Mr. Howell, I want to start off with you, a couple questions. I notice in your testimony that you said that the Consumer Product Safety Commission supports the goals of H.R. 1796. Do you all support this specific legislation?

Mr. HOWELL. We do certainly, and this is from a technical staff perspective. Technical staff certainly supports the intent of the legislation. We believe that there is a need to work together on the language of the warning label, but beyond that, certainly putting a smoke alarm in every home, a grant program and, you know, making the UL standard for carbon monoxide alarms mandatory, we certainly support that language.

Mr. WHITFIELD. So on the technical side, the warning label is just one area that you would like to——

Mr. HOWELL. And it is really a minor issue. Warning labels are a tricky science and we have human factor experts that would certainly be willing going forward to work with committee staff to develop the appropriate language for a warning label.

Mr. WHITFIELD. And would there be any other technical areas that you would be concerned about?

Mr. HOWELL. No, sir.

Mr. WHITFIELD. Now, one other question I wanted to ask you. Under section 7 of the Consumer Product Safety Act, you all have the authority to promulgate a safety standard if two conditions are met. Do you have the authority to mandate the standard of alarms?

Mr. HOWELL. Section 7 of the CPSA requires the Commission to rely upon voluntary consumer product safety standards rather than promulgate a consumer product safety standard whenever compliance with the voluntary standard is adequate or would eliminate or adequately reduce the risk of injury and it is likely that there is substantial compliance with the standard. At this point we believe that the standard is indeed adequate to reduce or eliminate the risk of injury and we also believe that there is substantial compliance.

Mr. WHITFIELD. So that would prohibit you from making it mandatory?

Mr. HOWELL. Yes, sir.

Mr. WHITFIELD. Thank you.

I notice in the legislation on page 4, and Mr. Andres, have you read this legislation?

Mr. ANDRES. Yes, I have.

Mr. WHITFIELD. It says, "Paragraph 2 does not apply to any carbon monoxide detector not covered by the standard as provided in section 1.4 of the standard." What is that referring to?

Mr. ANDRES. We actually read through that and we were a little bit confused by some of the language in there, and I think we need to work with Mr. Matheson to look at some of the language. I think the way that the provision is written right now, there is a lot of confusion between the term "detector" and "alarm" and they use those two terms interchangeably, and technically they are actually two different devices. So I think there is some language adjustments that need to be made to clean that up because honestly I didn't really understand what they were referring to in that section.

Mr. WHITFIELD. Yes, so I think it is important that we remember alarm and detector are two separate things, correct?

Mr. ANDRES. That is correct, and oftentimes a different UL standard would be applicable.

Mr. WHITFIELD. And on page 3 where they make this a mandatory standard, it says "mandatory consumer product safety standard, the American National Standard for single and multiple station carbon monoxide alarms." What is that safety standard in layman's terms? What is that?

Mr. ANDRES. Well, UL 2034 is the standard for conformance so——

Mr. WHITFIELD. For performance?

Mr. ANDRES. It not only looks at performance but also has requirements for design characteristics, so Underwriters Laboratories would actually accept a manufacturer's, a number of their alarms, and that particular standard would be used to test the design characteristics of that. When it comes to carbon monoxide alarms, they are going to look at not only electrical and mechanical safety but they are also going to look at specificity to detection of carbon monoxide. They are also going to look at the accuracy of carbon monoxide detection, which is very important, and they are going to look at the accuracy over time. So the UL 2034 standard has evolved over the years and it is actually a very good standard now. It has gone through a number of changes that have made it a very robust standard.

Mr. WHITFIELD. I know that we have an issue in the United States of not enough people have these in their homes, but how many alarms would you say are being sold in the United States today that do not meet this standard that is set out in this legislation, or would you have any idea?

Mr. ANDRES. I actually think today we are fortunate that most alarms that I am aware of are actually listed to this ANSI standard. I am not aware of any right now that are not.

Mr. WHITFIELD. Even imported alarms?

Mr. ANDRES. Correct.

Mr. WHITFIELD. OK. I see my time has expired, Mr. Chairman.

Mr. RUSH. The Chair now recognizes the gentleman from Utah, the author of the legislation, Mr. Matheson, for 2 minutes.

Mr. MATHESON. Thank you, Mr. Chairman.

Mr. Howell, you may have referenced this a little bit in your opening statement but there is a Senate version of this bill, as you are aware, and in the Senate version, it includes a provision that mandates the use of a shutoff switch, it is my understanding, on portable generators, where the machine would—you know, there is detection of carbon monoxide level at some point and it would disable the generator. And I understand the CPSC has been working in conjunction with the University of Alabama in looking at the development of this type of a device. Could you just give us a quick update on the progress of this study and how effective the shutoff switch has been in reducing the dangers of carbon monoxide poisoning?

Mr. HOWELL. Yes. CPSC staff investigated two approaches to the concept of a gas-sensing shutoff device to shut nff an operating portable generator before it created a hazardous CO exposure. Both methods pose significant disadvantages. One approach was that of a shutdown system in which the CO-sensing device was mounted on the generator to detect the level of CO in the vicinity of the generator. Staff found that a disadvantage to this approach was a propensity for false shutdowns when the generator was operated in a ventilated outdoor environment but where the exhaust tended to accumulate around the generator. Staff also is concerned about the sensory reliability and life which may be comprised when exposed to the door environmental conditions, engine vibration, combustion products and heat.

The second approach the staff investigated involved a CO-sensing device located in a remote location away from the generator where occupants in the house might be that would shut down the portable generator using wireless technology if unsafe CO was developing inside the house. We conducted a demonstration using off-the-shelf components including a residential CO alarm, a radio frequency receiver and transmitter, and a portable generator. One disadvantage, and I want to say a major disadvantage of this approach was that it required the consumer to properly locate the remote sensor in the occupied area in order for it to work successfully and therefore it could be easily defeated by the consumer.

Mr. MATHESON. I appreciate that.

Mr. Chairman, I just wanted to get the Consumer Product Safety Commission's understanding of those difficulties because that is one of the differences between the House and the Senate bill, and the reason we did not include this language in the House version was because of these concerns about how well a shutoff switch would work, and I will yield back.

Mr. RUSH. The Chair thanks the gentleman.

The Chair now recognizes for 2 minutes the gentleman from Nebraska, and the Chair acknowledges the fact that the gentleman waived his opening statement so if you require an extra 2 minutes——

Mr. TERRY. I appreciate that. My questions will be short. I am not sure about the answers, though.

Let me first attack, or not attack but talk about the standards for both the detectors and the alarms. You need to help me work through why we need to have Congressional law to mandate the

standard when it seems to me that that isn't really what the issue is. The issue is that too many homes don't have CO detectors. Which one of you said that you actually had incident in your own home? Was that you, Doctor?

Dr. LAVONAS. That was me, Mr. Terry.

Mr. TERRY. Yes, we have had the same thing in our home. I have got three little kids, and we had our CO detector go off and found out that there was some crack in a part of the furnace, and so I am a believer in having those, but making the standard that everyone seems to agree on is adequate today mandatory, I am not sure we need to do that.

Mr. Howell, you are on the technical side. Explain to me why the voluntary standard that two of you have already said seems to be adequate needs to be made mandatory.

Mr. HOWELL. Mr. Terry, the decision to make this standard mandatory certainly would be the prerogative of the Congress. CPSC, as I indicated, not only is not currently involved in a move to make this standard mandatory but the CPSA actually prohibits us from making it mandatory as long as we feel like there is substantial compliance and that the standard adequately protects the American consumer.

Mr. TERRY. So if there wasn't compliance to this voluntary standard and that was inadequate, then you could make it mandatory?

Mr. HOWELL. We could make it mandatory or we certainly could promulgate a standard that was more stringent than the current UL standard.

Mr. TERRY. But you think that the current voluntary standard is adequate, if I buy a CO detector that is going to meet the standards?

Mr. HOWELL. Absolutely. Having said that, if I may, making this standard mandatory would give CPSC greater authority to keep any non-complying carbon monoxide alarms out of the U.S. market should they try to enter the market.

Mr. TERRY. Have you found instances of noncompliance?

Mr. HOWELL. At this point we have not.

Mr. TERRY. And then the other is on the warning labels and pictograms on portable generators. I think Jim has done a good job of showing why I think we probably need to do that, but the question then is begged, why does Congress need to mandate that on you? And that would be your-sorry, Mr. Howell. You get to represent the agency that has the authority.

Mr. HOWELL. That is not a problem. As I indicated before, in 2007 CPSC actually mandated warning labels on portable generators and on the packaging, and very clearly identified the risk to the consumer and the correct behavior. Our label clearly states using a generator indoors—and this part is in bold and caps—can kill you in minutes. There are also pictograms that indicate the behavior that we wanted to discourage. It says never use inside a home or garage even if doors and windows are open, and then it also illustrates the correct behavior. Only use outside and far away from windows, doors and vents. The Commission upon staff's recommendation and the development of this label by our human factors experts felt like this was a good label and served the purpose.

Mr. TERRY. Thank you very much. Yield back my 4 seconds.

Mr. RUSH. The Chair thanks the gentleman.

The Chair wants to apprise members that the staff has just informed me, or reminded me, rather, that there are 5 minutes under the committee rules for questioning, 2 minutes for opening statements and 5 minutes for questioning, and those who have gone before, if you require more—you are OK for now? All right. Well, thank you very much.

The Chair now recognizes the gentlelady from California, Mrs. Matsui, for 5 minutes.

Mrs. MATSUI. Thank you, Mr. Chairman.

Mr. Andres, the CPSC has estimated that 180 unintentional nonfire carbon monoxide poisoning deaths occurred in 2006 and were associated with consumer products. Of these deaths, 71 percent took place in homes. The data also showed that carbon monoxide poisoning deaths are more likely to arise in homes with no functioning alarms. To reduce deaths, CPSC has attempted to reduce carbon monoxide levels in homes by examining the limitations and detection capabilities of low-cost carbon monoxide alarms. Mr. Andres, I want to know how industry has worked with the CPSC and other stakeholders to develop voluntary standards to improve consumer product performance.

Mr. ANDRES. Yes. In fact, as outlined in some of the ANSI protocols to develop a recognized standard, there is a technical committee that is formed. We refer to it as the standards technical pattern, and in fact, the Consumer Product Safety Commission oftentimes participates in technical discussion on the performance of carbon monoxide alarms, and I have personally attended a number of these technical panel reviews over the years, and if anybody were to look at the amendments that have been made towards UL 2034, you would see that the standard has evolved into a very robust-type standard. Some of the major changes that have been made toward the standard are, number one, a requirement to demonstrate whatever sensing technology you are employing that that technology be proven to be accurate, not just accurate on day one at the time that the Underwriters Laboratory engineering is going to test the product, but certainly accurate years down the line. We have at Kidde, for example, over 10 years of ongoing test data that is third-party witnessed by Underwriters Laboratories. At the same time, Underwriters Laboratories has imposed environmental tests so that sensing technology is proven to be accurate under high humidity extremes or low temperature extremes or high temperature extremes. The Consumer Product Safety Commission has participated in many of these technical discussions and they have also raised issues in the past about performance of these sensing technologies, brought those into industry so that we could all discuss it, and that has led to the evolution of much better sensing technology today.

Mrs. MATSUI. I think that many of us have been made aware, particularly some of the testimony here, about the tragedies that occurred, and I think some of us have experienced this historic storm that we had in February where many of us lost our power and our heat sources, and once again we were reminded about the dangers of carbon monoxide. And it is unfortunate that things like that have to happen for us to be reminded of that, and that is why,

you know, I look at some of the data about the deaths and injuries that might occur. Do you believe that you are at a point where you don't need the stronger regulatory law? I mean, can we reduce more deaths or risks of deaths if we have a stronger regulatory law or reduce the risk of carbon monoxide as source?

Mr. ANDRES. Alarms have evolved to a point where you can buy an excellent alarm for an $18 price tag that covers you for multiple sources of CO source. You know, we talked about generators but it is beyond generators. There are fireplaces, charcoal grills, attached garages with running cars, water heaters. I mean, for a $20 device being able to protect against all those individual sources, that is just a fantastic deal. I mean, the same time we look at what we are doing here today. I mean, this is National Poison Prevention Week. We are having a very good discussion on, you know, a very pertinent point, carbon monoxide. Anything we can do to raise awareness will naturally leave to saving additional lives, so we are going to raise the awareness to the American public. They are going to react to that, many of them, and purchase carbon monoxide alarms. What you are doing here today will help raise that awareness.

Mrs. MATSUI. And I just wanted to comment, I think that, you know, we are looking at these things sometimes in silos. We are looking at the alarms right now. But you mentioned the other aspects of it, you know, the generators and all of this that are really a greater part of it too. So in a certain sense, we have to address some of those concerns and how they might affect as being the source of this and so I think that you are right, it is absolutely important to do this but I also think that we need to look beyond this also because this is—partly it is education but part of it is also the interconnectedness of all of this, and I think that is really the important thing. So with that, I yield back my time.

Mr. RUSH. The Chair recognizes now the gentlelady from Colorado, Ms. DeGette, for 5 minutes.

Ms. DEGETTE. Thank you very much, Mr. Chairman, and I want to give an official welcome to Dr. Lavonas, who is my constituent, and almost as importantly works for Denver Health, which this committee has heard me sing the praises of many, many times and does such a wonderful job not just with providing health care to folks but with some of these public health issues throughout our region. I want to welcome you, and Mr. Matheson and I both agreed that the entire panel provided excellent testimony and in particular you, Doctor.

I just want to ask a couple of questions of the panel. The first one, as we know, the legislation provides for grants to States and localities to assist in certain activities related to preventing carbon monoxide poisoning. Dr. Lavonas, do you think that the grants are a helpful way to address this issue?

Dr. LAVONAS. Yes, I do. I have been through—this is my third time working with a governmental body on questions regarding carbon monoxide alarms, and so I have heard from my previous experience the barriers that they face. The biggest barrier that the State of Colorado faced was cost. It costs money to implement a standard, particularly if there is government-owned housing or government-imposed requirements that are going to require training.

I think this bill does address that. I think that it may be helpful to allow the States to use this grant money in some additional ways as well as they see fit, for example, to allow the States to apply for grant money to put alarms in State-controlled housing or to fund alarm programs to provide subsidized alarms for low-income communities. But fundamentally, cost is a barrier. Every State in the Nation is struggling with their budget this year.

Ms. DEGETTE. Yes, and also the local governments, many of which like Pitkin County which passed a law after that tragic death in the family that you described and many other counties, they are struggling with their budgets too. So what you are saying is, if we are going to do a grant system, be sure we give maximum flexibility so that that money can be used as wisely as possible.

Dr. LAVONAS. Yes, ma'am.

Ms. DEGETTE. I wanted to ask you, one struck me during your testimony about the patient that you had who had brain injuries from carbon monoxide poisoning because we do hear, there are these tragic deaths. Mr. Devine has letters from people who survived. But my question is, we have the tragic deaths but we have many more people who have the poisoning who are somehow rescued. What are the long-term health impacts on folks who have survived from these poisoning episodes?

Dr. LAVONAS. These impacts can be significant. About three-quarters of survivors do OK. About a quarter of survivors develop a brain injury that sometimes can get worse for a few days after the poisoning. The problems have to do with—everybody is a little different but problems with concentration, problems with what is called executive processing like can I read a map, can I follow instructions, problems with short-term memory and problems with movement, tremors, similar to somebody with Parkinson's disease.

Ms. DEGETTE. And do we have any sense annually about how many of these lasting brain injuries there are as a result of carbon monoxide poisoning?

Dr. LAVONAS. Well, we know there are—if you add the suicide and the unintentional exposures together, probably about 45,000 or 50,000 people who visit an emergency department for carbon monoxide poisoning each year. We know from good research that about a quarter of these, perhaps more, will develop a lasting brain injury.

Ms. DEGETTE. Mr. Howell, I am wondering if you can tell me, as you know, the bill requires the CPSC to publish the existing voluntary Underwriters Laboratories 2034 standard for carbon monoxide alarms as a federal mandatory standard. Do you know how—can you tell us—I am sure you know how—the Underwriters Laboratories standard for carbon monoxide detectors was determined?

Mr. HOWELL. If you are asking how the standard came to be, it certainly is a gathering of technical experts, industry, stakeholders and of course CPSC is represented. Performance standard design criteria is developed and it is balloted and approved by technical experts that work to develop these standards.

Ms. DEGETTE. Do you think it will sufficiently protect the public?

Mr. HOWELL. At this point our indications are that it is adequate to protect the public from the risk as we see it today.

Ms. DEGETTE. OK. Just one last question. What proportion of carbon monoxide alarms currently available on the market conform to that standard?

Mr. HOWELL. I do not have an exact number but it is our indication that there is substantial compliance with the UL 2034 standards.

Ms. DEGETTE. Mr. Devine, do you know?

Mr. DEVINE. At this time we really understand that all the alarms that are available at retail establishments for consumers to purchase are compliant to the UL 2034 standard. Essentially all of the major retailers require us as manufacturers to have compliance to this standard today.

Ms. DEGETTE. Thank you.

Thank you very much, Mr. Chairman.

Mr. RUSH. The Chair thanks the gentlelady.

There was a question that came to mind, so the Chair will entertain any requests for one additional question from the members here, and the Chair recognizes himself for 1 minute.

Can anybody provide any information on the threat of carbon monoxide poisoning in any other place other than homes? And I am particularly concerned or interested in any evidence of carbon monoxide poisoning in automobiles.

Mr. HOWELL. Let me take the question as it began, which is any place outside of homes. CPSC actually has recorded incidents of people in outdoor environments, campers and tents, whether either through the use of generators or other fuel appliances that are used to either heat or cook have resulted in deaths to those from carbon monoxide poisoning.

Mr. RUSH. Anyone else?

Mr. DEVINE. Yes, Mr. Chairman. In addition to outside of the residence, also concerning to us is the hotel-motel while people are traveling. There have been occurrences, unfortunate incidents where people have had carbon monoxide poisoning while they are in a hotel-motel from a variety of different sources as well.

Mr. RUSH. Thank you.

The Chair recognizes the ranking member for 1 minute.

Mr. WHITFIELD. Thank you.

Mr. Howell, I wanted to ask you a question. You didn't come up to testify on H.R. 4805, the formaldehyde bill, which applies to hardwood, plywood, medium-density fiberboard and particleboard, all of which are products, and since you are the Consumer Product Safety Commission, are you familiar with this formaldehyde legislation?

Mr. HOWELL. I am aware that it was there. I have not actually studied the legislation at this point.

Mr. WHITFIELD. I was just thinking that these are products and you all deal with products and whether or not maybe your agency should have the jurisdiction over this formaldehyde issue, but we can talk about that later. I was just curious if you had looked at it. Thank you.

Mr. RUSH. The Chair wants to thank the witnesses. You have really been providing an invaluable service to this committee with your testimony and your answers to the questions. The Chair would like for you to know that we will keep the record open for

2 weeks, and if there are any members of the subcommittee who are not present who would like to submit questions to you in writing, would you please respond to those questions promptly within a 2-week period. Thank you so very much, and thank you for your time and your investment in the future of America. Thank you so much and God bless.

The Chair wants to thank the members of the second panel for their participation in this hearing and wants to introduce the second panel of this hearing for a discussion on the other matter that is before this subcommittee, the bill introduced by Mrs. Matsui. The Chair wants to thank all the witnesses for your investment of your time in this hearing.

The Chair wants to introduce beginning at his left Mr. James J. Jones, who is the deputy assistant administrator for the Office of Prevention, Pesticides and Toxic Substances of the U.S. EPA. Seated next to Mr. Jones is Mr. Tom Julia, who is the president of the Composite Panel Association. And seated next to Mr. Julia is Mr. Andy Counts, who is the CEO of the American Home Furnishings Alliance, and Mr. Don Ryan is sitting next to him, who is of the Sierra Club and a founding board member of the National Center for Healthy Housing. And next to Mr. Ryan is Dr. Melvin E. Andersen, who is the director of Program in Chemical Safety Sciences at The Hamner Institutes for Health Sciences. Again, we welcome all of the witnesses.

It is the practice of this committee to swear in the witnesses, so will you please stand and raise your right hand?

[Witnesses sworn.]

Mr. RUSH. Please let the record reflect that the witnesses have all answered in the affirmative.

The Chair now recognizes Mr. Jones for 5 minutes for the purposes of an opening statement.

TESTIMONY OF JAMES J. JONES, DEPUTY ASSISTANT ADMINISTRATOR, OFFICE OF PREVENTION, PESTICIDES, AND TOXIC SUBSTANCES, U.S. ENVIRONMENTAL PROTECTION AGENCY; TOM JULIA, PRESIDENT, THE COMPOSITE PANEL ASSOCIATION; ANDY COUNTS, CEO, AMERICAN HOME FURNISHINGS ALLIANCE; DON RYAN, SIERRA CLUB, FOUNDING BOARD MEMBER, THE NATIONAL CENTER FOR HEALTHY HOUSING; AND MELVIN E. ANDERSEN, CIH, PHD, DART, DIRECTOR, PROGRAM IN CHEMICAL SAFETY SCIENCES, THE HAMNER INSTITUTES FOR HEALTH SCIENCES

TESTIMONY OF JAMES J. JONES

Mr. JONES. Thank you, Chairman Rush, Ranking Member Radanovich and members of the subcommittee. Thank you for the opportunity to speak with you today regarding the U.S. Environmental Protection Agency's efforts on formaldehyde and the potential legislative action in Congress.

Formaldehyde is a widely used chemical and may be found both indoors and outdoors. It is used in building materials and household products and also produces a byproduct of combustion. In homes, the most significant sources of formaldehyde are likely to

be pressed wood products made using adhesives that contain urea-formaldehyde resins.

Inhalation of formaldehyde can cause irritation of the eyes, nose, throat and skin as well as inflammation and damage to the upper respiratory tract. Additionally, there is growing evidence that formaldehyde exposure may impact pulmonary function and increase respiratory symptoms, asthma and allergic sensitization in children. In 1989, EPA classified formaldehyde as a probable human carcinogen.

EPA is currently engaged in a reassessment of the potential cancer and non-cancer risks of formaldehyde that will be entered into EPA's Integrated Risk Information, or IRIS program. As a result of this reassessment process, EPA is reexamining its conclusions regarding the cancer and non-cancer effects of formaldehyde. This assessment will be ready for external review soon. The agency has also asked the National Academy of Sciences to provide independent external scientific peer review, and EPA will offer opportunities for public comment on the underlying science.

The recent focus of formaldehyde in the Office of Prevention, Pesticides, and Toxic Substances resulted from a March 2008 petition to adopt the California State regulation concerning emissions of formaldehyde from three types of composite wood products. They petitioned EPA to exercise its authority under TSCA section 6 to adopt and apply nationally the California formaldehyde emissions regulation for these composite wood products. In response, EPA announced on June 24, 2008, that it was partially granting and partially denying the petition. While the agency denied the specifics of the petition request, EPA announced plans to issue an Advanced Notice of Proposed Rulemaking to initiate a proceeding to assist us in obtaining a better understanding of the available control technologies and approaches, industry practices and the implementation of the California regulation.

The ANPR was issued on December 3, 2008, and describes EPA's initial steps in that investigation and requested comment information and data relating to formaldehyde emissions from pressed wood products.

The challenge of regulating chemicals under our current TSCA authority is worth noting. As Congress moves toward TSCA reform legislation, we have stated in previous hearings that as a result of the legal and procedural requirements TSCA places on EPA to collect data, there are large, troubling gaps in the available data and state of knowledge of many widely used chemicals in commerce. Chemical producers are not required to provide EPA the data necessary to fully assess a chemical's risks. In cases such as formaldehyde where EPA has adequate data on a chemical and it wants to protect against well-known risks to human health and the environment, there are legal hurdles that prevent quick and effective regulatory action.

In regards to formaldehyde, the agency noted in its 2008 ANPR that EPA does not have sufficient information to evaluate whether the CARB standard would likely be the least burdensome alternative necessary to protect adequately against such risks. This finding illustrates the inherent difficulty the agency faces in regulating chemicals under TOSCA even for a chemical such as form-

aldehyde where data and information are available regarding its health effects.

Restoring confidence in our chemical management system is a top priority for EPA and an environmental priority for the Obama Administration. This Administration's principles for how TSCA should be revised and modernized call for stronger and clearer authority for EPA to collect and act upon critical data regarding chemical risks. Under a reformed TSCA, EPA should have the necessary authority and tools to quickly require testing and obtain other information from manufacturers that is relevant to determining the safety of chemicals and should also have clear authority to take risk-management actions when chemicals do not meet safety standards.

EPA currently anticipates being able to make a determination on whether to pursue regulatory action on formaldehyde in 2011. If we were to propose a new regulation at that time, a final rule could be anticipated 1 to 3 years later depending on the comments we receive and additional analysis and consultations which may be required in order to finalize.

As this committee considers legislation on formaldehyde, we agree that formaldehyde is a hazardous chemical and support the goal of legislation in reducing the risks of formaldehyde in pressed wood products. Reducing formaldehyde emissions in pressed wood products should be an important public health goal. California has made a valuable contribution to formaldehyde emissions reductions through it standards and is providing a clear model for addressing the problem.

We look forward to working with this committee as it moves forward to reduce exposure to formaldehyde from these products. It is our hope that Congress will also be able to act on TSCA reform since the Administration believes it is important to work together to quickly modernize and strengthen the tools available in TSCA.

Thank you for the opportunity to present EPA's views, and I am happy to answer any questions the subcommittee may have.

[The prepared statement of Mr. Jones follows:]

Testimony of James J. Jones
Deputy Assistant Administrator
Office of Prevention, Pesticides and Toxic Substances
U.S. Environmental Protection Agency
before the
Subcommittee on
Commerce, Trade, and Consumer Protection
Committee on Energy and Commerce
United States House of Representatives
March 18, 2010

Chairman Rush, Ranking Member Whitfield, and members of the Committee, thank you for the opportunity to speak with you today regarding the U.S. Environmental Protection Agency's efforts on formaldehyde and potential legislative action in Congress.

Formaldehyde is a widely-used chemical and may be found both indoors and outdoors. It is used in building materials and household products and can also be produced as a by-product of combustion. In homes, the most significant current sources of formaldehyde are likely to be pressed wood products made using adhesives that contain urea-formaldehyde (UF) resins. Pressed wood products made for indoor use include particleboard, plywood, and fiberboard.[1]

Inhalation of formaldehyde can cause irritation of the eyes, nose, throat, and skin, as well as inflammation and damage to the upper-respiratory tract.[2] Additionally, there is growing evidence that formaldehyde exposure may impact pulmonary function, and increase respiratory symptoms, asthma, and allergic sensitization in children.[3] There is evidence that some people can develop sensitivity to formaldehyde.[4] In 1989, EPA classified formaldehyde as

[4] Agency for Toxic Substances and Disease Registry. Toxicological Profile for Formaldehyde. 1999. http://www.atsdr.cdc.gov/toxprofiles/tp111.html

a probable human carcinogen. At that time, there was sufficient evidence in animals and limited evidence in humans from a set of 28 epidemiology studies.[5] In 2005, the International Agency for Research on Cancer (IARC) concluded that there is sufficient evidence in humans and sufficient evidence in experimental animals for the carcinogenicity of formaldehyde.[6]

EPA recognizes that since 1989 there has been additional research into the health effects of formaldehyde. EPA is currently engaged in a reassessment of the potential cancer and non-cancer risks of formaldehyde that will be entered into the EPA's Integrated Risk Information System (IRIS) program. As a result of the IRIS reassessment process, EPA will be reexamining its conclusions regarding the cancer risk of formaldehyde after considering the currently available scientific information, including human data. EPA will also be evaluating the non-cancer health effects of inhalation of formaldehyde.

The recent focus on formaldehyde in the Office of Prevention, Pesticides and Toxic Substances resulted from a March 2008 petition from 25 organizations and approximately 5,000 individuals to adopt the California state regulation concerning emissions of formaldehyde from three types of composite wood products: 1) hardwood plywood; 2) particleboard; and 3) medium density fiberboard. They petitioned EPA to assess and reduce the risks posed by formaldehyde emitted from these products by exercising its authority under TSCA section 6 to: adopt and apply nationally the California formaldehyde emissions regulation for these composite wood products; and to extend the regulation to include composite wood products used in manufactured homes.

In response, EPA announced on June 24, 2008, that it was partially granting and partially denying the petition. While the Agency denied the specifics of the petition request, EPA announced plans to develop and issue an Advance Notice of Proposed Rulemaking (ANPR) to initiate a proceeding to assist us in obtaining a better understanding of the available control

[6] IARC Monographs *on the Evaluation of Carcinogenic Risks to Humans* (see http://monographs.iarc.fr/ENG/Monographs/vol88/index.php and http://monographs.iarc.fr/ENG/Meetings/88-formaldehyde.pdf)

technologies and approaches, industry practices, and the implementation of California's regulation.

The ANPR was issued on December 3, 2008 and describes EPA's initial steps in that investigation and requested comment, information, and data relating to formaldehyde emissions from pressed wood products. The notice also announced a series of public meetings to obtain additional stakeholder input which took place in early 2009. In 2009, the Administration conducted an additional meeting in New Orleans to provide an opportunity for residents of the so-called "FEMA trailers" to offer their views.

As I noted, EPA is working towards an updated IRIS cancer and non cancer assessment regarding health effects of inhalation exposure to formaldehyde, and this should be ready for external review soon. The Agency has asked the National Academy of Sciences to provide independent external scientific peer review and EPA will also offer opportunities for public comment on the underlying science. Also, we are conducting an exposure assessment this year and will focus on exposures in communities with environmental justice concerns. In addition, we are developing an industry survey to characterize the current industry practices, control technologies and the extent to which the industry has adopted the California standards.

The point of these efforts is to gain a greater scientific understanding of the potential health risks associated with the use of formaldehyde in pressed wood products. In turn, this vital information will inform the regulatory approach EPA will take on formaldehyde, as we consider whether it is appropriate to use our authority under TSCA to ban or restrict the use of formaldehyde in pressed wood products.

The challenge of regulating chemicals under our current TSCA authorities is worth noting. As Congress moves toward TSCA reform legislation, we have stated in previous hearings that as a result of the legal and procedural requirements TSCA places on EPA prior to collecting data, there are large, troubling gaps in the available data and state of knowledge on

many widely used chemicals in commerce. Chemical producers are not required to provide, without further action from EPA, the data necessary to fully assess a chemical's risks.

In the cases where EPA has adequate data on a chemical and wants to protect the public against well-known risks to human health and the environment, there are legal hurdles that prevent quick and effective regulatory action. Meanwhile, the public may be exposed to chemicals for which we have little understanding of the consequences.

As has been frequently cited, after years of study, EPA issued a rule in 1989 phasing out most uses of asbestos – a chemical whose health effects had been exhaustively studied and demonstrated to cause lung cancer, mesothelioma and asbestosis in humans. Yet, a Federal court overturned the rule because EPA failed to clear the hurdles imposed under TSCA before existing chemical risks can be controlled. In regards to formaldehyde, the Agency noted in its 2008 ANPR that,

> "On the basis of the significant differences in the legal standards applicable to the California Health and Safety Code (H&SC) and TSCA section 6, and the insufficiency of the information available to EPA for purposes of conducting the TSCA section 6 analysis, EPA is not granting the specific request in the petition to commence a proceeding under TSCA section 6 to impose the CARB formaldehyde ATCM nationwide. Even if the information available to EPA were sufficient to support an evaluation of whether formaldehyde in composite wood products presents or will present an unreasonable risk, petitioners have not provided sufficient information, and EPA does not otherwise have sufficient information, to evaluate whether the CARB ATCM would likely be the least burdensome alternative necessary to protect adequately against such risk."

This finding illustrates the inherent difficulties the Agency faces in regulating chemicals under TSCA.

Restoring confidence in our chemical management system is a top priority for EPA and an environmental priority for the Obama Administration. This Administration's principles for how TSCA should be revised and modernized call for stronger and clearer authority for EPA to collect and act upon critical data regarding chemicals risks. Under a reformed TSCA, EPA should have the necessary authority and tools, such as data call in, to quickly and efficiently require testing or obtain other information from manufacturers that is relevant to determining the safety of chemicals, and should also have clear authority to take risk management actions when chemicals do not meet the safety standard, with flexibility to take into account a range of considerations, including children's health, economic costs, social benefits, and equity concerns.

EPA currently anticipates being able to make a determination on pursuing regulatory action on formaldehyde in 2011. If we were to have the information and data necessary to propose a new regulation at that time, a final rule could be anticipated one to three years later, depending on the comments we would receive and the additional analysis and consultations which may be required in order to finalize.

As this Committee considers legislation on formaldehyde, we agree that formaldehyde is a hazardous chemical and support the goal of legislation in reducing the risks from formaldehyde in pressed wood products. Reducing formaldehyde emissions in pressed wood products should be an important public health goal. California has made a valuable contribution to formaldehyde emissions reductions through its standards and is providing a clear model for addressing this problem. We look forward to working with this Committee as it moves forward to reduce exposure to formaldehyde from these products. It is our hope that Congress will also be able to act on TSCA reform, since the Administration believes it is important to work together to quickly modernize and strengthen the tools available in TSCA.

Thank you for the opportunity to present EPA's views, and I am happy to answer any questions the Subcommittee may have.

Mr. RUSH. Mr. Julia, you are recognized for 5 minutes.

TESTIMONY OF TOM JULIA

Mr. JULIA. Thank you, Mr. Chairman, Ranking Member Radanovich, members of the subcommittee, and thank you in particular to Mrs. Matsui for taking the leadership to introduce this important piece of consumer legislation.

I am Tom Julia, president of The Composite Panel Association, a not-for-profit association representing more than 90 percent of the North American production of particleboard, medium-density fiberboard and hardboard. We are representing manufacturers of two of the three products regulated under this legislation, and we are here to offer to our strong support.

Composite panel products used in construction materials, furniture, cabinets and for hundreds of other uses are a major worldwide industry. In the United States alone, panel mills employ thousands of workers and the sale of our product affect hundreds of thousands of manufacturing jobs, typically in small rural communities throughout the Nation. We are among the greenest industries in the world, and most U.S.-made products use 100 percent recycled residual or post-consumer wood. CPA itself is a world leader in quality assurance, product testing and certification and sponsorship of voluntary industry standards.

I am proud to say today that nearly 100 percent of U.S. production capacity of particleboard and MDF is compliant with the California standard phase I and in many cases phase II, the levels that would he required under this legislation. Our sister trade association, the Hardwood Plywood Veneer Association, represented in the audience today, can tell you a comparable story for hardwood plywood products, the other product regulated under this bill.

None of this happened by accident. It took a long-term commitment to lower emission levels, a major and ongoing capital investment in new technology, and an early commitment to the California rule and to meeting its deadlines. We wish that everyone would share this strong commitment to product stewardship and lower formaldehyde emissions, especially some of those making products overseas that are bound for American markets. Fortunately, most of the U.S.-based trade associations representing offshore producers have strongly committed themselves to supporting this bill and responsible importers are meeting the CARB rule. But there is still too much product entering the U.S. market made by companies who don't participate in trade associations, who don't get their products tested and certified, who don't sell into California and who often sell low-priced goods to the most vulnerable of our citizens. These are the bad actors that H.R. 4805 will reach while at the same time ensuring a consistent standard of compliance and enforcement throughout the United States.

By establishing national requirements, you will give the American public full confidence that panel producers are doing everything possible to minimize the environmental footprints of our products, that a rigorous federal standard stands behind these products and that compliance doesn't just happen some of the time, it happens all of the time. We submit to you that is good for public

health, this is good for domestic jobs and this is good for the American consumer.

We are here today at a rare moment in history when industry and environmentalists, labor and health care groups can come together and support a common result. This is also a day to think, as we heard earlier today, about the emergency housing units provided to victims of Hurricane Katrina and Hurricane Rita. Had there been a national emissions standards in place and third-party testing and certification to validate compliance, it is very possible there never would have been a FEMA trailer problem, at least one related to formaldehyde emissions from composite wood. And by passing this bill, you can make a statement that says we will never let it happen again.

I cannot say enough about third-party testing and certification. Responsible industries around the world are embracing it and it indeed has become our industry's equivalent to what President Reagan called trust and verify. It is also the key to the success of this bill.

In closing, I urge you to take what California has called the toughest production standard in the world and make it America's standard too. Earlier today there were some questions about preemption and the impact of this bill on the States, and I would be happy in my responses to questions to address those, Mr. Chairman, or at this time. Thank you so much.

[The prepared statement of Mr. Julia follows:]

US HOUSE OF REPRESENTATIVES
SUBCOMMITTEE ON COMMERCE, TRADE AND CONSUMER PROTECTION
LEGISLATIVE HEARING ON HR 4805
THE FORMALDEHYDE STANDARDS IN COMPOSITE WOOD PRODUCTS ACT
MARCH 18, 2010

STATEMENT OF THOMAS A. JULIA
PRESIDENT, COMPOSITE PANEL ASSOCIATION

Thank you Mr. Chairman and members of the Subcommittee for this opportunity to address you today about a bill with significant implications for American consumers.

I am Tom Julia, President of the Composite Panel Association (CPA), a trade association celebrating its 50th anniversary of service this year. The CPA represents companies responsible for more than 90% of the North American production capacity of particleboard, MDF and hardboard. We also represent most of the companies making wood-based decorative surfacing materials, as well as others affiliated with the composite panel industry.

The CPA represents manufacturers of two of the three major products that would be regulated under HR 4805, and I am here today to offer our strong support for this legislation.

Composite panel manufacturing and the use of our products in both construction applications and home and office furnishings, is a major worldwide industry. In the US alone our mills employ more than 20,000 workers, and affect more than 350,000 additional jobs, typically in small rural communities through the nation.

We pride ourselves as being among the greenest industries in the world, as almost all of our members' panel products are made with 100% recycled, residual or post-consumer wood. Indeed our industry is predicated on recycling and always has been. The CPA itself is a world leader in quality assurance, product testing and certification, sponsorship of voluntary industry standards, and development of technical data about industry products. Moreover, we have shared our technical expertise with organizations throughout the world, even assisting several international consumer product testing organizations who today are testing panel

products in China that are bound for the US. We believe this it is a good think that the consumers have high confidence in the composite wood products in their homes and offices regardless of the source, and we are committed to supporting global manufacturing too, even though our members' markets are exclusively domestic.

I am also proud to say that virtually 100% of both US and Canadian production capacity of particleboard and MDF is already certified to meet or exceed the CARB Phase 1 emissions levels, and many are already meeting the Phase 2 limits that go into affect for our products beginning next year. A sister association, the Hardwood Plywood Veneer Association, reports similar success for hardwood plywood products, the third of the three products regulated under HR 4805.

None of this happened by accident. It took a long term commitment to lowering emission levels, a major capital investment in technology, and an early commitment to the CARB rule and to meeting its deadlines. In no other part of the world has there been such a commitment and urgency to product stewardship and regulatory compliance, even for US markets where the CARV rule is not enforceable.

For decades CPA has operated the largest and most stringent third party testing and certification program for composite panels in North America. It includes monthly audits and random testing to assurance compliance with both formaldehyde emission requirements as well as physical properties. We operate a state-of-the-art International Testing and Certification Center in Leesburg, Virginia, where we can test to even the exceeding challenging tolerances of CARB Phase 2 emission requirement as well as other ultra-low emitting criteria.

The third party testing and certification requirements embedded in California's emission rules are based in large part on the CPA's Grademark Certification Program, and we were the first organization worldwide to be recognized and approved as a CARB-approved Third Party Certifier.

In short, we know a lot about composite wood products and about the use of formaldehyde based adhesives, and we have a demonstrated record of helping industry achieve and document increasingly lower emission profiles for its products.

We are convinced that it is imperative that our customers and the American public have full confidence that panel producers are doing everything possible to minimize the environmental footprint of our products and – equally important – full confidence that a rigorous, reliable testing and certification program stands behind our products, as mandated by federal law.

We wish everyone felt the same way and would demonstrate the same commitment, especially some of those responsible for the massive influx of composite panel products entering the United States from overseas. While things have improved since the CARB rule went into effect, and US-based trade associations representing many of these producers have strongly committed themselves to compliance with the CARB rule, there is still too much product that enters the US market without any regulatory oversight.

These are the bad actors that HR 4805 will enable the EPA to reach, while at the same time ensuring a consistent standard of compliance and enforcement not only in California but also throughout the United States.
To be clear, not all importers are of the same mind, and not all products manufactured offshore are suspect. Indeed many companies have a long track record of product stewardship on a global scale, and many others have moved quickly to make sure their products meet the CARB rule as well as any prospective national standard. But there are, and a Congressional directive can help EPA make sure that compliance doesn't just happen some of the time but rather all of the time. That means putting in place the first ever federal standard governing emission levels from composite panel products– no matter where they are made in the world if sold in the US, and no matter where they are sold in the US.

With CPA's considerable experience, we know that in the rare instances when products are found to emit high levels of formaldehyde, they are most often products made without regard to industry standards, international accreditations or in-house testing.

Beginning with HR 4805, and its counterpart in the Senate, the Congress has a chance to change this. I submit that your real challenge is not whether to move ahead and direct EPA to enact a sensible rulemaking but rather how quickly and comprehensively they can do so to effect meaningful change.

A lot of eager lawyers and expert consultants are waiting in the wings, hoping a multi-year extravaganza that costs the federal government and

American taxpayers millions of dollars, that costs industry even more, and that bogs EPA staff down for years before a federal rule is adopted.

Who would be served by this? Certainly not the American consumer, nor the domestic composite panel industry – nor public health itself.

Last summer CPA submitted comments in response to the Sierra Club's petition for rulemaking by the EPA. We said yes, fill the void and establish a national standard. We said base it on the work done by the California ARB over the past seven years to formulate its Air Toxic Control Measure for Composite Wood Products. No more, no less. We said resist the urge to go down the path of a complex TSCA 6(a) rulemaking approach and find a better way. We said this is a moment in history when industry, environmentalists, labor and health care groups can come together all support the same approach.

Last but hardly least, we were are still cognizant of the allegations of high formaldehyde emissions from the emergency housing units provided by FEMA to victims of hurricanes Katrina and Rita. The Sierra Club has it right on this one: had there been a national standard in place and a third party testing and certification regimen to validate compliance, its likely there never would have been a FEMA trailer problem, at least not one related to formaldehyde emissions from composite wood products manufactured here or abroad.

I am here today to urge Congress to give direction and urgency to EPA, and not permit the agency to be drawn into a long, complex and expensive rulemaking. Instead, I urge you to memorialize what California has done and take the "toughest production standard in the world" (CARB's words, with which we agree), and make it America's standard too. Do it now, do it this year and give the American people the full confidence that what's in our homes and offices has been subject to rigorous in-mill quality assurance, to third party testing and certification, to verifiable chain of custody documentation, and to an enforcement regimen with teeth.

CPA is pleased to be part of a coalition supporting this bill that includes the American Home Furnishing Alliance, the Business and Institutional Furniture Manufacturers Association, the Hardwood Plywood Veneer Association, the Kitchen Cabinet Manufacturers Association, the American Forest and Paper Association, the APA-Engineered Wood Association, and other major business groups. We are equally pleased that this coalition includes the

Sierra Club, the National Center for Health Housing, the United Steelworkers Union and other influential environmental and public health advocates. We thank and commend them for their early leadership on this matter, and note that many are represented on the panel or in the audience here today.

I will close be addressing two questions that have sometimes been raised during our discussions with members of Congress and others since last year, and that bear repeating.

The questions are why not pre-emption in this bill, and why not give EPA the opportunity to establish emissions ceilings that are different than those established by California.

While the CPA might support pre-emption, the typical reasons for desiring it do not necessarily apply here, and so we do not believe it is essential. This is not the case of asking EPA to develop an entirely new regulation that is unfamiliar to the 50 states. Rather, compliance with the CARB rule is already being practiced by industry throughout the United States, though perhaps less by some than others. Indeed, California's rule is becoming a *de facto* national standard, so the incentive for any state to do anything different is not there. If Congress directs the EPA to establish a federal standard based on California's parameters, this will only help ensure that other states are not tempted to initiate a rule of their own, and will ensure the certainty that all stakeholders look for in a regulatory outcome.

Our reasons for not making pre-emption a condition of passing this bill are also pragmatic. Indeed, the breadth of stakeholder and Congressional bipartisan support for this legislative approach to date has been the result of consensus. If pre-emption were to be made an issue now we beleve that consensus would unravel.

As to the levels themselves, the formaldehyde emission ceilings called for under the CARB rule are already exceedingly low, and the rule incentivizes the manufacture of what are termed Ultra Low Emitting as well as No Added Urea Formaldehyde adhesive systems. This is memorialized in HR 4805, and the American ingenuity – and the free market – is already responding by manufacturing dramatically lower emitting products over the past two years. This the appropriateness of once again addressing formaldehyde emissions from industry products again down the road is becoming moot. A federal standard based on CARB's approach will boost this positive direction and given everyone the assurance that at least the wood products sector is in full

compliance. Thus while we appreciate the desire to continue to address health related concerns about formaldehyde exposure, we submit that the levels of exposure that are possible under the CARB rule and a corresponding national standard are significantly below any reasonable level of concern. Moreover, the third party testing and certification requirement of the rule is the mechanism that will provide full confidence to the marketplace if implemented properly by the EPA.

Thank for again for holding this hearing and for the opportunity to address you today. CPA looks forward to continuing to support the work of the Congress on this important matter.

Mr. RUSH. Thank you.
The Chair recognizes Mr. Counts for 5 minutes.

TESTIMONY OF ANDY COUNTS

Mr. COUNTS. Good morning. I am Andy Counts, chief executive officer of the American Home Furnishings Alliance. I would like to thank Chairman Rush, Ranking Member Radanovich, members of the subcommittee for this opportunity to testify. I would especially like to thank Congresswoman Doris Matsui for her leadership along with Congressman Vern Ehlers for advancing this important legislation.

The AHFA is the world's largest trade association, serving the home furnishings industry. Member companies comprise an extensive global network of manufacturers who produce home furnishings or component parts constructed of composite wood products.

AHFA supports the regulation of formaldehyde emissions from composite wood products, and we support H.R. 4805. We believe that a national approach is crucial in order to avoid conflicting State standards and allow for the harmonized distribution of products and supplies.

AHFA along with wood products industry, environmental, health and labor organizations worked for more than 7 years with the California Air Resources Board to establish formaldehyde emission limits for composite wood products. These new emission limits are the most stringent in the world. Outside these emissions limits, however, there are several aspects of the California rule that cannot be implemented nationally. H.R. 4805 provides EPA the platform and flexibility needed to address these issues and modify the California approach, providing a commonsense, pragmatic national regulation.

Of critical importance will be the inclusion of adequate compliance timelines and sell-through provisions. Due to the unprecedented economic conditions of the last few years, inventory levels remain high. Unlike in California where noncompliant inventories could be moved to other markets, adequate sell-through provisions are needed nationally to accommodate increased inventories and slow inventory turns. We request a sell-through period of 36 months finished products following the compliance deadline for composite wood products.

It is important to note that the California formaldehyde standard and the national standard proposed under H.R. 4805 regulate emissions from composite wood products and not the finished products that contain composite wood components. In fact, the value-added steps associated with finished products such as lamination and finishing have been proven to lower emissions of composite wood components. EPA must focus compliance and enforcement where it belongs: at the point of manufacture and process control. The regulations should not contain any provisions for the testing of finished goods such as furniture or cabinets. If the raw board component parts are properly regulated, downstream users of these products will be required to purchase them and to only use or resell these safe products to consumers. This ensures the overall safety of the

global supply chain and the citizens who purchase home furnishings.

AFHA applauds the efforts of our global suppliers that have worked tirelessly to comply with the California standards. We stand ready to educate the industry on the new national standard and provide the tools necessary to ensure compliance on a global basis. We also look forward to working closely with EPA during the development of this regulation.

Thank you for this opportunity, and I look forward to answering any questions you may have.

[The prepared statement of Mr. Counts follows:]

Oral Testimony of Andy S. Counts

American Home Furnishings Alliance

Before the U.S. House of Representatives Subcommittee on
Commerce, Trade, and Consumer Protection

March 18, 2010

Good Morning. I am Andy Counts, the Chief Executive Officer of the American Home Furnishings Alliance (AHFA). I would like to thank Chairman Rush, Ranking Member Stearns and Members of the Subcommittee for the opportunity to testify. I would especially like to thank Congresswoman Doris Matsui for her leadership, along with Congressman Vern Ehlers, for advancing this important legislation.

The AHFA is the world's largest trade organization serving the home furnishings industry. Member companies comprise an extensive global network of manufacturers who produce home furnishings or component parts constructed of composite wood products. AHFA supports the regulation of formaldehyde emissions from composite wood products and we support H.R. 4805. We believe that a national approach is crucial in order to avoid conflicting state standards and allows for the harmonized distribution of products and supplies.

The AHFA along with the wood products industry, environmental, health, and labor organizations worked for more than seven years with the California Air Resources Board (CARB) to establish formaldehyde emission limits for composite wood products. These new emission limits are the lowest anywhere in the world. Outside these emission limits there are several aspects of the California rule that can not be implemented nationally. H.R. 4805 provides EPA the platform and flexibility needed to address these issues and modify the California approach providing a commonsense, pragmatic national regulation.

Of critical importance will be the inclusion of adequate compliance timelines and sell through provisions. Due to the unprecedented economic conditions of the last few years inventory levels remain high. Unlike in California where non-compliant inventories could be moved to other markets; adequate sell through provisions are needed nationally to accommodate increased inventories and slow inventory turns. We request a sell through period of 36 months for finished goods following the compliance deadline for composite wood products.

It is important to note that the California formaldehyde standard and the national standard proposed under H.R. 4805 regulate emissions from composite wood products and not the finished products that contain composite wood components. EPA must focus compliance and enforcement where it belongs, at the point of manufacture and process control. The regulation should not contain any provisions for the testing of finished goods, such as furniture or cabinets. If the raw board component parts are properly regulated, downstream users of these products will be required to purchase only these regulated products, and to only use or resell these safe products to consumers. This ensures the overall safety of the global supply chain and the citizens who purchase our products.

AHFA applauds the efforts of our global suppliers that have worked tirelessly to comply with the California standards. We stand ready to educate the industry on the new national standard and provide the tools necessary to ensure compliance on a global basis. We also look forward to working closely with EPA during the development of this regulation.

Thank you again for the opportunity to share our views on this important issue and I look forward to answering any questions you may have.

Mr. RUSH. Mr. Ryan is recognized.

TESTIMONY OF DON RYAN

Mr. RYAN. Thank you, Mr. Chairman, Mr. Radanovich and Representative Matsui. My name is Don Ryan. It is my pleasure to testify today in strong support of H.R. 4805. I testify on behalf of two organizations: the National Center for Healthy Housing and the Sierra Club. The National Center is dedicating to ensuring that all Americans' homes are healthy and safe through proven and practical steps. The National Center is concerned about formaldehyde because of the enormous body of scientific evidence documenting formaldehyde's human health risks. Formaldehyde is an irritant, an allergen, a cancer risk, and composite wood products are a significant source of exposure, and just as importantly, an opportunity to significantly reduce exposures.

The Sierra Club is one of the Nation's oldest and largest environmental organizations. It is committed to protecting public health as well as natural resources. And it was the Sierra Club that first called the Nation's attention to the dangers of high formaldehyde levels in FEMA trailers after Hurricanes Katrina and Rita. The primary source was manufactured wood products with formaldehyde glue, most of which apparently came from overseas.

The painful story of formaldehyde and FEMA trailers is not yet over as just last week the federal government announced the sale of 120,000 of these travel trailers. I am concerned about the sale at several levels. The trailers may pose formaldehyde hazards. They may pose other health hazards. Some of these trailers may come to be occupied as permanent homes, even though that is not their designed intent, and there is a chance the warning labels may be removed before the resale to future buyers. What I want to drive home is that all these health hazards, these headaches, these heartaches could have been completely avoided, and that is why H.R. 4805's enactment is so important.

I want to applaud Representatives Matsui and Ehlers for introducing this bill. I want to thank this subcommittee for holding this hearing and moving it forward.

I also want to take a minute to salute the staff of the California Air Resources Board because the opportunity before us today to advance public health across the Nation is due to their hard work over the past 7 years to carefully craft the standard that is protective, that is practical, that is enforceable. But there are limits to what one State can accomplish when it comes to a worldwide market for products such as composite wood products. As we have seen with other consumer products, with drywall, with dog food, with children's toys, ensuring compliance by overseas manufacturers is absolutely critical and often very difficult. The California formaldehyde standard is the toughest production standard in the world. The standard has already taken effect. The standard is already working. Manufacturers are already complying.

So at the most basic level, what H.R. 4805 does is two things. It extends the California standard's public health protections across the country as quickly as possible, and number two, it strengthens enforcement to level the playing field so that unscrupulous manufacturers cannot undercut responsible manufacturers.

So this bill is a giant step forward for public health. It has the support of environmental, health, labor and consumer advocates and this bill is a giant step forward for responsible manufacturers because it levels the playing field. It will create green jobs for American workers.

And finally, I want to note this bill is a big win for the American taxpayer because it avoids the complexities and the clumsiness of TSCA by directing EPA to issue its regulation without delay.

So I would urge this subcommittee's support of the bill. I think it deserves your bipartisan support. I hope it wins your unanimous support, and I ask each of you to urge the full Energy and Commerce Committee to recommend this bill's early approval by the full House.

[The prepared statement of Mr. Ryan follows:]

Don Ryan Statement on behalf of the Sierra Club and the National Center for Healthy Housing before the

House Subcommittee on Commerce, Trade, and Consumer Protection

March 18, 2010

Chairman Rush and members of the Subcommittee, I thank you for the opportunity to testify in support of H.R. 4805 as a representative of the Sierra Club and the National Center for Healthy Housing. Both organizations wholeheartedly support the bill and applaud the leadership of Representatives Matsui and Ehlers in introducing this important legislation.

The National Center for Healthy Housing is the nation's leading organization dedicated to creating healthy and safe homes for children through proven and practical steps. NCHH conducts research and provides training to health and housing professionals across the United States and promotes policies that make homes healthier. As one of the National Center's founders and a member of its board, I want to assure you the healthy homes community believes this bill takes our nation an important step closer to making homes healthier for all.

The Sierra Club is one of the nation's oldest and largest environmental organizations. For over 113 years, the Sierra Club has been dedicated to protecting our nation's natural resources and public health. Sierra Club, on behalf of its members, works to protect and enhance the health of the environment throughout the country. The Sierra Club has over 1.3 million members and supporters living throughout the United States.

Sierra Club has taken the lead nationally in fighting the battle to protect people from high levels of formaldehyde exposure. As a grassroots organization, Sierra Club got involved in this issue when the Club's Mississippi chapter began getting reports of serious respiratory problems from Hurricane Katrina and Rita survivors who were living in FEMA trailers. The Chapter chair, Becky Gillette, learned that formaldehyde may be a cause and began sampling the trailers for formaldehyde. The tests showed very high levels that – the Centers for Disease Control and Prevention conceded years later – were serious enough to warrant quick evacuation of the residents from these FEMA trailers. Wood products made with formaldehyde glue appeared to the primary source. While lawsuits may eventually resolve who was at fault, it appears that much of the wood involved was imported from overseas in the rush to meet the huge demand for FEMA trailers, and that little or none of it was subject to compliance with any federal or even voluntary industry standard. A national standard on formaldehyde emissions could have prevented all of this.

The Sierra Club and NCHH remain concerned about the long-term health impacts of the residents who unwittingly were exposed to such high levels of formaldehyde. We also remain concerned that last week, the federal government sold 120,000 of these trailers with only a simple warning in an effort to recover pennies on the dollar. As Ms Gillette told the Washington Post, "What if Toyota ordered a recall, then simply put a sticker on its vehicles saying they were unfit to drive before reselling them? There's a double standard for the government."

Beyond looking backwards to clean-up the mistakes from Hurricane Katrina and Rita, the Club looked forward to prevent future tragedies. For years, it had been tracking rulemaking by the California Air Resources Board to protect Californians from formaldehyde as a toxic air contaminant. In April 2007, California established aggressive technology-based standards to reduce formaldehyde from hardwood plywood, particleboard and medium-density fiberboard. These regulations set the most protective standards in the world through a practical, technology-based approach. More importantly, the standards included rigorous third party testing and certification to ensure compliance.

The North American manufacturers of the wood products responded immediately by committing to full compliance with the California rules. While they believed that California overstated the risk of formaldehyde, they saw the value in reducing the formaldehyde emissions and in being responsible stewards of their products.

