyed manner. Second, the FCC should view its statutory mission through a *de*regulatory lens, as Congress intended. The trend in recent years has been the opposite, unfortunately. One stark example is the FCC's regulatory use of Section 706 of the 1996 Telecom Act, which had previously been widely viewed as a deregulatory section.

In sum, decreasing the burdens of onerous or unnecessary regulations increases investment, spurs innovation, accelerates competition, lowers prices, creates jobs and serves consumers. I look forward to working with all of you as we find ways to scale back unnecessary and harmful regulations. Thank you again for the opportunity to appear before you today.

STATEMENT
OF
COMMISSIONER ROBERT M. MCDOWELL
FEDERAL COMMUNICATIONS COMMISSION

"THE VIEWS OF THE INDEPENDENT AGENCIES ON REGULATORY REFORM"

BEFORE THE
SUBCOMMITTEE ON OVERSIGHT AND INVESTIGATIONS
COMMITTEE ON ENERGY & COMMERCE
UNITED STATES HOUSE OF REPRESENTATIVES

JULY 7, 2011

Thank you, Chairman Stearns and Ranking Member DeGette, for inviting me to join you today. As a commissioner, serving both in the majority and now the minority, I have supported policies that promote consumer choice offered through abundance and competition in lieu of regulation whenever possible. I therefore welcome today's dialogue on regulatory reform.

Removing unnecessary or harmful rules is by no means a partisan concept. As many of you have noted, on January 18 of this year, President Obama issued an executive order directing agencies to review existing regulations to determine whether they are "outmoded, ineffective, insufficient, or excessively burdensome."[1] Additionally, Cass Sunstein, the Administrator of the Office of Information and Regulatory Affairs, sent a memorandum to agency heads regarding the executive order in which he noted that it "does not apply to independent agencies, but such agencies are encouraged to give consideration to all of its provisions, consistent with their legal authority."[2] Sunstein further wrote that, "[i]n particular, such agencies are encouraged to consider undertaking, on a voluntary basis, retrospective analysis of existing rules."[3] Moreover, Chairman Genachowski recently indicated that he would follow the spirit of this executive order and review outmoded FCC regulations. I look forward to working with him on this important endeavor.

Two months ago our office compiled some compelling Code of Federal Regulations ("CFR") statistics which now turn out to be relevant to today's hearing. We discovered that over 50 years ago, there were only 463 pages in the FCC's portion of the Code of Federal Regulations ("CFR"). During this period, Americans only had a choice of three TV networks and one phone company. Today, over-the-air TV, cable TV, satellite TV and radio, and the millions of content

[3] *Id.* at 6.

suppliers on the Internet are overwhelming consumers with choices. In other words, the American communications economy was far less competitive in 1961 than it is today, yet it operated under fewer rules.

In contrast, by late 1995, right before the Telecommunications Act of 1996 became law, the FCC's portion of the CFR had grown to 2,933 pages – up from 463 pages 34 years earlier. In fact, the 1996 Telecom Act states that the FCC should "promote competition and reduce regulation."[4] Just the opposite occurred, however. As of the most recent printing of the CFR last October, it contained a mind-numbing 3,695 pages of rules. So, even after a landmark *de*regulatory act of Congress, the FCC *added* hundreds more pages of government mandates.

To put it another way, the FCC's rules, measured in pages, have grown by almost 800 percent over the course of 50 years, all while the communications marketplace has enjoyed more competition. During this same period of regulatory growth, America's GDP grew by a substantially smaller number: 357 percent.[5] In short, this is one metric illustrating government growth outpacing economic growth.

To be fair, some of those rules were written due to various congressional mandates. And sometimes the FCC does remove rules on its own accord or forbear from applying various rules in response to forbearance petitions. But all in all, the FCC's regulatory reach has grown despite congressional attempts to reverse that trend.

---

[4] Telecommunications Act of 1996, Pub. L. 104-104, 110 Stat. 56 (1996) ("1996 Telecom Act").

[5] The growth rate was calculated based on historical figures reported by the Commerce Department's Bureau of Economic Analysis. *See generally* Bureau of Economic Analysis, U.S. Dep't of Commerce, "National Economic Accounts," http://www.bea.gov/national/index.htm#gdp; *see also id.*, "Current and Real Gross Domestic Product," http://www.bea.gov/national/xls/gdplev.xls.

My testimony will focus on four points:

(1) The FCC's authority;

(2) Examples of ongoing proceedings that propose streamlining various regulations;

(3) Examples of regulations that are ripe for repeal; and

(4) Where we should go from here.

THE FCC HAS AMPLE AUTHORITY FROM CONGRESS TO DEREGULATE.

The 1996 Telecom Act passed both houses of a Republican Congress with a large bipartisan vote and was signed into law by a Democratic president. Congress envisioned allowing potential rivals, such as cable and phone companies and new entrants, to compete against each other. Added competition, lawmakers thought, would obviate the need for more rules. The plain language of the statute, plus its legislative history, tell us that as competition grows, deregulation in this economic sector should take place. The legislative intent of key parts of the legislation, such as Sections 10, 11, 202(h) and 706 – just to name a few – was to *reduce* the amount of regulation in telecommunications, broadcasting and information services. Unfortunately, over time, it does not appear that a net reduction of regulation has been the end result.

Congress has already provided the Commission with the legal tools it needs to reverse the pro-regulation trend of the past 50 years. Congress ordered the FCC through Section 10 of the 1996 Telecom Act to "forbear" from applying a regulation or statutory provision that is not needed to ensure that telecom carriers' market behavior is reasonable and "not necessary for the protection of consumers."[6] Similarly, Section 11 requires the FCC to conduct reviews of

[6] 47 U.S.C. §160(a)(2); *see* Harold Furchtgott-Roth, *FCC ignores law while blindly increasing its regulations*, THE WASHINGTON EXAMINER, (May 1, 2011), http://washingtonexaminer.com/opinion/op-eds/2011/05/fcc-ignores-law-while-blindly-increasing-its-regulations#ixzz1RFsckE4k; *see also* Randolph J. May, *Rolling Back Regulation at the FCC*, NATIONAL REVIEW ONLINE, (Apr. 11, 2011), http://www.nationalreview.com/articles/print/264898.

telecom rules every two years to determine "whether any such regulation is no longer necessary in the public interest as the result of meaningful economic competition,"[7] and to "repeal or modify any regulation it determines to be no longer necessary in the public interest."[8] Removing unneeded rules can liberate capital currently spent on lawyers and filing fees -- capital that would be better spent on powerful innovations. Accordingly, it is my hope that the FCC stays faithful to Congress's intent, as embodied in Section 11, by promptly initiating a full and thorough review of *every* FCC rule, not just those that apply to telecom companies, but all rules that apply to any entity regulated by the Commission. The presumption of the FCC's review should be that a rule is not necessary unless we find compelling evidence to the contrary.

RECENT FCC PROCEEDINGS PROPOSE SOME REGULATORY STREAMLINING.

Chairman Genachowski has already initiated some proceedings in the past couple years that will help clear away some of the regulatory underbrush, and he should be commended for those efforts. For instance, in May, the Commission adopted a Notice of Proposed Rulemaking (NPRM) that proposed to eliminate certain reporting requirements for international telephone service. Also, in January of 2010, the FCC issued an NPRM that proposes to streamline the application process for satellite and earth stations. In addition, the agency issued an NPRM this past February which seeks comment on ways the FCC can reform and modernize its Form 477 data collection processes. I look forward to continuing to work with my colleagues on these pending proceedings.

MANY MORE FCC RULES SHOULD BE REPEALED.

Much more work remains to be done. The first set of rules I would discard would be the recently issued Internet network management regulatory regime, also known as "net neutrality."

[7] 47 U.S.C. §161(a)(2).

[8] 47 U.S.C. §161(b).

As I have stated several times, those rules are unnecessary at best, and will deter investment in badly needed next-generation infrastructure at worst. There has been no evidence of systemic market failure that justifies these overly burdensome regulations. Moreover, language in the net neutrality order itself concedes that the Commission did not conduct a market power analysis or make a market power finding.[9] Notably, even though the FCC adopted the net neutrality rules last December, they have yet to become effective. In the interim, America's Internet remains open and freedom-enhancing, as it *always* has been. Now, before the new rules go into effect and cause uncertainty and unintended consequences in the marketplace, is the perfect time to repeal them.

While perhaps not as controversial as net neutrality, there are many other unnecessary rules still on the books. For instance, a good number of phone companies are still required to read aloud to new customers a list of independent long-distance companies. This so-called "equal access" scripting requirement is a dusty old vestige from the break-up of the AT&T long-distance monopoly. Ma Bell's long-distance arm was declared "non-dominant" way back in 1995. In other words, the long distance market has been competitive for almost 16 years, yet our antiquated rules live on. Ironically, these rules no longer apply to the Baby Bells or their successors. It is *smaller* phone companies that must bear the burden of living under them. Such costs – be they regulations or taxes on companies – are always paid for, ultimately, by consumers.

Furthermore, the FCC has too many forms. As I mentioned, the Chairman has launched an initiative which seeks to reform the FCC's data collection processes. I support these efforts and hope that this exercise results in comprehensive reform of the FCC's burdensome data

[9] *Preserving the Open Internet, Broadband Industry Practices*, Report and Order, 25 FCC Rcd 17905, n. 49 (2010) ("Open Internet Order").

collection procedures as opposed to simply shaving them around the edges. To give you an example of the current processes, there is Form 603; Form 611-T; Form 175; Form 601; Form 492; Form 477; Form 323; and Forms 396, 396-C, 397 and 398, among others. While a few forms may be necessary, many could be eliminated or simplified. Several forms require companies to submit data that is no longer needed or is supplied elsewhere. Take, for example, my "favorite" form, the Enhanced Disclosure form. Back in late 2007, over my dissent, the Commission voted to require TV licensees to fill out a form describing to the government what kind of programming they were airing to the public and when they were airing it. Broadcasters estimated that it would cost them up to two full-time jobs to hire people to do nothing all day but fill out the form and send it to Washington bureaucrats. Also, unless I'm missing something, TV stations don't aim to keep their work product a secret from anyone. If the government wants to know what is being aired, it can turn on the TV.

There is some good news on this front, however. First, the Office of Management and Budget under both Presidents Bush and Obama have prevented the Enhanced Disclosure form from going into effect because of concerns that the mandate violates Paperwork Reduction Act prohibitions. Second, a recent FCC staff report analyzing the "Information Needs of Communities"[10] recommends that the Commission scrap the form -- a recommendation I heartily endorse – and replace it with a more streamlined online disclosure system. I am skeptical of any potential replacement because of the risk that it might simply resurrect the Enhanced Disclosure form's pointless and burdensome mandates in a new electronic guise. Nevertheless, I hope the FCC moves forward on a rulemaking effort to eliminate the form quickly.

[10] Steve Waldman and the FCC Working Group, *The Information Needs of Communities: The changing media landscape in a broadband age* (June 2011).

Similar repeal initiatives should be on our plates soon. For example, as I noted in a speech in May, the Fairness Doctrine is literally still codified in the CFR.[11 12] The Fairness Doctrine was a rule that thrust the government's coercive reach into editorial decisions of broadcasters. In short, the Doctrine regulated political speech. Political speech is core protected speech under the First Amendment, and the Fairness Doctrine is patently unconstitutional. In fact, the FCC decided as much in 1987, when everyone assumed the agency had killed it. Instead, it appears that the Commission merely opted not to enforce the rule. To his credit, Chairman Genachowski recently informed your committee that he supports removing references to the Fairness Doctrine (and its corollaries) from the CFR and intends to move forward on this effort in August. I look forward to helping him fulfill that promise.

Similarly, it is time to eliminate the outdated newspaper/broadcast cross-ownership rule in our upcoming quadrennial review of our media ownership regulations. Evidence suggests that the old cross-ownership ban may have caused the unintended effect of reducing the number of media voices – especially newspapers – in scores of American communities. The FCC staff's *Information Needs of Communities* report is replete with data documenting the declining state of American newspapers, including the fact that more than 230 papers have closed their doors since 2007.[13] Although it is impossible to attribute the deaths of all those papers to the FCC restriction, I note that many knowledgeable observers for years have attributed the hobbling and

[12] Attached as Exhibit A for the Subcommittee's convenience are copies of the speech on regulatory reform that I gave on May 19 to the Telecommunications Industry Association as well as letters I sent to Acting Chairman Copps and Chairman Genachowski in 2009 on FCC reform in general.

[13] Steve Waldman and the FCC Working Group, *The Information Needs of Communities: The changing media landscape in a broadband age* (June 2011) at 41, http://transition.fcc.gov/Daily_Releases/Daily_Business/2011/db0609/DOC-307406A1.pdf (providing list of developments concerning shuttered papers between 2007 and 2010). Another 18 newspapers moved to online-only editions. *Id.*

eventual disappearance of the old *Washington Star*, once the city's premier daily, to the cross-ownership ban which forced the paper to separate from its radio and TV operations.[14] But how many modern-day *Washington Stars* could have survived the Internet's effect on traditional business models if they already had been part of a stronger, multi-platform news operation?

WHERE THE FCC SHOULD GO FROM HERE.

Although I have appreciated the FCC's review of various rules on an ad hoc basis, a more constructive approach would be to initiate a *comprehensive and sustained* effort to repeal or, where appropriate, streamline unnecessary, outdated or harmful FCC rules. The FCC should review every rule and should adopt the presumption that a rule is not necessary unless it finds compelling evidence to the contrary. A large-scale and aggressive review would signal to investors that the Commission takes seriously Congress's and the President's calls to deregulate.

In addition to a review of current regulations, the agency should approach the adoption of any new rule with caution and humility. First, all future regulatory proceedings should start with a thorough market analysis that assesses the state of competition in a sober and clear-eyed manner. Furthermore, if the FCC opts not to include a market analysis, it should explain why. It has been my philosophy that in the absence of market failure, unnecessary regulations in the name of serving the public interest can have the perverse effect of harming consumers by inhibiting the constructive risk-taking that produces investment, innovation, competition, lower prices and jobs.

Second, the FCC should view its statutory mission through a *de*regulatory lens, as Congress intended. The trend in recent years has been the opposite, unfortunately. One stark

Fritz, Allbritton Communications Company, before Committee on Energy and Commerce, U.S. House of Representatives, Dec. 5, 2007, available at http://energycommerce.house.gov/cmte_mtgs/110-ti-hrg.120507.Fritz-testimony.pdf).

example is the FCC's use of Section 706 of the 1996 Telecom Act, which had previously been widely viewed as a deregulatory section.[15] Section 706 requires the FCC to determine whether "advanced telecommunications capability [broadband] is being deployed to all Americans in a reasonable and timely fashion."[16] In all of the reports starting with the first in 1999, the FCC has answered "yes" to that question. In 2010, however, the Commission dramatically reversed course and answered "no."[17] This year, the FCC made the same flawed finding.[18] I dissented from both of those Section 706 reports. The reports were unsettling, considering that America has made impressive improvements in developing and deploying broadband infrastructure and services. In addition to my concern that the reports were outcome driven, I also warned that the conclusions could be used as a pretext to impose unnecessary new rules. Unfortunately, my fears were realized only five months after the issuance of the 2010 Section 706 Report. The Commission then, in a 3-2 vote, relied heavily on the findings in that report in an attempt to

---

[15] Congress stated that "[i]f the Commission's determination is negative, it shall take immediate action to accelerate deployment of such capability by *removing barriers* to infrastructure investment and by promoting competition in the telecommunications market." 47 U.S.C. § 1302(b) (emphasis added) (Section 706 of the Telecommunications Act of 1996 has since been codified in Title 47, Chapter 12 of the United States Code but is commonly referred to as "Section 706"). Clearly, Congress envisioned the Commission "removing barriers" if it determined that broadband was not being deployed in a timely manner. Adding new rules, such as those regulating Internet network management, erects new barriers contrary to the directive to remove them.

[16] 47 U.S.C. § 1302(b).

[17] *See Inquiry Concerning the Deployment of Advanced Telecommunications Capability to All Americans in a Reasonable and Timely Fashion, and Possible Steps to Accelerate Such Deployment Pursuant to Section 706 of the Telecommunications Act of 1996, as Amended by the Broadband Data Improvement Act, GN Docket No. 09-137, A National Broadband Plan for Our Future*, GN Docket No. 09-51, Sixth Broadband Deployment Report, 25 FCC Rcd 9556 (2010) ("2010 *Section 706 Report*"). In fact, the 2010 Section 706 Report explicitly included in its caption and referenced findings from the National Broadband Plan that "95% of the U.S. population lives in housing units with access to terrestrial, fixed broadband infrastructure capable of supporting actual download speeds of at least 4 Mbps."

[18] *Inquiry Concerning the Deployment of Advanced Telecommunications Capability to All Americans in a Reasonable and Timely Fashion, and Possible Steps to Accelerate Such Deployment Pursuant to Section 706 of the Telecommunications Act of 1996, as Amended by the Broadband Data Improvement Act*, GN Docket No. 10-159, Seventh Broadband Progress Report and Order on Reconsideration, FCC 11-78 (May 20, 2011) ("2011 Section 706 Report").

manufacture a legal foundation for the net neutrality order.[19] Given this history, it is reasonable to be concerned that reiteration of the negative Section 706 finding two years in a row may be used to bolster additional FCC regulatory efforts in other areas where Congress has not given the FCC legal authority to do so.

In sum, decreasing the burdens of onerous or unnecessary regulations increases investment, spurs innovation, accelerates competition, lowers prices, creates jobs and serves consumers. I look forward to working with all of you as we find ways to scale back unnecessary and harmful regulations.

Thank you again for the opportunity to appear before you today.

Letter from FCC Commissioner Robert M. McDowell to FCC Acting Chairman Michael Copps (January 27, 2009).

Remarks of FCC Commissioner Robert M. McDowell
Telecommunications Industry Association
TIA 2011: Inside the Network

Thursday, May 19, 2011
The Gaylord Texan
Dallas, Texas

As prepared for delivery

Thank you, Grant. You and your team have put together another impressive show.

It's great to be back in Texas. My family has deep roots in the Lone Star State – more than five generations worth, in fact. My great-great grandfather, James Knox McDowell, was an abolitionist who moved here before the Civil War. As a fan of Abe Lincoln's, he helped found a fledgling new political party, known as the Republican Party. That started a long line of Republicans in the McDowell family. Of course, back in those days, you could ride across the dusty plains of Texas for days and never see any sign of another Republican. There were so few Republicans here that James cast the only vote in his county against secession – the *only* vote.

After enduring a great deal of hardship during and after the War, including surviving a failed lynching at the hands of the Klan, James and his wife, Victoria, went on to raise five sons. One of them, C.K. McDowell, my great grandfather, went from working as a ranch hand and cowboy living in a frontier dugout, to reading the law and becoming an attorney. After the turn of the century, somehow he was elected chief judge of Val Verde County. Upon his election, a riot broke out in the town of Del Rio because he was … well, a Republican. The Texas Rangers had to be called in to quell the violence. (Not the baseball team, the horsemen with guns.) But his picture still hangs on a wall in the old courthouse in Del Rio. For decades, he was the *only* Republican on that wall.

In his later years, he went on to run for governor of Texas and won the Republican nomination in 1942. Keep in mind that back then the Republican Party of Texas could have held its convention in a phone booth. For all I know, he was nominated by default because no one else wanted the "honor." But while writing this speech, I thought I would look up the election results from his race. Ready? It ends up that the incumbent governor, Coke R. Stevenson, garnered 280,735 votes. Judge Caswell Kelliston McDowell hauled in 9,204 votes. That translated into a whopping 3.17 percent. Some would call that a "rounding error."

So what does any of this have to do with the FCC? Well … it seems that we McDowells have a knack for picking places where we end up being the *only* Republican. And while there are a lot more Republicans in Texas these days, there are no more Texas Republicans on the FCC. I had no idea that my family history was preparing me for such loneliness and being on the short end of votes – the shortest of short ends, in fact. But it all makes sense to me now.

3.17 percent. That's quite a number. So let's change the subject and take a look at another number: 463. That was the total number of pages in the FCC's portion of the Code of Federal Regulations – the "CFR" – 50 years ago. The CFR is the book that contains most of the federal government's regulations affecting our country's economy. And at the time of then-FCC Chairman Newt Minow's famous "TV is a vast wasteland" speech, in 1961, all of the FCC's rules governing radio, television, telegraphs, telephones and such could fit neatly into 463 pages Keep in mind, in 1961 Americans only had a choice of three TV networks and one phone company. Today, over-the-air and cable TV, satellite TV and radio, and the millions of content suppliers on the Internet are overwhelming consumers with choices. In other words, the American communications economy was far less competitive in 1961 than it is today, yet it operated under fewer rules.

By late 1995, right before the Telecommunications Act of 1996 became law, the FCC's portion of the CFR had grown to 2,933 pages – up from 463 pages 34 years earlier. With the '96 Act, Congress envisioned allowing potential rivals, such as cable and phone companies and new entrants, to compete. Added competition, lawmakers thought, would obviate the need for more rules. The plain language of the statute, plus its legislative history, tell us that as competition grew, deregulation – *DE*regulation – in this economic sector should take place. The legislative intent of key parts of the '96 Act, such as Sections 10, 11, 202(h) and 706 – just to name a few – was to *reduce* the amount of regulation in telecommunications, information services and broadcasting. In fact, the Act states that the FCC should "promote competition and reduce regulation."[1] But, as it ends up, just the opposite occurred. As of the most recent printing of the CFR last October, it contained a mind-numbing 3,695 pages of rules. That's right, after a landmark *de*regulatory act of Congress, the FCC *added* hundreds more pages of government mandates.

To put it another way, the FCC's rules, measured in pages, have grown by almost 800 percent over the course of 50 years, all while the communications marketplace has enjoyed more competition. During this same period of regulatory growth of 800 percent, America's GDP grew by a substantially smaller number: 357 percent.[2] In short, this is one imperfect but relevant metric illustrating growth in government outpacing economic growth.

To be fair to the Commission, some of those thousands of pages of rules were written due to congressional mandates. And sometimes the FCC does remove rules from its books as the

---

[1] Telecommunications Act of 1996, Pub. L. 104-104, 110 Stat. 56 (1996).

[2] The growth rate was calculated based on historical figures reported by the Commerce Department's Bureau of Economic Analysis. *See generally* Bureau of Economic Analysis, U.S. Dep't of Commerce, "National Economic Accounts," http://www.bea.gov/national/index.htm#gdp; *see also id.*, "Current and Real Gross Domestic Product," http://www.bea.gov/national/xls/gdplev.xls.

result of forbearance petitions, or by its own accord, just as we did last week with some international reporting requirements. But all in all, the FCC's regulatory reach has grown despite congressional attempts to reverse that trend.

Now at this point I need to issue a warning. For the next couple of minutes, I'm going to sound like a lawyer.

As both former FCC Commissioner Harold Furtchgott-Roth and the Free State Foundation's Randy May have written recently, Congress ordered the FCC through Section 10 of the '96 Act to "forbear" from applying a regulation or statutory provision that is not needed to ensure that telecom carriers' market behavior is reasonable and "not necessary for the protection of consumers."[3] Similarly, Section 11, the less famous sibling of Section 10, requires the FCC to conduct reviews of telecom rules every two years to determine "whether any such regulation is no longer in the public interest as the result of meaningful economic competition,"[4] and to "repeal or modify any regulation it determines to be no longer necessary in the public interest."[5]

Please keep in mind that removing unnecessary or harmful rules is by no means a partisan concept. The '96 Act passed both houses of a Republican Congress with a large bipartisan vote and was signed into law by a Democratic president. And on January 18 of this year, President Obama issued an executive order directing agencies to review existing regulations to determine whether they are "outmoded, ineffective, insufficient, or excessively burdensome."[6] As he wrote in the *Wall Street Journal*, he is seeking to "remove outdated regulations that stifle job creation and make our economy less competitive."[7]

---

[3] 47 U.S.C. §160(a)(2).
[4] 47 U.S.C. §161(a)(2).
[5] 47 U.S.C. §161(b).
[6] Exec. Order No. 13,563, 76 Fed. Reg. 3821 (2011).
[7] President Barack Obama, *Toward a 21st-Century Regulatory System*, WALL ST. J., Jan. 18, 2011.

So, having established that we have strong bipartisan support to deregulate, let's get to work. Removing unneeded rules can liberate capital currently spent on lawyers and filing fees -- capital that would be better spent on powerful new communications equipment. Accordingly, I call on the Chairman and my fellow commissioners to stay faithful to Congress's intent, as embodied in Section 11, by promptly initiating a full and thorough review of *every* FCC rule, not just those that apply to telecom companies, but all rules that apply to any entity regulated by the Commission. The presumption of our review should be that a rule is not necessary unless we find compelling evidence to the contrary.

Of course, the first set of rules I would discard would be the recently issued Internet network management regulatory regime, also known as "net neutrality." As I have stated numerous times, those rules are unnecessary at best, and will deter investment in badly needed next-generation infrastructure at worst. But to be realistic, reversal of them will have to be at the hands of the courts or Congress.

Similarly, it would take congressional action to start to erase the regulatory stovepipes created by Titles I, II, III and VI. Products and services are converging across platforms. So should the statute.

But here are a few other rules the FCC could get rid of itself.

Did you know that many phone companies are still required to read aloud to new customers a list of available independent long distance companies? This so-called "equal access" scripting requirement is a dusty old vestige from the break-up of the AT&T long distance monopoly. Ma Bell's long distance arm was declared "non-dominant" way back in 1995. In other words, the long distance market has been competitive for almost 16 years, yet our antiquated rules live on like a slumbering Rip Van Winkle who fell asleep in the 1980s.

Ironically, these rules no longer apply to the Baby Bells or their successors, and have never applied to wireless carriers. It is smaller phone companies that must bear the burden of living under them. Such costs – be they regulations or taxes on companies -- are always paid for, ultimately, by consumers. It took the Commission about a year to put out for public comment a 2008 petition to eliminate these dinosaurs, and we are several years overdue to repeal them.

Similarly, it is smaller non-Bell companies that must live under cost allocation requirements and ARMIS (Automatic Reporting Management Information System) reporting mandates. For carriers living under flexible price cap rules in an environment that is more competitive than a few years ago, these cumbersome and costly requirements make no sense.

Then there are the forms – lots of forms. Government bureaucracies *love* to require people to fill out forms. There is Form 603; Form 611-T; Form 175; Form 601; Form 492; Form 477; Form 323; and Forms 396, 396-C, 397 and 398, among others. Several forms require companies to submit data that is no longer needed or is supplied elsewhere. Take for example, my "favorite" form, the enhanced disclosure form. Back in late 2007, over my dissent, the Commission voted to require TV licensees to fill out a form describing to the government what kind of programming they were airing to the public and when they were airing it. Broadcasters estimated that it would cost them up to two full-time jobs to hire people to do nothing all day but fill out the form and send it to Washington bureaucrats. Proponents of this rule may have meant well. In fact, at the time of its adoption I overheard one advocate exclaim joyfully, "Two full-time jobs? That's terrific. That's job creation!" Of course, they didn't realize that the new requirement would result in the *elimination* of two jobs elsewhere at the station, such as the newsroom, to pay for the new mandate.

Also, unless I'm missing something, TV stations don't aim to keep their work product a secret from anyone. If the government wants to know what is being aired, it can turn on the TV – all Big Brother and First Amendment concerns aside.

The good news is that the enhanced disclosure form has been held up by the Office of Management and Budget (OMB) since 2008 because it raises Paperwork Reduction Act problems, among other things. And, yes, that's the same office that has temporarily held up the effectiveness of the net neutrality rules. Given that both the Bush and Obama White Houses have kept it from going into effect, why don't we just put it out of its – and our – misery and repeal it?

I'm not saying that all forms are unnecessary. But multiple forms sometimes collect the same data, such as Form 477 collecting the same ownership information required by Form 602. Do we really need to kill America's information economy with a thousand paper cuts?

And now, if you have fallen asleep, this last part should wake you up. In fact, the likely headline coming out of this speech will have nothing to do with telecom equipment. Sorry about that. Are you ready? It is rare that the English language can come up with two words that, when put together, generate so much controversy. This is potent stuff, so you'd better brace yourself. The … Fairness Doctrine. It still exists! No, it doesn't still exist the way Elvis "still exists." The Fairness Doctrine is literally still codified in the CFR.[8] We stumbled on this forgotten fact while researching material for this speech.

For those of you who have no idea what I am talking about, the Fairness Doctrine was a rule … well, still IS a rule, apparently … that thrust the government's coercive reach into editorial decisions of broadcasters. In short, the Doctrine regulated political speech. Suffice it to say that political speech is core protected speech under the First Amendment, and the Fairness

[8] 47 C.F.R. § 73.1910 (broadcasting); 47 C.F.R. § 76.209 ("origination cablecasting").

Doctrine is patently unconstitutional. The FCC decided as much in 1987 when everyone assumed the FCC killed it. We thought that this monster's dead and stinking corpse was left to rot in a government graveyard. Instead, it appears that the Commission merely opted not to enforce the rule. Its words still defile the pages of the CFR, and we should erase it with a repeal order immediately.

In closing, a comprehensive and sustained effort to repeal and streamline unnecessary, outdated or harmful FCC rules would signal to investors that the Commission takes seriously Congress's and the President's calls to deregulate. With the certainty that the Commission will not only refrain from issuing new unneeded rules, but weed out old ones as well, investment capital is more likely to start flowing again.

Congress could do its part as well. Adoption of tax policies that accelerate depreciation schedules for tech equipment and classify some capital investments as expenses have a history of stimulating economic activity and job creation. By some estimates, every one dollar in accelerated depreciation tax incentives generates nine dollars in GDP growth.[9] One study estimated that the tech tax incentives of 2002 and 2003 may have increased GDP by $20 billion and affected the creation and retention of up to 200,000 jobs.[10]

The bottom line is the bottom line. History teaches us over and over again: Decreasing the burdens of onerous regulatory and taxation policies increases investment (which means more purchases of telecom equipment), spurs innovation, accelerates competition, lowers prices, creates jobs and pleases consumers. So what is there not to like? Let's get on with such a program right away.

Thank you for having me here today, and I look forward to your questions.

Office of Commissioner Robert M. McDowell
Federal Communications Commission
Washington, D.C. 20554

July 20, 2009

The Honorable Julius Genachowski
Chairman
Federal Communications Commission
445 Twelfth Street, SW
Washington, DC 20554

Dear Mr. Chairman:

Once again, congratulations on your nomination and confirmation as Chairman. I am greatly encouraged and energized to know that you, Commissioner Copps and I will be working together on a plethora of communications policy challenges facing the economy and American consumers. Although you have only been here for three weeks, I applaud the steps you have already taken to reform the agency. Your recent statements regarding boosting employee morale, promoting greater transparency, and creating a more informed, collaborative and considerate decision-making process are heartening. Anything we could do to advance the timely and orderly resolution of Commission business would be constructive. I am confident that you will agree that the preliminary steps Mike took during his interim chairmanship have provided a sound footing upon which to build.