Unfortunately, there are limits to State leadership when it comes to a worldwide market for products such as composite wood products. While California's use of third parties to certify compliance with the rule allows overseas manufacturers and importers to comply with the rule, it is especially difficult to enforce their compliance. And as we have seen with consumer products such as drywall, pet food, and children's toys, overseas compliance is critical – and difficult to ensure.

Therefore, the Sierra Club drafted a petition to ask the U.S. Environmental Protection Agency (EPA) to exercise its authority under the Toxic Substances Control Act (TSCA) and enact a national standard on formaldehyde emissions from composite wood products based on California's approach. More than 20 organizations joined in signing onto this petition. And, to its surprise, in less than a week more than 5,000 individuals representing every state signed the petition too.

The Club submitted the petition to EPA in March 2008. Three months later, EPA decided to hold a series of public meetings across the country. It eventually held seven hearings with the last hearing held in New Orleans in March 2009.

While reading the comments submitted by the industry, the Club realized that the manufacturers were committed to resolving the problem despite their opposition to the specific request in the Club's petition. It reached out to the key association – the Composite Panel Association – and through extensive discussions, NCHH and the Club realized that there was common ground for a legislative solution that would accomplish three goals:

- Set a framework for EPA rulemaking that gives stakeholders confidence that the outcome will be reasonable, timely, and effective
- More quickly level the playing field for North American producers to the benefit of public health
- Avoid a prolonged regulatory and legal battle over the risks presented by formaldehyde by relying on a technology-based approach that, while aggressive, can be achieved using current technologies

For the next year, Sierra Club and NCHH negotiated joint consensus legislative language and broadened the consensus to include the key industries that rely on composite wood products, such as furniture and cabinets.

Senators Klobuchar and Crapo introduced S. 1660 in September 2009. Under their leadership and the leadership of the Senate Environment and Public Works Committee, final language has been crafted that all stakeholders can support. The National Center for Healthy Housing and the Sierra Club fully support this compromise language.

H.R. 4805, which mirrors S. 1660, represents a careful crafted compromise balancing many competing interests. It builds on the excellent work of the California Air Resources Board. It will not single-handedly address all issues related to formaldehyde, but it takes a major step forward by addressing one of the most significant sources of formaldehyde emissions in a way that is responsible, enforceable, and is already being accomplished by most of our domestic manufacturers and some others around the world. Therefore, NCHH and the Club fully support this legislation. We thank Representatives Matsui and Ehlers for introducing it, and encourage the Subcommittee and the full Committee on Energy and Commerce to support this bill and recommend its early approval the full House to give EPA clear direction.

-- End --

Mr. RUSH. Thank you.
Dr. Andersen, you are recognized for 5 minutes.

TESTIMONY OF MELVIN E. ANDERSEN

Mr. ANDERSEN. Thank you, Mr. Chairman. Good morning. I am Dr. Mel Andersen, director, Program in Chemical Safety Sciences, The Hamner Institutes for Health Science.

I completely applaud the legislation. I think it is important for the American people, and I am here actually to take objection with the scientific basis of the California risk assessment that has been used to support the emissions standards.

My professional career spans 40 years and five or six employers. My primary area of expertise is pharmacokinetics, how chemicals get to target tissues in the body, what they do there. In 1998 I served as a peer reviewer for an alternative risk assessment other than the California risk assessment that was developed by an organization, the Chemical Industry Institute of Toxicology, peer reviewed in Canada. I was a peer reviewer for that process.

The Hamner is the successor to CIIT. I have worked at The Hamner since 2002. Before that I was a professor of environmental health at Colorado State University in Fort Collins, Colorado. Over the past 5 years, I have conducted research at The Hamner funded by the Formaldehyde Council to understand the changes in genes and gene expression in the nose when rats are exposed to formaldehyde. More recently, we have been studying this area called pharmacokinetics of formaldehyde in the nose.

I want to stress that today I am here neither representing the formaldehyde council nor The Hamner. I am here representing a 40-year practitioner in toxicology and risk assessment.

You, me, all of us have substantial amounts of formaldehyde in every single cell in our body. The number actually is 12,000 parts per billion. It is part of normal metabolism. We have to have it. Formaldehyde causes toxicity when inhaled concentrations increase the levels in the tissues in the front of the nose to cause toxicity, cell death, regeneration and ultimately cancer at high concentrations.

Our studies show that at 100 parts per billion, there is no increase in the amount of formaldehyde in tissues in the nose compared to background levels, background physiological levels. But formaldehyde is a carcinogen, yes. It is a nasal irritant, yes. In trailers where people are closed, it has irritant properties. It could cause asthma. And we need to protect against it and this legislation is a good legislation to help us protect people who are in these trailers, people who live in all kinds of homes.

My comments really come down to just two points. The California risk assessment is extremely conservative using what are now antiquated approaches from the 1970s. They have not been updated by a better understanding of the biology of formaldehyde, its effects on tissues or a better understanding of cancer biology now that we have moved into the 21st century. They are technologies that are quite old. The CIIT assessment that was done 10 years ago is still in some ways outdated. It is better. It actually predicts risks that are probably 2,000-fold lower than estimated by the California risk assessment but it is still outdated. Neither one of them

take account of the fact that there is a good bit of indigenous formaldehyde.

I provided two visuals, one a table showing this comparison of the risks from what is an EPA risk assessment, almost equivalent to the California one, and one is the CIIT assessment. I provided a table that shows as a function of concentration different effects, different exposures going from 5 to 10 parts per million in outdoor air to higher concentrations, and then ones in which we have irritancy, 300 parts per billion, the threshold limit value of the American Conference of Government Industrial Hygienists, and then on to concentrations which are clearly toxic.

The proposed legislation sets limits on emission rates from building products. I am an industrial hygienist. Among all the letters after my name, CIH is certified industrial hygienist. As a certified industrial hygienist, it makes good sense to me to limit off-gassing of formaldehyde from these products by good manufacturing processes and to protect people from irritation, from a likelihood of asthma and from respiratory distress. However, I am here today because I find it, in my professional judgment, I find it objectionable that this decision is being taken based on outdated biologically deficient risk assessment, an assessment that neglected a broad body of research on formaldehyde carcinogenicity, on formaldehyde toxicity, ignores the attributes of biochemistry of cellular formaldehyde, a physiological material in our bodies, and it creates the impression that formaldehyde at concentrations only several parts per billion poses a substantial, quantifiable cancer risk in people. That is the piece of the legislation that I find most worrisome that you are indirectly agreeing when you accept this—that levels of formaldehyde well below any that would cause any significant changes in formaldehyde in the body will cause cancer in some definable number of people in a population.

This legislation should endorse the reduction in emissions, clearly. I applaud the legislation. I applaud the people who have brought this legislation to the committee. I wish it could be done without endorsing the questionable risk assessment from California that significantly overestimates the risks of inhaled formaldehyde, and I believe in public concerns about some particular end points, especially cancer.

Thank you very much for this opportunity to provide this perspective on House 4805 and to visit a panel of this kind for the first time in my career. Thank you very much.

[The prepared statement of Mr. Andersen follows:]

Testimony on H.R. 4805
Committee on Energy and Commerce
March 18, 2010

"Formaldehyde Emissions and Formaldehyde Risk Assessment"

Melvin E. Andersen, PhD, CIH, DABT, FATS
Director, Program in Chemical Safety Sciences
The Hamner Institutes for Health Sciences
Six Davis Drive
Research Triangle Park, NC 27709-2137
MAndersen@thehamner.org

Introduction: Good morning. I am Dr. Melvin E. Andersen, Director, Program in Chemical Safety Sciences, The Hamner Institutes for Health Sciences, Research Triangle Park, NC. I am very pleased to be here today to offer brief personal comments on the science used to assess the risk of inhaled formaldehyde by the State of California. The California risk assessment, dating from 1992, provided the rationale for decisions about acceptable formaldehyde emission rates from various building materials. These acceptable emission rates have found their way into H.R. 4805 - the bill under consideration. The 1992 California risk assessment used methods that date back to the 1970's when our knowledge of cancer biology and of the steps in cancer causation were very primitive. Their approach over-estimates cancer risks of formaldehyde at low exposure levels.

My Background: My professional career, spanning nearly 40 years, has focused on understanding how chemicals enter the body, how they make their way into cells and tissues, and how they affect tissues to cause toxicity. My resume' lists nearly 400 published papers and book chapters. The goal of my work has been to make the best use of contemporary science in improving chemical health risk assessments. I am regarded as an international expert in the area of pharmacokinetic (PK) modeling, i.e., a discipline describing the processes by which chemicals reach tissues at sufficient concentrations to cause toxicity. Among my papers are six that describe aspects of toxicology and risk assessment challenges with formaldehyde. In addition, in 1998 I served on a multi-stakeholder panel – US EPA, Health Canada, CIIT and TERA - convened in Ottawa, Canada to peer-review an alternative formaldehyde risk assessment that more adequately considered the extensive toxicological data base on formaldehyde and nasal cancer. CIIT here refers to the Chemical Industry Institute of Toxicology – the organization that developed the alternative risk assessment. TERA - Toxicology Excellence for Risk Assessment – organized the peer-review process. Aspects of the CIIT risk assessment were published in 2003 and 2004.

Current Hamner Research with Formaldehyde: CIIT was the predecessor organization to the Hamner where I have worked since 2002. Scientists at CIIT first discovered the nasal carcinogenicity of formaldehyde in rats about 30 years ago and have conducted a diverse array of studies to understand the changes in nasal tissues caused by inhalation of various concentration of formaldehyde and the role these changes play in nasal cancer. Over the past 5 years, The Hamner has been involved in research supported by the Formaldehyde Council to look at the changes in expression of genes in the rat nose after formaldehyde exposures and especially to see the differences in gene expression for different levels of exposure. Gene expression patterns differed markedly for concentrations causing nasal cancer in rats, above 6000 ppb, and those where no nasal cancers occur, 2000 ppb and below. Two papers from this research, by me and by my colleague Dr. Russell Thomas, received awards from the Risk Assessment Specialty Section of the US Society of Toxicology. Over the last 3 months, we have extended our formaldehyde research program at The Hamner to examine the manner in which inhaled formaldehyde enters nasal tissues and increases concentrations of formaldehyde in epithelial cells at the front of the nose. This newest portion of our formaldehyde research, focusing on pharmacokinetics, has not been supported by the Formaldehyde Council. It has been self-funded by The Hamner. It also bears some emphasis that today I am representing myself and my professional opinions. I am neither representing the Formaldehyde Council nor The Hamner.

You, me and formaldehyde: Formaldehyde is not simply a commercial chemical. It is present in every cell in our bodies –your cells and mine - at substantial concentrations. Formaldehyde is formed during normal metabolism and participates in important cellular functions. Cells in the body have specialized chemical processes to deal with formaldehyde, keep its free cellular concentration low, and stay healthy. Formaldehyde toxicity occurs when inhaled concentrations lead to a significant increase of tissue formaldehyde in the epithelial cells in the front portion of the nasal airways. Our current studies, in an area called pharmacokinetic modeling, show that formaldehyde inhaled at concentrations of 100 ppb or below would not increase cellular formaldehyde in cells in the nose significantly over physiological concentrations. This aspect of formaldehyde biology, i.e., its presence in all cells as a natural metabolite, was not considered in either the 1992 California assessment or in the 1998 CIIT-assessment. Table 1 compares the relationship between exposure levels in ambient and indoor air with inhaled concentrations that lead to specific biological or pharmacokinetic responses.

Formaldehyde and Nasal Cancer in Rats: Formaldehyde unquestionably has the potential to cause toxicity when inhaled concentrations become sufficiently large. When people breathe formaldehyde at 1000 ppb, it causes burning and irritation of the eyes and tissues in airways. The American Conference of Governmental Industrial Hygienists (ACGIH) has recommended an

occupational exposure for formaldehyde of 300 ppb as a ceiling – a concentration that is not to be exceeded in the workplace. In rats that breathe formaldehyde for 6 hrs per day every week day for two years, higher concentrations, 6000 ppb and above, caused squamous cell cancer in the front of the nose. At 15000 ppb, over half of the exposed rats developed nasal cancer. It is my professional judgment that formaldehyde is likely to be a 'high dose' human carcinogen: it would cause cancer if you or I were exposed to 15000 ppb, which is a highly irritating, locally corrosive concentration, every day for most of our life. However, a large body of research now shows that nasal cancer from formaldehyde in rats is closely associated with epithelial cell toxicity and with the recurrent scarring and healing processes that go on in these two-year exposures. The CIIT-risk assessment was based on a better understanding of the relationship between cellular toxicity of formaldehyde, the repeated damage and healing, and cancer. My professional judgment, similar in principle to the conclusions of the CIIT assessment and shared by many other toxicologists/risk assessors, is that formaldehyde only poses a cancer risk if concentrations are high enough, above 1000 ppb, to kill cells in the nose. Differences in the estimated risks based on the older methodology versus the CIIT risk assessment are captured in Figure 1. The California risk assessment, similar to the EPA assessment dating to 1987, indicated that 100 ppb exposures over a lifetime would result in 700 cancers in a million exposed individuals. The CIIT assessment indicated a risk of only 0.33 cases in the same size population.

Recommendations: The proposed legislation sets limits on emission rates from building products. Setting the limits based on reductions of off-gassing compounds into breathing zones is a good public health practice. As a certified industrial hygienist, it makes sense to me to follow good manufacturing practices to keep emission rates low. However, it is highly objectionable to take this decision based on an out-dated, biologically-deficient risk assessment – an assessment that neglects a broad body of research on formaldehyde carcinogenicity and toxicity, ignores key attributes of the biochemistry of cellular formaldehyde, and creates an impression that formaldehyde at concentrations of only several ppb poses a substantial, quantifiable cancer risk in people. The legislation should endorse the reduction in emissions without endorsing the questionable risk assessment.

Exposure Category	Concentration Range
Ambient Air	1-5 ppb
Indoor Air	10-50 ppb
FEMA Trailers	77 ppb (Geometric mean)
PK: No Increase in Tissue Concentration	100 ppb
Occupational Standard, TLV Ceiling	300 ppb
Genomic Threshold	700 ppb
Genomic Oxidative Stress Markers	≥ 2000 ppb
Rat Nasal Cancer	6000 ppb

Table 1: Comparisons of human formaldehyde exposures, including the occupational exposure limit of 300 ppb, with the formaldehyde concentrations associated with increases in tissue formaldehyde in the nose, alteration in gene expression in nasal tissues, and rat nasal cancer. **PK** stands for pharmacokinetics; **TLV** is Threshold Limit Value, a trademark of the American Conference of Governmental Industrial Hygienists.

Upper-Bound Excess Cancer Risk at 100 ppb formaldehyde

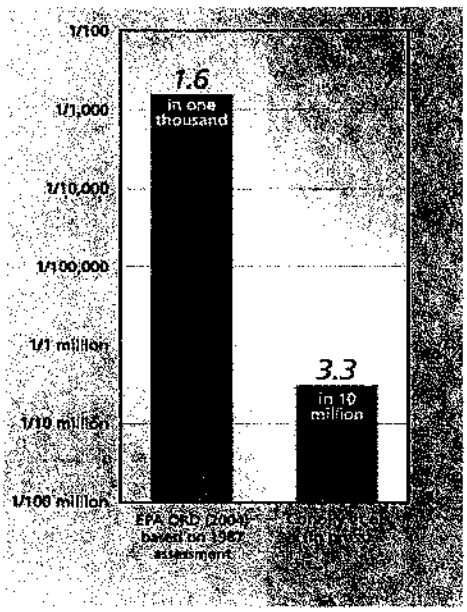

Figure 1: The graph shows the *estimated upper-bound excess lifetime cancer risk levels* for continuous long-term exposure to **100 ppb** formaldehyde in the air. At this exposure level, EPA's published assessment from 2004 predicted an additional cancer risk of 1.6 in one thousand people. The CIIT assessment estimates the cancer risk level to be 3.3 in ten million people. The 1992 California assessment estimated a risk of about 0.7 in one thousand, close to the EPA ORD assessment. This figure was adapted from the ACC-LRI Perspective- September 2004.

Mr. RUSH. Thank you very much, and I thank all the witnesses. The Chair recognizes himself for 5 minutes for the purposes of questioning the witnesses.

There are a number of questions that I might raise, and I guess in consideration of the limited time that I have, I really want to focus on this proposed sale that you alluded to, Mr. Ryan and Mr. Counts and others. This sale of these FEMA trailers and mobile homes, is this a wise undertaking by the federal government and are these mobile homes and trailers safe, and what course of action do you recommend that the federal government consider? I want to ask Mr. Jones and Mr. Counts and Mr. Ryan this question.

Mr. JONES. I don't feel it is appropriate for me as an EPA official to comment on FEMA, Homeland Security. We have briefed the officials from FEMA about our assessment and so they have awareness of how we view the risk associated with FEMA but it really, I think, is up to FEMA and Homeland Security to respond specifically to the appropriateness of their actions.

Mr. RUSH. Mr. Counts or any other—Mr. Ryan, Dr. Andersen, if you have any comments, I have 3 minutes.

Mr. RYAN. I would note the FEMA trailers present a vexing problem. We certainly can't say they are safe. FEMA can't say they are safe or EPA or CDC. In fact, the trailers are being sold with a label, a cautionary label that is intended to warn future buyers. The trailers are not intended as permanent housing units but we have a housing crisis in this country and almost certainly some of them will come to be occupied and used as housing, and there is a concern in the resale of those homes, whether the warning label may fall through the cracks.

Mr. RUSH. Mr. Counts.

Mr. COUNTS. I feel I wouldn't be qualified to respond on the FEMA trailers. Our members are not in the trailer business nor do they supply to that industry. So I will——

Mr. RUSH. Mr. Julia, Dr. Andersen raised some serious disagreements on concerns about the California standards, and what percentage of your membership are affected by the California standards?

Mr. JULIA. Mr. Chairman, it is fair to say that virtually the entire U.S. industry is affected by the California standards, and indeed we believe that even prior to California our industry was manufacturing using exceedingly low levels of formaldehyde and emissions levels are exceedingly low, and once perfected under phase II of California and under federal law will be truly de minimis standards. Moreover, the California rule as this federal bill does incentivizes industry to develop even lower, what are called ULEF and NAUF adhesive systems which indeed would do exactly what I believe public policy should do which would be to promote technological innovation and capital investment in lower-emitting technologies. But it is fair to say that the California regulation has become a de facto law of the land. It is indeed practiced almost throughout the United States by virtually every significant manufacturer or user of composite panel products. The problem with the California rule is that it is only enforceable in California.

Mr. RUSH. The Chair's time is expired. The Chair recognizes Mr. Radanovich.

Mr. RADANOVICH. Thank you, Chairman Rush, and I appreciate the testimony of all the witnesses.

Mr. Andersen, I am going to ask you a question. As I understand your testimony, your research in the weight of the current scientific evidence on formaldehyde shows that emission levels significantly higher than those permitted in California would not pose a health risk. Give me an idea of why you object to the standard set in California but also if you can give me an idea of the consequences of an emittance level that is set dramatically low.

Mr. ANDERSEN. I think the consequences from my point of view is that California law is based on causing cancer. It is based on an observation of cancer in rats at high doses when formaldehyde is corrosive. I mean, formaldehyde would cause cancer in you or I if we let ourselves be exposed to levels which were corrosive in our nose for our whole lifetime. We would walk away from it. But that is the basis. So they use that to make projections of very low-dose cancer risks, levels where the contribution of the formaldehyde is minuscule, absent to natural formaldehyde. That is the first. The second consequence from my opinion is the stress on trying to set the standard based on cancer. The FEMA trailer issue was one of irritation, respiratory distress and asthma. The levels should be based on asthma recognizing that formaldehyde doesn't pose a low-dose cancer risk. That is my professional opinion, which is shared by a large number of individuals.

Mr. RADANOVICH. Does formaldehyde air out? If you open the trailers in Louisiana for a certain amount of time, will that level diminish?

Mr. ANDERSEN. It will diminish, depending on how long this—there is so much in the wood and it will come out for a period of time and the concentrations in the air will continually diminish.

Mr. RADANOVICH. Thank you.

Mr. Julia, I appreciate your testimony. Your association comes out with a statement saying that the California standard is way too high and yet in your testimony, you support the bill and the legislation that sets it at the California standard. As I understand it, your association doesn't agree with what you are saying there. Do you want to reconcile that?

Mr. JULIA. I am not sure what is inconsistent, Congressman.

Mr. RADANOVICH. In March 1, 2002, in wood products, there was a belief that risk assessments upon which formaldehyde is being considered for regulation by the CARB in California are outdated and greatly overstate the potential for formaldehyde-related health problems. This was in a testimony on March 1st under Wood and Wood Products by Chris Leffle, who is the senior vice president for Composite Products Association.

Mr. JULIA. That is absolutely correct. When this regulation was introduced at the very end of 2001, it called for a de facto ban on our products, a de facto deselection of wood products, which we felt would have been a dramatic overreach and was initially linked to a very great degree on what we believe were challengeable health findings. In the 7 years as that evolved, California through significant evaluation of economic conditions or economic performance of our industry, technical capabilities of our industry and a whole lot of public workshops, I then came to be persuaded that their regula-

tion should be guided and I would have to therefore respectfully differ a little bit with the conclusion of my colleague on the panel here. California's decision, and indeed, I was in every one of those workshops, has been guided by technology, not by perceived cancer risk. Certainly they did that research and we have never said that—we have never acquiesced and said that we agree with those conclusions but their conclusions on the levels that they set in California were based on technological capability. It is, as they have characterized it, a "technology-driven regulation" and we think that is a very important distinction, one that is preserved in this legislation so it does not become a battle or a presumption that somehow current industry practices or current industry products present a health risk.

Mr. RADANOVICH. Thank you, Mr. Julia.

Mr. Andersen, that is kind of in conflict with what you were mentioning a little bit earlier, that it is a cancer risk assessment process and that your statements earlier mentioned being outdated and——

Mr. ANDERSEN. I think the cancer——

Mr. RADANOVICH [continuing]. Less scientific. Go ahead and respond to that.

Mr. ANDERSEN. I think the cancer risk assessment from 1992 fails to take into account a great deal of information about formaldehyde, its toxicity, its biology and it is outdated in that context. It is my understanding as I look through this legislation, and I have only been aware of it for a brief period of time in background, that the presumed risks from formaldehyde in the air were linked to this cancer model to develop emission rates.

Mr. RADANOVICH. All right. Thank you very much, Mr. Chairman.

Mr. RUSH. The Chair recognizes the gentlelady from California, Mrs. Matsui, for 5 minutes.

Mrs. MATSUI. Thank you, Mr. Chairman.

I have a question for Mr. Julia. H.R. 4085 would build upon the CARB rule by establishing national technology-based limits founded on the technological feasibility of the standards on formaldehyde emissions from most composite wood products. Now, industry has had a longstanding commitment to lowering emission levels, investing in technology and working collaboratively with regulatory authorities and public interest groups to set limits on emissions. Now, despite the strong commitments from domestic producers to voluntarily comply with the CARB rule, unacceptable levels of composite wood products are entering the U.S. markets without meeting our standards.

Mr. Julia, what are your estimates for the kind of economic productivity that heightening formaldehyde emission standards for composite wood products would create?

Mr. JULIA. Well, when the State of California first introduced its regulation, I think I was quoted at one of the first public hearings as saying that this was going to be the law of unintended consequences, that if in fact it didn't address trade issues, and indeed care and ensure a level playing field for domestic production, that we would in fact have the law of unintended consequences, that in fact domestic producers would be required to comply with a poten-

tially very onerous regulation whereas offshore producers would perhaps not have to comply with it, and indeed more of that product, the very product that California was concerned about, would enter the U.S. marketplace.

I think what we have seen is a significant evolution over 7 or 8 years, particularly in the offshore industry, which are represented by at least one individual here in this room such that they have come to make, I would say, a significant commitment among the responsible ones to comply with this regulation. I can tell you a story, a brief story of one of the largest home furnishings manufacturers in the world which does a tremendous amount of sourcing in Asia, and it has reduced over the past 2 to 3 years its number of suppliers by almost 75 percent. It really becomes a survival of the fittest sort of the thing where they have taken a look at the ability of their sources to meet the expectations not only in California but throughout the United States of the stewardship that is required in the California rule and would be required here and they have made the internal decision that for a matter of public policy, for a matter of corporate policy and for a matter of liability, they will only be sourcing for companies who can verify indeed that they produce products to lower formaldehyde levels.

And if I may, just in closing, return to the testing and certification part of this legislation. That is indeed the key because on all these issues, if you get to what level is the right level, what level is the lowest level, how do we enforce against imports, how do we enforce against domestic products, the secret to all of that, I believe, is to have third-party testing and certification whereby nobody is going to try to test every single table, every single chair, every single nightstand. That is physically impossible to do. Nobody is going to go into every store, nobody is going to go into every furniture mill whether for the federal government or the state of California or anybody else. That would be prohibitive. But you can verify all that through third-party testing and certification and create a chain of custody and a label where you can track every product all the way up to the testing agency that actually performed the initial testing.

Mrs. MATSUI. Mr. Julia, I take it you have no concerns about the implementation of the CARB rule nationwide at all?

Mr. JULIA. Concerns?

Mrs. MATSUI. Yes. No concerns about this implementation of the CARB rule nationwide?

Mr. JULIA. Well, I do have concerns. I think quite frankly there are 49 States in which you cannot enforce the CARB rule. The CARB rule—you know, I draw my analogy, the earlier comments today about carbon monoxide. Like Congressman Gingrey, I have a personal experience where my daughter was exposed to carbon monoxide poisoning at Virginia Tech 2½ years ago and nearly died, and I understand that in the State of Virginia we have no regulation of carbon monoxide. I understand that in the State of Maryland there is a very significant regulation on carbon monoxide detectors. The ability to simply say that because you have a rule in California which industry is embracing that that somehow solves the problem, I would submit to you, Congresswoman, that it does not solve the problem because you don't have a patchwork of dif-

ferent States doing things. In fact, you have nobody else doing anything. There is not a single State that is able to enforce that rule.

Mrs. MATSUI. That is why we are here today in actuality. So I don't have much time so I would yield back until—unless we have further time later on?

Mr. RUSH. The Chair will consider that.

The Chair now recognizes the gentleman from Louisiana, Mr. Scalise, for 5 minutes.

Mr. SCALISE. Thank you, Mr. Chairman. Just a few questions, first for Mr. Julia.

You had stated that if Congress directs the EPA to establish a federal standard based on California's parameters, this will only help ensure that other States are not tempted to initiate a rule of their own, and so I guess what I want to know is, do you know where specifically in the bill are other States prevented from passing different laws and regulations?

Mr. JULIA. Congressman, they are not. There is nothing in this bill that calls for federal preemption, and obviously that has been an issue of concern to a lot of folks. We would say perhaps in a typical situation, federal preemption is something we would support. This is a unique circumstance in which you have a State regulation where there has never been a federal regulation, there has never been any other State regulation, there is no other State that we are aware of thinking about a regulation, that California spent an awful lot of time working on and indeed a regulation they thought they would take a year or two to do. It took them 7 years to do, largely because they had a lot of input from stakeholders.

Mr. SCALISE. And it hasn't been fully implemented.

Mr. JULIA. It is in the process of being implemented. By the time this federal schedule kicks in, it will be fully implemented other than the sell-through periods of it.

We believe that because of the unique situation here and because of the difficulty of reaching accommodation within the Congress on this issue of preemption or not preemption, if you take a look at the particular facts and circumstances that really make this situation unique, you have a rule that the regulatory community, you have a rule that all of the industry stakeholders throughout the supply chain have embraced, that the environmental community, health care and labor community have embraced. We would argue that, you know, there is—I would pose the question, the rhetorical question, where else would California or any other State go at this point if the federal government stepped in and said we are going to take that model, we are going to make it apply to the entire United States. Essentially I would say problem solved. There is really no other place for a State agency, California included, to go at that point in terms of regulating our products, and that is certainly our hope and intention.

Mr. SCALISE. Mr. Counts, you had stated that "We believe that a national approach is crucial in order to avoid conflicting State standards and allow for the harmonized distribution of products and supplies." Yet of course, this legislation doesn't do anything to stop other States from enacting different or conflicting regulations. Would you be concerned if other States enacted different laws or regulations?

Mr. COUNTS. It is certainly a concern. Any time you have to create different products for your supply chain in different States, it would be very cost prohibitive. It is our thought that this is the most stringent standard in the world and there is no incentive for other States to follow and develop their own formaldehyde standard if we have a national standard that is in place.

Mr. SCALISE. Thank you. I yield back.

Mr. RUSH. The Chair wants to announce that we will have additional questions of the witnesses. The Chair recognizes himself for up to 3 minutes and the Chair will allow 3 minutes for each member to ask additional questions.

I want to clarify something for the record. In your written statement, Mr. Julia characterized the legislation as not giving EPA the ability to establish emissions limits that are different from those set by California. Mr. Jones, doesn't the legislation permit EPA to set formaldehyde standards at a given level after the initial rulemaking required by the bill?

Mr. JONES. Chairman Rush, the bill initially requires the agency to set formaldehyde standards that are the functional equivalent of the CARB standard. That is what the provision itself does. That wouldn't take away EPA's existing authorities under TSCA section 6 to regulate formaldehyde if it could make the findings required under section 6. So that authority would remain intact despite implementation of the bill that is before the Congress right now.

Mr. RUSH. The Chair recognizes the ranking member for 3 minutes.

Mr. RADANOVICH. Thank you, Mr. Chairman.

Mr. Julia, I recognize the national standard sounds good. I recognize your industry's concern about the bad players on composite wood. But does the industry also have a concern about a standard that is set unnecessarily low as it relates to the cost of the product that you are trying to produce?

Mr. JULIA. We absolutely would have such a concern, and at very many of the workshops in California this is exactly the argument that we made because if you look at the record, the initial proposals coming out of California were indeed very different than what ended up being the California rule and we felt that over a period of years and education and working cooperatively with the staff of the California Air Resources Board, they came to appreciate the technological capability of the industry, the curve that we have been on of lowering, lowering, lowering our emission levels. We have never said either prior to the California rule or since then that anything that we make is in any way, shape or form dangerous to public health. We have never addressed in those hearings that issue of the perceived risk.

We believe it is a legitimate inquiry but we don't think it bears on the issue here in that the levels that we are talking about in this legislation are so low we don't believe that they rise to the occasion of asking the health concerns and the exposure concerns that some parties would like to bring to the table.

Mr. RADANOVICH. Yet Mr. Andersen, your conviction is pretty firm that the standard could be 10 times higher and not pose a risk.

Mr. ANDERSEN. I believe that, but there is another significant concern I have, this idea that we are going to be conservative based on cancer and then talk about numbers of cancers people will have. I think this is a disservice to public health. It is a disservice to my neighbors, who only hear that this can cause cancer when it is not a significant carcinogen. It needs to be regulated based on the right reasons, and these regulations and assessments need to take in the body of information. I guess you are hearing a purist here that we have to do this for the right reason, and we shouldn't be scaring people. Right now we scare people with these conservative estimates that say you are going to have cancer. One in a million will have cancer. All people hear is, you will have cancer. And especially for things that aren't legitimate carcinogens at realistic human exposure levels. This is terrible public health policy. That is my professional judgment.

Mr. RADANOVICH. Thank you, Mr. Andersen.

Thank you, Mr. Chairman.

Mr. RUSH. Mrs. Matsui is recognized for 3 minutes.

Mrs. MATSUI. Thank you, Mr. Chairman.

I have a question for Mr. Counts. You know, we understand that this has been a long process and I think it has been addressed before—at the beginning of the process there was wide disagreement but through the process, I guess took about 7 years or so, there became a cooperative effort here between industry, the regulatory authorities and the public interest groups. And I think that is something that you have to look at, the fact that this wasn't done overnight and it really took people working together. But after years of review and rulemaking, CARB finalized the rules establishing these standards, the first phase of which went into effect on January 1, 2009. Now, we know H.R. 4085 will apply these standards nationwide. Now, Mr. Counts, do you believe that manufacturers of composite wood products outside the United States will be able to comply with this proposed standard?

Mr. COUNTS. I am confident that if they are given the appropriate compliance times and sell-through provisions that they will be able to comply. They have had to comply with stringent European and Japanese standards for several years now. The biggest hurdle with California was a brand-new testing requirement that international labs were not familiar with, but they are getting up to speed on that and compliance is coming along very aggressively. So I am confident that on a national basis, given the proper timeline, they can comply.

Mrs. MATSUI. Does AHFA anticipate any issues maintaining adequate supply levels once the regulation is promulgated?

Mr. COUNTS. Well, the United States is the largest market for home furnishings in the world, and this is the most stringent standard in the world, so as we get to phase II of the California levels on a national basis, there is going to be some trial and error from our panel suppliers to make sure that they are complying. Unless the economy improves greatly, there is going to be a lot of inventory out there that is not compliant. We have to make sure we have adequate time to sell through all that product and work through the kinks but hopefully that will not be a major issue.

Mrs. MATSUI. And what steps has industry generally and AFHA taken to reduce formaldehyde emissions over the years?

Mr. COUNTS. Well, we have several members that distribute nationally and they are embracing the California standard on a national level. We have some members that do not sell in California and they are finding it harder and harder to find panel that would not be compliant with California. So we are instructing them that the national standard is very likely and they need to move forward in that direction, and we are providing education and tools to make that happen.

Mrs. MATSUI. Thank you, and I yield back.

Mr. RUSH. Mr. Scalise.

Mr. SCALISE. Thanks, Mr. Chairman.

A couple of questions for Mr. Jones. Some of the panelists lament the perceived length of a section 6A rulemaking process. If in attempting to apply the CARB standard, if EPA used the quality control order provisions in section 6B instead, are there such concerns?

Mr. JONES. Thank you, Mr. Scalise. Section 6B under TSCA allows the agency to do facility-by-facility regulation. For some industries where there may be two facilities, it might be more expeditious to go in that manner. In the case of formaldehyde in pressed wood, I believe there are hundreds of facilities and so it may actually be longer using 6B going facility by facility than just having a national standard under 6A.

Mr. SCALISE. It seems to me that the major issue is imports. What can EPA do under all the existing legal authorities to address the issue of wood products with higher formaldehyde levels that are coming into our country from other nations?

Mr. JONES. So if there were a federal regulation either because we acted under 6A or this bill became law, it would apply to imports.

Mr. SCALISE. But what can you do under your current legal authority? Are there more things you can be doing right now to address those imports that are coming in from other countries that have higher levels of formaldehyde?

Mr. JONES. We would have to have a regulation in place, either one that we initiated or that was initiated because this bill became law before we could do anything related to imports, and right now there is not a federal regulation——

Mr. SCALISE. Clean Air doesn't give any kind of ability to you?

Mr. JONES. I don't believe that a hazardous air pollutant regulation would have any ability to influence imports, but that is something we can confirm.

Mr. SCALISE. All right. Thanks. I yield back.

Mr. RUSH. The Chair will recognize himself for just a couple more questions. Any other member who has additional questions, you will be recognized.

Mr. Jones, if EPA were to set different standards in the future, they would have to be issued under TSCA. Is that correct?

Mr. JONES. That is correct, Chairman Rush.

Mr. RUSH. But EPA has found it exceptionally difficult, if not impossible, to use that statute to regulate chemicals like formaldehyde. Would you agree that the inherent limitations of TSCA raise serious legal obstacles for EPA on this or any other issue?

Mr. JONES. I would agree with that. The agency is pursuing a formaldehyde assessment that may well lead to a regulation but it is going to be very difficult and tricky for us to get over the hurdle of least burdensome, the potential permutations that you need to analyze before you could be affirmative in your determination that you picked the least burdensome. It has proven to be very difficult for the agency. And so we are probably 3 to 4 years away from having a formaldehyde regulation in place but we are going to try to work with the existing statute to see what we can do.

Mr. RUSH. Mr. Ryan, do you have any comments on this issue that I raise?

Mr. RYAN. I would just endorse Mr. Jones' comments in terms of TSCA authority and the clumsiness of TSCA in getting to an early solution to the public health opportunity at hand.

Mr. RUSH. Thank you very much.

The Chair thanks the witnesses, all of you. You have been very sacrificial in terms of your time and we really appreciate it. The Chair wants to thank the members who were present and those who have remained present. The Chair wants to note that we will have hearings of this type in the future, and now the Chair announces that the committee is hereby adjourned.

[Whereupon, at 12:45 p.m., the Subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

Statement of the Honorable Joe Barton
Ranking Member, Committee on Energy and Commerce
Legislative Hearing on H.R. 4805
And H.R. 1796, the Residential Carbon Monoxide Poisoning Prevention Act
Subcommittee on Commerce, Trade, and Consumer Protection
March 18, 2010

Thank you for holding this hearing today to discuss these two bills. I am told there is a consensus behind the formaldehyde legislation we are considering today. Mr. Chairman, nothing is quite as intoxicating as feeling that you are part of a "consensus deal." And, nothing is as deflating as realizing the unintended ramifications of an ill-considered "consensus deal."

I know, because I felt the euphoria when we passed the precautionary Consumer Product Safety Improvement Act and, now, I feel the pain of seeing the major unintended consequences that law has wrought.

There are probably sensible reasons to support the provisions of this legislation. I think it is important, however, that we dissect what our committee is being asked to enact, and explore its implications rather than accepting, at face value, pleas to simply ratify a negotiated product as-is.

The overarching purpose of this bill is to codify the State of California's air emissions regulatory standard for formaldehyde in furniture and composite wood board. The bill uses explicit references to the state regulation -- something that not even the elected officials of California enacted.

I am troubled by this approach for two reasons: First, press articles around the time that California developed its regulation indicate that many people questioned the very risk assessment that was used to support the regulation. Indeed, many people believe that several subsequent studies, which bring the latest science to bear, actually refute California's conclusions about the role of formaldehyde emissions and their harm to humans. We should never use outdated science to regulate, particularly when both economic and human health are at stake. Second, the California regulation has been fully phased in yet. We don't yet know if it has resulted in an incremental improvement in either public health or affordable products. I regret that the State of California is not here as a witness to answer obvious questions about how this regulation is working.

This bill claims to be about EPA handling formaldehyde under the Toxic Substances Control Act (TSCA). But I am not sure why we would have the EPA regulate consumer products through TSCA rather than give that authority to the Consumer Product Safety Commission (CPSC) which is tasked with protecting the public from unsafe consumer products. Structurally, I think we need to know why TSCA is the appropriate venue when the Consumer Product Safety Act or the Federal Hazardous Substances Act might be better authorities for this effort.

Beyond the issue of blindly codifying one state's regulatory standard and applying it to 49 more states, the provisions of H.R. 4805 are all the more curious since TSCA has existing procedures for EPA to take the actions contemplated in this bill. In fact, EPA is considering a petition filed on March 24, 2008, by 25 organizations and 5,000 individuals to adopt as Federal law the same California regulation that H.R. 4805 contemplates. Given the controversy surrounding the risk assessment studies used in California, I would hope that EPA gets the science right this time. Moreover, I question whether the quality-control orders under TSCA Section 6(b), rather than TSCA generic regulatory authority under TSCA Section 6(a), might be a more efficient way to effectuate a change if needed. I hope our witnesses can explain this aspect of the debate to me.

I also have serious concerns about the lack of Federal pre-emption under this bill. I am told this legislation has been constructed to avoid the pre-emption section of TSCA and I am quite concerned about the implications this has for interstate commerce. In particular, because of the way this bill is drafted, the states could create and endless loop of new regulations and laws that makes selling these products in multiple markets a nightmare. This is terrible precedent and bad policy. If the weight of high-quality scientific study shows the problem to be serious enough to warrant federal intervention, we should have a meaningful national standard to address it. We should not send the message to Sacramento or other state capitols that we think they should be setting 50 different policies in 50 different places.

My last point about this bill is about the delegation of legislative powers to the Executive Branch. H.R. 4805 gives EPA the power to modify by regulation the standard we are create by statute. This is a recipe for trouble. We should write clear definitions about what Congress means. If EPA does not think that the law is doing what it should, then the Agency should come back up here and tell us what needs to be changed. We should not give the Agency a blank-check to do our job. I hope we will change that feature of this bill if we intend to mark-up this legislation.

I have reservations about H.R 1796, the Carbon Monoxide Poisoning Prevention Act, as well. As a principle matter, Congress should not simply pick and choose which voluntary safety standards should become mandatory. The CPSC is fully empowered to promulgate mandatory standards if the voluntary standards are inadequate or industry is not complying with those voluntary standards.. Neither is the case with CO detectors.

Similarly, this Committee travelled this path for a number of different existing standards in the previous Congress. We set a bad precedent and we are repeating the mistake. Industry has developed good standards. My Democrat colleagues acknowledge as much because they have plucked those standards and attempted to write them into law. But if we continue down this path, industry stakeholders are unlikely to continue to participate in the voluntary standard development process. And if that happens, the burden will fall to the CPSC alone and turn the CPSC into nothing more than a rule-writing agency for tens of thousands of consumer products. The CPSC will not be able to focus on enforcement. And that will not improve product safety.

Finally, I respect the sponsor of the legislation for his interest in promoting safety, but a grant program to states directing them to enact this policy is neither warranted nor appropriate. Twenty five states have already enacted laws requiring monoxide detectors in homes, generally as part of state building safety codes and permits. While the grant money may be a small amount by Washington standards, every taxpayer penny counts. It is our obligation to ensure that grant money is not used by the states as essentially the marketing arm of private companies to promote detectors. I think the responsibility for advertising should fall on the companies that make them.

I welcome our witnesses and look forward to their testimony. Although I have been critical in my opening remarks, I keep an open mind -- it's just going to take some serious convincing. I remain concerned that dealing with the issues these bills raise may be compromised by a desire not to disrupt a "deal" that private stakeholder interests have cut amongst themselves and other legislators. I hope this Committee will address these problems in a worthy manner.

I yield back the balance of my time.

Denver, CO 80204

Dear Dr. Lavonas:

Thank you for appearing before the Subcommittee on Commerce, Trade, and Consumer Protection on March 18, 2010, at the hearing entitled "H.R. 1796, the Residential Carbon Monoxide Poisoning Prevention Act, and H.R. 4805, the Formaldehyde Standards for Composite Wood Products Act."

Pursuant to the Committee's Rules, attached are written questions for the record directed to you from certain Members of the Committee. In preparing your answers, please address your response to the Member who submitted the questions.

Please provide your responses by April 28, 2010, to Earley Green, Chief Clerk, via e-mail to Earley.Green@mail.house.gov. Please contact Earley Green or Jennifer Berenholz at (202) 225-2927 if you have any questions.

Sincerely,

Henry A. Waxman
Chairman

RE: HR 1796, the Residential Carbon Monoxide Poisoning Prevention Act

Dear Representative Matsui,

Thank you for your interest in HR 1796. I am happy to answer your questions, and apologize for my brief delay in doing so. I do need to state that the opinions I am about to express are my own, and do not necessarily represent the views of the Denver Health and Hospital Authority.

In response to your questions:

The U.S. Consumer Product Safety Commission (CPSC) has employed a three-part approach to address CO poisoning from consumer products that: (1) reduces or eliminates CO production at the source, (2) alerts customers to CO hazardous levels, & (3) educates consumers to the dangers posed by CO.

1. Is it possible or warthwhile to expand this approach?

As you correctly point out, any effective plan to reduce deaths due to CO poisoning will require three elements: (1) source reduction, (2) early detection and warning, and (3) public education.

The CPSC has taken positive steps in each of these dimensions. Using a data-driven approach, they have identified the type of consumer product responsible for the largest number of severe CO poisoning cases (electrical generators) and prioritized this product for engineering controls, studies of automatic shut-off devices, and mandatory warning labels.

DENVER HEALTH

The strength of this approach is that CPSC has engineering and risk-communication expertise, and knows how to work with industry to drive effective change. I support the CPSC efforts to date, and hope these efforts will continue.

There are limitations which CPSC cannot overcome, even with an expanded CPSC-based strategy. These limitations will have to be addressed by another means.

First, consumer products are only responsible for about half the unintentional CO poisoning in the US, and only a small fraction of the attempted suicide by CO poisoning. Motor vehicles cause more CO poisoning deaths overall than consumer products. Motor vehicle emissions are regulated by EPA, not CPSC. CPSC is not permitted to work on CO poisoning related to motor vehicle exhaust. The structure and customs of federal government operations make it difficult for topic experts to work together across agency lines on anything but the most informal basis.

Second, there is a practical limit to the ability of each element of the CPSC approach. Although engineering controls can greatly reduce the amount of CO produced by a new item (generator, stove, furnace, etc.), items eventually wear out, go out of adjustment, or simply break. People routinely ignore safety warnings and actively defeat safety devices engineered into consumer products. Although we'd all like to see a CO detector coupled to an automatic shut-off device on electrical generators, my understanding is that reliable technology just isn't there yet.

It is possible and worthwhile for CPSC to expand the approach they've taken with generators to other consumer products. In particular, priority should be given to engineering studies of CO detection/alarm/shut-off devices integral to home heating systems. In addition, I would propose:

(1) The creation and funding of a CO poisoning group within the CDC. With 3-5 dedicated FTE's and a modest research/implementation budget for CO poisoning prevention, the Air Pollution and Respiratory Health Branch of the CDC's National Center for Environmental Health could focus on this issue and finally make real progress on reducing death and disability due to CO poisoning.

(2) A statement from Congress directing Federal agencies to improve interagency cooperation on CO poisoning prevention issues. This need not cost money: we just need to give staff at CPSC, EPA, CDC, HUD, etc., permission to work with each other more closely.

(3) A directive from Congress that the EPA establish a standard for CO levels in indoor air. Although OSHA has workplace standards for indoor air, to my knowledge there is no regulatory standard for indoor air in general.

I recognize that these proposals go beyond the wording of H.R. 1796. I would be happy to work with the Committee or interested Representatives to explore these or other ideas in more detail.

2. In addition to supporting H.R. 1796, which industry has largely done, what other ways could stakeholders be helpful to comprehensively address the problem of CO poisoning?

Of the three approaches described above, I think that the "low-hanging fruit" is early detection by the widespread use of CO alarms. The fastest way to reduce the death and disability numbers is to increase the number of homes and businesses with working CO alarms. Although I'm not discounting the value of improved engineering and public education campaigns, CO alarms are something that we can implement rapidly and at low cost.

In an ideal world, I would like to see a requirement for CO alarms in all occupied structures, similar to the current smoke alarm requirement. Although we'll get there eventually (both the International Residential Code – 2009 and the National Fire Protective Association Standard 720-2009 require CO alarms), the Congress could save hundreds of lives and prevent thousands of cases of severe CO poisoning each year by taking this step.

Short of such a bold move, some partial steps might include:

(1) Requiring CO alarms in all housing units paid for by the federal government. Each agency (HUD, DoD, Park Service, State Department, etc) already has a list of minimum requirements, including smoke alarms. Congress could direct each agency to add CO alarms to this list of requirements, thereby saving the lives of HUD beneficiaries, federal employees, and their families and reducing federal health care costs used to treat CO poisoning in these victims.

(2) Requiring CO alarms in day care centers, dormitories, and other places where large numbers of children sleep. Current mandates require smoke alarms, but not CO alarms. Children are unable to take personal steps to prevent CO poisoning, and must rely on adults to do so on their behalf. Congress could require that adults provide CO alarms to protect children.

(3) Requiring CO alarms in hotels, motels, and other places where travelers sleep. Current mandates require smoke alarms, but not CO alarms. Recent research shows that serious CO poisoning events in hotels, motels, and resorts are too common to ignore.[3] Travelers are unable to take personal steps to prevent CO poisoning, and must rely on property owners and managers to do so on their behalf. Congress could require that property owners provide CO alarms to protect travelers.

(4) Providing funding to the states to defray their costs associated with implementation of CO alarm programs. When states enact CO alarm laws, they have to pay to install alarms in property they own and manage, such as dormitories, prisons, and official residences. This cost is a barrier to the passage of state CO alarm laws. Although H.R. 1796 provides some

[3] Weaver LK, Deru K. Carbon monoxide poisoning at motels, hotels, and resorts. *American Journal of Preventive Medicine* 2007; 33(1): 23-7.

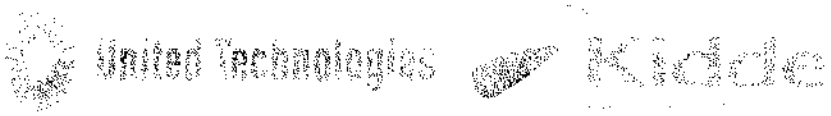
funding, the amount of money is probably insufficient to have a large impact. Congress could support states that wish to implement CO alarm programs by assisting with these costs.

Once again, I recognize that these proposals go beyond the current wording of H.R. 1796. I am happy to explore these or other ideas in more detail, either for this bill or future legislation.

Thank you very much for taking time to learn more about CO poisoning, and for taking steps to reduce the number of Americans burned each year. I am happy to address any further questions.

Sincerely,

Eric Lavonas, MD, FACEP, FACMT
Associate Director



ANSWERS TO QUESTIONS FOR THE RECORD
PROVIDED BY
JOHN ANDRES, DIRECTOR OF ENGINEERING,
KIDDE RESIDENTIAL AND COMMERCIAL
ON
CARBON MONOXIDE POISONING PREVENTION

APRIL 27, 2010

1. How has industry worked with the CPSC and other stakeholders to develop voluntary standards to improve consumer product performance?

Answer: Via the standard's technical panel, industry leaders and the CPSC remain in contact regarding new studies, technology advances, and other criteria to ensure quality product performance. In addition, both parties provided input into the evolution of UL 2034, the third-party standard to which CO alarms are voluntarily tested and listed. In the 18 years since first being published, the standard has gone through several revisions, each of which is based on years of field test data intended to progressively strengthen the standard.

2. How will analyzing product safety performance of CO alarms help foster private sector innovation and create jobs in our economy?

Answer: As the standard for CO alarm quality becomes mandatory, there will be potential for new businesses to evolve surrounding specific industry needs. In addition, the awareness of the standard could lead to an increase in technology innovation, which would stem from entrepreneurs and other business development.

3. Is it possible to reduce deaths and injuries associated with CO poisoning without a stronger regulatory law or reducing the risk of CO at its source?

Answer: Yes, it is possible to reduce CO poisoning deaths and injuries without stronger regulatory laws. This bill, we believe, appropriately strengthens the regulatory requirement and offers grants to raise education and awareness. We believe that both stronger regulations and education are critical. Most state laws requiring CO alarms do not have strict compliance measures for homeowners, and officials/nonprofit organizations/fire departments rely on education and awareness to encourage them to install CO alarms. Without funding to educate the public about the dangers of CO and the need for CO alarms, a reduction in CO poisonings will be limited.

4. What are your estimates for the kind of economic productivity that designing and building products in a manner that would ensure greater consumer protection from CO exposure would create?

Answer: We estimate that the need for safer products could result in additional positions in service and innovation markets, as well as prompt new business development.

For additional information please contact Libby Elliott at (202) 336-7406 or Tom Sri at (919) 563-5911 ext 8543.

April 28, 2010

Honorable Henry Waxman, Chairman
Committee on Energy and Commerce
2125 Rayburn House Office Building
Washington, D.C. 20515

Dear Chairman Waxman:

Thank you for the opportunity to testify before the Subcommittee on Commerce, Trade and Consumer Protection on March 18, 2010. The Composite Panel Association (CPA) represents companies that are among those most impacted by H.R. 4805 and we strongly support passage of this bill.

H.R. 4805 has significant value to American consumers and public health generally, as well as to the competitiveness of domestic wood products manufacturers and hundreds of thousands of American jobs.

My responses to the questions posed in your letter dated April 14, 2010, are provided below.

Rep. Barton questions on pre-emption.

The bill as introduced contains no pre-emption provision that would prevent a state from initiating a rule of its own covering formaldehyde emissions from composite panel products, but CPA believes this is highly unlikely. This is because California enacted an exceedingly comprehensive regulation in early 2008 after more than six years of work with a wide range industry stakeholders. CPA spearheaded this industry dialogue with CARB through the broad based California Wood Industries Coalition (CWIC), which included both California-based and national organizations and companies. California's regulation was enacted with broad support, and there is no incentive for CARB or any other state agency to replicate or expand on this approach. Moreover, this rule has filled a vacuum and become a "de facto" national standard, since there never has been a comprehensive federal regulation in this area.

Affected parties throughout the U.S. and around the world have quickly seized on California's rule as their means of assuring environmental compliance regardless of where they sell products in the U.S., and H.R. 4805 creates a further disincentive for a competing approach by California or any other state. Also, the "third party testing and certification" (TPC) mechanism called for by California's rule embraces a stewardship approach already widely practiced in the U.S. and Canada, and now around the world too.

CANADA
Post Office Box 747, Station "B", Ottawa, Ontario K1P 5P8 • Tel 613.232.6782 • Fax 703.724.1588
INTERNATIONAL TESTING AND CERTIFICATION CENTER
73 Lawson Road, Suite 101, Leesburg, Virginia 20175 • Tel 703.724.1128 • Fax 703.724.1588

The CARB rule is working, and this result has made a positive contribution to product quality assurance and to fair trade. The long term result could be good for domestic jobs and manufacturing, as well as for public health, and the prospect of any other state coming up with its own regulatory approach is remote.

The problem with California's rule is that it cannot be enforced in any state except California, and that there is a risk of harm to domestic industries for this very reason. A federal standard modeled on the CARB approach would remedy this form the standpoint of nationwide enforceability. It would also provide additional assurance that no other state might seek to develop a different enforcement mechanism of its own.

If any state were to develop a regulatory approach inconsistent with what CPA hopes the federal government will do, we would strongly oppose such an effort and expect to be supported by a broad coalition of industry, environmental, labor and health care groups, all of which have come together in an unusual way in support of H.R. 4805 and its counterpart S. 1660.

Rep. Matsui question on economic productivity.

H.R. 4805 will go a long way toward successfully addressing concerns about formaldehyde emissions from wood products, and toward providing further consumer confidence in industry products sold in the U.S. regardless of where they are made in the world. Most concerns that have arisen over the years about formaldehyde emissions from wood products relate to finished goods made offshore and those that do not comply with even the voluntary industry standards that have overwhelmingly embraced for decades by American manufacturers. Composite panel products are made almost exclusively from highly "green", recycled and residual raw materials, and by effectively addressing concerns about formaldehyde emissions from these products (including incentivizing the use of non-formaldehyde based adhesive systems), H.R. 4805 will have a positive impact on the competitiveness of these products in existing and new markets. That's good for American jobs and economic productivity.

Rep. Matsui questions on jobs, innovation and compliance by offshore manufacturers.

As conveyed in these responses and in previous CPA testimony before CARB, EPA and other public bodies, there are important direct and ancillary benefits to having a national standard on formaldehyde emissions whereby Congress ensures that offshore and other non-U.S. manufacturers are covered by the same ruels as American manufacturers.

Beyond the direct considerations of public health and consumer protection, there are positive domestic jobs and fair trade aspects to this legislation. It is unfair for American manufacturers to be expected to compete in a global marketplace when our industries embrace, invest in and are held to high standards of product efficacy and safety, if at the same time those who export competing products for sale in the U.S. are not held to the same standards.

This consideration is not unique to H.R. 4805. Rather it is a profoundly important one in any such Congressional mandate – i.e., there should be equity when it comes to the economic impact of such a regulation so American manufacturers are neither kept nor placed at a competitive disadvantage insofar as manufacturing and regulatory compliance costs. Passage of H.R. 4805 will contribute to global fair trade and to the expansion of domestic, green jobs as well as to continued capital investment and green product innovation by domestic wood products manufacturers. These are all good things for the American economy.

Rep. Matsui question on third part testing and certification.

Third party testing and certification (TPC) is key to the success of California's rule and will be for the effective enforcement of a federal standard. Self-certification will not work, especially for many offshore manufacturers. The U.S. industry has known this for decades and has overwhelmingly embraced a stringent third party testing and certification component to its business practices, long before there was a CARB rule. A rigorous TPC approach is essential if the federal standard contemplated by H.R. 4805 is to be credible, enforceable and effective. It should be based on internationally recognized criteria and accreditations, as is California's. There is nothing protectionist about this approach, and the evidence of international acceptance is compelling even in the first 16 months of the CARB rule.

H.R. 4805 asks the EPA to embrace a stewardship approach being used in California and already widely practiced in the U.S. and Canada, and around the world too. California has already approved 33 TPC agencies around the world, and they in turn have recognized 753 manufacturing facilities as qualified to meet the formaldehyde emissions requirements that are called for in H.R. 4805. The numbers are impressive:

33 CARB-approved TPCs
- 13 in Europe
- 9 in North America (all in US)
- 9 in Asia
- 2 in Australia/New Zealand

753 CARB-certified composite panel mills worldwide
- 474 in Asia
- 148 in Europe

- 109 in North America
- 16 in South America
- 6 in Australia/New Zealand

Rep. Matsui question on actions by other states.

CPA believes no state will develop a regulation to compete with California's if H.R. 4805 passes. Moreover, California is now in its second year of experience with its own regulation and will have no incentive to change or expand it if H.R. 4805 succeeds, even without a pre-emption provision. If the bill is unsuccessful though, there could be such a temptation even before the US Environmental Protection Agency completes action on its own planned rulemaking. See also the response to Rep. Barton's questions, above.

Please let me know if there is any additional information CPA can provide to the Committee.

Very truly yours,

Thomas A. Julia
President

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE

2125 Rayburn House Office Building

Washington, DC 20515–6115

April 14, 2010

Mr. Andy Counts
CEO
American Home Furnishings Alliance
317 West High Avenue, 10th Floor
High Point, NC 27260

Dear Mr. Counts:

Thank you for appearing before the Subcommittee on Commerce, Trade, and Consumer Protection on March 18, 2010, at the hearing entitled "H.R. 1706, the Residential Carbon Monoxide Poisoning Prevention Act, and H.R. 4805, the Formaldehyde Standards for Composite Wood Products Act."

Pursuant to the Committee's Rules, attached are written questions for the record directed to you from certain Members of the Committee. In preparing your answers, please address your response to the Member who submitted the questions.

Please provide your responses by April 28, 2010, to Earley Green, Chief Clerk, via e-mail to Earley.Green@mail.house.gov. Please contact Earley Green or Jennifer Berenholz at (202) 225-2927 if you have any questions.

Sincerely,

Henry A. Waxman
Chairman

100 Years

AHFA

American Home Furnishings Alliance

The Honorable Doris Matsui

The State of California, in a cooperative effort between industry, regulatory authorities, and public interest groups (environmental, public health, and labor organizations), recently established limits on formaldehyde emissions in most composite wood products. In 2008, after several years of scientific review and rulemaking, the California Air Resources Board (CARB) finalized rules establishing higher standards in composite wood products, the first phase of which went into effect on January 1, 2009. H.R. 4805 would apply CARB's rule nationwide by establishing emissions standards for formaldehyde in domestic and imported composite wood products.

1. Do you believe that manufacturers of composite wood products outside of the United States will be able to comply with the proposed standard?

> *The AHFA believes manufacturers of composite wood products outside the United States will be able to comply with both Phase 1 and Phase 2 of the California ATCM or H.R. 4805. The global composite wood industry has successfully worked through the challenges of reformulating glue resin systems and production modifications. Currently, there are 33 CARB approved domestic and international 'Third Party Certifiers' (TPC). The TPC provide testing, certification and documentation to the manufacturers of composite wood products (CWP) sourced by fabricators and importers that become component parts of finished products. While the challenge will always be adequate lab 'space' AHFA believes these 33 labs have sufficient space to accommodate the potential increased sourcing demand created by a national standard.*

2. Does AHFA anticipate any issues maintaining adequate supply levels once the regulation is promulgated?

> *Sourcing issues will always be the critical challenge of maintaining an adequate supply of compliant composite wood products. Currently there are 750 TPC certified CWP 'mills' (manufacturers) globally supplying the sourcing needs for fabricators and importers of finished products containing CWP component parts. These 750 certified mills have the capability and capacity to supply Phase 1, Phase 2, NAF (no added formaldehyde) and ULEF (ultra low emitting formaldehyde) composite wood products. It is imperative that sourcing and supply issues are addressed to ensure an*

adequate supply of compliant composite wood products. While the California ATCM has become the 'de facto' international standard and most fabricators/importers are sourcing compliant board for products sold in states outside California, demand must be monitored once there is a 'national standard.' There must be a sufficient supply of Phase 2 board and the wood products industry must continue working to implement emerging resin technologies. The transition from a 'California only' standard to a national standard must be seamless with no unintended 'bottlenecks' that would impede the supply of compliant composite wood products.

3. What steps has industry generally and AHFA specifically taken to reduce formaldehyde emissions over the years?

Historically, the wood products industry has worked with glue resin suppliers and CWP suppliers to steadily reduce potential formaldehyde emissions. Beginning with the voluntary HUD standard (1985), the wood products industry has worked with ASTM and ANSI to develop testing standards to properly identify emissions, evaluate a baseline and begin reducing formaldehyde emissions from our products. AHFA member companies have worked with their suppliers to source glues and composite wood products that meet the current emission requirements. AHFA participates as a member of the ASTM/ANSI standards rule making 'canvas' and has been at the table from the inception with CARB, EPA and the federal legislature as a key stakeholder.

The Honorable Joe Barton

1. In your written testimony you state: "we believe that a national approach is crucial in order to avoid conflicting state standards and allows for the harmonized distribution of products and supplies." Yet this legislation does nothing to stop another state from enacting different or conflicting regulations. Would you be concerned if other states enacted differing laws or regulations?

The AHFA believes that a national approach is crucial in order to avoid a 'patchwork quilt' of conflicting state standards and allows for the harmonized distribution of products and supplies. Multiple state standards would be a concern but we believe states would not have any incentive to develop a specific standard if a national one was in place. California expended considerable time resources to develop the ATCM. Time and resources other states do not have or are willing to allocate toward the development of a specific state rule that would be dramatically different.

HENRY A. WAXMAN, CALIFORNIA

April 27, 2010

The Honorable Doris Matsui
Committee on Energy and Commerce
2125 Rayburn Office Building
Washington, DC 20515-6115

Dear Congresswoman Matsui,

In the email and letter from Henry Waxman, Chairman of the House of Representatives Committee on Energy and Commerce dated April 14, 2010, you asked me to address the following question:

"Formaldehyde is a chemical known to have adverse effects on human health. It has been recognized by the International Agency for Research on Cancer and by the Environmental Protection Agency (EPA) as such. This chemical can cause difficulty in breathing in some humans exposed at elevated levels (above 0.1 parts per million). In addition, inhalation of formaldehyde can cause nose and throat irritation, burning sensations in the eyes and throat, and nausea. Other effects include coughing, wheezing, chest pains, bronchitis, and severe allergic reactions.

1. While I fully recognize that formaldehyde is a natural product, would you concur that efforts to lower exposure to formaldehyde emissions would protect public health, bolster consumer confidence, and benefit our economic recovery efforts?"

My response follows.

A stated in my prepared remarks, I believe lowering emission standards within reason would protect the public from excessive formaldehyde exposures, bolster confidence by insuring that products with excess formaldehyde would be removed from the market, and benefit recovery by assuring that US corporations following good manufacturing practices would not face competition from unregulated foreign manufacturers. My main concern is that you and your colleagues have generated a good law based on a faulty premise, i.e., the formaldehyde cancer risk assessment conducted by the State of California that does not acknowledge the background of formaldehyde in each of our cells. It seems all too likely that the benefits provided by the law will soon be forgotten and the precedent set by acceptance of the faulty risk assessment will live on and influence other bills and policy decisions in coming years. My purpose in testifying was to support the legislation while asking that the legislation distance itself from endorsement of the California cancer risk assessment. Your comments above on the respiratory irritation from formaldehyde are accurate and indisputable. The cancer risk assessment and conclusions that formaldehyde is a human carcinogen at lower levels of exposure, however, are highly questionable. I believe them to be incorrect.

Sincerely,

Melvin E. Andersen

FINANCIAL SERVICES AND GENERAL GOVERNMENT APPROPRIATIONS FOR FISCAL YEAR 2011

WEDNESDAY, APRIL 14, 2010

U.S. SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 2:30 p.m., in room SD–138, Dirksen Senate Office Building, Hon. Richard J. Durbin (chairman) presiding.

Present: Senators Durbin and Collins.

CONSUMER PRODUCT SAFETY COMMISSION

STATEMENT OF HON. INEZ TENENBAUM, CHAIRMAN

OPENING STATEMENT OF SENATOR RICHARD J. DURBIN

Senator DURBIN. Good afternoon. This hearing of the Financial Services and General Government Appropriations Subcommittee will come to order.

And I've got to report that Senator Collins will arrive momentarily. She'll miss my opening remarks. It will be devastating, but she'll recover.

Today's hearing is on the President's fiscal year 2011 budget request for the Consumer Product Safety Commission (CPSC). And testifying is Chairman Inez Tenenbaum.

Thank you for being here.

The Consumer Product Safety Commission is the Federal regulatory body tasked to protect children and families from unsafe consumer products. Every day, infants sleep in cribs, children don bike helmets and ride bicycles, and adults purchase medicines. We rely on the Consumer Product Safety Commission to make sure that infants aren't strangled by the slats or sides of the cribs, that children don't sustain head injuries while biking, and that parents don't worry that their children will open the child-resistant packaging.

Two years ago, the Consumer Product Safety Improvement Act (CPSIA) was enacted, giving the CPSC new authorities and resources, and significantly strengthening its ability to protect Americans from defective and unsafe products. Many people deserve credit for that, and I want to single out Senator Mark Pryor of Arkansas. What a great job he did bringing us all together for a bipartisan bill to authorize and empower your Commission.

For example, lead content levels for cribs, bunk beds, infant rattles, and children's jewelry have been reduced. Levels must be certified, based on independent third-party testing by a CPSC-recognized laboratory. Tracking labels will soon be on children's products, accompanied by product registration cards. And a publicly available, searchable database with safety information on consumer products is being established and will be operational early next year, we hope.

While the new lead limits are among the most stringent in the world for some children's products, the Commission voted to defer enforcement of testing and third-party certification requirements until February 10, 2011, in order to increase the number of available testing and certification facilities.

What a difference a few years can make. The Consumer Product Safety Commission has been transformed from a quiet, modest little agency with mostly voluntary enforcement powers to a more robust and proactive agency with enhanced enforcement authority.

Staffing, at a low of 385 in January 2008, is now at 502 and will grow to more than 530 by the end of this year. The budget this year, 2010, is double what it was 6 years ago. The first foreign office in Beijing has been opened, after all of the publicity that came out about products that were being exported from China into the United States. The need—now, this is a significant—of all the statistics—the need for toy recalls has declined 75 percent from 2008 to 2009, including an 80-percent decline in toy recalls due to lead-content violations.

For fiscal year 2011, CPSC is requesting $118.6 million—$400,000 more than the fiscal year 2010 enacted amount of $118.2 million, and a staffing level of 576, which is an increase of 46 FTEs.

I'm not going to go through all the details of the budget request. They're going to come up during the course of our questioning here.

I'm looking forward to the testimony of Chairman Tenenbaum, and I am going to introduce her after I defer to my colleague here, Senator Collins.

STATEMENT OF SENATOR SUSAN COLLINS

Senator COLLINS. Thank you, Mr. Chairman.

And thank you for calling this hearing.

While the Consumer Product Safety Commission is a relatively small agency, as your statements pointed out, it has a critical mission of keeping the public safe from dangerous products. We all remember the alarming and too frequent tragic stories of hazardous toys that demonstrate the need to strengthen protections for consumers, particularly for children, as the chairman has pointed out.

In 2008, we acted to strengthen the laws governing the safety of goods entering this country and to provide much-needed additional resources to intercept unsafe products by passing the Consumer Product Safety Improvement Act. This new law included provisions resulting from a 2007 product safety investigation that I conducted in my role as the ranking member of the Homeland Security and Governmental Affairs Committee. That investigation produced provisions that included better coordination and information sharing between the Commission and Customs and Border Protection

(CBP) so that inspectors at our Nation's ports can focus their resources on the most risky shipments, targeting products, manufacturers, and importers with poor consumer safety records. And I'll be interested today to hear more about this improved import surveillance plan and the efforts to improve coordination with CBP.

While it is crucial for the Consumer Product Safety Commission to implement regulations to protect children from lead and other hazardous materials, we do want to ensure that the regulations do not prove overly burdensome or costly to small businesses, such as thrift shops and those who produce handmade crafts, clothing, and toys. The Commission needs to consider these small, often home-based businesses when issuing its rules and guidance, particularly for third-party testing.

Again, I very much look forward to hearing from the Chairman today, and appreciate our chairman, as we consider the budget request for the Commission.

Senator DURBIN. Thanks, Senator Collins.

I'm pleased to welcome Chairman Inez Tenenbaum, the ninth Chairman of the Consumer Products Safety Commission, sworn into office on June 23, 2009. Previously, Ms. Tenenbaum was elected as South Carolina's State superintendent of education, where she served two terms. She has extensive experience in legal, legislative, administrative, and regulatory matters and served on numerous task forces that provide oversight on children and family services.

Thanks for being here. I look forward to your testimony.

Ms. TENENBAUM. Good afternoon, thank you—thank you. I'll start all over again.

Good afternoon, Chairman Durbin and Ranking Member Collins. Thank you so much for this opportunity to appear in front of you.

I am pleased to be here today to discuss the U.S. Consumer Product Safety Commission's fiscal year 2011 budget. During the past 9 months as Chairman of the CPSC, I have had the opportunity to see firsthand the great work that the Commission undertakes every day. From new regulations to ensure the safety of cribs, to enforcement action against children's jewelry with harmful levels of lead, cadmium, and other toxic metals, the CPSC is once again an agency that means business when it comes to protecting the safety of the American consumer.

Much of this progress would not have been possible without the reauthorization of the Commission through the Consumer Product Safety Improvement Act of 2008 and the additional funding received by the agency in fiscal years 2009 and 2010. I greatly appreciate the increased resources that members of this subcommittee have supported over the past 2 years, and can assure you that these resources have been put to good use through increased staffing and improved import surveillance and enforcement efforts. It has also provided the resources necessary for the Commission to develop robust responses to new and emerging hazards, such as contaminated drywall, that has caused serious problems for thousands of homeowners. The results of this new commitment to the CPSC are already very encouraging.

One concrete example of this increased staffing and resources at the agency: During 2008, the number of CPSC full-time employees,

FTEs, had dropped to only 385. This was the lowest level in the agency's history and down from a high of 978 in 1980. Section 202 of the CPSIA required the agency to increase the number of FTEs to at least 500 by the end of fiscal year 2013. And I'm very pleased to report that we've already reached that milestone and currently have 505, as of April 9, dedicated FTEs at the CPSC.

But, employee numbers are only one indicator of change. Another key metric is results. One concrete example of that is our ability to stop dangerous products before they enter the stream of commerce. In fiscal year 2007, the CPSC collected approximately 750 samples of suspect products entering our country. In 2009, that number rose to almost 1,600. At the same time, we started to see a commensurate decrease in the number of voluntary recalls, from 563 in fiscal year 2008 to 466 in fiscal year 2009. The Commission's proposed 2011 budget requests $118.6 million—and it's designed to accelerate this forward momentum by continuing internal modernization and rebuilding efforts.

As noted in my written statement, the proposed 2011 budget is only $400,000 over our current 2010 level, but it will allow the Commission to support the key areas of emphasis by reallocating $13.9 million in funds used in 2010 nonrecurring activities. Specifically, the proposed budget will allow the Commission to pursue new and enhanced initiatives in four key areas:

The first is the Commission's compliance initiative. Since the passage of the CPSIA, the Commission's staff has worked diligently to promulgate and implement the numerous rules required by that law. In 2011, the CPSC's work will shift from developing rules mandated by the CPSIA to enforcing those rules, both within our borders and at ports of entry. To further facilitate those efforts, the CPSC's 2011 budget requests approximately $4.6 million and an addition of 41 full-time employees to support additional responsibilities associated with three key elements of the compliance program: regulatory enforcement, import surveillance, and defect investigations.

The second area is information technology modernization and Commission implementation of a searchable public database of consumer product safety information. Section 212(b) of the CPSIA requires the Commission to upgrade its information technology systems and to develop a database that allows consumers to submit incident reports that can subsequently be reviewed by all members of the general public.

In response to this mandate, CPSC is developing a single, integrated, Web-based environment. The Consumer Product Safety Risk Management System, or RMS, will change the way the Commission receives and analyzes data. With the new RMS, the CPSC will be transformed. The Commission will have one powerful database for the input and analysis of multiple sources of data. Overall, this new capability has the potential to uncover more defect patterns for staff to examine and to triage. This, in turn, could lead to an increase in recalls of defective products and the prevention of injuries and deaths. The Commission has already allocated approximately $20 million to fund many of the initial planning and design costs of the RMS and deeply appreciates this subcommittee's past support of the program.

In 2011, funding resources—requirements will largely shift from design-and-build costs to maintenance items. Therefore, the 2011 budget requests $1.8 million for a staffing combination of eight FTEs and contract positions to maintain the system and comply with OMB's requirements for information technology governance, cybersecurity, and privacy.

The third area is consumer outreach and education. Providing consumers with recall and product hazard information that helps make families and communities safer is one of my top priorities. Over the past year, the Commission has made great strides in consumer outreach by reestablishing our presence on network television, in the national newspapers, and on the radio. The agency also launched CPSC 2.0, a social media initiative that is reaching out to tens of thousands of consumers via YouTube, Twitter, Flickr, the OnSafety blog, and our own recall widget. This year and in fiscal year 2011, the Commission plans to accelerate efforts to conduct grassroots education and advocacy in hard-to-reach and vulnerable populations. We will also continue to focus on public education and outreach efforts to prevent drownings and entrapment involving children in residential and public pools.

Fourth, the 2011 budget proposes an additional $2 million for the CPSC to support the National Nanotechnology Initiative. In the last few years, there have been increasing public concerns over potential health impacts associated with this technology. Although nanomaterials may have the same chemical composition as nonnanomaterials, at the nano scales, they may demonstrate different physical and chemical properties and behave differently in the environment and the human body. The $2 million proposal will allow the Commission to conduct exposure and risk assessments of nanotechnology materials, allow for database updates to properly flag reports of nanotechnology incident with consumer products, and conduct consumer outreach efforts, such as public meetings.

PREPARED STATEMENT

Mr. Chairman, thank you again for the opportunity to testify on the proposed 2011 budget for the U.S. Consumer Product Safety Commission, and I look forward to working with you and other members and Ranking Member Collins on this subcommittee, and will be happy to answer any of your questions.

[The statement follows:]

PREPARED STATEMENT OF INEZ TENENBAUM

Good afternoon, Chairman Durbin, Ranking Member Collins, and Members of the Subcommittee on Financial Services and General Government. I am pleased to be here today to discuss the U.S. Consumer Product Safety Commission's (CPSC) fiscal year 2011 budget request.

During the past 9 months as Chairman of the CPSC, I have had the opportunity to see first-hand the great work that the Commission undertakes every day. From new regulations to ensure the safety of cribs to enforcement action against children's jewelry with harmful levels of lead, cadmium and other toxic metals, the CPSC is once again an agency that means business when it comes to protecting the safety of American consumers.

Mnch of this progress would not have been possible withont the reanthorization of the Commission through the Consumer Product Safety Improvement Act of 2008 (CPSIA), and the additional funding received by the agency in fiscal year 2009 and fiscal year 2010. I greatly appreciate the increased resources Members of this Subcommittee have supported over the past 2 years, and can assure all of you that

those resources have been put to good use through increased staffing, improved import surveillauce, and increased compliance activities. It has also provided the resources necessary for the Commission to develop robust responses to new and emerging hazards such as contaminated drywall that has caused serious problems for thousands of homeowners.

The results of this new commitment to the CPSC are already very encouraging. One concrete example of this is increased staffing and resources at the agency. During fiscal year 2008, the number of CPSC full-time employees (FTEs) had dropped to only 385—the lowest in the agency's history. Section 202 of the CPSIA required the agency to increase the number of FTEs to at least 500 by the end of fiscal year 2013. I am very pleased to report that we have already reached that milestone, and have 502 FTE positions filled at the CPSC as of April 1, 2010.

But employee numbers are only one indicator of change. Another key metric is results. One concrete example of that is our ahility to stop dangerous products before they enter the stream of commerce. In fiscal year 2007, the CPSC collected approximately 750 samples of suspect products entering our country. In fiscal year 2009, that number more than doubled to almost 1,600. At the same time, we started to see a commensurate decrease in the number of voluntary recalls from 563 in fiscal year 2008 to 466 in fiscal year 2009.

The Commission's proposed fiscal year 2011 budget request of $118.6 million is designed to accelerate this forward momentum by focusing on modernization efforts that will flag emerging hazards and help us keep those products out of our country and the hands of children.

While this request is only $400,000 over the fiscal year 2010 level, it will allow the Commission to increase the FTE level by 46 in fiscal year 2011 (for a total of 576 FTEs), fund a broad new compliance initiative, implement the second phase of the Commission's continued Information Technology (IT) modernization, continue to improve consumer outreach, and direct $2 million in support of the Federal National Nanotechnology Initiative by reallocating $13.9 million in funds used for fiscal year 2010 nonrecurring activities.

THE COMMISSION'S COMPLIANCE INITIATIVE

Since passage of the CPSIA, Commission staff has worked diligently to promulgate and implement the numerous rules required by that law. In 2011, the CPSC's work will shift from developing rules mandated by the CPSIA to enforcing those rules—both within our borders and at ports of entry.

To further facilitate those efforts, the CPSC's fiscal year 2011 budget requests $4,647,000 and the addition of 41 full-time employees (FTEs) to support additional responsibilities associated with three key elements of the compliance program: regulatory enforcement, import surveillance, and defect investigations.

Regulatory Enforcement

Experience shows that enforcing new rules takes considerably more resources than enforciug an existing rule that has been iu place for a uumber of years. The number of new rules mandated by the CPSIA during fiscal year 2009 and fiscal year 2010 are more than douhle the number of rules promulgated by the Commission since 1990—and will result iu a dramatic increase iu euforcement respousibility.

The fiscal year 2011 budget, therefore, requests $1,647,000 and 15 FTEs to enforce the new rules. This includes four new compliance officers, five field investigators, three lab testing and other technicul specialists, two attorneys, and one FTE to coordinate with state and local authorities.

Import Surveillance

The Commission's import enforcement workload will also increase as investigators ramp up efforts to verify testing certifications and collect increasing numbers of suspect product samples at our Natiou's ports. The need for more staff and better coordination with U.S. Customs and Border Protection (CBP) was specifically highlighted in an August 2009 Government Accountability Office (GAO) report. Mr. Chairman, I know this is an area of critical interest for both you and Ranking Member Collins, and the Commission is eager to fully address this issue.

Accordingly, the fiscal year 2011 budget requests $1,965,000 to expand coverage at the ports, verify third-party testing certifications, collect samples of suspect products, and—most importantly—stop unsafe products from entering the country. This request will support an additional sixteen FTEs dedicated to import surveillance (five investigators and analysts that will be stationed at ports, two compliance officers to process additional import samples, and nine FTEs for lab testing and other specialties), as well as $100,000 for the destruction of goods refused at the ports by CPSC.

Defect Investigations

The number of product incident reports the Commission receives almost doubled between fiscal year 2003 and now. With the rollout of the searchable public database by March 11, 2011, we expect that the number of incident reports will grow exponentially. These reports often provide critical information and data to the CPSC. However, with current resources, CPSC staff is only able to thoroughly investigate a very small number (approximately 10 percent) of the total reports received.

Increased resources are needed to enhance our defect investigation capability, and ensure that the Commission can adequately review and process the rapidly increasing number of product incident reports. Therefore, the fiscal year 2011 budget requests $1,035,000 and ten additional FTEs (three compliance officers, five field investigators, one technical specialist, and one attorney) to support this critical effort.

INFORMATION TECHNOLOGY MODERNIZATION

Section 212(b) of the CPSIA requires the Commission to develop a database that allows consumers to submit incident reports that can subsequently be reviewed by all members of the general public and upgrade its information technology systems.

As noted above, the searchable public database will be launched in less than 1 year, and I look forward to working with Members of this Subcommittee to ensure that your constituents know how to access and use it. In the course of completing the database, we are also working to solicit extensive public input and establish clear rules for how the database will operate and how CPSC will interact with consumers and manufacturers.

In order to support the data that will be generated by the database and meet the information technology modernization mandate, CPSC is developing a single, integrated, web-based environment, the Consumer Product Safety Risk Management System (RMS), that will change the way the Commission receives and analyzes data. Current systems at the Commission are fragmented, and information flows often have to be manually sorted by staff to identify new and emerging hazard patterns.

CPSC will be transformed with the new RMS. The Commission will have one powerful database for the input and analysis of multiple sources of data. This capability will be absolutely critical as data streams from the new public database start flowing into the Commission. In addition, the system will have new predictive "data mining" tools that will allow the CPSC to compare new incidents electronically with all prior incidents. Overall, this new capability has the potential to uncover more defect patterns for staff to examine. This, in turn, could lead to an increase in recalls of defective products and the prevention of injuries and deaths.

The Commission has already allocated approximately $20 million to fund many of the initial planning and design costs for the RMS, and deeply appreciates this Subcommittee's past support of this program. In fiscal year 2011, funding requirements will largely shift from design and build costs to maintenance items. Therefore, the fiscal year 2011 budget requests $1.880 million for a staffing combination of eight FTE and contract positions to maintain the system and comply with Congressional and Office of Management and Budget (OMB) requirements for information technology governance, cybersecurity and privacy.

CONSUMER EDUCATION AND OUTREACH

Providing consumers with recall and product hazard information that helps make families and communities safer is one of my top priorities. Over the past year, the Commission has made great strides in consumer ontreach by re-establishing our presence on network television, in national newspapers, and on the radio. We have also re-established the trust of consumers that CPSC is putting their interests first.

The agency also launched "CPSC 2.0," a social media initiative that is reaching tens of thousands of consumers via YouTube, Twitter, FlickR, the OnSafety blog, and our Recall Widget. This year the Commission plans to further accelerate this initiative by expanding the platforms we use to include cell phone text messages.

The Commission also plans to accelerate efforts to conduct grassroots education and advocacy in hard-to-reach and vulnerable populations. In August 2009, the GAO released a report recommending that the CPSC increase its focus on reaching minority populations. Since becoming Chairman of the CPSC, I have directed Commission staff to explore additional outreach efforts to underserved populations. In carrying ont a special Minority Outreach initiative, we will increase our use of existing tools, such as the Neighborhood Safety Network (NSN) program—that provides vital information to more than 5,600 community organizations and leaders—as well as use new tools, such as targeted, grassroots programs for Hispanics, African-Ameri-

cans, American Indians, and other minority groups. This will also remain a key priority of the Commission in fiscal year 2011.

One of the most tragic subjects the Commission deals with are drownings and entrapments involving children in residential and public pools. I am pleased to note that the fiscal year 2011 budget contains $1,000,000 specifically for continuing pool and spa safety education. This funding will build on the previous funding of $8.1 million in fiscal year 2009 and fiscal year 2010, and continue to help the agency drive down the 300 child drownings each year and increase compliance with the Virginia Graeme Baker Pool and Spa Safety Act.

NANOTECHNOLOGY

The CPSC's fiscal year 2011 budget also proposes $2 million to snpport the Federal National Nanotechnology Initiative, and seeks to collect additional data and explore environmental, health, and safety issues related to the increasing use of nanotechnology in consnmer products.

In the last few years, there has been increasing public concern over potential health impacts associated with this technology. Although nanomaterials may have the same chemical composition as non-nanomaterials, at the nanoscale they may demonstrate different physical and chemical properties and behave differently in the environment and in the human body.

The $2 million proposed will allow the Commission to conduct exposure and risk assessments of nanomaterials, allow for database updates to properly flag reports of nanotechnology incidents with consumer products, and conduct consumer outreach efforts such as puhlic meetings. Perhaps even more importantly, it will also allow the Commission to take a very proactive approach to this emerging issue, rather than merely reacting to incident reports after they are received.

Mr. Chairman, thank you again for the opportunity to testify on the proposed fiscal year 2011 budget for the U.S. Consumer Product Safety Commission. It provides the funding necessary to continue the transformation of this agency from what some have described as a "teething tiger" into the world's leading lion of consumer protection.

I look forward to working with you and other members of the Subcommittee on the Bndget Request, and would be happy to now answer any questions you may have.

STAFFING INCREASES

Senator DURBIN. Thanks, Chairman Tenenbaum.

And I might note that the increase—or, should I say—the restoration of employees at the Consumer Products Safety Commission, we thought, was warranted, because of the massive numbers of products that come your way, and particularly the increase in imports into the United States, which created a brand new challenge for us. And so, just for the record, that was our thinking behind the increase in full-time equivalent employees.

I want to discuss about five issues, and I'm sure I won't get into all of them.

LEAD STANDARDS

So, let me ask about lead, because we were concerned, when we wrote the bill, as to whether or not we came up with a reasonable standard for lead in toys. And before the bill was written, there was no lead limit at all for children's products. In February 2009, permissible lead levels in children's products were reduced to 600 parts per million. By August, the lead limit in children's products were to come down to 300 parts per million. In those coated with paint, the limit dropped to 90 parts per million.

A stay of enforcement on third-party testing requirements was granted by the Consumer Products Safety Commission in February 2009 for 1 year because there was "substantial confusion," in the industry, regarding specific requirements related to the applica-

bility, as well as testing and certification. An extension of that stay of enforcement was granted in December of last year on testing and certification for many children's products for 1 year, until February 2011, while the CPSC continues to accredit third-party-testing labs.

Now, I want to make sure I understand. If we have written this law in a fashion that makes it difficult for you to either understand or enforce—when I read the word "confusion," I want to make sure I understand what's behind that—then it's our responsibility to step forward and correct any errors that we've made there. If, however, this is a question of just setting up the mechanism for enforcement, that, to me, is a different question, and I can understand it takes more time. So, could you address the lead issue in toys and children's products first?

Ms. TENENBAUM. Thank you, Mr. Chairman.

Yes, we did stay the enforcement on certain products while we put in place the specific testing requirements for those products, so that we could have laboratories who knew how to go about testing those products. But, third-party testing and certification was never stayed on lead in paint, which now is at 90 parts per million. We are also enforcing full- and nonfull-sized cribs; pacifiers; small parts; and lead content on metal children's jewelry. What we stayed was lead content in nonmetal, not in children's jewelry or in paint. So, it could be lead content in brass or something else, but not children's jewelry.

But, we've also realized that the strict levels under 101, which says that you can exempt articles where the lead is inaccessible to the child or if you can show that, through normal and foreseeable use and abuse, any lead is not absorbed into the body. So, it's that "any lead," where you might have very small levels and contact with the children's product is very infrequent. For example, bicycles and all-terrain vehicles (ATVs).

Senator DURBIN. We heard about that.

Ms. TENENBAUM. So, we stayed the bicycles and the ATVs, in terms of testing, until we could work this out, and also certain books. The newly printed ordinary children's books do not contain lead, but, the children's books printed before 1985 do. We had a problem with exempting those. So, if we had more flexibility around section 101 for any lead, then we would be able to work with the products as they came up for our consideration.

We have proffered a discussion around functional purpose. It would require industry to come to us and say, "We need this lead in our product for the functional purpose. If it's an ATV, we need it to make the ATV stronger. The contact with lead components on the ATV will be infrequent. It will have no adverse health effect on the user." And so, then, we could give the ATV or the bicycles an exemption.

So, it's a narrow class of products that, if we had a functional purpose amendment to the CPSIA, then we would be able to exempt those products, like ordinary children's books.

Senator DURBIN. But, do you think that's going to require an amendment to the law?

Ms. TENENBAUM. We do.

Senator DURBIN. Okay. So, we ought to look at that.

Now, let—and to make it clear, the stay does not apply to lead paints, small parts, or children's jewelry. We are talking about functional products and ATVs and the like. If——

Ms. TENENBAUM. And we stayed enforcement of the lead in ATVs last year.

Senator DURBIN. Okay.

OTHER TOXIC SUBSTANCES

Now, I'm going to go 2 extra minutes and give Senator Collins the same time, because I wanted to ask, as a followup—and we're finding that there were replacements by some who are sending products into the United States—replacing lead with cadmium and antimony. And are you regulating those, as well?

Ms. TENENBAUM. Well, I issued a stern warning to Chinese manufacturers, in a speech to the Chinese, back at the beginning of this year. I was unable to attend the conference in China, because I had a hearing in Congress. But, we gave a stern warning. And our counterpart in China, the AQSIQ, issued the same stern warning to manufacturers and said, "Do not substitute any of these metals for lead." Now, we really don't think that that is occurring, that they're intentionally substituting. But, we think they're being careless in not realizing that you cannot use these metals in children's products.

Under the ASTM F963 standard, which is the toy standard, the surface coating on toys is regulated.

Senator DURBIN. But, I understood——

Ms. TENENBAUM. Also, children's jewelry is regulated under the Federal Hazardous Substance Act. We could call a toxic metal a banned hazardous substance. And right now, we are doing our research to establish the level of what we will allow for cadmium and other metals in children's jewelry.

Senator DURBIN. So, I understood that the children's pets—Zhu Zhu pets out of China, there was—they found some evidence of antimony in those. Are you saying that——

Ms. TENENBAUM. Well, the company——

Senator DURBIN [continuing]. They did or didn't?

Ms. TENENBAUM. The company who manufactures the Zhu Zhu pets came to the CPSC, just days after one nonprofit organization announced they had found the antimony, and showed us all of their laboratory tests. We did our own testing, and then we established that the antimony was not at harmful levels to children. And we put that press release out that there were no harmful levels of antimony in Zhu Zhu pets.

Senator DURBIN. Okay.

Senator Collins.

Senator COLLINS. Thank you, Mr. Chairman.

Obviously, our first priority is to make sure that all products, including toys for children, are safe. There has been an issue with small home-based businesses finding it very expensive to comply with the standards in the new law. They obviously do not want to be selling products that aren't safe, that are not—that would in any way endanger our children. But, the cost of third-party testing can be prohibitive.

And I want to give you an example. Last year, I met with a woman who owned a business called The Little Hat Company in South Berwick, Maine. And she produced children's hats. And she had this network of women who made the hats out of their homes. It worked so well for them, because they all had young children and they could stay home with the children, yet be able to make some money. Well, the combination of the cost of third-party testing for the Consumer Product Safety Improvement Act plus the economic downturn has forced this business to close up altogether. And that affected not only the business owner, but all of these part-time sewers whom she employed who were producing these cute little caps out of their homes.

As a result of this concern, last year we included language in the report accompanying the omnibus bill noting the concerns of these very small manufacturers—seems even odd to call them "manufacturers"; they're really craftspeople—regarding the third-party testing requirements. And we urged you to consider these types of home-based businesses when you issue your rules and your guidance on third-party testing, because we really need to find a way that allows them to ensure their products are safe, but doesn't put them out of business when, in fact, their products are safe.

What efforts have you made to address the concerns of these small businesses?

Ms. TENENBAUM. Thank you, Senator.

We have been extremely sensitive to the concerns of small businesses and crafters throughout the implementation of the CPSIA. In fact, we wrote a guidance on the CPSIA for small businesses, resaler crafters, and manufacturers of children's products. And over the last 9 months, the Commission has had four actions which provided relief to small businesses and crafters. And here are the four rules that we promulgated to do this:

First of all, tracking labels. The CPSIA required that children's products have a tracking label. We decided that there was no "one size fits all" and for small crafters, that was very important to them.

Two, lead determinations proceeding. This was a rule that we wrote, and we said products made out of cotton, paper, untreated wood, to name a few, do not—will never have—contain lead. Therefore, businesses like The Little Hat Company, if it was a cotton hat, would not have to have third-party testing. And we put that out to tell people that you do not even have to have a certificate, which would save them a tremendous amount of resources.

The third thing was component-part testing. If the hat was made of cotton, the hat would not have been testing, but if they had buttons sewn on it to make it decorative, if they bought buttons from a company that could certify they were lead-free, then The Little Hat Company would not have had to do additional testing. And so, if you could just test the component, then you would not have to test the whole product.

And the fourth is, we continue to stay enforcement on testing and certification for many children's products, giving people time to understand this law, and also to let the component-part testing market develop. Groups like the Handmade Toy Alliance have recognized our work, and they continue to work with us. We, for ex-

ample, just last month, we had two Webinars with the ETS4 community, which is the handmade toy and handmade crafters, on eBay, and the Handmade Toy Alliance, so that we could talk to them about what the CPSIA requires and make sure they understood how to comply with the law.

We will continue to keep small manufacturers in mind as we go into our rulemaking. And we also want to make our small business ombudsman, which is a part-time job, a full-time job, and expand this into education and outreach, so that we can have regularly broadcast Webinars for small businesses and answer their questions individually to allay their concerns with compliance.

Senator COLLINS. Thank you. Those sound like very worthwhile and protective moves on the Commission's part.

This women's business was cotton hats. And she did ornamate them, at times, with buttons, and was concerned about having to test the buttons. And I remember raising with her, "Well, wouldn't that be the button manufacturer's job?" So, I'm very happy that you've clarified that. And I will relay that information to her, in the hopes that, when the economy improves, she can get back in business and not have to worry about adding what really is a tremendous cost to a very small business.

I'd like to, in my remaining moment, just ask you a little more about the small business ombudsman, since I did note that you plan to establish a full-time position. How would you ensure that this position is truly going to be able to assist small businesses? How are you going to inform small businesses that it even exists?

Ms. TENENBAUM. Well, we've had a small business ombudsman for a number of years, and most recently the small business ombudsman was located in the Office of International Programs and Intergovernmental Affairs, and the duties were only part time.

We are working with Booz Allen Hamilton to write a new strategic and operational plan for the Commission. And we are already beginning to realize that one of our primary functions should be education and outreach. So, we could place this full-time small business ombudsman in a larger Office of Education Outreach, where we would work with colleges and universities. We could invite professors to participate. We could work with nonprofits. And also, we would have a regular curriculum, where we would regularly host workshops. Since I've been the Chairman, we've hosted two workshops. One was a workshop for the database and another one was for continued testing. And we reached out and reserved a block of seats just for the Handmade Toy Alliance and small businesses. And so, we will continue to be very sensitive to small businesses in that regard.

Senator COLLINS. Thank you.

Thank you, Mr. Chairman.

ADDRESSING HARMFUL CHEMICALS/ELEMENTS IN PRODUCTS

Senator DURBIN. I want to ask you about a couple of issues that raise a larger question: the relationship of the CPSC to some other agencies of the Federal Government, when it comes to particular hazards.

The first one is known as BPA—I'm going to mispronounce this—Bisphenol A, which is, as I understand it, a plastic coating that

may be in virtually every canned product we buy and shows up in other things—baby bottles and sippy cups, sometimes; maybe pacifiers. And it's been linked to heart disease and cancer in humans and abnormal development in animals.

The EPA, Environmental Protection Agency, listed BPA as a chemical of concern. Although some products are labeled BPA free, they're still found to contain this chemical. So, to what degree does the Consumer Product Safety Commission feel a responsibility, under the law, to verify labeled contents or claims, such as "BPA free" in consumer products?

Ms. TENENBAUM. We feel very responsible. In fact, we work regularly on interagency committees with the EPA, with the National Institute of Standards and Technology (NIST), with the National Science Foundation (NSF), and the National Institutes of Health (NIH). And the research that all of these agencies do, we read and take very seriously. So, we are tracking the research on BPA and other chemicals. We track all the nanotechnology research. And then, our scientists will make determinations and recommendations, and we will eventually go into rulemaking if we think that it's necessary.

We also can take the information and begin voluntary recalls or mandatory recalls.

Senator DURBIN. Have you done that in relation to BPA yet?

Ms. TENENBAUM. Let me get back with you. I know we have done extensive work on BPA. And before I misspeak today, let me get you a full report on what we've done on that.

[The information follows:]

U.S. CONSUMER PRODUCT SAFETY COMMISSION ACTIVITY ON BISPHENOL-A (BPA)

Overview

Bisphenol-A (BPA) is used in the manufacture of polycarbonate plastics and epoxy resins. Small amounts of BPA can migrate out of products made out of polycarbonate (such as reusable bottles and food containers) during their normal use. BPA is considered an endocrine disruptor. BPA has also been shown to canse reproductive and developmental effects in animals at high doses. However, there is a lack of scientific consensus over whether BPA causes these types of effects at low doses.

Regulatory Jurisdiction

Jurisdiction over BPA is split between two agencies: The Food and Drng Administration (FDA) and the CPSC.

—BPA used in food containers or snrfaces that come in contact with food is considered an unintentional food additive and is subject to the jnrisdiction of the FDA.

—Polycarbonate is also used in bicycle helmets and safety glasses, which is under CPSC jurisdiction. These products are made of polycarbonate because that material is very hard. The hardness of the polycarbonate in these products is beneficial in terms of the safety provided to the user, and CPSC Health Sciences staff does not believe the exposures from these prodncts would be significant compared to products under FDA jnrisdiction that come into contact with food or liquids.

—If BPA is used in children's products that are intended for children to mouth or which children could mouth, that would also fall under CPSC jurisdiction. In such products, staff would have to look at the hazard, the exposure and the subsequent risk posed by any BPA present.

—Several Federal agencies (the National Institute for Environmental Health Sciences (NIEHS), FDA, the National Toxicology Program, and the U.S. Environmental Protection Agency (EPA)) are currently conducting research on the safety of BPA, especially at low levels of exposure. CPSC staff is monitoring

these studies and are participating, as appropriate, to provide technical input and peer review.

Current Efforts Involving CPSC and Our Federal Partners to Further Study BPA

CPSC's Heath Sciences staff recently participated in an Office of Management and Budget (OMB) coordinated Federal agency review of the EPA draft Notice of Proposed Rulemaking (NPRM) to establish the Concern List under section 5(b)(4) of the Toxic Substances Control Act (TSCA). This list included BPA.

Health Sciences staff are also currently participating in the activities of the revitalized President's Task Force on Environmental Health and Safety Risks to Children. One of the reasons for revitalization of this task force is to create a high-level group that can ensure coordination across agencies that are dealing with common chemical concerns. CPSC was specifically recognized as a key partner on this group.

Staff from EPA's Design for the Environment (DfE) project recently invited CPSC staff to participate in a group being organized to look at BPA alternatives in thermal paper. CPSC staff has participated in meetings with that working group.

Senator DURBIN. So, now let me raise another question, another issue, involving other Federal agencies, from a slightly different perspective. The first example was a claim that a product was BPA free. And, as I said, it could have contained a chemical of concern, and the manufacturer said, "No, it doesn't." And you're saying that you accept the responsibility to test to make sure that it doesn't.

Ms. TENENBAUM. We would.

If it's within our jurisdiction as a consumer product, we would follow the research and we would ask for copies of the reports. Our scientists also sit on numerous committees with the other Federal agencies.

Senator DURBIN. So, let me give you another example that comes at it from a different angle. Recent research has questioned whether Triclosan—I hope I'm pronouncing it correctly—an antibacterial chemical widely used in home products, such as liquid soaps, hand sanitizers—I probably put it on my hands 10 times a day—dishwashing liquid, shaving gels, toothpaste, some clothing and toys—may disrupt the body's endocrine system—so, that explains my problems—and whether it helps to create bacteria that are resistant to antibiotics. Now, the Centers for Disease Control has found that the chemical is so pervasive that it has been found in 75 percent of Americans.

This chemical is regulated by three agencies: Food and Drug Administration (FDA), Environmental Protection Agency, and the Consumer Product Safety Commission. The FDA now says that recent research raises valid concerns about the possible health effects of this chemical, and EPA is also reexamining it.

So, what—in light of that situation, where no claim is being made that it's free of Triclosan, but there have been questions raised by other Federal agencies about its safety and impact on humans—what is the CPSC's responsibility, and what have you done, related to this?

Ms. TENENBAUM. We saw the same article and were discussing it on the way over here. And again, we will receive the research, work with our colleagues in the other agencies, and if their concerns are such that we think consumers are endangered, then we will take action either to issue a safety warning, do a voluntary recall, or write regulations.

Senator DURBIN. So, here's what I'm getting at, Madam Chairman. Assume, hypothetically—I won't mention this particular chemical—but, assume the set of circumstances I just described for

chemical *x*. But, assume that the industry says, "Well, you're just wrong. It doesn't create these problems. And we have our scientists, who come to a different conclusion." What is the threshold at which the CPSC says, "Here is what we're looking for. We are looking for an assertion—a credible assertion by a certain Federal agency that puts us on notice that we have to be sensitive to and look for this certain chemical. It can be litigated in court, it can be disputed in laboratories, but we are looking for this threshold." What is that threshold on a chemical, such as Triclosan, as to when the CPSC says, "We are sufficiently warned that it could be dangerous that we are going to step forward and try to protect Americans from exposure"?

Ms. TENENBAUM. The threshold would be whether or not it causes harm or the threat of harm to a consumer.

Senator DURBIN. Who makes that decision on——

Ms. TENENBAUM. We would on our products. For example, in this year's—in the 2011 budget, we're requesting $2 million so that we can work with the National Nanotechnology Initiative to get the agencies who are doing the research on nanotechnology to test our consumer products so that we will know, firsthand, what we have to do with those products, regarding nanotechnology.

Senator DURBIN. So, you aren't looking to the FDA or the EPA or the Centers for Disease Control. You're basically establishing testing standards to establish whether there's a danger to humans, and then regulating, based on your conclusions.

Ms. TENENBAUM. We have our own scientists who draw the threshold. In fact, they are working right now to come up with a threshold, in children's jewelry, for cadmium and any other metals. So, we will look at what the research other agencies have done. We would not duplicate it. But, if we feel like—that the work is good science, good solid data, then we can act on it.

Senator DURBIN. Do you take into consideration if States have decided to regulate? For example, BPA, if I'm not mistaken, has been regulated—I think it's in California, maybe even in Connecticut. Do you take that into consideration?

Ms. TENENBAUM. We do. And, in fact, when I became Chairman, I asked the Office of General Counsel to have quarterly meetings with all the States' attorneys general. We wanted to not have an adversarial position with them. We felt like they were our partners, because we're a small agency. We need our attorneys general in all 50 States—and I came out of State government—to work with us. And in the last meeting we had, nearly every one of them attended either in person or by conference call they or their representative. So, we feel like California, for example, is very aggressive when it comes to consumer products, and they give us information on what they find.

Senator DURBIN. Thank you.

Senator Collins.

Ms. TENENBAUM. Illinois' attorney general is also very proactive.

Senator COLLINS. Madam Chairman, I want to go back to an issue I raised in my opening statement, and that is, I authored provisions of your new law that were intended to bring about better coordination and information sharing between the Commission and Customs and Border Protection. I was alarmed to learn that CBP

had so little authority, prior to this law, to actually seize and destroy dangerous consumer products. So, what was happening is, a lot of times, the products were turned back at one port and then would be shipped through another port.

So, we were trying to close that port-shopping hole, if you will. The bill authorized CBP to seize and destroy these products that are entering our ports, rather than just refusing them. But, the success of that depends on close coordination with the Commission, and the Commission was charged with developing a comprehensive risk assessment so that there would be better targeting of the incoming shipments for inspection. So, the idea was that the Consumer Product Safety Commission was supposed to target the shipment, and then CPB would go inspect that, and could actually destroy the products, rather than just refusing them.

That is why I was disappointed when the Government Accountability Office (GAO) reported, last August, that not as much progress been made in this area as I would have held—hoped. The Commission, for example, it says, does not have access to key CBP import data that it could use to target the incoming shipments. It said that it—the agreements hadn't been updated between the two agencies, that there still was not the kind of information sharing that's absolutely essential for this to be successful.

Why hasn't there been more progress made in this very important area? Because this is really critical to keeping dangerous products from ever coming into our country in the first place.

Ms. TENENBAUM. You are so right. And actually, the GAO report helped propel us to having even closer coordination and cooperation with the CBP.

On March 25 of this year, we submitted our concept of operation to define our plans for using the International Trade Data System to the CBP. And that will help us look at the types of products and the names of importers, to help us quickly and more proactively identify potential risk and provide more timely responses.

And we're also asking for resources, in the 2011 budget, so that we can have the capacity for our IT system and CPB's to talk to each other; we need to be able to data-mine between the two agencies.

We are working with the CBP and have piloted enforcement programs that are developing new and streamlined import procedures with them. So, we already have pilot projects going. We have placed a full-time employee at the Commercial Targeting and Analysis Center (CTAC), right here in Washington, which is CTAC, which allows us to look at pre-arrival manifest systems, so that our people know what is coming in on the shipments. We can target whether or not our products—consumer products—are on that shipment.

We also have developed a repeat-offender listing and work with the CBP to identify and stop potentially hazardous shipments. Also, we work with them to have specific targeting operations which have proven that, when we can target shipments, we're finding a very high percentage of products that are violative of the standards.

We have the Operation Guardian Program, which we use the CBP's resources, and they will go ahead and identify violative holi-

day lights, Christmas lights, children's upper- and outerwear with drawstrings, and seize those products.

Right now, we're waiting to have the memorandum of understanding (MOU) between the two agencies signed. Once that MOU is signed, then we hope that we will have access to their automated targeting system. And once we have access to their system, we will have greater knowledge and potential information on how to improve further targeting methodologies. In fact, we will have a risk assessment methodology, and we're asking for funding in the 2011 budget to help us with this project, because then we'll be able to have information to develop a full-risk assessment methodology so that CBP and the CPSC can share data and collectively target incoming ships.

Senator COLLINS. Well, I'm pleased to hear of that progress, a lot of which is quite recent. I think it might be helpful, after 6 months or so, if the Chairman and I ask the GAO for a new assessment on how that relationship is working.

I just have one final issue that I wanted to raise with you, and that's the Chinese-made drywall problem. Now, I feel fortunate, because my State, fortunately, did not, apparently, get a lot of the Chinese-made drywall that has produced such problems in 37 other States. What concerns me is, there were some 3,000 reports from residents of 37 States related to problems with this drywall, including health concerns, noxious fumes, metal pipe corrosion—significant problems. What can CPSC do to better anticipate and prevent problems like this? It seems like you shouldn't have to get to a point where you have 3,000 complaints before a problem is identified.

Ms. TENENBAUM. Well, let me start by saying that I understand the anxiety and stress that the families that have had the impacted drywall have gone through. I've visited homes in Florida and Virginia, and I saw, firsthand, the impact that they had on people's lives. Young families, where all their equity was tied up in this one home, had to move out and move in with relatives. Some of them had to file for bankruptcy. And it was a crisis that I walked into when I became the Chairman last year.

There have been more resources spent on this—over $3.5 million—than any other investigation we've ever undertaken at the CPSC. It's taken longer than we had liked for it to, but, we were also pioneering protocols and testing to validate a new science.

We partnered, last year, with other Federal agencies to do a 51-home study. We were able to find out that certain gases were being off-gassed in the homes. With that information, we then went to Lawrence Berkeley Laboratories. We recently released the findings of those chamber tests, in which we found that the Chinese drywall was off-gassing hydrogen sulfide at 100 times greater limits than domestic drywall.

Now, not all Chinese drywall was off-gassing the hydrogen sulfide. In fact, there were over 6 million pieces of Chinese drywall imported into the country after Hurricane Katrina, and not all of it had the problem. What we are able to do working with the Department of Housing and Urban Development (HUD), is to develop an identification protocol to determine if you have the off-gassing in your home. We've just come out with our own protocol for reme-

diation, which basically is, remove all the Chinese drywall, rewire the house, and remove the pipes. This is the only way to make the homeowner able to move back into the home.

Now, we provided all of our research to the multidistrict litigation, which was a Federal lawsuit in Louisiana, and the judge in that case, last week, even went further. There was a company—a Chinese company, called Taishan, which did not respond to the complainant. It was a damages hearing tried in their absence, in which the judge awarded $2.6 million to seven Virginia homeowners. In that case, he said, "Take out all the drywall, Chinese and non-Chinese. Take out all the wiring. Take out all the cabinets and appliances, carpet. And essentially take the home down to the studs, and rewire. So, it was more extensive than what we said was the remedy.

And now we are wrapping up studies. We have one study ongoing on long-term corrosion. How much would this corrosion result in any kind of fire hazard, for example? And that's what the long-term corrosion is. But, this was an anomaly, the off-gassing of hydrogen sulfide, because it wasn't found in all the Chinese drywall, just some out of parts of China.

So, the next step is, how can homeowners find resources to remediate? There are really four ways.

In some cases, the builder has gone back in—I've seen this in Florida and in Virginia—and torn out the drywall, torn out the wiring, rewired the house, put in new drywall, and moved the homeowners back in. And that has happened in both States.

In other cases, there have been civil suits. We have the multidistrict suit, down in Louisiana. There have been other civil suits where builders, retailers, manufacturers on up the chain of commerce are being sued.

A third way is to try to find some kind of public funding. I know that the Director of HUD has sent a letter saying States can use the community block grant funding. If that funding is available, that funding can be used.

And then, the fourth way is to try to get some participation from Chinese manufacturers. We have told the AQSIQ and the Chinese, from the Chinese Ambassador to all the people with whom we deal, that we are going to work with the Chinese companies to try to find a just and fair solution. We want them to participate in some way, financially. And so, we will begin those talks relatively soon.

Senator COLLINS. Thank you.

Senator DURBIN. I had the same issue on my list to bring up, and I'm glad Senator Collins did. And I think her question, though, is one that I still want to try to probe a little more.

After 3,000 complaints, we knew we had a problem. The question is, when it comes to children's products and toys, we're basically trying to reach a point where we have a certification of testing before they arrive in the United States. So, let me ask about a product like drywall, here. Is it your impression that there is any requirement for testing in China of such things before they are exported to the United States?

Ms. TENENBAUM. The regulations relating to drywall in the United States have to do with the strength, in terms of how much weight it can bear. We did not have regulations which said, "You

cannot off-gas hydrogen sulfide." It was a novelty. And so, therefore, we had to build the protocols. We had to start from the ground up and work through getting the test designed to even figure out what was coming off the drywall.

Senator DURBIN. So, look at it prospectively. If there was another shipment of drywall being manufactured in China for export to the United States, would it be subject to testing for this hydrogen sulfide?

Ms. TENENBAUM. Not right now. And it was only after Katrina, when we needed more drywall than we could manufacture domestically, that we started importing the drywall. We were handling our own needs just in the United States, and we did not have the problem.

Senator DURBIN. Well, I would say——

Ms. TENENBAUM. But, the other thing is, we have started requiring labeling. We want tracking labels so that we know the company and the area of China in which the drywall was manufactured. And we also have worked with the CBP, where they have stopped shipments into the country. In fact, they found a shipment coming in from San Francisco, and they notified us. And then we went out to check on it, and it was not gypsum.

Senator DURBIN. Well, I can tell you that—whether it's this situation with drywall or the melamine spiking into the pet food, which showed up as a higher level of protein, and therefore, was worth more—nominally worth more, until they discovered it was dangerous. It really might be beyond us to imagine how many possible things could happen from products coming in from a place where there are very few standards being applied at the source of manufacture.

I'd like to close by asking about one of your beloved retirees, whom we talked about over and over again in this subcommittee. And I don't even remember his last name, but his name was Bob. And Bob was the toy-tester. And some of our staff went out with their cameras and took pictures of Bob's workshop, which consisted of a table with toys stacked up on them. And Bob had made some marks on the wall at certain levels—4 foot and 6 foot—and then would drop the toys from those levels and see if they busted into little pieces that kids could swallow. And it didn't strike most of us as the kind of sophisticated testing most Americans would expect from an agency with your reputation. Now, Bob has retired, God bless him. And I know he did a good job for us while he was there, with the resources available. But, please tell me what the world of toy testing looks like at CPSC after Bob.

Ms. TENENBAUM. Well, thank you. Bob the toy-tester has retired. And we do not have just one person testing toys. Our staff estimates, depending on the workload, that toy-testing involves up to 20 staff from the Office of Hazard Identification and Reduction at any given time, including the laboratory, the engineering, human factors, and health scientists.

In addition, our field and import surveillance staff tests or screen toys at the port and the field. For example, investigators at the port have XRF machines, and they can screen for lead and other metals. If the toy fails XRF screening, it's sent to the laboratory for further analysis by our toxicologists and our chemicals. And if the

toy fails on the small-parts screening, then it's sent to human factors to conduct an age determination to identify the age of the child for whom the toy will be purchased and is most appropriate. And based on this age determination, the laboratory and health scientists test the toy for small parts and sharp edges.

For toy hazards that fall outside of a specific toy regulation, many other CPSC technical personnel conduct product safety assessments on the specific toy in support of compliance activities.

And if you give me a moment, I'd like to tell you about our new lab. We brought pictures of the new lab. After 35 years at our current antiquated lab space, the CPSC will open a new modern testing facility in Rockville, Maryland. We're leaving Gaithersburg. And we will open it in December 2010. And this facility has 63,000 square feet, and we will be able to hold 100 staff and guest researchers in our laboratory. And for the first time, we'll have all of our technical personnel involved in testing housed under one roof.