Accordingly, in the collaborative and transparent spirit of my January 29, 2009, letter to Mike, I offer below a number of suggestions on achieving the important public interest objectives of reforming this agency. As you and I have already discussed, these thoughts are intended as a starting point for a more public discussion that should examine a larger constellation of ideas for moving forward together to improve the public's ability to participate in our work, as well as our overall decision-making abilities. Many of these ideas have been discussed by many people for a long period of time, and if we don't care who gets the credit we can accomplish a great deal.

Operational, financial and ethics audit.

I would first recommend that we commence a thorough operational, financial and ethics audit of the Commission and its related entities, such as the Universal Service Administrative Company, the National Exchange Carrier Association and the federal advisory committees. Just as you recently articulated in your June 30 request for information on the Commission's safety preparedness, I would envision this audit as an examination akin to a due diligence review of a company as part of a proposed merger or acquisition, or after a change in top management. I would not envision the process taking a lot of time; yet, upon completion, we would be better positioned to identify and assess the current condition of the FCC and its related entities, as well as how they operate.

This undertaking would be a meaningful first step on the road to improving the agency. As with all FCC reform endeavors, I hope that all of the commissioners would be involved in this process, including its development and initiation. We should seek comment from the public and the Commission staff, and we should provide Commission employees with additional opportunities to submit comments anonymously. I also propose that we hold a series of "town hall" meetings at the FCC's Washington headquarters, at a few field offices, as well as in a few locations around the country to allow our fellow citizens to attend and voice their opinions directly to us.

As part of a financial review, it is crucially important that we examine the Commission's contracting process, as well as the processes relating to the collection and distribution of administrative and regulatory fees currently conducted exclusively by the Office of Managing Director. For instance, we should consider whether the full Commission should receive notice prior to the finalization of significant contracts or other large transactions.

In the same vein, it is time to examine the Commission's assessment of fees. Regulatory fees are the primary means by which the Commission funds its operations. You may be aware that the FCC actually makes money for the tax payers. As Mike has also noted, our methodology for collecting these fees may be imperfect. At first blush, it appears that we may have over-collected by more than $10 million for each of the last two years. Some have raised questions regarding how the fee burden is allocated. Our recent further notice of proposed rulemaking could lead to a methodology that lowers regulatory fees and levies them in a more nondiscriminatory and competitively neutral manner.

We should also work with Congress to examine Section 8 of the Act and the Commission's duty to collect administrative fees. I am hopeful that we will examine why we continue to levy a tax of sorts of allegedly $25 million or so per year on industry, after the Commission has fully funded its operations through regulatory fees. As you may know, that money goes straight to the Treasury and is not used to fund the agency. Every year, we increase those fees to stay current with the Consumer Price Index. At the same time, our regulatees pass along those costs to consumers and they are the ones who ultimately pay higher prices for telecommunications services.

Further, given the significant concerns raised about the numbers and the way the audits have been conducted, I recommend that we examine the financial management of the universal service fund. You may know that the Commission's Inspector General reported last year that the estimated erroneous payment rate for the High Cost program between July 2006 and June 2007 was 23.3 percent, with total estimated erroneous payments of $971.2 million. While I am pleased that the OIG identified this error, it is time that we get to the bottom of this matter and remedy it.

In the same spirit, an ethics audit should ensure that all of our protocols, rules and conduct are up to the highest standards of government best practices. Faith in the ethics of government officials has, in some cases, eroded over the years and we should make sure that we are doing all that we can to maintain the public's trust.

Update and republish the FCC strategic plan.

Also in connection with this review, I hope that we can work together to update and republish the Commission's strategic plan. Like me, you may find that, as we toil on day-to-day tasks, it can be easy to lose sight of our strategic direction. Completing this task would create a solid framework for future actions and demonstrate our commitment to transparency and orderliness, each of which is critical to effective decision making.

Potential restructuring of the agency.

The findings of our review, combined with our work to develop a new strategic plan, would provide us with the information and ideas necessary for considering a potential restructuring of the agency. As you know, the Commission has been reorganized over the years – for instance, the creation of the Enforcement Bureau under Chairman Kennard and the Public Safety and Homeland Security Bureau under Chairman Martin. Close coordination among the staff in pursuit of functional commonality historically has improved the Commission's effectiveness. Nonetheless, the time is coming again to reconsider this option.

I am not suggesting that we make change for the sake of change. After all, we would agree that the agency needs to be flexible and must be responsive to its myriad stakeholders, most importantly American consumers. There are, however, additional improvements we can make to increase our efficiency. As Mike emphasized, the Commission's most precious resource, really our *only* resource, are its people. Many of our most valued team members are nearing retirement age. We need to do more to recruit and retain highly-qualified professionals to fill their large shoes. I hope our next budget will give us adequate resources to address this growing challenge.

Next, I would encourage consideration of filling many of the numerous open positions with highly-qualified applicants and making more efficient use of non-attorney professionals. For example, there is no reason why we cannot use engineers to help investigate complaints and petitions that involve technical and engineering questions. This would be especially useful as we continue to consider matters pertaining to network management. Similarly, our economists could be better used to help assess the economic effects of our proposed actions.

Improve external communication.

As you and I have also discussed, we need to improve our external communications regarding FCC processes and actions. I greatly appreciate Mike's promptness in posting the Open Meeting dates covering his tenure. I am hopeful that we will swiftly establish and publish Open Meeting dates for the entire 2009 calendar year. The public, not to mention the staff, would also greatly benefit if we would provide at least six months' notice on meeting dates for 2010 and beyond.

As part of these communications improvements, I look forward providing input as to updating the Commission's IT and web systems. I applaud your commitment to this endeavor and Mike's success in securing additional funding toward this end. Clear, concise and well-organized information systems will ensure that all public information is available, easily located and understandable. I also recommend that we update the General Counsel's part of the website to include litigation calendars, as well as access to pleadings filed by all the parties. Additionally, I suspect that our customers would prefer that licenses of all stripes be housed in one database, rather than separate databases spread across the stovepipes of our several bureaus. We should seek comment on this, and other similar administrative reform matters.

In addition, I propose that we create, publish on the website and update regularly an easy-to-read matrix setting forth a listing of all pending proceedings and the status of each. This matrix would include those matters being addressed on delegated authority. The taxpayers should know what they are paying for.

Similarly, I suggest that we establish and release a schedule for the production of all statistical reports and analyses regularly conducted by the Commission, and publish annual updates of that schedule. This would include, for example: the *Wireless Competition Report*, which has traditionally been released each September; the *Video Competition Report*, which until recently, was released at the end of each year; and the *High-Speed Services Report*, which, at one point, was released biannually. Similarly, quite some time before your arrival, I went on record calling for giving the American public the opportunity to view and comment on at least a draft or outline of the National Broadband Plan. I look forward to working with you to increase public awareness regarding the status and substance of our work on this plan. The goal here would be not only to ensure that the public is fully aware of what we are working on and when, but also to give these valuable analyses to their owners – the American people – with regularity.

In the same vein, Congress, the American public and consumers, among other stakeholders – not to mention your fellow commissioners – would greatly appreciate it if notices of proposed rulemakings actually contained *proposed rules*.

Improve internal communication.

Also, we need to overhaul our internal information flow, collaboration and processes. I am eager to work with you, Mike, and our future colleagues, to identify and implement additional measures to increase coordination among the commissioner offices, between commissioner offices and the staff, as well as among the staff. It is important that we cooperate with each other to foster open and thoughtful consideration of potential actions well before jumping into the drafting process. The bottom line is simple: No commissioner should learn of official actions through the trade press.

An effective FCC would be one where, for instance, Commissioner offices would receive options memoranda and briefing materials long before votes need to be cast. For example, for all rulemakings, within 30 days of a comment period closing, perhaps all commissioners could

receive identical comment summaries. Also, within a fixed timeframe after receiving comment summaries, say 60 to 90 days, all commissioners could receive options memos complete with policy, legal, technical and economic analyses. In preparation for legislative hearings, it would be helpful if all commissioners received briefing materials, including witness lists, at least five business days prior to the hearing date. For FCC *en banc* hearings or meetings, we should aim to distribute briefing materials to all commissioners at least one week prior to the event date. The details here are less important than the upshot: all commissioners should have unfettered access to the agency's experts, and receive the benefit of their work. Again, I am grateful to Mike for his preliminary efforts in this regard.

Also along these lines, I hope that your team will reestablish the practice of regular meetings among the senior legal advisors for the purpose of discussing "big picture" policy matters, administrative issues, as well as to plan events and meetings that involve all of the offices. Given the numerous tasks we have before us, I trust you will agree that regular meetings among this group will improve our efficiencies, and go a long way toward lessening, if not eliminating, unpleasant surprises.

Just as important would be to hold regular meetings among the substantive advisors and relevant staff, including the Office of General Counsel. Having ample opportunity to review and discuss pending proceedings and the various options at the early stages of, and throughout the drafting process would allow us to capitalize on our in-house expertise early and often. Taking such precautions might also bolster the Commission's track record on appeal. Indeed, this type of close collaboration might lead to more logical, clear and concise policy outcomes that better serve the public interest.

Another idea is to update and rewrite our guide to the Commission's internal procedures, currently entitled *Commissioner's Guide to the Agenda Process*. For instance, just as Mike has done with respect to the distribution of our daily press clips, I propose that we undertake a thorough review of the physical circulation process, including identifying and making changes to reduce the amount of paper unnecessarily distributed throughout the agency. Current procedures require that each office receive about eight copies of every document on circulation when one or two would suffice. I also wonder why our procedures mandate delivery of 30 paper copies of released Commission documents to our press office. The overwhelming majority of reporters who cover our agency pull the materials they need from our website. Perhaps this is another area where we could save money and help the environment all at the same time.

Coordinate with other facets of government.

Finally, on a more "macro" level, I propose that the commissioners work together to build an ongoing and meaningful rapport with other facets of government, especially in the consumer protection, homeland security, and technology areas. I am confident that close collaboration with our government colleagues with similar or overlapping responsibilities would greatly benefit the constituencies we serve.

In closing, I again extend my warmest congratulations on your new position as Chairman. You are to be commended for the steps you have taken thus far toward rebuilding this agency. I look forward to working together with you, Mike and our new colleagues upon their confirmation to do even more.

Sincerely,

Robert M. McDowell

Office of Commissioner Robert M. McDowell
Federal Communications Commission
Washington, D.C. 20554

January 27, 2009

The Honorable Michael J. Copps
Acting Chairman
Federal Communications Commission
445 Twelfth Street, SW
Washington, DC 20554

Dear Mike:

Once again, congratulations on being named Acting Chairman. Additionally, thank you for your dedication and commitment to public service and the Commission. It goes without saying that I am looking forward to continuing to work with you.

I am greatly encouraged and energized to know that you, Commissioner Adelstein and I will be working together toward the goals of boosting employee morale, promoting greater transparency, as well as creating a more informed, collaborative and considerate decision-making process, all aimed toward advancing the timely and orderly resolution of Commission business. Thank you for addressing these and many other issues within minutes of becoming Acting Chairman. I certainly appreciate the new atmosphere you are creating at the Commission, and I know that the FCC's talented and dedicated career employees appreciate your efforts as well. Accordingly, with the utmost respect for you, the Commission staff and the new Obama Administration, I offer below several preliminary suggestions on achieving the important public interest objectives of reforming this agency. My letter is intended to continue a thoughtful dialogue on moving forward together to improve the public's ability to participate in our work, as well as our overall decision-making abilities. Our collaborative efforts to rebuild the agency should not be limited to the thoughts outlined in this brief letter. As you and I have discussed many of these ideas already, let this merely serve as a starting point for a more public discussion that should examine a larger constellation of ideas.

I would first recommend that we commence a thorough operational, financial and ethics audit of the Commission and its related entities, such as the Universal Service Administrative Company and the Federal Advisory Committees. As with all FCC reform endeavors, I hope that all of the commissioners will be involved in this process, including its development and initiation. We should seek comment from the public and the Commission staff, and we should provide Commission employees with an opportunity to submit comments anonymously.

I would also suggest that we work to update and republish the Commission's strategic plan. Completing this task would create a solid framework for future actions and demonstrate our commitment to transparency and orderliness, each of which is critical to effective decision making.

The findings of our review, combined with our work to develop a new strategic plan, would provide us with the information and ideas necessary for considering a potential restructuring of the agency. I am not suggesting that we make change for the sake of change. After all, we agree that the agency needs to be flexible and must be responsive to its myriad stakeholders, most importantly American consumers. There are, however, steps we likely would want to implement to increase our efficiency. For example, as you have already stated, delegating some authority back to upper and mid-level management, filling many of the numerous open positions with highly-qualified applicants and making more efficient use of non-attorney professionals come to mind.

As we have also discussed previously, we need to improve our external communications regarding FCC processes and actions. As an immediate first step, I suggest that we swiftly establish and publish Open Meeting dates for the entire 2009 calendar year. The public, not to mention the staff, would also greatly benefit if we would provide at least six months' notice on meeting dates for 2010 and beyond.

Also, we agree that we need to overhaul our internal information flow, collaboration and processes. I am eager to continue to work with you and Commissioner Adelstein to identify and implement measures to increase coordination among the commissioner offices, between commissioner offices and the staff, as well as among the staff. It is important that we cooperate with each other to foster open and thoughtful consideration of potential actions well before jumping into the drafting process.

As part of these communications improvements, I share your desire to update the Commission's IT and web systems. They are in dire need of an overhaul. Clear, concise and well-organized information systems will ensure that all public information is available, easily located and understandable.

Finally, I propose that the commissioners work together to build an ongoing and meaningful rapport with other facets of government, especially in the consumer protection, homeland security, and technology areas. I am confident that close collaboration with our government colleagues with similar or overlapping responsibilities would greatly benefit the constituencies we serve.

In closing, Mike, I again extend my warmest congratulations on your designation as Acting Chairman. I look forward to working together with you and Commissioner Adelstein to improve our agency during the coming days and weeks.

Sincerely,

Robert M. McDowell

cc: The Honorable Jonathan S. Adelstein

Mr. STEARNS. I thank the gentleman.

Welcome, Chairman Wellinghoff, for your opening statement.

TESTIMONY OF JON WELLINGHOFF

Mr. WELLINGHOFF. Thank you, Chairman Stearns, Ranking Member DeGette and members of the subcommittee. I want to thank you all for having us here today, and my colleague, Commissioner Moeller, to discuss our views on regulatory reform in independent agencies. We have submitted full testimony here that I would like to have entered into the record, and I will summarize my testimony.

The commission continually seeks to streamline its regulations in order to foster competitive markets and facilitate enhanced competition to minimize consumer costs. Implementing the statutory authority provided by Congress, I am committed to assisting consumers in obtaining reliable, efficient and sustainable energy services at a reasonable cost for appropriate regulatory and market means. Fulfilling this mission involves pursuing two primary goals: ensuring that rates, terms and conditions are just and reasonable and not unduly discriminatory or preferential, and promoting the development of safe, reliable and efficient infrastructure that serves the public interest. The commission has taken and continues to take a number of steps to make certain that its regulations meet the fundamental objectives set forth by Congress without imposing undue burdens on regulated entities or unnecessary costs on those entities or their customers.

For example, the commission has taken several steps to remove barriers to entry of new businesses and technologies which facilitate competitive markets and can lower consumer costs. The commission also seeks out ways to help entities, particularly small ones, navigate the federal regulatory process. The commission has also recently reduced burdens on applicants, speeding up processes of filings and improved public access to documents.

In sum, I support the goals of Executive Order 13563. I have directed the commission staff to conduct review of the commission's regulations with the goals of the Executive order in mind. This direction is consistent with the commission's practice of engaging in constant self-review to avoid red tape or unnecessary regulation that would impose undue burdens on the energy industry and its consumers.

Thank you, and I look forward to answering any questions.

[The prepared statement of Mr. Wellinghoff follows:]

One Page Summary: Testimony of Chairman Jon Wellinghoff

The Commission continually seeks to streamline its regulations in order to foster competitive markets and facilitate enhanced competition to minimize consumer costs. In implementing the statutory authority provided by Congress, I am committed to assisting consumers in obtaining reliable, efficient, and sustainable energy services at a reasonable cost through appropriate regulatory and market means. Fulfilling this mission involves pursuing two primary goals: ensuring that rates, terms and conditions are just, reasonable and not unduly discriminatory or preferential, and promoting the development of safe, reliable and efficient infrastructure that serves the public interest. The Commission has taken, and continues to take, a number of steps to make certain that its regulations meet the fundamental objectives set by Congress without imposing undue burdens on regulated entities or unnecessary costs on those entities or their customers.

For example, the Commission has taken several recent steps to remove barriers to entry of new business and technologies, which facilitates competitive markets and can lower consumer costs. The Commission also seeks out ways to help entities, particularly small ones, navigate the federal regulatory process. The Commission has also recently reduced burden on applicants, sped up processing of filings and improved public access to documents.

In sum, I support the goals of Executive Order 13563. I have directed the Commission's staff to conduct a review of the Commission's regulations with the goals of the executive order in mind. This direction is consistent with the Commission's practice of engaging in constant self-review to avoid red tape or unnecessary regulation that would impose undue burdens on the energy industry and consumers.

Testimony of Chairman Jon Wellinghoff

Federal Energy Regulatory Commission

Before the House Subcommittee on Oversight and Investigations

Of the Committee on Energy and Commerce

United States House of Representatives

July 7, 2011

Mr. Chairman and members of the Subcommittee:

My name is Jon Wellinghoff, and I am the Chairman of the Federal Energy Regulatory Commission (FERC or Commission). Thank you for the opportunity to appear before you today to discuss my views on regulatory reform and independent agencies. It is my belief that the Commission continually seeks to streamline its regulations in order to foster competitive markets and facilitate enhanced competition to minimize consumer costs.

In implementing the statutory authority provided by Congress, the Commission is committed to assisting consumers in obtaining reliable, efficient, and sustainable energy services at a reasonable cost through appropriate regulatory and market means. Fulfilling this mission involves pursuing two primary goals: ensuring that rates, terms and conditions are just, reasonable and not unduly discriminatory or preferential, and promoting the development of safe, reliable and efficient infrastructure that serves the public interest. While independent agencies such as the Commission are not subject to Executive Order 13563, consistent with the goals of the executive order, the Commission

has taken, and continues to take, a number of steps to make certain that its regulations meet the fundamental objectives set by Congress without imposing undue burdens on regulated entities or unnecessary costs on those entities or their customers. I describe below some of the Commission's recent efforts toward these important goals.

Reducing Regulatory Burdens

The Commission regularly reviews its regulations to ensure that they achieve their intended purpose and do not impose undue burdens on regulated entities or unnecessary costs on those entities or their customers. For example, in the Energy Policy Act of 2005, Congress directed FERC to establish new rules under which the Commission would provide incentive rates to encourage development of electric transmission infrastructure. In July 2006, the Commission implemented that directive by issuing Order No. 679. Since then, the Commission has received more than 75 applications for transmission incentives. Given the significant changes in the electric industry and the Commission's experience in applying Order No. 679, the Commission issued a Notice of Inquiry in May of this year regarding the scope and implementation of its transmission incentives program. Through this Notice of Inquiry, the Commission is seeking public comment on whether its incentive regulations are encouraging the development of transmission infrastructure in a manner consistent with the intent of Congress. The development of transmission infrastructure will facilitate competition in regional electricity markets, which helps ensure just and reasonable rates without burdensome regulatory oversight.

The Commission also is responsive to industry requests to reevaluate its regulations. With respect to the natural gas industry, for example, the Commission

responded to requests to reduce the burden of certain annual natural gas reporting requirements. In Order No. 704-C, the Commission clarified the requirements for natural gas market participants to annually report information regarding physical natural gas transactions that use an index or contribute to the formation of a gas index. The Commission exempted certain transactions from natural gas index reporting requirements, particularly with reference to blanket sales certificates, finding that those transactions were burdensome to report and provided little market information. The Commission also exempted small entities that were obligated to report solely by virtue of possessing a blanket sales certificate. Thus, the Commission removed regulatory burdens on regulated entities, including small businesses.

Moreover, in 2007, the Commission undertook a ten-year review of its electric transmission open access regulations, including its landmark Order No. 888, which prohibited public utilities from using their monopoly power over transmission to restrain or prevent competition. In reviewing these regulations, the Commission conducted significant outreach to the regulated industry and other stakeholders. This effort culminated in the issuance of Order No. 890, which revisited the Commission's open access policies and amended its *pro forma* Open Access Transmission Tariff to further improve competition in wholesale markets by, among other things, increasing the ability of customers to access new generating resources and promoting efficient utilization of transmission by requiring an open, transparent, and coordinated transmission planning process.

Simplifying the Regulatory Process

The Commission also seeks out ways to help entities, particularly small ones, navigate the federal regulatory process. One example of these efforts is the Commission's encouragement of small hydropower development. In response to rising public interest in small hydropower and low-impact hydropower projects, the Commission has developed a publicly available website that provides detailed information on how to navigate the small hydropower regulatory process. Commission staff also has been hosting and will continue to host public tutorials and webinars tailored to the needs of entities intending to file applications to develop small hydropower projects. In addition, Commission staff conducted a study last year in coordination with the hydropower industry, government agencies, Native American tribes, non-governmental organizations, and the general public to evaluate the effectiveness of the Commission's integrated licensing process for hydroelectric facilities. Reflecting similar outreach, the Commission has entered into a number of memoranda of understanding with other federal agencies and state governments to reduce regulatory conflict and overlap.

The Commission and its staff also have coordinated seminars around the country on environmental review and compliance for natural gas facilities. In the past two years, over 1,000 people have attended these seminars. I believe that these seminars increase transparency, help stakeholders better understand the natural gas regulatory process, improve inter-agency coordination, and allow faster processing of applications.

The Commission recently revisited certain regulations to reduce burden on the applicants, speed up processing of the filings and improve public access to documents.

For example, in March of last year, the Commission issued a final rule to revise its Form 556, through which cogeneration and small power production facilities either self-certify qualifying facility (QF) status or apply for Commission certification of QF status. Among other changes, the final rule reduces the burden on small entities by exempting generating facilities that are 1 MW and smaller from the need to file a Form 556 in order to be certified as a QF. This change will facilitate the development of small generating facilities. The final rule also removed the contents of Form 556 from the Commission's regulations and, in their place, provided that an applicant seeking to certify QF status of a small power production or cogeneration facility must complete, and electronically file, the Form 556 that is in effect at the time of filing. The Commission stated that this change takes advantage of newer technologies that will reduce both the filing burden for applicants and the processing burden for the Commission.

The Commission also has taken various steps to simplify the regulatory process by moving from paper to electronic formats in a number of areas. Most notably, the Commission has developed and implemented a standard electronic tariff filing system known as eTariff. Electronic filing reduces the burden on those who make filings at the Commission -- and on those who use such filings, such as regulated entities, the public, and Commission staff -- by providing faster and easier access to tariffs. The eTariff filing process has greatly improved public access to tariff filing documents by posting such filings in near real-time into the public record, and increased ten-fold the number of FERC regulated tariffs that are now available through the Commission's web site.

Similarly, the Commission is moving to automate various forms to simplify the

regulatory process. For example, section 205(f) of the Federal Power Act requires respondents to submit certain information in Form 580 to ensure the economical purchase and use of fuel and electric energy, among other purposes. In 2010, the Commission established Form 580 in an electronic pdf-fillable form and streamlined the information required by the Form.

Removing Barriers to Entry for New Business and Technologies

In addition to reviewing its regulations to reduce undue burdens, the Commission has taken several recent steps to remove barriers for entry of new business and technologies, which in turn facilitates competitive markets and can lower consumer costs. In recent years, improvements in technology have led to an increasing variety of resources being capable of contributing to reliable, efficient, and sustainable energy services. The Commission has initiated a number of recent rulemaking proceedings to ensure that regulations it developed prior to those improvements do not prevent the use of emerging technologies to provide services subject to the Commission's jurisdiction. In general, increased competition among providers of these services will tend to place downward pressure on rates for those services. I also would note that in each of these rulemakings, the Commission seeks public comment to ensure that any changes the Commission proposes are appropriately tailored to their intended purpose.

One example of this effort is that the Commission also has taken steps to remove barriers to the use of emerging technologies that are capable of responding to certain transmission system needs more quickly than the generators that have traditionally provided those services. These types of emerging technologies include batteries,

flywheels and other electric storage devices. In February of this year, the Commission proposed to revise its regulations with respect to provision in organized wholesale electric markets of regulation service. Regulation is an ancillary transmission service that protects the grid by correcting deviations in grid frequency and imbalances on transmission lines with neighboring systems. The Commission's proposed changes are intended to ensure that resources that provide faster and more accurate regulation service are compensated appropriately for their performance. Again, this proposed rule has the potential to lower costs to consumers, as increased use of fast and accurate resources should allow system operators to purchase less regulating capacity.

A variety of resources are capable of providing regulation and other aocillary transmission services but may be discouraged from doing so by certain aspects of the Commission's market-based rate policies. They may also lack of access to the information necessarily to supply those services. Therefore, the Commission is now exploring whether changes are needed to allow more resources to provide ancillary services. Just last month, the Commission issued a Notice of Inquiry that sought public comment on ways in which the Commission can facilitate competition in the provision of ancillary services from all resource types, including electric storage. The Commission also sought comment in that Notice of Inquiry on whether the Commission's accounting requirements present a barrier to development of electric storage.

The Commission also has taken a number of recent steps to remove barriers to demand response participation in organized wholesale electric markets. Pursuant to a Congressional directive, Commission staff in 2009 developed a National Assessment of

Demand Response Potential, which found that the potential for peak electricity demand reductions across the country is between 38 gigawatts and 188 gigawatts, up to 20 percent of national peak demand, depending on the penetration of advanced metering and the applicable regulatory policies. Also pursuant to a Congressional directive, Commission staff in 2010 developed a National Action Plan on Demand Response. In addition, the Commission has amended its regulations to facilitate demand response participation in organized markets. In Order No. 719, for example, the Commission amended its regulations to facilitate provision of ancillary transmission services by demand response resources that are technically capable of providing those services.

Conclusion

In sum, I support the goals of Executive Order 13563. I have directed the Commission's staff to conduct a review of the Commission's regulations with the goals of the executive order in mind. This direction is consistent with the Commission's practice, which I have described, of engaging in constant self-review to avoid red tape or unnecessary regulation that would impose undue burdens on the energy industry. I look forward to working with you to ensure that this remains the case.

I appreciate this opportunity to share my thoughts on regulatory reform and independent agencies and would be happy to answer any questions you might have.

Mr. STEARNS. I thank the gentleman.
Commissioner Moeller, welcome.

TESTIMONY OF PHILIP D. MOELLER

Mr. MOELLER. Thank you, Mr. Chairman, Ranking Member DeGette, members of the committee. I appreciate the chance to be before you today to talk about these important issues. I welcome your oversight, and I will summarize my written comments with a brief history, I guess, of how our regulations have evolved at the commission and then give you three examples of where I think we kind of struggle with balancing the need to ensure that our services are provided safely at fair and just rates but also making sure that we are protecting and not unduly burdening the entities that we regulate.

The Federal Power Commission, our predecessor, really came into its own after the passage of the 1935 Federal Power Act and the 1938 Natural Gas Act, and as regulators then, the commission was highly relating these entities because they were monopoly providers of services that were deemed essential but over the decades and particularly in the last 25 years, regulation has evolved so that more competitive forces can provide consumers with frankly lower prices at better service. These came through two landmark orders on the natural gas side, 436 and 636, which restructured the pipelines, and then on the electric side, orders 888 and 2000 that set up regional markets and allowed for open access of the transmission systems. Again, these have had great benefits for consumers but our responsibilities as regulators in monitoring these markets have increased substantially since then.

Three areas where we particularly spend time, the first of which I will say is the reliability area of assuring the reliability of the bulk power system. Now, the origins of this issue came from the 1965 Northeast blackout a voluntary set of regulations came about after that, but as time went on, particularly in the late 1990s, it was clear that a mandatory system was going to be necessary, some kind of a cop on the interstate electric highway, and although there was legislation in the late 1990s, eventually it took the 2003 blackout and the 2005 Energy Policy Act before you as Congress directed us to create a national electric reliability organization with eight regional entities, and in the meantime, we have adopted 101 national standards, 11 regional standards, and we have had a very active enforcement process on those standards. In fact, we have had 7,000 violations to date since they became mandatory in June of 2007. And frankly, we are struggling with our role, the role of NERC, the role of the regional entities because we have a bit of a backlog on these violations. They are about to about 3,200.

I think the good news, though, is that through NERC, or through our direction to NERC, they are working to make sure that it is a better streamlined process so that we can eliminate the backlog and essentially share the best practices amongst the entities we regulate on the bulk power system.

A second area is related to that and that is with our new powers of enforcement that you gave us in the 2005 Energy Policy Act, partly emanating from the Western crisis in 2000 and 2001. You gave us the kind of major league enforcement authority that few

agencies have. We can fine entities up to $1 million per day per violation. And initially when we put out some of our rulings with some significant fines, there was some criticism from the industry that we lacked transparency in the process and lacked priorities, and I am happy to say that our office of enforcement under the urging of several of us on the commission has opened up that system so that we are a much more transparent system now. We adopted annual priorities in terms of enforcement, adopted guidelines based on the U.S. Sentencing Commission, and essentially have processes and policies in place that allow anyone under investigation to know at certain times that they are and give them the certain rights that other agencies give them. So we are making progress there.

The third area I would note, because I come from the Pacific Northwest, is the hydropower system. We regulate 2,500 hydropower dams throughout the Nation and some have complained that that processing of licensing or, more often, re-licensing, is both costly and time consuming, and that much is true, but I don't think much of that can be put on FERC. I think actually the laws itself that govern the process of re-licensing are worth looking at if this is something that inspires you because we actually I think do a good job under the current system of setting timetables but often the resource agencies don't have any consequence to missing the timetables involved.

In the meantime, though, I think we have tried as an agency to develop small hydropower systems through MOUs with various states that are interested. We have tried to open up the process to stakeholders and developers that are interested in small hydropower development and we have come up with a pilot licensing process for the new hydrokinetic technologies of in-stream power, ocean power and tidal power, again in a way through our regulations to try and encourage an industry to move forward.

And finally, I will send a compliment to our colleagues at the Federal Trade Commission. They have been active in some of our rulemakings, and their perspectives are always very valuable.

Thank you for the opportunity again to testify, and I look forward to answering any questions.