This building was built by a private company as a laboratory. And it's very impressive. And we invite you, when we open the lab later on this year—you might want to wait til January 2011—to go with us out to see our new lab.

Senator DURBIN. Only if you invite Bob.

Ms. TENENBAUM. All right. We'll bring Bob back.

But, we want to show you—this is our new lab, and this is the old lab. The old lab has 37,000 square feet, as compared to the 63,000 square feet. And these were nine buildings that were 1950s-era buildings, all over that campus. And it only was able to hold 42 people. And we would have to do one test and then take the equipment down to reassemble it to do another test. This new lab allows us to test multiple products at one time. It enhances our ability to look at the children's electrical, combustion, sports, recreational equipment. We will have a dedicated space for children's testing. So, we'd love to show it to you, when we're ready.

ADDITIONAL COMMITTEE QUESTIONS

Senator DURBIN. Chairman Tenenbaum, we're going to send you some more questions in writing——

Ms. TENENBAUM. Thank you.

Senator DURBIN [continuing]. And open it up to other members of the subcommittee who might like to do the same.

Keep the record open until Wednesday, April 21, at 12 noon for subcommittee members to submit statements or questions.

And I thank you very much for your testimony.

I thank Senator Collins for joining me today.

[The following questions were not asked at the hearing, but were submitted to the Commission for response subsequent to the hearing:]

QUESTIONS SUBMITTED BY SENATOR RICHARD J. DURBIN

CHINESE PRODUCTS

Question. How are things progressing with the safety of Chinese products?

Answer. Recalls of product manufactured in China have begun to decline. After increasing steadily for many years, from a low of 121 in fiscal year 2003 to a high of 346 in fiscal year 2008, the number of recalls of consumer products manufactured

in China dropped to 230 in fiscal year 2009. Through June of fiscal year 2010, we have recorded 80 recalls of these consumer products, indicating a rate that should put the China recalls well below 200 for fiscal year 2010.

In general, we find the Chinese government cooperative in pressing its industry to correct specific issues. However, while the government has publicly stated its policy that industry should comply with best manufacturing practices for making safe consumer products, it needs to put more resources behind that policy.

Question. Have the Chinese disseminated information on standards and manufacturing processes throughout China and are their toys being tested and certified? How does the process work?

Answer. The Chinese government has stated that its own laboratories that inspect toys for export under Chinese rules must adhere to the safety requirements of the export market. We have conducted training for these laboratories on numerous occasions. CPSC also has made a significant amount of information about toy safety requirements available in Chinese on our web site and Chinese toy industry publications have picked up our material and reprinted it for their readers on several occasions.

All toys imported from China (and elsewhere) are subject to the CPSIA mandate that they be certified compliant with U.S. regulations and tested for compliance by an independent third party conformity assessment body (lab) accepted by CPSC. Importers typically select a lab from CPSC's list and instruct their Chinese suppliers to have the product tested by the lab. Alternatively, they permit the Chinese suppliers to select the lab from our approved list.

Question. In October 2009, the Chinese CPSC (AQSIQ) agreed to take immediate action to eliminate the use of lead paint in toys. Have the Chinese banned products with lead paint? What about products with lead?

Answer. There is an AQSIQ directive in place prohibiting the practice. AQSIQ has been aggressive in taking corrective action with manufacturers who attempt to use lead paint on toys exported to the United States. Overall, we have seen a substantial decrease in cases of toys with lead paint level exceeding current limits.

Question. When is your next meeting with Chinese officials and what do you hope to accomplish?

Answer. I will participate in a trilateral U.S.-EU-China Product Safety Summit in October 2010. AQSIQ will participate at the ministerial level and the European Commission will send their Commissioner responsible for product safety. Both the CPSC and our European partners view the event as an importaut opportunity to impress upon AQSIQ the need to get Chinese manufacturers to rely on best manufacturing practices for producing safe consumer products.

Question. Have any other countries followed suit to make their products safer?

Answer. The European Commission is a close partner with CPSC in our work with China. We have conducted joint training for manufacturers and continue to coordinate our messaging on product safety to the Chinese government.

BEIJING OFFICE AND ACTIVITIES

Question. I understand that at the end of last year, you established CPSC's first overseas office at the U.S. Embassy in Beijing and hired a Product Safety Specialist to work there. What are the responsibilities of this individual?

Answer. The Product Safety Specialist—

—acts as a pro-active resource distribution point for Chinese suppliers and government officials who need U.S. consumer product safety compliance information;

—serves as a liaison with AQSIQ to ensure timely exchange of critical regulator-to-regulator information;

—reports regularly to CPSC, in writing, on China's regulatory implementation of product safety measures and the effectiveness of Chinese product safety reform efforts;

—works closely with the CPSC Office of International Programs and Intergovernmental Affairs' China Program Coordinators to facilitate implementation of the U.S.-China Product Safety Work Plan (i.e., personnel and information exchanges);

—proposes and coordinates monitoring and evaluation activities to determine the impact of CPSC product safety initiatives for Chinese suppliers;

—analyses data from Chinese government and industry sources regarding safety and qnality of consnmer products;

—provides information to CPSC and the Beijing Embassy Economic Section on changes in Chinese practice, regulations, laws, or structures associated with product safety;

—translates relevant product safety documents and verifies document translations;
—coordinates visits to China of CPSC officials and assists with visits to CPSC by Chinese officials;
—with approval from CPSC headquarters and using fully cleared materials, provides selected Chinese audieuces with briefiugs ou U.S. requirements for cousumer products;
—upon specific request by CPSC headquarters, visits production facilities and test labs, by arrangement with, and at the invitation of Chinese government officials and facility managers, in order to observe specified operations and verify specific activities.

Question. What are your plans to hire a Regional Product Safety Officer? What will be the responsibilities of that individual and what countries will be overseen?

Answer. The recruiting announcement for the Regional Product Safety Officer was listed on USAJOBS.gov on August 6, 2010. The deadline for applications is September 6, 2010.

The Regional Product Safety Officer will have the following responsibilities in the Asia-Pacific region:

—act as a pro-active resource distribution point for Asia-Pacific regional regulators, suppliers, and other stakeholders, who should understand U.S. consumer product safety compliance information;
—serve as a liaison with regional regulators to ensure timely exchange of critical regulator-to-regulator information;
—report regularly to CPSC on important regulatory implementation of product safety measures in the region and the effectiveness of national product safety programs;
—speak at appropriate events in the region to brief key target audiences on U.S. requirements for consumer products.
—with CPSC headquarters approval, visit regional production facilities and test labs, by arrangement with, and at the invitation of local government officials and facility managers, in order to observe specified operations and verify specific activities; and
—supervise the local hire Product Safety Specialist working in Beijing.

STAFFING

Question. Your 2010 operating plan states that staffing will remain at 530 FTEs in 2010, however, our enacted fiscal year 2010 conference report language states that the increased funding we provided shall support new staff hires, including at key ports of entry. May I have your assurances that you intend to hire additional staff in 2010? What will your FTE goal be? How many part-time and full-time employees are currently employed at the Commission?

Answer. The Commission continues to aggressively hire key staff during the remainder of fiscal year 2010. As of July 28, we have made 96 new hires since the start of the fiscal year 2010, which represents a 21 percent increase in overall agency staffing. During the current fiscal year, we have hired four additional employees at ports of entry for our Import Surveillance Division, and currently have five additional hires pending in this Division.

To date in fiscal year 2010, the CPSC has had 38 resignations and retirements. As a result, we project that we will average about 490 "annualized" FTEs for the fiscal year. This is a 13 percent increase over the annualized FTE usage for fiscal year 2009. The current FTE ceiling target we have given managers for fiscal year 2011 is 576 FTEs. This is the FTE number funded in the fiscal year 2011 CPSC budget request.

As of August 7, 2010, CPSC employment stood at 520.4 FTEs. This number includes approximately 25 temporary student hires that count against our FTE limit. As of August 7, 2010, we also have 15 pending hires and over 69 active vacancy announcements.

Question. I am aware that a number of long-time, well-qnalified and knowledgeable staff have left the Commission. What are you doing to fill the gaps left by these important staff members? Are yon having difficulty recrniting the highly technical staff that yon need?

Answer. Our attrition rate has remained steady and is 5.9 percent thus far in fiscal year 2010. We continne to hire in all of onr technical areas to handle the workload, provide for expertise in each technical area and ensure the transfer of knowledge as staff leave.

We have had difficulty filling positions for a few technical areas such as Mathematical Statisticians, Engineering Psychologists, Fire Protection Engineers, Toxi-

cologists, and Chemists. To maximize hiring potential in these areas, we have utilized the full range of recruitment flexibilities and incentives available for these positions, including recruitment and relocation bonuses, annual leave service credit, superior qualifications appointments, and telework opportunities. We have also opened many of these positions at both the entry grade level and at the senior journeyman level to ensure opportunities for applicants with varying degrees of education and experieuce.

The CPSC has also sought to expand the pool of qualified applicants by attending targeted job fairs, posting ads in professional journals and engaging in outreach to colleges and universities with a concentration in the technical areas we are recruiting.

WORKLOAD

Question. The reauthorization placed many new requirements on CPSC along with deadlines for achieving those milestones. How is CPSC managing the balance of meeting its long-standing responsibilities with the new mandates placed on the agency by the Consumer Product Safety Improvement Act?

Answer. In the Consumer Product Safety Improvement Act (CPSIA), Congress set an aggressive regulatory agenda for the CPSC over the course of the first 2 to 3 years after enactment. While the CPSIA mandates 42 separate action items for the Commission to undertake, that number nnderstates the agency workload that results from each of those mandates. For example, that count does not include any interpretative rules, such as the definition requirements for "child care article" and "toy" under section 108.

To put this in context, mandatory rulemaking activity averaged less than seven per year from fiscal year 2000 through fiscal year 2008, with the number of rulemaking projects per year ranging from a low of one in fiscal year 2005 to a high of 10 in both fiscal year 2007 and fiscal year 2008. With the passage of the CPSIA, rulemaking activity has increased significantly, averaging about 26 substantial rulemaking activities each year for fiscal year 2009, fiscal year 2010 and proposed fiscal year 2011. The Commission also conducted an additional 15 activities supporting rulemaking proceedings in fiscal year 2009 and 15 to date in fiscal year 2010.

The work required by the CPSIA is in addition to the Commission's ongoing regulatory activity in a variety of areas, including upholstered furnitnre, portable generators and cigarette lighters, as well as our ongoing compliance work in evaluating and recalling products that present hazards to consumers.

Timely implementation of the CPSIA is the agency's top priority, but we have also tried to prioritize our work in a way that maximizes effectiveness and provides flexibility if new hazards emerge. One example of this flexibility is the Commission's ongoing investigation of contaminated drywall, which is now the largest investigation in the history of the CPSC.

Question. How is the Commission prioritizing work associated with new responsibilities as a result of the reauthorization act? What criteria are being used to prioritize this work?

Answer. The CPSIA established a schedule of mandatory rulemaking activities, and these requirements have heen placed on the Commission's rulemaking agenda.

In addition, the CPSC has a regulation entitled "Policy on Establishing Priorities for Commission Activities," (16 CFR § 1009.8) that guides its efforts to prioritize the work of the agency. A description of the process for prioritizing Commission action can be found in our semi-annual regulatory agenda/plan submission that snmmarizes the regulation cited above and lists following general criteria: frequency and severity of injuries; causality of injuries; chronic illness and future illness; cost benefit of CPSC action; unforeseen nature of the risk; vulnerability of the population; probability of exposure to the hazard; and any additional criteria.

Completion of congressionally mandated tasks is a key agency priority and resources have been allocated accordingly. Other work, such as the investigation of contaminated drywall and other potential emerging hazards are also allocated priority resources as necessary.

Question. In what areas do you feel that CPSC has been slow to act due to the complexity of issues and why?

Answer. The development of a draft proposed rule addressing the third-party testing requirements under CPSA section 14(d)(2) has been extremely complex and involved thousands of hours of staff resources. This proposed rule has the potential to offer families a vital new layer of safety and reassure U.S. consumers that toys and other children's products are free of many known hazards. On the other hand, the rule also impacts tens of thousands of mannfacturers and importers across all

of the various industry sectors producing children's products, including small business entities.

Given the complexity of the global snpply chain and the number of various industries affected by these requirements, CPSC staff has sought extensive pnblic comment from all interested stakeholders to further inform development of the proposed rule. On December 10 and 11, 2009, the Commission held a Testing Policy Workshop and invited public comment on aspects of section 14 of the CPSA, as amended by the CPSIA. Staff presentations were given, and breakout sessions were held on the following topics: Sampling and Statistical Considerations; Verification of Third-Party Test Results; Reasonahle Test Programs and Third-Party Testing; Challenges for Small Manufacturer/Low Volume Production; Component Testing and Material Changes; and Protection Against Undue Influence.

A draft Federal Register notice for the proposed rule was published April 1, 2010, and the comment period expired August 3, 2010. Work is progressing, with the final rule scheduled for completion this year.

PORT SURVEILLANCE

Question. How many full-time CPSC staff work at how many U.S. ports?

Answer. The Import Surveillance Division currently staffs 11 U.S. ports with 14 on-site compliance investigators. The 11 U.S. ports with current on-site CPSC staffing include: Buffalo, New York; Denver, Colorado; Houston, Texas; John F. Kennedy International Airport, New York City, New York; Los Angeles/Long Beach, California; Miami, Florida; Newark, New Jersey; Norfolk, Virginia; San Francisco, California; Savannah, Georgia; and Seattle, Washington. We are cnrrently recruiting for four additional locations (Chicago, Illinois; Laredo, Texas; Detroit, Michigan; and Port Everglades, Florida) and expect to have staff in place in those locations by October 30, 2010.

CPSC has also co-located staff in the Commercial Targeting and Analysis Center (CTAC) located within the Office of International Trade at U.S. Customs and Border Protection in Washington, DC.

Question. How will your fiscal year 2011 bndget request augment this?

Answer. The fiscal year 2011 budget request proposes to increase the number of personnel in the Import Snrveillance Division to 23 FTEs. Of those 23 FTEs, 19 would be stationed in ports of entry.

Question. In what ways are you working with Customs and Border Patrol?

Answer. CPSC has partnered with U.S. Customs and Border Protection (CBP) on a series of efforts focused on increasing surveillance of imported consumer products.

In March 2010, CPSC submitted to CBP our revised Concept of Operations that defines CPSC's plans for nsing the International Trade Data System. This plan includes defined processes to create screening and targeting criteria and the overall automation of import enforcement mechanisms. By doing so, we have identified touch points between the agencies where cooperation and coordination can be developed.

On April 26, 2010, CPSC was the first agency to sign an interagency Memorandnm of Understanding (MOU) with CBP allowing CPSC personnel to co-locate at the Commercial Targeting and Analysis Center (CTAC). This MOU will greatly improve upon our interagency communication and information sharing.

This month, CPSC also formally executed an MOU with CBP that will give CPSC access to information in the Treasury Enforcement Communication System (TECS). This will assist CPSC investigators in the ports by providing them access to information that will improve local targeting and prodnct interdiction activities.

CPSC is also actively involved in supporting the Importer Self Assessment-Product Safety (ISA–PS) program that is currently being piloted by CBP. The ISA–PS is envisioned to be a partnership among CBP, CPSC and importers to maintain a high level of product safety compliance to prevent unsafe imports. The ISA–PS is a voluntary approach to product safety compliance and will allow the agency to direct our resources to those companies with higher risk.

Question. For the future, do you envision locating a testing laboratory on the west coast so that many of the nation's imports can be tested at, or near their point of entry?

Answer. It does not appear that funding will be available in the near future for an additional CPSC testing laboratory on the west coast. However, CPSC and CBP have been in discussions for several months on utilizing CBP laboratories to test samples collected by CPSC at import. Training of select CBP laboratory personnel has been completed and beginning September 20, 2010, targeting will begin for an operation at several ports of entry focusing on potentially violative imitation jewelry.

Products collected as part of this operation will be sent to both CPSC's lab and a CBP lab for analysis. This pilot analysis program will enable ns to determine if the results obtained at a CBP lab are comparable to those obtained at the CPSC lab. If the pilot confirms that the resnlts are comparable, the anticipated next step is to begin having CBP labs test CPSC samples independently, with Compliance relying on those resnlts to make admissibility determinations. When implemented, the nse of CBP labs will increase the number of import samples that can be collected and tested.

GAO REPORT ON CPSC'S OVERSIGHT OF IMPORTED PRODUCTS

Question. A GAO report from August 2009 found that CPSC didn't have access to key Cnstoms and Border Patrol import data that conld be used to target incoming shipments for inspection. Further, the report fonnd that CPSC's activities at U.S. ports could be strengthened by better targeting incoming shipments for inspection and hy improving CPSC's coordination with CBP. What is being done to address these issnes? Are you revising your agreements with Customs and Border Patrol? Please address the additional key issues raised in the Angust 2009 GAO report (GAO–09–803) on CPSC's Oversight of Imported Products, and discuss steps taken to address these concerns.

Answer. As noted in a previous response, CPSC is now an active participant in the Commercial Targeting and Analysis Center (CTAC) that has been developed by U.S. Customs and Border Protection (CBP) to spearhead the coordination of the efforts of the various Government agencies responsible for import safety enforcement.

On April 26, 2010, CPSC and CBP signed a Memorandnm of Understanding (MOU) for the exchange of information within the CTAC. This document gives both agencies authority to share information, combining for the first time CBP entry and advance cargo data with CPSC violator information. This partnership has enhanced information exchange, improved targeting decisions, and assisted in development of risk analysis capability.

In addition, CPSC and CBP just execnted an MOU that gives CPSC access to information in the Treasury Enforcement Communication System (TECS). This will assist CPSC investigators at the ports by providing them access to information that will improve local targeting and product interdiction activities.

NANOTECHNOLOGY

Question. Yonr fiscal year 2011 reqnest includes $2 million to support the Federal National Nanotechnology Initiative data collection activities and environmental, health and safety research, related to consumer products. Why are nanomaterials of concern? What kinds of activities will CPSC nndertake as part of the National Nanotechnology Initiative?

Answer. The National Nanotechnology Initiative (NNI) has developed a definition of nanomaterials that specifies that these materials have a specific size range in the nanoscale, 1–100 nm (a nanometer (nm) is one-billionth of a meter), and nniqne physical and chemical properties that differ from other materials not in that specific size range. Becanse of the small size and uniqne properties of nanomaterials, there is a concern that they may cause health effects in humans or organisms in the environment. In particular, there is concern about nanomaterials incorporated into consumer prodncts, and the potential risk of nanomaterials entering the bodies of adults and young children who use products that contain these materials.

As part of the NNI activities, several Federal agencies, including the CPSC, have worked together to identify and prioritize the qnestions that should be addressed and the types of research to be conducted to ensure the responsible development of nanotechnology and the safe use of nanomaterials. These research priorities are listed in the Federal environmental, health, and safety research plan that is cnrrently undergoing revision by several Federal agencies. (A copy of the plan is available online at http://www.nano.gov/NNI_EHS_Research_Strategy.pdf).

There are also international efforts, including the OECD Working Party on Manufactured Nanomaterials (WPMN), to prioritize the testing needed for nanomaterials, sponsor health effects studies, and share information on test results. The CPSC staff participates in the international efforts along with several Federal agencies.

CPSC staff is aware of its role in the national and international efforts to address nanomaterial health and safety concerns, and has proposed a number of projects for fiscal year 2011 that address the identified needs outlined in the Federal strategy. In fiscal year 2011, CPSC plans to establish agreements with a number of agencies including the Environmental Protection Agency (EPA), National Institute for Occupational Safety and Health (NIOSH), the National Institute for Standards and Technology (NIST), and the National Science Foundation (NSF) to develop testing meth-

ods and conduct studies to quantify the releases of a variety of nanomaterials from several classes of consumer products. The information derived from these studies will be used in evaluations to determine if there are any potential risks associated with identified releases of nauomaterials from tested products. The CPSC also iutends to work with other Federal agencies to increase the availability of information about nanomaterials in publically available databases and literature.

CHINESE DRYWALL INVESTIGATION

Question. I understand that CPSC and HUD have now issued guidance to homeowners with problem drywall, instructing that all problem drywall and wiring be eliminated and replaced. Is your guidance the culmination of your work on this subject or what are the next steps with regard to Chinese drywall?

Answer. CPSC and HUD have provided the public an effective means of identifying homes with problem drywall and of remediating those homes through the issuance of our interim guidance. In our remediation guidance, we have recommended the replacement of all possible problem drywall, all fire safety alarm devices, all electrical components and wiring, and all gas service piping and fire suppression sprinkler systems. CPSC and HUD expect to fine-tune our guidance documents as we analyze the results of our scientific studies as those studies wrap up.

While our scientific investigation is wrapping up, the CPSC continues to vigorously pursue avennes for relief for consumers as we continne to monitor private litigation and remain engaged with AQSIQ.

LABORATORY STATUS

Question. I believe you were scheduled to move into yonr new laboratory space this year but the contract award process took longer than expected and you now expect to move at the end of the year. What activities will occur at the new laboratory space?

Answer. The CPSC Laboratory supports the overall CPSC mission to reduce unreasonable risk of injury associated with consumer products. This function requires selecting, procuring, calibrating, operating, and maintaining sophisticated laboratory equipment by knowledgeable and skillful personnel. Work results must be competent in order to withstand the scrutiny of litigation.

The new laboratory will house facilities for the testing and evaluation of products for hazards under Sections 7, 8, 12, or 15 of the Consumer Product Safety Act. This includes facilities for testing of regulated products such as children's sleepwear, general wearing apparel, mattresses and futons, and carpeting.

The flammability test laboratory will include a 2-hour fire-rated burn room for large- and bench-scale ignition test, various hoods and test chambers for small-scale ignition tests, and a chemistry laboratory and chemical hood for fiber analysis and specialized (plastic film, chemicals and solids) flammability testing.

The chemistry laboratory will house all the analytical instrumentation used by the chemists to evaluate children's and consumer products and household chemicals. This laboratory will contain four separate laboratory testing cells used for sample preparation where solvents and acids are used, the analysis of total acids and bases, testing for flash point and viscosity analysis and extractions such as those used in the phthalate plasticizer project.

The Instrumentation Laboratories will house the inductively conpled plasma spectrometer, which is used for analysis of metals, two Gas Chromatograph Mass Spectrometers, a Fourier Transform Infra-red Spectrophotometer, and two small indoor air quality exposnre chambers.

CPSC's combustion products and appliances laboratory will contain three specialized and highly sophisticated chambers and instrumentation for testing a range of residential appliances including furnaces, stoves, ovens, gas-fueled fireplace sets, unvented space heaters, and camp stoves and heaters. A temperature- and humidity-controlled carbon monoxide gas chamber used to test CO alarms will also be situated in that space. Adjacent to these chambers, we plan to install the apparatus of the mechanical test laboratory: a large fatigue cycle test frame, a 14-foot tall monorail head-form drop tester for helmet and playground surface testing, two tensile/compression strength testers for evalnating mechanical support structures (such as bicycle frames), and a hydraulic pressure test facility for evaluating fire suppression sprinklers.

The electrical and mechanical test laboratories will be nsed for testing various consumer products, such as ATVs, small electrical household appliances, cribs, baby walkers, and toys. We will also have fireworks laboratory space to test some of the characteristics of Class C pyrotechnic devices for compliance with Federal regnlations.

Question. I understand that the new facility does not allow for fireworks testing? Are you not testing fireworks then?

Answer. CPSC is not able to conduct the full range of fireworks testing at our current laboratory and will not be able to conduct the full range of testing at our new facility. We conduct testing to evaluate fireworks fuse burn time, functionality and reliability of the fuse to ignite the device, launch tube integrity, functionality and location of the aerial effects, and other characteristics at the Blossom Point Research Facility in southern Charles County.

SEARCHABLE CONSUMER PRODUCT SAFETY INCIDENT DATABASE

Question. In less than a year, the public will be able to access a CPSC database that will allow an individual to report an incident or injury from a product and also allow an individual to research safety information about a product. Where is the Commission, at this point, in developing the system?

Answer. In September 2009, funds were apportioned by the Office of Management and Budget (OMB) for the development of the public database. Since that apportionment, CPSC staff has worked diligently to complete the tasks required to implement the database by the March 2011 deadline.

In January, public workshops were held with consumer groups and industry to solicit comments and suggestions about how to best meet the requirements of Section 212 of the CPSIA. In April, the Commission proposed a rule specific to the implementation of the database. Comments received through this implementation proceeding have been used to help develop the system.

With strong support from ageucy executives, much of the development work has been completed and internal and several external focus groups have reviewed specific parts of the application. CPSC has also taken advantage of opportunities for presentations at meetings held by the Cousumer Federation of America, the International Consumer Product Health and Safety Organization, and with the National Association of Manufacturers. Comments have been positive.

Later this fall, CPSC plans to hold more workshops with iudustry and consumer groups to garner more feedback. CPSC's Office of Public Affairs is also coordinating the development of the public awareness campaign consistent with the release of the database in March 2011. Overall, development work for the public consumer product safety incident database is on target and we anticipate a successful release in March 2011.

Question. What types of issues are you grappliug with as you envision the system's development?

Answer. CPSC has not run into significant issues with the development of the system. During the public workshops held on the database many useful comments and suggestions were provided by industry and consumer groups. The Commission also received close to 50 comments in response to the proposed rule. These comments are currently being analyzed in preparatiou of the final rule. Although some of the technical details of the database design may be affected by the adoption of the final rule, the possible changes are manageable within the implementation timeframes.

Question. What types of input or assistauce are you receiving for this type of undertaking?

Answer. As noted above, CPSC held public workshops with industry and consumer groups to help provide input for the design and functionality of the system. Meetings with other stakeholders and external focus group testing in recent months have also proven useful. Additional workshops are planned, along with more extensive use of the Commission's saferproduct.gov website to provide more information to the public as updated information becomes available. CPSC will continue to work as closely with industry and consumer groups well in advance of the launch of the public database to ensure its success.

STATEMENT SUBMITTED SUBSEQUENT TO THE HEARING

Senator DURBIN. Subsequent to the hearing Senator Mary Landrieu has requested that a statement she has submitted be inserted into the record.

[The statement follows:]

PREPARED STATEMENT OF SENATOR MARY L. LANDRIEU

Thank you Chairman Durbin and Ranking Member Collins for calling this oversight hearing on the Consumer Product Safety Commission's (CPSC's) budget for fiscal year 2011. The Consumer Product Safety Commission continues to do great work

to ensure that consumers protected against hazardous products. Of particular interest to me and the state of Louisiana is the CPSC's ongoing investigation into defective drywall made in the People's Republic of China. As homeowners in my state, and nationwide face possible health and environmental risks from Chinese-made drywall products, it is my hope that the CPSC will be able to provide a definitive solution in the investigation into this issue facing impacted consumers in the near future.

According to published reports, since 2006 more than 550 million pounds of drywall have been imported to the United States from China. This is enough to make tens of thousands of homes. However, these products may have come into the country as far back as 2000 and could be in over 100,000 homes nationwide. This is because since 2004, builders have turned overseas for materials because our own U.S. snppliers could not keep up with demand created by the U.S. construction boom, as well as a series of hurricanes and other natural disasters. This would include the 2004 Florida hurricanes, Hurricanes Katrina and Rita of 2005, and other disasters. The drywall entered the United States through numerous ports, including the Port of New Orleans. As I understand it, Florida was the number one destination for these products with over 3 million drywall boards. Louisiana was next with almost 660,000 drywall boards. In Louisiana alone, this could be as many as 7,000 homes. Overall to date, the CPSC has received about 3,082 incident reports from 37 states, the District of Columbia, Puerto Rico, and American Samoa. This problem spans the country, from California in the West to right here in the District of Columbia and Virginia. It is not just an isolated issue for homeowners in the Gulf Coast—Chinese drywall is a nationwide problem.

It is my understanding that the CPSC received its first consumer incident report from Florida in December 2008. In Louisiana, we began to see reports from homeowners in southeast Louisiana in late February of 2009. These reports were similar to those seen in Florida homes: a "rotten egg" smell within homes; health issues such as skin irritation, persistent cough, bloody noses, hair loss, and asthma attacks; lastly homeowners noticed blackened and corroded metal components in their homes. According to the Louisiana Department of Health and Hospitals, 990 calls have been received regarding defective drywall, and 551 of those callers have completed the DHH survey. The majority of these reports were centered in New Orleans and surrounding parishes in southeast Louisiana. From Orleans Parish, 151 calls have been received, followed by St. Tammany Parish with 118 calls, and Jefferson Parish, St. Bernard Parish, and East Baton Rouge Parish follow close behind. Just to give you an example of how widespread this issue is in my state, we have seen hundreds of homeowners ranging from St. Bernard Parish Fire Chief Thomas Stone to New Orleans Saints Head Coach Sean Payton report this prodnct in their homes. Many parents have been seeking answers on what might be making their kids sick or, now that more details are coming out, how they should safely remove this product from their homes. This defective Chinese drywall represents an attack on these families and presents another obstacle on our road to Gulf Coast recovery.

In response to these reports, my office has heard from countless constituents on the need for consistent, scientifically-based information on the product, as well clear guidance on the public safety, health, and environmental impact. Families have asked for information on which Federal or State agencies to contact, in addition to any updates we have on the health risks posed by this product. Many families also called concerned about the impact of defective drywall not just on their children bnt also on pets. To address these questions, on April 23rd, my office issued a fact sheet for homeowners updating them on the Federal/State response, providing key contact information, and answering frequently asked questions. My office updates this document regularly as new information becomes available.

On the state level, it is my understanding that the calls which the Louisiana Department of Health has received have ranged from homeowners requesting home inspections, advice on home evacuations, in addition to inquiries on specific health information to provide their primary care physicians and veterinarians. A key question is that of remediation or possible financial assistance in order to deal with this problem. Many of my constituents received either Federal Emergency Management Agency (FEMA) or Small Business Administration (SBA) disaster assistance to rebnild these homes following Hurricanes Katrina and Rita of 2005. These families spent months in FEMA trailers and rental units following these disasters, they paid out of pocket or took on debt to rebuild. Now they find their rebuilt homes in worse shape than these post-disaster temporary units. In this situation, families are looking for answers and a timeline for when more information will be known on the definitive health impacts of this product.

In response to these concerns from my constituents, I have been working closely with Senators whose states contain contaminated drywall. Along with my col-

leagues, I have sent letters to various agencies requesting appropriate assistance for homeowners and I have filed S. 2731, the "Small Business Administration Disaster Recovery and Reform Act of 2009." S. 2731 includes a provision, which with restrictions, would authorize SBA to make disaster home loans for the repair and replacement of Chinese drywall. Senator Nelson has co-signed, and I look forward to pnshing for this bill to become law to provide relief to homeowners.

Earlier this year, CPSC and the U.S. Department of Housing and Urban Development (HUD) issued a protocol to help identify problem drywall in homes. Fnrther, interim remediation guidance was released by these agencies on April 2 based on CPSC's ongoing scientific research. These guidelines are a positive step to relief for affected homeowners, and the coordination of the CPSC and HUD is to be commended. However, it is important for all Federal agencies to better coordinate with CPSC and HUD in an effort to better assist in the remediation and recovery efforts.

While I understand the need to be thorough and build a case that might stand np to future legal scrutiny, and I understand that accnrate scientific testing takes time, my constituents need definitive answers now. Parents caring for sick children or pets need answers, workers removing these products from homes need to know potential health risks, and local health officials need to know what environmental impact may occur if this drywall is dumped into landfills. Though results which have been released and interim remediation protocol are great leaps, I mnst stress the importance of a final solution.

In closing, I believe that the scope of this problem is huge because it touches on so many different stakeholders. The first thonght is on the impact to homeowners and renters, as it shonld be for a health risk of this nature. However, medical professionals and veterinarians are also dealing with this issue as families report health problems. The possible pnblic safety impact also draws in fire marshals, construction workers, and environmental inspectors. So this defective prodnct is not just a concern for homebuilders or homeowners, but is a concern for many other professions in both the public and private sectors. That is why the testing of this hazardous material is so important—we mnst ensnre that there is a timely and effective Federal response in cooperation with local health authorities. I look forward to working closely with my colleagues to support additional efforts to address this critical matter facing our homeowners.

I thank the Chairman and ask that a full copy of my statement appear in the record.

SUBCOMMITTEE RECESS

Senator DURBIN. And this meeting of the subcommittee stands in recess.

[Whereupon, at 3:26 p.m., Wednesday, April 14, the subcommittee was recessed, to reconvene subject to the call of the Chair.]

H.R. 4678, FOREIGN MANUFACTURERS LEGAL ACCOUNTABILITY ACT, AND H.R. 5156, CLEAN ENERGY TECHNOLOGY MANUFACTURING AND EXPORT ASSISTANCE ACT

WEDNESDAY, JUNE 16, 2010

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCE, TRADE,
AND CONSUMER PROTECTION,
COMMITTEE ON ENERGY AND COMMERCE,
Washington, DC.

The subcommittee met, pursuant to call, at 10:00 a.m., in Room 2322, Rayburn House Office Building, Hon. Bobby L. Rush [chairman of the subcommittee] presiding.

Present: Representatives Rush, Sarbanes, Sutton, Stupak, Barrow, Matsui, Braley, Dingell, Stearns, Whitfield, Terry, Murphy, Gingrey, Scalise, and Latta.

Also Present: Representatives Sánchez and Turner.

Staff Present: Angelle Kwemo, Counsel; Felipe Mendoza, Counsel; Michelle Ash, Chief Counsel, Commerce, Trade, & Consumer Protection; Peter Ketcham-Colwill, Special Assistant; Althea Gregory, Intern; and Elizabeth Letter, Special Assistant.

OPENING STATEMENT OF HON. BOBBY L. RUSH, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ILLINOIS

Mr. RUSH. The subcommittee on Commerce, Trade and Consumer Protection will now come to order.

The purpose of today's hearing is to hear testimony on two bills, H.R. 4876, the Foreign Manufacturers Legal Accountability Act, and H.R. 5156, the Clean Energy and Technology Manufacturing and Export Assistance Act.

The chair recognizes himself for 5 minutes for an opening statement.

I want to thank the members of the subcommittee for participating in this important legislative hearing. As I stated before, we will be considering two important bills.

The first bill deals with products manufactured overseas that are flooding the U.S. market and aren't safe for American consumers. And the second bill deals with access to global markets by American manufacturing new products. Both bills aim at protecting American jobs and American consumers. And I would be remiss if I didn't commend Congresswoman Betty Sutton and Congresswoman Doris Matsui for attempting to lean on both of these very critical issues for the safety of the American people.

Last year we were saddened by the tragedies caused by the toxic effects of Chinese drywall on consumers. The victims sometimes from areas still reeling from the aftermath of Hurricane Katrina, finding themselves suffering as a result of serious health problems.

More saddening is the fact that it is very difficult, if not impossible, to hold accountable the foreign manufacturers of those products. H.R. 4876, the Foreign Manufacturers Legal Accountability Act, will fix that loophole and allow suppliers of foreign-made products to be sued for defects in those products used here on U.S. soil. And I must also say that while the U.S. market is open to global manufacturers, the contrary is not always the case.

Our next bill illustrates the need for green technology and the need for necessary remedies. Last year, the subcommittee held a hearing on how to increase the export of green technology products. We heard about the challenges U.S. manufacturers are facing in overseas markets despite the fact that U.S. technology is unquestionably one of the best.

We all agree that clean energy is a vast, untapped market. There is a large world demand for U.S. goods. But our market share in 2008 dropped in from 14 to 9 percent. Even emerging economies are rising and trying to replace the U.S. in its current position as global leader in manufactured goods. It will happen if we don't assert our long-recognized and long-held leadership on this particular matter.

H.R. 5156, the Clean Technology Manufacturing and Export Assistance Act will help our industry do that and will strengthen the manufacturing industry's capacity and also provide them with the tools they need to boost their exports.

We have, on several occasions, highlighted the importance of having a strong domestic policy to allow the manufacturing industries to be confident enough to penetrate the international markets. We are all aware that the events currently taking place in the Gulf of Mexico is another real concern. It reinforces the need for environmentally friendly technologies. This is where our future lies.

As I said before, and I will repeat it again, we must seize every opportunity or fall drastically behind. And I want to thank all of the witnesses again for being here, and I look forward to your testimony on the bills we are considering today.

And now I am going to recognize the ranking member for 5 minutes for the purposes of an opening statement.

OPENING STATEMENT OF HON. ED WHITFIELD, A REPRESENTATIVE IN CONGRESS FROM THE COMMONWEALTH OF KENTUCKY

Mr. WHITFIELD. Chairman Rush, thank you very much and we certainly appreciate the witnesses being with us here this morning as we explore two pieces of legislation that I think all of us would agree have great intentions, and I think it's important because this legislation is so important that we listen to some experts today about some concerns that certainly I have about this legislation, although I agree with the intent of the legislation.

For example, on 4678, which holds foreign manufacturers accountable in the U.S. for selling products that comply with our safety standards and require them to have an agent for service of

process, I don't really have any problem with that. But I think we have to explore, for example, in 2002, the Congress passed the Public Health Security and Bioterrorism Act, and under that Act, under certain circumstances, certain companies had to have registered agents. The U.S. Customs law already requires agents for companies that do business in the U.S. in certain instances.

We are signatory to the Foreign Sovereign Immunity Act, and we know that in many countries around the world like China, a lot of those companies are owned by the government and it raises the issue even if you have a service of process you obtain the judgment can you really collect on it, because of sovereign unity and so forth. And then we have the Hague Convention on the Service Abroad of Judicial and Extra Judicial Act and what will the impact of this have on that?

So we have a lot of mechanisms already in place through the government to ensure the people of America that we are dealing and consuming and using safe products. Now, I am not saying that those are enough. But I also know that if we adopt this kind of legislation, we might also expect that other countries may also adopt it, which could have some negative impact on our small exporters that are trying to open up foreign markets, and I know that President Obama, one of his goals is to significantly increase our exports.

So all of these are issues that I think we have an opportunity to work together here, but I think it is important that we explore the ramifications of this legislation. And so we look forward to the witnesses' testimony on that issue.

On the clean energy technology manufacturing export assistance fund, I think all of us are certainly interested in exporting green technology or clean technology, and I know already the Department of Commerce has an extensive assistance program to encourage exports of U.S. products. And it appears that this legislation would simply be carving out clean energy technology, which is fine.

But as I was reading this legislation, just to give you an example of one thing I was concerned about because I am from a coal State. Coal still provides 51 percent of all electricity produced in America, and I don't think anyone believes that renewable energies or wind power or anything else, I guess they are one in the same, over the immediate term will come close to providing our electricity needs.

But if this bill became law, for example, I would like to see some assistance given to carbon capture sequestration technology because China is using more coal every day than the United States even thinks about. And right now, they are just burning coal, low-grade coal, and polluting the environment and if we can export clean coal technology to them, that would be great.

But as I read this legislation, it says to be eligible for this program, the project or the entity has to do one of the following: Generate electricity. Well, carbon capture sequestration does not generate electricity but it removes carbon dioxide. Second thing, substantially increases the energy efficiency of buildings, industry, or agricultural processes. Well, I am not sure that carbon capture sequestration would meet that criteria, or it substantially increases the energy efficiency of the transportation system.

So those are some questions that I think we need to explore because this is very important legislation, it has great goals, and I think we have an opportunity here to explore a lot of these issues and come up with a proposal that all of us can agree to. I yield back my 14 seconds.

[The prepared statement of Mr. Whitfield follows:]

Statement of the Honorable Ed Whitfield
Ranking Member,
Subcommittee on Commerce, Trade, and Consumer Protection
Hearing on H.R. 4678, the Foreign Manufacturers Legal Accountability Act, and H.R. 5156

- H.R. 4678 seeks to hold foreign manufacturers accountable in the U.S. for selling products that comply with our safety standards. That is a worthy goal I believe we all share.

- Reading this legislation, I do have concerns whether this is the best policy approach that will achieve the desired result while at the same time not inflicting harm on US companies.

- This legislation prohibits foreign manufacturers from introducing, selling, or holding to sell or distribute merchandise in commerce unless the manufacturer has a registered agent in the United States authorized to accept service of process for all civil and regulatory matters in State and Federal courts.

- It is my understanding that the importer or customs broker is often the manufacturer of record under the Consumer Product Safety Act and certain liability attaches to that role.

- I will be interested to learn from our witnesses what improvement a registered agent will provide over current law? Is there a mechanism to force foreign manufacturers to appear in court and abide by judgments?

- The good multinational companies will likely comply voluntarily, but it is easy to imagine the fly-by-night night companies that manufacture shoddy products in foreign countries may simply disappear and reconstitute themselves to sell under a new company name.

- If the registered agent is the importer or customs broker, it is not clear how the registered agent will be selected by manufacturers that use multiple importers or brokers.

- Turning to H.R. 5156, the Clean Energy Technology Manufacturing and Export Assistance Act of 2010", this legislation provides a new $75 million promotion and assistance program for "clean" energy within the Department of Commerce's International Trade Administration.

- I do find it interesting that we are having a hearing on this proposal, after a series of hearings we've held in the Subcommittee on Energy and Environment, looking at so-called "green" jobs.

- I know that the President and others have touted green jobs as a tremendous opportunity for the United States, but I am not as optimistic, and in fact there was a study conducted by a university in Spain, which itself has promoted a green jobs economy, which showed an actual loss of traditional jobs for new green jobs created, and which forecast that for every 4 jobs created in the renewable energy sector, the United States should expect to lose nine jobs.

- While I want to see U.S. innovation rewarded through growth of commercially viable technologies I do believe the approach in this legislation presents serious concerns because it appears to put the cart before the horse.

- The biggest obstacle to increasing our exports of new energy technology is making sure foreign markets are truly open to U.S. manufacturers. The Administration recognizes this and I commend them for focusing their energies on opening these markets and ensuring strong protections for intellectual property exist and are enforced.

- Until tariffs and preferences in some countries for their own domestic manufacturers are eliminated, all our promotion efforts will be in vain.

- If our companies can increase their exports through expanded market access, this new legislation will be justified. However, to gain foreign market access, we will be called on to reciprocate and open our energy markets. As a result, our current domestic markets will likely

face stiffer competition which could limit job growth. Such outcomes must be carefully evaluated.

- With that said, the goal to increase exports is best achieved through continued efforts to negotiate free trade agreements or ensuring our existing agreements with our trade partners permit equal access.

- My concern with this program is that it appears to subsidize the efforts of businesses that want to export their goods. Traditionally, private enterprises must develop these competencies internally or contract expert consultants to provide these services. Viable companies can and will invest in their export capabilities and should not rely upon taxpayer funded subsidies.

- Further, while more government jobs would be created at taxpayer expense, it would likely displace private sector professionals that provide the same or similar services.

- Finally, if we are concerned about long term job growth, we have to be concerned with the overall trade picture and how sensitive issues such as the transfer of intellectual property to developing countries affects America's long term competitiveness.

- I yield back.

Mr. RUSH. The chair thanks the gentleman.

The chair recognizes the gentlelady from Ohio, Ms. Sutton, for 2 minutes.

OPENING STATEMENT OF HON. BETTY SUTTON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Ms. SUTTON. I thank the chairman for holding this hearing, and I think both of these pieces of legislation are important. I am proud to be the sponsor of H.R. 4678 along with 61 cosponsors from both sides of the aisle.

I am going to keep my remarks limited to that at this point.

Every year many Americans are injured, sometimes fatally, by dangerous products that have been manufactured abroad and imported into the United States. Recent examples include toxic drywall, faulty infant cribs, lead paint in children's toys and defective tires. These products not only hurt American consumers, they hurt American businesses.

U.S. manufacturers are responsible for insuring that the products that they put on the market are safe, yet it is extremely difficult for injured parties to hold foreign manufacturers accountable because they are unable to serve process or establish jurisdiction. As a result, American consumers and businesses are forced to engage in cost-prohibitive and time-consuming international legal battles rarely receiving the redress they deserve.

The Foreign Manufactures Legal Accountability Act would require foreign manufacturers doing business in the U.S. to identify a registered agent authorized to accept service of process on behalf of that manufacturer. Registering an agent would constitute an acceptance of jurisdiction of the State in which the agent is located. This bipartisan bill would help protect American consumers and businesses from defective products manufactured abroad, would level the playing field for American manufacturers, and provide U.S. consumers with the necessary tools to seek proper redress.

And I want to thank my colleague and cosponsor Representative Mike Turner who is here this morning for his work and support on this legislation.

I also want to thank Representative Linda Sánchez for her leadership and work on this issue, and she may be joining us as well.

I look forward to hearing from the witnesses and to working through whatever concerns that the ranking member may have to a solution on this very, very important work.

At the end of the day, this is about fairness and justice. American consumers and businesses deserve both, and this legislation will help us achieve that.

Mr. RUSH. The chair now recognizes the gentleman from Ohio, Mr. Latta, for 2 minutes.

OPENING STATEMENT OF HON. ROBERT E. LATTA, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Mr. LATTA. Thank you, Mr. Chairman, Ranking Member Whitfield. Thank you for holding this hearing today on these two pieces of legislation both related to manufacturing. My congressional district is heavily based in manufacturing, and I am constantly advo-

cating for ways to assist these manufacturers to remain in business and to continue producing goods.

According to the National Association of Manufacturers, my district is the largest manufacturing district in the State of Ohio, the 20th largest in Congress. When I was first elected in December of 2007, I represented the ninth largest manufacturing district, and in two years it dropped to 20th. The current unemployment rate in Ohio is just under 11 percent, and there are many counties in my district that have over 12 percent unemployment.

In looking at these two pieces of legislation, the subcommittee needs to ensure that it does nothing to hinder further economic growth to put further restrictions on U.S. manufacturers. It is important that Americans have safe products for use and that companies comply with U.S. safety standards. However, I have several concerns with H.R. 4678 and that will have unintended consequences on American manufacturers.

They are concerns that under this bill the U.S. companies that have contracted with foreign manufacturers for parts will be the ones responsible for establishing a registered agent on behalf of the foreign supplier. In addition, I have concerns that other nations will reciprocate similar laws that would impose additional compliance regulations or liability exposure to U.S. exporters abroad.

The manufacturers in my district can not withstand either of these scenarios. Many of these companies are still holding on by their fingernails in this troubled economy and will not be able to withstand further government mandates or increased exposure to liability. I have concerns that this legislation could inadvertently lead to an increase in lawsuits on our manufacturers.

My district is also home to many facilities relating to alternative energy sources. Clean energy technology manufacturing is an important piece of the puzzle for America's energy independence. As with all of our manufacturing products, exporting is a key to the U.S. to remain a world leader. However, I do have concerns with H.R. 5156 and its creation of another new government program administered by the International Trade Administration within the Department of Commerce. At a time when our national debt is skyrocketing, I do not believe in expanding our government but should be trying to limit it.

There are also concerns that this new grant program duplicates other programs that have already been created through the energy stimulus bills.

I look forward to the hearing today.

Mr. RUSH. The chair now recognizes Mrs. Matsui for 2 minutes.

OPENING STATEMENT OF HON. DORIS O. MATSUI, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Ms. MATSUI. Thank you, Mr. Chairman, and thank you for calling today's hearing.

I, first of all, want to applaud my good friend, Betty Sutton, for introducing H.R. 4678, and I support her legislation. I would also like to thank the witnesses for being with us here today. And I particularly want to welcome our witness from the Sacramento area, Jack Crawford, CEO of Jadoo Power.

Under Jack's leadership, Jadoo Power is a leader in manufacturing clean energy technologies and providing hybrid fuel cell power for military, government, and commercial applications. Jack has a wealth of expertise in the clean energy sector, and I look forward to hearing from him today.

As he can attest, the Sacramento region is well positioned to be a leader in producing clean energy technologies with more than 110 clean tech companies that focus on production of fuel cell technology, biofuels, solar, wind energy, and others.

To continue growth, the U.S. clean energy sector, particularly small and medium-sized firms, need manufacturing expert assistance to boost their competitiveness in the international marketplace. In fact, our Nation's clean tech industry is lagging behind many of its competitors in exports, including Germany and China. This is simply unacceptable. The U.S. must he a leader in manufacturing and exporting clean technologies. That is why I, along with Chairmen Rush and Dingell and Representative Eshoo, introduced H.R. 5156, a bill to boost the competitiveness of American-made clean tech products both here in the United States and around the world.

The bill will create a fund to develop and sustain a national clean energy technology export strategy to provide U.S. clean tech firms with expert assistance and finding and navigating foreign markets to sell their goods and services to new customers.

The President has laid out a laudable goal to double U.S. exports over the next 5 years, and this legislation will ensure clean energy exports are at the forefront of the national export strategy. The bill will also strengthen America's domestic clean tech manufacturing industry.

Ultimately, H.R. 5156 will enhance our standing in the race to be the global leader in clean energy. The BP oil spill only underscores the need for leadership in the clean energy market, and this spill has sent a strong message that America is serious about being the leader in producing and exporting these technologies.

I look forward to working with my colleagues on the committee to achieve this goal, and I thank you, again Mr. Chairman, for holding today's hearing.

Mr. RUSH. Dr. Gingrey is recognized for 2 minutes.

OPENING STATEMENT OF HON. PHIL GINGREY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF GEORGIA

Mr. GINGREY. I want to thank you for holding today's hearing on two pieces of legislation, H.R. 4678 and 5156, to allow us to hold a discussion on important issues facing consumers as we strive to create jobs. I believe that both of these bills are well intentioned as they attempt to assist consumers and improve the clean technology trade deficit that we currently face.

Unfortunately, I believe that both bills will have unintended consequences that could prevent them from accomplishing their respective goals.

Mr. CHAIRMAN, H.R. 4678 seeks to rectify the problems that have been associated with foreign product recalls. While I am saddened by what has occurred to the victims—one of whom is on our first

panel of witnesses—I fear that H.R. 4678 will not fully address the underlying issue.

The purpose of this legislation is to hold foreign manufacturers responsible for the products that come to the United States. However, unintended consequences many times domestic companies contracting with foreign manufacturers will likely be responsible for establishing registered agents, thereby putting American companies at risk as opposed to their foreign counterparts.

I have similar concerns with H.R. 5156. During the budget window of this bill, we provide $75 million in funding instead of tackling two of the biggest problems with our clean technology trade deficit.

Mr. Chairman, the first deals with the raw materials available domestically to support innovation in clean technology. The minerals needed to commercially manufacture these products are either not abundantly available in U.S. or current policies prevent them from being mined properly.

The other problem is the issue of trade. Without access to markets, without burdensome tariffs, we will continue to trail our competitors when it comes to clean technology products. Unfortunately, I do not believe that H.R. 5156 will ultimately alleviate the trade deficit that we face in this area.

Mr. Chairman, despite my concern about these bills though, I do look forward to hearing from both panels of witnesses so they can provide us with their expertise on these matters.

Mr. RUSH. The chair now recognizes the chairman emeritus for the full committee, the gentleman from Michigan, Mr. Dingell, for 5 minutes.

OPENING STATEMENT OF HON. JOHN D. DINGELL, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF MICHIGAN

Mr. DINGELL. Mr. Chairman, I thank you. I commend you for holding today's hearings on H.R. 4678, the Foreign Manufacturers Legal Accountability Act, and H.R. 5156, the Clean Energy Technology Manufacturing and Export Assistance Act.

The former will help ensure foreign manufacturers are held accountable for injuries their products may cause to American public health and safety. And the latter will bolster the Nation's exports in the growing sector of green technology. Both are important, and I support efforts such as these and will welcome the input of our witnesses.

Before concluding my remarks, I wish to say a few words in support of H.R. 5156 which you, Mr. Chairman, Congresswoman Matsui, and I are original sponsors.

There is broad agreement that the United States lags behind other nations in terms of exports. Whereas exports can now account for 49 percent of Germany's GDP, they account for only 9 to 13 percent of our own. More alarmingly, while Germany exported $19.6 billion in clean technologies and services between 2004 and 2008, the United States exported only 7.7 billion.

In brief, the United States consumes far more than it produces and in so doing, is squandering not only our valuable resources, our moneys, but our opportunity to be a leader in green technology ex-

ports. H.R. 5156, by establishing a modest support mechanism for the export of such technologies by U.S. manufacturers will significantly help remedy this matter.

Moreover, the tax revenue generated from these exports will pay more than the bill's cost over a 5-year period. The bill should enjoy bipartisan support and must be recognized as a critical component of our Nation's economic recovery.

And to return to H.R. 4678, it should be noted that had such legislation been in effect, our troubles with the matter of Toyota vehicles and their safety consequences would have been handled much easier.

Mr. Chairman, I thank you, and I yield back the balance of my time.

Mr. RUSH. The chair recognizes the gentleman from Louisiana, Mr. Scalise.

OPENING STATEMENT OF HON. STEVE SCALISE, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF LOUISIANA

Mr. SCALISE. I would like to focus my comments on H.R. 4678, the Foreign Manufacturers Legal Accountability Act, a bill that is relevant to my State and district because of the problems we are experiencing with toxic drywall.

To date the Consumer Product Safety Commission has received over 3,300 incident reports related to toxic Chinese drywall from 37 States. Twenty percent of these reports are from Louisiana, which is second only to Florida. And my office continues to receive complaints from constituents affected by toxic drywall.

Last week, a resident of New Orleans contacted my office at a loss for what steps to take or what to do for help. Like many others, her family was forced to move out of her home because of toxic Chinese drywall, and they can no longer afford to pay the mortgage on the home they aren't occupying while paying rent for temporary housing at the same time.

The CPSC has been investigating toxic Chinese drywall for over a year and a half, and it has sufficient evidence that toxic Chinese drywall manufactured by Chinese companies is responsible for the severe damage we have seen in thousands of American homes. Last month, the Commission even identified 10 drywall manufacturers whose products emitted high levels of hydrogen sulfite in laboratory testing. Unfortunately, no action has been taken against these companies.

We must hold the manufacturers of toxic Chinese drywall accountable, and I have continued to push for this including requesting that the Department of Homeland Security pursue any and all options available to the department including the seizing of assets being shipped into the United States against those entities that manufacture toxic Chinese drywall and have been found liable for the damages associated with the contaminated products.

These foreign manufacturers bear responsibility for serious damage for thousands of homes across the country and have caused homeowners significant financial hardship and in some cases, physical harm. Even more concerning is that they have done so without repercussion. We must take action to hold accountable those who

are responsible for the damages caused by toxic Chinese drywall until they settle with the affected victims or comply with the rulings of U.S. courts.

Given the challenges we are facing in doing this, I am pleased to see some of my colleagues recognizing this issue. The goals of H.R. 4678 are good, but I do have questions about whether its implementation will accomplish its intentions. While it can be argued that this bill would make it easier to prosecute foreign manufacturers in the U.S., foreign courts would still be under no ohligation to enforce such judgements. We would still be dependent on the good will of foreign courts to enforce those judgments.

My constituents and others around the country who have been affected by toxic Chinese drywalls deserve answers and solutions, and this subcommittee must work with the intergovernmental task force on problem drywall to help deliver that.

Mr. RUSH. The chair now recognizes the gentleman from Georgia, Mr. Barrow of Georgia for 2 minutes.

Mr. BARROW. I thank the chairman, and I will waive opening.

Mr. RUSH. The chair now recognizes Mr. Braley for 2 minutes.

OPENING STATEMENT OF HON. BRUCE L. BRALEY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF IOWA

Mr. BRALEY. Thank you, Mr. Chairman, for this important hearing.

And as chairman of the Populist Caucus, I am proud that the bill known as H.R. 4678, the Foreign Manufacturers Legal Accountability Act, is part of our America Jobs First platform. This bill requires foreign manufacturers doing business in the United States to identify a registered agent authorized to accept service of process on behalf of the manufacturer.

And one of the reasons I support this legislation is because unlike a lot of people at this hearing, I have actually tried to hold foreign manufacturers accountahle for their defective products in U.S. State courts. It is virtually impossible. There are companies marketing products in this country who put the word "U.S.A." in their company logo and put out publications that say "in an industry dominated by foreign competition, we are proud of the fact that our products are manufactured right here in the United States," and yet when those products gave rise to a defect and suit was pursued, they turned around and said these products, in fact, were not made in the United States. They were made in China. Which then dumps you into the bottomless pit of attempting to get suit on an entity that may be a part of the Chinese government who is manufacturing that defective product.

So you can imagine how difficult it is when you have to translate that document into the native language of the country of where the suit is being served, then get help from a government entity that may be unwilling to subject its manufacturers to liability in U.S. courts. And after all of those delays, nothing happens.

And I have heard some of my colleagues express concerns about U.S. companies heing exposed to increased litigation. They are not well founded concerns because the reality is right now in many States if you cannot find the manufacturer of a defective product and hold them accountable, then some of the immunity that goes

to the distributors of those products, if the manufacturer is available and can be pursued in that State court go out the window and then the U.S. distributors and manufacturers are the one on the hook.

So this bill actually is a great thing for U.S. manufacturers. It levels the playing field and gives them the same opportunities to compete with foreign manufacturers that U.S. companies have.

That is why I support it. And I yield back.

Mr. RUSH. The chair now recognizes the gentleman from Florida, Mr. Stearns, for 2 minutes.

OPENING STATEMENT OF HON. CLIFF STEARNS, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF FLORIDA

Mr. STEARNS. Mr. Chairman, thank you very much.

Having chaired this committee when the Republicans were in the majority, we tried to wrestle with this problem of reciprocity between countries where there is fraud, abuse, and incompetence and intentional mislabeling and things like that. Mr. Braley mentioned some of the problems. We were never able to get to the point where we were able to get together a bill that would deal with this very serious problem. It affects not only manufacturing, but also the Internet, how to go after people that are fraudulent on the Internet or basing their companies outside the United States. So I think the bill is well intended. I think the hearing will be worthwhile listening to.

But I have to tell you that I don't think the problem that Mr. Braley talked about is going to be solved here because this agent is going to like a cardboard agent where he will deliver all of these documents that are in English, and he will just dead file them.

I think this registered agent will be there, but I think we might even have to explore other ways to have reciprocities between countries because that is the larger issue because a lot of these countries are going to just stonewall us.

Can we hold foreign manufacturers accountable for harmful products? Foreign courts are under no obligation to enforce U.S. judgements. So I welcome this hearing, Mr. Chairman. I look forward to what they have to say.

I just conclude with H.R. 5156, the Manufacturing and Export Assistance Act, clean energy technology. This is going to cost us money. This is questionable. I would think all of this, Mr. Chairman, was in the cap-and-trade which passed out of the House. Perhaps it is also in the stimulus bill. So, you know, I think we have to realize that if we didn't get everything together in that cap-and-trade I would be very surprised. There were hundreds of amendments and we discussed it for weeks. So I think a lot of it was there.

I just conclude where are you going to get all of this clean energy technologies bit parts from.

So I think it is worthwhile to have these hearings on these two bills. I just think that perhaps when we mark this up, we might have to make it a little bit stronger.

Mr. RUSH. At this time I am going to entertain a unanimous consent request that two members who are not members of the sub-

committee for the purposes of this hearing. And those individuals are Ms. Sánchez of California and Mr. Turner of Ohio.

Hearing no objections. So ordered.

I will recognize Ms. Sánchez recognized for 2 minutes for the purposes of an opening statement.

OPENING STATEMENT OF HON. LINDA T. SÁNCHEZ, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Ms. SÁNCHEZ. Thank you, Mr. Chairman, and distinguished members of the committee, and I appreciate you allowing me to participate with the subcommittee today. And I apologize. I am not going to be able to stay for the entire time, but the committee I serve on is currently holding a hearing as well.

I want to share my support for the Foreign Manufacturers Legal Accountability Act that was introduced by my good friend, Congresswoman Sutton from Ohio. I am an original cosponsor of this piece of legislation, and I introduced similar legislation in the last session of Congress, and we held hearings on that in the Judiciary Committee as well.

I have long been alarmed by the steady stream of toxic or defective foreign manufactured foods or products that harm U.S. families every year. Beyond the risks that these products pose to our health and welfare, I am also concerned that many foreign manufacturers have gained an unfair advantage over U.S. manufacturers by avoiding liability for the injuries and deaths that their products cause.

Because of the difficulties associated with serving process on and establishing jurisdiction over foreign manufacturers, many Americans that are harmed by defective foreign-made products have no recourse. They literally never get their day in court.

The Foreign Manufacturers Legal Accountability Act amends current law to facilitate service of process on foreign manufacturers. Quite simply, it just requires manufacturers who want to put their goods in our stream of commerce to establish a registered agent in the United States who then can be served process.

That simple requirement just making sure that they are servable if injuries should arise will level the playing field for U.S. manufacturers by eliminating the unfair competitive advantage enjoyed by foreign manufacturers. This would essentially put them on equal footing making sure that all companies, whether foreign or domestic, are held accountable for the harm that they cause to American consumers.

I want to thank the chairman for calling this hearing, and I am pleased that the subcommittee has taken the time to discuss H.R. 4678.

And again, I appreciate the invitation to come. And I yield back my time.

Mr. RUSH. I now recognize Mr. Terry.

OPENING STATEMENT OF HON. LEE TERRY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEBRASKA

Mr. TERRY. I appreciate that.

I am concerned. I am also going to discuss the Foreign Manufacturers Legal Accountability Act as one of the original sponsors and worked a little bit with Ms. Sutton on this.

I think this is an important piece of legislation in protecting American consumers from defective goods manufactured outside the United States in the sense that if they don't have any presence within the United States, there may be very little ability for the victim to be compensated or justice to occur which then falls then mostly on the taxpayers instead of the foreign entity. And all this does, and Cliff is correct, the gentleman from Florida, that this doesn't really correct that problem but you can't get to the second hurdle and the third hurdle in this process without being able to effectively hand the petition to a representative of that country. And so this is just setting up the first step here.

We do need to continue the dialogue on this. But this seems to be kind of the first step, the easy, noncontroversial, or for the most part, the least controversial part of the process.

I want to thank the chairman for holding the hearing on this matter. I am anxious to hear from the witnesses and their input.

And I yield back.

Mr. RUSH. Mr. Murphy.

OPENING STATEMENT OF HON. TIM MURPHY, A REPRESENTATIVE IN CONGRESS FROM THE COMMONWEALTH OF PENNSYLVANIA

Mr. MURPHY. Thank you, Mr. Chairman. We have now reached a point where China is the largest foreign holder of U.S. debt at $900 billion, and more than 2.3 million manufacturing jobs have been displaced to Chinese companies that sell products like drywall that causes terrible illness, lead in toys, and fungus in diapers and toxins in baby bottles.

I am thankful we are having a hearing on how to hold better manufactures of a harmful product liable, but the larger issue is, how we are going to pursue policies that are going to invigorate American manufacturing in a fair playing field. And if we are going to tame an economic dragon like China, it is not going to be about lofty theories or more government spending, but how to make sure that it is a level playing field. I know that along with Congressman Tim Ryan of Ohio, he and I have introduced H.R. 2378, the Currency Reform Fair Trade Act, which stops some of the unfair trade practices of China, particularly some of their currency manipulation, which we consider vital.

As we are looking at legislation that tries to find ways to help promote American businesses, I believe that often times we do not need American businesses to get more ideas on how to wade through complex trade laws, but make sure that we have trade laws that are fair and they are fairly enforced. Recently the Steel Caucus, which I am vice chair, has pushed for and been successful in getting some findings where China has dumped pipe and in the past steel, rolled steel in unfair trade practices. This is what manufacturers want to see. But we also want to make sure we have a system whereby we are not setting up laws here such as cap-and-trade and light bulb laws which basically turn our jobs over to China.

I am looking forward to hearing some insight today from this panel today to make sure we do have fair trade laws and make sure what we are doing. Not just to tell American companies how to wade through this complexity but make sure they are able to use their ingenuity, their creativity and their manufacturing skills to bring back American jobs.

And I yield back. Thank you.

Mr. RUSH. The chair now recognizes the gentleman from Ohio, Mr. Turner, for 2 minutes.

OPENING STATEMENT OF HON. MICHAEL R. TURNER, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF OHIO

Mr. TURNER. Thank you, Chairman Rush and Ranking Member Whitfield. I thank you for allowing me to participate in today's hearing on H.R. 4678, the Foreign Manufacturers Accountability Act of 2010. I am an original cosponsor of H.R. 4678, and I want to thank my Ohio colleague, Betty Sutton, for her hard work on this important piece of legislation. Representative Sutton has been a steadfast advocate for her community and for manufactures in Ohio.

I also want to thank the U.S. Chamber of Commerce, who has been working with both my office and Representative Sutton's office on H.R. 4678, and I look forward to the continued collaboration as we move forward with this important legislation. The Chamber has expressed concern about a provision that may permit jurisdiction in U.S. courts for non- U.S. matters it is an unintended consequence and both Betty Sutton and I are looking at language that could adjust that.

In this hearing I know there could be other unintended consequences, and I look forward to those being addressed. But mostly I appreciate the manner in which Representative Sutton has worked on this in a bipartisan manner and worked with the Chamber to ensure that the bill will protect consumers while at the same time avoid jurisdiction in U.S. courts concerning matters that have not caused injuries in the United States.

The State of Ohio has faced many challenges as it transitions from being a manufacturing-based economy. Many of our local manufacturers have worked to remain competitive but find themselves in an uphill battle with foreign manufacturers because of unfair trade practices. One way in which foreign manufacturers are given an unfair advantage is by their ability to often times avoid the American judicial system. Because service of process in establishing jurisdiction is difficult with these products, maintaining a registered agent in the U.S. will assist American consumers in their ability to redress injuries. How does it do this? By establishing agents, it allows U.S. courts to have jurisdiction over the foreign entity and thereby allow them to render a judgment including the issue of seizing assets.

And it will also help level the playing field for domestic manufacturers as they also have to avail themselves of the American judicial system. I want to thank you again for the opportunity to participate and for holding this important hearing. I look forward to reading the testimony from the witnesses today and hearing the

comments and working with Congresswoman Sutton for drafting this important legislation.

Mr. RUSH. The chair thanks all of the members of the subcommittee for their opening statements.

It is now time for us to hear from the policy experts, our witnesses who have been invited to testify before this hearing. And let me again welcome you and thank you so much for extending your valuable time to this subcommittee.

And I want to introduce you all beginning on my left, Mr. Jeremy Baskin, who is with the Office of the General Counsel for the U.S. Consumer Product Safety Commission. Seated next to Mr. Baskin is Ms. Ami Gadhia. She is a policy counsel for the Consumers Union. Next to Ms. Gadhia is Mr. Bill Morgan. He is the victim of defective Chinese drywall. And seated next to Mr. Morgan is Professor Andrew Popper, and Professor Popper is a professor of law at the American University in Washington. And next to Professor Popper is Marianne Rowden. She is the President and CEO of the American Association of Exporters and Importers, or the AAEI.

The chair again welcomes you. And it is the practice of this committee that all of the witnesses be sworn in.

So will you please stand and raise your hands.

Let the record reflect that all of the witnesses have responded in the affirmative.

And now we will have 5 minutes of opening testimony from our witnesses beginning with you, Mr. Baskin.

STATEMENT OF JEREMY BASKIN, OFFICE OF THE GENERAL COUNSEL, UNITED STATES CONSUMER PRODUCT SAFETY COMMISSION; AMI GADHIA, POLICY COUNSEL, CONSUMERS UNION; BILL MORGAN, VICTIM OF DEFECTIVE CHINESE DRYWALL; ANDREW POPPER, PROFESSOR OF LAW, AMERICAN UNIVERSITY WASHINGTON COLLEGE OF LAW; MARIANNE ROWDEN, PRESIDENT AND CHIEF EXECUTIVE OFFICER, AMERICAN ASSOCIATION OF EXPORTERS AND IMPORTERS (AAEI)

STATEMENT OF JEREMY BASKIN

Mr. BASKIN. Good morning, Chairman Rush, Ranking Member Whitfield. My name is Jeremy Baskin. I am the general attorney who works with the import surveillance division of the Office of Compliance of the U.S. Consumer Product Safety Commission.

I am pleased to be here today to discuss the U.S. Consumer Product Safety Commission's efforts in the area of import surveillance and H.R. 4678, the Foreign Manufacturers Legal Accountability Act. Before I begin, let me first note that the testimony that I give this morning is mine and has not been reviewed or approved by the Commission and may not necessarily represent the views of the Commission.

From 1998 to 2007, the volume of consumer products imported into the United States increased over 100 percent. During that time period, imports from China nearly quadrupled and now constitute over 40 percent of all consumer goods. The shift in specific product areas has been more pronounced.

In 2002, approximately 60 percent of toys purchased in the United States were imported from China and Hong Kong. By 2008, that number had risen to almost 80 percent of the U.S. market.

In response to the rapid increase in consumer product imports, the CPSC has taken several steps to inspect products entering the country to ensure that they comply with applicable safety standards. In 2008, the Commission announced its import safety initiative and established a new import surveillance division within the Office of Compliance. The establishment of this new division allowed the CPSC to collocate permanent full-time compliance investigators at key ports of entry of the United States.

In 2009, the division had 10 full-time employees, FTEs, dedicated to port surveillance. That number is scheduled to rise to 14 FTEs by the end of fiscal year 2010 and 19 by fiscal year 2011. In addition, the division can call on the resources of the entire Office of Compliance which has over 100 FTEs when necessary.

The CPSC has also sought to enhance its relationship with larger agency partners such as the Department of Homeland Security. Through the operation guardian program, CPSC partners with U.S. Customs and Border Protection, CBP, staff in order to leverage joint resources. In addition, CPSC recently assigned two FTEs to CBP's new commercial targeting and analysis center, called to CTAC, and executed a memorandum of understanding with CBP that allows the agency direct access to pre-arrival cargo data. This allows CPSC inspectors to target suspect shipments before they arrive, and most importantly, before potentially dangerous goods can enter the U.S. stream of commerce.

We have also conducted training programs with CBP to educate both government personnel and the importing community on CPSC and CBP product detention and seizure authorities. So far, the results of these initiatives are encouraging.

In fiscal year 2007, CPSC collected approximately 750 samples of suspect products entering our country. In fiscal year 2009, the number more than doubled to almost 1,600. At the same time, we started to see a commensurate decrease in the number of voluntary recalls from 5,063 in fiscal year 2008 to 466 in fiscal year 2009.

In most cases, CPSC has been able to work with domestic partners of foreign manufacturers such as importers or retailers on enforcement activities to obtain relief for consumers without resorting to adjudicative proceedings. In a few cases, however, the lack of a registered agent for service of process has hindered the Commission's ability to develop information that would help us provide relief to consumers.

One example of this is the CPSC's effort to provide relief to U.S. homeowners impacted by problem drywall imported from China. In a number of cases, CPSC staff attempted to send requests for information to Chinese drywall manufacturers only to have these requests returned to the Commission refused and unopened.

The lack of registered agent for service of process has also been recognized by Chinese industry groups and some local lawyers in China have provided legal advice seeking to exploit this situation. Thankfully this type of sentiment appears to be rare. However it is foreseeable that additional attempts to stymy or obstruct commission efforts to obtain information voluntarily from manufactur-

ers outside of U.S. legal jurisdiction and that could occur in the future.

Any such recalcitrance could impede commission efforts to assist consumers with potentially defective consumer products. Additional authority allowing CPSC to require that foreign manufacturers designate a U.S. registered agent for service of process could be helpful in some cases, particularly those involving administrative requests for documents or information.

On January 15, 2010, CPSC chairman Inez M. Tenenbaum noted in a statement accompanying a report to Congress that helpful changes to existing statutes might include service of process requirements for foreign manufacturers so the agency can more easily pursue recalls.

Currently, any action against an identifiable foreign manufacturer would require service of process using The Hague convention.

As the subcommittee moves forward however some additional direction would be helpful with regard to the range in size of manufacturers that would be subject to the registration process. In addition, it might also be helpful to involve the import safety working group in this process to ensure that appropriate jurisdictional and operational details are addressed.

Mr. Chairman, thank you again for the opportunity to testify. I would be happy to answer any questions at this time.

[The prepared statement of Mr. Baskin follows:]

Statement of
Jeremy Baskin
Import Surveillance Division
Office of Compliance
U.S. Consumer Product Safety Commission

Before the
House Committee on Energy and Commerce
Subcommittee on Commerce, Trade, and Consumer Protection

Legislative Hearing on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act"

June 16, 2010

Good morning, Chairman Rush, Ranking Member Whitfield, and Members of the Subcommittee on Commerce, Trade and Consumer Protection. My name is Jeremy Baskin, and I am a general attorney who works with the Import Surveillance Division of the Office of Compliance at the U.S. Consumer Product Safety Commission (CPSC).

I am pleased to be here today to discuss the U.S. Consumer Product Safety Commission's efforts in the area of import surveillance and H.R. 4678, the "Foreign Manufacturers Legal Accountability Act." The testimony that I will give this morning is mine, and has not been reviewed or approved by the Commission and may not necessarily represent the views of the Commission.

I. CPSC Efforts to Increase Oversight of Imported Products

From 1998 to 2007, the value of consumer products imported into the United States increased over 100 percent. During that time period, imports from China nearly quadrupled – and now constitute over 40 percent of all imported consumer goods. The shift in specific product areas has been more pronounced. In 2002, approximately 60 percent of toys purchased in the U.S. were imported from China and Hong Kong. By 2008, that number had risen to almost 80 percent of the U.S. market.

In response to the rapid increase in consumer product imports, the CPSC has taken several steps to inspect products entering this country to ensure that they comply with applicable product safety standards. In 2008, the Commission announced its Import Safety Initiative and established a new Import Surveillance Division within the Office of Compliance. The establishment of this new Division allowed the CPSC to co-locate permanent, full-time compliance investigators at key ports of entry into the United States. In 2009, the Division had ten full time employees (FTEs) dedicated to port surveillance; that number is scheduled to rise to fourteen FTEs by the end of fiscal year (FY) 2010, and nineteen FTEs in FY 2011. In addition, the Division can call on the resources of the entire Office of Compliance, which has over one hundred other FTEs, when necessary.

The CPSC has also sought to enhance its relationships with larger agency partners, such as the Department of Homeland Security. Through the Operation Guardian program, CPSC partners with U.S. Customs and Border Protection (CBP) staff in order to leverage joint resources. In addition, CPSC recently assigned two FTEs to CBP's new Commercial Targeting and Analysis Center (CTAC) and executed a Memorandum of Understanding with CBP that allows the agency direct access to pre-arrival cargo data. This allows CPSC inspectors to target suspect shipments before they arrive and – most importantly – before potentially dangerous goods can enter the U.S. stream of commerce. We have also conducted training programs with CBP to educate both government personnel and the importing community on CPSC and CBP product detention and seizure authorities.

So far, the results of these initiatives are encouraging. In FY 2007, the CPSC collected approximately 750 samples of suspect products entering our country. In FY 2009, that number more than doubled to almost 1600. At the same time, we started to see a commensurate decrease in the number of voluntary recalls from 563 in FY 2008 to 466 in FY 2009.

II. Working with Foreign Manufacturers

In most cases, CPSC has been able to work with domestic partners of foreign manufacturers, such as importers or retailers, on enforcement activities to obtain relief for consumers without resorting to adjudicative proceedings. One example of this is a $50,000 settlement with a Hong Kong corporation with offices in the United States that imported toys manufactured in China that violated the Commission's lead paint ban.

In a few cases, however, the lack of a registered agent for service of process has hindered the Commission's ability to develop information that would help us to provide relief to consumers. One example of this is the CPSC's efforts to provide relief to U.S. homeowners impacted by problem drywall imported from China. In a number of cases, CPSC staff has attempted to send requests for information to Chinese drywall manufacturers, only to have these requested returned to the Commission – refused and unopened.

The lack of a registered agent for service of process has also been recognized by Chinese industry groups, and some local lawyers in China have provided legal advice seeking to exploit this situation. In fact, the Chinese Building Material Industry website, in discussing U.S. court judgments, recently featured the following advice from a local attorney:

> How shall these building materials companies face the litigation and sentence of the U.S. court? If these companies don't have any business operation in the United States, and refuse to pay the compensation, then it's impossible to implement the sentence by the federal court.[1]

This type of sentiment appears rare. However, it is foreseeable that additional attempts to stymie or obstruct Commission efforts to obtain information voluntarily from manufacturers outside of U.S. legal jurisdiction could occur in the future. Any such recalcitrance could impede Commission efforts to assist consumers with potentially defective consumer products.

III. H.R. 4678, the Foreign Manufacturers Legal Accountability Act

Additional authority allowing the CPSC to require foreign manufacturers designate a U.S. registered agent for service of process could be helpful in some cases – particularly those involving administrative requests for documents or information. On January 15, 2010, CPSC Chairman Inez M. Tenenbaum noted in a statement accompanying a report to Congress on the progress of implementing the Consumer Product Safety Improvement Act of 2008 that helpful changes to existing statutes might include "service of process requirements for foreign manufacturers so the agency can more easily pursue recalls." Currently, any action against an identifiable foreign manufacturer would require service of process using the Hague Convention.

As the Subcommittee moves forward, however, some additional direction would be helpful with regard to the range and size of manufacturers that would be subject to the registration process. In addition, it might also be helpful to involve the Import Safety Working Group in this process to ensure that appropriate jurisdictional and operational details are addressed.

* * * * *

Mr. Chairman, thank you again for the opportunity to testify on H.R. 4678 and the Commission's overall efforts to increase oversight of imported consumer products. I would be happy to answer any questions at this time.

Mr. RUSH. Thank you, the chair now recognizes Ms. Gadhia for 5 minutes.

STATEMENT OF AMI GADHIA

Ms. GADHIA. Thank you, good morning, Chairman Rush, Ranking Member Whitfield, and members of the subcommittee. My name is Ami Gadhia, and I'm policy counsel with Consumers Union, the nonprofit publisher of Consumer Reports Magazine. We appreciate the opportunity to testify the today in support of the Foreign Manufacturers Legal Accountability Act. I offer my testimony on behalf of both CU and the Consumer Federation of America. My full comments are contained in my written testimony, but I will summarize them briefly here.

H.R. 4678 is necessary to ensure that consumers who are harmed by unsafe products can obtain redress no matter where the product is manufactured. It will also create a level playing field for all manufacturers, both domestic and foreign, by holding the responsible party accountable when consumers are injured. CUA and CFA have long fought for legislation and regulation that will result in safer products on our store shelves. But in the event that an unsafe product makes it into the marketplace, consumers should be able to pursue all remedies for the harm they suffer whether the manufacturer of the unsafe product is a foreign company or a domestic one.

The products that Americans use every day are increasingly being manufactured overseas. According to the Toy Industry Association in 2007, toys made in China made up 70 to 80 percent of the toys sold in the U.S.

Of the products recalled by the CPSC since 2006, more than 75 percent of products were manufactured outside of the U.S.

We have too many frightening examples in recent years of dangerous or deadly foreign made products melamine, which is toxic to animals, was blended into pet food to give artificially high protein readings. Diethylene glycol, potentially lethal to humans, was substituted for its higher cost cousin glycerin, in the manufacture of toothpaste. Tires were manufactured with either a minimal or missing gum layer needed to prevent catastrophic tread separation. Toxic lead paint was substituted for the paint that was originally approved for popular children's toys presumably to save money.

These are all cases were unscrupulous business practices have jeopardized the health and safety of the consumer.

This legislation would assist our Federal agencies as well in their ability to recall consumer products manufactured by foreign entities.

The following example is illustrative in May 2001, the CPSC recalled a home soda machine manufactured by Drinkmaker of Sweden. Components inside the soda machine broke apart and went flying, and there were reports of lacerations, fractures and contusions caused by the machine. However, the manufacturer, Drinkmaker of Sweden AB, either could not be contacted by the Commission or would not cooperate with the voluntary recall. Fortunately, a responsible company, the Soft Drink Company of Seattle, Washington, agreed to conduct the recall of these machines with the CPSC and to repair the Drinkmaker.

It is untenable, however, to have a system of accountability that relies upon this kind of altruistic and rare behavior. By requiring that foreign manufacturers have registered agents in the U.S., H.R. 4678 will make considerable strides in assisting CPSC, FDA and EPA in holding the appropriate entities responsible for the products that they introduce and sell to U.S. consumers.

If foreign entities have the benefit of selling products and making profits from sales in the U.S., they should be accountable if the product causes harm.

While in some instances, U.S. retailers and other entities have shouldered the burden of the foreign manufacturers for the products they sell, this cannot be relied upon and is not always fair.

Domestic manufacturers who make safe products should not be undercut by foreign manufacturers who are not prioritizing safety. If a foreign manufacturer knows that they cannot be held responsible in U.S. Courts for the dangerous products they sell, this knowledge has a likely significant impact upon the manufacturing decisions. Did they use the stronger more expensive component? Do they ensure that the product meets safety standards? Holding manufacturing entities accountable in our civil justice system acts as an important deterrent to unethical and potentially harmful business conduct.

Deterring wrongful conduct is a significant attribute of our civil justice system and it does not make sense that foreign manufacturers who sell products in the U.S. Should be outside that system.

We have a modest suggestion for an improvement to the bill. In section 3(a)(3) of H.R. 4678, the minimum size of the foreign manufacturer is left to the discretion of the applicable agency. At a minimum, the heads of each agency must coordinate the definition of which companies would fall under the bill's scope, and ideally there will be a consistent definition. It would be confusing and counterintuitive if a manufacturer were to produce some products that fall under the scope of this bill and some products that do not.

Further, a consumer could be killed or seriously hurt by a product made by a manufacturer of any size. Our groups understand that it may be necessary to make a determination about which manufacturers fall under the bill but ensuring that consumers can obtain redress should be prioritized.

We want to prevent companies from purposely using the size limits to evade responsibility to purchasers and users.

Finally, we oppose efforts to weaken aspects of this legislation including efforts to shift cases from State to Federal courts. Efforts to limit access to State courts have negative consequences for consumers. Corporations that violate State laws are less likely to be held accountable for their wrongdoing when a Federal Court hears the case rather than's State court. Further corporations now seek to avoid responsibility under State law as States enact laws expanding consumer and environmental protections.

When a case is based solely on a violation of State law as many product liability cases are, no compelling reason exists for stripping State courts of the ability of enforce that State law.

Consumers Union and Consumer Federation of America support the Foreign Manufacturers Legal Accountability Act and we look

forward to working with you to ensure that this bill becomes law. Thank you.

[The prepared statement of Ms. Gadhia follows:]

Statement of

Ami V. Gadhia

Policy Counsel

Consumers Union

Before the

Subcommittee on Commerce, Trade, and Consumer Protection

of the House Energy and Commerce Committee

Regarding H.R. 4678, the Foreign Manufacturers Legal Accountability Act

June 16, 2010

I. Introduction

Chairman Rush, Ranking Member Whitfield, and Members of the Subcommittee, my name is Ami Gadhia, Policy Counsel with Consumers Union, the non-profit publisher of *Consumer Reports*® magazine.[1] We appreciate the opportunity to testify in support of the Foreign Manufacturers Legal Accountability Act of 2010. I offer my testimony today on behalf of both CU and the Consumer Federation of America (CFA).[2]

H.R. 4678 is necessary to ensure the fairness of our civil justice system and to ensure that consumers who are harmed by unsafe products can obtain redress no matter where the product is manufactured. It will also create a level playing field for all manufacturers – both domestic and foreign – by holding the responsible party accountable when consumers are injured.

CU and CFA have long fought for legislation and regulation that will result in safer products on our store shelves, and that will require importers of record to post a bond to ensure accountability for recalls and defective products. In the event that an unsafe product makes it into the marketplace, however, consumers should be able to pursue all remedies for the harm they suffer, whether the manufacturer of the unsafe product is a foreign company or a domestic one. This legislation will help consumers to pursue remedies against foreign manufacturers and producers of unsafe products.

II. Importance of the Foreign Manufacturers Legal Accountability Act

The Foreign Manufacturers Legal Accountability Act directs the Food and Drug Administration (FDA), the Consumer Product Safety Commission (CPSC) , and the Environmental Protection Agency (EPA), with respect to products under each agency's jurisdiction, to require foreign manufacturers and producers of such products, in excess of a minimum value or quantity, to establish a registered agent in the United States who is authorized to accept service of process on their behalf for the purpose of all civil and regulatory actions in state and federal courts. The Act further requires the registered agent to be located in a state with a substantial connection to the importation, distribution, or sale of the products and directs the Secretary of Commerce to establish, maintain, and make available to the public a registry of such agents. The Act also prohibits importation into the United States of a covered product or component part if the product or any part of the product was manufactured or produced outside the United States by a manufacturer or

producer who does not have a registered agent whose authority is in effect on the date of the importation.

A. Many Consumer Products are made by Foreign Manufacturers and have been the Subject of Recalls

This law is important for several reasons. First, more and more consumer products are being made abroad. Whether the products are toys, drywall, dog food, pharmaceuticals or toothpaste, the consumer products that Americans use everyday are increasingly being manufactured overseas. For example, according to the Toy Industry Association, in 2007, toys made in China made up 70 to 80 percent of the toys sold in the United States.[3]

In 2009, the CPSC recalled 465 products; 563 products in 2008; 472 in 2007; and 467 in 2006. In 2006, of products recalled, 24% were manufactured in the United States; in 2007, 18 % were manufactured in the United States; in 2008, 17%; and in 2009, 22% were made in the United States.[4] This means that more than 75 percent of products recalled since 2006 were manufactured outside of the United States.

Unfortunately products made overseas have posed great risks to consumers. In 2006, Consumers Union testified about these issues:

> High profile recalls of 2006 involved safety problems with Chinese imports were characterized by deceptive or dishonest business practices in an effort to cut costs. Melamine, which is toxic to animals, was blended into pet food to give artificially high protein readings. Diethylene glycol, potentially lethal to humans, was substituted for its higher-cost cousin, glycerin, in the manufacture of toothpaste. Tires were surreptitiously manufactured with either a minimal or missing gum layer needed to prevent catastrophic tread separation. Toxic lead paint was substituted for the paint that was originally approved for popular children's toys, presumably to save money. These are all cases where unscrupulous business practices have jeopardized the health and safety of the consumer.[5]

Agencies in the U.S. government were able to recall these products, which is critical for getting the unsafe products off of store shelves and out of consumer's hands. These recalls also focused our nation's attention on product safety and highlighted the weaknesses of our product safety system. Our federal agencies with jurisdiction over these products, including the CPSC, the FDA, and NHTSA, were in need of increased authority and increased resources to prevent these problems and to protect American consumers.

[5] Testimony of Don Mays, Senior Director, Product Safety Planning & Technical Administration, Consumers Union, "Ensuring the Safety of Chinese Imports: Oversight and Analysis of the Federal Response" Before the U.S. Senate Committee on Commerce, Science, &Transportation, July 18, 2006.

B. Previous Legislative Efforts Have Not Focused on Bringing Foreign Manufacturers Into Our Civil Justice System

Regarding the CPSC, Congress acted and passed the Consumer Product Safety Improvement Act in August of 2008. Consumer groups supported this law and hailed its passage as the most significant improvements to the CPSC since the agency was established in the 1970's. The Consumer Product Safety Improvement Act of 2008 is making consumer products safer by requiring that toys and infant products be tested before they are sold, and by banning lead and phthalates in toys. The law also creates the first comprehensive, publicly accessible consumer complaint database, gives the CPSC the resources it needs to protect the public, increases civil penalties that CPSC can assess against violators of CPSC laws, and protects whistleblowers who report product safety defects.

While this law has made great strides in improving product safety, and will continue to do so as its implementation continues, the CPSIA focuses on improving safety by requiring that children's products subject to mandatory standards be tested to ensure compliance with the standard. The law does not address bringing foreign manufacturers into our civil justice system. However, to fully protect consumers from unsafe products, wherever they are made, American consumers must be able to hold manufacturers accountable when they are harmed – no matter where the products are made.

C. This Legislation Would Improve Regulatory Efforts to Protect Consumers From Unsafe Products

This legislation would positively impact an agency's ability to recall consumer products manufactured by foreign entities when the manufacturer does not have a registered agent in the United States. From what we know, the CPSC, for example, has been able to conduct recalls of products made by foreign manufacturers in many circumstances. CPSC has been able to collaborate with foreign entities to get unsafe products off the shelves. The CPSC has also been able to find creative ways to ensure that products are recalled when the foreign manufacture has not agreed to a recall. But our federal agencies need a formal and consistent method to protect U.S. consumers against dangerous products when those products are made by a foreign manufacturer.

The need for legislation is illustrated by the following example. In May of 2001, CPSC recalled a home soda machine manufactured by Drinkmaker of Sweden. According to CPSC's press release,[6] there were three reports of injuries caused by this product: a 7-year-old boy required hospitalizations due to lacerations; a 44-year old man suffered multiple fractures and lacerations to his right hand; and a 52- year old man suffered lacerations, fractures and contusions. Components inside the soda machine broke apart and posed serious risks of laceration to those individuals struck by flying broken parts. However, the manufacturer, Drinkmaker of Sweden AB, either could not be contacted by the Commission or would not cooperate with the voluntary recall.

Fortunately, a responsible company, The Soft Drink Company of Seattle Washington, agreed to conduct the recall of these machines with CPSC and also agreed to offer the remedy for consumers, which was to repair the Drinkmaker. In this case, the CPSC effectively worked with a U.S. company that stepped up to the plate to accept responsibility for the safety of these products. However, it is untenable to have a system of accountability that relies upon this kind of altruistic

[6] CPSC Press Release, "CPSC, Drinkmaker of Sweden AB Announce Recall of Home Soda Machines," May 10, 2001, available on the web at http://www.cpsc.gov/CPSCPUB/PREREL/prhtml01/01151.html.

and rare behavior. We must have a system that enables the federal government to protect U.S. citizens consistently. By requiring that foreign manufacturers must have registered agents in the United States, H.R. 4678 will make considerable strides in assisting CPSC, FDA and EPA to hold the appropriate entities responsible for the products they introduce and sell to U.S. consumers.

D. Fairness and Accountability

If foreign entities have the benefit of selling products and making profits from sales in the U.S., they should be accountable if the product causes harm. While in some instances, U.S. retailers and other entities have shouldered the burden of the foreign manufacturers for products they sell, this cannot be relied upon and is not always fair. H.R. 4678 will place responsibility on the appropriate entity. Importantly, this bill does not eliminate responsibility or liability for domestic manufacturers or retailers if they share responsibility for the product. Fairness dictates that responsible entities should be accountable and this law strives to accomplish that.

In addition, the fact that foreign entities without contacts in the Unites States cannot be held accountable for the unsafe product they sell to American consumers has significant adverse effects upon the consumers who are injured by those products, as well as domestic manufacturers who make safe products. Consumers who are injured by products, no matter where they are made, deserve legal redress when they suffer harm. Domestic manufacturers who make safe products should not be undercut by foreign manufacturers who are not prioritizing safety. Our current system fails to provide this important protection to our citizens at great costs to individuals and to our society.

E. Deterrence

If a foreign manufacturer knows that they cannot be held responsible in U.S. courts for the products they sell, this knowledge has a likely significant impact upon their manufacturing decisions. Do they use the stronger, more expensive component? Do they ensure that the product meets the safety standards? Do they prioritize safety if they know they are not accountable to U.S. consumers in U.S. courts? Holding manufacturing entities accountable in our civil justice system acts as an important deterrent to unethical and potentially harmful business conduct. Deterring wrongful conduct is a significant attribute of our civil justice system and it does not make sense that foreign manufacturers who sell products in the U.S. should be outside of that system.

III. Modest Suggestions for Improvement

Our groups support this bill and its proposed method for ensuring that manufacturers are held responsible for the products they sell in the United States. This bill includes products regulated by the U.S. Consumer Product Safety Commission, the Food and Drug Administration and the Environmental Protection Agency. We support the inclusion of products under the authority of these three agencies but also suggest that the National Highway Traffic Safety Administration be included in the scope of this legislation. In 2007, tires manufactured in China were recalled because they posed significant hazards to consumers.[7] The company sold its tires through a small family owned importer in New Jersey but the company not only denied that the tires were hazardous but

[7] "Chinese Tire Recall to Start Monday," *CNN*, June 28, 2007, at http://money.cnn.com/2007/06/27/autos/chinese_tire_recall/index.htm and "Chinese Tires Are Ordered Recalled," by Andrew Martin, *NY Times*, June 26, 2007.

also lacked the funds to cover the costs of the recall. Thus, issues involving foreign manufacturers can involve automobile parts and we suggest that products regulated by NHTSA be included within the scope of this legislation.

In Section 3(a)(3) of H.R. 4678, the minimum size of the foreign manufacturer is left to the discretion of the head of the applicable agency with jurisdiction over the specific product. At a minimum, the heads of each agency must coordinate the definition of which companies would fall under the bill's scope and ideally there will be a consistent definition. It would be confusing and counterintuitive if a manufacturer were to produce some products that fall under the scope of this bill and some products that do not. Further, a consumer could be killed or seriously hurt by a product made by a manufacturer of any size. Our groups understand that it may be necessary to make a determination about which manufacturers fall within the bill based upon, but ensuring that consumers can obtain redress should be prioritized. We want to prevent companies from purposefully using the size limits to evade responsibility to purchasers and users of their products.

IV. Trade Implications

Some concerns have been raised about whether the Foreign Manufacturers Legal Accountability Act violates World Trade Organization (WTO) agreements. WTO violations occur when foreign entities are treated differently than domestic ones under U.S. laws. This legislation seeks to do the opposite. This legislation actually creates an equal playing field by holding all manufacturers, no matter where there are based, responsible for the safety of the products they sell in the United States. Manufacturers as well as the products produced and sold in the U.S. would be treated equally under this legislation.

V. We Oppose Efforts to Weaken This Legislation

We oppose efforts to weaken aspects of this legislation, including efforts to shift cases from state to federal courts that benefit from the provisions of this bill. Efforts to limit consumer's access to state courts have negative consequences for consumers. Corporations that violate state laws are less likely to be held accountable for their wrongdoing when a federal court hears the case rather than a state court. Further, corporations now seek to avoid responsibility under state law as states enact laws expanding consumer and environmental protections. When a case is based solely on a violation of state law, as many product liability cases are, no compelling reason exists for stripping state courts of the ability to enforce that state law. In addition, state courts should be given the opportunity to develop their own state law in emerging areas by hearing these types of cases.[8]

VI. Conclusion

Consumers Union and Consumer Federation of America support the Foreign Manufacturers Legal Accountability Act. This law is necessary to ensure the fairness of our civil justice system and to ensure that consumers who are harmed by unsafe products can obtain redress no matter where the product is manufactured. This legislation creates an equal playing field for all manufacturers by holding the responsible party accountable. We look forward to working with you to ensure that this bill becomes law.

[8] Based on the principles of federalism, federal law discourages federal judges from expanding liability under state law.

Mr. RUSH. The chair now recognizes Mr. Morgan for 5 minutes.

STATEMENT OF WILLIAM MORGAN

Mr. MORGAN. Chairman Rush members of the subcommittee, thank you for allowing me to come here and testify. Thank you for allowing me the opportunity to come here and share my experiences with you here this morning. My name is Bill Morgan. I'm a retired police officer after having served the City of Newport News, Virginia for 24 years. My wife, Deborah, is a school teacher. She and I have been married 27 years. We have two daughters and our first grandchild was born a couple of weeks ago.

My wife and I bought our dream home in July 2006. It was a beautiful home on a corner lot in Williamsburg, Virginia with a big yard. Both Debbie and I fell in love with the home. It was the perfect home for our family. We paid a little under $400,000 for the home.

After my wife experienced multiple episodes of nose bleeds and headaches and after our house had a series of failures with the air conditioning and electrical systems, we discovered our had been built with defective drywall imported from China. We learned that this drywall contains high amounts of sulfur and that corrosive sulphur gases were circulating in our home corroding our electrical and mechanical equipment. My home was built with almost 200 sheets of 4 foot by 12 feet Chinese drywall.

After a hearing in front of Judge Eldon Fallin in New Orleans earlier this year, he found that the electrical and mechanical systems in my home had been completely destroyed and needed to be replaced. The only solution to this extensive damage is to strip my house back down to the studs and completely rebuild it. I can't afford that.

The corrosive gases have also damaged my computers, televisions and other electrical and electronic devices in my home. We were scared for our family's health and concerned about the risk of fire. We moved out of the house in June, 2009 last year. Since having to abandon our dream home, I've been unable to pay the rent on the place where we are currently living and my mortgage. I have lost my home in foreclosure, and I have had to file for personal bankruptcy.

The company that manufactured the drywall in my home was called Taishan. This company is located outside of Beijing in China. Although the Chinese company sent enough drywall into Norfolk, Virginia to build several hundred homes, it has refused to take any responsibility for its defective product. In the complaint that was filed on my behalf, it was necessary to have a lawsuit translated into Mandarin with special process service flying to China utilizing a time consuming and expensive process.

The Foreign Manufacturers Legal Accountability Act would streamline this process and give victims of defective foreign products a more speedy and equitable procedure to have their claims addressed. My lawyers have advised me that they spent well in excess of $150,000 serving foreign drywall manufacturers for victims like myself.

It's not unusual for these foreign authorities to sit on the lawsuits for 6 months before serving them on the defendant manufac-

turers. The average American, like myself, cannot afford this expensive time consuming and frustrating procedure.

Foreign manufacturers should not be allowed to sell products which destroy homes and make people sick with impunity. Unless these companies require to make themselves amenable to being sued in U.S. Court, they should not be allowed to sell their products here.

U.S. businesses are required to abide by our laws and foreign businesses that profit off of U.S. consumers should do so as well.

I look forward to answering any questions you folks may have, and thank you for allowing me to come here and share this experience with you here today.

Hearing on
"Foreign Manufacturers Legal Accountability Act"
Rayburn House office building room 2322

June 16, 2010
10:00 AM

Chairman Rush, and members of the subcommittee, thank you for allowing me the opportunity to share my experience with you this morning.

My name is Bill Morgan. I am a retired police officer having served the city of Newport News for 24 years. My wife Debra is a teacher. She and I have been married for 27 years and have two daughters and our first grandchild was born a couple of weeks ago.

My wife and I bought our dream home in July 2006. Our home was beautiful--on corner lot with a big yard in Williamsburg Virginia. Both Debra and I fell in love with it as the perfect home for our family. We paid a little under $400,000 for the home.

After my wife experienced multiple episodes of nosebleeds and headaches, and after our house had a series of failures with the air-conditioning and electrical systems, we discovered that our home had been built with defective drywall imported from China. We learned that this drywall contains high amounts of sulfur, and that corrosive sulfur gases were circulating in our home corroding electrical and mechanical equipment.

My house was built with almost 200 sheets, 4' x 12', of this Chinese drywall. After a hearing in front of Judge Eldon Fallon in New Orleans earlier this year, he found that the electrical and mechanical systems in my home had been completely destroyed and needed to be replaced. The only solution to this extensive damage is to strip my house back down to the studs, and rebuild it. I can't afford that. The corrosive gases have also damaged my computers and televisions and other electronic and electrical devices.

We were scared for our family's health, and concerned about the risk of fire. We moved out of the house in June of 2009. Since having to abandon our dream home, I have been unable to pay both the rent on the place where living now and my mortgage. I've lost my home in foreclosure, and I had to file for personal bankruptcy.

The company that manufactured the drywall in my home is called Taishan (pronounced "tie-shan".) This company is located outside of Beijing in China. Although this Chinese company sent enough drywall into Norfolk Virginia to build several hundred homes, it has refused to take responsibility for its defective product. In the Complaint that was filed on my behalf, it was necessary to have a lawsuit translated into Mandarin, with special process servers flying to China utilizing a time-consuming and expensive playbook.

The "Foreign Manufacturers Legal Accountability Act" would streamline this process, and give victims of defective foreign products a more speedy and equitable procedure to have their claims addressed. My lawyers have advised me that they've spent well in excess of $150,000 serving foreign drywall manufactures for victims like myself, and that future service costs are expected to double that number. Even after these expensive translations, it is not unusual for the foreign authorities to sit on the lawsuits for six months before serving them on the defendant manufacturer. The average American cannot afford this expensive, time-consuming and frustrating procedure.

Foreign manufacturers should not be allowed to sell products which destroy homes and make people sick with impunity. Unless these companies are required to make themselves amenable to being sued in a US court, they should not be allowed to sell their products here. US businesses are required to abide by our laws and foreign businesses that profit off US consumers should do so as well. I look forward to answering any questions you may have about my experience, and thank you again for allowing me the opportunity to testify this morning.

Mr. RUSH. The Chair recognizes Mr. Popper for 5 minutes.

STATEMENT OF ANDREW POPPER

Mr. POPPER. I thank you, Mr. Chairman, and a special hello to Congresswoman Sutton from my alma mater Baldwin-Wallace in Berea, Ohio.

H.R. 4678 is a straightforward appropriate essential step. It is, as far as I can tell, constitutionally sound, beneficial to consumers, beneficial to U.S. businesses and consistent with the laws and practices in many of our trading partners. It is as far as all of the witnesses seem to understand, a way to level the playing field. It strips foreign manufacturers of an unfair advantage. It closes an understandable loophole in our legal system. And that is not a loophole that is illegitimate. There is a constitutional basis for it. But there is also an answer for it. And the answer is this legislation.

It begins at least in terms of how we think about these things with the obvious need, and I don't think any of us could say it better than Mr. Morgan just did. When you place into the stream of commerce millions of products, and we are talking about millions of products with toxic levels of lead, drywall that is destroying a home and a family, cribs that present a risk of strangulation, aqua dots that are coated with date rape drug as part of their paint, contaminated toothpaste and seafood and honey and pet food, you got a problem.

And you might want to think that there are nice ways to get around this or our existing system of laws will account for it, but you really need to take the bull by the horns here.

This is a very wise, very simple piece of legislation. The idea of designating an individual for service of process, and by that designation, establishing consent is, as I think we all said, it's a logical, simple, appropriate and constitutional approach.

Imagine the scenario that was just presented by Mr. Morgan repeated over and over and over again. The majority of our most common pharmaceutical products are manufactured abroad, crash helmets, manufactured abroad, and the list, as you see from my testimony, goes on and on and on.

Here is a bill that deals with the problem finally of the difficulty of haling into court—an interesting term—a foreign entity that otherwise has a minimum contact and reasonability basis for resisting service of process.

Here is a bill that actually solves the problem.

And we all recognize what the problem is. If you don't have an agent or officer in this country, if you don't own property or have a representative in the United States, it becomes difficult under our current system, under our current jurisprudence to establish in persona jurisdiction. Now with one simple bill that mimics legislation in other fields that seems fair that seems a legitimate quid pro quo, a condition for doing business in the United States that is mimicked in many other areas, you solve the problem.

There were other solutions that people thought of, the aggregate of contacts suggestion that comes from the concurring opinion and the plurality opinion in Asahi is a legitimate answer. It's just complicated.

This is simple. This is right. And this is the moment to do it.

You have foreign producers who are creating a risk and are now being given a simple choice. I like to think of this legislation in terms of that word. This is choice. This is party autonomy. You don't have to do business here. If you choose to do business here, then you're subject to our laws. If we are lucky enough under the other legislation that is being considered or in any other area to have our wonderful manufacturing community able to market its goods abroad, do you think that they would get a free pass from other countries? China has just adopted a comprehensive tort law with strict liability, punitive damages, do you think that China is going to recognize a minimum contacts theory and not impose on our companies who do business there the same responsibility that we ought to be imposing on companies who do business in the United States?

I don't think so. I don't think so.

On the question of trade, and on the question of whether this creates an unfair advantage, there was a case involving artificial Christmas trees that catch on fire in the United States District Court about 2 years ago. And that product was manufactured in China. And the court held as follows, in this age of WTO and GATT, it is only reasonable that companies that distribute allegedly defective products to regional distributors in this country anticipate being haled into court.

Well, of course it's reasonable. Of course it's normal, it is a condition of doing business here. And yet a loophole exists. Close the loophole. It's not that complicated. This is leveling the playing field. This is getting rid of a free pass that we are giving foreign manufacturers, a free pass that our manufacturers don't get.

The law of the land in this country, the law of the land in virtually every common law country is lex loci delicti. You apply the law to the place of the wrong. The place of the wrong is here. This is where the manufacturer is harmed. Give the manufacturer the access to our courts, give the harmed individual access to our courts and let our system of justice work.

This is good legislation. It's going to produce fair result. It isn't perfect. No legislation is. The Constitution isn't perfect. That's why we keep amending it.

I ask that you give consideration to this bill. Thank ynu.

[The prepared statement of Mr. Popper follows:]

Testimony of Andrew F. Popper

Professor of Law

American University, Washington College of Law

Before the Committee on Energy and Commerce

United States House of Representatives

111th Congress, Second Session

June 16, 2010

H.R. 4678

The Foreign Manufacturers Legal Accountability Act

Professor Andrew F. Popper
American University
Washington College of Law
4801 Massachusetts Ave., N.W.
Washington, D.C. 20016
202.274.4233
apopper@wcl.american.edu

I welcome the opportunity to testify on H.R. 4678, *The Foreign Manufacturers Legal Accountability Act* and am honored by your invitation.

I am a faculty member at the American University, Washington College of Law and have taught torts and administrative law for the last 31 years. I have written and spoken in those fields on a number of occasions and have submitted my resume to the Committee.

After review and analysis, H.R. 4678 strikes me as a strong bill that is constitutionally sound, beneficial to consumers, beneficial to U.S. businesses, and consistent with the domestic laws and practices of many of our major trading partners. It levels the civil liability landscape, stripping foreign manufacturers of an unfair advantage. It addresses a powerful but understandable loophole in our legal system, facilitating access to the courts by injured consumers.

By making possible litigation against those who place into the stream of commerce dangerous, defective, and even deadly goods, the bill triggers corrective justice incentive mechanisms of the tort system. When you create the realistic possibility for liability, you activate incentives to make safer and more efficient products.

H.R. 4678 is a simple, elegant, appropriate, and essential step forward. I believe this bill will make good law and effectuate a positive, highly beneficial change in the civil justice system.

This statement begins with a simple summary of the bill. Next, I address the nature of the problem and the necessity for the legislation. In the following section, I discuss some of the procedural and jurisdictional challenges in this field and the way in which the bill meets those challenges. The next section raises briefly the constitutional

minimum contacts and reasonability requirements and concludes that the bill is constitutionally sound. Thereafter, I discuss the conformity of this legislation to current trade law.

I. A Simple Summary

There are three central features in this bill:

1. Designation of an agent for service of process. H.R. 4678 requires foreign manufacturers of certain products and component parts[1] to designate a registered U.S. agent to accept service of process for civil or regulatory actions. The agent should be located in a state where the manufacturer has a substantial connection either through importation, distribution, or sale of its products. The bill prohibits importation of products or components manufactured by companies who fail to designate a registered agent within 180 days of the regulation.

2. Delineation of affected products or component parts. Three federal agencies[2] will determine those products and component parts subject to the terms of the bill. Each agency will also establish the minimum quantity or value required to trigger the terms of the bill.

---

[1] The products or components affected by this bill include drugs, devices, and cosmetics, as defined by § 201 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321); biological products as defined by § 351(i) of the Public Health Service Act (42 U.S.C. 262(i)); consumer products as defined by § 3(a) of the Consumer Product Safety Act (15 U.S.C. 2052); chemical substances as defined by § 3 of the Toxic Substances Control Act (15 U.S.C. 2602); and pesticides as defined by § 2 of the Federal Insecticide, Fungicide, and Rodenticide Act (7 U.S.C. 136).

[2] Food and Drug Administration, Consumer Product Safety Commission, and Environmental Protection Agency.

3. Consent to the jurisdiction of state and federal courts. Establishment of a registered agent in a state constitutes *consent* to jurisdiction by the foreign manufacturer in the courts of that state and in federal courts.

II. The Nature of the Problem and the Need for Legislation

Foreign manufacturers and distributors of defective goods sold in the United States should be liable for the harm they cause. When sellers place millions of toys in the stream of commerce with toxic levels of lead, children's play-beads containing deadly drugs, and poorly designed cribs that to give rise to the prospect of infant strangulation, they must be held accountable.

Freed of the obligations, incentives, and corrective justice effect of the domestic civil justice system – the tort system – to make products safe, foreign manufacturers and distributors have created an intolerable risk to U.S. consumers and placed a grossly unfair burden on domestic distributors and retailers.

Consider this scenario: failing to exercise that reasonable level of care demanded of every U.S. manufacturer, a foreign producer exports to the U.S. a child's toy, pharmaceutical product (*e.g.*, heparin), motorcycle crash helmet, building materials, animal food (for house pets or livestock), or seafood (for human consumption). As a direct and proximate result of using the product, a U.S. consumer suffers an injury or dies. The consumer (or the grieving family) attempts to hold accountable in a U.S. court the foreign producer only to learn that while our legal system would impose liability on any U.S. company under these circumstances, a foreign producer cannot be sued – *i.e.*, cannot be "haled" into court.

It is both the current state of the law – and wholly unacceptable – that a foreign producer cannot readily be held accountable in the above scenario even if (a) the product was unquestionably dangerous and defective, (b) the harm to the victim was foreseeable, and (c) the foreign producer has sold large numbers of these products in the U.S. in the past.

H.R. 4678 provides a logical, necessary, and constitutionally sound response that will help close this gaping loophole in our civil justice system.

I started writing – and first testified – about this several years ago.[3] At the time, as I focused on the frustrating nature of the jurisdictional and constitutional issues, I began to explore the magnitude of the problem. How often did the above scenario take place? What was – and is – the magnitude of the problem?

Here is my conclusion: Conservatively, there are tens of millions of defective, dangerous, and in some instances deadly goods produced abroad for sale in U.S. markets. Well over 80% of the products regulated by the Consumer Product Safety Commission are manufactured abroad – and many of those producers are not subject to tort liability regardless of the fact that their products are dangerous and are likely to be sold in the U.S.

While this hearing is devoted to the legal issues raised and the powerful and

>
> (Products for general use): The Topsy-Turvy Deluxe Tomato Planters (China) instablity; SoundStation2W Wireless Conference Phones (China) fire risk; "Remy" shag rugs (India) fire risk; HP Fax 1010 and 1010xi Machines (China) fire risks; Shopko and Boscov TV stands (China) instability; Dirt Devil Vacuums Power Brush Attachment Tools (China) shatter hazzard; Santorini Chairs (Taiwan) faulty welding/chair collapse; Arctic Cat All-Terrain Vehicles (Taiwan) defective speed coutrol mechanism; All-Terrain Vehicles from KYMCO and Kawasaki (Taiwan) design/loss of control of the vehicle; Paintball Gun Remote Line Adapters from Real Action Paintball (China) overtightening could cause an explosion; SLA90 Youth All-Terrain Vehicles (Chiua) lacked front brakes, a manual fuel shut-off, and proper padding; Amsterdam Bicycles (Taiwan) faulty chain derailer; Infra-Red Sauna Rooms (China) overheating hazard; Bosch Hammer Drills (Malaysia) operates in off" positinn; Crafters Square Hot Melt Mini Glue Guns (China) fire risk; Bench Scale Adapters (China) fire hazard; Cuddly Comfort Pillows (China) pillows contain small metal fragments.

---

[1] *Id.* This list was presented in a white paper I delivered at an American Association for Justice/American University, Washington College of Law program, *Dangerous Products: From Lead Toys to Tainted Drugs, A Discussion for Consumer Protection Professionals and the Media*, Washington, DC, November 14, 2008.

This list barely scratches the surface of the problem. The child's toy, Aqua Dots, was recalled after it was alleged to be contaminated with a "date rape" drug. Litigants in Florida allege that Chinese drywall installed in their homes is dangerous, malodorous, and contaminated with high levels of sulfur. There are allegations regarding contaminated toothpaste, seafood, pet food, honey, and claims regarding product integrity deficiencies in steel pipes and automobile tires. While countries outside the U.S. claim they can insure product safety, the record suggests a very different result.[5]

Every U.S. manufacturer of any product is subject to the U.S. rule of law, the U.S. civil justice system, and U.S. regulatory mandates. That foreign entities and individuals profit from the sale of goods – on occasion, dangerous or even deadly defective goods – and are somehow outside this system is offensive, dangerous, and unfair. It is time to put an end to this injustice.

III. H.R. 4678: A Simple, Elegant, Appropriate, and Essential Change

H.R. 4678 provides a remarkably elegant and simple solution to the jurisdictional and constitutional challenges that have thwarted scores of victims in the past.

---

[5] After the tainted pet food debacle a few years ago, China, the source of tens of millions of dangerous goods, claimed it would implement 10,000 new safety regulations. As of the date of this testimony, many of those regulations are not in place. *More Legislation to Combat Shoddy Products*, FINANCIAL TIMES, January 9, 2008. http://www.legalinfo.gov.cn/english/News1/content/2009-01/20/content_1024166.htm?node=7604; *Chinese Officials Dealing With New Pesticide Tainted Food Crop*, March 3, 2010, http://chinadigitaltimes.net/2010/03/chinese-officials-dealing-with-new-pesticide-tainted-food-crop/; *Melamine Reprise: Who Knew What When?*, http://chinadigitaltimes.net/2010/01/melamine-reprise-who-knew-what-when/, January 2010.