[The prepared statement of Mr. Moeller follows:]

Summary of Testimony of Commissioner Philip D. Moeller
Before the U.S. House of Representatives
Committee on Energy and Commerce,
Subcommittee on Oversight and Investigations

July 7, 2011

Highlighted are three areas where the Commission has specific regulatory challenges. In these three areas we have a difficult role in balancing the need to assure that the services provided are done safely and at just and reasonable rates --- while not imposing undue burdens on the entities we regulate.

In 2005, Congress gave the Commission significant new responsibilities including a new regulatory directive to increase the reliability of the Bulk Electric System through the creation of mandatory and enforceable reliability standards and certifying a new Electric Reliability Organization. It has truly been a paradigm shift for an entire industry to go from a set of voluntary standards to mandatory and enforceable standards with significant potential of financial penalties.

The Commission, through our Office of Enforcement, has established new measures to provide our regulated industry with a better understanding of our enforcement processes. Ultimately, our intent is not to assess penalties, but instead, to increase compliance with our regulations.

The licensing process of hydropower projects (and the re-licensing of existing projects) is an expensive and multi-year process. Most of the cost and time involved in this process can be traced to the requirements of the federal hydropower licensing law. An examination of related laws and specifically the roles and responsibilities of resource agencies could help streamline the licensing process and provide more certainty for those seeking to develop this abundant renewable resource.

Testimony of Commissioner Philip D. Moeller
Before the U.S. House of Representatives
Committee on Energy and Commerce,
Subcommittee on Oversight and Investigations

July 7, 2011

Chairman Stearns, Ranking Member DeGette, and members of the Subcommittee, thank you for the invitation to testify before you on the subject of streamlining regulation in an effort to increase the effectiveness of the federal government. This is a vital issue for the Congress to consider and I welcome yoor oversight of our agency and our efforts. Throughout my career in botb the public sector and the private sector, my personal philosophy has always been to work toward increasing the effectiveness of regulation and legislation, with an emphasis on defining specific problems that need fixing and working toward specific solutions to those problems. I am a strong believer in effective oversight that periodically reviews government action to make surc that the solutions that are proposed and enacted through legislation or regulations were and continue to be effective, necessary and not counterproductive.

With enactment of the Federal Power Act and the Natural Gas Act in 1935 and 1938, respectively, the Federal Power Commission was required to regulate both the sales of electricity at wholesale and the transportation of natural gas along interstate pipelines, products that were often sold by monopolies. Given the monopoly power of numerous utilities, the Commission engaged in a comprehensive regulation of the costs and revenoes of jurisdictional transactions. Of the many achievements of the Commission, we developed the Uniform System of Accounts, a comprehensive manner of ensuring consistency in the books and records of regulated utilities. Yet with technological improvements in the means of generating electric power and transporting natural gas, the

Commission recognized that competition among utilities could result in prices that were lower for consumers than traditional cost-based regulation.

In light of the emerging prospects for competition, the Commission began a series of initiatives, including several groundbreaking orders, which opened up wholesale markets to certain forms of competition. Thus, despite issuing more regulations comprising of more words on paper, this Commission was actually allowing the public more freedom to engage in transactions that would result in better outcomes than under traditional regulation.

Throughout the 1980s and 1990s, the Commission issued landmark rulings (*i.e.*, Order Nos. 436 and 636) which restructured natural gas pipeline services by unbundling sales of the commodity from transportation services, thereby transforming pipelines into solely transportation providers. Meanwhile, in the electric industry, the issuance of Order No. 2000 established the creation of regional markets administered by Regional Transmission Organizations and Independent System Operators, and Order No. 888 initiated changes to promote open-access transmission service that has allowed competitive forces to discipline the wholesale electric markets. Our responsibilities to monitor these markets have vastly increased after these regulations took effect.

Our economic regulation of the wholesale electric markets consumes most of the agency's time and resources, but that does not diminish our other regulatory duties: safety and environmental regulation of non-federal hydropower dams, limited safety and economic regulation of natural gas pipelines and onshore liquefied natural gas terminals, and economic regulation of interstate oil pipelines.

In my testimony today I highlight three areas where the Commission has specific regulatory challenges. In these three areas we have a difficult role in balancing the need to assure that the services provided are done safely and at just and reasonable rates --- while not imposing undue burdens on the entities we regulate. We have made a lot of progress but admittedly still have a lot of work to do on each of them.

In 2005, Congress enacted the Energy Policy Act. This wide-ranging legislation gave the Commission significant new responsibilities including a new regulatory directive to increase the reliability of the Bulk Electric System through the creation of mandatory and enforceable reliability standards and certifying a new Electric Reliability Organization (now known as the North American Electric Reliability Corporation or NERC.) Congress also tasked us with another major regulatory responsibility by enhancing our enforcement powers by requiring additional market oversight and giving us the ability to fine entities up to $1 million per day per violation for violations of our rules. Our regulatory responsibility for Bulk Electric System reliability provides an appropriate example of the tradeoffs involved in our role as regulators. The Commission has spent considerable time and effort since 2005 implementing this regulatory responsibility.

It has truly been a paradigm shift for an entire industry to go from a set of voluntary standards to mandatory and enforceable standards with significant potential of financial penalties as noted above. This has been a difficult transition for everyone involved, as we to date have adopted 101 national and 11 regional reliability standards that apply to the owners and operators of our Bulk Electric System. More than 7,000 possible violations both large and small have been reported since the first group of

standards approved by the Commission became mandatory on June 18, 2007. These violations are first reviewed by one of eight Regional Entities, are then reviewed by NERC, and then by the entire Commission. All of these violations are relevant to our efforts to prevent small or widespread outages in the Bulk Electric System. However, the entire system (consisting of the regional entities, NERC and FERC) currently has more than 3200 possible violations that are pending dismissal or filing with the Commission.

While some of these possible violations represent new cases, there is a significant backlog in processing these violations before NERC files them with the Commission. We have endeavored to create a more streamlined system of reviewing violations and at our direction NERC is working to develop a more efficient way to address minor violations and to develop a "lessons learned/best practices" informational resource for regulated entities. But clearly we have a lot of work ahead of us to reduce the backlog at the Regional Entities and at NERC in order to improve the effectiveness of this area of regulation.

Regarding our relatively new authority related to enforcement, I have made it a personal priority to increase the effectiveness and transparency of our Office of Enforcement. When the federal government wields the power of its sword, it should be firm and fair. In the first years of this new authority, many regulated entities contended that we lacked transparency in both our enforcement priorities and the results, with wide-ranging penalties that at times did not seem proportional to the violations that occurred. I wish to highlight that the Commission, through our Office of Enforcement, has established new measures to provide our regulated industry with a better understanding of our enforcement processes. Ultimately, our intent is not to assess penalties, but instead,

to increase compliance with our regulations. Maintaining a transparent enforcement process will provide jurisdictional utilities with a greater level of certainty that their actions will be evaluated fairly and objectively by us, their regulators.

Among the new measures that have been established since last year, the Commission is now announcing its annual enforcement priorities; we have enacted objective penalty guidelines based on the U.S. Sentencing Guidelines model; and we have formalized a process to disclose exculpatory material during the course of an investigation, similar to the due process afforded by some other Federal agencies. Moreover, to provide transparency to our investigative process, the Commission has begun issuing public notices that announce the initiation of an enforcement investigation. While the specific details of the matter remain confidential, we now make public basic facts surrounding the investigation. This information will help to inform the regulated community about the views of the Office of Enforcement and will likely contribute to a better understanding of the Commission's compliance obligations.

As someone who hails from the Pacific Northwest, I have always had a keen interest in promoting cost-effective and environmentally-friendly hydropower resources. It is a fact that the licensing process of hydropower projects (and the re-licensing of existing projects) is an expensive and multi-year process. However, most of the cost and time involved in this process can be traced to the requirements of the federal hydropower licensing law. This existing law emphasizes both extensive environmental reviews of a project's impacts and a role for federal and state resource agencies. There are no consequences to these agencies if they miss deadlines that are part of the Commission's licensing process or of the laws and regulations they must comply with before the

Commission can issue a license, such as the Endangered Species Act and the Clean Water Act. For those members interested in promoting hydropower development, an examination of this and related laws and specifically the roles and responsibilities of resource agencies could help streamline the licensing process and allow greater certainty for those seeking to develop this abundant renewable resource.

In the meantime, the Commission has worked to promote the development of both smaller hydropower resources and the newer hydrokinetic technologies that include harnessing in-stream power, tidal power, and ocean power. Specifically, the Commission has developed a pilot license process for hydrokinetic resources and focused on removing barriers to developing smaller hydropower resources by creating a small hydro initiative. This initiative includes adding new web-based resources to make it easier for applicants to understand and complete the licensing process, updating or creating Memoranda of Understanding (MOUs) with other agencies to improve coordination, and a new education and outreach program for developers and interested stakeholders.

Thank you again for the opportunity to testify before you today. I look forward to working with you in the future and to answering any questions.

Mr. STEARNS. I thank the gentleman.
Chairman Leibowitz, welcome.

TESTIMONY OF JON LEIBOWITZ AND WILLIAM E. KOVACIC

Mr. LEIBOWITZ. Thank you, Chairman Stearns, Ranking Member DeGette, Mr. Barton, Dr. Burgess, Mr. Terry, members of the subcommittee. Let me thank you for the opportunity to appear here today with my friend and my colleague, Bill Kovacic, to discuss the FTC's longstanding regulatory review program. It has been and it is a bipartisan priority for us as well as our plans for ensuring that this program continues to protect American consumers while minimizing burdens on American businesses.

Today, the FTC is announcing additional measures to strengthen our regulatory review process including an expedited schedule for reviewing rules and guides to meet the demands of the marketplace, a new streamlined form for pre-merger filings, a new page on our Web site to provide greater transparency and public participation in reviews and a sort of review of the reviews, that is, we are asking stakeholders how we can make our review process even better. In that same spirit, we are also seeking to identify acts of Congress that appear to be of little value but that impose burdens on businesses, particularly small businesses and the commission.

So let me give you a brief overview of the FTC before Commissioner Kovacic describes the history and nature of FTC regulatory reviews. After he is finished, I will tell you a little more about what the commission is doing today to enhance and improve our approach to regulations.

Simply put, we are building on our longstanding regulatory housecleaning efforts over the years under which we have eliminated outdated rules from the Mad Men era including those addressing extension ladders, fiberglass curtains and frosted cocktail glasses. That is true.

As you know, the Federal Trade Commission is the only federal agency with both consumer protection and competition jurisdiction in broad sectors of the economy, and our work touches the lives of virtually every American. We are primarily a law enforcement agency but we perform our mission using other tools as well including rulemakings from time to time, either when Congress asks us or when additional clarity is needed in the marketplace. Most of our rules, by the way, are a result of directives from Congress because you have recognized that they would be valuable to consumers and businesses alike by protecting all of us from unfair and deceptive acts or practices and by leveling the playing field so that legitimate businesses aren't at a competitive disadvantage from the bottom feeders who don't always play fair, and with that, I would like to turn it over to Commissioner Kovacic.

Mr. STEARNS. Mr. Kovacic, go ahead. Just for members' information, the two gentlemen from the Federal Trade Commission are going to split their 10 minutes so they will be going back and forth, as I understand. Welcome.

Mr. KOVACIC. Thank you, Mr. Chairman, Madam Ranking Member and your colleagues for the opportunity to speak here today. Although the Executive order that we have been focusing on doesn't bind independent agencies, the FTC does endorse its goals, and in

particular, we endorse the intuition that changing market conditions dictate ongoing efforts to determine whether existing rules have become outdated, unduly burdensome or simply ineffective.

To ensure that our work meets this objective, since 1992 we have had a voluntary program to review our rules and guides. We examine each regulation and rule in a 10-year cycle. Each year we publish a schedule of review and we begin the examination of each rule or guide by publishing a Federal Register notice, and this notice seeks comment on the continuing need for the regulation or the guide and an examination of its costs and benefits to consumers and businesses. We also ask whether consequent economic developments call for changes in the rule or its outright abolition. We also consider whether the measure conflicts with other intervening State, local or national legal commends.

We use these comments and we use the results of workshops that we conduct from time to time to decide whether there is a continuing need for the regulatory command or guideline and how needless burdens could be avoided, and if adjustments are warranted, we start proceedings to modify or appeal the rule or guide. As John mentioned, through this process, we have repealed 37 rules and guides. We haven't repealed one outright since 2004. I think we did look at the most serious cases first but we have undertaken modifications with respect to others since that time. We now have 12 reviews in place. In one proceeding, we are considering amendments to the labeling requirements for the alternative fuels and alternative-fueled vehicles, and here we are assessing how to eliminate the need for firms to apply redundant labels that are mandated by different agencies. In another instance, we have accelerated the review of our Hart-Scott-Rodino mechanism for mandating the notification and reporting of mergers, and we intend to initiate reviews of 11 more rules or guides by the year's end.

Comments provided in this process I think overwhelmingly show business support for not only the mechanism we have used but for the rules and guides themselves, and our guidelines in particular stand out as means to reduce business burdens by clarifying what we regard to be the line that separates appropriate from inappropriate behavior, and in doing so, we think we have significantly reduced the cost of complying with what you know to be the exceedingly broad general mandates that appear in our statutes.

My colleague will now explain recent measures that we have taken to enhance this review process, and I look forward to your questions and comments later. Thank you.

Mr. LEIBOWITZ. As Commissioner Kovacic has explained, we have long had a program for reviewing our guides and our regulations. You noted, Chairman Stearns, in your opening statement the importance of taking costs and benefits into account and we do do that. It is critically important to us. All of our work including the guides is done publicly with input from stakeholders.

But earlier this year, we began examining what more we could do to improve these rules and really relieve undue burdens on industry, so as part of this effort and very much in the spirit of the President's Executive order, here is what we are doing. First, as Commissioner Kovacic noted, we are undertaking a review of 23 rules and guides. That is more than a third of all the rules we ad-

minister, rules and guides we administer. As announced in our Federal Register notice today, six of the rules under review have been accelerated to take into account for rapid changes in the marketplace. Congresswoman DeGette, you mentioned the Do Not Call Rule, and we recently strengthened the Do Not Call Rule, the Telemarketing Sales Rule, which Do Not Call is part of. It has 200 million, actually now more than 200 million registered phone numbers, and Dave Barry has called it the most effective government program since the Elvis stamp.

Second, our Federal Register notice asked for the public to comment on the FTC's 20-year program of reviewing its rules. Businesses have generally been, as Commissioner Kovacic noted, supportive of our regulatory reviews but we nevertheless asked a number of questions. For example, how often should the commission review rules and guides, how can we modify programs to make them even more responsive to the needs of consumers of businesses.

Third, the FTC's new regulatory reform Web site just went live today because not everyone reads the Federal Register, although I know many of you do. It serves to provide—and many of us do. It serves to provide greater transparency for members of the public to understand our regulatory review efforts. It allows them to more easily comment on our ongoing rule reviews as well as on the FTC's process to review its rules. It also contains links to the 37 rules the commission has eliminated over the years as well as easy links to other resources like the new 10-year review schedule and the streamlined HSR, Hart-Scott-Rodino, pre-merger form.

Fourth, commission staff are seeking to identify statutes that might impose undue burdens on businesses or on the commission. Although a law's goals may be laudable, some statutes passed by Congress, as we know, can detract from other beneficial work, and I think Commissioner Moeller sort of alluded to this with respect to licensing issues. So one example is the FACT Act, which was passed in 2003, Fair and Accurate Credit Transactions Act, and it came out of the Financial Services Committee, and it required the FTC to conduct 30 separate rulemakings, studies and reports, 30. Some of those obligations of course make sense, but at one point around 2005, and this was shortly after I came to the commission, about a third to half of our financial practices staff, and these are the folks who go after mortgage fraud, were actually spending time writing reports because they were obligated, and we do what Congress tells us to do. Now, we have been writing reports since 1914, we are very good at it, but in fact our staff should have been spending more time going after the bad guys who were preying on American homeowners. So consistent with the goal of reducing unnecessary burdens, commission staff is now working to identify reports required by statute, and I think statutes themselves that divert businesses or commission resources from more pressing work, and the staff has identified sort nf two such reports at least preliminarily. So year after year, the mandated ethanol industry report has shown that there is almost no concentration in the ethanol fuel market. The report doesn't appear to provide significant value to the public but it does impose burdens on small businesses because they have to respond to inquiries from the FTC, and so our staff

is proposing that the report be eliminated or at the very least that the frequency be reduced to every 3 years.

Additionally, while the FTC, the DOJ, the Department of Education are very involved in fighting scholarship scams, and for the FTC's part, we compile complaints, the annual report about scholarship scams, the annual report that the three agencies must jointly produce each year on the topic which is required by statute, doesn't appear to FTC staff to advance any real or significant goals.

So Mr. Chairman, through these four initiatives, we are working to improve the FTC's review program. We will do our best going forward and working with this committee to ensure that all of our regulations protect American consumers while minimizing burdens on businesses. Thank you. Of course, we are happy to answer questions.

[The prepared statement of Mr. Leibowitz and Mr. Kovacic follows:]

PREPARED STATEMENT OF
THE FEDERAL TRADE COMMISSION

on

The FTC's Regulatory Reform Program:

Twenty Years of Systematic Retrospective Rule Reviews
&
New Prospective Initiatives to Increase Public Participation and Reduce Burdens on Business

Before the

House Committee on Energy and Commerce
Subcommittee on Oversight and Investigations

Washington, D.C.
July 7, 2011

I. Introduction

Chairman Stearns, Ranking Member DeGette, and Members of the Subcommittee, we are Chairman Jon Leibowitz and Commissioner William Kovacic of the Federal Trade Commission ("FTC" or "Commission").[1] As the only federal agency with both consumer protection and competition jurisdiction in broad sectors of the economy, the FTC's work touches the economic life of every American. We appreciate the opportunity to appear before you today to testify about the FTC's ongoing and comprehensive regulatory review program. Since 1992, we systematically and rigorously have reviewed our rules to ensure that they enhance consumer welfare without imposing undue burdens on business. Going forward, the FTC will continue an aggressive schedule of regulatory reviews and is seeking public comment to improve our regulatory review program.

Through Executive Order 13563, the President recently directed all Executive Branch agencies to engage in a regulatory review process. While the FTC, as an independent agency, is not bound by this Order, it fully supports the Order's goals. In a rapidly changing marketplace, effective regulations and industry guidance can become outdated, ineffectual, and unduly burdensome. To ensure that the Commission's regulations and compliance advice remain cost-effective, the FTC has engaged in a systematic review program for the last two decades, scheduling all rules and industry guides for review on a ten-year cycle. Pursuant to that

[1] This written statement represents the views of the Commission. Our oral presentations and responses to questions are our own and do not necessarily reflect the views of the Commission or any other Commissioner.

program, the Commission has rescinded 37 rules and guides and updated dozens of others since the early 1990s.[2]

After 20 years, the Commission is taking a fresh look at our regulatory review program. The FTC currently is seeking public comments on ways it can improve its regulatory review process to better serve consumers and businesses. In addition, the FTC just announced an updated schedule of rule and guide reviews for the next decade, which included accelerating two rule reviews. To enhance these efforts, the Commission is launching a new web page on FTC.gov dedicated to our regulatory review program to increase transparency, foster public participation, and make it easier for the public to comment on ongoing reviews.[3]

The Commission currently has a robust regulatory review docket, with 13 rules and guides under review and 10 additional reviews scheduled to start this year. In other words, more than a third of the Commission's 66 rules and guides will be under review, or will have just been reviewed, by the end of 2011.[4]

As part of its commitment to regulatory review, the Commission does not wait ten years to review a rule or guide if there is reason to believe that changes may be appropriate. The

---

[2] The Commission has rescinded 24 guides and 13 trade rules that had been promulgated under the FTC's general authority. The Commission began using a ten-year calendar in 1992, but rescinded two rules using a similar process in 1990. Although it has been many years since a rule has been fully rescinded using this review process (the Commission rescinded its Smokeless Tobacco Rule, 16 C.F.R. Part 307, pursuant to statute in 2010), the Commission has made significant updates and improvements to its rules and guides in recent years.

[3] Federal Trade Commission, Regulatory Review, http://www.ftc.gov/regreview.

[4] An additional nine rules that had previously been scheduled for review are being transferred to the Consumer Financial Protection Bureau ("CFPB") pursuant to the Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. 111-203, Sec. 1061(b)(5), 124 Stat. 2004 (July 21, 2010) ("Dodd-Frank Act").

Commission has recently accelerated the scheduled review of six rules and guides that require attention. For example, the Commission just completed review of its Hart-Scott-Rodino Transmittal Rule and promulgated a revised rule that reduces the filing burden on companies seeking to merge and streamlines the premerger notification form from 15 to 10 pages. Another example of the Commission's proactive approach to regulatory review is its accelerated review of its Alternative Fuels and Alternative Fueled Vehicles Rule, where it is working with a sister agency to harmonize our rules and ensure that automobile manufacturers need not apply redundant labels.

II. FTC Rules and Guides Protect Consumers and Level the Playing Field for Businesses

The Commission works to protect consumers from deceptive and unfair commercial practices, and to ensure a vibrant and competitive marketplace. The FTC performs these dual missions through a variety of tools, including law enforcement, research, studies of marketplace trends and legal developments, consumer and business education, as well as rules and guides.

Congress often delegates rulemaking authority to the Commission to use its expertise to implement statutes, and most of the FTC's rules have been promulgated pursuant to such specific delegations. The Commission's regulations and guides serve an important public interest, protecting consumers from deceptive and unfair business practices, and creating a level playing field for legitimate businesses.

The agency administers and enforces 15 "trade regulation rules" authorized by the FTC Act and 35 rules authorized by other statutes.[5] Further, the Commission currently publishes 16

[5] This excludes nine statutory rules that are being transferred to the CFPB pursuant to the Dodd-Frank Act. The FTC has not issued an entirely new trade regulation under its FTC Act Section 5 authority (using Magnuson-Moss procedures) since 1984.

industry guides. These guides set forth the Commission's interpretation of the prohibition on deceptive practices in Section 5 of the FTC Act.[2] In this way, they help clarify the line between deceptive and legitimate conduct, thereby giving marketers greater certainty when seeking to avoid running afoul of the law. The Commission understands the importance of avoiding undue burden on business, and seeks to promulgate rules and guides that improve the ability of legitimate businesses to compete in a marketplace free from deceptive and unfair practices.

To provide just two examples, the Children's Online Privacy Protection Rule ("COPPA Rule"),[3] which was promulgated pursuant to the Children's Online Privacy Protection Act of 1998, helps protect the privacy of children online. It requires operators of websites and online services directed to children under the age of 13, as well as operators of general audience sites and services having knowledge that they collect information from children, to provide notice to parents and obtain their consent before collecting, using, or disclosing children's personal information. In the past ten years, the Commission has brought 16 law enforcement actions alleging COPPA rule violations and has collected more than $6.2 million in civil penalties. The comments submitted during the Commission's ongoing regulatory review of the COPPA rule[4]

---

[2] 15 U.S.C. § 45(a).

[3] 16 C.F.R. Part 312.

[4] Although the Commission generally reviews its rules approximately every ten years, the agency accelerated its COPPA review by five years (from 2015 to 2010) due to the rapid pace of technological developments, including a dramatic increase in children's use of mobile devices and changes in the way they use and access the internet.

indicate widespread agreement, including among industry members, that the regulation is an important part of an effective government program to address children's online privacy."

Similarly, the Telemarketing Sales Rule ("TSR")[10] has been widely hailed both for its effective anti-fraud provisions and the important privacy protections provided by the Do Not Call provisions. Our 1999 regulatory review of the TSR revealed a broad consensus among consumers that the original Rule's provisions designed to decrease intrusive and unwanted telemarketing calls were ineffective in reducing those calls.[11] As a result, the Commission adopted a revised and strengthened TSR in January 2003 by establishing the National Do Not Call Registry. The amended Rule is widely-recognized as an important bulwark against fraud and an important privacy protection, empowering consumers, not telemarketers or government, to decide whether they want to receive telemarketing calls. Over 208 million numbers are on the Registry.

III. The Commission's Regulatory Review Program

This section discusses the FTC's program for scheduling periodic reviews of its rules and guides, the method the Commission uses to review rules and guides, and steps it is taking to improve this process.

---

[9] *See* Prepared Statement of the Federal Trade Commission on Consumer Privacy and Protection in the Mobile Marketplace Before the Committee on Commerce, Science, and Transportation, 112th Cong. (May 19, 2011), *available at* http://www.ftc.gov/os/testimony/110429mobilemarketplace.pdf.

[10] 16 C.F.R. Part 310.

[11] Under the earlier rule, consumers had to ask each business that made a telemarketing call not to call again, and those businesses then had to put that consumer's telephone number on an internal do not call list.

A. Scheduling Regulatory Reviews

The Commission currently schedules its rules and guides for review on a ten-year cycle; *i.e.*, all rules and guides are scheduled to be reviewed ten years after implementation and ten years after completion of a regulatory review. The Commission publishes this schedule annually, with adjustments in response to public input, changes in the marketplace, and resource demands. As a result of this process, the Commission accelerated four reviews in recent years and just announced that it would accelerate the review of two others.

Because of recent increases in the use of environmental marketing claims, in 2007, the Commission accelerated its review of its Guides for the Use of Environmental Marketing Claims, also known as the Green Guides.[12] The Commission accelerated in 2010 its review of the Children's Online Privacy Protection Rule[13] to address rapid changes in technology and children's use of online media. The Commission accelerated from 2014 to 2010 possible amendments to the Labeling Requirements for Alternative Fuels and Alternative Fueled Vehicles[14] that would harmonize FTC rules with EPA rules and eliminate the need for automobile manufacturers to apply redundant labels from different agencies. The Commission also just completed review of the Hart-Scott-Rodino Antitrust Improvements Act ("HSR") Transmittal Rule to streamline the premerger notification form,[15] and is accelerating its review of

[14] 16 C.F.R. Part 309.

[15] 16 C.F.R. Part 803.

the HSR Coverage Rule[16] from 2013 to 2011, to more rapidly alleviate any unnecessary burden on merger filers. Finally, the Commission is accelerating review of the Appliance Labeling Rule,[17] previously scheduled for 2018, to 2012 to address rapid changes in appliance technology and help ensure that consumers have the information about the energy efficiency and operating costs of appliances and electronic devices in the marketplace.

B. Current Regulatory Reviews

As part of its ongoing regulatory review program, the Commission has pending reviews relating to 13 of its rules and guides.[18] Of the 13 additional rules and guides originally scheduled to be reviewed in 2011, the Commission is postponing review of four of them due to resource constraints resulting from the acceleration of the reviews noted above, and because staff has determined that there is no pressing need for review this year.[19] As noted above, the

[18] Guides for Private Vocational and Distance Education Schools, 16 C.F.R. Part 254; Guide Concerning Fuel Economy Advertising for New Automobiles, 16 C.F.R. Part 259; Guides for the Use of Environmental Marketing Claims, 16 C.F.R. Part 260; Automotive Fuel Ratings, Certification and Posting Rule, 16 C.F.R. Part 306; Trade Regulation Rule Pursuant to the Telephone Disclosure and Dispute Resolution Act of 1992 [Pay Per Call Rule], 16 C.F.R. Part 308; Labeling Requirements for Alternative Fuels and Alternative Fueled Vehicles Rule, 16 C.F.R. Part 309; Children's Online Privacy Protection Rule, 16 C.F.R. Part 312; Care Labeling of Textile Wearing Apparel and Certain Piece Goods as Amended Rule, 16 C.F.R. Part 423; Use of Prenotification Negative Option Plans Rule, 16 C.F.R. Part 425; Rule Concerning the Cooling-Off Period for Sales Made at Homes or at Certain Other Locations, 16 C.F.R. Part 429; Mail or Telephone Order Merchandise Rule, 16 C.F.R. Part 435; Disclosure Requirements and Prohibitions Concerning Business Opportunities Rule, 16 C.F.R. Part 437; and Used Motor Vehicle Trade Regulation Rule, 16 C.F.R. Part 455.

[19] Administrative Interpretations, General Policy Statements, and Enforcement Policy Statements, 16 C.F.R. Part 14; Guides for the Jewelry, Precious Metals, and Pewter Industries, 16 C.F.R. Part 23 (recently amended to keep pace with developments in the platinum market); Preservation of Consumers' Claims and Defenses Rule ("Holder in Due Course Rule"), 16

Commission is accelerating one rule review to 2011.[30] Thus, the Commission intends to initiate a review of, and solicit public comments on, 10 additional rules and guides during 2011, for a total of 23 rule reviews this calendar year.[31]

C. Process for Reviewing Rules and Guides

When the Commission reviews a rule or guide, it publishes a notice in the Federal Register seeking public comment.[32] This notice asks all interested parties to comment on the continuing need for the regulation or guide as well as its costs and benefits, both to consumers and businesses. Additionally, the Commission asks whether current or impending technological or economic changes affect the need for, or require modification of, the regulation or guide and whether the regulation or guide conflicts with state, local, or other federal law. The Commission

[30] HSR Coverage Rule, 16 C.F.R. Part 801.

[31] Guides for the Advertising of Warranties and Guaranties, 16 C.F.R. Part 239; Rules and Regulations under the Wool Products Labeling Act of 1939, 16 C.F.R. Part 300; Rules and Regulations under Fur Products Labeling Act, 16 C.F.R. Part 301; Rules and Regulations under the Textile Fiber Products Identification Act, 16 C.F.R. Part 303; Retail Food Store Advertising and Marketing Practices Rule, 16 C.F.R. Part 424; Interpretations of Magnuson-Moss Warranty Act, 16 C.F.R. Part 700; Disclosure of Written Consumer Product Warranty Terms and Conditions, 16 C.F.R. Part 701; Pre-Sale Availability of Written Warranty Terms, 16 C.F.R. 702; Informal Dispute Settlement Procedures, 16 C.F.R. Part 703; and HSR Coverage Rule, 16 C.F.R. Part 801.

[32] Rules and guides serve very different purposes; review of each is important for different reasons. The Commission periodically reviews rules to ensure they remain relevant in a changing marketplace and continue to serve their intended purpose without unduly burdening commerce. Guides, on the other hand, help clarify the line between deceptive and non-deceptive marketing in a particular context. As such, they help companies avoid incurring the risks and cost of determining how their claims may be interpreted. Because the meaning of advertising terms is established by what reasonable consumers understand in the real world, and not what the Commission believes they should mean, it is important to periodically update the Commission's guides to ensure they reflect evolving consumer understanding.

also asks specific questions about how the rule or guide can be improved and for data, studies, or other evidence to support the commenter's recommendation.[23] Typically, the Commission receives substantive comments from businesses, trade associations, consumer and other public interest groups, state law enforcement, individual consumers, and other interested stakeholders. It also often holds workshops at which interested parties can express their views to the Commission staff and respond to the views of others.