We all recognize the legal issue: assertion of jurisdiction over an individual or entity presents a challenge when the entity's contacts with state are limited or minimal. Not surprisingly, many foreign manufacturers do not have an officer, agent, representative, employee, office, or property (indicia of more than minimal contact) in a particular state where their products cause harm. At present, such manufacturers cannot readily be haled into court if their contacts fail to meet the constitutionally compelled "minimum contacts" requirement. Notwithstanding the presence of a citizen injured by an overtly defective product manufactured by a known (but foreign) defendant, U.S. courts have, to date, been unreliable fora.

In the absence of the ingenious solution presented in H.R. 4678, access to justice is limited or denied. To hale a foreign manufacturer into court, a victim must show that the foreign entity has "purposefully established 'minimum contacts' in the forum State."[6] In addition, the assertion of judicial power must be consistent with notions of fair play and substantial justice, fundamental fairness, and reasonability – for the defendant. *Asahi Metal Industry Co., Ltd. v. Superior Court of California, Solano County*.[7] This test requires courts to assess the burdens the defendant faces in having to defend a claim in the U.S., including an assessment of whether the defendant "purposefully availed" itself of the rights and obligations of the forum state.[8] Foreseeable presence of a product alone is unlikely to meet these requirements.[9]

---

[6] *Burger King Corp. v. Rudzewicz*, 471 U.S. 462, 474 (1984).

[7] 480 U.S. 102, 113 (1987); *International Shoe v. Washington*, 326 U.S. 310, 316 (1945).

[8] *Asahi Metal Industry Co., Ltd. v. Superior Court of California, Solano County*, 480 U.S. 102, 113 (1987); *Burnham v. Superior Court of California*, 495 U.S. 604 (1990).

[9] *World-Wide Volkswagen v. Woodson*, 444 U.S. 286 (1980).

Justice O'Connor's plurality opinion in *Asahi* requires contacts that go beyond the "mere act of placing the product into the stream" of commerce such as advertising, marketing, or designing a product for the forum state.[10] Justice Brennan concurred in *Asahi*, suggesting a more fundamental "stream of commerce" approach – a simple notion involving the foreseeable presence of the product – but his view has not been followed in most state courts. In the void created by *Asahi* and similar cases, courts are – at best – unsure about the most basic exercise of power over foreign manufacturers who produce goods that harm U.S. consumers.

Do not accept the assertion that the constitutional and jurisdictional riddle presented by the *Asahi* case is insoluble.

First, in what has become a rather well-known footnote, Justice O'Connor speculated whether "Congress could, consistent with the Due Process Clause of the Fifth Amendment, authorize federal court personal jurisdiction over alien defendants based on the aggregate of national contacts, rather than on the contacts between the defendant and the State in which the federal court sits."[11] The footnote simply posed the question and could be seen as an invitation to the Congress to solve the jurisdictional and constitutional question by a legislative declaration that the minimum contacts/reasonability/fairness requirements are met when there is an aggregation of national contacts (though the approach was limited to federal courts). The aggregation of national contacts approach requires definitions of the volume of activity. It is *not* the basis of H.R. 4678.

---

[10] *Asahi*, at 111-112.

[11] *Asahi* at 113.

H.R. 4678 is in part predicated on a more fundamental notion – choice or party autonomy.[12] If a foreign producer chooses to sell products in the U.S., as a condition of doing business, the producer or its domestic distributor must consent to the jurisdiction of the U.S. courts and designate a registered agent for service of process. Consent to jurisdiction, much like agreements regarding the body of law to apply in a particular contractual transaction, is common, understandable, and effective.[13]

This is a wonderful step forward both in protecting consumers and leveling the playing field in this area.

IV. HR 4678: A Constitutionally Sound Proposal

Foreign manufacturers are subject to the jurisdiction of domestic courts if there are sufficient minimum contacts with the forum state and if the proceeding comports with our notions of fairness, justice, and reasonability. While *Asahi* requires judges to take into account the unique burdens a defendant faces in a foreign legal system, if a manufacturer reaps the benefits of a distribution network, it should not be able thereafter

[12] The "choice" aspect of this bill is not absolute since it is coupled with the notion of meaningful contacts. However, for large producers and distributors, this can be akin to generalized notions of party autonomy. Support for the notion of party autonomy is not a matter of controversy. See, Louise Ellen Teitz, *The Hague Choice of Court Convention: Validating Party Autonomy and Providing an Alternative to Arbitration*, 53 Am. J. Comp. L. 543 (2005) Michael Whincop & Mary Keyes, *Putting the "Private' Back into Private International Law: Default Rules and the Proper Law of the Contract*, 21 Melb. U. L. Rev. 515, 542 (1997); Michael E. Solimine, *Forum-Selection Clauses and the Privatization of Procedure*, 25 Cornell Int'l L.J. 51, 52 (1992).

[13] In the automobile safety area, the National Traffic and Motor Vehicle Safety Act, 49 U.S.C. 30164, requires non-U.S. manufacturers selling vehicles in the United States to designate a permanent resident of the U.S. as an agent for service of process and for purposes of administrative and judicial proceedings that might result if the product turns out to be problematic. A clarification of those rules issued in August, 2005 (Fed. Reg. August 8, 2005, vol. 70. no. 151).

to deny the forum court's jurisdiction.[14]

At their core, these dual requirements (minimum contacts and fairness) involve notice and a relationship with a forum state. Designation of an agent in a state where there are substantial contacts (as mandated by H.R. 4678) meets those requirements.

In the absence of H.R. 4678, the problems with the current state of the law will remain unsolved. Two years ago, I studied dozens of case where jurisdiction was denied even though the products in question were made with the purpose of being sold in the U.S.[15] While there are some cases that find it "fundamentally unfair" to allow a foreign manufacturer to insulate itself from the jurisdiction of the court solely by the use of a distributor, they are not the norm.[16]

The minimum contacts puzzle is not complicated. The more a defendant purposefully avails itself of the rights and obligations of the forum state, maintains facilities, bank accounts, owns property, pays taxes, has employees, agents, advertizes, establishes communication with consumers online or otherwise, the less minimum the contact become. All these features infer notice and "relationship" with the forum state – and H.R. 4678 actually *requires* both.

Constitutional concerns are often framed in terms of two other terms: service of

[15] *Id.*

[16] *Saia v. Scripto-Tokai*, 366 Ill. App. 3d 419; 851 N.E.2d 693 (2006), *cert. denied* 550 U.S. 934 (2007); *Cunningham v. Subaru of America, Inc.*, 631 F. Supp. 132, 136 (D. Kan. 1986) (finding avoidance of accountability "fundamentally unfair" for certain foreign manufacturers who produce goods designed for sale and sold in the U.S.).

process and reasonability. On its face, H.R. 4678 provides s statutory solution for service of process. As to a reasonability assessments based on the Fifth Amendment and Fourteenth Amendments,[17] one approach is to look at the policies underlying the statutes, the interests of the state, the ease of litigating a claim, and fundamental fairness. A state's interest in having a producer or distributor of defective goods held accountable, particularly when the producer has an agent in the state and has consented to the jurisdiction of the state, seems a straightforward matter.

Some courts have simplified the reasonability matter and held that once purposeful availment is found, the reasonability requirement is satisfied ("reasonableness . . . is presumed once the court finds purposeful availment. . .")[18] Consent to jurisdiction imposed by law and the presence of a registered agent in the state would satisfy the reasonableness analysis. However, without H.R. 4678, the reasonability calculus becomes complex.

Typical of reasonability cases is *Bou-matic, v. Ollimac Dairy*[19] which relied on seven factors to assess reasonability: 1) The extent of purposeful interjection; 2) the

---

[17] Fifth Amendment (for federal) aad Fourteenth Amendment (for state) considerations still apply. The question becomes whether those considerations are addressed in a statute that mandates an agent for service of process and requires consent to jurisdiction.

[18] *Bou-matic v. Ollimac Dairy*, U.S. District Court, Eastern District of California, 2006 U.S. Dist. LEXIS 14543, March 15, 2006 citing *Ballard v. Savage*, 65 F.3d 1495, 1500 (1995), which cites *Sher v. Johnson*, 911 F.2d 1357, 1364 (9th Cir.1990) ("once a court finds purposeful availment, it must presume that jurisdiction would be reasonable"). The *Bou-Matic* court noted that, "[w]hen such a presumption operates, the burden of proving unreasonableness shifts to defendant. . . who must "present a compelling case that the presence of some other considerations would render jurisdiction unreasonable." (citing) *Ballard*, 65 F.3d at 1500 (and quoting *Burger King*, 471 U.S. at 477, supra, note 6)).

[19] *Id.*

burden on the defendant to defend in the chosen forum; 3) conflict with interests of the sovereignty of the defendant's state; 4) the foreign state's interest in the dispute; 5) the most efficient forum for judicial resolution of the dispute; 6) the importance of the chosen forum to the plaintiff's interest in convenient and effective relief; and 7) the existence of an alternative forum.[20] The court also noted that one must look broadly to the connections the manufacturer has with the United States, not just to the forum state.[21] H.R. 4678 would greatly simplify this type of inquiry.

H.R. 4678 can be analogized to various registration statutes.[22] While such statutes often facilitate service of process, they have not always resolved *in personam* jurisdiction,[23] and have been only part of a fairness/reasonability due process analysis.[24]

[20] Id. at 13.

[21] Id. at 16.

[22] *E.g.*, National Traffic aud Motor Vehicle Safety Act, 49 U.S.C. § 30164; 49 U.S.C. § 10330 (requires every interstate carrier subject to the jurisdiction of the Interstate Commerce Commission to designate an agent for service of process in each state which it operates in); Foreign Corporation Act, Minn.Stat. § 303 *et seq.*; Tex. Bus.Corp. Act Ann. art. 8.10(A); 10 Del.Code § 3114 (upheld, *Armstrong v. Pomerance*, 423 A.2d 174 (Del.1980). *Cf.* various state single-act motorist statutes, e.g. *Hess v. Palowski*, 274 U.S. 352 (1927) (discussing what was then Mass.Stat.1923, c. 431, § 2).

[23] *See e.g.*, *Applewhite v. Metro Aviation, Inc.*, 875 F.2d 491, 494 (5th Cir. 1989) (service was proper but did not resolve personal jurisdiction.) *but cf. Burnham v. Superior Court*, 495 U.S. 604 (1990) (personal service of process over an individual is sufficient for personal jurisdiction).

[24] *See*, Sean K. Hornbeck, *Comment, Transnational Litigation and Personal Jurisdiction over Foreign Defendants*, 59 ALB.L.REV. 1389, 1433-1436 (1996) ("Unless otherwise indicated, courts will read statutes containing such service provisions as including an authorization for a national contacts test.") *and* ("The Ninth Circuit construed "worldwide" or national service of process provisions as legislatively authorizing both service abroad and the use of a national contacts tests for purposes of asserting personal jurisdiction over foreign defendants.") (internal citations omitted), (citing *Go-Video, Inc. v. Akai Elec. Co., Ltd.*, 885 F.2d 1406 (9th Cir. 1989) (upheld a statutes authorizing international service of process using a "national contacts" approach); Parrish, *Sovereignty, Not Due Process: Personal Jurisdiction Over Jurisdiction Over Nonresident Alien Defendants*, 41 WAKE FOREST L.REV. 1, 21, FN (2006) (discussion of personal jurisdiction issues).

However, a designated agent plus a legislative declaration of consent to jurisdiction provides a solid basis for declaring satisfied the reasonability requirement, even when characterized as simple registration.[25] An entity that consents to jurisdiction gives up right to challenge it, even if compelled to consent[26] by statute.[27]

V. H.R 4678: Consistent with Globalization and with the Legal Systems of U.S. Trading Partners

In *Jones & Pointe v. Boto*,[28] a foreign manufacturer sold artificial Christmas trees in Virginia, derived profits from those sales, and maintained a website that invited inquiries regarding the products in question.[29] This information was available to any person and the design of the website inferred no limitations on the areas where the site

---

[25] There is some disagreement about the effect on *in personam* of simple registration statutes. *Compare Knowlton v. Allied Van Lines, Inc.*, 900 F.2d 1196, 1200 (8th Cir. 1990) ("One of the most solidly established ways of giving such consent is to designate an agent for service of process within the State.") *and Shapiro v. Southeastern Greyhound Lines*, 155 F.2d 135, 136 (6th Cir. 1946) ("Service upon an agent so designated in conformity with a valid state statute constitutes consent to be sued . . . The fact that the consent was given under a valid federal statute rather than under a state statute does not detract from the force and legal effect of that consent."), *with Wenche Siemer v. Learjet Acquisition Corp.*, 966 F.2d 179, 183 (5th Cir. 1992) ("the mere act of registering an agent [. . .] does not act as consent" and fact that Learjet sold 1% of national business in Texas not enough to establish *general* jurisdiction) *and Ratliff v. Cooper Laboratories, Inc.* 444 F.2d 745 (4th Cir. 1971), *cert. denied* 404 U.S. 948 (1971) ("The principles of due process require a firmer foundation than mere compliance with state domestication statutes.").

[26] *See Knowlton supra* note 25 at 1200 ("The designation of an agent, in accordance with federal law, also operates as consent to the personal jurisdiction of the Minnesota courts.")

[27] *See Knowlton supra* note 25, at 1199-1200 ("Such consent is a valid basis of personal jurisdiction, and resort to minimum contacts or due-process analysis to justify the jurisdiction is unnecessary.") (quoting *Ins. Co. of Ireland, Ltd., v. Compagnie des Bauxites de Guinee*, 456 U.S. 694 (1982)).

[28] 498 F. Supp. 2d 822, 829 (E.D. Pa. 2007).

[29] Id. at 829.

was to be accessed or the products sold. Accordingly, the court held that "in this age of WTO and GATT [the General Agreement on Tariffs and Trade] one can expect further globalization of commerce, *and it is only reasonable that companies that distribute allegedly defective products through regional distributors in this country. . . anticipate being haled into court by plaintiffs in their home states* [emphasis added]."[30] H.R. 4678 resolves the question of "home state" and is fully consistent with evolving trends and expectations in our increasingly globalized economy.[31]

In terms of the WTO[32], H.R. 4678 does not create an undue barrier or obstacle to trade. It imposes on foreign manufacturers the same responsibilities and obligations of domestic sellers and producers. The WTO concept of trade without discrimination requires a somewhat level playing field for domestic and non-domestic market participants and H.R.4678 does just that.

Moreover, while I do not teach in the international trade area, it appears that many of the primary U.S. trading partners (including China and most of Latin America) do not give U.S. companies doing business in their countries a "free pass" from their legal systems.[33] It is only logical, therefore, that foreign companies within the U.S. are

---

[30] Id. at 831 (citing *Barone v. Rich Brothers Fireworks*, 25 F.3d 610, 615 (8th Cir. 1994).

[31] I discuss some of the special challenges plaintiffs face when trying to pursue claims against foreign defendant in my article in the *Product Safety and Liability Reporter* (supra, note 3) For this testimony, I will only note that Central Authority established by the Hague Convention on the Service of Process Abroad of Judicial and Extrajudicial Documents in Civil and Commercial Matters is the likely means of serving process on a foreign defendant (there are other mechanisms, e.g., letters rogatory, that are unreliable at best). Time, costs, and inconvenience plague this process. The ability to secure service of process through a domestic designated agent set forth in H.R. 4678 should ease some of the burden on injured U.S. consumers.

[32] For general information about the World Trade Organization, see, www.wto.org

[33] Yu Shanshan, *Psst. China Has Tort Laws. Oh, And They Are Relevant For Foreigners*, April 1,

likewise subject to the jurisdiction of U.S. courts.

More than a century ago, the Supreme Court recognized that the U.S. legal system did not operate in isolation.[34] As the 19th Century drew to a close, an international vision of commerce emerged. Part of that vision, however, was the understanding that there are rules to follow both in terms of international law and the country-by-country application of domestic law predicated, *inter alia*, on protecting the "rights of [a country's] own citizens or of other persons who are under the protection of its laws."[35] H.R. achieves precisely that objective: without creating any unusual burdens, it gives U.S. consumers access to the civil justice system.

The short of it is that H.R. 4678 aligns the U.S. with our trading partners. It does not create unique or extraordinary trade barriers. Moreover, the general rule in tort law in almost every country regarding forum is *lex loci delecti* – the law of the place of the wrong. H.R. 4678 is fully consistent with this construct.

VI. Conclusion

H.R. 4678 is important not only in terms of injured consumers but in terms of

---

2010. http://www.beijingtoday.com.cn/tag/tort-law (on the application of China's New Tort law); Peter Neumann and Calvin Ding, *China's New Tort Law: Dawn of the Product Liability Era*, http://chinabusinessreview.net/public/1003/neumann.html, June 2010; John F. Molloy, *Conference Report, Miami Conference Summary of Presentations*, 20 Ariz. J. INT'L & COMP. LAW 47, 59-63 (2003) (describing the strategic and practical considerations relevant to U.S. companies sued in Latin America countries)

[34] *Hilton v. Guyot*, 159 U.S. 113 (1895).

[35] "But it is the recognition which one nation allows within its territory to the legislative, executive or judicial acts of another nation, having due regard both to international duty and convenience, and to the rights of its own citizens or of other persons who are under the protection of its laws." *Id.* at 164.

U.S. business interests. When foreign entities (through their products) are in the U.S. and are outside the reach of the U.S. court system, a market distortion occurs. Quite simply, foreign entities (and their domestic distributors) are at a distinct cost advantage over their domestic competitors who must both avoid liability by exercising higher levels of care and must insure against the chance of product failure.

In other areas of law (*e.g.*, antitrust[36]) entities located abroad that affect and cause harm to interests within the U.S. bear responsibility for those consequences in U.S. courts. Entities doing business here – selling goods directly to consumers – should also be no less accountable in our courts.

H.R. 4678 levels the playing field and protects consumers. It is constitutionally sound and consistent with trade law. It is a straightforward and essential change, giving injured persons access to the civil justice system.

~

I have had the honor of testifying on matters pertaining to tort law and tort reform on many occasions over the last 25 years. Almost every bill I considered during that time raised troubling questions about the protection of consumers. My testimony supporting H.R. 4678 is a first for me.

This is good legislation that will produce fair and just results. I ask respectfully

California*, 34 VA. J. INT'L L. 213 (1993)

that you adopt H.R. 4678.[37]

[37] My great thanks to American University, Washington College of Law students Katie Leesman, Lucia Rich, Jon Stroud, and Allyson Valadez for their invaluable assistance. AFP

Mr. RUSH. Ms. Rowden, you are recognized for 5 minutes.

STATEMENT OF MARIANNE ROWDEN

Ms. ROWDEN. Thank you, Chairman Rush, Ranking Member Whitfield, and members of the subcommittee, my name is Marianne Rowden, and I'm president and CEO of the American Association of Exporters and Importers. AAEI has been the voice of the International Trade Community since 1921, and we represent the entire spectrum of the trade community. AAEI greatly appreciates the opportunity to testify today. Our written testimony submitted for the record raises five points, but I would like to concentrate on two fundamental issues.

Since enactment of the Consumer Product Safety Improvement Act, product safety has become an integral part of trade compliance. This new responsibility follows the trade community adopting new practices to enhance supply chain security since 9/11.

Our experience over the last decade has been that regulating goods produced outside of the United States requires two things: First a wholistic risk management system; and two, implementation of product safety legislation, which would eliminate the need for H.R. 4678.

Let's turn to the chart entitled A Multi-Layered Approach to Wholistic Risk Management.

This chart categorizes companies based on risk characteristics. This solution will allow the government to spend its limited resources efficiently and effectively to prevent defective products from entering the commerce of the United States, secure the homeland and increase trade compliance.

We would like to highlight the companies who joined CPSC's voluntary partnership program with CBP, the importer self-assessment program for product safety would fall into the ultra low risk category as a result of their demonstrated commitment to ensuring the integrity of their imported products and the safety of U.S. consumers.

This wholistic risk management approach is critical to the implementation of product safety laws enacted by Congress. First, without information about the integrity of imported products, we will continue to see defective products. AAEI is working with CBP, FDA, CPSC and other Federal agencies to leverage the data already collected by CBP to assess risk.

Congress has chosen different methods for dealing with risks posed by different products. For consumer products, Congress has directed CPSC to require certifications demonstrating that the product meets applicable safety standards.

For food drugs and devices, Congress chose to require foreign manufacturers to register with FDA because of the risks posed to the public health by potential bad actors seeking to compromise the integrity of these products.

These laws need time for implementation and evaluation of their effectiveness before adding more legislative requirements.

Finally, AAEI remains concerned that if Congress chooses to pass H.R. 4678, similar requirements will be placed on U.S. companies exporting to foreign markets. We believe it will be difficult for small U.S. companies to expand export opportunities and create

jobs in the United States if they are required to appoint a registered agent in foreign countries to defend lawsuits.

We thank you for the opportunity tn testify today, and I'm happy to answer the subcommittee's questions.

[The prepared statement of Ms. Rowden follows:]

AMERICAN ASSOCIATION OF EXPORTERS AND IMPORTERS

1050 17th Street, N.W., Suite 810
Washington, DC 20036

Statement of Marianne Rowden
President & CEO, American Association of Exporters and Importers

Testimony on "H.R. 4678, Foreign Manufacturers Legal Accountability Act"
before House Energy and Commerce
Subcommittee on Commerce, Trade, and Consumer Protection

June 16, 2010

A. Introduction and Overview

Chairman Rush, Ranking Member Whitfield and Members of the Committee, good morning. My name is Marianne Rowden and I am the President and CEO of the American Association of Exporters and Importers (AAEI). AAEI appreciates the opportunity to offer its comments on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act of 2010."

It is a privilege to appear before you today at this hearing, and we are honored that the Committee has invited AAEI to provide our expertise about the impact of H.R. 4678 on international trade and the U.S. trade community. We hope that AAEI's testimony provides the Committee with a broader perspective on the ripple effects that legislation such as H.R. 4678 can have on the global trading system and U.S. companies importing products into the United States as well as those seeking to export to foreign markets as well.

AAEI has been a national voice for the international trade community in the United States since 1921. AAEI represents the entire spectrum of the international trade community across all industry sectors. Our members include manufacturers, importers, exporters, wholesalers, retailers and service providers to the industry, which is comprised of brokers, freight forwarders, trade advisors, insurers, security providers, transportation interests and ports. Many of these enterprises are small businesses seeking to export to foreign markets. AAEI promotes fair and open trade policy. We advocate for companies engaged in international trade, supply chain security, export controls, non-tariff barriers, import safety and customs and border protection issues. AAEI is the premier trade organization representing those immediately engaged in and directly impacted by developments pertaining to international trade. We are recognized as the technical experts regarding the day-to-day facilitation of trade.

B. H.R. 4678 Will Not Enhance Product Safety

AAEI's testimony on H.R. 4678 addresses five areas of concern regarding the impact of this bill on the international trade community: 1) AAEI favors a risk management approach to product safety issues; 2) the U.S. importer of record is the entity which bears the legal responsibility for legal and regulatory action in connection with imported products; 3) recent legislation by Congress already requires many foreign manufacturers in highly-regulated industries to register with U.S. federal agencies; 4) U.S. federal agencies are working with foreign governments to monitor and prevent defective products from being exported to the United States; and 5) requiring foreign manufacturers to appoint a registered agent in the U.S. will negatively impact U.S. exporters, particularly small-medium enterprises.

AAEI believes that Congress is at its best when it enacts legislation that provides a framework and tools to achieve certain outcomes rather than mandating processes to

achieve a particular result. Congress has begun enacting legislation to deal with product safety problems resulting from imported defective products. AAEI believes that Congress should continue its work on product safety legislation for goods which pose a health or safety risk to the American public, and to let the various current pieces of legislation affect change before adding any new requirements.

1. Risk Management for Product Safety

Over the last decade, the international trade community has had to deal with a variety of risks as a result of global sourcing for the U.S. market as well as U.S. companies expanding their sales to foreign markets. These risks include ensuring the integrity of shipping containers to protect the U.S. homeland from a weapon of mass destruction being shipped through the global supply chain as well as ensuring the integrity of the product in the shipping container to protect against defective products which may harm the health and safety of the American public.

Risk management has been the policy adopted by U.S. Customs and Border Protection after the attack on 9/11 to regulate the global supply chain. Congress has ratified this policy by basing CBP's risk-based account management program, the Customs-Trade Partnership Against Terrorism (C-TPAT), in section 211 of the Secure and Accountability for Every Port Act (SAFE Port Act), P.L. 109-347 (October 13, 2006).

Congress has followed this risk management approach for product safety as well in passage of the Consumer Product Safety Improvement Act (CPSIA). Specifically, section 222 provides that:

> (a) RISK ASSESSMENT METHODOLOGY.—Not later than 2 years after the date of enactment of this Act, the Commission shall develop a risk assessment methodology for the identification of shipments of consumer products that are—
>
> (1) intended for import into the United States; and
>
> (2) likely to include consumer products in violation of section 17(a) of the Consumer Product Safety Act (15 U.S.C. 2066(a)) or other import provisions enforced by the Commission.

See, 15 U.S.C. § 2066. The heart of risk management must be account-based management, which is essentially a pre-entry assessment of a company's risk profile and a post-entry assessment of its actual compliance with U.S. customs and product safety laws.

AAEI has designed a chart entitled "A Multi-Layered Approach to Holistic Risk Assessment" which categorizes importers by risk based on certain characteristics. For example, companies which are "ultra-low risk" are those who join public-private partnership programs (such as C-TPAT or ISA) because they work with CBP on a continual basis to ensure that their compliance level is high. Importers which import cargo from low-risk countries should be designated as low-risk, whereas importers that have high-risk characteristics or import from high-risk countries are medium-risk, and unknown importers with infrequent shipments from the highest risk countries pose the highest risk for both trade compliance and supply chain security. However, such assessments can only be made using an account-based system whereby CBP develops a risk-based methodology to create a company profile for CBP to determine the appropriate tools for the level of risk posed by the company.

CBP and CPSC have developed an account-based risk management program, the Importer Self-Assessment (ISA) for Product Safety. CBP has found a correlation between companies

with good internal controls and highly compliance rate with U.S. customs laws. It is this correlation which forms the foundation of ISA, and can support the development of account-based management programs. Companies join ISA in order to be removed from the annual Focused Assessment audit pool so that they can devote the resources necessary (e.g., compliance personnel) to conduct the periodic self-audits required by ISA. ISA requires companies to document these periodic audits. Unfortunately, only two companies have been accepted into the ISA for product safety program. AAEI supports ISA's risk-based analysis of companies' business processes, and supports the development of "risk assessment" methodologies, such as those required by the CPSIA, for product safety.

2. Role of the U.S. Importer of Record

Under U.S. customs law, the U.S importer of record (i.e., the owner or purchaser of the goods) is the entity which has the legal responsibility to ensure that the goods are entered with "reasonable care" and in compliance with all federal laws. See, 19 U.S.C. § 1484(a). Only entities who can demonstrate their right to make entry, that is show that they have a financial interest in the goods as an owner, purchaser (or in some cases, a license customs broker on behalf of an importer) have the right to make entry.[1]

As the owner of the merchandise, the U.S. importer is the entity over whom the United States exercises legal jurisdiction since generally enforcement actions by federal agencies relating to the imported goods are by their nature *in rem* actions (i.e., actions against the goods). Moreover, implementation of H.R. 4678 would require CBP to develop another complex layer of regulations to determine who the actual manufacturer is for purposes of appointing a registered agent. We believe that such determinations may be difficult to make depending on the particular manufacturing process (e.g., mixtures and compounds) or the variety of commercial relationships (e.g., third-party contract manufacturing).

3. Legislation Already Requires Registration of Foreign Manufactures in High Risk Industries

In 2002, Congress enacted the Public Health Security and Bioterrorism Preparedness and Response Act of 2002 (the Bioterrorism Act), which President Bush signed into law June 12, 2002. The Bioterrorism Act was passed to protect the U.S. food and drug supply from an act of terrorism. In order to make the food supply more secure, Congress mandated that "any facility engaged in manufacturing, processing, packing, or holding food for consumption in the United States" be registered with the Secretary of Health and Human Services (through the Food and Drug Administration). See, section 305 of the CPSIA. In addition to the registration requirement, the statute also mandates:

> for a foreign facility, the owner, operator, or agent in charge of the facility shall submit a registration to the Secretary and shall include with the registration the name of the United States agent for the facility.

See, 21 U.S.C. § 350d(a)(1)(B).

---

[1] CBP has issued a number of Headquarters Ruling Letters (HRL) concerning who has the right to make entry. See, HRL 222020 dated August 1, 1990; HRL 223904 dated November 4, 1992; HRL 224015 date November 18, 1992; HRL 225357 dated December 22, 1994; HRL 114894 dated June 20, 1997; HRL 115110 dated November 2, 2000; HRL 115808 dated October 8, 2002; HRL 115805 dated January 7, 2003; HRL 116024 dated August 14, 2003; HRL W563380 dated May 27, 2006.

Similarly, the Bioterrorism Act requires foreign manufacturers of drugs and medical devices to register as well:

> (1) Any establishment within any foreign country engaged in the manufacture, preparation, propagation, compounding, or processing of a drug or device that is imported or offered for import into the United States shall, through electronic means in accordance with the criteria of the Secretary—
>
> (A) upon first engaging in any such activity, immediately register with the Secretary the name and place of business of the establishment, the name of the United States agent for the establishment, the name of each importer of such drug or device in the United States that is known to the establishment, and the name of each person who imports or offers for import such drug or device to the United States for purposes of importation; and
>
> (B) each establishment subject to the requirements of subparagraph (A) shall thereafter—
>
> (i) with respect to drugs, register with the Secretary on or before December 31 of each year; and
>
> (ii) with respect to devices, register with the Secretary during the period beginning on October 1 and ending on December 31 of each year.

21 U.S.C. § 360(i).

Since federal law already requires the registration of foreign manufacturers of food, drugs, and devices, we believe that H.R. 4678 is unnecessary and would simply duplicate existing federal law.

Instead of requiring the registration of foreign manufacturers, Congress decided to take a different approach for consumer products:

> (1) GENERAL CONFORMITY CERTIFICATION.—Except as provided in paragraphs (2) and (3), every manufacturer of a product which is subject to a consumer product safety rule under this Act or similar rule, ban, standard, or regulation under any other Act enforced by the Commission and which is imported for consumption or warehousing or distributed in commerce (and the private labeler of such product if such product bears a private label) shall issue a certificate which—
>
> (A) shall certify, based on a test of each product or upon a reasonable testing program, that such product complies with all rules, bans, standards, or regulations applicable to the product under this Act or any other Act enforced by the Commission; and
>
> (B) shall specify each such rule, ban, standard, or regulation applicable to the product.

15 U.S.C. § 2063(a). Thus, Congress chose to require a certification regime rather than require the registration of foreign manufacturers because it was concerned with the prevention of defective products entering into the commerce of the United States, rather than post-entry recall.

Because chemicals are used in a wide variety of industries, they are regulated by multiple federal agencies (e.g., EPA, FDA). In the case of chemicals used in the production of pharmaceuticals (e.g., active pharmaceutical ingredients), the chemicals company may be subject to the Bioterrorism Act. For imported chemicals subject to the Toxic Substances

Control Act (TSCA), the certificate serves as a product declaration to identify whether the chemical is listed in EPA's inventory. Therefore, we believe that enactment of H.R. 4678 would be disruptive to the existing regulatory regime for this highly regulated industry.

4. U.S. Working with Foreign Governments

In addition to the foreign manufacturer registration requirement under the Bioterrorism Act of 2002, Congress empowered the Secretary of Health and Human Services to engage with foreign governments to prevent defective products from being imported into the United States. Specifically, the statute states that:

> (3) The Secretary is authorized to enter into cooperative arrangements with officials of foreign countries to ensure that adequate and effective means are available for purposes of determining, from time to time, whether drugs or devices manufactured, prepared, propagated, compounded, or processed by an establishment described in paragraph (1), if imported or offered for import into the United States, shall be refused admission on any of the grounds set forth in section 381(a) of this title.

21 U.S.C. § 360(i)(3).

As a result of the product safety issues resulting from imported products with melamine, the United States has embarked on a number of bilateral and multi-lateral arrangements to cooperate on product safety, such as through the Security and Prosperity Partnership of North America, the U.S.-China Strategic Economic Dialogue (SED), the U.S. - European Union (EU) High Level Regulatory Cooperation Forum, the Transatlantic Economic Council, and the Global Health Security Initiative. See, Import Safety - Action Plan Update issued by the President's Interagency Working Group on Product Safety (July 2008), which may be found at http://archive.hhs.gov/importsafety/report/actionupdate/actionplanupdate.pdf.

A number of federal agencies (e.g., CPSC, FDA, and HHS) have entered into memoranda of understanding (MOU) with their counterparts in the People's Republic of China to cooperate on product safety matters. Within the U.S. government, CBP has recently signed an MOU to allow CPSC personnel to access CBP commercial automated systems for import safety risk assessments. AAEI believes that this collaborative work among government agencies should continue.

5. Impact on U.S. Exporters

AAEI is particularly concerned about the impact H.R. 4678 would have on U.S. exporters if this bill is enacted by Congress. The President has made it a priority to double U.S. exports over the next five years, particularly through his National Export Initiative. In particular, the Administration seeks to increase exports among small-medium size enterprises since these are the companies which generate the most job growth.

If the United States enacts H.R. 4678 requiring foreign manufacturers to appoint a registered agent to receive service of process, we must anticipate that our trading partners will enact similar measures. It will be difficult and expensive for American SMEs to maintain registered agents in all the foreign markets to which it exports. Moreover, having a registered agent in foreign markets increase the likelihood that these companies will be subject to litigation before foreign courts in countries with legal proceedings which are less transparent than the United States. SMEs have fewer resources to dedicate to trade

compliance, and having to maintain a registered agent in other countries will simply add another disincentive to export to foreign markets due to a lower return on investment because of the risks associated with potential foreign litigation. For these reasons, AAEI believes that the policy underlying H.R. 4678 is ultimately counter-productive to the goals of U.S. trade policy.

Finally, we raise certain other legal issues which the Committee should consider before voting on H.R. 4678. In particular, we note that the United States either has existing statutes or is a signatory to a number of international treaties which may be affected by this bill:

- Foreign Sovereign Immunities Act: We note that many foreign companies are owned, in whole or in part, by the government (e.g., Airbus, China). While U.S. law has recognized "commercial activity" as a general exception to jurisdictional immunity of a foreign state, this Committee should be aware that our trading partners may react negatively if H.R. 4678 is passed.

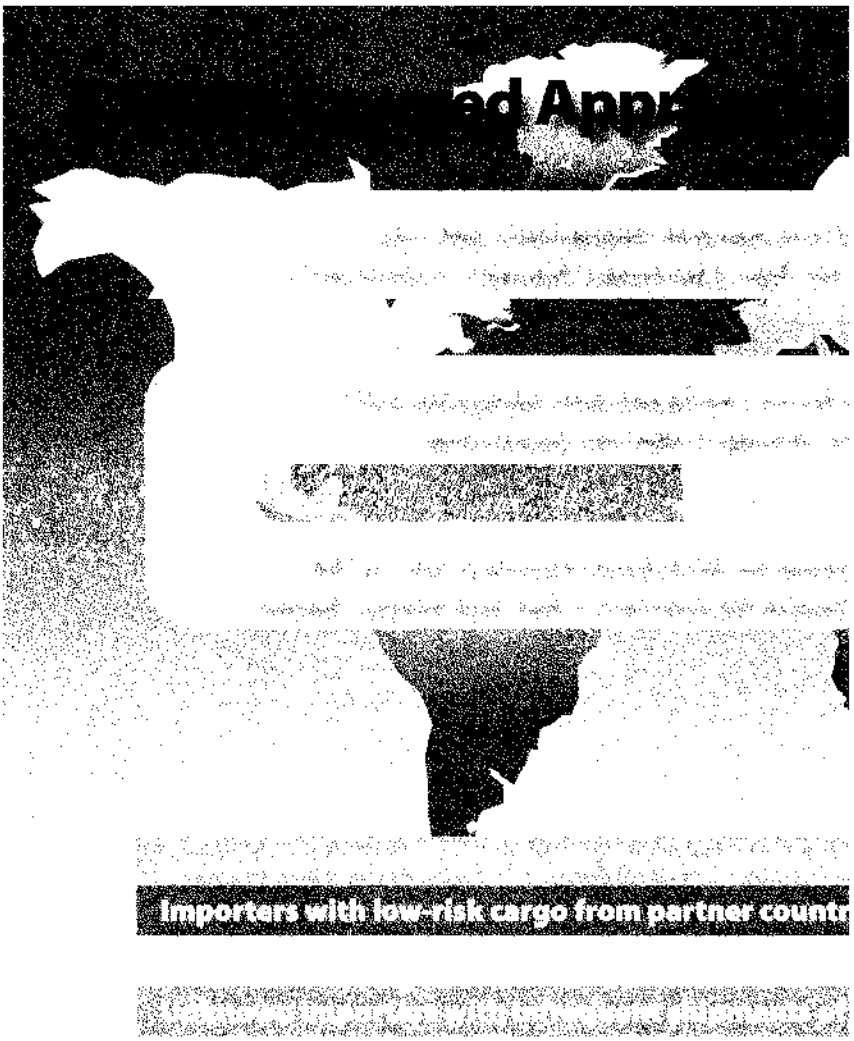
- Hague Convention on the Service Abroad of Judicial and Extra-Judicial Documents in Civil or Commercial Matters: This treaty provides for signatory countries to designate a "central authority" to accept service of process from a foreign person or entity on behalf of a domestic individual or entity. (See, also, the Inter-American Convention on Letters Rogatory.)

- Hague Convention on Foreign Judgments in Civil and Commercial Matters: We note that the United States is not a signatory to this treaty, which has not been widely accepted and thus is not considered "international law" due to lack of accession by many countries. Nonetheless, even if H.R. 4678 was enacted and foreign manufacturers appointed registered agents, there is no method by which a judgment for money damages rendered in a U.S. court could be enforced against a foreign corporation with assets outside the United States. (See, however, the Convention on the Recognition and Enforcement of Foreign Arbitral Awards and the Inter-American Convention on International Commercial Arbitration, which the U.S. is a signatory. See, also, Foreign Judgments Act.)

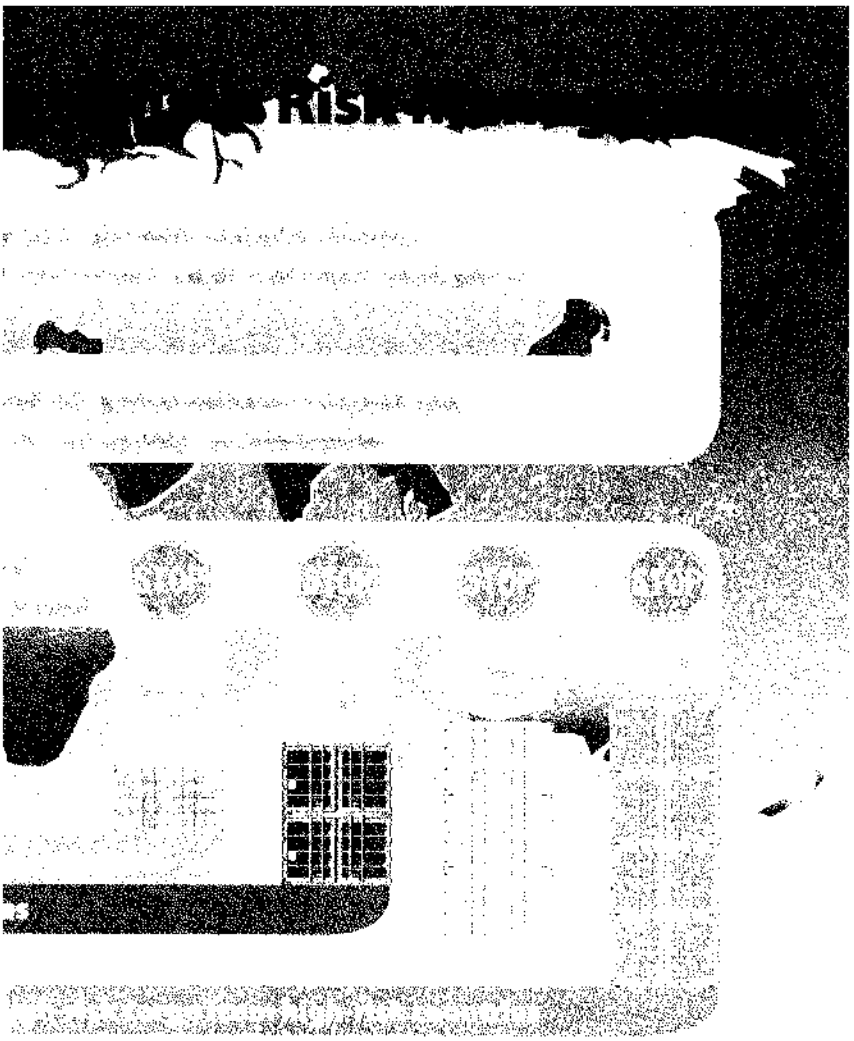
We do not believe that this is an exhaustive list of potential legal issues which may arise if Congress enacted H.R. 4678. Rather, AAEI believes that there are a myriad of policy reasons noted above to dissuade this Committee from moving forward with this legislation.

C. Conclusion

In conclusion, we wish to thank the House Energy and Commerce Subcommittee on Trade, Commerce, and Consumer Protection for its invitation to provide our observations, comments, and suggestions on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act." We greatly appreciate the Committee's consideration of this bill to deal with the consequences of defective products. We hope that our testimony will provide practical ideas for the Committee to explore in developing legislation on product safety, and we are happy to answer any additional questions you may have or provide further clarification and information on any of the ideas described in our testimony today. AAEI looks forward to working with this Committee concerning product safety issues.



Importers with low-risk cargo from partner countr



Mr. RUSH. The chair thanks all of the witnesses for their opening statements. And the chair now recognizes himself for 5 minutes for the purposes of questioning the witnesses.

Mr. Morgan, I must begin with you, your story of you and your family, the tragedy that you had to endure was heart wrenching. There is not one of us that wasn't moved by your story that you provided us. And I want to thank you for your willingness to share your story with us today. The story of defective Chinese drywall in what you thought was your dream home has, you said, made your life turned upside down, forced into bankruptcy and forced you to lose your home. And I can't think of anything that would be as horrible as having someone to lose their home under these kind of circumstances.

Your story demonstrates quite clearly to all of us that the expense of foreign defective products on the American consumer can be enormous and can be life altering.

We are not only moved emotionally, but we are also outraged by what happened to you and your family, and what is happening to not only you and your family but to thousands of other American consumers who are victims of this defective drywall, and other products, I might add, foreign manufactured and defective that come in from overseas.

We are just very, very moved by the results that Americans have to suffer from the circumstances.

I guess this might be kind of an interesting elementary question, but can you share how you feel about that and say why you support this legislation?

Mr. MORGAN. Yes, sir. I hear no ill will to China or the companies, 14 months ago, my life was perfect. We had no concerns, no issues, and in 14 months, I'm here today talking with you good ladies and gentlemen. Just hold them accountable like anybody else in this country. I don't think they should be placed on a higher standard. Just put them, hold them accountable like everybody that does business in this country is. As a police officer, my wife being a school teacher, we always had to obey the rules. It's just our nature. And I think that is probably the most frustrating thing is they are not being made to obey the rules of doing business in this country.

Mr. RUSH. Since your story has been made known to the public, have you been able to identify or share your stories with other American citizens who have had a similar story?

Mr. MORGAN. Yes, sir. And my story is very typical. The sad thing is it took almost 2 years for our home to start to display the problems. In other words, we built it brand new in 2006 and it was around 2008 we started experiencing the problems with the electrical systems, the air conditioning, my wife had the nose bleeds the coughing, the headaches, all those types of things. And the homes that were built last year, there are a lot of people that have it in their homes and they don't know it yet. Anything I can do, and that's one reason I wanted to come here today, anything I can do to bring awareness to this, it's hurtful to sit and tell people that I've had to file bankruptcy. May 17th my home went into foreclosure.

My wife and I were always the type of people, our mortgage check was there on the first because we were afraid if it was a day late they were going to come take the house. Here again, we have always done what we're supposed to do, and that's just what I hope anybody that does business with this country will be held to the same standards as those of us that live here and work here.

Mr. RUSH. Again, I want to thank you and members of this committee, our hearts go out to you and we are highly motivated to solve this problem.

Mr. MORGAN. Thank you, chairman.

Mr. RUSH. The chair is extending this time now, the chair now recognizes Mr. Whitfield for 5 minutes.

Mr. WHITFIELD. Thank you very much, and thank you all for your testimony.

When we talk about safety of products in the U.S., of course one part of it is we have a mechanism where we can recall certain items and then what this legislation really is about is giving an individual or a legal entity an opportunity to get a defending party into court. And let's take Mr. Morgan's example, and Mr. Morgan, I also would like to convey my very much concern about you and your family and what has happened to you and other people caught in the same circumstance.

But if this law had been in effect, the one that we are talking about, and Mr. Popper, if we if we were able to serve, get the service of process on the Chinese company that provided this drywall and if we obtained a judgment in a court in the U.S., whether Federal or State, whatever, how difficult would it be to actually obtain the funds to collect to the judgment?

Mr. POPPER. I guess the best way to answer that would be to say that you would never get to that question unless this legislation is adopted. Because you would never get to having that manufacturer in court.

Mr. WHITFIELD. I understand that. If we are going to try to really help people like Mr. Morgan, we can help get service of process very easily. But what can we do to collect on the judgment? In his case for example?

Mr. POPPER. The potential of liability changes behavior. The potential for civil liability is one of the most powerful forces in the American economy. Selling a product in the United States and knowing that you don't get a free pass or a dodge but that you can be haled into court and that you can haled, found liable, I think, creates an incentive that is worthwhile. That is the whole theory behind the tort system. That is the corrective justice effect. I don't mean to avoid your question. But you start with the fact, you asked me how this could happen or how this could be avoided? That is one way. The second way is we position——

Mr. WHITFIELD. How do we collect the money?

Mr. POPPER. You go after the manufacturer and if the manufacturer doesn't cough up the money on the judgment, or if the manufacturer makes it difficult to secure that judgment under The Hague convention, then you have to go after the distributor. But you don't get to do any of that right now. None of those, none of those values are there.

To be clear, this legislation doesn't solve every problem in the civil litigation system when you're dealing with a foreign manufacturer. It does give you a valid starting point. This bill wasn't designed, as I read it to facilitate the collection of foreign judgments. It allows for the entry of the judgment. Now potentially, you have got a judgment creditor, you have a company that is in trouble, you have an enforcement mechanism through the Department of Homeland Security——

Mr. WHITFIELD. Mr. Popper, thank you, I appreciate that. I only have 1 minute and 50 seconds left. Thank you for that.

But the importer of this product, Mr. Baskin, this tainted wallboard that was used in Mr. Morgan's house, would there be any mechanism through a treaty or otherwise that a lawsuit could have been filed against the importer or the distributor of the product in the U.S.?

Mr. BASKIN. The importer is responsible for obligations that the Tariff Act puts on him with regard to importation, but the importer would not necessarily be responsible for paying money damages.

Mr. WHITFIELD. Mr. Morgan did your employers sue the importer of the product?

Mr. MORGAN. Not yet, no, sir.

Mr. WHITFIELD. Have they had talked to you about doing that?

Mr. MORGAN. Yes, sir, I know all things are being looked at, and I would have to defer any additional questions like that to them.

Mr. WHITFIELD. So they have not made a final decision yet. OK. But they are looking in it.

One other question I would like to ask, and I'm not an expert in this certainly, but some experts have told us that this legislation may run afoul of WTO requirements for similar treatment of foreign and domestic products that if the bill passed foreign manufacturers would face the penalty of exclusion of their goods from commerce for failure to have a registered agent and thereby accepting the specific jurisdiction of the State court. However domestic manufacturers do not face this significant penalty of banishment from commerce for any similar violation.

Is there any argument there that WTO would look at this as a discriminatory type action?

Mr. BASKIN. I would have to defer to Customs and International Trade Commission for an answer like that. CPSC wouldn't be in a position to answer that.

Mr. WHITFIELD. But Mr. Popper, you had indicated that recently China had changed their tort law. Is that correct?

Mr. POPPER. My understanding, and it is in my testimony that China adopted a new, what they call a new tort law to take effect July 1, 2010.

Mr. WHITFIELD. Have you had an opportunity to look at that yet? That law?

Mr. POPPER. It has been in the making for 8 years, and I have looked at the components parts of it that are available online. I haven't read it in its native tongue.

Mr. WHITFIELD. May I ask one other question and I know we have other people.

But Mr. Baskin, does the Consumer Product Safety Commission have a position on this bill?

Mr. BASKIN. Yes. We support the concepts of the bill. But as I noted in my testimony, there are some issues that we would have with regard to the range and size of manufacturers that would be subject to the process.

Mr. WHITFIELD. You do support the concept?

Mr. BASKIN. Yes.

Mr. RUSH. Thank you. Ms. Sutton is recognized for 5 minutes.

Ms. SUTTON. Thank you, Mr. Chairman.

Mr. Baskin, in your testimony, you stated that earlier this year Chairman Tenenbaum sent a letter to Congress, and in the letter noted that helpful changes to the existing statutes might include a service of process requirements for foreign manufacturers so that the agency can more easily pursue recalls, is that correct?

Mr. BASKIN. Yes.

Ms. SUTTON. And so this legislation could be helpful to the Consumer Product Safety Commission as well as to providing redress for injured consumers, correct.

Mr. BASKIN. Yes.

Ms. SUTTON. Ms. Gadhia, thank you very much for your testimony as well.

The CPSC has a number of tools as we have heard here today intended to prevent unsafe consumer products from entering the market. And you testified that this bill will make considerable strides in assisting CPSC and other agencies in holding appropriate entities responsible for products that they introduced and sell to our consumers.

Could you elaborate about how this would work together and complement the CPSC's activities?

Ms. GADHIA. Absolutely. As has been noted, there are mechanisms on the front end such as the CPSIA and other statutes in place that hold all manufacturers to certain safety standards that their products have to meet before they are sold in the U.S.

And there are mechanisms once those parts come to our borders, through the good work of CBP and Department of Homeland Security to screen those products. But there are two issues with regards to that, one, not every company is going to follow the safety standards. You're going to have unscrupulous products, manufacturers and products, dangerous products coming through. And with the resources that CBP and others have, they are not able to screen every single one of the products at the border.

So the end result for a variety of reasons is that there are going to be dangerous products on the market, despite everyone's efforts. And so this is yet another mechanism on the other side of things to address the harm when it does occur and allows consumers when they are injured and go through the devastating circumstances that Mr. Morgan and his family have gone through to try to begin to obtain some redress for that.

Ms. SUTTON. Thank you. And of course, Professor Popper, you were just explaining the benefits of also having this kind of legislation pass so that we can give an incentive to those who produce products to make them safe. Would you like to elaborate on that and how this is a useful tool up front as well as providing redress?

Mr. POPPER. I think that there is no question that the potential for liability changes behavior. It means both making sure in the

production process that you have exercised reasonable care and that in the distribution and sale process you provide adequate information and warning. You know that liability is down the road. Whether as has been suggested, you may have difficulty selecting the judgment is a very separate question.

The other piece of this is that once you interject the CPSC into the equation and the way the consumer product safety improvement legislations worked is, you end up with findings of regulatory violations where you don't have the collection of judgments a problem. Those findings become facts that constitute a violation, they constitute a breach of a duty of care and they are readily imported into our legal system. It's the way U.S. manufacturers function. They work both the front end and back end. It's what creates safer products. Why not do that with foreign manufacturers? It seems fair to me.

Ms. SUTTON. I appreciate that very much. Mr. Morgan, thank you so much for being here and for testifying for sharing your experience with the committee in an effort to try and improve the situation for others.

I'm very sorry to hear about what has happened to your family. I'm sorry to hear about the toll that it has taken and the time that you have had to deal with in pursuing some kind of effort at recourse.

To the questions that some of my colleagues have raised about enforcement, I have some ideas about enforcement too so I look forward to pursuing those.

But I just, I'm struck and I think that it was professor Popper who indicated that your words frankly summarize it when you say foreign manufacturers should not be allowed to sell products which destroy homes and make people sick with impunity or the list of any of these other products that come into our stream of commerce, and frankly it will improve safety of products not just for American consumers, but for all consumers. And so I would advise and encourage folks to look at the list of items, Professor Popper, that is contained in your testimony I believe about things that are coming in to this country.

And I don't have much time left, but I would just because I'm not very familiar, Ms. Rowden, with exactly with your entity that you are representing but I believe you said you represent the international trading community in the United States. And you support what I believe you described as fair and open trade policies, did you all support, did your organization support then things like NAFTA and CAFTA and NPTR?

Ms. ROWDEN. Yes, traditionally, we have supported free trade agreements.

Ms. SUTTON. So you support all those things?

Ms. ROWDEN. Yes.

Mr. RUSH. The chair now recognizes Commander Murphy.

Mr. MURPHY. Thank you, Mr. Chairman and thank you to the panel. Professor Popper, a question for you, I just want to make sure I have a proper summary of your testimony, so if we use these products, you can be poisoned, strangled, choked, fall, crash, burned, bruised, cut or die but you can't sue?

Mr. POPPER. That's correct.

Mr. MURPHY. Then given that, then I have a couple of follow-up questions there. And you pointed out that when one has to face the responsibility of litigation or the chance of litigation, it is a motivator for companies to make sure they keep an eye on their products because they are going to be held responsible for that.

Does that add to the cost of products made in America such that products made in other countries that don't bear that responsibility use that as a mechanism to actually undercut the cost of products and sell them cheaper in the United States?

Mr. POPPER. I'm not sure I understand exactly your question, but I believe in my testimony what I stated in the written portion of it was that foreign manufacturers who are freed of this responsibility bear lower costs because they don't have to observe the due care responsibilities and they bear lower insurance costs and companies in the United States do have to observe due care responsibilities, do have to observe statutory obligations, do have to ensure against harm, and do spend more money. Consequently, the U.S. companies are definitely at a disadvantage.

Mr. MURPHY. That is what I wanted to know if you have any kind of dollar figure percent figure you have that it is one of those things that foreign companies may actually, we know they manipulate currency, they do a number of other things to subsidize or manipulate taxes, but I'm wondering along these lines too if we have any kind of dollar figure of what it is that they may by bypassing us actually undercut the cost of products.

Mr. POPPER. It's actually a very wonderful question, and it's very volatile because it is what is referred to in the United States from time to time as the tort tax. If you listen in the tort reform debate to people who don't necessarily agree with me on some of the issues, and they complain about the imposition of liability what they do is they place a percentage number on what it costs to produce good and safe products in this country and comply with our tort system. And I'm going to estimate that it is somewhere in the neighborhood of 15 to 20 percent.

Mr. MURPHY. But that is a significant number——

Mr. POPPER. Massive.

Mr. MURPHY. And companies are saying we will just build in China and send it over here, and we don't have to pay that extra 15 to 20 percent and we manipulate currency which puts another 40 percent savings on, it's hard to compete with those countries.

Mr. POPPER. It's hard to compete with those countries and with those products so long as those products are not subject to the U.S. legal system.

Mr. MURPHY. Thank you. Mr. Baskin, I have a question, too, on your testimony. Does the Consumer Product Safety Commission have sufficient personnel to screen these products before they even get over here?

Mr. BASKIN. That would be a question that would be outside of my range of knowledge here.

Mr. MURPHY. I know you mentioned about the number of people who were involved in this and you have increased the number of screening, which is good news, but, even before they enter our ports, or I don't know where you feel that it's more important to check them before they leave the country of origin or when they

come to our country, it's one of those areas that in order to protect consumer safety, if someone from your agency could get back to us because it's an important question to know what we would need to do with that.

Mr. BASKIN. Certainly, certainly.

Mr. MURPHY. Can someone also answer the question of what happens to U.S. Products in a foreign country? So if we sent something to a foreign country and it is deemed to be unsafe or some other problem, what happens to those products from foreign countries, anybody know?

Mr. POPPER. I will just give you a quick answer.

Footnote 33 in my written testimony, I refer to a couple of pieces, one on the new Chinese tort law, and the other a piece pertaining to South and Central America and the imposition of liability on U.S. companies doing business in foreign countries. And the record varies. But for the most part, I have come to stand behind lex loci delicti. If you're in another country and you commit a wrong, the idea that the United States State Department is going to come in and bail you out when you're being subjected to civil liability, as far as I know, doesn't happen.

Mr. MURPHY. One final question then, do the importers of products in this country, do they mislabel products in terms of country of origin, content, anything else? Is that showing up anywhere, Mr. Baskin, in your findings?

Mr. BASKIN. That is always an issue. I have spent some time in Customs, and that is always a violation that customs would find. It would be no less applicable to CPSC.

Mr. MURPHY. Thank you very much.

Mr. RUSH. The chair now recognizes Mr. Braley for 5 minutes.

Mr. BRALEY. Mr. Morgan, I had the opportunity at the height of the Chinese drywall publicity to inspect some homes in Delray Beach, Florida, and I got to see first hand exactly what you were describing in your home, the corrosive effect on the wiring and the materials, the overwhelming smell of sulfur in there. And it was eye opening for me because the homeowners were devastated about what was happening to homes that they put a lot of money and were very proud of. And then I went back to Iowa where I live, and I was sick for about the next 6 weeks with respiratory problems.

Have you or your family had any types of health-related problems because of being exposed to this Chinese drywall that we were talking about?

Mr. MORGAN. Yes, sir, my wife experienced nose bleeds for a long time, persistent coughing and headaches. After we moved out of the Chinese drywall house into our rental home she had nose bleeds for 2 days and she hasn't had one since.

Mr. BRALEY. You're the perfect example of what foreign manufacturers who aren't subject to having a registered agent available in the United States do manipulate and that is they know that the long period and cost of trying to hold them accountable for what whatever they do, people will get frustrated and give up because at some point you have to move on with your life and you can't wait for that magic solution when you have got bills to pay and people are pushing you into bankruptcy. Has that been your experience?

Mr. MORGAN. Yes, sir, I mean just the cost just to do the translation, you know, $150,000, to myself or people like me it might as well be $1 million. It's just money that we don't have, we can't afford, and being a police officer, I hate to say in public, thank goodness for attorneys. They have been a real lifesaver for us in trying to get some of our life back. It's just been a maddening process. It really has.

Mr. BRALEY. Mr. Popper I want to follow up with you. I have a very clear memory of a front line program talking about the trade imbalance between China and the United States, and they showed the Port of Long Beach with shipping container after shipping container come in with finished consumer products, a lot of them electronics, you name it, coming in and then they showed what was leaving the Port of Long Beach and it was recycled scrap metal and cardboard. That was the extent of what was going on in terms of the bulk of the shipping coming in and out of that port.

And you talked about the practical aspects of enforcing a judgment against a foreign manufacturer.

When you have got a judgment, all it is is a piece of paper. It means nothing whether you're suing a domestic manufacturer or foreign, but it gives you the right to enforce a judgment, and if you have got assets available in the United States, through a domestic manufacturer, you pursue that. If they refuse to pay, or if they are not insured, you can levy on those assets, you can attach them, you can have them sold, and then those proceeds can be used to satisfy a judgment, correct?

Mr. POPPER. That is correct.

Mr. BRALEY. The same thing applies with foreign goods that would be in this country coming in through our ports that are owned by a foreign manufacturer, those are tangible assets that if need be, could be levied upon to satisfy a judgment if you can trace them back to the owner of the manufacturer, and they are doing business in the stream of commerce in the United States, right?

Mr. POPPER. That is correct.

Mr. BRALEY. So it is not like we are developing a remedy without a payoff. It's just that it's very difficult, given the relationships with these foreign manufacturers and their ability sometimes to hide their assets overseas that makes it difficult for people who have been injured by these defective products to actually get a payout at the end.

Mr. POPPER. Yes.

Mr. BRALEY. Would you agree with that?

Mr. POPPER. I would agree with that.

Mr. BRALEY. Ms. Gadhia, one of the things I want to talk to you about is why this is so important? Because when you talk about something as massive as what we've seen with Chinese drywall, the average individual consumer, by themselves, are typically powerless against these large foreign manufacturers many of whom are hard to identify, because when you go into your Lowes or your Home Depot, they may have a product there that looks on the surface like it's a domestic product, and in reality, it was imported by a distributor, and being sold under their name rather than the original manufacturer. Why is it so important to consumers that we move forward on this legislation?

Ms. GADHIA. It's incredibly important because, first of all, I think consumers have an expectation, and rightfully so, that the products that come into their homes regardless of where they come from are safe and it's only fair to domestic manufacturers that the rules that they play by should also apply to foreign manufacturers.

You also need a mechanism that works on the other end of this entire supply chain in this system, where when you have got standards in place and you have got border protection in place, but you still have unsafe products coming through, sometimes you have a situation where you didn't know that this product was going to be problematic. I don't think anybody could have foreseen that you would have a children's toy with a chemical on it that turned to the date rape drug. I don't think you could have foreseen years ago that you would have sulfur coming out of drywall and causing these kinds of horrific problems. You have a lag time between these products coming in sometimes and the problems they cause, and you need that redress on the other side for consumers to be able to be made whole.

Mr. BRALEY. Thank you. I yield back, Mr. Chairman.

Mr. RUSH. The chair recognizes Mr. Sarbanes now for 5 minutes.

Mr. SARBANES. Thank you, Mr. Chairman. Thank you to the witnesses for their testimony.

I always feel at these hearings, and in particular, committee, that I'm always sitting here saying you mean we don't already do that? Whatever the topic is, whether it's regulating chemicals, or in this case, whether consumers are going to have recourse when these foreign manufactured products come into the country, because I think the average American probably expects that this is already being done.

And in that respect, I want to thank Congresswoman Sutton for this legislation because I think as four out of five of you testified, it makes absolute common sense to pursue it.

I once argued in the Fourth Circuit a case on minimum contact. So I'm very familiar with the frustration, of a case called Eloquent Machine Corporation. And we were down to trying to make the case that faxes and other communications that were coming into the State of Maryland were sufficient to establish minimum contact for the purpose of exercising personal jurisdiction, I don't know if you're familiar with that case or not. But in any event, it makes absolute sense to try to fill this, or close this loophole as you have described it. And I wondered, though, if you could, Mr. Popper, respond to Ms. Rowden's arguments about whether we sort of don't need to go there yet, but it's really just a matter of improving the oversight through CPSC and other measures that we can take and that this is just kind of a extra layer that is unnecessary at this time. If you could respond to that, I would appreciate it.

Mr. POPPER. I think about 2–1/2 years ago when we started learning about the problems with pet food and the entire country seemed to mobilize around the issue, your question was answered. Were you dealing with isolated incidents, isolated problems and you had a solid regulatory structure in place, it might be worth waiting to allow that system to mature.

I think that is not the case. I think you are looking at a remarkably broad problem when you're talking about 80 percent or more

of the goods regulated by CPSC, the vast number of our pharmaceutical products, goods throughout the United States that we use in good faith. You started out your comment about why don't we already do this, I think as a country, one of the best things about us is that we operate in good faith, we operate in trust. We believe that when we buy a product sold by a reputable seller that we can rely on its safety and its efficacy. And we have learned with foreign manufactured products we can't do that. The regulatory system needs to be bolstered. The civil liability system needs to be bolstered.

I certainly understand the desire to maximize our trade position. I think that is correct at every level. But requiring companies doing business in the United States, whether they are domestic or foreign, to follow the same set of laws strikes me as not inconsistent with that goal. It strikes me as perfectly consistent with it.

And from my perspective as a law professor, I thank you for saying lawyers are, from time to time, heroes. They are. But you can be a good lawyer and representing a client who has a serious problem and run into exactly what you ran into in the Fourth Circuit, and there is nothing you can do about it. And when that happens, the concerns that we might have about some of our trading partners being miffed about the impositional liability strike me as not particularly the dominant concerns that one ought to have.

Mr. SARBANES. I appreciate it, and I think, Ms. Gadhia, you made the point that even a very rigorous regulatory oversight regime doesn't mean that you're going to completely be able to prevent harmful products from coming into the stream of commerce.

Ms. GADHIA. Correct.

Mr. SARBANES. And you need other ways to create deterrence and/or create some remedy or recourse should that happen.

Ms. GADHIA. That is absolutely correct. And in addition, as I mentioned in my testimony, this type of registered agent can also help agencies like the CPSC that are trying to conduct recalls within that regulatory scheme to do so in a proper fashion.

Mr. SARBANES. I have got 15 seconds. One last question for you Mr. Popper. And that is you spoke a little bit about what other countries have in place. Can you speak about what is happening with Chinese products going into certain other countries in terms of the way they are handling, because China has obviously been a focus of our discussion here.

I mean, are we sort of in good or bad company, however, you might want to characterize it, in terms of the way we are equipped to handle these products coming in from China when we look at other countries or are others ahead of us on that?

Mr. POPPER. To the best of my knowledge, we provide a remarkably generous environment for foreign manufacturers by not imposing liability. I believe in the EU countries and in Latin America and in South America they are treated the same as their domestic companies. And so I think what we are doing is both domestically and internationally leveling the playing field.

And if I might add just in terms of the regulatory obligations, keep in mind that as effective as regulatory systems are, they do not provide individual personal injury remedies. They provide a regulatory recourse, that affects the broad population, but the indi-

vidual affected adversely by the violation of a safety regulation doesn't have recourse before the agency. The agency isn't an Article 3 court. It doesn't provide those remedies.

Mr. RUSH. The chair now recognizes Mr. Stupak for 5 minutes.

Mr. STUPAK. Thank you, Mr. Chairman, thank you all for your testimony. Mr. Morgan, sorry, about your problems there and unfortunately your problems are duplicated many times throughout this country. Just a question though, you said you had your house built, right.

Mr. MORGAN. Yes, sir.

Mr. STUPAK. Did your builder charge you the going rate for drywall or did you get a lesser cost.

Mr. MORGAN. I don't know. I would like to know what the cost difference was.

Mr. STUPAK. I would like know that too. You might have a perfect claim right there against your builder.

Let me ask Mr. Baskin or Ms. Gadhia, what happens when products come into the United States like this drywall, let's say, come came in right now from China high in sulfur, what would happen to it? You discover it at the border.

Mr. BASKIN. Luckily it's not. So that is a good thing in that——

Mr. STUPAK. But if it did, what would happen.

Mr. BASKIN. If it did, it could be detained at the border.

Mr. STUPAK. It sits there, right.

Mr. BASKIN. Yes.

Mr. STUPAK. Why don't we shove it back to the shipper?

Mr. MORGAN. The authorities allow that eventually.

Mr. STUPAK. They do?

Mr. BASKIN. Yes.

Mr. STUPAK. Well, then we had the inferior steel coming in from China, we had a couple of schools collapse in California because of inferior steel, they are telling us they have no authority to return it. In other words, it comes in, if they test the steel, it doesn't have the proper strength, they set it aside, tag it, set it aside, and it sits there, or whoever ordered it comes, picks it up, they are told they can't use it, say, for construction of a school, but it sits there or they take it use it for some other use in theory. So while you have authority to detain it, do you have specific authority to send it back to China.

Mr. BASKIN. I don't know about the steel situation.

Mr. STUPAK. How about drywall? Right now if bad drywall came in, you had the right to detain it at the border I agree with you, but do you have a right to send it back to China? And if so, who pays for it.

Mr. BASKIN. Good questions all. I would have to defer an answer to that, get that question in writing and we can get back to you on that.

Mr. STUPAK. Ms. Gadhia, you indicated, and Mr. Sarbanes, that the registered agent could help in a recall. How would a registered agent help in a recall underneath this legislation.

Ms. GADHIA. The border would help is that you have got an entity here in the U.S. that should the agency need to get information from the agency about the scope of the product and when it was manufactured, the dates that they believe the defective product

was manufactured, where the product went, how it was distributed, you have got an actual agent here that is, as the agent for service, of process, a contact domestically for the agency so they aren't trying to chase an entity overseas.

Mr. STUPAK. But sure but 4647 just requires you to have a registered agent here to accept process. You don't have to know anything about the product. You just have to be able to accept process so you don't have to send it to China and try to chase someone down where the central government holds it for 6 months before they give it to the manufacturer. How would a registered agent help? There would have to be more in the legislation wouldn't there to be able to really help in a recall.

Ms. GADHIA. I think what it would do is it gives the agency one more option, one more entity to try to get that information from rather than sending it to China and having it sent back.

Mr. STUPAK. I agree if you're going to bring a lawsuit, you have a person or individual or entity you serve the process to and that manufacturer in this case is drywall would be considered served, but I don't know if I have a registered agent how that would help in a recall because they are not required to know manufacturing location, physical location, they just have to be a registered agent for a company, right?

Ms. GADHIA. I might defer on the details of what the CPSC would be looking for as far as information the recall process to the agency. But I think it would depend on the case. It would depend on in some situations the agent for service of process might be an entity that has that information. In some cases you're right it could be simply and agent that accepts the paperwork.

Mr. STUPAK. So in this legislation shouldn't we expand the role of the registered agent more than just a person or entity that accepts service? Shouldn't they have greater knowledge of at least, if it's going to help in a recall.

Ms. GADHIA. I think it could certainly help to do that, to expand it.

Mr. STUPAK. So do you suggest we put that in this legislation.

Ms. GADHIA. I would respectfully take a minute to, I would respectfully respond that I would think about that a bit and get back to you on the record, if that's all right.

Mr. STUPAK. Please do. Mr. Chair, when we are in Oversight and Investigations, we see this all the time, whether it's melamine or whatever it might be, and a registered agent doesn't do anything to help you. In fact, all it is is a point of contact here in the United States.

Ms. Rowden, why doesn't the American Association of Exporters and Importers just volunteer to be the registered agent for all these importers?

Ms. ROWDEN. Oh, gosh.

Mr. STUPAK. Oh, gosh? I mean——

Ms. ROWDEN. Our members are importers and exporters of goods. Often it is the U.S. importer who has the legal responsibility under U.S. customs law to deal with product safety and also will ensure——

Mr. STUPAK. Are you saying that the importers are certifying that the product is safe when they bring it in this country.

Ms. ROWDEN. They have the obligation to make sure that that product meets all U.S. laws.

Mr. STUPAK. Really? Under what law is that.

Ms. ROWDEN. All laws, not only U.S. Customs law, the FDA——

Mr. STUPAK. So Mr. Morgan should just sue the importer.

Ms. ROWDEN. He can. The question is I'm not a trial attorney, but whether that would, the causation would be there for the U.S. importer to be liable. I just don't know.

Mr. STUPAK. So the fact that they may have it, it's not real liability that Mr. Morgan could look to the importer of this drywall and say aha, you imported this, you had a responsibility and duty to make sure it met U.S. standards and if not, therefore, Mr. or Ms. Importer, you are subject to our courts and jurisdiction.

Ms. ROWDEN. Certainly, the U.S. importer is subject to U.S. law as a U.S. entity. They are subject to all the regulatory requirements.

Mr. STUPAK. But doesn't the law require them to knowingly know that they imported a defective product, and the burden of proof is really on Mr. Morgan, not on that importer to show that.

Ms. ROWDEN. That would be a normal trial law.

Mr. STUPAK. So it's really useless. But going back to my question. Why wouldn't you just be the registered agent? All you're doing accepting process, so therefore you could cut down on all the expenses, the fear of Congress putting forth regulations that you fear in your statement here, it could be resolved by your agency, just being the registered agent. All you're doing is accepting process and we could short circuit this, get right to the court and see who has liability here.

Ms. ROWDEN. But our association has no commercial relationship with foreign manufacturers.

Mr. STUPAK. You don't have to have a commercial relationship. All you have to be is a person who is present in the United States over usually the age of 21 and be willing to accept the process. You don't have to be an attorney or anything. All you have to be is a person, you are a point of contact to begin that process so Mr. Morgan doesn't have to run all over China to find his manufacturer.

Ms. ROWDEN. It is not our role as a trade association to serve as that function, because that is a legal function.

Mr. STUPAK. Well, if you're trying to promote trade, why wouldn't you do that? Because you're promoting trade, you're providing a service for people importing or exporting in. I would think that would be the service you would want to do.

Ms. ROWDEN. I doubt that our membership would support that.

Mr. STUPAK. I doubt that too, but good argument. I yield back, thank you.

Mr. ROSS. The chair thanks the members, and also the chair thanks the witnesses for your outstanding and extraordinary contribution to this hearing. And with that in mind, again we thank you for the valuable time, you allowed us to utilize your valuable time.

This first panel now is dismissed. Thank you very much for coming. And Godspeed to each and every one of you.

Mr. Morgan, this committee does stand in support of you and your family. Thank you very much.

Will the second panel please be seated.

We certainly want to welcome members of the second panel to this subcommittee hearing. And again, I want you to reemphasize to you how extraordinarily grateful we are for your sacrifice of your time and energy to be here to help make a contribution to the hearings that the subcommittee has to deliberate on the important matters. And I want to recognize each and every one of you by name.

And to the members of the subcommittee on my left, is Mary Saunders. She is the assistant Secretary for manufacturing and services for the international trade administration. Seated next to Ms. Saunders is Ms. Deborah Wince-Smith. She is president and CEO of the council on competitiveness.

And next to Ms. Wince-Smith is Mr. Owen E. Herrnstadt. Mr. Herrnstadt is the director of trade and globalization for the international association of machinists and aerospace workers.

And then next to Mr. Herrnstadt is Mr. Jack Crawford Junior. He is the chief executive officer of Jadoo Power.

And Mr. Anthony Kim is seated next to Mr. Crawford. He is the policy analyst for Heritage Foundation.

Again, welcome to each and every one of you. It is the customary tradition of this committee to swear in the witnesses. So would you please stand and raise your right hand.

Mr. RUSH. Let the record reflect that all of the witnesses answered in the affirmative.

We will begin with you, Ms. Saunders. You have 5 minutes for an opening statement.

STATEMENT OF HON. MARY SAUNDERS, DEPUTY ASSISTANT SECRETARY FOR MANUFACTURING AND SERVICES, UNITED STATES DEPARTMENT OF COMMERCE; DEBORAH WINCE-SMITH, PRESIDENT AND CHIEF EXECUTIVE OFFICER, COUNCIL ON COMPETITIVENESS; OWEN E. HERRNSTADT, DIRECTOR OF TRADE AND GLOBALIZATION, INTERNATIONAL ASSOCIATION OF MACHINISTS & AEROSPACE WORKERS; JACK CRAWFORD, JR., CHIEF EXECUTIVE OFFICER, JADOO POWER; ANTHONY KIM, POLICY ANALYST, HERITAGE FOUNDATION

STATEMENT OF MARY SAUNDERS

Ms. SAUNDERS. Chairman Rush, Ranking Member Whitfield, thank you for the opportunity to speak to you today about the important topic of clean energy technology and export assistance.

As you are well aware, clean energy is one of the greatest economic opportunities of the 21st century, and promoting the development, production and energy efficiency technologies and services is the highest priority for the Department of Commerce. These technologies are important to economic growth in the United States and locally.

At the International Trade Administration or ITA, we have identified significant overseas market opportunities for U.S. firms in these technologies surfaces areas.

For the record, I will not be commenting on H.R. 5156, but rather, my testimony will provide a prospective on the issues, challenges and opportunities within the clean energy technology and

services sector today, as well as highlight some of the many programs that ITA has put in place to support U.S. industry competitiveness on this front.

ITA is the lead export promotion agency in the Federal Government. Our mission is to create prosperity by strengthening the competitiveness of the U.S. industry, promoting trade and investment, and ensuring fair trade compliance with trade laws and agreements that enhance the ability of U.S. firms and workers to compete in the global marketplace on a level playing field.

At his State of the Union Address this year, President Obama announced the National Export Initiative, or NEI, with the goal to double U.S. exports in years in support 2 million jobs. The President also emphasized that the Nation that leads the clean energy economy will be the Nation that leads the global economy.

Clean energy technologies are a key way to meet global and economic development needs, mitigate climate change and capture the high value of innovation of jobs that this sector offers. Within ITA, we are responding to the NEI and to the President's emphasis on clean energy by hiring trade specialists in emerging growth markets, supporting small and medium size enterprises to broaden their exposure to international markets and developing outreach and trade mission programs to improve exports in high growth replacement clean energy.

U.S. clean energy technologies and services companies face fierce competition in international markets. I want to highlight three factors that have a strong effect on international competitors: The strength of the domestic industry, the availability of international markets that offer U.S. companies a fair opportunity to compete, and the ability of U.S. companies to access the resources and master the skills required to export.

The United States currently has a relatively small share of manufacturing capacity for clean energy-related industries. Nevertheless, there are clear opportunities for the U.S. To lead the world in high technology for clean energy manufacturing. We can leverage the R&D and innovation being pursued by companies, universities, and the Department of Energy national labs.

Just turned on the microphone. Sorry.

U.S. clean energy exports cannot increase if protection and rules and policies prevent open competition. Many countries have adopted policies that make it more difficult for foreign firms to compete in their markets. These include favoring their domestic industry through preferential tendering criteria and burdensome certification requirements.

In addition, concerns regarding adequate protection of intellectual property rights hamper some firms from entering foreign markets.

Intense foreign competition from State-owned enterprises poses another challenge for U.S. companies, particularly in the civil nuclear sector.

And the final challenge to increasing clean energy technology exports that must be addressed is the willingness of U.S. firms to export. In the clean energy sector in particular, companies face challenges to exporting that are not market or policy based but are internal to that particular company's knowledge and comfort with the

export process. Issues include a shortage of available capital or financing, complex domestic and foreign regulatory requirements, lack of knowledge, and comfort in local financial institutions to finance innovative clean energy products and difficulty in finding a local partner or distributor.

ITA has multiple clean energy initiatives to support the President's NEI and works in close collaboration with other agency partners. We have initiatives focusing on sustainable manufacturing energy efficiency for U.S. companies as well as a civil nuclear trade initiative that identifies the sector's most pressing trade challenges and opportunities and coordinates public and private sector efforts to address them.

We are leading a trade promotion coordinated committee effort to develop an export strategy for renewable energy and energy efficiency technologies and Secretary Locke recently established a renewable energy and energy efficiency advisory committee for industry to advise the Department directly on pressing trade promotion activities.

ITA is actively promoting U.S. Clean energy solutions in overseas markets through trade events, foreign buyer programs at major renewable energy trade shows. We have brought delegations from all over the world to these events. We have organized numerous trade missions focused on clean energy.

Most recently, the Secretary led a clean energy business development mission to Hong Kong, other cities in China and Indonesia. We have a number of reports and helpful resources, and I have brought copies of several of them. They provide a useful resource for small and medium-sized enterprises in the clean energy technology industry.

And we recently released a small renewable energy assessment report on Indonesia and have continued to hold informational webinars on diverse topics.

Lastly, I wanted to highlight the market development cooperative program which allows nonprofit groups or universities to propose projects to develop global markets for specific technologies. Last year, we awarded three awards in the clean energy sector. This year we have received numerous applications for MDCP rewards and are currently reviewing them.

In closing, I would like to thank you, Chairman Rush, Ranking Member Whitfield, and members of the subcommittee for the opportunity to highlight what ITA is doing to help U.S. Companies compete in markets for clean emergency technologies and for all kinds of U.S. goods and services around the world.

Expanding opportunities to export clean energy technologies will not only maintain the competitiveness of U.S. companies, but will create jobs and generate economic growth. In addition, it will increase the reliability of our energy supply.

American businesses have the technology, the expertise and the experience to help countries around the world reach their climate and energy goals and this an extraordinary opportunity and a win-win for everyone.

I welcome any questions you might have.

[The prepared statement of Ms. Saunders follows:]

MARY SAUNDERS
PRINCIPAL DEPUTY ASSISTANT SECRETARY
FOR MANUFACTURING AND SERVICES,
MANUFACTURING AND SERVICES
INTERNATIONAL TRADE ADMINISTRATION
U.S. DEPARTMENT OF COMMERCE
TESTIMONY BEFORE THE
HOUSE COMMITTEE ON ENERGY AND COMMERCE,
SUBCOMMITTEE ON COMMERCE, TRADE AND CONSUMER PROTECTION
for a hearing entitled
"Clean Energy Technology Export Assistance"
June 16, 2010

Introduction

Chairman Rush, Ranking Member Whitfield, and members of the Subcommittee, thank you for the opportunity to speak before you today about the important topic of clean energy technology export assistance.

As you are well aware, clean energy is one of the greatest economic opportunities of the 21st century, and promoting the development, production, and deployment of clean energy and energy efficiency technologies and services remains a high priority at the U.S. Department of Commerce. These technologies are important to economic growth in the United States and globally. At the International Trade Administration -- otherwise known as ITA – we have identified significant overseas market opportunities for U.S. firms in these technology and services areas.

For the record, I will not be commenting on H.R. 5156, but rather my testimony will provide a perspective on the issues, challenges, and opportunities within the clean energy technologies and services sector today, as well as highlight some of the many programs ITA has put in place to support U.S. enterprises competing for market opportunities associated with the deployment of these technologies and services around the world.

ITA is the lead export promotion agency in the Federal government. The mission of ITA is to create prosperity by strengthening the competitiveness of U.S. industry, promoting trade and investment, and ensuring fair trade and compliance with trade laws and agreements that enhance the ability of U.S. firms and workers to compete in the global marketplace on a level playing field. This mission is critical to enhancing America's global competitiveness and expanding commercial opportunities for American manufacturers, farmers, and service workers throughout the world.

ITA's four units are dedicated to expanding export opportunities through a variety of means: 1) The U.S. and Foreign Commercial Service (US&FCS) designs and executes programs that provide companies with practical advice and assistance for exporting; 2) Market Access and Compliance (MAC) focuses on opening foreign markets, monitoring and working with the

Office of the U.S. Trade Representative to enforce trade agreements, strengthening intellectual property rights enforcement, and further reducing or eliminating barriers to trade and investment overseas; 3) Manufacturing and Services (MAS), the unit where I work, provides industry expertise, research and policy analysis used by policy makers to develop and implement domestic and international policies that enhance the global competitiveness of U.S. firms; and 4) Import Administration (IA) identifies, monitors, and works with the U.S. Trade Representative to address unfair foreign subsidization that impedes U.S. exporters' ability to compete in foreign markets, as well as assisting U.S. exporters involved in foreign antidumping cases that may limit U.S. exports.

Within MAS, we provide coverage of all industrial sectors. In-depth coverage of the clean energy sector is a priority. Our Office of Energy and Environmental Industries provides industry expertise and trade policy support for a variety of clean energy technologies and services, including renewable energy, clean coal, energy efficiency, nuclear power, smart grid, and environmental technologies.

Our work to promote clean energy technologies and services focuses on four areas: first, as the government's industry advocate, we make sure that industry's views are taken into account when policymakers formulate economic and trade policy; second, we help U.S. business represent their views at international meetings affecting the clean energy technologies industry; third, we coordinate with industry to eliminate trade barriers; and fourth, we undertake industry, economic, and trade policy analysis on issues impacting the global competitiveness of the U.S. clean energy technologies and service industries.

The President's National Export Initiative

At his State of the Union Address this year, President Obama announced the National Export Initiative or "NEI" with the goal to help double U.S. exports in 5 years and support 2 million jobs. Since the NEI was announced, the President has signed an Executive Order and formed an Export Promotion Cabinet that consists of top leaders throughout the Administration, including from the Departments of Commerce, Labor, State, and Agriculture, the Export-Import Bank, the Office of the U.S. Trade Representative, and the Small Business Administration. The NEI focuses on expanding trade opportunities for U.S. companies, particularly small- and medium-sized enterprises, increasing access to credit for U.S. businesses, and enforcing existing trade laws and obligations.

In addition, in that same State of the Union Address, the President emphasized that "The Nation that leads the clean energy economy will be the nation that leads the global economy." The President has come out in strong support of clean energy technologies as a way to meet global energy and economic development needs, mitigate climate change, and capture the high-value engineering, innovation, and jobs this sector offers.

Within ITA, we are responding to the NEI and to the President's emphasis on clean energy by hiring trade specialists in emerging growth markets, supporting small- and medium- sized enterprises to broaden their exposure to international markets, and developing outreach and trade mission programs to improve exports in high-growth sectors like clean energy.

Specifically, the Department of Commerce and the Department of Energy are co-leading an interagency effort to draft a National Renewable Energy and Energy Efficiency Export Strategy with the goal of doubling exports in these two sectors by 2015. The Strategy will coordinate U.S. government programs to better support U.S. clean energy companies wishing to compete abroad. The Strategy will focus on increasing exports in electricity generation and demand response, including goods and services related to renewable energy, large-scale storage, and energy efficiency. A Federal Register Notice has been issued requesting input from private businesses, trade associations, academia, labor organizations, non-governmental organizations, and other stakeholders.

Global Challenges and Opportunities

President Obama has set a goal of the United States becoming the leading exporter of clean energy technologies. Specifically, he has called for new policies to "advance a cleaner environment, a stronger response to the challenge of climate change and more sustainable natural resources and energy supplies." Reaching this goal requires effort by both industry and government. It is a priority of the Obama Administration and of the Department of Commerce to continue strengthening U.S. competitiveness in this sector and enhance the ability of U.S. firms to export clean energy technologies. However, we have a lot of work to do to meet that goal.

For example, the United States is, overall, the world's largest producer of electricity from wind. Solar installations are increasing as well. However, we currently import roughly three times the renewable energy equipment, such as wind and solar, as we export. GE installed the largest percentage of wind turbine capacity in the United States in 2009, but faces increasing competition from European and Asian companies.

There is a lot we don't know. These statistics do not chart our trade in services. This is a crucial blind spot that needs remedy. While manufacturing clearly needs to be part of the discussion, the United States is a leader in highly skilled services which make up a greater proportion of renewable energy jobs than manufacturing.

With great challenges come great opportunities. Global demand for clean energy technologies is growing rapidly, as are export opportunities for U.S. companies. And exports of clean energy technologies, like any export, will also benefit the U.S. economy by creating and sustaining jobs here at home and by increasing revenues. For instance, global investment in renewable energy and energy efficiency was $145 billion in 2009, having increased every year since 2002. Governments have allocated an additional $180 billion to renewable energy and energy efficiency in the stimulus bills that were passed by many countries last year.

Looking forward, the potential global market for civil nuclear goods and services is valued at $400 billion over next 15 years. The projected demand for U.S. clean coal technology equipment in key global markets which utilize coal for power generation is estimated at $36 billion through 2030. And, according to some reports, the projected global smart grid market is expected to increase from $90 billion in 2010 to $171 billion in 2014. The Department of Energy estimates that $40 billion per year in increased exports of clean energy technologies

would generate up to 750,000 green jobs by 2020. Our ability to realize this potential depends on achieving U.S. leadership in the field.

The U.S. Clean Energy Industry and Factors Affecting their Competitiveness

U.S. clean energy technologies companies face fierce competition in international markets.

Beyond macroeconomic issues of labor prices, currency valuation, health expenses, etc., three other factors have a strong effect on international competitiveness: (1) the strength of the domestic industry, (2) the availability of international markets that offer U.S. companies a fair opportunity to compete, and (3) the ability of U.S. companies to access the resources and master the skills required of exporting.

I will discuss each in turn.

1. Creating a Strong Domestic Industry

A strong domestic industry is a prerequisite for exports. The United States is in fierce competition for new markets in developed countries as well as in developing countries, such as China and India, which have set ambitious national targets for ramping up clean energy. Enforced national targets or renewable portfolio standards give companies certainty in the long-term presence of demand.

The United States has a relatively small share of worldwide manufacturing capacity for clean energy-related industries such as wind and solar. In 2008, the United States had 16% of global wind manufacturing capacity and 6% of global solar manufacturing capacity. Nevertheless, there is a clear opportunity for the United States to lead the world in high-technology, clean energy manufacturing. The R&D and innovations being pursued by companies, universities, and the Department of Energy's national labs will be key to that leadership role.

The American Recovery and Reinvestment Act (ARRA) provides significant support for advancing clean energy technologies within the United States - a total of $36.7 billion of federal funds. These investments, most of which are matched by the award recipients, serve to stimulate our economy, develop new jobs in our manufacturing, service, and R&D sectors, and foster further clean energy investments by the private sector.

Approximately seventy percent of our nation's Clean Energy Stimulus Program is allocated to energy efficiency, renewable energy, and smart grid development and deployment. Specifically, $16.8 billion of stimulus funds have gone towards energy efficiency and renewable energy programs, $4 billion is allocated for renewable energy loan guarantees, $4.5 billion is directed to developing and deploying a fully-integrated smart grid system throughout the United States, and $3.4 billion has been allocated to advance the commercial deployment of carbon capture and storage (CCS) technologies. In addition, the $2.3 billion manufacturing tax credit included in the American Recovery and Reinvestment Act (ARRA) was an important step for the U.S. federal government to provide national incentives that compete with foreign competitors.

To ensure that the United States continues to foster the emergence of smart grid technologies, the Administration has established a Subcommittee of the National Science and Technology Council's Committee on Technology to coordinate agency involvement in this issue and develop a comprehensive policy framework.

2. Opening Overseas Markets

Despite the flood of news about fast-growing clean energy technology opportunities in foreign markets, U.S. clean energy technology exports cannot increase if protectionist rules and policies prevent open competition.

The connection between clean energy technologies and green jobs has led many countries, developing and developed alike, to adopt policies that make it more difficult for foreign firms to compete in their markets. Many countries – either implicitly or explicitly – favor their domestic industry through preferential tendering criteria (China) and burdensome certification requirements (Korea, Japan). In addition, concerns regarding adequate protection of intellectual property rights also hamper some firms from entering foreign markets. This is an area particularly critical to new, small- and medium-sized clean energy companies whose survival might depend on a small number of critical patents.

Intense foreign competition from state-owned enterprises poses another challenge for U.S. companies, primarily in the civil nuclear sector. Foreign firms have enjoyed significant government support, ranging from direct government ownership and management, to concessionary financing, industrial coordination, support for manufacturers and nuclear liability protection. Also, for the civil nuclear industry, a lack of an effective global nuclear liability regime poses significant concerns.

3. Firm-Level Export Challenges

The final challenge to increasing clean energy technology exports that must be addressed is the willingness of U.S. clean energy firms to export. The Economist recently reported that only 4% of all U.S. companies export.

In the clean energy sector in particular, companies face challenges to exporting that are not market or policy-based, but are internal to that particular company's knowledge and comfort with the export process. Many companies face a shortage of available capital or financing, which hampers their ability to increase their manufacturing capacity to meet global market demands. Complex domestic and foreign regulatory requirements also pose issues for companies. Local financial institutions that traditionally facilitate deals involving U.S. exports lack the knowledge and comfort to finance innovative clean energy products. Many U.S. companies, particularly small and medium-sized companies, struggle to understand the local customs and business culture in foreign markets. Likewise, many companies find it difficult to find a local partner or distributor without a keen understanding of local companies' ability. Finally, small companies frequently lack a basic understanding of the export process. Often these companies do not understand foreign tariff systems, currency conversion, or patenting

requirements. Fear of intellectual property rights violations in particular can hinder U.S. clean energy companies from seeking opportunities overseas.

ITA's Role in Supporting U.S. Competitiveness through Exports and Various Clean Energy Initiatives

1. Clean Energy Initiatives

ITA has multiple clean energy initiatives in place and has organized industry promotional events and released a number of publications or educational materials to support exporters. We also engage in bilateral, regional and multilateral negotiations. Recent examples of programs administered by ITA that support the clean energy industry, either directly or indirectly, include the following:

- Last year, ITA launched an **Energy Efficiency Initiative** (EEI) to assist U.S. manufacturers to improve the energy efficiency of their operations as well as to promote the development and deployment of energy efficient technologies. The EEI is focused on the industrial energy efficiency and comprises three pillars--- 1) market development, 2) trade policy and promotion, and 3) outreach and resource development. The EEI targets America's eight high-energy consuming industries—Aluminum, Metal Casting, Forestry Products, Mining, Chemicals, Petroleum Refining, Glass, and Steel.

- Activities to date include an *Energy Efficiency in Manufacturing Road Show* to Toledo, Ohio and a Forum on Energy Efficiency in Manufacturing in Washington, DC both of which I hosted last fall; a *Checklist for Corporate Efficiency*; a Department paper on the global competitiveness of the industrial energy efficiency technologies sector (being developed), a primer on financing options, a smart grid webinar series; and a recent Smart Grid Manufacturers Forum in St. Paul on June 9th organized in partnership with DOE, the State of Minnesota and the University of Minnesota.

- We administer a **Civil Nuclear Trade Initiative** the goal of which is to strengthen the competitiveness of the U.S. nuclear industry as it endeavors to rebuild its manufacturing base by capturing opportunities abroad. The Initiative, developed and administered by MAS, identifies the industry's most pressing trade challenges and opportunities and coordinates public and private sector efforts to address them. As part of this initiative, ITA Under Secretary Francisco Sanchez will be leading approximately ten U.S. civil nuclear companies on a trade policy mission to Poland, Czech Republic and Slovakia in mid July (11-17).

- ITA recently held a **Green Financing Roundtable** (May 21st) which brought together stakeholders and relevant government agencies to improve awareness of existing green finance market space, trends, opportunities, and obstacles facing U.S. financial services firms investing in wind, solar, biofuel, biomass and waste, energy-efficient technologies and other emerging energy options.

- We have organized several events aimed at both informing industry of the latest developments in the international climate change negotiations and eliciting their feedback (i.e., recent **national climate change webinar** hosted by Secretary Locke).

- We also have established an **interagency Working Group on Renewable Energy and Energy Efficiency under the TPCC**, as noted earlier, to focus on coordinating export promotion activities of the U.S. Government within these sectors. In April, this working group agreed to draft a national strategy to help double U.S. exports in those two key sectors. In addition to an in-depth look at the global competitiveness of these sectors, the ensuing report will contain commitments by USG agencies relating to these sectors. We have published a Federal Register Notice requesting public comments.

- Secretary Locke recently established a **Renewable Energy and Energy Efficiency Industry Advisory Committee** in order for industry to advise the Department directly on pressing trade promotion and policy issues.

- **ExporTech** was developed and is delivered in partnership with Manufacturing Extension Program (NIST-MEP.) It is designed to assist new-to-export companies, primarily in manufacturing, with developing an international growth plan customized to the businesses specific exporting objectives. Since its inception, the initiative has seen a 600 percent increase from three programs in 2007 to 21 in 2010. To date over 200 companies in 18 states have participated in ExporTech programs. The ExporTech program enables small and medium-sized companies, including clean energy firms, to accelerate or expand their growth in to new markets and to create and refine an international growth strategy.

- **Sustainable Manufacturing Initiative** – ITA's Sustainable Manufacturing Initiative addresses green technology implementation as a component of business competitiveness. The Initiative encourages U.S. companies to use sustainable practices that improve their bottom line. This can make them more competitive in the global marketplace, and therefore, potentially more interested in exporting. A component of this Initiative is SMART Sustainable Manufacturing American Regional Tours. ITA has held 7 "SMART" TOURS (Seattle, Rochester, Grand Rapids, St. Louis, Seattle, Atlanta, and Beltsville) – The next SMART tour, which will focus on energy efficiency in the forest products sector, will be held in September in Richmond, VA. NIST-MEP centers have between an integral partner on this front.

- **Manufacture America** - This summer, Nicole Lamb-Hale, Assistant Secretary for Manufacturing and Services, will lead a series of road shows to help demonstrate U.S. Government resources to help manufacturers retool their facilities to engage the growth industries of the 21st century, creating and preserving jobs in some of the hardest hit communities around the country. The road shows will help link manufacturers to global demands that provide export opportunities, such as clean energy, and meet President Obama's goal of doubling exports in five years. NIST-MEP centers will also provide a supporting role here.

2. Industry Promotional Events

ITA is actively promoting U.S. clean energy solutions in overseas markets. We have held trade events and foreign buyer programs at major renewable energy trade shows and brought delegations from all over the world to these events. ITA's aggressive clean energy technology promotion program includes over 90 trade events held worldwide last year and many more planned for the rest of 2010. These are in addition to the day-to-day services we offer U.S. companies, such as tailored matchmaking and consulting services, international company profiles, and international partnership searches. We now have a new Green Tech website that aggregates all of our export promotion programs in a single place, providing easy industry access (www.buyusa.gov/green)

In the past year, ITA has held International Buyer Program (IBP) events at two major energy trade shows. The IBP hosted nearly 1100 delegates at the 2010 Offshore Technology Conference in Houston, Texas and 13 delegates at the 2010 Electric Power Show. In December, an IBP will be held at Power Gen International in Orlando, Florida, the largest power generation trade show in the world. In May 2011, ITA will hold an IBP event at the American Wind Energy Association Windpower Conference & Expo in Anaheim, California.

ITA has also organized trade missions focused on clean energy: Solar Energy Trade Missions to India (March 2009 and February 2010) with 14 companies participating; Energy Efficiency Trade Mission to India (November 2009), led by Deputy Chief of Staff Rick Wade, with 16 companies participating; and most recently, the Secretary-led Clean Energy Business Development Mission to Hong Kong, and other cities in China and Indonesia (May 2010), focusing on solar, wind, power generation and distribution/smart grid, green building, and energy information services, with 24 companies participating.

Last year, ITA also led a Clean Energy Policy Mission to Indonesia focusing on geothermal and other forms of renewable energy. We also organized a five-city Green Build Road Show -- to Pittsburgh, Denver, San Francisco, San Jose, and Phoenix -- to help U.S. companies take advantage of the $975 billion construction market in Europe.

During the December 2009 Copenhagen negotiations on climate change, we hosted "Bright Green," an exhibition of U.S. technology that can help fight climate change, and are likely to host a similar event at the next UNFCCC meeting in Cancun. We hosted a U.S. industry promotional event at the IAEA General Conference in Vienna last fall with the U.S. civil nuclear power industry. We expect to host this program again this September.

3. Publications and Educational Materials

As I mentioned earlier, in support of the President's National Export Initiative, we are working with our interagency partners to develop a National Renewable Energy and Energy Efficiency Export Strategy. We are also working on a competitiveness report on small modular nuclear reactors. We have ramped up our efforts to promote the commercialization and export of clean energy technologies through increased outreach to industry on best practices and markets, technical assistance and capacity-building events, and helping develop trade policies that promote cleaner technologies.

In 2009, ITA released a number of reports and helpful resources including a *Checklist for Corporate Energy Efficiency* and a *Trade Finance Guide*, which serves as a useful resource for small- and medium-sized enterprises (SMEs) in the green technology industry. We also have published clean energy exporters' guides for China and India, providing valuable planning information to companies interested in exporting green technologies to these growing markets. The guides contain market overviews, analyses of the clean energy markets in these countries, market opportunities for trade and investment through 2020, and resources available to U.S. businesses to help enter these markets. We recently released a smaller renewable energy market assessment report on Indonesia and have continued to hold informational webinars on topics as diverse as smart grid and biomass funding opportunities.

4. Domestic Regulatory Program

The role of MAS's Regulatory Affairs Program is to represent the competitiveness interests of U.S. companies and industries in the Federal regulatory review process. MAS conducts economic analyses to support regulatory reform and reviews cost-benefit analyses prepared by other Federal agencies. MAS's primary value added arises from its unique industry and international trade expertise.

The MAS Regulatory Affairs Program has participated in interagency discussions for almost three dozen rules since the program started in 2006, including rules from the Occupational Safety and Health Administration (OSHA), the Environmental Protection Agency (EPA), and the Department of Homeland Security (DHS). Through this program, we continue to review key rulemakings that could potentially affect the export competitiveness of the U.S. clean energy and other industries.

5. Bilateral, Regional & Multilateral Dialogues

ITA has also been active in organizing events to spur the exchange of best practices with foreign governments and foreign industry. Such programs have ranged in focus from helping trading partners reduce greenhouse gas emissions in cement manufacturing to explaining what investment framework has been developed to attract investment to the renewable energy and energy efficiency sectors.

ITA has worked on clean energy issues under the U.S.-EU Framework for Advancing Transatlantic Economic Integration and the U.S.-Brazil Commercial Dialogue, and assesses the impact of foreign regulations, such as the European directive on energy-using products, on U.S. interests. We have many similar commercial dialogues with other countries including China, India and others.

Along with the Department of State and other agencies, ITA works within the G-8, G-20 and the Asia-Pacific Economic Cooperation forum, where climate change is becoming a priority issue, to represent the interests of the United States, with a focus on economic and industrial concerns. ITA monitors foreign government climate- and energy-related programs and proposals for potential countervailable or WTO-inconsistent subsidies.

6. Market Development Cooperator Program

Lastly, I wanted to highlight the Market Development Cooperator Program, which MAS manages. The program allows non-profit groups or universities to propose projects to open up foreign markets to U.S. exports. In 2009, we awarded three MDCP awards in the clean energy sector. This year, the Department has received numerous applications for MDCP awards and is currently reviewing them.

The MDCP has been an effective means to promote U.S. exports abroad, especially in the clean energy sector. One particular example I'd like to highlight is the International District Energy Association (IDEA), which has partnered with the Department as a cooperator in the MDCP since 2005. Our MDCP awards to IDEA during this time have contributed to the export of $263 million of U.S. clean energy technologies, principally to Middle East markets.

Conclusion

In closing, I would like to thank you Chairman Rush, ranking Member Whitfield, and Members of the Subcommittee for the opportunity to highlight what ITA is doing to help U.S. companies compete in markets for clean energy technologies and for all kinds of U.S. goods and services around the world. I would like to make one final point, however, before answering any questions you might have:

Expanding opportunities to export clean energy technologies will not only maintain the competitiveness of U.S. companies, but will create jobs and generate economic growth. In addition, it will increase the reliability of our energy supply. American businesses have the technology, the expertise and the experience to help countries around the world reach their climate and energy goals. It is an extraordinary opportunity and a win-win for everyone.

Thank you for your time today. I welcome any questions you may have.

Mr. RUSH. The chair recognizes Ms. Wince-Smith for 5 minutes.

STATEMENT OF DEBORAH WINCE-SMITH, PRESIDENT AND CHIEF EXECUTIVE OFFICER, COUNCIL ON COMPETITIVENESS

Ms. WINCE-SMITH. Chairman Rush, thank you for inviting me to testify today on the Clean Energy Technology Manufacturing and Export Assistance Act. This legislation acknowledges the pivotal role that the emerging clean energy industry will play in ensuring America's economic competitiveness and in our national security going forward.

The growth and vitality of this industry depends upon the development of a robust domestic market coupled to access to a burgeoning global market for these essential technologies and services that will take us to a low carbon economy, energy security, and addressing climate change.

Since 1986, the Council on Competitiveness has brought forth creative solutions to America's most pressing competitiveness challenges. Comprised of leaders from industry, academia and organized labor, the Council is unique in its abilities to build synergies and consensus across a wide span of organizations and interests.

Next week on June 23rd, our chairman, Samuel Allen, the CEO and chairman of John Deere Corporation, will be launching with our members a new flagship initiative on U.S. manufacturing competitiveness in the 21st century. I submit for the record a summary of this initiative.

The Council, with our partners in government and the private sector, will deliver a national manufacturing strategy to the administration and Congress at a national summit in 2011. And energy and the clean energy revolution will be at the heart of this agenda.

Our energy security innovation and sustainability initiative where we outlined a very robust plan last September, clearly supports an alliance with the objectives of the Clean Energy Technology Manufacturing and Export Assistance Act.

As the 20th century drew to a close, rising global competition, the opening of global markets, challenged U.S. manufacturers raising concern about the export of U.S.-made goods, offshoring of our manufacturing production, the loss of skilled U.S. manufacturing jobs, and a rising account deficit, currency manipulation and distortion. With the growing strength and consumer demand of the emerging economies, competitors such as China, India, South Korea, and Brazil, now there are many that feel that U.S. manufacturing will spiral into further decline.

The Council believes that no Nation can be a technology and economic leader without a robust multi-sector manufacturing capacity. And the stakes are extremely high. Our roadmap for energy security sustainability and competitiveness highlighted that revenue in just three clean energy sectors—wind, solar and biofuels—is projected to nearly triple over the next decade and markets for clean technologies and their attendant services will expand exponentially.

These markets and the jobs and economic growth that will bring our country to the forefront require a set of enabling policies and programs in research and development, in manufacturing and commercial deployment here in America. So we believe that H.R. 5156

is an important policy step in addressing this challenge, and I am pleased to be here today to voice our support for this proposal and legislation.

But there are many more policy steps required to ensure a vibrant ecosystem that supports America's capacity. For next generation R&D, and battery storage, carbon capture sequestration, and nuclear reactors, to increasing energy productivity and efficiency. We must engage in this intense global competition in Asia, Europe, the Middle East and the Americas.

As an example of what is at stake, within the past decade, the United States has fallen from first to fifth among top solar manufacturing companies and now imports solar cells from the EU and Asia. China now is doing assembly work for solar cells in the United States.

I cannot emphasize enough the importance of taking a systems approach to our energy sustainability and economic policies. We have to understand the linkage between policies and how we integrate them into a holistic strategy, everything from domestic tasks and fiscal policies to regulatory issues to, of course, global standards and trade policy.

Let me highlight quickly four areas in our energy sustainability report that captures the essence of what you are trying to accomplish in this legislation with respect to expanding U.S. exports.

The first is that we must remove tariffs and non-tariff barriers for sustainable energy products and services while not creating a dual track for preferential trade liberalization. We have to ensure that tariff reduction and removal of barriers are transparent, reciprocal, and provide access to all national markets where strong worker and consumer protections are provided.

Two, we have to ensure intellectual property rights for all industrial products and services, copyrights and sustainable energy solutions are protected. This is a huge issue with China, India, and Brazil and other parts of the world.

Three, we must ensure our continued U.S. technological leadership for the breakthroughs and commercializations. The Council has proposed that we need a long-term stable source of funding. And in the future, we argue that 30 percent of any revenue from carbon pricing should be allocated to R&D including the demonstration of clean energy technologies.

And four, to insure that the technologies of tomorrow will be manufactured in the United States, we should allocate 40 percent of revenues derived from any future carbon pricing program to manufacturing initiatives, Federal, State or local clean manufacturing zones, pilot projects as well as immediate expensing and depreciation of the costs of retooling for production and qualified products, and dedicating high-performance computing assets to the clean energy manufacturing revolution.

In conclusion, Mr. Chairman, the Council believes that the transformation to a low-carbon economy will unleash American innovation, it will create new industries, revitalize and rebuild manufacturing jobs across our Nation and keep and grow high-skilled jobs for this generation and the next. But we have to come together around an integrated manufacturing policy and to accelerate this

growth, stewardship, and security for all. Thank you, and I am welcome to answer any questions.

[The prepared statement of Ms. Wince-Smith follows:]

Statement by
Deborah Wince-Smith
President
U.S. Council on Competitiveness
before the
House Subcommittee on Commerce, Trade, and Consumer Protection
June 16, 2010

Council on Competitiveness

Introduction
Chairman Rush, Congressman Whitfield and other distinguished members of the subcommittee, thank you for inviting me to testify today on the "Clean Energy Technology Manufacturing and Export Assistance Act". This legislation acknowledges the important role that the emerging clean energy industry will play in ensuring America's economic competitiveness and national security going forward. The health of this industry depends upon the development of a robust domestic market and access to a burgeoning global market for these essential technologies and services.

It is critical that the United States create the right conditions for breakthrough innovations across the manufacturing eco-system, especially in the field of clean energy. Perhaps more importantly, we need to ensure the environment exists here for manufacturing at scale in order to create high-value jobs and enhance our national prosperity.

Council on Competitiveness
I'd like to start by providing a little background about the Council on Competitiveness - who we are, and how we operate.

Since 1986, the Council has brought forth creative solutions to America's most pressing competitiveness challenges. Composed of leaders from industry, academia and organized labor, the Council is unique in its ability to build synergies and consensus across a wide span of organizations and interests. Our scope of issues reflects many factors that affect our nation's ability to compete: ranging from the business environment, innovation, advancing key enabling technologies, building a world-class workforce and igniting regional innovation through entrepreneurship.

By leveraging its exceptional convening power, the Council attracts the best minds, at the right time to the right issues. Not representing a singular interest, the Council operates at the level of the national interest, taking a systems approach in framing problems and developing solutions. The Council proactively engages all perspectives and forges critical partnerships with stakeholders in the public and private sectors.

The Council is fortunate to have some of America's top leaders serve on our Board of Directors:

- Our Chairman is Samuel R. Allen, Chairman & CEO, Deere & Company
- Our Industry Vice Chair is Michael J. Splinter, Chairman, President & CEO, Applied Materials, Inc.
- Our University Vice Chair is Shirley Ann Jackson, President, Rensselaer Polytechnic Institute
- Our Labor Vice Chair is Edward J. McElroy, Chief Executive Officer, UNITE HERE
- Our Chairman Emeritus is Charles O. Holliday, Jr., Former Chairman, DuPont

Council on Competitiveness

The Council continues to be at the forefront in tackling the key challenges facing U.S. competitiveness. Next week, on June 23rd, we will formally launch a new flagship initiative on U.S. Manufacturing Competitiveness in the 21st century and I submit for the record a summary of this initiative. The Council will prepare and deliver a National Manufacturing Strategy to the Administration, the Congress and its members at a national summit convened in late 2011. With the advice, participation and buy-in from a wide range of stakeholders – this strategy will energize a vibrant, diversified and technologically advanced manufacturing value web, resulting in American jobs, economic growth, energy sustainability and national security.

The manufacturing initiative will build on the Council's other initiatives and our long-standing focus on technology and innovation to drive productivity and competitive advantage:

- The National Innovation Initiative, 2004
- Energy Security, Innovation and Sustainability Initiative, 2009
- Technology Leadership and Strategy Initiative, on-going
- High Performance Computing Initiative, on-going
- Skills and Workforce Initiative, on-going

Today, I will speak directly to our new manufacturing initiative and the findings of our Energy Security, Innovation and Sustainability Initiative which support the objectives of the "Clean Energy Technology Manufacturing and Export Assistance Act".

U.S Manufacturing Competitiveness in the 21st Century

As the 20th century drew to a close, rising global competition and the broad opening of global markets challenged U.S. manufacturers. As a result, there has been continuing concern about the export of U.S. made goods, off-shoring of U.S. manufacturing production and the loss of U.S. manufacturing jobs. With the growing strength of newly-developing low-cost competitors such as China, India, South Korea and Brazil, there are many who fear that U.S. manufacturing will spiral into further decline. Others believe that the U.S. can improve national prosperity through service industries alone without a robust manufacturing sector.

The Council believes that no nation can be a technology and economic leader without a robust multi-sector manufacturing capacity. The global competitive landscape for manufacturing is undergoing a transformational shift that will reshape the drivers of

trade, economic growth, job creation, national prosperity and national security. Manufacturing is and will continue to be an essential path for attracting and retaining high value investments, spurring innovation, increasing exports and creating high value jobs. Developed and emerging nations are in heated competition to create the most compelling opportunities to innovate, build a highly-skilled workforce, improve standards of living and enhance national security.

Council on Competitiveness

Strong export growth will enable the United States to maintain acceptable economic growth rates, improve productivity, encourage innovation and create good-paying jobs. Exports of manufactured goods from the U.S. grew at an average annual pace of almost 9 percent between 2002 and 2008 demonstrating there is considerable worldwide demand for U.S. goods. Yet, the U.S. share of world manufactured exports, as of 2008, dropped to only 9.2 percent, down from almost 14 percent in 2000.[1] The most dramatic change was the rise of China to overtake the United States as a leading exporter of manufactured products. This is a worrisome trend especially in clean energy and other advanced technologies. Just consider that the following are no longer manufactured in the United States at a time when we are transitioning to a low carbon world:

- Lithium-ion, lithium polymer and NiMH batteries for cell phones, portable consumer electronics, laptops and power tools
- Advanced rechargeable batteries for hybrid vehicles
- Crystalline and polycrystalline silicon solar cells, inverters and power semiconductors for solar panels

Higher employee wages and exports go hand-in-hand. Employees in the most trade-intensive industries – where combined exports and imports amount to at least 70 percent of their domestic industrial output—earn an annual compensation package that averages about $86,000. This is 47 percent more than average compensation in the least trade-engaged sectors of manufacturing.[2]

Long-term national and economic security in the United States critically depends on our having innovative and agile manufacturing capabilities. Current economic conditions and energy security challenges have only heightened the need to accelerate competitive advantages for U.S. manufacturing companies in the global marketplace. Manufacturers will maintain their global leadership position through technological differentiation, not through labor cost advantage.

21st century manufacturing spans ideas, products and services; well beyond the production of only goods as in the 20th century. This post-industrial manufacturing ecosystem represents a complex and highly integrated globalized value web. This web includes cutting-edge science and technology, innovation, talent, sustainable design, systems engineering, supply chain excellence and a wide range of smart services; as well as energy efficient, sustainable and low carbon manufacturing.