Using this feedback, the Commission determines whether there is continuing need for the rule or guide, and, if so, whether it still serves its intended purpose without unduly burdening commerce. After analyzing the comments, the Commission either initiates a proceeding to modify or repeal the regulation or guide in question, or determines no changes are warranted.[24]

If the Commission determines that a rule should be modified, it issues either an Advance Notice of Proposed Rulemaking or a Notice of Proposed Rulemaking, in which it summarizes the public comments, sets forth the proposed modifications, explains the costs and benefits of the proposed modifications and why they are justified, and seeks additional public comment.[25] At

Reg. 13550 (Mar. 14, 2011); Review of Trade Regulation Rule on Care Labeling of Textile Wearing Apparel and Certain Piece Goods as Amended, *available at* http://www.ftc.gov/os/fedreg/2011/03/110314carelabelingfrn.pdf.

[24] As noted above, in the last two decades, the Commission has rescinded 37 rules and guides whose costs exceeded their benefits.

[25] The procedures the Commission follows when amending a rule depend on whether the regulation in question is a trade regulation rule. After the Commission gets to the stage of a Notice of Proposed Rulemaking, it will either follow the relatively streamlined notice-and-comment processes under the Administrative Procedure Act, 5 U.S.C. § 553, available for Commission rulemakings with respect to unfair methods of competition, 15 U.S.C. § 46(g), or when Congress directs the Commission to promulgate rules for a particular statute pursuant to APA notice-and-comment procedures, or it will take further steps to comply with the provisions for trade regulation rulemaking under Section 18 of the FTC Act, 15 U.S.C. § 57a.

the same time, it also publishes a burden estimate under the Paperwork Reduction Act and seeks comment on that estimate. The Commission actively looks for means to reduce burden while preserving the effectiveness of a rule. For example, as part of its ongoing review of the Business Opportunity Rule,[25] the Commission approved issuance of a Staff Report recommending changes designed to significantly decrease the disclosure burdens on covered sellers of business opportunities, reducing the categories of information they must provide from 23 to five.[27]

D. Improvements to Regulatory Review Process

As part of the Commission's commitment to robust and effective regulatory review, it recently asked for public comment on how the FTC can improve its regulatory review program to better serve consumers and businesses.[28] The Commission asked ten distinct questions, including questions about how often it should review rules and guides; how it can modify its regulatory review program to make it more responsive to the needs of consumers and businesses; how it should identify those rules and guides that can, and should, be modified, streamlined, expanded, or repealed; whether it should consider other federal or state models for regulatory review; and whether there are specific rules or guides that are ripe for review. By working to improve this long-standing, successful program, the Commission will ensure that all of its

[28] Regulatory Review Schedule, Notice of Intent to Request Public Comments, and Request for Information and Comment, *available at* http://www.ftc.gov/os/fedreg/2011/01/110107regreview.pdf; *see also* Federal Trade Commission, Regulatory Review, http://www.ftc.gov/ftc/regreview.shtm.

regulations continue to protect American consumers while minimizing the burden on businesses that provide the products and services consumers want.

The FTC has also created a new web page on FTC.gov to help consumers, businesses, lawmakers, and other interested parties learn more about the FTC's regulatory review program and allow interested parties to comment on ongoing reviews and on the review process itself.[2] On the FTC Regulatory Review page, the public can find the ten-year schedule of regulatory reviews, links to comment on rules that are under review, a link to provide direct feedback on the FTC's regulatory review program, and a list of rules and guides that have been eliminated over the years. The web page will also provide direct and easy access to the new streamlined form for merger filings, which resulted from the FTC's recent review of the HSR rules.

Furthermore, consistent with the goal of reducing unnecessary burdens, within and outside the government, Commission staff are in the process of identifying reports required by statute as well as statutes themselves that appear to be of limited value, but that divert business or Commission resources from more pressing work. Thus far, staff preliminarily have identified two reports that do not appear to be useful. The first is a report, required annually, on concentration in the ethanol market. The Commission has found each year that the market is extremely unconcentrated, and that entry is easy and ongoing. Therefore, this report seems to provide little useful information.[3] The second report is prepared by the Commission together

---

[2] Federal Trade Commission, Regulatory Review, http://www.ftc.gov/ftc/regreview.

[3] Under the FTC and DOJ Horizontal Merger Guidelines, market concentration is calculated using the Herfindahl-Hirschman Index ("HHI"). The HHI measures concentration by summing the squares of each participant in a market. An HHI can be no higher than 10,000, which is reached when a market is a monopoly. The Merger Guidelines regard an HHI below 1500 as unconcentrated. Mergers resulting in an HHI of up to 1500 are unlikely to have anticompetitive effects and generally require no additional analysis. See U.S. Department of Justice and the

with the Department of Justice and the Department of Education, and simply describes actions taken to address scholarship scams. Though stopping scholarship scams is an important priority, the report appears to provide little valuable information. Accordingly, the Commission will make appropriate recommendations to Congress at the conclusion of this review.

IV. Conclusion

Thank you for providing the Commission an opportunity to appear before the Committee to discuss our ongoing regulatory review program and new initiatives to help maximize effectiveness for American consumers while minimizing the burden for U.S. businesses.

Federal Trade Commission, *Horizontal Merger Guidelines*, August 19, 2010, at 24-26, *available at* http://www.ftc.gov/os/2010/08/100819hmg.pdf. The HHI in the ethanol industry is less than 700, which represents a highly unconcentrated market.

Mr. STEARNS. Mr. Kovacic, do you have anything briefly you would want to add since Chairman Leibowitz had most of the time?

Mr. KOVACIC. No, I don't. Thank you.

Mr. STEARNS. All right. With that, I will start with opening questions. I think before I start, I would like to put on the record Mr. Cass Sunstein's memorandum of February 2, 2011. Without objection, so ordered.

[The information appears at the conclusion of the hearing.]

Mr. STEARNS. And I understand the ranking gentlelady has a document, "Evaluation of Consumer Product Safety Database," that she would like to put in.

Ms. DEGETTE. That is correct.

Mr. STEARNS. Without objection, so ordered.

[The information appears at the conclusion of the hearing.]

Mr. STEARNS. Chairman Leibowitz, before I start my questions, I think myself and staff are a little struck that you have voluntarily stepped up to the plate and sort of followed the spirit of this Cass Sunstein letter right there, and I think it is interesting when you look at the letter I just put in the record, he said in particular such agencies, talking about the independent agencies, are encouraged to consider undertaking retrospective analysis of the existing rules. You have stepped up to the plate to do it. Not all the independent agencies have done it. You have actually identified some areas that you think you have to do where you don't think you should be doing it, so I guess the question from Members of Congress is, what would you like us to do to help you?

Mr. LEIBOWITZ. Well, I think having oversight hearings like this is useful. It sort of shines a public light on regulations that do work because of course regulations are very important and ones that need to be modified. You know, look, we are a very bipartisan consensus-driven agency. We work together. We try to do regulatory reviews because we know they are really, really——

Mr. STEARNS. Well, you have identified some things that I think you would like some legislation to——

Mr. LEIBOWITZ. And yes, and we have identified——

Mr. STEARNS. We will follow up on that.

Mr. LEIBOWITZ. That would be terrific, Mr. Chairman.

Mr. STEARNS. Commissioner McDowell, I couldn't help but take your comments "sober and clear manner" when you talked about over 50 years regulations have gone up 800 percent. Is that true? That is 16 percent a year in the law of 72. That means every 4½ years these regulations are doubling. That is really staggering to think that that is occurring. Is that an accurate explanation of what you said, that regulations could possibly be doubling every 4½ years based upon 800 percent increase for 50 years?

Mr. MCDOWELL. That would appear to be the case, yes.

Mr. STEARNS. Let me move, based upon what—I just put a letter in from Cass Sunstein where he said these independent agencies should step up and voluntarily—that is the spirit of what he is talking about. Obviously, President Obama has indicated he wants that done, and he didn't include the independent agencies but I would like, if you would, just to answer some questions yes or no just for the limited amount of time. So Commissioners Adler and

Northup, yes or no, did the CPSC submit a regulatory review plan to OMB? Just yes or no.

Mr. ADLER. No.

Mr. STEARNS. OK.

Ms. NORTHUP. No, it didn't.

Mr. STEARNS. Yes or no, has the CPSC publicly committed to conduct a review of all existing regulations in accordance with the Executive order? Yes or no.

Mr. ADLER. As far as I am concerned, yes.

Ms. NORTHUP. No, I have not been informed that we are having any review.

Mr. STEARNS. OK. Mr. Adler, if you answer yes, as you did, why hasn't there been a notice so that Commissioner Northup would know about it if you answered yes?

Mr. ADLER. Well, first of all, with respect to submitting a formal plan to Cass Sunstein, he is actually a hero of mine as a former academic, but in order to preserve independence——

Mr. STEARNS. You said you have issued a public notice?

Mr. ADLER. What I said was, we had begun a retrospective review beginning——

Mr. STEARNS. But you haven't issued a public notice?

Mr. ADLER [continuing]. In 2004 that was temporarily suspended in 2007, and as soon as Chairman Tenenbaum gets back, I anticipate we will resume that process.

Mr. STEARNS. So you personally believe the CPSC should conduct a review?

Mr. ADLER. Oh, yes, sir.

Mr. STEARNS. OK. CPSC used to conduct regulatory reviews but has stopped in recent years. Is that a fair statement?

Mr. ADLER. They stopped in 2007 under then-Acting Chairman Nord, and I believe it was because of passage of the Consumer Product Safety Improvement Act, and just competition for resources within a very tiny agency.

Mr. STEARNS. OK. Commissioner McDowell, do you believe the reviews the FCC conducts under the Telecommunications Act take the place of the kind of look-back the President and this committee has asked for?

Mr. MCDOWELL. No.

Mr. STEARNS. You also state in your testimony that net neutrality is the first rule you would discard upon the agency review of its regulation. Is that true?

Mr. MCDOWELL. Yes.

Mr. STEARNS. I agree with you. Chairman Genachowski hails the net neutrality rulemaking proceedings as a test case for openness. However, I believe there were some bad precedents set in this proceeding. Commissioner McDowell, do you believe you were able to review the record in the net neutrality docket or were there items placed late into the docket that made it very difficult to review before the vote?

Mr. MCDOWELL. There are about 3,000 pages of documentation placed into the record in the final 2 or 3 days or 4 days.

Mr. STEARNS. And you had no opportunity to review those?

Mr. MCDOWELL. Well, there was opportunity but there wasn't enough time.

Mr. STEARNS. As a commissioner, when was the first time you saw the net neutrality order that you voted against on December 21, 2010, and was it the same rules proposed in October 2009?

Mr. MCDOWELL. There were several drafts, of course, the first in October of 2009, but we got the final draft about quarter to midnight the night before the vote.

Mr. STEARNS. I understand although the agency passed its net neutrality rules in December, the docket to reclassify broadband services under Title II remains open. I think this is surprising, as Chairman Genachowski has made efforts to close other dockets opened at the FCC. Do you believe this docket should be closed?

Mr. MCDOWELL. Yes.

Mr. STEARNS. Are you aware of any reason why this docket remains open?

Mr. MCDOWELL. Only speculation. I have no firsthand knowledge.

Mr. STEARNS. Chairman Wellinghoff, in your testimony you say you support the goals of the Executive order and have directed commission staff to conduct a review of existing regulations with the goals of the Executive order in mind. Why didn't you submit a regulatory review plan to OMB?

Mr. WELLINGHOFF. Because I believe that we weren't subject to the Executive order under OMB.

Mr. STEARNS. Notwithstanding what Cass Sunstein had sort of directly, the spirit of the law was for you to comply?

Mr. WELLINGHOFF. I believe in fact we are complying with the spirit of the law by directing the regulatory review that I have directed staff to do.

Mr. STEARNS. Have you submitted a notice for public comment on this review?

Mr. WELLINGHOFF. My general counsel has indicated that is not necessary to staff review.

Mr. STEARNS. Well, let me ask you personally. Do you believe FERC should conduct a retrospective review in the spirit of the Executive order?

Mr. WELLINGHOFF. Yes, we are doing that. I have directed my staff to do that.

Mr. STEARNS. OK. My time is expired.

Ms. DEGETTE. Thank you, Mr. Chairman.

Mr. Chairman, my recollection of what Cass Sunstein said is that the independent agencies should comply with the spirit of the law, not the specific legal requirements, and I guess I will ask you, Chairman Leibowitz, since your agency is supposed to be the paragon of virtue today, have you submitted a plan to OMB? Has your agency submitted a plan to OMB?

Mr. LEIBOWITZ. We have not submitted a plan to OMB.

Ms. DEGETTE. And that is because you are not legally required to, right?

Mr. LEIBOWITZ. And that is because we are not legally required to, although as you know——

Ms. DEGETTE. But that doesn't mean you are not doing regulatory reform, correct?

Mr. LEIBOWITZ. No, no, no. I think as everyone knows, we are doing a lot of regulatory reform.

Ms. DEGETTE. And Commissioner Adler, also your agency, although it hasn't submitted a plan to OMB, you are doing regulatory reform too?

Mr. ADLER. That is correct.

Ms. DEGETTE. Thank you.

Now, Chairman Leibowitz, something you said was very interesting to me. You talked about how a lot of the regulations that you do is a result of statutes passed by Congress directing you to do regulations, correct?

Mr. LEIBOWITZ. That is correct.

Ms. DEGETTE. And you gave several examples of that, right?

Mr. LEIBOWITZ. Yes.

Ms. DEGETTE. Now, Commissioner Northup, you talked about a lot of the regulations that the CPSC is promulgating as a result of the statute that Congress passed, correct? Like the lead standards and other regulations.

Ms. NORTHUP. That is correct.

Ms. DEGETTE. So Mr. Chairman, one thing I am concerned about, you can't really talk about regulatory reform in a vacuum without looking at the statutes that Congress has passed but ask these agencies, and so I think there are two levels here. There is the regulations themselves, which may be overly burdensome, but there is also statutes that I think we should look at, and I know, Chairman Leibowitz, you had actually come up with a list of some statutes that you think could be streamlined so that the agencies, whether they are the independent agencies or not, could also streamline their regulations, correct?

Mr. LEIBOWITZ. That is correct.

Ms. DEGETTE. Would you be willing to submit a copy of those statutes to this committee so that we could then look at those statutes within the purview of this committee and think about ways to fix them so that we can reduce the burden of regulations?

Mr. LEIBOWITZ. It sounds like very much a bipartisan effort on this subcommittee, and we would be glad to do that.

Ms. DEGETTE. OK. For the rest of the commissioners who are here, I would just ask for a yes or no answer. Would you be willing to also submit a similar list of statutes that your agency deals with that you think could be streamlined so the regulatory process could be streamlined? Commissioner Adler?

Mr. ADLER. Yes.

Ms. DEGETTE. Commissioner Northup?

Ms. NORTHUP. I have.

Ms. DEGETTE. Oh, you have? Great. I would love to get a copy of that.

Mr. McDowell?

Mr. MCDOWELL. Yes.

Ms. DEGETTE. Chairman?

Mr. WELLINGHOFF. Yes.

Ms. DEGETTE. Commissioner?

Mr. MOELLER. Yes.

Ms. DEGETTE. Chairman?

Mr. LEIBOWITZ. Yes.

Ms. DEGETTE. And Commissioner Kovacic?

Mr. KOVACIC. My list is the same as Jon's.

Ms. DEGETTE. OK. Great. This is a good effort down here at the end of this table.

And I wanted to ask you, Commissioner McDowell, because you had listed off numbers of regulations. I don't think that you think that—first of all, are all those regulations that you listed—I don't know them by heart—are they all duplicative or unnecessary regulations, the ones you listed?

Mr. MCDOWELL. Are you talking about the number of pages I cited?

Ms. DEGETTE. Well, you listed some different sections. You just threw out a whole bunch of regulations.

Mr. MCDOWELL. The sections I cited were statutory sections that gave us the power to deregulate on our own, and I also listed——

Ms. DEGETTE. No, no, but——

Mr. MCDOWELL [continuing]. The forms——

Ms. DEGETTE [continuing]. You said there—oh, the forms. Just because there is a form, doesn't mean that it is per se unnecessary, correct?

Mr. MCDOWELL. No, and I didn't imply that.

Ms. DEGETTE. So the numbers of the forms that you listed, are those particular forms unnecessary in your view?

Mr. MCDOWELL. Not all of them necessarily.

Ms. DEGETTE. OK. So you were——

Mr. MCDOWELL. That is what I said in my testimony.

Ms. DEGETTE. That was kind of a figure of speech that you were talking about a lot of forms, right?

Mr. MCDOWELL. I think that my testimony speaks for itself. It is a lot of forms.

Ms. DEGETTE. Well, here is my question to you. Have you compiled a list of regulations for your agency that you think are duplicative or overly burdensome?

Mr. MCDOWELL. Yes, ma'am, it is in my testimony.

Ms. DEGETTE. OK. That is the comprehensive list. And has everybody else——

Mr. MCDOWELL. It is not the complete list but there is——

Ms. DEGETTE. Could you get us your complete list? That would be really helpful.

Mr. MCDOWELL. Sure.

Ms. DEGETTE. You know, along with our brand-new member from Colorado, Mr. Gardner, my neighbor to the north and others, we are trying to develop bipartisan legislation, and to be honest, as you see from these folks down here, regulatory reform is not a partisan issue. I mean, nobody wants to have overly burdensome regulations, and so I guess what I would ask everybody here from all of these agencies, as well as a list of statutes that you think lead to overly burdensome regulations, if you can give us a list of regulations that you think are overly burdensome, that would be helpful too.

Commissioner Adler, would you be willing to do that?

Mr. ADLER. I am speaking only for myself, but for myself, yes.

Ms. DEGETTE. OK. Commissioner Northup, I believe you have probably already done that.

Ms. NORTHUP. I have. It is part of my testimony but I have also previously sent to the Hill a list of——

Ms. DEGETTE. If you could get that to our staff too, that would be great.

And Commissioner McDowell?

Mr. MCDOWELL. Absolutely.

Ms. DEGETTE. Mr. Chairman?

Mr. WELLINGHOFF. Yes.

Ms. DEGETTE. And Commissioner Moeller?

Mr. MOELLER. Yes.

Ms. DEGETTE. And then——

Mr. LEIBOWITZ. We certainly will, although we have eliminated a lot of regulations. We do ongoing regulatory reviews pretty rigorously.

Ms. DEGETTE. OK. Thank you very much.

Mr. STEARNS. The gentleman from Texas, Mr. Barton, is recognized for 5 minutes.

Mr. BARTON. Well, thank you. I would stipulate that all the individuals before us are paragons of virtue today because they are subject to the Energy and Commerce Committee and that recognition makes you a paragon.

I think we need to repeat, this is kind of a hearing that is unusual in that this Executive order that we are asking you folks to comment on explicitly excludes you, and as we all know in Washington, not too many commissioners and chairmen voluntarily comply with things that they don't have to. Those of us that have been around a little bit understand that.

So my first question is, what should this committee do in the absence of statutory language that would force compliance with something similar to the Executive order? Should we pass some sort of a statutory requirement that you all do similar things that the President says in his Executive order or should we let the sleeping dog lie? Let us try Chairman Wellinghoff. He doesn't come before us too often.

Mr. WELLINGHOFF. Thank you, Mr. Barton. I don't have any specific recommendation for you, sir. I think in fact, as I have indicated in my testimony, we are going to comply with the spirit of it and in fact have a staff review, and I think our agency certainly as an economic regulatory agency, each and every regulation that we institute do in fact take into account whether rates are just and reasonable and services are, and we also provide the industry with an opportunity to fully comment on those regulations and determine ultimately whether the regulations are burdensome based upon those comments and information that we gather. So I don't have any specific recommendation for you.

Mr. BARTON. Mr. Leibowitz?

Mr. LEIBOWITZ. I would say this. You know, we comply with the spirit of the Executive order. I think it is a terrific Executive order. We go beyond it because I think only four of our rules would be sort of within reg flex, and we do reg reviews of all of rules and all of our guides, but I also think it is important to preserve the independence of agencies too, and as you can see, you know, agencies provide—by having members not of the President's party, agencies as a sort of institutionalized matter provide checks and balances, and they are independent voices. And so I understand

what you are saying because I think you believe that the Executive order has a lot of good things in it, and we agree.

Mr. BARTON. The Republicans think what the President says he is doing, we are not sure he is doing it, but what he says he wants to do, we think is a good thing. And so you folks say the right words, you are comply with the spirit and you agree in general, but the truth is, you are not going to do anything unless you absolutely have to. The question is, should I get with Ms. DeGette and Mr. Stearns and put together a bipartisan bill that would make it a requirement?

Mr. LEIBOWITZ. Let me defer to Commissioner Kovacic because I know he wants to add something here.

Mr. KOVACIC. Congressman Barton, I would like to quarrel with your suggestion that we only do what the gun at the head compels us to do. I was a junior case handler at the FTC for the first time in 1979, and I think it has been in the DNA of the agency internally, partly because of our structure, partly because we have a large team of economists to do this kind of introspective work as long as I have known the agency, and I would emphasize, I think that would be very constructive would be two things. First is for us to have perhaps a more frequent conversation in settings like this with your staff about we do. In 2008, 2009, we did a comprehensive self-study of our agency. We benchmarked ourselves with 40 of our counterparts overseas. We talked extensively with our counterparts at Federal, State government, and we did a substantial publicly available assessment of how we are doing. I think it would be helpful on one front to have a more extensive continuing conversation with the committee about the measures we do take that aren't obliged, and the second is, to go back to something that several of you have mentioned——

Mr. BARTON. You are going to have to be quick, because I have got 20 seconds and I have got one more question.

Mr. KOVACIC. The other thing is to think more in the design of legislation itself about what burdens it will impose.

Mr. BARTON. I want to ask Commissioner McDowell—I can't let him sit here and not ask him some question. The pending regulation regulating the Internet under Title II is still pending at the FCC. Do you have any information for us what Chairman Genachowski intends to do with that? Is he going to withdraw it or push forward with it? What is your view on that?

Mr. MCDOWELL. Sir, just to be clear, the open proceeding to regulate the Internet under Title II, I don't have any information as to whether or not he is going to withdraw it or what the reasoning might be for keeping it open.

Mr. BARTON. Don't you think he should withdraw it?

Mr. MCDOWELL. I do.

Mr. BARTON. That is the right answer. Thank you, Mr. Chairman.

Mr. STEARNS. I thank the gentleman.

I think the next speaker on this side is Mr. Green. You are recognized for 5 minutes.

Mr. GREEN. Thank you, Mr. Chairman.

First, I want to take the opportunity to thank all our commissioners for being here. Those of us who have been on this com-

mittee a number of years welcome back our colleague from Kentucky. What you do every day is very important in ensuring the health and safety of our citizens, particularly consumer protection, but everything. FERC, obviously from Texas, FERC is very important to what we do, and the FCC and of course FTC.

Mr. Leibowitz, in your testimony you discuss the children's online privacy protection rule or regulation your agency promulgated that helps protect privacy of children online. Can you please tell us more about this rule and does it ensure that children are protected while using the Internet?

Mr. LEIBOWITZ. Well, it was a bipartisan piece of legislation passed out of this committee, but we also understand that the Internet has changed and technology has changed the way children use the Internet dramatically in the last few years, and that is why we actually moved up our regulatory review of COPPA by 5 years, and so we are working with stakeholders. We put out a sort of notice of inquiry and we will have proposed COPPA improvements, draft legislation. We always put out—I am sorry, draft rule. We put that out. We take comments again, hopefully within the next few weeks by the end of the summer.

Mr. GREEN. And I know for all the agencies, and this is just an example, there is a lot of concern about agency regulation, but so much of what you do is in response to legislation, whether it is new legislation or previous legislation or may have been amended, and this is a good example of a rule that frankly as a father, or a grandfather now, I can't possibly monitor what my grandchildren may be doing on the Internet but we do need to have protection from an entity other than just the family.

Mr. LEIBOWITZ. Right, and the whole notion of COPPA, which is that if you are 12 years old or younger, you shouldn't be able to give consent to have your personal information go to companies on the Internet, you need to have parental consent, is a really good one, and that is the bedrock of COPPA, the law you passed.

Mr. GREEN. Some of us might move that age a little higher, but I appreciate it.

Mr. LEIBOWITZ. Some of us might encourage you to do that.

Mr. GREEN. And beyond issuing standards that require safety such as that, you have done children's cribs. Consumer protection safety works on manufacturers to organize recalls and remove dangerous products from the market.

Mr. Adler, a recall authority has the potential to save lives, doesn't it?

Mr. ADLER. It certainly does, sir, and I believe we have saved many lives.

Mr. GREEN. And other agencies have tools to help consumers too. For example, the FCC has taken steps against consumer fraud and deceptive practices through its enforcement powers.

Mr. ADLER. All the time.

Mr. GREEN. Mr. Leibowitz, in your understanding, in fiscal year 2010 your agency initiated 66 court cases to protect the rights of consumers. How valuable is that enforcement action?

Mr. LEIBOWITZ. Well, we think they are critically—we are principally an enforcement agency. We do rules, mostly when you tell us to, but what we really do on both the antitrust and the con-

sumer protection side is go to court to stop unfair or deceptive acts or practices and to stop people who engage in unfair methods of competition, and we have brought a variety of cases protecting privacy, stopping mortgage scams. That is what we do.

Mr. GREEN. The lawsuits you file can have real impact on individual lives. Is that correct?

Mr. LEIBOWITZ. Yes, I mean, often getting redress if we win a case or if we settle one for injured victims, yes.

Mr. GREEN. So there is a positive byproduct of agencies issuing regulations and enforcing regulations that are based on what Congress passes and the President signs?

Mr. LEIBOWITZ. Absolutely.

Mr. GREEN. Mr. McDowell, I was pleased that the chairman of the FCC announced that the commission would comply with the President's Executive order on regulatory review. It is important that that review is as comprehensive as possible, and I am looking forward to seeing the streamlining of the FCC, which I am sure as commissioners you would love to have. Given the constant change and the growing competition in the communications market, do you agree that the FCC should be diligent in reviewing and potentially eliminating regulations that no longer protect the public interest?

Mr. MCDOWELL. Absolutely, in a comprehensive way.

Mr. GREEN. The biannual review requirement is the commissioner's major tool to accomplish this. Is this correct?

Mr. MCDOWELL. It is, but only for telecom companies, not for media companies or information service providers, etc.

Mr. GREEN. Over the past 10 years, the commission has complied with its statutory duty to prepare and submit a biannual review?

Mr. MCDOWELL. Yes, sir.

Mr. GREEN. Do you believe the biannual review requirement should be amended to include other entities?

Mr. MCDOWELL. I do.

Mr. GREEN. And would you submit your recommendations for the record?

Mr. MCDOWELL. Yes, sir, and it is my testimony but I will reiterate it too.

Mr. GREEN. OK. I appreciate it.

Mr. Chairman, I will yield back my time.

Mr. STEARNS. The gentleman yields back his time, and the gentleman from Nebraska is recognized for 5 minutes.

Mr. TERRY. Thank you, Mr. Chairman. Let me first start by thanking Jon Leibowitz. First of all, I like the little play between the two of you because it kind of signals that you work with both sides and work together, and Mr. Kovacic, the way that you have answered questions, you are telegraphing or telling us that you two actually work together, and I really appreciate that. I think that is the way America expects our agencies to work. So I want to thank you for that. And Jon, you are doing a good job. I like that you are actually——

Mr. LEIBOWITZ. Is this a setup? Because——

Mr. TERRY. No, there is no "comma but" coming here. I like that you are already attacking the issue of finding the regulations that are not very useful anymore and don't serve the purpose. So good job. That is exactly what my bill that is in a different committee

wants every agency, independent agency to do, and it is to provide the flexibility.

Commissioner Northup, we can sit here and say good job on cribs but it is amazing to me that we are sitting here talking about bicycles and ATVs and large cars and trucks that, you know, 6- and 7-year-olds play with but don't eat but yet we are regulating them.

So you have to admit, Mr. Adler, there is some absurdity to the law. Do you agree with the rules and regulations——

Mr. ADLER. I think that Congress basically got the law right, and by the way, what you are talking about is a mandate that Congress imposed, not that the commission imposed, but there are always some portions of the law that need to be reexamined, and the issue you raised with bicycles and ATVs is one of those that we are actually taking a look at.

Mr. TERRY. And in regard to the absurdity of Congress's mandate—and by the way, I list this as one of those votes that I thought if I had to take back, we should have really fought harder on this one to make it a better law.

So Anne, do you have specific requests for us of where we should change the Consumer Product Safety Improvement Act?

Ms. NORTHUP. Well, let me just said if I had been there, I wasn't, but I can imagine that I would have voted for the law. I certainly would expect I would have. When I was being confirmed by the Senate, I read the law. It seemed like such a good law. I was supportive. So many of the Senators at the confirmation hearing said we want you to use all the flexibility we gave you to rationalize this law; we believe that bicycles and ATVs and scooters—I mean, it goes way beyond those two—carving them out may be some people happy, but like you say, trucks kids play with, the axles in those trucks, if they bend, what good are they, but the problem is, when you try to—when we have tried to find flexibility, there just hasn't heen three out of five votes for that. So it is going to take a change in the law. The discouraging part is that even the commissioners can't seem to agree how sweeping a change they would support but we desperately need——

Mr. TERRY. Well, do you have flexibility on, for example, third-party testing? I think there was an incident when this bill was being developed by a toy manufacturer that manufactured in China that perhaps there was accusations that their data in-house was not correct, so if you are a large international company, mandating third-party testing when you found out your in-house testing was inaccurate, but do it on a 10-person company in Omaha, Nebraska, on tee shirts where on every size and every color doesn't make sense to me. Do you have the flexibility to——

Ms. NORTHUP. No, we don't have that flexibility.

Mr. TERRY. Is that an area that we should look at?

Ms. NORTHUP. It is an area. In fact, today there are vast new ways to enforce the law. We track things coming in from overseas, tools that we didn't have in 2008. And I would give the commission the ability, the flexibility to require third-party testing where they think there is risk and they think it will be effective to enforce it. It is one of the proposals I have made. It would make a huge difference in the cost of this because as you say, every small business

is telling us when they have to third-party test every single component individually for lead, when they have to then do random——

Mr. TERRY. Or phthalates.

Ms. NORTHUP [continuing]. When they have to do phthalates, when they have to do it to the toy standard, it is extremely expensive.

Mr. TERRY. Well, and one quick point on that. Do you guys try and obtain data, for example, when the third-party testers are telling a small company that prints motorcycles on tee shirts that asking that they test the cumulative effects of 10 tee shirts of the same color and size, do you ask, produce one piece of evidence that a child has eaten ten tee shirts?

Ms. NORTHUP. The problem here is that if there is, say, a dot of blue paint on that, they need enough blue paint to test to have a quantity of blue paint. I will tell you, I have pushed for a component part testing allowing somebody to—and I think we are going to pass this, and this is the flexibility that I think would be—is probably the most flexible regulation we have where you can take your blue paint and test it and then you can put it on every tee shirt and you don't have to tear up the tee shirt.

But when you talk about bikes, for example, that have 141 parts to them and every part, every time you change the shipment of spokes, the shipment of pedals, you have to have a new test for that, then you have to change the label so it reflects the component test that was used, it is very complicated.

Mr. STEARNS. The gentleman's time has expired, and Ms. Schakowsky, the gentlelady, is recognized for 5 minutes.

Ms. SCHAKOWSKY. Thank you.

You know, I think we all here agree that it is important for regulatory agencies to be efficient and mindful of the impact of regulations on businesses, and I think we all agree. I helped negotiate this bill. I am very proud of the legislation. But Henry Waxman introduced legislation that would deal with some of the unintended consequences. I think maybe we as a committee ought to take another look at that legislation, and I know that the commission would be willing, as I understand it. Is that not true, Mr. Adler, on behalf of Mr. Tenenbaum and Ms. Northup? I think we ought to look at that.

But let me just say, to go back to risk-based assessment, that is what we had before, and I think that what we have found is that why we regulate and that is because time and time again industry has shown that they aren't going to police themselves, and that we need to do it, and one of the issues is the industry standard for cribs, and we had a press conference with the attorney general in Illinois on June 28th when the crib standard went into effect, and I congratulate all of you on that, although I have to say, I was disappointed to see the press release that went out that, you know, we didn't give people enough time when of course you had said earlier that you wished it had gone into effect the next day so that parents could be sure when we put our kids to bed alone or grandchildren that they are going to be safe.

So let me ask you, Mr. Adler, do you consider the crib standard to be an example of a victory for the Consumer Product Safety Improvement Act?

Mr. ADLER. I think it is one of the finest things that has been done under the Consumer Product Safety Improvement Act. It is taking children who are our most vulnerable involuntary risk takers who are put in cribs that have to be the safest place in the home because they are there for long periods of time with no supervision, and it is saying that we have the most stringent safety standard in the world. I think it is really a magnificent achievement and I commend the Congress for directing us to——

Ms. SCHAKOWSKY. And in fact, in the regulation, you did give some places that might have cribs some time to comply. Is that not true?

Mr. ADLER. We did, and I am delighted to respond to the issue that Commissioner Northup and I disagree on with respect to the independent retailers. I think that we had a group that said we need more time but we had another group that said please, please, please do not give more time, we have compliant cribs and we are prepared to sell them right now.

Ms. SCHAKOWSKY. I ant to mention on the database, I have an op-ed from a gentleman in New Jersey whose daughter was injured by a crib in 2007. He called the manufacturer and asked if they had any other complaints about the crib and was told no, there weren't any, but actually found out that there were 84 reports to similar problems. Fortunately, his daughter was not hurt very bad.

So Mr. Adler, the public information database was created by the CPSIA because previously, manufacturers would not, and the CPSC could not share lifesaving information with consumers. Is that correct?

Mr. ADLER. That is correct. I think the database is one of the finest pieces of the Consumer Product Safety Improvement Act.

Ms. SCHAKOWSKY. So do you think that it actually is serving the function of making consumers more aware?

Mr. ADLER. It is, and I might just quickly point out that it is modeled after a similar database at the National Highway Traffic Safety Administration. Ours actually has more due-process rights for manufacturers than they do at NHTSA, and I think it is a very balanced piece that provides the proper attention to disclosure to protect consumers with the rights of manufacturers to make sure that the information is correct.

Ms. SCHAKOWSKY. Do you think that Congress should force the Consumer Product Safety Commission to do a full cost-benefit analysis every time it takes steps to protect children from harmful products no matter how dangerous those products are?

Mr. ADLER. I actually think Congress got it right. Congress didn't say regulate with no attention to the economic impact. Congress said that when we regulate with respect to children, that we need to follow the dictates of the Regulatory Flexibility Act, and one of the things I like about that is, it is focused on vulnerable small business. That is the group that we are supposed to make specific economic findings with respect to when we are trying to protect our most vulnerable consumers.

Ms. SCHAKOWSKY. I think I will yield back the 2 seconds I have. Thank you, Mr. Chairman.

Mr. STEARNS. I thank the gentlelady. The gentleman from Texas, Dr. Burgess, is recognized for 5 minutes.

Mr. BURGESS. Thank you, Mr. Chairman, and Commissioner Northup, it is good to see you here.

Ms. NORTHUP. Thank you.

Mr. BURGESS. It is amazing you got confirmed by the Senate, so congratulations on that. What an accomplishment.

And I apologize for being late. We had a Health Subcommittee hearing going on simultaneously. Can you give us an idea of the scope of the effect on the retail industry on this crib ban that has now gone into effect? I mean, I realize that the other commissioner said a cost-benefit analysis is not necessary but still, there has got to have been an impact.

Ms. NORTHUP. Let me just say, first of all, the regulatory flex analysis that we do is only—it is like checking a box. Sometimes it is a paragraph, sometimes it is a page. It says that small businesses are going to be affected, we are going to put some out of business, but we go right ahead and regulate. There is nothing, there is no requirement that it be cost-effective.

What happened with the crib standard was, is that we issued it and we considered at the request of manufacturers how long it would take for them to get the new qualifying cribs tested, third-party tested, and into the market. Six months was decided. We didn't really think about retailers. There was one sentence in our rule that said we think 3 to 6 months is enough for retailers too. Unfortunately, it took longer to get them developed, it took longer to get them tested, and by the time they got them to the retail stores, the retail stores, some of the orders they had placed last November arrived a week before the new standard took effect. They were not third-party tested, and so they were junk to them. How many? Well, we know that one group of retailers that did a survey had 17,000 of them. We know that we called five, not our biggest stores but five major retailers; they had 100,000 as of the 1st of June. That comes to about $32 million worth of materials that will have to be thrown away if they are not—and these are not drop-side cribs. These are not even cribs that are almost identical to the standard. They haven't been third-party tested or certified. But the new crib standard that went in in 2009 was the basis of our crib standard. And let me just say, if these are unsafe, then why we would have allowed daycare centers, the motel-hotel industry, leasers 2 years before they had to place them? It is because we did not believe they were unsafe.

Mr. BURGESS. That is a valid question.

In the winter of 2008, it was kind of a bleak time up here on the Hill, and with no thought to my personal safety, I took a trip to the CPSC and looked at the testing facility. It is remarkable in that it is very Spartan. There are certainly no——

Ms. NORTHUP. We have a new one now.

Mr. BURGESS. Oh, you do have a new one?

Ms. NORTHUP. Yes. We just moved 3 weeks ago.

Mr. BURGESS. This was an old missile base, as I recall, when I went out there, and I was struck that the folks there were working diligently and they were quite inventive and innovative, and I actually took a great deal of confidence away from that, but at the same time, I will never forget sitting in that press conference that the people on the youth motorcycle thing put together a couple of

years ago, a beautiful little blond-haired boy about 10 years old in full motocross regalia standing at the microphone and said Mr. Congressman, if you will let me ride my bike, I promise I won't eat the battery when I am finished. And you know, that is the level of absurdity to which we have sunk.

Ms. NORTHUP. This testimony today has been fascinating, hearing the agency talking about the DNA, the DNA of the CPSC is really fabulous, but that has all changed because of the Consumer Product Safety Improvement Act and the rulemaking that we have done in compliance with levels and requirements that are unrelated to risk. For years this agency was risk-based, it worked with the Voluntary Standards Committee, which is very important because products emerge, they evolve, and these voluntary standards keep up with these evolutions. Any time we didn't think they were strong enough, we had the right to intervene, and we did, as my colleague pointed out.

Mr. BURGESS. Let me just briefly, I do need to ask our friend from the Federal Trade Commission a question on the—familiar with the ACO—if you read the Federal Register, you may be aware that there was a health care law signed last year that has caused some of us some grief, and when this new accountable care organization reg came through, did you guys participate in the writing of that regulation?

Mr. LEIBOWITZ. Well, we participated. It is principally from CMS, as you know, and we participated——

Mr. BURGESS. Well, what I know is, when we had the briefing, they had one guy from CMS and two guys from the Federal Trade Commission.

Mr. LEIBOWITZ. One from the Federal Trade Commission and one from the Department of Justice because we wrote it with the Department of Justice, or maybe two from the Federal Trade Commission and one from the Department of Justice. So we did the antitrust component, and their draft guys were taking comments, we did a workshop. And can I just say one other thing? And I will turn it back over to you.

We believe that competition is critically important to health care, not regulation, and so what we are trying to do with the ACO implementation—you know, ACOs are a brave new world and very uncertain, but what we are trying to do is make sure that competition principles remain.

Mr. BURGESS. Look, you give the antitrust exemption to Major League Baseball, the National Football League, but here is the deal. The 21st century health care model, and this was started in the previous Administration with Secretary Leavitt, has been continued with Don Berwick at CMS, and now we have got an ACO rule that doesn't work in actuality. The rule is—you put something that was working in practice and rendered in invaluable in theory, and that is the problem that I see with what you have done.

Mr. LEIBOWITZ. Well, look, we have certainly—one of the reasons we put out draft guidance—and again, we have a small component of it. It is only the competition portion. One of the reasons why we put out draft guidance and why we are meeting feverishly with all stakeholders is, we want to make sure that, you know, to the extent that there is an uptake on ACOs, the notion, you pick up

vertical efficiencies by putting together, as you know, different doctor practices, lab testing facilities and a hospital, is not a bad one. We want to make sure that you don't have one dominant provider so that it soaks up all the efficiencies, and we also——

Mr. BURGESS. What about the Karen Ferguson? I mean, you give a dominant provider status to insurance companies.

Mr. STEARNS. The gentleman's time has expired.

Mr. LEIBOWITZ. We will just point out, we cannot review the insurance industry. We are exempted from that. But yes, I hear what you are saying. I don't think we are in disagreement. We are going to try and make it work better.

Mr. STEARNS. The gentlelady, Ms. Christensen, is recognized for 5 minutes.

Mr. CHRISTENSEN Thank you, Mr. Chairman, and I want to also add my thanks to all of the commissioners for being here, and as I listen to the testimony, it seems that all of the independent agencies that you represent have been undergoing some regulatory reform and even though you are not under the Executive order, that you have really gone beyond what you had been doing to keep in spirit with the Executive order, and I commend you for that.

I sat on the Small Business Committee for about 10 years, and each of you is governed by the Regulatory Flexibility Act, and so you are required to look at how the impact of your regulations on small business reviewed. I was going to ask Commissioner Northup, my classmate——

Ms. NORTHUP. Yes.

Mr. CHRISTENSEN [continuing]. About the effectiveness, but you have already kind of said that it is not effective. Is it the experience of the other commissioners that the Regulatory Flexibility Act does not do enough to protect small businesses?

Mr. ADLER. I don't agree with my colleague about that. I think that especially with respect to the impact of the Regulatory Flexibility Act on our agency, I think it has been a very good provision. I was just reviewing section 604 of the Regulatory Flexibility Act, and to me, it is a smaller but focused cost-benefit analysis and it is something I think the commission has done very conscientiously.

Mr. CHRISTENSEN Did I misinterpret what you said?

Ms. NORTHUP. No. It is often just a paragraph in a long rule, and even if we find that it will impact small businesses, it is not even—it doesn't require us to decide it is still worth going forward to make any changes to our rules. It has no impact on the rules that I—one or two maybe but very few that I can remember ever.

Mr. CHRISTENSEN Does anyone else have that experience that RFA——

Mr. MCDOWELL. I find it to be toothless, and if you look at it from an appellate perspective, the appellate courts agree, there is really nothing the courts can do to make agencies change their rules based on the RFA.

Mr. CHRISTENSEN That would be very disappointing, but it seems as though most agencies have had—most of the commissions have had good experience with the act.

Mr. KOVACIC. I think, Madam, that it has some limited effect in focusing our attention on things that are important but I think there are a number of other things we have done that have tended

to be more significant and have come from within, and we would be glad to share those with you at your pleasure.

Mr. CHRISTENSEN Thank you. And what I have been hearing is that most of the commissions have gone beyond what really has been required, and I appreciate that.

Commissioner McDowell, on June 20th, you wrote a letter to Chairman Genachowski offering several recommendations on how the FCC should be reformed. You suggested reforming it to be more transparent, efficient, accountable and fiscally responsible, and from prior testimony to date, we have learned that Chairman Genachowski has proactively implemented some of those changes to facilitate your suggested reforms. Through these reforms, the FCC has improved external communications by creating a more user-friendly Web site which includes providing live streams of all public workshops and meetings. Do you think this new Web site has enhanced public participation and access to FCC activities?

Mr. MCDOWELL. Well, the FCC's Web site right now is a bit controversial. It depends on which segment of the audience that uses it you ask.

Mr. CHRISTENSEN You don't think that it has enhanced public participation?

Mr. MCDOWELL. Certainly in general, I think, Chairman Genachowski has taken some discreet steps on an ad hoc basis but I would like to see more comprehensive reform done.

Mr. CHRISTENSEN But the FCC has also made effort to collect broader input from the public and industry, which included having more than 85 staff-led public forums and reinvigorating external advisory committees. Do you think these efforts have allowed for an increase in public participation?

Mr. MCDOWELL. Absolutely.

Mr. CHRISTENSEN In fact, you have had several workshops on the national broadband plan to discuss potential reforms to the Universal Service Fund. Do you think that those workshops have been helpful?

Mr. MCDOWELL. They have, certainly.

Mr. CHRISTENSEN OK. And although the FCC is not subject to President Obama's Executive order on regnlatory reform, the FCC initiated their own look-back process which also is included in the statute. According to a letter Chairman Genachowski sent to Chairman Upton and Chairman Walden, this effort has resulted in the agency's eliminating and/or revising 49 regulations and identifying more than 20 sets of unnecessary data collection requirements for possible elimination. Is that correct?

Mr. MCDOWELL. I don't know. I haven't seen the list of the 49 or the 20, so I am not quite sure.

Mr. CHRISTENSEN Does it sound reasonable?

Mr. MCDOWELL. And I don't know if some are mainly data collection. I think the proceeding, as I understand, under section 11 that was initiated really was focused primarily on data collection, although it has general language in there, but the thrust of it was data collection and not just a comprehensive review of all of our rules that apply to all the entities regulated by the commissioner.

Mr. CHRISTENSEN Well, our information is that 49 regulations and identifying maybe 20 sets of unnecessary data. So it seems to

me that the FCC's current leadership has been really successful in implementing new ideas on how to improve current regulations, and I look forward to hearing more from the commission and their continued focus on ensuring public participation and open exchange of ideas that improve the work of our government.

My time is up. I yield back.

Mr. STEARNS. I thank the gentlelady, and the gentleman from California, Mr. Bilbray, is recognized for 5 minutes.

Mr. BILBRAY. Thank you.

Mr. Adler, you were bringing up this issue of trying to make sure that we have the safest cribs in the world, as we say. What percentage of the cribs that are on the market in the United States have elevated platforms or are made of a hard material—wood, plastic, steel?

Mr. ADLER. I don't know the answer to that. I would be delighted to——

Mr. BILBRAY. Would it be fair to say the overwhelming majority of them have elevated platforms or are made of hard material?

Mr. ADLER. I think that makes sense.

Mr. BILBRAY. And wouldn't you agree that any elevated platform or material when you have a child, you have a potential for injury because of dropping off of an elevated platform or injury because some activity that may end up meaning impact with the hard material, so there is a risk in both of those design features?

Mr. ADLER. That is an excellent point, and the commission standard is addressed to what we consider the unreasonable risks, but I don't think we could make that a fatality-free zone under all circumstances.

Mr. BILBRAY. OK, and that is the point, is what is a reasonable level. You know, you could sit there and say that because we do not require all cribs to be on the ground, we do not require all cribs to be made of inflated material or soft material, it is not the safest it could be. It is reasonableness, and I think that is a determining factor. Wouldn't you agree?

Mr. ADLER. I would absolutely agree with that, but what we have done is make the cribs that are produced in the United States the safest within the types of fatalities that we think that——

Mr. BILBRAY. I just think that—and I appreciate that, making sure that, you know, we make these claims and these statements and elected officials or as public officials but it is reasonableness that really is the determining fact, and that is where the judgment issue has to come down.

Let us talk reasonableness, Mr. McDowell. You recently discovered that the so-called Fairness Doctrine was still on your books, almost a quarter of a century after it was abandoned. Do you think it is reasonable that a federal agency has basically misinformation, if not, some people may say the lingering lie of the Fairness Doctrine on your books? Do you think it is reasonable that almost a quarter of a century after a regulation isn't there, it still is being stated as being part of the process?

Mr. MCDOWELL. I don't think it is reasonable that the language remains on the books, if that is your question.

Mr. BILBRAY. And what are we doing to make sure that this mistake isn't throughout your regulatory guidelines so the public and

the business community can read something and find out is it the gospel or isn't it?

Mr. MCDOWELL. Exactly. If the commission has opted not to enforce the rule, the rule should disappear from the books.

Mr. BILBRAY. OK. Let us get down to the fact that the FCC has taken nearly 12 months—and I will say this. I spent decades in regulatory agencies so I understand how tough it is when you are in a regulatory agency of trying to take the theory of legislation and make it a practical application. But when you have got decisionmaking that is delayed for over 12 months, you know, and there is nothing on the books that requires you to make a decision in what is a reasonable time period, don't you think—is there anything to make you make a decision in less than 12 months?

Mr. MCDOWELL. Certainly, statutory language helps. There is nothing like the force and effect of law. But even that sometimes is not observed. For instance, the video competition report we are required to produce every year, the last time I think I voted on one was in 2007.

Mr. BILBRAY. OK. So in other words, we need to basically tighten it up but also have some enforcement on that tightening. I will just tell you, somebody that built the light rail system in San Diego, we abandoned any federal funding just so we could avoid the regulatory oversight, and we built that system under budget and on time because we didn't take federal funding, and I think that is one of the things we don't talk enough about. People want transit, they want this, they want that. Sometimes the most important component to get the public the services that you claim you care about is getting the federal regulatory agencies out of the way so you can get the job done, and that is why I would just like to state down the line.

Mr. Moeller, you were talking about hydroelectric. When you are reviewing the hydroelectric and the relicensing, are you required to consider the no-project option and the environmental damage done if you don't approve it? Things like climate change, emissions, pollution, and that kind of thing, are you required to basically take a look at this and understand that if you do not approve it, it will have an adverse impact because the alternative-energy capabilities or generation is going to cause pollution where the hydroelectric is not.

Mr. MOELLER. Well, typically, I think of the no-action alternative as truly no action as opposed to perhaps modifying or taking out a dam and then the consequence being that it would be a result of more generation that would be less environmentally friendly than hydro. But typically I think it essentially doesn't get to that. It is a long settlement process where——

Mr. BILBRAY. But you don't have a specific requirement that you have to consider offsets for shutting down a plant?

Mr. MOELLER. Not that I am aware of.

Mr. BILBRAY. Well, that is one of those things that I think we need to talk about, Mr. Chairman, more, is that, you know, when you don't improve a road improvement, you should have to offset the pollution caused by the congestion rather than always we look at all of the emissions that happen for construction. But the no-project option and the environmental and economic and social im-

pact of that need to be considered but the environmental impact is one that if individual a real hypocrisy that you want to have offsets for the emissions caused for building the project but nobody who is stopping the project has to account for the environmental pollution by not finishing the project, and I yield back, Mr. Chairman.

Mr. STEARNS. I thank the gentleman, and the gentleman from Louisiana, Mr. Scalise, is recognized for 5 minutes.

Mr. SCALISE. Thank you, Mr. Chairman. I appreciate you holding this hearing. I appreciate all of the commissioners who have come here to participate and talk about the costs of regulations, especially how it impacts people, and when you look at lot of the intent and what is usually said about regulations that come out, they all sound really good and, usually the name of a bill, you can tell how bad it is by how good the name sounds. It is usually an inverse proportion.

And so as I talk to people, our economy is still very sluggish right now, and of course, in many cases, when you talk to small business owners, when you talk to American job creators, as many of us do, the first thing they will tell you that is the biggest impediment to job creation in America are federal regulations. You know, all of the other things that get in their way, they can manage. It seems like the federal regulations have become the biggest burden to creating jobs in America today, and so when you look at some of these regulations, you definitely want to look and see what is the real impact, are they even achieving some of the results that they were intended to, and in many cases you find out they are not, and then you look at some of these agencies, and we have had a number of hearings and I appreciate the chairman having the hearings that we have had going through various agencies, even looking at the President's Executive order, and we have seen and it has been pointed out even by some of the people implementing it the shortcomings of the President's Executive order, how it doesn't really get at the cost of regulation, and I read, there was a report that was recently done by the Small Business Administration that is titled the Impact of Regulatory Costs on Small Firms, and this really looked at how it impacts our small businesses, the people that actually create the bulks of the jobs in our economy and, you know, I guess it is not surprising for those of us that have been in some of these hearings but they talk about the cost of federal regulations to small businesses is over $1.7 trillion, and how does that break down? I broke it down per family. Over $15,000 per family is the cost to small businesses of these regulations. And so when you look at the regulations and when you look at the impact and how it is not only affecting jobs, it is a major impacter that is costing us jobs but it also costs every American family over $15,000. You say where is the bang for the buck.

And I want to ask Commissioner Northup, you touched on this in your opening testimony. You talked about some of the things you have seen, and you have seen businesses go under, actually go bankrupt because of some of these regulations, and in many cases had actually no health impact, you know, bills that were sold and regulations that were sold as helping the health of children had actually nothing to do with health and it just had to do with some kind of radical policy somebody had that didn't help anybody's

health, it just made a company go bankrupt. Can you expand on some of the things you have seen in terms of how these regulations not only impact the businesses that you have talked about but also how in many cases there is not even a relationship between health and——

Ms. NORTHUP. Well, I will give you two quickly. One of them is the—in the bill that you passed, you had exclusions with the lead limit for electrical products, and we have a whole cutout for that. You had exclusion for inaccessible parts, and we have addressed that. You also had an exclusion for lead where not any lead could be absorbed. I assume you meant for some things to be included in that, perhaps screws, nuts and bolts that are holding a crib together, maybe the handlebars of a bike because lead in the handlebars, if you suck on it, unlike paint, it is trapped in that metal. You can't suck out the lead. But our agency, even though I proposed a de minimis standard where if you rub the handlebars and less than a molecule could be gotten off that, it couldn't possibly change your blood lead content, that absorbability exclusion that you wrote in the bill, I intended you meant for it to apply to something. And the rest of the commissioners decided no, and so basically they have found that even though you wrote in the non-absorbability exclusion, that it applies to nothing, that there is not one material that it applies to.

If we had nuts, screws, bolts, things that can't be swallowed, things that have small amounts in them that are in lead, trapped in—excuse me—trapped in steel, that those things would have been excluded from this law. It would have made a huge difference.

Mr. SCALISE. Let me ask, and I am running out of time. I want to ask just by a show of hands how many people have actually read this report that came out just a few months ago on the impact to small businesses of the regulations? Can I get a show of hands? Not one person on the panel read this. I think it should be required reading for all regulators. But if I can ask unanimous consent to submit this into the record?

A final question, if I can ask——

Mr. STEARNS. Before we put it in the record, the minority would like to look at it.

Mr. SCALISE. Sure. I will be happy to hand that over. It is a report that was published in September of 2010. It cites a number of sources but goes into very good detail on sector of breakdowns, also differential between large businesses and small, how they differentially fall higher even on our small businesses.

Commissioner McDowell, you gave an assessment on the things that the FCC did to take into consideration. It was looking at both net neutrality and data roaming rules. Did they look into and do proper market analysis, in your opinion, to look at the impact how that would be on our job creators?

Mr. MCDOWELL. There was no proper market analysis, no finding of market power. In fact, the order, the net neutrality order says as much, that there was no market analysis conducted.

Mr. SCALISE. See, that is the problem with a lot of these regulations that come down. They have dramatic impacts on job creators and they cost us jobs, run jobs to other countries, and yet it just seems like the regulators kind of go into their own shell and are

oblivious to the actual impact on our economy, so hopefully we can shift that course, and I appreciate the chairman for having this hearing and more like it to get our economy back on track.

Thanks. I yield back.

Mr. STEARNS. And the minority has looked at this, so by unanimous consent, this will be made part of the record, so I thank you for bringing this.

[The information appears at the conclusion of the hearing.]

Mr. STEARNS. The gentlelady from Tennessee, Ms. Blackburn, is recognized for 5 minutes.

Mrs. BLACKBURN. Thank you all for your patience in being here.

Commissioner McDowell, I want to stay with you. On that net neutrality order, no market analysis done, no look-ahead at what the cost-benefit analysis was going to be. If there had been that analysis done, do you believe the commission would have gone ahead and issued that order?

Mr. MCDOWELL. I think so. I think that whole proceeding was outcome based, outcome driven.

Mrs. BLACKBURN. Chairman Leibowitz, I want to come to you. I am concerned about the FTC's food guidelines, food marketing guidelines. I have two grandchildren. They are age 3 and age 2. And so things of this nature really I pay a lot of attention to. You know, you think about the unintended consequences that are going to come forward with this, and I think that you may see is that an unintended consequence could be seen as hampering free speech, harming our economy and not having a significant reduction in childhood obesity, and one of the things that I have found recently is that the food currently sold through the WIC program, which is designed by USDA experts to provide a healthy diet for young children, could no longer be marketed under this proposal. So you claim these proposed food marketing restrictions are voluntary but aren't these government standards going to form the basis for NGO attacks? And then also talk about what you think—I think that you could see there should be consider about shareholder actions, so if you will address that quickly, please?

Mr. LEIBOWITZ. Thank you, Congresswoman. Well, first, as you know, this was an obligated requirement. We are not the only agency. We do the marketing side. We don't do the science side. That is the agriculture department, the CDC and the FDA. But it was a Sam Brownback, Tom Harkin obligation in our appropriations bill. We are obligated to do what Congress tells us to do. It is voluntary. So in that sense, there is no enforcement mechanism. We are taking comments from stakeholders. And let me just say, and you recognize, as we all do, there is an obesity crisis and there are twice as many obese children as there were a generation ago, but speaking only for myself, you know, I try to take a sort of pragmatic approach here. If my kids eat Special K with yogurt in the morning, which actually wouldn't quite meet the nutrition guidelines, I am pretty happy, because you know what? I think that is better than what else they might eat or better than not eating anything at all. So my understanding is that within the next week—first of all, we will be getting comments and we will be reviewing those comments very seriously from stakeholders, but within the next week, my understanding is that the food marketing companies

are going to come up with some proposed standardized or uniform guidelines. If they come up with guidelines that are good, and I think they will, then we ought to take that into account going forward member of the working group, and we will.

Mrs. BLACKBURN. Let me shift gears with you. I want to go to the privacy issues that are out there, and we know that the Internet online advertising is really an economic engine in this country and the industry is beginning to voluntarily enter into some self-regulatory structures when it comes to privacy. Do you believe the FTC should impose a top-down technology mandate on the Internet governing the privacy issue?

Mr. LEIBOWITZ. It is the last thing we want to do, no.

Mrs. BLACKBURN. OK. Thank you for that. I appreciate that. I think that just as I said with Chairman McDowell, if you were to look at the net neutrality issue, if there had been a robust review of cost-benefit analysis, I think that it would have been determined that the net neutrality order, especially paragraph 84, was going to be detrimental to our economy, and I think that a heavy hand on the privacy issue would likewise.

I have got less than a minute. I want to ask each of you, just a show of hands, how many of you have read the Executive order that we are discussing and have been through the process of reviewing that? OK. So all of you have. All right. How many of you disagree with any part of that order? Is there any part of that order that you have disagreement with? Yes, sir, go ahead.

Mr. KOVACIC. I don't think—I think a number of the provisions aren't very well specified. I think it could have benefited from a much fuller discussion about how it intended specific tradeoffs that are implicit in the order were to be made. There has been subsequent guidance, subsequent commentary. It is a nice start.

Mrs. BLACKBURN. OK. Anyone else? Commissioner?

Mr. MCDOWELL. I would agree. I think it could be broader and more comprehensive and more aggressive.

Mrs. BLACKBURN. OK. Any other addition to that? Thank you all for your patience. Yield back.

Mr. STEARNS. The gentlelady's time is expired. The gentleman from Virginia, Mr. Griffith, is recognized for 5 minutes.

Mr. GRIFFITH. Thank you, Mr. Chairman.

Commissioner McDowell, it is nice for me to be able to say that in a formal setting in my new role. When I look at the FCC's merger review process under Republican and Democrat Administrations, I see a process that appears to be broken. The XM and Sirius merger took way too long. The Comcast-NBC merger took way too long. There is simply too much discretion for the commission to halt the timeline for the review of the transfer of control of licenses in an expeditious manner. Is there something we can to provide applicants with certainty regarding the timing of the FCC review process?

Mr. MCDOWELL. And Congressman Griffith, it feels good to say that as well, my first time saying that publicly, so congratulations. Yes, the FCC has an 180-day shot clock that is honored more in the breach that in the rule to get mergers done. I read yesterday also that the Assistant Attorney General for Antitrust, Christine Varney, is stepping down and there is a big merger, the AT&T and

T-Mobile merger, that needs a fair, thorough and expeditious review, and I would hope that her stepping down doesn't delay that. I think we could get that done by the end of the year in a fair, thorough manner.

But I have been in a dialog with Chairman Genachowski about making sure that we move as quickly as we can on our merger review process. I think there are a lot of problems with how the commission under both Republicans and Democrats have conducted themselves in terms of taking too long or imposing conditions that have absolutely nothing to do with the substance of the merger itself. So Congress could look at that. There could be a statutory provision certainly, but the best thing to do would be for the FCC to honor its own 180-day shot clock.

Mr. LEIBOWITZ. So Congressman, may I just add something?

Mr. GRIFFITH. Yes, please.

Mr. LEIBOWITZ. We do from time to time work with the FCC on merger reviews, and I think from our perspective, you don't deserve a particular outcome but you do deserve sort of a speedy resolution. Sometimes it takes a little longer with documents, but that is what you deserve, so I think that is a reasonable point.

Mr. MCDOWELL. And I agree.

Mr. GRIFFITH. And I think most of us would agree with that as well.

Commissioner Northup, do you think Congressman Waxman's proposed legislation will actually ease any burdens under the Consumer Product Safety Improvement Act?

Ms. NORTHUP. No, I don't think it goes nearly far enough, and in fact, he has proposed previously a functional purpose exemption which I have to say is like picking winners and losers. If you think a part—first of all, it says it can't be harmful to children and then it says if it serves a function, for example, on a bicycle and is necessary, then we can exempt it. Well, if it doesn't harm a child, why do we have to then exempt it in part by part? It means that big companies that have lots of product or big expensive products can afford to get a functional exemption because it is a very complicated petition you would have to file with us. They can afford to file the petition and all the supporting work and everything and then we can exempt them but for small needs for these same exact materials that do not harm a child, I don't think that, you know, they probably would be able to afford either the wait for us to act on it or the cost to put the petition together. So that in particular to me is, you know, not a good way to go about easing this. Making the absorbability a useful exception would make a huge difference.

Mr. GRIFFITH. Did you want to add onto that?

Mr. ADLER. Well, I wanted to disagree.

Mr. GRIFFITH. Somebody else may give you time to do that but let me—I have got one more thing I want to say and if I could take back my time because I am running out of time. I did hear from several of you as I was listening to the testimony that you all, at least a couple of you, made mention that perhaps the legislation created more of the problem than the agency created and that we should be careful when we craft legislation that that may be costing jobs as well as the regulations costing jobs that are ultimately awarded, and while in some cases it may be an agency that is

pushing the envelope and some cases it is just the agency following exactly what Congress told them to do, and I do appreciate that. I yield back my time.

Mr. STEARNS. The gentleman yields back the balance of his time. The gentleman from Colorado, Mr. Gardner, is recognized for 5 minutes.

Mr. GARDNER. Thank you, Mr. Chairman, and thank you for your time and testimony today.

Chairman Wellinghoff, in developing energy policies such as policies to support the integration of renewables, demand response or the deployment of smart grid technologies, does FERC evaluate the impact that increased energy price, evaluate the impact that increased energy prices resulting from the implementation of these policies will have on jobs?

Mr. WELLINGHOFF. The policies that we implement aren't directed to specific technologies but rather directed to the integration of all technologies into competitive marketplace. We believe, and I think my colleague, Commissioner Moeller, I think would agree, we believe that competition is good for consumers and so to the extent that we can maximize competition, we can increase the types of resources that are available in the market, whether they be coal or nuclear or natural gas or solar, geothermal, hydroelectric or any of these resources, and also to the extent that we can do things like incorporate in demand response and energy efficiency which usually at the lowest cost resources, the whole mix of those resources in a competitive environment allowed to compete fairly in that competitive environment will in fact produce the lowest cost for consumers.

Mr. GARDNER. So do you do an analysis that these policies, the impact they will have on jobs?

Mr. WELLINGHOFF. We don't a specific impact on——

Mr. GARDNER. So you don't do an analysis then?

Mr. WELLINGHOFF. We don't do a specific analysis.

Mr. GARDNER. A specific analysis on jobs? You do not do a specific analysis on jobs?

Mr. WELLINGHOFF. We don't, but we do believe that——

Mr. GARDNER. So in terms of——

Mr. WELLINGHOFF. Excuse me, if I could finish. We do believe——

Mr. GARDNER. Actually, reclaiming my time. In terms of the Executive order, so you do not believe that the Executive order, which I think you said you believe in the spirit of, you do not believe that it requires you to look at jobs? I understand that you are exempted from it but you believe, you said you want to follow the spirit of it. Do you think you ought to be concerned about jobs and looking at the job impact?

Mr. WELLINGHOFF. I think we are always concerned about jobs to the extent that we can drive down prices in a competitive atmosphere and allow for the economy to have access to low-cost power. To the extent that we can provide low-cost competitive power within the economy, we are going to create jobs and we are going to maintain jobs.

Mr. GARDNER. But you don't do an analysis to know that or not?

Mr. WELLINGHOFF. My basic economics, what I know if basic economics, tells me that if we can lower costs for electricity, we are going to have the ability to increase jobs.

Mr. GARDNER. Would you commit today to start beginning a jobs analysis when you make decisions?

Mr. WELLINGHOFF. I certainly have no problem looking at jobs. I believe, for example——

Mr. GARDNER. But shouldn't that be our——

Mr. WELLINGHOFF [continuing]. Your colleague from Louisiana, for example, was talking about this issue with respect to jobs and regarding that, Entergy, which is one of the utilities in Louisiana, has chosen to join a competitive market, Myso. An analysis was done that showed by joining that competitive market, something over $700 million could be saved. I think there is a lot of money if you can take that money and save it for Louisiana consumers and others throughout the region. It wasn't just Louisiana but spread out the region. That additional money in the pockets of consumers is going to help them create jobs and invest back in the economy in ways that more jobs will be created. So I think that is a very valid example of the types of things that FERC is doing to the regulations and the competitive structures that we are putting in place to ensure that in fact we can create more jobs.

Mr. GARDNER. Well, and then so what you are telling the committee then, and I believe what you just said, though, when it comes to developing energy policies like integration of renewables, demand response or the deployment or smart grid technologies, then you are saying today that you will do a jobs analysis on these decisions?

Mr. WELLINGHOFF. I am saying that to the extent that it is possible to do so, we certainly will in fact look at the impact on jobs.

Mr. GARDNER. I think we ought to be looking at the impact on jobs no matter what we do so that we have an idea of——

Mr. WELLINGHOFF. I absolutely agree.

Mr. GARDNER. And so Commissioner Moeller, do you care to comment on this?

Mr. MOELLER. I generally want to associate my remarks with the chairman because we are believers in competitive wholesale markets and those ultimately are what benefit consumers the most and allow more resources. I think we should always be cognizant of the employment impact we have on rising energy prices because it can be substantial.

Mr. GARDNER. Thank you, Commissioner Moeller.

I see my time is expired and I yield back.

Mr. STEARNS. I thank the gentleman for his questions. I think we are completed with our first round. I think the ranking member and I have talked that we are going to ask a few more questions and then wrap up.

I don't think there has ever in my experience been such a distinguished group of people that could make an impact on deregulation in America as you folks today so we are here with a certain humility in asking you what is the best way for us to move forward. As Mr. Scalise pointed out with that Small Business Administration report, had every U.S. household paid an equal share of the federal regulatory burden, each household would pay $15,586. That was in

2008. And when you compare that with what we spent for health care costs in 2008, the federal regulatory burden exceeded by 50 percent the private spending on health care, which equaled $10,500. So it is within your power to deregulate and to get rid of burdensome regulations, which would spur the economy. So we are not talking about something insignificant.

So I guess the larger question is, we passed in 1980 the Regulatory Flexibility Act. Obviously that is not applicable today and it is not working, so the question is for you is sort of a wrap-up understanding, the President reached out with his Executive order that did not apply to the independent agencies in some of your opinions. We think Cass Sunstein's letter did imply but we don't seem to have you jumping to the forefront to try to deregulate. Should Congress should either statutes or legislation provide, one, either more flexibility to you or should we update the Regulatory Flexibility Act of 1980? So we are reaching out for you to tell us, one, should we do some of the things I mentioned, and secondly, would you be willing to help us in terms of providing us documentation on what we should do? I will start with Commissioner Adler.

Mr. ADLER. Mr. Chairman, the devil is always in the details. I would be delighted to look at anything you drafted and to respond to it.

Mr. STEARNS. So you think that we should take the Regulatory Flexibility Act of 1980 and update it in Congress?

Mr. ADLER. Actually, I am probably a bigger fan of the Regulatory Flexibility Act than some folks here. As I read it, I think it is a fairly useful tool, especially in terms of what we do when we are trying to regulate and we are looking particularly at the impact on small business. That is actually something that both Commissioner Northup and I agree on is that we do have to worry about the impact on small business.

Mr. STEARNS. Commissioner Northup?

Ms. NORTHUP. Yes, but unfortunately, it has no teeth in it. No matter what the regulatory analysis is, if you decide in our agency that you should go ahead and regulate, it almost has no impact on what we do. So unless we are required to justify the cost with the benefit, adding that to it, I think that would be an important improvement, but other than that, it is a box we check and it doesn't have an effect.

Mr. STEARNS. Just for your information, I checked the Consumer Product Safety Improvement Act. Everybody in Congress voted for it under the Bush Administration except one, and that was Ron Paul. So you probably would have been like most——

Ms. NORTHUP. I am sure I would have, and, like I said, when I first read it before my confirmation, I was really very excited about it.

Mr. STEARNS. Commissioner McDowell?

Mr. MCDOWELL. I think statutory action is the best way to sort of cut through this Gordian knot of regulation and statutory provisions that have built up over the years and so I would be happy to work with you on something like that.

Mr. STEARNS. Mr. Wellinghoff, Commissioner, Chairman?

Mr. WELLINGHOFF. Yes, Chairman Stearns. As I indicated to Congressman Barton, I don't have any specific recommendation for you. However, certainly anything that the committee decided to draft, we would be happy to work with you in any way.

Mr. STEARNS. Commissioner Moeller?

Mr. MOELLER. Mr. Chairman, I generally think a government of both legislative and regulatory bodies should periodically review legislation and regulations, so if that is in order, I would certainly endorse that. And as our chairman said, I had a specific example about hydropower re-licensing that I would be happy to provide to you. It would be quite complicated, given the number of federal laws involved, but any help that we can provide, we would be happy to do so.

Mr. STEARNS. Chairman Leibowitz?

Mr. LEIBOWITZ. I am also happy to work with you, although as my colleague, Commissioner Kovacic, pointed out, I think only four rules that we have actually are within reg flex but we do do, you know, reg reviews and rule reviews. In fact, we are in the middle of 23 of them now, so I will defer to my colleague, Mr. Kovacic.

Mr. KOVACIC. Mr. Chairman, if I could just underscore a couple of themes that have come up already today. One, the enormous value of having committees and the Congress all assess before the fact the likely impact in regulation writing of legislation adopted. Second, the custom you are developing in this hearing of making a regular question for all of us how much are you spending in each budget cycle to look at evaluation and the assessment of effects, not just to measure accomplishment by activity itself but looking at actual impacts and ask us how much are you setting aside in each budget cycle to do this. And last, we do an enormous amount of work as advocates for competition and better consumer protection techniques before the government agencies, before our State governments, and this perhaps provides specific suggestions that we would be happy to share with you about how adjustments in national and State legislation could improve productivity and improve economic performance.

Mr. STEARNS. I am going to yield to the ranking member, but I think each of you have indicated you will help us. You are saying something should be done. So I am going to presuppose that all of you will submit to us some specifics that we could incorporate and still working as the Energy and Commerce Committee towards this.

The gentlelady from Colorado.

Ms. DEGETTE. Thank you, Mr. Chairman, and I agree. I had asked them for that information earlier, and I really look forward to working with all of you because as we all said—no, actually it was one of you who said the devil is in the details of these regulations. You can say we are all for regulatory reform. We also probably need to streamline some of the statutes because a lot of the regulations flow from the statutes and so I think we need to look at all of those.

I have been sitting up here thinking about this lead standard with the CPSIA. I was on the conference committee with Chairman Barton and others, and Mr. Chairman, you are exactly right. There was only one no vote on that bill in the House, and Chairman Bar-

ton and Ranking Member Waxman and a bunch of us, and even the other body sat around for a long time trying to figure out what to do with this lead standard. I remember it so clearly, and when we drafted the new lead standards, what we decided was, was that determining total lead content was preferable to risk assessment because what happened with risk assessment is, it was dependent on a product-by-product determination which you couldn't do because of the large number of children's products in the marketplace, and so in addition, although with most chemicals a traditional risk-based model can work, if you have persistent bioaccumulative toxins like lead, science has demonstrated that traditional models are inappropriate and exposures inevitable, and we spent a lot of time in that conference committee talking about what we do about bikes and ATVs and things like that. So it is not like Congress never talked about these things.

I think what we need to do now that we have passed this—and it wasn't one of these provisions slipped in in the middle of the night either. We really, really hammered this out on a bipartisan, bicameral basis. So now I think what we need to do, given the experience that the CPSC has had in trying to draft the regulations, is sit down and figure out what about that new lead standard might work, what might not work, and this is what led to this effort by then-Chairman Waxman last year to develop this legislation everybody has been talking about. The staff undertook a consultative shareholder process with small business and others to try to figure out what we do about the ATVs, the bicycles, the tee shirts with the blue ink and things like that. He did release a consensus discussion draft of a document to try to figure out how to address these concerns because we need to do it but unfortunately your side of the aisle, Mr. Chairman, rejected that.

And so we can sit down and talk about it. We did do that. We did that when the Republicans were in the majority in the Congress and when we had President Bush in the White House, but we can't devolve to the stage where we say oK, we are the majority, we are just going to do it our way and to heck with you, and vice versa. We really need to work together on how to make this work for small businesses and most importantly for consumers. So as someone who has fortunately or unfortunately been in those trenches, sometimes these regulations actually came from scientific basis and it is going to take some really hard work to fix it. I think every witness here would agree with that on some of these harder regulations that might be more burdensome.

And just one last thing, Mr. Chairman. Ms. Christensen was asking a question about Chairman Genachowski's efforts to eliminate outdated and unnecessary regulations at the FCC, and he had sent a letter to the subcommittee, to you and to me, outlining the efforts which noted that they eliminated 50 outdated regulations and identified 25 sets of data collection that are no longer necessary. So Mr. Chairman, I would like to ask unanimous consent to put that letter into the record.

Mr. STEARNS. Will the gentlelady let us take a few moments to review it?

Ms. DEGETTE. Yes.

Mr. STEARNS. What is the date of this? I don't see the date on this.

Ms. DEGETTE. Today.

Mr. STEARNS. Oh, it is today's date? OK. I would say at this point there is some concern that is really perhaps some of it is applicable but there is others that is concern on this committee we talked about earlier, the fact that Chairman Genachowski was invited as chairman to come up. He said he could not come, and so it is customary if he doesn't come, we do not respectfully take his statement and make it part of the record since he didn't show, and we are a little concerned that this might in fact be part and parcel of his opening statement. So I think at this——

Ms. DEGETTE. Mr. Chairman, I would just point out, it is not an opening statement, it is a letter to us, and we generally——

Mr. STEARNS. I think the staff is interpreting it as an opening statement and so I am just saying at this point we are not able to rule in favor of that and so I think we are just going to hold off and not put it part of the record.

At any rate, I will close by saying that civilizations rise and fall because of burdensome regulation. It is in your hands, you people, to do as much as you can to make the small businessperson succeed so that we can have innovation in this country.

I thank you for your time, and the subcommittee is adjourned.

[Whereupon, at 1:07 p.m., the subcommittee was adjourned.]

MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES, AND OF INDEPENDENT REGULATORY AGENCIES

FROM: Cass R. Sunstein
Administrator

SUBJECT: Executive Order 13563, "Improving Regulation and Regulatory Review"

Executive Order 13563 states that "[o]ur regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation." It sets out certain principles and requirements designed to promote public participation, improve integration and innovation, increase flexibility, ensure scientific integrity, and increase retrospective analysis of existing rules. The purpose of this Memorandum is to offer guidance on these principles and requirements.

Relationship between Executive Order 13563 and Executive Order 12866

Executive Order 13563 is designed to affirm and to supplement Executive Order 12866; it adds to and amplifies the provisions of Executive Order 12866, rather than displacing or qualifying them. After the issuance of Executive Order 13563, agencies should continue to follow the principles and requirements contained in Executive Order 12866.

Section 1 of Executive Order 13563 specifically reiterates five principles from Executive Order 12866. These principles generally involve consideration of benefits, costs, and burdens. Section 1 also asks agencies "to use the best available techniques to quantify anticipated present and future costs as accurately as possible," such as identifying changing future compliance costs that might result from technological innovation or anticipated behavioral changes. The goal of this provision is to promote careful and accurate quantification. At the same time, Section 1 recognizes that agencies may consider and discuss certain values that "are difficult or impossible to quantify"; such values include "equity, human dignity, fairness, and distributive impacts."

Public Participation

Section 2 of Executive Order 13563 emphasizes the importance of public participation. It requires agencies to "afford the public a meaningful opportunity to comment through the Internet on any proposed regulation, with a comment period that should generally consist of not less than

60 days." This section complements a corresponding provision in Executive Order 12866,[1] while also emphasizing the importance of public comment through the Internet. Section 2 aims to promote agencies' continuing efforts to use online technologies to facilitate greater participation in the rulemaking process, thus making that process simpler and more accessible - - and less burdensome and costly—for all stakeholders.

Section 2 also requires an "open exchange" of information among government officials, experts, stakeholders, and the public. In this context, "open exchange" refers to a process in which the views and information provided by participants are made public to the extent feasible, and before decisions are actually made. Section 2 thus seeks to increase participation in the regulatory process by allowing interested parties the opportunity to react to (and benefit from) the comments, arguments, and information of others during the rulemaking process itself. In this way, Section 2 is designed to foster better and more informed agency decisions.

This provision is not satisfied simply through the acceptance of electronic submission of rulemaking comments by interested parties who lack information about the arguments and information provided by other parties. A central goal of public participation is to improve the content of rules, and open exchanges of information by interested parties can be helpful in that endeavor.

Section 2 also directs agencies (to the extent feasible and permitted by law) to give the public timely online access to the rulemaking docket on Regulations.gov, including relevant scientific and technical findings. For proposed rules, agencies are required to include an opportunity for public comment on the rulemaking docket, including comment on relevant scientific and technical findings.[2]

Finally, Section 2 directs agencies, where feasible and appropriate, to seek the views of those who are likely to be affected by rulemaking, even before issuing a notice of proposed rulemaking. This provision emphasizes the importance of prior consultation with "those who are likely to benefit from and those who are potentially subject to such rulemaking." One goal is to solicit ideas about alternatives, relevant costs and benefits (both quantitative and qualitative), and potential flexibilities.

---

[1] "Each agency should afford the public a meaningful opportunity to comment on any proposed regulation, which in most cases should include a comment period of not less than 60 days." Executive Order 12866, Section 6(a)(1).

[2] This requirement is consistent with Office of Information and Regulatory Affairs, Memorandum for the President's Management Council, *Increasing Openness in the Rulemaking Process - Improving Electronic Dockets* (May 28, 2010), available at http://www.whitehouse.gov/sites/default/files/omb/assets/inforeg/edocket_final_5-28-2010.pdf, which states, "To the extent feasible, and consistent with applicable laws, regulations, and policies, agencies should make their electronic regulatory dockets on Regulations.gov consistent with their paper-based dockets. Both dockets should provide the public with access to all relevant materials. To the extent that they are part of a rulemaking, supporting materials (such as notices, significant guidances, environmental impact statements, regulatory impact analyses, and information collections) should be made available by agencies during the notice-and-comment period by being uploaded and posted as part of the electronic docket."

Integration and Innovation

Section 3 of Executive Order 13563 calls for "[g]reater coordination across agencies" to produce simplification and harmonization of rules. This provision complements related provisions of Executive Order 12866, such as the provision asking each agency to "tailor its regulations to impose the least burden on society, including individuals, businesses of differing sizes, and other entities (including small communities and governmental entities), consistent with obtaining the regulatory objectives, taking into account, among other things, and to the extent practicable, the costs of cumulative regulations."[1]

Section 3 of Executive Order 13563 instructs agencies (1) to consider the combined effects of their regulations (together with those of other agencies) on particular sectors and industries and (2) to promote coordination across agencies and harmonization of regulatory requirements. Section 3 thus emphasizes the crucial importance of simplifying and harmonizing regulations and acknowledges that, at times, regulated entities might be subject to requirements that, even if individually justified, may have cumulative effects imposing undue, unduly complex, or inconsistent burdens. Section 3 is designed to reduce burdens, redundancy, and conflict, and at the same time to promote predictability, certainty, and innovation.

Efforts at harmonization might occur within agencies, as efforts are made to coordinate various rules. Such efforts may also occur across agencies, as agencies work together to produce greater simplicity and predictability. Such interagency efforts may be promoted or assisted by OIRA.

Flexible Regulatory Tools

Section 4 of Executive Order 13563 states that ". . . each agency shall identify and consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public." Such approaches include "warnings, appropriate default rules, and disclosure requirements, including provision of information to the public about risks in a form that is clear and intelligible." This provision complements, and does not displace, related provisions in Executive Order 12866 (such as the provision in Section 1(b)(3), asking each agency to "identify and assess available alternatives to direct regulation, including...providing information upon which choices can be made by the public").

Section 4 acknowledges the importance of considering flexible approaches and alternatives to mandates, prohibitions, and command-and-control regulation. It emphasizes the potential value of approaches that maintain freedom of choice and improve the operation of free markets (for example, by promoting informed decisions). It directs agencies to consider the use of tools that can promote regulatory goals through actions that are often less expensive and more effective than mandates and outright prohibitions. When properly used, these tools may also encourage innovation and growth as well as competition among regulated entities.

[1] Executive Order 12866, Section 1(b)(11).

Science

Section 5 of Executive Order 13563 refers to the President's Memorandum for the Heads of Executive Departments and Agencies, "Scientific Integrity" (March 9, 2009), and implementing guidance. It emphasizes that each agency shall "ensure the objectivity of any scientific and technological information used to support the agency's regulatory actions."

In implementing guidance, the President's Science Adviser stated, "Science, and public trust in science, thrives in an environment that shields scientific data and analyses from inappropriate political influence; political officials should not suppress or alter scientific or technological findings."[4] Section 5 of Executive Order 13563 extends the President's Memorandum and implementing guidance to the context of regulatory actions.

Retrospective Analysis of Existing Rules

Section 6 of Executive Order 13563 emphasizes the importance of retrospective analysis of rules and contains a "look back" requirement: "Within 120 days of the date of this order, each agency shall develop and submit to the Office of Information and Regulatory Affairs a preliminary plan, consistent with law and its resources and regulatory priorities, under which the agency will periodically review its existing significant regulations to determine whether any such regulations should be modified, expanded, streamlined, or repealed so as to make the agency's regulatory program more effective or less burdensome in achieving the regulatory objectives."

Executive Order 13563 recognizes the importance of maintaining a consistent culture of retrospective review and analysis throughout the executive branch. Before a rule has been tested, it is difficult to be certain of its consequences, including its costs and benefits. During the process of retrospective analysis, the principles set forth in Sections 1 through 5 remain fully applicable, and should help to orient agency thinking.

Agency plans should not, of course, call into question the value of longstanding agency rules simply because they are longstanding. Many important rules have been in place for some time. The aim is instead to create a defined method and schedule for identifying certain significant rules that are obsolete, unnecessary, unjustified, excessively burdensome, or counterproductive. Agencies should explore how best to evaluate regulations in order to expand on those that work (and thus to fill possible gaps) and to modify, improve, or repeal those that do not. Candidates for reconsideration include rules that new technologies or unanticipated circumstances have overtaken. Agency review processes should facilitate the identification of rules that warrant repeal or modification.

While systematic review should focus on the elimination of rules that are no longer justified or necessary, such review should also consider strengthening, complementing, or modernizing rules where necessary or appropriate—including, if relevant, undertaking new rulemaking. Retrospective review may reveal that an existing rule is needed but has not operated

[4] John Holdren, Memorandum for the Heads of Agencies and Departments, *Scientific Integrity* (December 17, 2010), available at http://www.whitehouse.gov/sites/default/files/microsites/ostp/scientific-integrity-memo-12172010.pdf.

as well as expected, and that a stronger, expanded, or somewhat different approach is justified. In formulating its preliminary plan for retrospective review, each agency should exercise its discretion to develop a plan tailored to its specific mission, resources, organizational structure, and rulemaking history and volume.

While each agency should set its own priorities, all plans are expected to address the following topics:

- **Public participation**. Consistent with the general commitment to public participation, agencies should solicit the views of the public on how best to promote retrospective analysis of rules. Even before preliminary plans are written, for example, the public might be asked to provide comments on how such plans might be devised and to help identify those rules that might be modified, streamlined, expanded, or repealed. Consistent with existing guidance on the Paperwork Reduction Act (PRA), agencies may consider general efforts to obtain public feedback, including town hall meetings and online equivalents, to be exempt from PRA requirements.[3] Agencies are encouraged to consider providing a period of public comment after drafts of preliminary plans are written and/or after such plans have been submitted to OIRA. Agencies may want to reach out to stakeholders with an interest in the rules mentioned in the preliminary plans to ensure that diverse views are considered. Because knowledge of the effects of rules is widely dispersed in society, and because members of the public are likely to have useful information and perspectives, agencies should consider developing mechanisms to promote public consultation about existing rules on a continuing basis.

- **Prioritization**. The preliminary plan should specify factors that the agency will consider and the process that the agency will use in setting priorities and in selecting rules for review. To the extent feasible, the preliminary plan should also include an initial list of candidate rules for review over the next two years.

- **Analysis of costs and benefits**. Agencies may well find it useful to engage in a retrospective analysis of the costs and benefits (both quantitative and qualitative) of regulations chosen for review. Such analyses can inform judgments about whether to modify, expand, streamline, or repeal such regulations, and can also provide valuable insight on the strengths and weaknesses of pre-regulatory assessments, which can be used to enhance the agency's analytic capability.

- **Structure and staffing**. Responsibility for retrospective review should be vested with a high-level agency official who can secure cooperation across the agency. The preliminary plan should also consider how best to maintain sufficient independence from

[3] For further explanation of the applicability of the Paperwork Reduction Act, please see Office of Information and Regulatory Affairs, Memorandum for the Heads of Executive Departments and Agencies, and Independent Regulatory Agencies, *Information Collection under the Paperwork Reduction Act* (April 7, 2010), available at http://www.whitehouse.gov/sites/default/files/omb/assets/inforeg/PRAPrimer_04072010.pdf and Office of Information and Regulatory Affairs, Memorandum for the Heads of Executive Departments and Agencies, and Independent Regulatory Agencies, *Social Media, Web-Based Interactive Technologies, and the Paperwork Reduction Act* (April 7, 2010), available at http://www.whitehouse.gov/sites/default/files/omb/assets/inforeg/SocialMediaGuidance_04072010.pdf.

the offices responsible for writing and implementing regulations. Finally, the plan should identify possible actions to strengthen internal review expertise (if necessary).

- **Coordination with other forms of retrospective analysis and review.** Under existing requirements and authorities, many agencies are already engaged in retrospective analysis and review. For example, the Regulatory Flexibility Act, 5 U.S.C. §610, requires agencies to "publish in the Federal Register a plan for the periodic review of the rules issued by the agency which have or will have a significant economic impact upon a substantial number of small entities." The same provision calls for review of all such agency rules every ten years. It is appropriate to use existing processes, and information now at hand, as significant inputs into preliminary plans.

Within 100 days, agencies should submit initial drafts of their preliminary plans to the appropriate desk officer at the Office of Information and Regulatory Affairs (OIRA). OIRA desk officers will review the plans and may provide suggestions to the agencies on possible improvements. OIRA desk officers are also prepared to work with agencies as they finalize their preliminary plans.

Independent Agencies

Executive Order 13563 does not apply to independent agencies, but such agencies are encouraged to give consideration to all of its provisions, consistent with their legal authority. In particular, such agencies are encouraged to consider undertaking, on a voluntary basis, retrospective analysis of existing rules.

July 2011

Evaluation of the Consumer Product Safety Database

Committee on Energy and Commerce, Democratic Staff

In August 2008, Congress passed and President Bush signed into law the Consumer Product Safety Improvement Act, strengthening the ability of the Consumer Product Safety Commission (CSPC) to identify product hazards and remove dangerous products from the marketplace. The law required that the CPSC create an online database for consumers, health care professionals, and public safety officials to report safety hazards and incidents involving consumer products.

The CPSC SaferProducts.gov database went live on March 11, 2011. For the first time, reports about dangerous products are now publicly available to parents and other concerned consumers. The database is also improving the commission's ability to identify trends in product hazards quickly and efficiently.

The Republican-controlled House of Representatives is expected to soon vote on the FY 2012 Financial Services and General Government Appropriations bill. This bill contains a provision that would shut down the new database by barring CPSC from using any funds "to carry out any of the activities" related to the database. Consumer organizations have described the possible elimination of the database as "a giant step backwards for consumer safety protections."[1]

To assess the new consumer safety database, Democratic Committee staff analyzed the most recent data available online, the consumer product incidents reported to the CPSC over a three-month period from the database's launch on March 11, 2011, to June 7, 2011. This report, the first analysis of the database since its creation, summarizes the staff's key findings.

The database contains more than 1,600 incident reports. During its first three months of operation, consumers, health care professionals, public safety officials, and others reported 1,624 incidents that CPSC then published in the online database. Almost one-third of these incidents involved reports of death or injury.

The database contains 31 reports of incidents that resulted in fatalities. These fatality reports include accounts of infants who died in cribs and playpens and teenagers and adults who were killed while riding ATVs. One report describes a death caused by carbon monoxide poisoning from a faulty furnace.

The database contains an additional 483 reports of incidents that resulted in an injury. The reports include incidents in which children suffered amputations or injuries to their fingers when their hands became trapped in the hinges of strollers. Numerous people reported ATV accidents resulting in serious injuries and hospitalization. Other consumers reported ankle and knee injuries from footwear. Most of these incidents required some level of medical attention.

Many other incident reports describe product defects that could cause injury. One consumer reported that the hinges on a safety gate broke, causing the gate to fall down the stairs. A mother reported that a hair dryer started sparking while she was using it to dry her daughter's hair. Another consumer reported that her front-loading washing machine had burned her clothes. Many consumers reported light fixtures, small appliances, and electronics that began over-heating and smoking with normal use.

Kitchen products account for one-third of the incident reports. Other product categories receiving the most reports include home maintenance, nursery equipment, furniture and furnishings, and toys. See Table 1.

Table 1. Incidents Reported in the SaferProducts.gov Database: By Category

Product Category	No. of Incident Reports
Kitchen	545
Home Maintenance and Structures	204
Baby - Nursery Equipment and Supplies	161
Furniture, Furnishings, and Decorations	143
Toys and Children	119
Clothing and Accessories	112
Yard and Garden	101
Sports and Recreation	75
Electronics	73
Drywall	27
Personal Care	26
Containers and Packaging	15
Hobby	13
Fuel, Lighters, and Fireworks	11
Products at Public Facilities	1

Consumers, public safety officials, and others have filed incident reports. Consumers reported the vast majority of product safety incidents to this database, accounting for 1,574 (97%) of the incident reports. State and local agencies (18 reports), public safety officials (15 reports), health care professionals (12 reports), medical examiners (4 reports), and even child service providers (4 reports) also have reported incidents to the database.

The information in the incident reports is accurate. Opponents of the CPSC database have claimed that the database allows "companies and their brands to be unfairly characterized"[2] and that "the database could be filled with bogus reports."[3] But this is not occurring. Product manufacturers are given the opportunity to review and dispute information in incident reports before the reports are published online in the database. They have challenged the accuracy of only 202 reports. The CPSC has accepted in whole or part 154 of the manufacturers' claims (over 75%) and took action by removing inaccurate information or not publishing the incident report in the database.

The information in the incident reports is detailed. Opponents of the database also have claimed that the database would be filled with reports by anonymous individuals that do not identify the specific products involved. This is also not occurring. More than 80% of the incident reports in the database include the product's model or serial number. In addition, 82% of the persons filing reports have given the CPSC permission to release their contact information to the manufacturers.

Hundreds of thousands of consumers are using the database to obtain important information about product safety. According to CPSC officials, there have been more than 305,000 visits to the new website. The individuals visiting the website have conducted almost 1.8 million product searches. More than half of all site visits and almost half of all searches occurred in June 2011, indicating that the database is rapidly becoming more popular among consumers and others searching for critical product safety information.

The new CPSC consumer safety database has been available to the public for only a few months. During this short time period, consumers, public health officials, and others have already reported more than 1,600 product safety incidents – including hundreds that caused death or serious injury – and almost 300,000 consumers have searched the database for important public safety information. Efforts by House Republicans to eliminate this database would deprive the public and government officials of critical information needed to improve consumer safety.

Executive Summary

The annual cost of federal regulations in the United States increased to more than $1.75 trillion in 2008. Had every U.S. household paid an equal share of the federal regulatory burden, each would have owed $15,586 in 2008. By comparison, the federal regulatory burden exceeds by 50 percent private spending on health care, which equaled $10,500 per household in 2008. While all citizens and businesses pay some portion of these costs, the distribution of the burden of regulations is quite uneven. The portion of regulatory costs that falls initially on businesses was $8,086 per employee in 2008. Small businesses, defined as firms employing fewer than 20 employees, bear the largest burden of federal regulations. As of 2008, small businesses face an annual regulatory cost of $10,585 per employee, which is 36 percent higher than the regulatory cost facing large firms (defined as firms with 500 or more employees).

The regulatory landscape highlighted above and detailed in this report emerges from an updated analysis of the regulatory record explored in three previous studies for the Office of the Chief Counsel for Advocacy of the U.S. Small Business Administration (Hopkins, 1995; Crain and Hopkins, 2001; and Crain, 2005). Direct comparisons to the results in these prior studies should be made with caution, however. The present study introduces some new methodological techniques, which may account for some of the differences in the cost estimates for 2008 versus those for prior years.

I. Purpose and Highlights

Government regulations pervade modern life in America and other nations with few exceptions. Regulations are needed to provide the rules and structure for societies to properly function. This research, while mindful of this fact, does not consider the benefits of federal regulations, but looks at the overall costs imposed by them. Little stock is taken of the cumulative effects.

Unlike most fiscal actions taken by government, the costs of regulatory actions are relatively hidden. For example, consider the activities, products, and services consumed by a typical household on a typical day. The costs of government regulations get stirred into the indistinct mixture of countless economic forces that determine prices, costs, designs, locations, profits, losses, wages, dividends, and so forth. Isolating the contribution of regulations to one's daily routine requires more than simply looking at the sales receipts, for example, as in the case of government sales taxes. A comprehensive list of regulatory influences that affect one's daily existence is indeed extensive and overwhelming to track or sum up. Yet, knowledge of the cumulative consequences of regulatory actions, and how these are changing, provides important information to assess and evaluate the performance of a political-economic social system.

This report seeks to fill some of these gaps in our knowledge by providing estimates of the costs of federal government regulations in the United States. An awareness of regulatory costs reveals much about the balance in public versus private sector responsibilities for and control over resources. Transparency about compliance costs can inform critical judgments about what society gives up in exchange for government responsibility exercised through the machinery of the regulatory process.

Policymakers long ago recognized the importance of information about U.S. taxing and spending programs; such fiscal information has been provided systematically

for nearly a century and is in fact mandated by the Constitution (Article 1, Section 9). The annual federal budget process and the *Budget of the United States* provide considerable detail regarding where the money comes from and how it is spent. The quest for transparency in the nation's fiscal affairs has increased through the online availability of and public access to detailed budget information.

Unfortunately, comparable information about the impact of federal regulatory programs is largely absent. Federal regulations escaped any rigorous scrutiny until limited tracking was mandated by Executive Order 11821 in 1974. The federal Regulatory Right-to-Know Act, enacted in 2000, was a major attempt to make information about the costs and benefits of regulations far more transparent and widely available than before. This act requires the U.S. Office of Management and Budget (OMB) to submit an accounting statement and report that includes an estimate of the total annual costs and benefits of federal rules and paperwork "to the extent feasible."[1]

In the 2009 Report from OMB, the estimated annual cost of major federal regulations ranges between $51 billion and $60 billion in 2001 dollars. Denominated in 2009 dollars (that is, adjusting for inflation), this annual cost is between $62 billion and $73 billion. The estimated cost range provided in OMB's report differs markedly from estimates in three prior studies commissioned by the Office of Advocacy of the U.S. Small Business Administration (hereafter referred to as "Advocacy").[2] Thomas Hopkins

---

[1] Section 624 of the Treasury and General Government Appropriations Act of 2001, Pub. L. 106-554, 31 U.S.C. § 1105 note.

[2] Thomas D. Hopkins, *Profiles of Regulatory Costs, Report to the U.S. Small Business Administration*, U.S. Department of Commerce, National Technical Information Service #PB96 128038, November 1995 (http://www.sba.gov/advo/). W. Mark Crain and Thomas D. Hopkins, *The Impact of Regulatory Costs on Small Firms*, U.S. Small Business Administration, 2001 (http://www.sba.gov/advo/). Hopkins (1995) began to fill the information vacuum regarding the federal regulatory burden, presenting a profile of the level and distribution of federal regulatory compliance costs using data through 1992, and made cost projections through 2000. The Hopkins study was updated and extended in Crain and Hopkins (2001); that study examined the actual, as distinct from projected, regulatory burden in 2000. Crain (2005) updated and provided methodological revisions to the 2001 study and estimated compliance costs for 2004.

(1995) estimated annual federal regulatory costs to be $777 billion. Mark Crain and Thomas Hopkins (2001) estimated the annual costs to be $876 billion (both numbers are converted here to 2001 dollars, the base year normally used by OMB in its reports). More recently, Crain (2005) estimated the annual costs to be in excess of $1 trillion (again in 2001 dollars). According to these three studies for Advocacy, the costs of federal regulations are larger than the costs reported by OMB by a factor of 13 to 17. What accounts for this large discrepancy?

OMB discusses this issue openly and candidly, stating in its 2009 *Report*: "because these estimates exclude non major rules and rules adopted more than ten years ago, the total benefits and costs of all Federal rules now in effect are likely to be significantly larger than the sum of the benefits and costs reported."[3]

It is worth emphasizing at the beginning of this report the main factors that cause OMB's estimates to differ so greatly from those in the studies for Advocacy, including the new estimates presented here for 2008. If OMB or other government-provided estimates were complete and comprehensive, further study would add little value. First, in compiling its accounting statement, OMB includes only those regulations that it cleared during the previous 10 years, which in the 2009 report included October 1, 1998, to September 30, 2008. Limiting the analysis to this time period omits some of the most costly federal regulations, such as the regulations stemming from the parts of the Clean Air Act and its amendments that were enacted before 1998.

Second, the annual OMB accounting statements are based solely on cost-benefit analyses that were performed by the separate federal agencies.[4] In other words, the

---

[3] U.S. Office of Management and Budget, Office of Information and Regulatory Affairs (2005), *Draft Report to Congress on the Costs and Benefits of Federal Regulations*, p. 9.

[4] In some cases, the cost estimates are based on OMB's transparent modifications of agency-provided cost-benefit estimates. Agencies are not required to perform cost-benefit analyses on

sources for the cost and benefit estimates that OMB uses to compile its accounting statement are the federal agencies that promulgate and enforce regulations, and those agencies frequently declare many costs to be "inestimable." This means that while the annual OMB accounting statements offer a trove of relevant information, the coverage in these annual statements is limited; federal agencies have not assessed the costs (or the benefits) for a host of regulatory activities — past and present. This is particularly problematic in the case of economic regulations, which have not been analyzed by federal agencies and therefore have not been included in OMB's annual accounting total. Burdensome economic regulations such as import restrictions, antitrust policies, telecommunications policies, product safety laws, and many other restraints on business activities are implemented outside of the OMB regulatory review process.[5] None of these regulatory costs are therefore included in OMB's annual estimates of total costs.

Third, the OMB annual reports to Congress include "major" regulations reviewed by OMB. This methodological decision is understandable given the massive volume of "non major" regulations. Nonetheless, thousands of non major regulations in the aggregate may amount to substantial costs. Fourth, and finally, a host of regulations are issued by independent regulatory agencies — federal government entities that fall outside the executive branch — and, therefore, are not subject to the reporting

---

regulations that are expected to have an economic impact of less than $100 million, and thus these are omitted from OMB's cost estimate.

[5] For example, regulations implemented directly through the legislative process are outside the OMB review process. Furthermore, the totality of rules, both existing and new, with anticipated impacts below $100 million, and not subject to the Paperwork Reduction Act, are also outside the OMB review process.

requirements in Executive Order 12866.[6] The costs and benefits of such regulations are not included in the aggregate costs and benefits reported by OMB.[7]

These and other differences between OMB's cost calculations and those used in this study will be described in further detail in the sections that follow. This preliminary discussion anticipates the natural question about the large difference between OMB's cost estimates and the cost estimates in Hopkins (1995), Crain and Hopkins (2001), Crain (2005), and those presented in this study. An appreciation of the limitations of OMB's regulatory accounting procedures also motivates one of the purposes of this study, which is an inclusive accounting of all federal regulations and their estimated cost. The cost estimates provided by OMB — in general, calculated by the specific executive branch agency that promulgated the regulation — are used whenever possible in this report, in particular for environmental regulations, occupational safety and health, and homeland security regulations. In the case of regulatory activities for which OMB does not offer cost estimates, the report performs independent analysis to approximate the costs and relies on other secondary sources. For example, the report specifies and estimates an econometric model and then uses the parameters to estimate the cost of economic regulations.

This report seeks to update and improve the 1995, 2001, and 2005 studies for Advocacy and advance the understanding of who bears what burdens from regulation. In particular, the report seeks to identify the federal regulatory burden on small U.S. firms, and to assess whether and to what extent this burden disadvantages small businesses

---

[6] Exec. Order No. 12,866 §1(a), 58 Fed. Reg. 51,735 (Sept. 30, 1993).

[7] On this subject, OMB (2009, p. 23) states that "...it would be highly desirable to obtain better information on the costs and benefits of these rules." The OMB reports provide in tabular form information that is available from the Government Accountability Office (GAO) about the costs and benefits of regulations issued by independent regulatory agencies. As OMB (2009) notes, monetized costs were reported for only two rules issued by independent regulatory agencies for the period 2007-2008.

relative to their larger competitors. Underlying the significance of this assessment for the U.S. economy is the fact that 89 percent of all firms in the United States employ fewer than 20 workers. By comparison, large firms (defined as those with 500 or more employees) account for only 0.3 percent of all U.S. firms.[8] If federal regulations place a differentially large cost on small business, this potentially causes inefficiencies in the structure of American enterprises, and the relocation of production facilities to less regulated countries, and adversely affects the international competitiveness of domestically produced American products and services. All of these effects, of course, would have negative consequences for the U.S. labor market and national income.

Some Key Findings: The Cost of Federal Regulations in 2008

The findings in this report indicate that in 2008, U.S. federal government regulations cost an estimated $1.75 trillion, an amount equal to 14 percent of U.S. national income. When combined with U.S. federal tax receipts, which equaled 21 percent of national income in 2008, these two costs of federal government programs in 2008 consumed 35 percent of national income. This obviously represents a substantial burden on U.S. citizens and businesses.

It is important to stress that direct comparisons between 2008 and prior years must be made cautiously because new estimation methodologies introduced in this study were not possible previously. This means that some of the cost differences are attributable to different estimation techniques. Given this cautionary caveat, the

[8] Tables 7 and 8 provide snapshots of the size distribution of American businesses. It should be pointed out that large firms employ 50 percent of all workers, whereas small firms employ 18 percent of all workers in the United States. These snapshots are computed from data compiled by the U.S. Census Bureau for Advocacy (source: U.S. Small Business Administration website, http://www.sba.gov/advo/research/data.html). For general information about the relevance of small business to the US economy, see Frequently Asked Questions on the U.S. SBA website, http://web.sba.gov/faqs/faqindex.cfm?areaID=24.

comparable cost in 2004 was an estimated $1.26 trillion (in 2009 dollars), or 11 percent of national income (Crain, 2005).[9] If regulatory costs in 2004 are recomputed using the methodologies introduced in this study, those costs rise by $445 billion to an estimated $1.7 trillion (again, converted into 2009 dollars). This apples-to-apples comparison — that is, using the same estimation methods —suggests that the cost of federal regulations increased by $43 billion (or three percent) between 2004 and 2008 after adjusting for inflation.

What is the distribution of federal regulatory costs among firms of different sizes? The findings in this report indicate that compliance costs fall disproportionately on small businesses. Table 1 summarizes the incidence of costs by firm size based on aggregate data for all sectors of the U.S. economy.

Table 1. Distribution of Regulatory Compliance Costs by Firm Size in 2008 *

	Cost per Employee			
Type of Regulation	**All Firms**	**Firms with <20 Employees**	**Firms with 20-499 Employees**	**Firms with 500+ Employees**
All Federal Regulations	$8,086	$10,585	$7,454	$7,755
Economic	$5,153	$4,120	$4,750	$5,835
Environmental	$1,523	$4,101	$1,294	$883
Tax Compliance	$800	$1,584	$760	$517
Occupational Safety and Health, and Homeland Security	$610	$781	$650	$520

*** Notes to Table 1:**

[9] Milton Friedman put the estimated burden of government mandates and regulations at roughly 10 percent of U.S. national income in 2003. See Milton Friedman, "What Every American Wants," *Wall Street Journal*, January 15, 2003, p. A10.

Costs are denominated in 2009 dollars. The cost per employee for each firm size category uses employment shares for the respective business sectors to compute the weighted averages.

Considering all federal regulations, all sectors of the U.S. economy, and all firm sizes, federal regulations cost $8,086 per employee per year in 2008. For firms with fewer than 20 employees, the cost is $10,585 per employee per year. The cost is $7,454 in medium-sized firms, and $7,755 in large firms. Costs per employee thus appear to be at least 36 percent higher in small firms than in medium-sized and large firms. These results are roughly consistent with the findings in Hopkins (1995), Crain and Hopkins (2001), Crain (2005), as well as other studies completed during the past 25 years.[10]

The underlying force driving this differential cost burden is easy to understand. Many of the costs associated with regulatory compliance are "fixed costs," that is, a firm with five employees incurs roughly the same expense as a firm with 500 employees. In large firms, these fixed costs of compliance are spread over a large revenue, output, and employee base, which results in lower costs per unit of output as firm size increases. This is the familiar empirical phenomenon known as economies of scale, and its impact is to provide a comparative cost advantage to large firms over small firms.

[10] Studies on the incidence of regulatory costs among firms of different sizes include Henry B. R. Beale and King Lin, *Impacts of Federal Regulations, Paperwork, and Tax Requirements on Small Business*, SBAHQ-95-C-0023; Microeconomic Applications, Inc., prepared for the Office of Advocacy, U.S. Small Business Administration, September 1998; Roland J. Cole and Paul Sommers, *Costs of Compliance in Small and Moderate-sized Businesses*, SBA-79-2668, Battelle Human Affairs Research Centers, Seattle, WA, February 1980; *Improving Economic Analysis of Government Regulations on Small Business*, SBA-2648-OA-79, JACA Corporation, Fort Washington, PA, January 1981; Robert J. Gaston and Sidney L. Carroll, *State and Local Regulatory Restrictions as Fixed Cost Barriers to Small Business Enterprise*, SBA-7167-AER-83, Applied Economics Group, Inc., Knoxville, TN, April 1984; and, *Economies of Scale in Regulatory Compliance: Evidence of the Differential Impacts of Regulation by Firm Size*, SBA-7188-OA-83, Jack Faucett Associates, Chevy Chase, MD, December 1984. For a theoretical discussion, see William A. Brock and David S. Evans, *The Economics of Small Businesses: Their Role and Regulation in the U.S. Economy*, Holmes & Meier, New York, NY, 1986, especially chapters 4 and 5. A recent survey and extension of this literature is provided by Steven C. Bradford, "Does Size Matter? An Economic Analysis of Small Business Exemptions from Regulation," *The Journal of Small and Emerging Business Law*, 8 (1), 2004, pp. 1-37.

The findings in Table 1 illustrate that the compliance cost disadvantage faced by small businesses is driven by environmental regulations, tax compliance, occupational safety and health, and homeland security regulations. The cost per employee of environmental regulations is more than four times higher in small firms than in large firms. With respect to tax compliance, the cost per employee is three times higher in small firms than in large firms. The particular drivers of the distribution of compliance costs among firm sizes differ across sectors of the U.S. economy. Later sections of the report lay out these patterns in further detail. It is worth highlighting the finding that not all regulations fall more heavily on small businesses than on larger firms. For example, the cost per employee of economic regulations falls most heavily on large firms. In part, this likely reflects the fact some industrial structures do not lend themselves to small firm participation (*e.g.*, utilities, telecoms, or mining) because large scale operations are a precondition to remain competitive. This simply reduces the number of small enterprises that would be affected. Another factor impacting the distribution of economic regulations is the Regulatory Flexibility Act (RFA). Under the RFA agencies are required to assess the effect of regulations on small businesses, and to mitigate undue burdens, including exemptions and relaxed phase-in schedules.[11]

This report details the distribution of regulatory costs for five major sectors of the U.S. economy: manufacturing, trade (wholesale and retail), services, health care (including social assistance), and "other" (a residual category containing all businesses not included in the other four).[12] This is the same five-sector grouping that was used in

[11] This may be especially relevant in the cost of complying with Saction 404 of the Sarbanes-Oxley Act of 2002. The impact of the exemption of small business entities has resulted in cost savings in the billions. See U.S. Small Business Administration, Office of Advocacy (annual editions), *Annual Report of the Chief Counsel for Advocacy on Implementation of the Regulatory Flexibility Act and Executive Order 13272,*

[12] The "other" category includes the following industries: forestry, fishing, hunting & agriculture; mining; utilities; construction; and transportation and warehousing.

the prior report for SBA. The sector-specific findings reveal that the disproportionate cost burden on small firms is most dramatic in the manufacturing sector; the compliance cost per employee for small manufacturers is more than double the compliance cost for medium-sized and large firms. In the health care sector and the "other" sector categories, the compliance costs also appear starkly higher in small firms compared with medium-sized and large firms. In the service and trade sectors, the distribution of regulatory costs among firm sizes is much more even overall, yet varies depending on the type of regulation.

The remainder of the report is organized into three sections and four appendices. Section II gives an overview of the regulatory accounting methodology and describes the primary sources for the cost estimates used in the report. Section III begins with a snapshot of American enterprise, showing the distribution of firms, employees, and payroll expenditures for the major sectors of the U.S. economy. It then presents the underlying assumptions and maps the methods used to allocate: (i) the regulatory burden that falls on business, (ii) the regulatory costs across business sectors, and (iii) the regulatory costs by firm size within each business sector. Section IV provides the detailed findings for the distribution of the costs across the sectors and firm sizes, and by type of regulation. The appendices contain details for the various analytical procedures used in the report, and supplemental information about the "on-budget" expenditures on federal regulatory agencies.

This report does not address the benefits of regulation, an important challenge that would be a logical next step toward achieving a rational regulatory system. The annual accounting statements compiled by OMB move toward such a system by presenting partial estimates of benefits as well as costs. This report, thus, should be seen as a building block toward a broader understanding of the costs of regulation, much of which creates important and substantial benefits. Like data on federal budgetary

outcomes, the regulatory cost estimates inform the discussion about the balance between public and private sector control over resources.

II. Scope of Regulatory Costs

Perspective on Regulatory Accounting

The imbalance between what is known about the costs and benefits of government regulations versus government fiscal programs is hardly surprising. Regulatory accounting requires the discovery of relevant costs and benefits not reflected in any governmental cash flow, which is inherently a difficult task. Fiscal accounting is simpler in two respects: it has the luxury of using well documented monetary flows tied to tax receipts and agency expenditures, and it tracks costs but not the associated benefits. Notwithstanding the practical difficulties associated with regulatory accounting, the impact of government regulations on business and citizen activities is no less real than the impact of fiscal programs.

The total direct cost of federal regulations consists of resources employed by government agencies to promulgate, monitor, and enforce regulations, as well as the compliance activities by citizens and enterprises. This report follows the practice in the three predecessor studies for Advocacy by focusing on the latter: the resource costs over and above those that show up in the federal budget and agency personnel charts. The report provides an accounting of the nonbudgeted costs imposed on individuals and businesses to comply with regulations. A simple example illustrates this perspective on regulatory accounting. The total direct cost to the nation of, say, a pollution control regulation consists of spending by the U.S. Environmental Protection Agency for monitoring and enforcement activities, plus spending by businesses to install abatement equipment, hire environmental engineers, attorneys, accountants, and so on to comply with the regulatory rules. EPA spending shows up in the federal budget, and therefore would not be included in this report's cost accounting. Rather, this report includes estimates of the impact on those who are regulated: the spending by businesses to

install abatement equipment, hire engineers, and so forth. In this sense, the estimates presented understate the full cost of federal regulations.

Regulatory agency spending — the cost component this report excludes — amounts to less than 3 percent of the nonbudgeted regulatory compliance costs on which this report focuses. Nonetheless, spending by federal regulatory agencies on regulatory activity reached $47 billion in fiscal year 2008, so it is not trivial. Appendix 4 provides the on-budget costs of federal regulations, and shows how these budgets have grown over time. Between 1990 and 2008 regulatory agency budgets grew by 129 percent in inflation-adjusted dollars, an average annual rate of about 7 percent.[13] Total staffing of federal regulatory activity in fiscal year 2008 equaled 249,471 full-time equivalent employees. These staffing levels grew by 63 percent between 1990 and 2008, or 4 percent on an annualized basis. While these on-budget indicators of federal regulatory costs are large and growing, they represent only a tiny fraction of the nonbudgeted compliance costs on which this report focuses. To reiterate, on-budget spending on federal regulatory activity equals only 2.7 percent of the estimated compliance costs borne by U.S. citizens and businesses.

Other important regulatory costs are not captured in this report's estimates, most notably activities by state and local governments, indirect burdens, and general equilibrium effects. Regulatory agencies in the 50 American states have promulgated hundreds of thousands of regulations that are superimposed on federal regulations. Consider state-level environmental regulations as just one example. The sections of the

[13] These data are from Veronique de Rugy and Melinda Warren (2009), *Expansion of Regulatory' Budgets and Staffing Continues to Rise: An Analysis of the U.S. Budget for Fiscal Years 2009 and 2010,* Regulatory Report 31, Arlington, VA: Mercatus Center, George Mason University. Appendix 4 in this report presents additional data from their study of regulatory budgets and staffing.

State Administrative Codes that regulate the environment consist of 18 million words.[14] The costs of complying with hundreds of thousands of state regulations are not explicitly considered here, but clearly add to the nation's total regulatory compliance burden.[15]

The report uses various methods to determine how the costs of regulations are distributed: between businesses and individuals, among sectors of the U.S. economy, and among businesses of different sizes. These tend to reflect the initial or statutory burden of the regulations, that is, based on who bears the initial compliance costs. It needs to be acknowledged that this initial compliance burden can be shifted, and the final incidence of regulations may differ from this initial or statutory assignment of the regulatory costs. The difference between the initial incidence and how costs are ultimately divided depends on the demand and supply elasticities in the respective product and input markets. The final incidence of the federal regulatory burden is likely to differ from the initial incidence of costs. Of course, this is exactly analogous to the distinction between how a government collects a tax versus who ultimately pays for the tax. Collecting 100 percent of gasoline taxes from the service station owner does not necessarily mean that the owner bears the full burden of the gas tax. Rather, the gas tax is passed on to consumers to the extent they are willing to pay a higher price at the pump. While acknowledging that shifting in the cost burdens will occur, this report does

[14] See W.M. Crain, "18 Millions Words Can Hurt You: The Cost of State Environmental Regulations," Policy Studies Working Paper, Lafayette College, 2010.

[15] A recent study of California state regulations estimated the costs of that state's regulation to be $493 billion in 2007; see Sanjay B. Varshney, and Daniel H. Tootelian, *Cost of State Regulations on California Small Businesses Study*, California State University, Sacramento, September 2009. Other researchers have ranked states in terms of their relative regulatory burden, for examples: John D. Byars, Robert E. McCormick, and T. Bruce Yandle, *Economic Freedom in America's 50 States: A 1999 Analysis*, State Policy Network, 1999; Ying Huang, Robert E. McCormick, and Lawrence McQuillen, *U.S. Economic Freedom Index: 2004 Report*, Pacific Research Institute, 2004; and Lawrence J. McQuillan, Michael T. Maloney, Eric Daniels, and Brent M. Eastwood, *U.S. Economic Freedom Index: 2008 Report*, Pacific Research Institute, 2008. A different methodology is used by Amela Karabegovic and Fred McMahon (with Christy G. Black) to rank American States and Canadian Provinces. See *Economic Freedom of North* America, The Fraser Institute, annual editions since 2002. No estimates seem to be available for the aggregate costs of state regulations for the 50 states.

not attempt to model these changes because the estimates of the relevant supply and demand elasticities for different sectors of the U.S. economy are not sufficiently consistent or reliable. This methodological issue is addressed again in Section III.

Similarly, the report does not account for a number of indirect or second-order costs of regulations. For example, environmental regulations directly affect the cost of producing electricity, and these show up as a direct cost for electric utilities. The report's cost estimates include these types of direct costs. Yet increases in the cost of electricity have ripple effects throughout the American economy in the form of higher energy costs, thus indirectly raising costs in virtually every sector. Some of these costs will be shifted even further onto consumers in the form of higher prices (directly for energy consumption, and, indirectly, for the other products purchased that now cost more because of higher energy costs). For another example, regulations that raise costs on health care providers will be shifted forward, at least partially depending on market elasticities, in the form of higher rates businesses must pay for health insurance premiums and other health care-related outlays. In turn, businesses will attempt to shift the burden of these higher health care-related outlays by increasing consumer prices or requiring employees to pay a larger share of health care costs. Some attempt is made to examine the more general impact of economic regulations, yet the distribution of these costs among sectors necessarily relies on the initial incidence.

Other general equilibrium effects include a reduction in dynamic efficiency, such as slowing innovations that would lead to productivity gains and therefore general economic expansions over time.[16] Again, the study does not measure the dynamic

[16] The effect of regulations on dynamic efficiency is not without opposing viewpoints. Perhaps the most famous is Professor Porter's theory that environmental progress and economic competitiveness are not inconsistent but complementary. See Michael Porter, "America's Green Strategy," *Scientific American* (1991). For a critique of the Porter theory, see for examples, Oats, Wallace, "Environmental Federalism." Washington, DC: Resources for the Future, Sept. 21, 2009;

effects; omission of the indirect and general equilibrium effects means that the estimates in the report probably understate the full burden of federal regulations.[17]

As a rule, the approach used in this report to approximate the costs of regulations follows the methods used by Hopkins (1995), OMB annual reports (2000 through 2009), Crain and Hopkins (2001), and Crain (2005). This consistency helps to make the results comparable over time. As in past studies, new estimation techniques are adopted when these offer obvious improvements in the reliability and quality of the cost estimates. The introduction of new methodologies obviously means that comparisons to regulatory costs in prior years must be qualified.

Major Categories of Federal Regulations: Sources and Methods

The report divides federal regulations into four categories: economic; environmental; tax compliance; and occupational safety and health, and homeland security.[18] A description of each category follows, along with an explanation of the primary sources and methods used to derive the compliance cost estimates.

---

and John List and Mitch Kunce, "Environmental Protection and Economic Growth: What Do the Residuals Tell Us?, *Land Economics*, 2000, 76(2), pp. 267-82.

[17] The effects of regulations on economic growth are recognized and discussed by OMB in its annual reports to Congress, but are not included in its cost estimates. The study by Hazilla and Kopp estimates of the indirect effects of environmental regulations as well as the dynamic consequences. Their evidence suggests that both of these costs are substantial. See Michael Hazilla and Raymond Kopp, "The Social Cost of Environmental Quality Regulations: A General Equilibrium Analysis," *Journal of Political Economy*, Vol. 98 (4), 1990. It is important to emphasize that the benefits of regulations might also be greater in a general equilibrium analysis than in partial equilibrium, and thus social welfare (benefits net of costs) might be higher in a general equilibrium than in a partial equilibrium analysis.

[18] These four categories differ slightly from those used in Crain (2005) and Crain and Hopkins (2001). They continue to conform reasonably well with the categories used by the U.S. Office of Management and Budget in its annual reports to Congress. Hopkins (1995) used slightly different categories: environmental, other social, economic, and process. Occupational health and safety regulations and homeland security regulations are combined on the rationale that both deal broadly with public safety issues.

1. Economic Regulations

Economic regulations include a wide range of restrictions and incentives that affect the way businesses operate — what products and services they produce, how and where they produce them, and how products and services are priced and marketed to consumers. Economic regulations affect both domestic and international business operations. For example, laws that impose quotas and tariffs on foreign imports limit competition from outside the United States, restrict production and employment, raise prices, and generally curtail U.S. economic activity.

One of the major differences between the cost estimates in this study and the estimates reported by OMB in its Annual Reports to Congress is that OMB does not include regulations issued by agencies not subject to Executive Order 12866 — the independent regulatory agencies.[19] In its 2009 report, OMB discusses and recognizes the potentially large impact of such regulatory activity (OMB, 2009, pp. 29-34). Nonetheless, OMB has not implemented estimates for a host of economic regulations, beyond those for which it has reviewed regulatory impact statements submitted by federal agencies during the past 10 years. As noted in the introduction to this report, OMB recognizes the potentially large costs associated with regulatory activities not included in its annual estimates of total regulatory costs.

A methodology was introduced in the prior report for Advocacy (Crain 2005) to expand the coverage by providing a method to assess the costs of broad-based economic regulations. Obviously, the goal is to incorporate into the analysis the impact

[19] Under Executive Order 12866, OMB requires and reviews regulations issued by executive branch agencies. This means, for example, that the costs are not included for rules issued by such agencies as: the Securities and Exchange Commission, the Consumer Product Safety Commission, the Federal Communications Commission, the Federal Trade Commission, and the Nuclear Regulatory Commission. The U.S. Government Accountability Office (GAO) is required by statute to report to Congress on major regulatory rules, including those issued by agencies not subject to Executive Order 12866. This GAO report, however, still does not include cost estimates for most federal regulations.

of the widest possible range of economic regulations, including those that are promulgated by independent regulatory agencies. The method employs cross-country regression analysis to examine the impact of a broad index of economic regulations on the national economic output (GDP).[20] The 2005 study used an index of economic regulations developed by the Organization for Economic Cooperation and Development (OECD). The cost estimate derived from this approach was referred to as the "baseline" estimate in the 2005 study, simply because the regression procedure accounted for most of the costs of economic regulations. That baseline estimate was then supplemented in two ways: (i) by a separate estimate of the cost of international trade regulations using data from the International Trade Commission, and (ii) with estimates for specific domestic economic regulations that were either not covered by the OECD index, or were promulgated in years after that index was computed. In other words, several different approeches were used in the 2005 study to compile an inclusive measure of the cost of economic regulations.

This study again uses the comparative, cross-country regression approach, in this case adopting an alternative index of economic regulations that is more comprehensive than the OECD index. This new index of economic regulations, labeled the Regulatory Quality Index, is computed by researchers at the World Bank as part of its Worldwide Governance Indicators (WGI) research project. The WGI project has estimated various measures of governance and institutional quality, including the

[20] It is interesting to note that in its 2000 Report to Congress, OMB used a comparable methodology and OECD data to include a more expansive estimate of the costs of economic regulations than it used in subsequent Reports to Congress. A similar regression methodology is employed by Varshney and Tootelian, *op. cit.*, to estimate the cost of state-level regulations in California. They use indices that gauge the extent of state government regulations and analyze the impact on gross state product, controlling for various factors that influence state economic performance.

Regulatory Quality Index used in this report. These indices are available from 1996 through 2008.

The Regulatory Quality Index measures perceptions of the ability of governments to formulate and implement sound policies and regulations that permit and promote private sector development. For example, the index values for 2008 are derived from 1,751 data points, representing four types of data: commercial business information providers (46 percent); public sector organizations (24 percent); nongovernmental organizations (17 percent); and surveys of firms or households (13 percent). The data from these four sources are aggregated using a statistical procedure known as the unobserved components model.[21] The elements included in the Regulatory Quality Index are listed in Appendix 1.

Three important aspects of the WGI Regulatory Quality Index — how it differs from the OECD economic regulation index used in Crain (2005) and why it enhances the accuracy of the estimated costs of economic regulation — should be described. First, a larger data series is available for the Regulatory Quality Index, covering a longer time period and more countries, and this helps to overcome the small sample size used to

[21] A detailed description of the methodology used in its construction is provided in Daniel Kaufmann, Aart Kraay, and Massimo Mastruzzi, "Governance Matters VIII: Aggregate and Individual Governance Indicators 1996--2008," World Bank Development Research Group, Macroeconomics and Growth Team, Policy Research Working Paper 4978, June 2009. See especially Appendix D. For further discussion of applications of the governance metrics see Kaufmann, Daniel and Aart Kraay (2008). "Governance Indicators: Where Are We and Where Should We Be Going?" *World Bank Research Observer*, Spring 2008. As noted in the text, the prior study (Crain, 2005) introduced this methodological approach as a baseline estimate for economic regulations, except that it used an index of regulations compiled by researchers at the Organization for Economic Cooperation and Development. (See G. Nicoletti, Scarpetta and O. Boylaud (2000), "Summary Indicators of Product Market Regulation and Employment Protection Legislation for the Purpose of International Comparisons," *OECD Economics Department Working Paper*, No. 226.) It is noteworthy that the OECD and WGI indices are correlated over the time periods for which both indices are available. The WGI index is employed in this report because it is available annually for a longer and more recent time period, while the OECD index is only available at five-year intervals: 1998, 2003, and 2008. Prior studies by Crain and Hopkins (2001) and OMB (2000) used an estimate based on the OECD findings in *Regulatory Reform in the United States*, OECD Reviews of Regulatory Reform, Paris, 1999. One criticism of the earlier method is that it fails to account adequately for major deregulation activities in various industries in the 1980s and 1990s.

estimate the parameters in the Crain (2005) study.[22] Second, the Regulatory Quality Index covers international as well as domestic economic regulations. This means that unlike the 2005 study, a separate estimate of the international economic regulation component is unnecessary. Third, the WGI Regulatory Quality Index includes rules and mandates that affect factors markets — which obviously include the labor market — as well as product markets. This means that the impact of economic regulations that affect the workplace is encompassed in this measure. For this reason the four categories of regulations are redefined from the 2005 study. In that report, "workplace regulations" were a separate category and estimated using a different methodology. In this report, the estimated costs of workplace regulations, such as laws affecting collective bargaining, employee drug-testing, and the American with Disabilities Act, are now included in the Regulatory Quality Index and merged into the general economic regulation category. Fifth, the OECD index used in the Crain (2005) estimate of economic regulations did not cover all business sectors.

In summary, the methodology for estimating the cost of economic regulations is the main difference between this report and prior reports. This improvement is made possible because of new research at the World Bank to measure economic regulations. This Regulatory Quality Index is available for a larger number of countries and for a longer sample period than anything available for prior studies. More important, the Regulatory Quality Index embodies extensive stakeholder knowledge about the countries' regulatory practices that affect domestic and international practices that are related to product markets and labor markets.

[22] The OECD Index used in Crain (2005) was based on the OECD Survey for 1998. Criticism of the short time period is raised in Winston Harrington, "Grading Estimates of the Benefits and Costs of Federal Regulation: A Review of Reviews," RFF Discussion Paper 06-39, Washington, DC: Resources for the Future. September 2006. See especially pages 14-16. Of course, a larger sample size generally improves the reliability of statistical estimation.

Cross-Country Regression Model. The cost of economic regulations is derived from regression analysis using a panel of OECD member countries, which includes the United States. The basic idea is to estimate empirically the impact of regulations on aggregate economic output, or GDP. The approach uses the Regulatory Quality Index as the main variable of interest, while controlling for other variables that affect national economic performance. The form of the regression model is specified in Equation 1.

(Eq. 1) GDP per Capita $_{it} = \beta$ (World Bank Index of Regulatory Quality) $_{it} + \phi$ (X) $_{it} + \alpha_i + \varepsilon_{it}$

The sample used to estimate Equation (1) consists of 25 OECD countries for which data on all of the relevant variables are available. The variable subscript *i* in Equation (1) denotes an observation in a particular country *i* (= 1, ..,25). The variable subscript *t* denotes an observation in a particular year, where *t* = 2002 through 2008.[23]

The dependent variable, GDP per capita, is real GDP divided by population, denominated in constant U.S. dollars (source: World Bank, 2010). The main explanatory variable of interest in Equation (1) is the *World Bank Regulatory Quality Index* (source: World Bank, 2009). This *Regulatory Quality Index* is scaled to have values that range from -2.5 to 2.5. Note that increases correspond to improvements in regulatory quality — that is, reductions in the regulatory burden imposed on the operation of product and factor markets.

The model also includes several economic and demographic control variables, represented by the vector X in Equation (1). These control variables are drawn from the empirical literature that examines differences in economic levels across countries and

[23] Values for the Regulatory Quality Index are available for many OECD countries starting in 1996. The sample in the regression model includes seven years, 2002 through 2008. This is because data for some of the control variables used to estimate Equation (1) are missing for various countries before 2002. Thus, the sample of countries that may be used in the analysis increases to 25 by beginning the sample in 2002.

over time. (For useful surveys of this literature, see Hall and Jones, 1997, Barro and Sala-i-Martin, 1995, and Barro, 1997.) The set of controls included in X are: foreign trade as a share of GDP, country population, primary school enrollment as a share of the eligible population, and fixed broadband subscribers per 100 people (data source: World Bank, World Development Indicators, online database). The variables are entered into the regression model as natural logarithmic transformations.

Because the dataset is organized as a panel — that is, it includes observations over time for the same set of countries — the model also includes country fixed-effects variables. Fixed-effects variables are simply country-specific indicator variables that control for time-invariant factors that affect economic performance. For example, a landlocked country may be disadvantaged relative to a country with ocean access. Geographic location obviously does not change over time, and including the fixed-effects variables helps to control for the impact of such factors. Appendix Table A-2 provides summary statistics for the variables used in the analysis.

The results of estimating Equation 1 are shown in Table 2, and these parameters are used to calibrate the cost of economic regulations.

Table 2. Impact of Economic Regulations on GDP in OECD Countries, 2002 through 2008

Independent Variable	ln (GDP per Capita) [a]
World Bank Regulatory Quality Index	0.094
	(2.77)**
ln (Country Population)	0.089
	(0.39)
ln (Foreign Trade as a Share of GDP)	0.242
	(4.95)**
ln (Primary Education as a Share of the Eligible Population)	-0.243
	(-2.37)*
ln (Fixed broadband subscribers per 100 people)	0.032
	(8.89)**
Constant	8.31
	(2.19)*
Observations	118
Number of Countries	25
R-square Within	0.85
R-square Between	0.03
F-stat (6,87)	85.4**

Notes to Table 2:

t-statistics in parentheses where:
* indicates significance at the 5 percent confidence level.
** indicates significance at the 1 percent confidence level.
The variables are denominated in 2009 U.S. dollars. The model includes fixed-country effects and fixed-year effects when significant.

As reported in Table 2, the coefficient on the World Bank *Regulatory Quality Index* is positive and significant at the one-percent confidence level. This indicates that less stringent restrictions systematically enhance a country's aggregate economic activity, as reflected by the level of its GDP per capita. The estimated coefficient is 0.094. This means that a one-unit change in the *Regulatory Quality Index* corresponds to a 9.4 percent change in real GDP per capita (recall that the dependent variable is entered into the regression model as a logarithmic transformation and thus percentage changes).[24] The Regulatory Quality Index value for the United States is equal to 1.579 in 2008, and, as noted, the index is calibrated to range between -2.5 and 2.5. The difference between 1.579 and 2.5 (the minimal amount of regulation) would require a change equal to 0.92, which would correspond to an increase in U.S. GDP per capita of 8.7 percent (=0.094 x 0.92). The estimated cost of economic regulations as reflected in lost GDP in 2008 is thus $1.236 trillion (denominated in 2009 dollars).

This estimated cost represents a very large increase over the estimated cost of economic regulations in 2004, which equaled $671 billion after converting the estimate in Crain (2005) into 2009 dollars. As noted, some of this difference is attributable to the change in the cost accounting methodology, one that is more complete than methodologies used in the prior studies for SBA. The 2008 estimate includes labor market economic regulations that were included under the "workplace regulations" category in the 2004 estimate. The approximate value of the "economic" component of the workplace regulations category in 2004 is $56 billion (again adjusting for inflation). This means that the comparable economic regulations cost (one that includes product and labor market regulations) in 2004 is $727 billion (=$671+$56). Even after

[24] For comparison, when Equation (1) is estimated without the country fixed-effects variables, the estimated coefficient on the *World Bank Regulatory Quality Index* equals 0.142, which is significant at the 1 percent confidence level. In other words, the parameter estimate used in the report for the cost of economic regulations is on the low end of the range of estimates using this regression analysis.

readjustment to account for the redefined categories, this still suggests that economic regulations increased by 70 percent from 2004 to 2008, or roughly $500 billion.

How much of this large increase comes from "real" regulatory changes and how much comes from methodological changes? If the cost of economic regulations in 2004 is re-estimated using the new methodology, that value rises by $445 billion to $1.172 trillion. This recalibration of the 2004 estimate suggests that the "real" cost of economic regulations increased by $63 billion between 2004 and 2008, after adjusting for inflation and estimation methods.

2. Environmental Regulations

Cost estimates for environmental regulations are derived from two sources: OMB's annual reports to Congress and Hahn and Hird (1991). The report assumes that OMB's coverage of environmental regulations has been relatively complete. OMB has reviewed the regulatory impact analyses for the most costly regulations promulgated by the Environmental Protection Agency back through the late 1980s. In its reports, OMB has relied on the cost estimates in Hahn and Hird (1991) to gauge the costs of environmental regulations prior to 1988, and this study follows that procedure.[25]

Table 3 lists the sources and estimated annual costs for environmental regulations that were enacted during various time periods. It is important to stress that the costs of environmental regulations shown in Table 3 are denominated in 2001 dollars, the same base year used in the original OMB sources of these estimates. This facilitates comparisons to the OMB reports, and these costs are converted into 2009 dollars in Section IV below.

[25] It is worth reiterating that OMB includes only the costs of "economically significant" regulations subject to E.O. 12866 review. These are less than 1 percent of EPA's rulemaking. Moreover, as noted earlier, the OMB annual reports now encompass only regulations issued in the prior 10 years. This was not always the case, and data on the earlier environmental regulations are summarized in OMB's past annual reports.

Table 3. Sources and Estimated Annual Costs of Environmental Regulations

Years Regulations Were Issued *	Cost Estimates (Millions of 2001 $)		Source for Estimate
	Low	High	
Through 2000, Q1	108,359	191,887	OMB 2001, Table 2
Apr 1999 to Sep 2001	11,380	12,812	OMB 2002, Table 7
Oct 2001 to Sep 2002	192	192	OMB 2003, Table 1
Oct 2002 to Sep 2003	335	335	OMB 2004, Table 1
Oct 2003 to Oct 2004	3,840	4,073	OMB 2005, Table 1-1
Oct 2004 to Sep 2005	2,609	3,373	OMB 2006, Table 1-3
Oct 2005 to Sep 2006	2,720	2,965	OMB 2007, Table 1-3
Oct 2006 to Sep 2007	7,475	7,584	OMB 2008, Table 1-3
Oct 2007 to Sep 2008	7,591	8,780	OMB 2009, Table 1-3
Total	144,501	232,001	

Note to Table 3:

These dates follow OMB's practice by reporting the costs by fiscal years, which begin October 1 and end September 30.

OMB discusses the shortcomings in these estimates, including the basic fact that cost estimates do not exist for all environmental regulations, and the inherent difficulties in performing the regulatory impact analyses (RIAs). For example, OMB does not include an estimate for the cost of the Superfund program, which is likely to be quite large. To account for some of these shortcomings, OMB provides a range of cost estimates for most regulations, and these are reported in Table 3.

Beginning in its 2003 report, OMB began the practice of limiting its cost summaries to regulations promulgated over the preceding 10 years, which in that report covered 1992 through mid-2002.[26] For this reason, this report begins with the OMB report for 2001, which includes its earliest cost accounting and takes Hahn and Hird

[26] U.S. Office of Management and Budget, Office of Information and Regulatory Affairs (2003), *Informing Regulatory Decisions: Report to Congress on the Costs and Benefits of Federal Regulations*, Table 2. OMB's cost estimates rely on regulatory impact analyses (RIAs) issued mainly by the U.S. Environmental Protection Agency.

(1991) as its beginning estimate of the costs prior to 1988. To account for environmental regulations promulgated since then, the costs of newly reviewed regulations are taken from OMB's annual reports for 2002 through 2009.

As shown in Table 3, this puts the cost of environmental regulations in a range between $144 billion and $232 billion (in 2001 dollars) or between $175 billion and $280 billion when converted into 2009 dollars. This report uses the high end of the cost range provided in the OMB reports and Hahn and Hird (1991). This reflects a judgment that cost estimates are absent for important environmental regulations and that government agencies tend to be conservative in estimating regulatory costs.[27] For comparison, if the midpoint of the high and low estimates were used, the cost of environmental regulations in this report would decline by roughly $50 billion, or 19 percent.

3. Tax Compliance

Prior studies of federal regulations stress the substantial burden of paperwork costs on the American public and businesses. In the modern era in which electronic

[27] Several regulatory experts draw a similar conclusion about the OMB environmental cost estimates, but considerable debate continues. For example, Johnson concludes that "the costs of water quality regulation totaled $93.1 billion in 2001. While this figure is based on conservative estimates of regulatory costs, it is significantly larger than the cost and benefit estimates produced by EPA." (Joseph Johnson, *The Cost of Regulations Implementing the Clean Water Act*, Arlington, VA: Mercatus Center, Regulatory Studies Program Working Paper, April 2004.) In contrast, in 1999, EPA estimated the costs of the 1972 Clean Water Act at $15.8 billion per year. ("A Retrospective Assessment of the Costs of the Clean Water Act: 1972 to 1997," U.S. Environmental Protection Agency, October 2000.) The discussion in Robert W. Hahn, "Regulatory Reform: What Do the Government's Numbers Tell Us?" in Robert W. Hahn (ed.) *Risks, Costs, and Lives Saved: Getting Better Results from Regulation*, New York: Oxford University Press and AEI Press, 1996, pp. 208-253, is also informative. Hahn makes a strong case that government agencies overestimate benefits and underestimate costs systematically. In addition, the review article by Jaffe, *et al.*, "Environmental Regulation and the Competitiveness of U.S. Manufacturing," *Journal of Economic Literature*, Vol. 33 (1), 1995, suggests that environmental costs in the long run have exceeded compliance cost estimates. Finelly, the study by Winston Harrington, *et al.* "On the Accuracy of Regulatory Cost Estimates," *Journal of Policy Analysis and Management*, vol. 19 (2), 2000, examines the estimates for 28 particular rules promulgated by EPA and OSHA and finds, in contrast, that overestimation of unit costs occurs about as often as underestimation.

submissions are displacing paper, the term *"paperwork burden"* has become merely a metaphor for the time and resources required for monitoring, recordkeeping, reporting, and compliance with statutes and regulations. Of this burden, the time required to comply with the federal tax code accounts for the lion's share. Of course, the federal government requires a host of additional forms that also impose recordkeeping and reporting burdens. However, these non-tax-related reporting and compliance requirements are largely tied to specific economic, environmental, or occupational safety and health and homeland security regulations. This means that the cost estimates for the other regulations will account for most of the non-tax-related compliance and reporting burden. In that sense, a separate estimate would be double-counting recordkeeping and form filing costs.

The estimates of the cost of federal tax compliance in prior studies for Advocacy relied mostly on annual studies of tax compliance produced by the Tax Foundation. These studies provided extensive details about the time required to file federal income tax forms and the number of specific forms filed. The estimates in this report rely mostly on data directly available from the U.S. Internal Revenue Service, simply because the Tax Foundation's latest report was for 2005. For certain forms, the Tax Foundation's estimates of the time required to file in 2005 are used.

The estimate of tax compliance costs in 2008 is consistent with past reports for Advocacy and is easy to describe. The first step compiles data from the Internal Revenue Service and in some cases from the Tax Foundation on the amount of time required to complete each type of tax form, and the number of filings for each type of form. The number of compliance hours is shown in the first row of Table 4 broken down by businesses and by individual and nonprofits, with a total for these two categories. The total number of hours required for compliance is nearly 4.3 billion per year, with

businesses devoting about 2.3 billion hours and individuals and nonprofits devoting about 2.0 billion hours.

Table 4. Sources and Estimated Costs of Compliance with the Federal Tax Code

	Businesses	Individuals & Nonprofits	Total
# Hours Required to Comply	2,280,966,382	2,018,119,637	4,299,086,018
Compliance Cost per Hour (in 2009 $)	$ 49.77	$ 31.53	
Total Compliance Cost (in 2009 $)	$95,984,291,402	$ 63,635,262,186	$ 159,619,553,588
Share of Total Compliance Cost	60%	40%	

The second step is to multiply the hours spent on compliance by an hourly wage rate that reflects either the value of the preparer's time (the average hourly wage rate for accountant and auditors in the case of individuals and nonprofits) or the hourly compensation rate for Human Resources professionals (in the case of businesses).[28] The estimated cost of federal tax compliance is nearly $160 billion (in 2009 dollars). To be clear, this $160 billion estimate includes the combined costs on individual filers, nonprofit organizations, and business filers. The estimated cost of compliance for businesses is about $96 billion, accounting for 60 percent of the total cost.

4. Occupational Safety and Health and Homeland Security Regulations

Prior studies for Advocacy used "workplace regulations" as one of the four categories for analysis. This category covered a wide array of regulations dealing with

[28] The source of the hourly rate data is the U.S. Bureau of Labor Statistics website.

wages, benefits, safety and health, and civil rights, among other things.[29] Because the economic cost component of workplace regulations is now reclassified and scored under the "economic" regulations category, this report modifies the workplace category to include only workplace regulations that deal with safety and health. These are primarily issued by the Occupational Safety and Health Administration, a division of the U.S. Department of Labor. It is noteworthy that occupational safety and health regulations alone accounted for 53 percent of the compliance costs of all workplace regulations in the 2005 study (Crain 2005). These were by far the largest element within the workplace regulations category.

This report relies on three sources to estimate the costs of occupational safety and health and homeland security regulations. These costs and sources are summarized in Table 5.

Table 5. Sources and Estimated Costs of Occupational Safety and Health and Homeland Security Regulations

Type of Workplace Regulation	Cost Estimate (Millions of 2009 $)	Source
Occupational Safety and Health (for those issued pre-2001)	64,313	Johnson (2005)
Occupational Safety and Health (for those issued 2001-2008)	471	OMB (2009), Table 1-2
Homeland Security (all through 2008)	10,416	OMB (2009), p. 18
Total	75,200	

[29] The source for the cost estimate for workplace regulations is the 2005 study by Joseph Johnson. The Johnson study offers a synthesis and evaluation of available estimates of the cost of regulations directed at the workplace, and from these different studies, generates an estimate of the total cost of workplace regulation. It provides the most comprehensive analysis to date, covering the 25 statutory acts and executive orders that encompass all significant workplace regulations promulgated by the federal government through 2001. Joseph M. Johnson, "A Review and Synthesis of the Cost of Workplace Regulations," in *Cross-Border Human Resources, Labor and Employment Issues*. Andrew P. Morriss and Samuel Estreicher (eds.), Kluwer Law International: Netherlands, 2005, pp. 433-67.

The cost calculations from the Johnson (2005) study are used where possible, that is, until 2001, and adjusted for inflation as shown in Table 5. The costs provided by OMB on OSHA regulations are used for those regulations issued subsequent to the Johnson study. All 17 of the homeland security regulations included in this report have been implemented since the 2005 report for Advocacy, and these cost estimates are all taken from OMB (2009). As examples, these are regulations concerned with transportation facilities security, chemical plant security, electronic availability of passenger manifest lists, cargo security, notice of imported food and registration of food facilities that might be vulnerable to bioterrorism, and air cargo security. The cost of these 17 homeland security regulations is $10.4 billion, and the total cost for this category — Occupational Safety and Health plus Homeland Security — is $75.2 billion.

Summary of Total Regulatory Costs

Table 6 summarizes the cost estimates described in this section by regulatory category, and notes the basic sources and procedures behind the estimates.

Table 6. Summary of Regulatory Compliance Costs in 2008
(Billions of 2009 dollars)

Type of Regulation	Cost Estimate	Sources
All Federal Regulations	1,752	Summation of Costs by Type
Economic	1,236	Original regression analysis using World Bank Regulatory Quality Index
Environmental	281	Hahn and Hird (1991); Crain (2005); OMB (2004, 2005, 2006, 2007, 2008, 2009)
Tax Compliance	160	IRS website, Bureau of Labor Statistics; Tax Foundation (2005)
Occupational Safety and Health, and Homeland Security	75	Johnson (2005); OMB (2009)

III. Incidence of Regulatory Costs

This section describes how the burden of federal regulations is distributed among major business sectors of the American economy, and, within sectors, how this burden is distributed among firms of different sizes. It begins with a brief quantitative summary of the composition of American enterprise: how the number of firms and the work force are distributed among firms of different sizes and among the major categories of business activities. This underlying composition of economic activity in America is a key element in the study, because it provides the basis for determining the incidence of regulatory costs.

A Snapshot of American Enterprise

The report uses a three-part firm size classification, relying on data available from Advocacy on employees per firm:

- Small firms — fewer than 20 employees
- Medium-sized firms — 20 to 499 employees
- Large firms — 500 or more employees.

The North American Industry Classification System (NAICS) devised by the U.S. Census Bureau divides American businesses into 2,000 distinct industry types. In order to make the results tractable, this report distills these classifications down to five broad categories:

- Manufacturing,
- Trade (wholesale and retail trade),
- Services,
- Health care, and
- Other (e residual containing almost all other nonfarm employers).[33]

[33] The U.S. Census Bureau provides Advocacy with these data. The Statistics of U.S. Business covers almost all nonfarm employer businesses. It omits farms, railroads, and most government-owned establishments, the U.S. Postal Service, and large pension, health, and welfare funds

Four of these five categories are adopted from the original Hopkins (1995) study for Advocacy. The health care category was added in the Crain (2005) study for Advocacy to reflect the growing scale and importance of this sector within the U.S. economy. The rationale for a small number of large categories, here and in previous reports for Advocacy, is to gain insight into the distribution of the regulatory burden across various types of economic activity — "manufacturing" versus "services" provides an obvious and distinct boundary. The "other" category includes: forestry, fishing, hunting & agriculture, mining, utilities, construction, and transportation and warehousing. To be sure, "other" bundles a diverse set of economic activities into a single category. However, in creating additional sector categories the analysis becomes less tractable.

Table 7 shows the distribution of American industry by sector and firm size using the most recently available data (for 2006) from Advocacy.[31] Table 7 presents three relevant size indicators: the number of firms, the number of employees, and payroll expenditures.[32] For example, the data indicate some six million firms in the United States and roughly 5.4 million of these are small businesses (less than 20 employees).

(100 + employees) and nonincorporated firms with no paid employees. According to the Census Bureau, nonemployers account for roughly 3 percent of all business activity (see U.S. Census Bureau, "Nonemployer Statistics," http://www.census.gov/epcd/nonemployer).

[31] American industry is obviously not static and these 2006 data on the distribution of business activity do not match up exactly with the years for the regulatory cost data. However, changes in the basic structure of American industry generally occur only incrementally. These data provide a reasonable approximation for the relevant years of the proportions of firms, employees, and payroll across the three firm size categories and the five sector classifications.

[32] The Office of Advocacy of the U.S. Small Business Administration contracts with the U.S. Census Bureau to collect the employer firm size data (see http://www.sba.gov/advo/stats/data.html). When the Census Bureau compiles its *Statistics of U.S. Businesses*, it relies on survey questionnaires filled out by firms. Occasionally, firms classify themselves under more than one industry type (or NAICS classification). This means that when summed by sector, the number of firms is greater than the actual number of firms. The data used in this report are corrected for this over count using a technique explained in Appendix 4. In brief, the correction relies on the fact that the number of employees in each industry is accurately reported to the Census Bureau, and the share of employees by sector is used to eliminate the redundancy and scale back over counts of firms.

Table 7. Size Distribution of American Business in 2006*

Sector	Size Measure	All Firms [a]	Firm Size:		
			<20 Employees	20-499 Employees	500+ Employees
All Sectors [a]	Firms	6,022,127	5,377,631	626,425	18,071
	Employment	119,917,165	21,609,520	38,614,220	59,693,425
	Payroll ($000)	5,099,088,373	772,519,440	1,492,491,072	2,834,077,860
Manufacturing	Firms	278,703	210,220	66,890	1,593
	Employment	13,631,683	1,180,832	4,875,389	7,575,462
	Payroll ($000)	659,910,538	44,023,629	205,977,710	409,909,200
Trade	Firms	1,048,443	941,506	105,527	1,410
	Employment	21,798,513	4,060,460	5,939,480	11,798,573
	Payroll ($000)	35,798,406	128,105,755	238,874,376	368,818,276
Services	Firms	3,064,433	2,755,361	296,335	12,738
	Employment	55,026,464	10,386,251	17,413,803	27,346,941
	Payroll ($000)	2,420,355,343	354,457,788	627,515,860	1,427,510,876
Health Care	Firms	596,992	526,261	69,895	835
	Employment	16,451,361	2,544,976	5,401,418	8,504,967
	Payroll ($000)	666,681,058	112,830,630	186,810,745	367,039,682
Other	Firms	1,033,556	944,284	87,778	1,494
	Employment	13,009,144	3,430,737	4,982,216	4,634,181
	Payroll ($000)	616,343,027	132,247,939	231,835,480	250,237,452

Notes to Table 7:

* Source: U.S. Small Business Administration, Office of Advocacy, "Statistics of U.S. Businesses: Firm Size Data," website: http://www.sba.gov/advo/stats/data.html. Payroll data are converted into 2009 dollars. The Office of Advocacy contracts with the U.S. Census Bureau to provide employer firm size data. These data for 2006 are the most recently available from the SBA.

[a] These Statistics of U.S. Businesses data cover almost all nonfarm employer businesses. Omitted are farms, railroads, and most government-owned establishments, the U.S. Postal Service, and large pension, health, and welfare funds (100 + employees) and nonincorporated firms with no paid employees.

Table 8 reports these business size indicators in a slightly different format, as shares of all U.S. industry, which are used to allocate compliance costs. Table 8 simply converts the raw data shown in Table 7 into percentage terms. For example, consider

the data in Table 8 that describe the manufacturing sector. Manufacturing accounts for 5 percent of all U.S. firms, 11 percent of all U.S. employment, and 13 percent of all U.S business payroll expenditures. Within the manufacturing sector, 75 percent of the firms are classified as small businesses (fewer than 20 employees), 24 percent have between 20 and 499 employees, and only one percent has 500 or more employees. Nine percent of manufacturing employees work in small firms, 36 percent in mid-sized firms, and 56 percent in large firms. Finally, regarding the distribution of payroll expenditures, small firms account for 7 percent, mid-sized firms account for 31 percent, and large firms account for 62 percent.

Table 8. Size Distribution of American Business (As a Percentage of Private Industry Employment)

	Sector Share of All U.S. Industry					
Size Measure	Manufacturing	Trade	Services	Health Care	Other	
No. of Firms	5	17	51	10	17	
Employees	11	18	46	14	11	
Annual Payroll	13	14	47	13	12	
	Percent of Firms, by Sector					
	Manufacturing	Trade	Services	Health Care	Other	All Sectors
<20 employees	75	90	90	88	91	89
20-499 employees	24	10	10	12	9	10
500+ employees	1	0.1	0.4	0.1	0.1	0.3
	Percent of Employees, by Sector					
	Manufacturing	Trade	Services	Health Care	Other	All Sectors
<20 employees	9	19	19	15	26	18
20-499 employees	36	27	32	33	38	32
500+ employees	56	54	50	52	36	50
	Percent of Payroll, by Sector					
	Manufacturing	Trade	Services	Health Care	Other	All Sectors
<20 employees	7	17	15	17	21	15
20-499 employees	31	32	26	28	38	29
500+ employees	62	50	59	55	41	56

Source: See Table 7.

The percentages displayed in Table 8 provide a snapshot of the distribution of productive activity and resources among broad sectors of American industry. It is against this descriptive backdrop that the report charts the incidence of regulatory compliance costs. These costs are allocated across the sectors and firm sizes shown in Table 8 using the procedures described in the remainder of this section.

Assumptions and Procedures Underlying the Cost Allocations

Business Portion of the Regulatory Burden