---

[1] *Facts about Modern Manufacturing 8th Edition*, MAPI/National Association of Manufacturers, 2009.
[2] Ibid

Rising energy demand, climate volatility and resource challenges require transformational manufacturing technologies and systems. Other nations are vying for market share in green manufacturing and clean energy industries. To drive economic growth, competitiveness and job creation, America must regain market leadership for technologies lost to other regions and also lead the world in energy efficient, sustainable and low carbon manufacturing. The examples of U.S. generated technologies creating value and jobs elsewhere are growing: ceramic oxides, semiconductor memory devices and production equipment, lithium ion batteries, flat panel displays, videocassette recorders and interactive electronic games.

Council on Competitiveness

The global challenges demand that we act now and not allow further erosion and atrophy of the U.S. industrial base. America must craft and mount a strategic response to provide jobs for our citizens in the 21st century. We need an engaged and skilled workforce, rapid deployment of frontier science and technology, deep pools of risk capital, a more global market oriented capital cost structure and regulatory environment, and 21st century physical and virtual infrastructures that will drive America's competitive advantage.

American public officials, opinion leaders and investors also need to understand and vigorously support these changes if we are to regain and retain our international leadership position. If America fails to adapt, we risk losing this critical underpinning of our economy and failing to reap the value from the investments in next generation energy technologies. America's edge lies with forward looking, high-value manufacturing that looks well beyond traditional assembly and fabrication of products.

The Critical and Transformational Role of HPC in Manufacturing

The use of high performance computing for modeling, simulation, and analysis has already provided a competitive advantage for many of the manufacturing Fortune 50.

These companies employ in-house advanced computing and have access to high performance computing hardware, software, and technical resources through partnerships with national laboratories. Many of these companies recommend that adoption of modeling, simulation, and advanced computing be accelerated throughout the U.S. manufacturing sector. For example, Pioneer Hi-Bred, a DuPont company, uses HPC to manage and analyze massive amounts of molecular, plant, environmental and farm management data, allowing them to make product development decisions much faster than by using traditional experiments and testing alone. For Pioneer, the result has been faster improvement in new seed products, staying ahead of the competition, a major jump in innovation and productivity, and the ability to help meet some of the world's most pressing demands regarding the availability of food, feed, fuel, and materials.

A substantial effort toward wider adoption of modeling and simulation requires the commitment of intellectual capital, computer hardware and software for complex problem solving, and other resources from among the diverse advanced computing assets spread across the nation's regions, states, and advanced computing centers. This truly

successful national initiative will leverage these vital resources from a new public-private partnership to bolster the U.S. manufacturing sector.

Council on Competitiveness

To these ends, the federal government should issue a "call to action" to U.S. manufacturing sector leaders and create a national manufacturing initiative enabled by advanced computing. These leaders in advanced computer-enabled design and manufacturing should be asked to leverage their expertise in modeling, simulation, and analysis and partner with the federal government to improve U.S. manufacturing competitiveness. The outcome of this call to action will be to accelerate and broaden the use of modeling and simulation, to increase penetration of these tools into smaller companies (pushing these tools further down into the supply chain), to solve the biggest complex problems with the latest techniques, and compete through innovation.

Through the national laboratory system, the federal government offers the greatest scientific and engineering resources, computer assets, and research software to be deployed for the initiative. Importantly, while the United States and Japan are the only significant manufacturers of HPC machines - an incredible advantage that must be utilized for economic growth - china is not far behind . To succeed, the initiative should also call upon, bring together, and leverage (all of) the nation's most advanced computing resources—state to state, region to region, center to center.

Modeling and simulation are critical tools needed by manufacturers of all sizes. These tools are especially valuable for the design, development and deployment of clean energy technologies and offer firms a significant cost advantage.

Energy Security, Innovation and Sustainability

The Council believes that energy security and sustainability are two of the defining and intertwined challenges of our time. For virtually every country, access to affordable energy is a basic need for economic growth, social development, improved standards of living, and increasingly for national security. However, neither an affordable nor a reliable supply of energy is a given for any country. As committee members well know, even as a nation with an immense wealth of natural resources, we face soaring energy demand, price volatility, and supply instability. At the same time, pressure is mounting around the world to mitigate greenhouse gas emissions from fossil fuels—with the prospect of a 45% increase in emissions by 2030, driven almost entirely by developing countries.[3]

Without access to cost-effective cleaner energy solutions, developing economies will have no alternative but to increase their dependence on the most rudimentary fossil-fuel technologies, contributing significantly to increased pollution and environmental damage. To summarize, the current trajectory of global energy trends is unsustainable environmentally, socially and economically. They are impacting:

[3] International Energy Agency, *World Energy Outlook 2008*, IEA/OECD, Paris (2008).

- the fundamental ability of American industry to compete in the global economy
- the political ability of our government to play an international leadership role
- the capacity of our military to carry out its missions

Energy security and sustainability are now first-tier economic, national security, and competitiveness concerns. It is, therefore, inevitable that the world will undergo a systems transformation in the way we use and produce energy. As this country moves toward sustainable energy policies and programs, the Council does not believe there is an unavoidable trade-off among economic growth, energy savings, and environmental interests. Indeed, the pending systems transformation offers an opportunity to integrate energy security, sustainability, and competitiveness.

We also know that we have a tremendous opportunity before us. In fact, these challenges have created a perfect storm for innovation. We can move to a new era of technological advances, market opportunity, and industrial transformation if we can successfully unleash the investment and innovation potential of the private sector to meet the challenges and seize the opportunities arising from these new public-private partnerships.

We must be poised to deploy new ideas and innovations that come from the significant new investment in energy research into scalable products, goods and services. Research must be viewed as encompassing basic, applied, development and test beds. If we do not have in place the infrastructure to reap value from our investment, you can rest assured another country will. And when that happens, the jobs and intellectual property will be lost; as well as the component subsystems leading to a hollowing out of the innovation enterprise.

As we enter a new era of technological innovation, driven by the twin challenges of energy security and climate change, we must be vigilant in ensuring that we support these nascent industries here at home. We do not want to repeat the errors of our past when despite having achieved scientific and technology breakthroughs in liquid crystal, plasma and other flat panel display technologies, we ceded market leadership to countries like Japan and Korea, as they rapidly scaled up their high quality manufacturing ability and captured the global display market.

We have learned that we cannot divorce our investments in R&D from our efforts to support each stage of the manufacturing continuum. We must design-in manufacturing considerations upfront in the innovation process. We must ensure that we have the appropriate regulatory and financing framework in place to allow our entrepreneurs to move agilely from testing and pilots to manufacturing and large scale system deployment.

Clean Energy Technology Manufacturing

"U.S. manufacturing of clean energy technologies lags behind its international competitors on almost all fronts. The United States is outpaced by at least one of its Asian competitors in the production of solar cells, wind turbines, and components for

nuclear power plants, and currently has no domestic high-speed rail manufacturing capacity. The United States is also in danger of falling behind in the development of CCS and advanced vehicle technology and is already a laggard in the production of advance batteries for hybrid and electric vehicles."[1]

Council on Competitiveness

H.R. 5156 is an important policy step in addressing these challenges and I am pleased to be here today to voice our support for this proposal. But there are many more policy steps required to ensure a vibrant eco-system that fully supports America's capacity to create, make and market essential clean energy technologies to the world.

The Council's views on the energy-competitiveness relationship have been well-defined over the past few years. We see energy as the lifeblood of our economy and we believe that America's competitiveness cannot be separated from energy issues.

In developing new industries to supply the sustainable energy and related services needed here and abroad, America can drive economic growth, create millions of new jobs and enhance the competitiveness and prosperity of the entire nation.

The United States must invest, create, commercialize and market the new products and services of the low-carbon energy future. We must actively engage in the intense global competition well underway in Asia, Europe, the Middle East and the Americas to capture the economic value, jobs and global market share for these new industries and infrastructure.

As an example of what is at stake, within the past decade the United States has fallen from first to fifth among top solar manufacturing countries and now imports solar cells from the European Union and Asia.

Revenue in just three clean energy sectors —wind, solar and biofuels— is projected to nearly triple over the next decade, from $145 billion in 2008 to $343 billion in 2019.[2] Markets for clean technologies like carbon capture and sequestration for coal plants will expand exponentially as demand for this abundant energy resource continues to grow.

These markets and the employment and economic growth they bring can be ours if we act now with the right set of policies and programs to catalyze research and development (R&D), investment, manufacturing and commercial deployment.

In July 2007, the Council on Competitiveness launched the Energy Security, Innovation & Sustainability (ESIS) Initiative in recognition of the critical linkages among these three issues and their profound impact on future U.S. productivity, standard of living and global market success.

---

[2] *Clean Energy Trends*, Clean Edge, April 2010

Council on Competitiveness

Drawing upon over a year's work of inquiry and real-time research and analysis, and in anticipation of the new administration, the Council issued *Prioritize: A 100-Day Energy Action Plan for the 44th President of the United States* in September 2008. The plan identified six "pillars" as integral to U.S. energy transformation and as top priorities for presidential action upon taking office.

At that time, the Council stressed that the action plan recommended in *Prioritize* marked the beginning, not the end, of a concerted commitment to ensure the United States achieves energy security in a sustainable manner, while ensuring the competitiveness of its workers, industries and economy.

In September 2009, at a National Energy Summit that the Council convened here in Washington, D.C., we released *Drive: A Comprehensive Roadmap to Achieve Energy Security, Sustainability and Competitiveness*. *Drive* builds upon the energy action plan in *Prioritize* and sets forth the next set of integrated building blocks for America's energy transformation, sustainability and competitiveness in a low-carbon world.

I cannot emphasize enough the importance of taking a systems approach to our energy, sustainability and economic policies.

Let me also flag for the Committee a select number of our recommendations that bear directly upon the intent of HR 5156, that would in fact complement and enhance the efficacy of the provisions of this legislation. With respect to accessing to global markets the Council recommends that we:

1. **Remove tariffs and non-tariff barriers for sustainable energy products and services** while not creating a dual track for preferential trade liberalization. The World Trade Organization should re-launch the Doha Round of trade talks with the leadership of the Group of Twenty (G-20) Finance Ministers and Central Bank Governors to ensure that tariff reductions and removal of non-tariff barriers are transparent, reciprocal and provide access to all national markets, where strong worker and consumer protections are provided.

2. **Assure intellectual property rights (IPR) for all industrial products and services, copyrights and sustainable energy solutions.** The Secretary of State should coordinate with the U.S. Trade Representative to obtain strong IPR protection for all international R&D cooperative programs and technology transfer agreements for sustainable energy and carbon mitigation.

3. **To ensure continued U.S. technological leadership.** We need to guarantee a long-term, stable source of funding. In the future, 30 percent of any revenue from carbon pricing should be allocated to R&D, including the demonstration of clean energy technologies. Three technologies—energy storage including batteries, carbon capture and storage and advanced nuclear reactors—are enabling technologies that are critical to develop if we are to fully exploit our renewable, coal and nuclear resources.

Several demonstrations at commercial scale of each technology should be fast tracked with set dates for timely completion.

4. **To ensure that the technologies of tomorrow will be manufactured in the United States**, a steady stream of financing support should be provided, including 40 percent of the revenues derived from any future carbon pricing program. Supported programs should include: federal, state or local clean manufacturing initiatives; the creation of clean energy development zones; financial assistance for the first two to three commercial manufacturing facilities for energy technologies; the expensing of the costs of retooling for production of qualified products, equipment or energy options; operating Regional Manufacturing Centers to promote advanced manufacturing technology; and dedicating a high performance computing (HPC) center for clean energy manufacturing.

We believe that the recommendations presented in *Drive* will unleash a new era of American innovation, create new industries, revitalize and re-build manufacturing jobs across our nation, keep and grow high-skilled jobs for this generation and the next and accelerate economic prosperity for all Americans as we lead global growth, environmental stewardship and security.

Conclusion

Thank you again for this opportunity to provide testimony on this important topic for American manufacturing competitiveness. We support the intent of the "Clean Energy Technology Manufacturing and Export Assistance Act", while recognizing there is a lot more to be done. It is critical that the United States create the right conditions for breakthrough innovations across the manufacturing eco-system, especially in the field of clean energy. Perhaps more importantly, we need to ensure the environment exists here for manufacturing at scale in order to create high-value jobs and enhance our national prosperity.

Attachment 1: Council on Competitiveness U.S. Manufacturing Competitiveness Initiative Overview

U.S. Manufacturing Competitiveness Initiative

For American Jobs, Growth and Security

Council on Competitiveness

Vision for U.S. Manufacturing in the 21st Century

The United States needs a vision and goals for manufacturing. We must seek to generate multiples of high-value jobs as American products—synonymous with high quality, lean and green manufacturing—are in high demand around the world. The United States will enjoy the highest level of labor, capital and resource productivity among the world's leading economies, ensuring a sustained competitive advantage in the global economy. Vibrant regional innovation ecosystems and smart networks of lean and agile small manufacturers will drive the U.S. manufacturing sector. By 2020, the United States will be the decisive leader in frontier research in new process technologies and manufacturing productivity, including advanced modeling and simulation. Clean and advanced manufacturing technologies will be widely deployed across the economy, as the risk and cost to commercialize and produce them at scale has been substantially reduced.

Initiative Goal

At a national summit convened in 2011, deliver to the Administration and the Congress a realistic and comprehensive solutions roadmap—with the advice, participation and buy-in from a wide range of stakeholders—that will energize a vibrant, diversified and technologically advanced manufacturing value chain, resulting in American jobs, economic growth and energy and national security.

Initiative Core Premises

Manufacturing, long a cornerstone of U.S. competitiveness, faces intense and accelerating competition from all corners of the globe. The U.S. share of the global market for manufactured exports declined from 19 percent in 2000 to 14 percent in 2007, while the Chinese share rose from 7 percent to 17 percent.[1]

The manufacturing ecosystem represents a value stream that spans from ideas to products. 21st century manufacturing goes well beyond production of saleable objects. It also includes cutting-edge science and technology, sustainable design and systems engineering, supply chain excellence and a wide range of smart services—as well as lean and green production.

Manufacturing is being reshaped by new forces. Half of middle class consumers will live outside the United States by 2030.[2] The rise of new consumers and capabilities in emerging economies will challenge American preeminence. The fast pace of technological change doubled the topple rate for established companies in the 20 years to the mid-1990s,[3] and today's global innovation networks diffuse frontier research and technology allowing competitors to leapfrog their competition.

Rising energy demand, climate volatility and resource challenges require transformational manufacturing technologies and systems. Other nations are vying for market share in green manufacturing and clean energy industries. To drive economic growth, competitiveness and job creation, America must regain market leadership for technologies lost to other regions and also lead the world in energy efficient, sustainable and low carbon manufacturing.

The global challenges demand that we act now. America must craft and mount a strategic response to provide jobs for our citizens in the 21st century. We need an engaged and skilled workforce, rapid deployment of frontier science and technology, deep pools of risk capital, and 21st century physical and virtual infrastructures that will drive America's competitive advantage.

Initiative Leadership

CEO-Level Leadership Council and Steering Committee
The Committee, led by Council Chairman Samuel R. Allen, is comprised of chief executives from industry, academia, organized labor and national laboratories, and will frame the critical questions, provide the strategic direction and create the policy solutions that will ensure a vibrant, resilient and sustainable manufacturing base upon which America will grow.

Council Board

Samuel R. Allen, Chairman and CEO, Deere & Company; Chairman, Council on Competitiveness

Michael R. Splinter, Chairman, President and CEO, Applied Materials, Inc.; Industry Vice Chair, Council on Competitiveness

Shirley Ann Jackson, President, Rensselaer Polytechnic Institute; University Vice Chair, Council on Competitiveness

Edward J. McElroy, CEO, ULLICO, Inc.; Labor Vice Chair, Council on Competitiveness

Charles O. Holliday, Jr., Former Chairman, DuPont; Chairman Emeritus, Council on Competitiveness

Deborah L. Wince-Smith, President and CEO, Council on Competitiveness

Industry Lead

James H. Quigley, Chairman and CEO, Deloitte Touche Tohmatsu; Executive Committee Member, Council on Competitiveness

Academia Lead

Susan Hockfield, President, Massachusetts Institute of Technology; Executive Committee Member, Council on Competitiveness

Labor Lead

William P. Hite, President, United Association of Pipe Fitters and Plumbers; Executive Committee Member, Council on Competitiveness

National Laboratories Lead

George H. Miller, Director, Lawrence Livermore National Laboratory; Executive Committee Member, Council on Competitiveness

Executive and Expert Advisors
An equally diverse and expert Advisory Committee is being formed to help shape the substantive aspects of the project, as well as provide ongoing counsel and support to Steering Committee Policy Solutions Groups and Council staff.

Distinguished Member and Affiliate Partners
As a broad-based, non-partisan organization committed to advancing U.S. competitiveness in the global economy, the Council cultivates partnerships with leading national organizations on issues of mutual concern. In bridging the interests and insights of many, the Council brings multi-disciplinary analysis and systems thinking to its work. The Council is proud to be partnering with several distinguished organizations on the U S. Manufacturing Competitiveness Initiative.

Public Sector Engagement
Policies affecting the U.S. manufacturing environment emanate from many quarters of the executive and legislative branch. To foster a holistic and integrated policy roadmap, the Council is proactively engaging policymakers from across the Administration and Congress in the launch of this initiative. Congressional staff from both parties have agreed to serve as advisors to the Council to ensure that the forthcoming recommendations are aligned with Committee jurisdiction and legislative timelines.

2010 Calendar of Events

June 23, 2010	Public Release of Council/Deloitte CEO Survey: Ranking Manufacturing Competitiveness by Country
	National Launch of Initiative, Council Executive Committee Meeting and Inaugural Manufacturing Steering Committee Meeting
October/November 2010	Steering Committee Meeting; Scenarios Released and Develop Preliminary Recommendations
December 8-9, 2010	Council Leadership Unveils Initial Findings and Steering Committee Recommendations
January 2011	CEO-Led Policy Solution Groups Commence Work
October 2011	Steering Committee Meeting and Release of Comprehensive Solutions Roadmap at National Manufacturing Summit
January 2012	Final Proceedings

Why the Council

Since 1987, the Council has brought forth creative solutions to America's most pressing competitiveness challenges. Composed of leaders from industry, academia and organized labor, the Council is unique in its ability to build synergies and consensus across a wide span of organizations and interests. By leveraging its exceptional convening power, the Council attracts the best minds, at the right time to the right issues. Not representing a singular interest, the Council operates at the level of the national interest, taking a systems approach in framing the problem and developing solutions. The Council proactively engages all perspectives and forges critical partnerships with stakeholders in the public and private sectors.

U.S. Manufacturing Competitiveness Initiative
Structure

Goals

The Initiative will bring together a cross-section of America's top private sector leaders to:

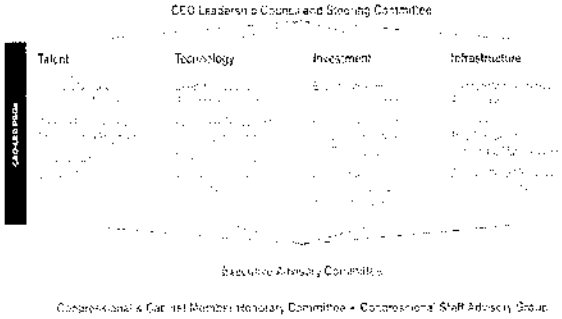
- Develop a shared vision for 21st century manufacturing across the entire manufacturing value chain.
- Sharpen our understanding of changes within the global economic environment and how they are impacting U.S. manufacturing competitiveness
- Create and advocate for a comprehensive set of policy solutions that will make the United States the most fertile and attractive environment for high-value manufacturing.

Council on Competitiveness

Why? America's national and economic security—and our ability to create wealth and new jobs—depend upon a robust and adaptive manufacturing ecosystem that supports the generation and translation of ideas into high-value goods and services that serve U.S. and global markets. Manufacturing accounts for the majority of the research and development and productivity growth in the U.S. economy, and contributes a large share to total gross domestic product. The United States cannot be a global economic and technological leader, nor fully recover from recent economic crises, absent a strong manufacturing base.

Process

A CEO-Level Leadership Council and Steering Committee—comprised of chief executives from industry, academia, organized labor and national laboratories—will frame the critical questions, provide the strategic direction, and develop a comprehensive set of actions to ensure a vibrant manufacturing base for America's future over the next 24 months.



Congressional & Cabinet Members Honorary Committee • Congressional Staff Advisory Group

Members of the Steering Committee will organize and lead Policy Solution Groups (PSGs) to develop recommendations that address specific elements of the manufacturing ecosystem—including talent, technology, investment and infrastructure. Each PSG will study discrete issues and produce an interim and final report for the Steering Committee—that will, in turn, summarize key findings and policy recommendations. The Steering Committee will integrate all of the PSG reports and findings into a final plan that they will present at a National Manufacturing Competitiveness Summit in 2011. CEO chairs will dedicate appropriate staff and executive support to the task.

The Steering Committee will also receive support and advice from an Executive Advisory Committee composed of manufacturing and thought leaders from business, academia, labor and non-governmental organizations.

Mr. RUSH. Thank you very much.
Mr. Herrnstadt.

STATEMENT OF OWEN E. HERRNSTADT, DIRECTOR OF TRADE AND GLOBALIZATION, INTERNATIONAL ASSOCIATION OF MACHINISTS & AEROSPACE WORKERS

Mr. HERRNSTADT. Thank you, Mr. Chairman.

The International Association of Machinists & Aerospace Workers is one of the largest manufacturing unions in the United States representing thousands of workers who produce goods for exports every day. We strongly believe in the importance of the clean energy industry and we welcome the opportunity to appear before you today.

Support for domestic manufacturing goods related to clean energy is a critical component for our economic recovery, and it is urgently needed. U.S. workers continue to be mired in the economic crisis while the official unemployment rate hovers at around 10 percent, the unofficial unemployment rate is approaching 20 percent. Some 8½ million workers have lost their jobs since December 2007 with a significant number directly working in manufacturing.

Today, there are over 15 million workers who are unemployed. Almost half of all of those who are unemployed have been without work for over 6 months.

The IEM continues to argue for the adoption of comprehensive policies that will address this jobs crisis. In order to be effective, we urge that these policies establish a framework for rebuilding our manufacturing base and ensuring its sustainability for the future.

H.R. 5156, the Clean Energy Technology Manufacturing and Export Assistance Act of 2010 represents one element of an overall program that is so desperately needed. If enacted, the bill would assist U.S. companies in exporting clean energy products and services. The bill would also require the Secretary of Commerce to submit a report to Congress which would assess the extent to which the program has been successful in creating jobs in the United States.

While H.R. 5156 represents an incredibly important step towards addressing the need to support manufacturing jobs in the clean energy sector, we urge an even more aggressive approach to ensure that Federal support for companies to export clean energy technology and services does, in fact, result in the creation or maintenance of jobs here at home.

A direct verifiable requirement that Federal support for clean energy exports results in the creation of U.S. jobs is essential. It appears that some companies are only too willing to produce clean energy goods and equipment in other countries. For example, as reported in The Washington Post, BP announced this spring that it would be laying off 320 workers and closing its solar panel manufacturing plant in Frederick, Maryland, the final step in moving its solar business out of the United States to facilities in China, India and other countries. In making the announcement, BP's CEO stated that BP was "moving to where we can manufacture cheaply."

We offer four specific suggestions for moving ahead and for building on H.R. 5156.

One, detailed employment impact statements should be a required factor in any decisionmaking process for government assistance. The employment impact statements would contain information pertaining to employment that would be mandated, created, or lost if the program in question were approved. We also suggest that capital equipment related to production as well as goods to be exported must be domestically made and contain domestic materials.

Strong domestic content requirements uniformly implemented and enforced could be specifically contained in current legislation.

Export assistance should also be sought by the U.S. Export-Import Bank who has also developed expertise in these areas.

And last but not least, domestic production for exports must be based on a fair and level field of global competition.

Clean energy exporters must be able to prosper, and they can only do so if they are able and are able to compete fairly. That means trade barriers removed when dealing with countries like China. Those barriers must be challenged and removed. Demands for transfer of technology and production in return for market access must also be curtailed. Currency manipulation must be formally recognized and addressed, and relatedly subsidies to the industry by other countries like China should also be challenged in a number of forums, including trade complaints.

As mentioned at the outset, U.S. manufacturing workers are in a crisis and not, coincidentally, so is our country's economy. Promoting U.S. clean energy companies to export domestically manufactured goods with U.S.-made materials and products represents one important solution to this crisis.

Again, we very much appreciate the opportunity to appear before you today and we would obviously be happy to answer any further questions.

[The prepared statement of Mr. Herrnstadt follows:]

TESTIMONY OF
OWEN E. HERRNSTADT, DIRECTOR OF TRADE AND GLOBALIZATION
INTERNATIONAL ASSOCIATION OF MACHINISTS AND AEROSPACE WORKERS
BEFORE THE
SUBCOMMITTEE ON COMMERCE, TRADE, AND CONSUMER PROTECTION
JUNE 16, 2010

Introduction

The International Association of Machinists and Aerospace Workers, (IAM) AFL-CIO, represents several hundred thousand active and retired members throughout North America.[1] Our members work in a variety of industries including aerospace, manufacturing, electronics, defense, transportation, shipbuilding, and woodworking to name a few. Our members also work in the energy sector manufacturing equipment and products. We have argued for many years that the health of our economy rests on our ability to develop technology that can contribute to domestic manufacturing opportunities. Clean energy and all of the goods and services related to the industry can serve as a significant factor in providing much needed manufacturing jobs to U.S. workers. Given our unique position as one of the largest manufacturing unions in the U.S., representing thousands of workers who produce goods for exports and as a firm supporter in the importance of the clean energy sector, we welcome the opportunity to appear before you today.

Support for domestic manufacturing goods related to clean energy is a critical component for our economic recovery. It is urgently needed. U.S. workers continue to be mired in the economic crisis. While the official unemployment rate hovers at around 10 percent, the unofficial unemployment rate is approaching 20 percent. Over 8.5 million workers have lost their jobs since December 2007, with a significant number directly working in manufacturing. Today, there are over 15 million workers who are unemployed. Almost half of all of those who are unemployed have been without work for over six months.

The IAM has urged the Administration and Congress to adopt comprehensive policies that address this job crisis. In order to be effective, these policies must go well beyond a band-aid approach: they must establish a framework for rebuilding our manufacturing base and ensuring its sustainability for the future. H.R. 5156, the Clean Energy Technology Manufacturing and Export Assistance Act of 2010, represents one element of an overall program that is desperately needed. If enacted, the Bill would assist U.S. companies in exporting clean energy products and services. The Bill would also require the Secretary of Commerce to submit a report to Congress which would assess, "the extent to which the program... has been successful in creating jobs in the United States."

While H.R. 5156 represents an important step toward addressing the need to support manufacturing jobs in the clean energy sector, we urge an even more aggressive approach to ensure that federal support for companies to export clean energy technology and services does in fact result in the creation or maintenance of jobs here at home. A direct, verifiable requirement that federal support for clean energy exports results in the creation of U.S. jobs is essential, since it appears that some companies are only too willing to produce clean energy goods and equipment in other countries. For example, BP, announced this spring that it would be laying off 320 workers and closing, "its solar-panel manufacturing

[1] Portions of this testimony are taken from the witnesses' article, "Green Jobs With Strings Attached", Economic Policy Institute, 12/2/2009.

plant in Frederick (Maryland), the final step in moving its solar business out of the United States to facilities in China, India and other countries..."[2] In making the announcement, BP's CEO, Tony Hayward stated that BP was "moving to where we can manufacture cheaply."[3]

As concluded by the Investigative Reporting Workshop (IRW), "[M]oney from the 2009 stimulus bill to help support the renewable energy industry continues to flow overseas..."[4] The IRW had previously reported about an announcement by a consortium of American and Chinese companies, "to build a $1.5 billion wind farm in Texas, using imported Chinese wind turbines". The IRW report noted that with respect to this project, "[C]ompany officials said they planned to collect $450 million in stimulus grants for the project."[5]

Federal incentives such as those provided by the H.R. 5156 could result in convincing companies in the clean energy industry to build and maintain domestic production to export goods, but only if that support is directly tied to domestic job creation. We are especially concerned that some companies could receive support for the export of capital equipment to other countries, while other exports could contain significant percentages of non-domestically produced parts, components, or materials. Transferring production equipment to other countries, and reinforcing foreign supply chains can, if not properly reviewed, result in creating additional global capacity and competition that could be harmful to U.S. workers. Using taxpayer money to facilitate this offshoring of work is unacceptable for any industry. In light of this hearing, it is particularly objectionable with respect to domestic manufacturing for the clean energy industry which is critical for our economic future.

In order to ensure that federal support for exports of clean energy goods and services will in fact result in the creation of jobs here at home, we offer the following suggestions:

1. **Require employment impact statements (EIS).** Detailed employment impact statements (EIS) should be a required factor in any decision making process for government assistance. The results of the EIS should be a significant factor in the final determination concerning the project or transaction under consideration. The EIS would contain information pertaining to employment that would be maintained, created, or lost if the program in question were approved. It would also contain in detail the duration, wage, location, and category of those jobs. The jobs analysis would also examine the impact on domestic jobs if the transaction involved the export of capital equipment.

   To assure that the EIS is accurate and that they are fully and effectively implemented, federal agencies such as the Department of Commerce should submit annual reports to Congress summarizing the methodology used to calculate the number of jobs supported by federal programs. The reports would also furnish Congress and the Administration with valuable information about how its programs regarding clean energy technology manufacturing and export assistance are assisting with the creation and maintenance of jobs here at home. In terms of HR 5156, such information could be included in Commerce's report as provided under Section 2(d).

---

[2] *BP closing Maryland solar manufacturing plant*, The Washington Post, 3/27/2010.
[3] Id.
[4] Russ Choma, *Renewable energy money still going abroad, despite criticism from Congress*, 2/8/2010.
[5] Id.. The announcement and subsequent controversy has led to a number of discussions and at least one legislative proposal offered by Senator Schumer.

2. **Equipment used for manufacturing goods, as well as the goods themselves, must be domestically produced.** Capital equipment related to production as well as goods and services to be exported must be domestically manufactured and contain domestic materials. Current domestic content requirements that are in effect throughout government can be vague and present several questions. For example, how is domestic content measured and applied? What factors are included in determining content? Is the calculation limited to raw materials, production assembly and maintenance, or are intangible items like the value of research and development, marketing, and the value of intellectual property rights, which can be used to inflate domestic content included? How will the origin of components and sub-components be considered? Strong domestic content requirements, uniformly implemented and enforced should be specifically contained in HR 5156.

3. **Export Assistance should also be sought through the U.S. Export-Import Bank.** The U.S. Export-Import Bank's objective is to assist companies in financing exports that will support U.S. jobs. Ex-Im has well-developed expertise in export assistance for short, medium, and long-term transactions. Special expertise has also been developed in the energy and environmental sectors. HR 5156 could adopt provisions seeking specific coordination between Commerce and Ex-Im.

4. **Domestic production for export must be based on fair and level global competition.** Clean energy exporters must be able to compete on fair playing field with producers in other countries. If the domestic clean energy sector is to prosper and result in more U.S. manufacturing jobs, trade barriers that exist in other countries like China must be challenged and removed. Demands for transfer of technology and production in return for market access must be curtailed. Currency manipulation must also be formally recognized by our own government and addressed. Relatedly, subsidies to the industry by other countries, like China, should also be challenged by trade complaints. Moreover, subsidies which may take the form of artificially created cheap laber cost derived from the failure to recognize and enforce fundamental human rights must also be challenged and remedied.

As mentioned at the outset, U.S. manufacturing workers are in a crisis, and not coincidentally, so is our country's economy. Promoting U.S. clean energy companies to export domestically manufactured goods with U.S. made materials represents one important solution to this crisis.

We very much appreciate the oppertunity to appear before you today and would be happy to answer any questions you might have.

Mr. RUSH. Mr. Crawford, you are recognized for 5 minutes.

STATEMENT OF JACK CRAWFORD, JR., CHIEF EXECUTIVE OFFICER, JADOO POWER

Mr. CRAWFORD. Thank you, Chairman Rush, Ranking Member Whitfield, members of the Committee on Energy and Commerce for inviting me to speak here today about ways to increase global competitiveness of small and medium-sized clean technology companies. I would also like to thank Representative Matsui for her kind welcome and applaud her efforts to boost competitiveness of clean technology companies in Sacramento, in the Sacramento area and the Nation.

I am Jack Crawford, Jr., the CEO of Jadoo Power, a small alternative energy technology company based in Folsom, California. I have the experience of starting and investing in and growing several technology companies in my career. I would like to talk about the challenges facing a clean energy technology startup and its efforts to market its clean products internationally.

Jadoo Power is an industry leader in advanced power and energy storage solutions. Jadoo has used its technology tn develop and deliver demonstration products to the military, government and commercial sectors such as portable power for medical devices to support wounded soldier in war zones, emergency response communication solutions, and surveillance and security applications.

Fuel cells such as those manufactured by Jadoo also advance this other advancement of other clean technologies such as solar, LED lighting and wind power solutions. Whatever the energy source, fuel cells save energy and reduce emissions.

Jadoo's technology is being productized for military and commercial uses and additional support to scale or manufacturing will enable us to deliver a future large volume order of our products.

It has been the case for many years that American science and engineering has been pre-eminent in the world. The U.S. is the unequivocal leader in energy innovation just as we have been in such sectors as semiconductors, biotechnology, and the Internet.

As we strive to become a global leader in clean technology, one area of innovation where our advantage is most threatened is manufacturing. While breakthrough technology occurs here in the U.S., we are losing out to countries like China and Germany when it comes to energy manufacturing and exporting in part because these countries are providing hosts of tax incentives and export financial incentives and advantages for their clean technology companies.

Selling our clean energy companies to foreign markets will be imperative to the future growth and sustainability of the clean technology industry in America.

Like all other sectors of our economy, small businesses are the cornerstone of the clean technology industry. However, when it comes to exporting products and services, small businesses are at a disadvantage. Unlike large U.S. companies, small- and medium-sized clean technology companies do not have the financial resources, the expertise, or the relationships to navigate through and succeed in foreign markets.

According to the trade promotion coordinating committee, about 30 percent of nonexporting small- and medium-sized companies would consider exporting if they had more access to international market information and assistance in pursuing export opportunities. Jadoo Power is one of those companies.

This legislation being discussed today will help clean energy technology place clean energy technology at the forefront of our national export strategy and help small businesses find new customers and markets abroad.

A greater level of support from the U.S. Federal Government would level the playing field, particularly for small- and medium-sized businesses and accelerate the ability of U.S. clean technology companies to meet global demand and better compete in the clean energy marketplace.

I commend Representative Doris Matsui of Sacramento, along with Bobby Rush, John Dingell, and Anna Eshoo for introducing H.R. 5156, the Clean Energy Technology Manufacturing Export Assistance Act of 2010. This bill sets out a national strategy to assist U.S. clean energy technology companies with export assistance to find new markets for their products and services and to better compete in the international marketplace.

This bill also provides domestic manufacturing assistance to find new ways to reduce production costs and increase productivity in the clean technology sector.

For Jadoo, H.R. 5156 would provide tangible benefits as the company works to advance its manufacturing clean technology products and secure access and growth in the international marketplace.

In addition to providing a robust business environment for Jadoo Power, the Sacramento region is well positioned to be a national leader in producing clean energy technology. Along with Jadoo Power, there are more than 100 other Sacramento-based small- and medium-sized clean technology companies that would benefit from H.R. 5156, as well as other clean technology companies in California and around the U.S.

Representatives Matsui and Lungren, Governor Schwarzenegger and Sacramento's mayor, Kevin Johnson, have been actively supportive of clean technology companies both locally, Statewide and their continued support will be important to this emerging industry along with new support of government policies.

The emerging global market for clean energy products is ever growing, and it is now time we look to market and sell our U.S. made clean energy products to foreign markets. With a clear opportunity of clean energy technology, the United States can catch up and be a leader of the world with technology in American-manufactured products.

As we look at innovation and entrepreneurship in our country, it is time for us to go green and go global.

Thank you for inviting me to today's legislative hearing and allowing me to present my perspective.

[The prepared statement of Mr. Crawford follows:]

Testimony of Jack Crawford, Jr.
CEO of Jadoo Power
Folsom, California

Before the

Subcommittee on Commerce, Trade and Consumer Protection
United State House of Representatives

Wednesday, June 16, 2010

Introduction

Thank you Chairman Rush, Ranking Member Whitfield, and members of the Committee on Energy and Commerce for inviting me to speak here today about ways to increase the competitiveness of small and medium sized clean technology companies in today's competitive international marketplace. The clean energy technology industry represents a tremendous opportunity for entrepreneurs and investors, and the battle for global leadership is raging. The U.S. is in a fierce competition to develop companies that enable us to generate and utilize energy more efficiently and to do this cheaper and cleaner than our competitors. Nothing less than our global leadership is at stake here. The country that succeeds in innovating and exporting clean technology products and services will be the global economic leader and job creator in the future.

I am Jack Crawford, Jr., the CEO of Jadoo Power, which is a small alternative energy technology company based in Folsom, California. Having had the experience of starting up, investing in, and growing several companies in my career, I bring some amount of understanding to the challenges facing a clean energy technology startup company, and recognize the particular set of problems faced by my own company in this economy in its effort to market our clean tech products internationally.

Company Overview

Jadoo Power is an industry leader in advanced power and energy storage solutions. Our systems provide hybrid fuel cell power for government, military and commercial applications. The industry is evolving and Jadoo Power is at the forefront--moving toward the next evolution of superior power solutions that will greatly surpass current technologies and contribute to a healthier world environment. Jadoo Power continues to enhance fuel cell performance, advance fuel developments, hybridize with other clean energy technologies, improve manufacturing processes, and reduce costs.

We are taking fuel cell advancements into the future delivering portable commercial applications including complementary solar and LED technology that will continue to out-perform existing capabilities and provide better overall solutions.

With the emissions of green house gasses from conventional motors, generators and engines, and the limited power capabilities and toxic chemicals of conventional batteries, advanced fuel cell technology offers the promise of portable, clean, zero emissions power. Photovoltaic solar panels and wind turbines can provide utility scale power, but there continues to be a need for clean, efficient power sources that are small, portable and mobile so that some pollution-producing engines can be eliminated. Jadoo's fuel cell technology and alternative energy research and development programs provide the potential for ubiquitous clean energy storage and production.

Jadoo Power is solving some of today's energy challenges as well as working toward the next generation of power demands that will deliver better energy solutions, greatly surpassing current technologies and contributing to a healthier environment through reduced pollutants. Fuel cells, such as those manufactured by Jadoo, advance the integration of renewables, such as solar and wind power, into the electricity grid by enhancing their stability. Whatever the source, fuel cells save energy and reduce emissions.

To that end, Jadoo is working to realize several objectives. These objectives include:

- Enhancing fuel cell performance
- Hybridizing fuel cells with solar and LED technology
- Reducing production costs and improving manufacturing and integration processes
- Continuing to build key customer and partner relationships in military, government, and commercial markets

Through these efforts, Jadoo will continue to take fuel cell advancements into the future and deliver commercial applications that out-perform existing capabilities and provide better power solutions. As a leader in fuel cell technology and next generation power systems, Jadoo Power's products are providing hybrid fuel cell power in military, government and commercial applications.

Jadoo has used its technology to develop and deliver prototypes to the military, government, and the commercial sectors, in the following application areas:

- Portable and Mobile Power for portable rapid response medical devices supporting wounded soldiers in war zones
- Zero emissions back-up power for both indoor and outdoor operation
- Key communication applications for Emergency and First Responder Solutions
- Unmanned aerial vehicles, robotic, and surveillance applications in the military, government and homeland security applications

Need for Clean Technology Manufacturing and Export Assistance

I commend Representative Doris Matsui of Sacramento, along with Representatives Bobby Rush, John Dingell, and Anna Eshoo for introducting H.R. 5156, the Clean Energy Technology Manufacturing and Export Assistance Act of 2010. This bill sets out a national strategy to assist U.S. clean energy technology companies with export assistance to find new markets for their products and services to better compete in the international marketplace. The bill also provides domestic manufacturing assistance to find new ways to reduce production costs, and promote innovation, investment and greater productivity in the clean technology sector.

Jadoo Power, as a clean energy technology company, is a member of a very promising new category of business that is enjoying particularly strong growth in tems of number of companies and employee count in the U.S., and in particular in California, and in the Sacramento area where Jadoo itself is headquartered. The Sacramento region has more than 100 clean technology companies, and is well-positioned to be a national leader in producing clean energy technology. Since 1995, the Sacramento area has seen tremendous job growth in "green jobs" increasing by more than 87%. The entire state of California showed an increase in green jobs of 36%, or 42,000 in this same period, as compared to an overall job growth in this period of 13% in California. Nationwide, clean energy technology has been adding employees at the average rate 9% per year, as of 2008, for a total of approximately 770,000 jobs in this field (1). As recently stated by industry trade journals, the U.S. has the potential to capture 250,000 jobs in the next 10 years making, installing and servicing fuel cells (2). Clearly, the clean energy technology sector represents many promising employment growth opportunities in the future, and with the proper support from state and federal governments, this future growth potential can be fully realized, along with corresponding product revenues and increases in supporting businesses such as sub-contractors and services companies.

Jadoo has recognized that it has superior technology that is unsurpassed domestically, as well as internationally, and is now beginning to investigate how to scale the company's sales and manufacturing capabilities in order to supply both the domestic and international markets. Jadoo hopes to become competitive in the international market. However, many small clean energy companies, like Jadoo Power, do not have the knowledge of foreign markets or a full understanding how the export process works. That being said, Jadoo recognizes some of the challenges of competing in international markets. In many cases foreign suppliers that may have technically inferior products but have subsidies and support for exports from their own governments which creates a non-level playing field. Similar challenges await other domestic clean tech companies including some in the Sacramento region like WINDensity, a distributed wind power and fuel efficiency product company. With extraordinary opportunities in international markets, the key for this company is also to scale manufacturing and identify efficient access to international markets.

In addition to foreign competitors that have subsidies and support from their own governments, the lack of enforcement of international intellectual property rights further inhibits the entrance of U.S. companies into foreign markets.

Financing and Manufacturing Challenges

Growing a clean tech company is a challenge. We are breaking into a heavily regulated industry with well established players who can sometimes be threatened by innovators upsetting the status quo. But those challenges are minor in comparison to the financing challenges we face when we seek to advance our technology, grow our company, and build a demonstration plant or a first commercial plant. The funding gap that exists at this phase is sometimes referred to as a "valley of death."

The U.S. is the unequivocal leader in energy innovation, just as we have been in such sectors as semiconductors, biotechnology, and the Internet. As we strive to become a global leader in clean technology, one area of innovation where our advantage is most threatened is in manufacturing. Whereas breakthrough technology occurs here in the U.S., we are losing out to countries like China, Germany and Malaysia, when it comes to clean energy manufacturing, in part because those countries are providing a host of tax incentives and other recruitment advantages to lure companies away. First-of-a-kind capital intensive manufacturing facilities are often not able to secure traditional bank loans, due the risky nature of those loans and the lack of hard assets in the company.

As Jadoo and other companies begin to scale up their manufacturing capabilities, in order to reduce product costs and address foreign markets, these companies need assistance in developing and scaling manufacturing facilities that will allow them to compete internationally, not just domestically. The emerging U.S. market for clean energy products is growing and it is now time we look to sell our U.S. made clean energy products to foreign markets. A greater level of support from the federal government – in addition to – local and state governments will level the playing field and accelerate the ability of US clean technology companies to build and operate compliant and cost effective manufacturing.

It has been the case for many years that American science and engineering has been pre-eminent in the world. As a result of our pioneering technologies, we made entire new industries possible and we need to be vigilant in our appreciation and adoption of new and innovative technologies. The President has established a goal to double U.S. exports over the next five years. H.R. 5156 will place clean energy technology products at the forefront of our national clean tech export strategy.

Unfortunately, many times the U.S. has not been able to reap the benefits of this new technology with global sales of American made products, leaving other countries to benefit from our technology lead. We hope that this time, with the clear opportunity of clean energy technology, the United States will lead the world with our technology, and also be able to benefit from the distribution of American manufactured clean energy products because of the support for a U.S. clean energy technology

manufacturing base. Along with providing greater energy security and environmental security, our country's focus on clean technology manufacturing companies will provide greater economic security by creating and sustaining millions of new American jobs.

With proper support and assistance, Jadoo is an example of a company that could be well positioned to expand its manufacturing facilities and grow "green collar" jobs, thereby maintaining these jobs in the U.S. With H.R. 5156 and other such policies, Jadoo is likely to increase its employee base many fold as it scales its manufacturing capability to address both domestic and international sales opportunities. It is Jadoo's belief that, like many other American clean energy technology companies, it is a domestic leader in clean energy, and it can become a global leader in manufacturing, selling clean energy products with the appropriate set of government policies and support.

We believe that the Department of Commerce's International Trade Administration (ITA) can play an important role for U.S. companies that are selling products to foreign buyers. ITA has a wealth of experience in export promotion, helping small and medium sized companies find and navigate foreign markets.

Large, established domestic manufacturers are likely to have the track record, critical mass and ability to raise capital from commercial banks for new efficient manufacturing capabilities required for successful international sales, but small businesses do not have that ability. Presently, the government does not have an appropriate program for small manufacturers such as Jadoo Power to provide critical export and manufacturing assistance.

In summary, we strongly support the goals of H.R. 5156 and support the creation of targeted policies that will enable American companies that have leading clean energy technologies to translate those leads into robust international product shipment though the support of the creation of globally competitive manufacturing capabilities. With capital to grow manufacturing capabilities as well as access to international markets of customers, many US-based small and medium sized clean technology manufacturing companies will become large companies that are global leaders in their industry.

Thank you for inviting me to today's legislative hearing, and allowing me to present my perspective.

Mr. RUSH. The chair now recognizes Mr. Kim for 5 minutes.

STATEMENT OF ANTHONY KIM, POLICY ANALYST, HERITAGE FOUNDATION

Mr. KIM. Chairman Rush, Ranking Member Whitfield and members of the committee. It is my privilege to testify today concerning the Clean Energy Technology Manufacturing Export Assistance Act of 2010. My name is Anthony Kim. I am a policy analyst at the Heritage Foundation. The views I express in this testimony are my own and should not be construed as representing any official position of the Heritage Foundation.

In recent years, clean energy has become a shorthand sum for the bold policy today on how to achieve green growth and enhance our energy security. The proposed legislation offers a timely opportunity to discuss better ways to trigger innovation in our clean energy technology sector.

Recognizing the urgency of developing a more competitive American clean energy technology sector, the proposed legislation intends to encourage innovation, investment and productivity, particularly via Federal subsidies. However, for the United States to regain economic leadership in the global clean energy industry, our strategy must be driven by real market conditions—not by government financial assistance that may serve as a temporary feel good action and delay more meaningful advancement of the clean energy sector.

Government-mandated funding has often resulted in unbalanced development and lasting government interference in the private sector which dampen dynamic growth and innovation. It also invites the question as to whether government has the expertise to effectively help private companies navigate through rapidly evolving clean energy markets.

The proposed bill also fails to acknowledge that there are existing government resources and market incentives to increase production of efficient or tentative clean energy.

In advancing the competitiveness of our clean energy sector, there are more practical policy alternatives that can and should be implemented. At the top of the list should be further globalization of international trade. Free trade fosters economic efficiency, and economic efficiency is the basis for innovation, growth, and competitiveness.

Over the past decades, the most practical improvements in energy efficiency and protecting environment have not come from government mandate funding. As chairman of the analysis of the Heritage Foundation's index of economic freedom, most progress has been driven by advances in freer trade and economic freedom. These unleash greater economic opportunity generating a purchase cycle of investment, innovation, and dynamic growth.

Comprehensive globalization provides the most efficient export promotion strategy. Such trade globalization can be achieved by advancing freer trade through multilateral as well as bilateral trade pacts. Free trade agreements have spurred competition and economic growth. In recent years, the FTAs currently enforced accounted for more than one trillion in two-way merchandise trade. FTAs also include provisions that safeguard American businesses

from discrimination and protect and enforce intellectual property rights for U.S. firms.

The pending FTA with Colombia, Panama, and South Korea will result in significant new market access and lower types for American businesses, including our clean energy producers.

There is no doubt that accelerating innovation and production of clean energy technology has become an economic necessity for our future. The best strategy to make this happen is not through special subsidies, but rather through dynamic leadership in opening markets and spurring innovation technology.

In conclusion, I want to emphasize that we need a strategy that conforms to conditions in the international marketplace, not one that struggles against it by subsidizing technologies that cannot stand on their own. We know one sure way of doing this, and that is through open markets, not closing them with protectionist measures.

Thank you again for the opportunity to testify before this committee today.

[The prepared statement of Mr. Kim follows:]

Clean Energy Technology Manufacturing and Export Assistance Act of 2010

Testimony before
House Committee on Energy and Commerce
Subcommittee on Commerce, Trade, and Consumer Protection

June 16, 2010

Anthony Kim
Policy Analyst
Center for International Trade and Economics
The Heritage Foundation

Chairman Rush, Ranking Member Whitfield, and members of the Committee, it is my privilege and honor to testify before you today concerning the Clean Energy Technology Manufacturing and Export Assistance Act of 2010.

My name is Anthony Kim. I am a policy analyst in the Center for International Trade and Economics at The Heritage Foundation. The views I express in this testimony are my own and should not be construed as representing any official position of The Heritage Foundation.

The Clean Energy Technology Manufacturing and Export Assistance Act aims to create a government fund in an effort to assist American clean tech firms in advancing their competitiveness in the global market. As a matter of fact, in recent years, "clean energy" has become a shorthand term for the broad policy debate on how to achieve green growth and enhance our energy security in the future. It is encouraging that the proposed legislation offers another timely opportunity to discuss better ways to boost the development of clean energy technology and trigger innovation in the American clean energy industry.

Indeed, the global clean energy industry presents an important market opportunity for the United States, one that could lead to dynamic exports and job creation. Private investment in clean technology is estimated to reach $450 billion annually by 2012 and over $600 billion by 2020 on a global scale, and potentially much larger if recent market opportunity estimates are realized.[1]

---

[1] World Economic Forum, "Green Investing: Toward a Clean Energy Infrastructure," January 2009, at *http://www.weforum.org/pdf/climate/Green.pdf*.

Shortcomings of the Clean Energy Technology Manufacturing and Export Assistance Act

Recognizing the urgency of the need to develop a more competitive American clean energy sector that can capitalize on such global market opportunity, the proposed legislation intends to "encourage innovation, investment, and productivity" in the sector, particularly via federal subsidies, by establishing a $75 million fund over the next five fiscal years that will be administered through the International Trade Administration.

However, for the United States to regain economic leadership in the global clean energy industry, our strategy must be driven by real market conditions, not by government financial assistance that serves as a momentary feel-good action and delays a more meaningful advancement of the clean energy sector.

Government-mandated funding has resulted in unbalanced government subsidies and lasting government interference in the private sector, which dampen dynamic growth and innovation of the sector. It also invites the question as to whether the United States government has the expertise and qualifications to effectively help private companies navigate through rapidly evolving clean energy foreign markets.

The proposed legislation fails to identify specific policies to be pursued and risks becoming little more than a financial subsidy grab bag for politically connected special interests. The proposed bill also neglects to acknowledge that there are existing government resources and market incentives for the private sector to invest and develop technological solutions to increase production of efficient alternative clean energy. If this bill becomes law, taxpayer money will be wasted in government bureaucracy.

The American people deserve a government that spends every taxpayer dollar with as much care as taxpayers spend their own dollars. In fact, in response to rising public uneasiness about the widening federal deficit, White House Chief of Staff Rahm Emanuel recently noted that President Obama's goal now is "to change Washington's focus from figuring out how to spend money to how to save money."[2] It seems that the currently proposed bill is more in line with "spending," not "saving."

Freer Trade: Key Ingredient in Making Our Clean Energy Sector More Competitive

In advancing the competiveness of our clean energy technology sector, there are more practical policy alternatives that can and should be implemented. At the top of the list should be further liberalization of international trade.

---

[2] Laura Meckler, "Giving Government Incentives to Save," *The Wall Street Journal*, June 7, 2010.

When a country lowers its barriers to trade, it opens its economy to competition and a wider variety of goods and services than was previously available. Competition spurs the movement of labor and capital from industries that cannot compete to those that can, enabling a nation both to produce more efficiently and to attract new investment—critical elements of any long-term economic growth and competitiveness strategy.

The need to adhere to such a strategy is no less important today than before.[3] Free trade fosters economic efficiency, and economic efficiency is the basis for innovation, growth, and competitiveness. Undeniably, trade has opened markets around the world to U.S. goods and services and has created a level of competition that leads to innovation, better and less expensive products, higher-paying jobs for Americans, and the investment needed for long-term economic growth and continued prosperity.

Indeed, the success of America's growth and rising prosperity over the past decades is based on reducing the state's role in the economy, breaking down barriers to international trade and investment, and streamlining the rules and regulations that shape and define long-term competitiveness. Tariffs, quotas, government subsidies, and cheap loans to businesses, outright nationalization of industry, and other policy mechanisms not only serve to distort prices and reduce international markets for goods and services, but also have a chilling effect on private investment and do little to boost business confidence.

These economic facts of life apply to the clean energy technology sector the same as they do to any other. The energy sector also needs freer trade. In fact, freer trade and advancing clean energy technology can go hand in hand, being mutually supportive.

Freer Trade Is Key to Green Growth

In remarks on World Environment Day, the Director-General of the World Trade Organization (WTO), Pascal Lamy, pointed out that "Trade opening has much to contribute in the fight against climate change and to the protection of the environment." Indeed, the most practical improvements in energy efficiency and protecting the environment through clean energy technology over the past decades haven't stemmed from government-mandated funding or regulations. As shown in the analysis of The Heritage Foundation's *Index of Economic Freedom*, the most progress has been driven by advances in freer trade and economic freedom. These

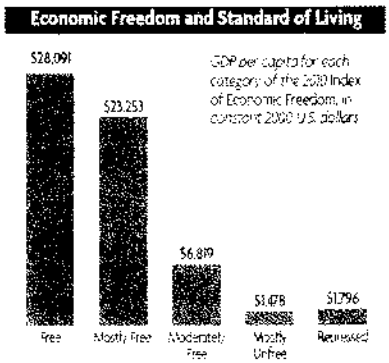
---

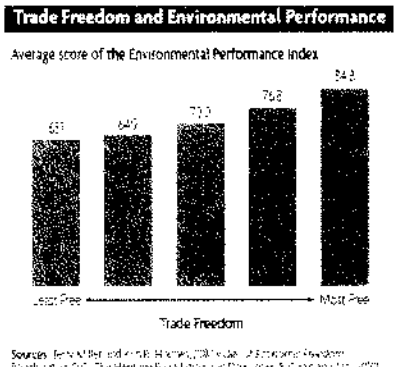
[3] Yet, while the U.S. has long been a leading advocate for open markets and trade liberalization, the recent financial crisis and global economic downturn have led some to question the worth of policies creating more trade freedom. Focusing predominantly on negative impact of trade on our economy, protectionists charge that trade is unfair to U.S. firms and employees. Unfortunately, they see only a small part of the story. Balanced against any trade-related economic pain must be the overall increase in U.S. employment, productivity, and wage rates that stems from an open, liberal trading environment

unleash greater economic opportunity and prosperity, generating a virtuous cycle of investment, innovation, and dynamic economic growth.

Echoing the same message, the WTO chief further noted:

> The entire world is well aware of the environmental dangers posed to our planet. But the ability of governments to respond to these dangers is tied closely to the resources at their disposal. Countries which have had success in alleviating poverty and raising living standards tend to be more adept at creating the conditions for a cleaner environment.





Policy efforts aimed at imposing stricter environmental standards through a national or global regulatory body run great risk of being not only fruitless, but also counterproductive. They undercut the economic growth and efficiency indispensable to effective efforts to protect the environment. Such regulations are likely to be little more that feel-good actions.

The fundamental flaw of those favoring new government directives is the fallacy that there must be a trade-off between economic growth and environmental protection. They seem to think that to get more of one, you have to have less of the other. The truth is just the opposite: To get more environmental protection, you need more growth, not less.

It is encouraging that many Americans see that truth. As a March 2010 Gallup survey reveals, more Americans believe that economic growth should take priority over environmental

protection when the two goals collide, with fewer willing to support environmental measures that may have a negative economic impact.

Freer Trade, Not National Export Initiative, Boosts U.S. Clean Energy Technology

Chairman Emeritus Dingell, a co-sponsor of the Clean Energy Technology Manufacturing and Export Assistance Act, pointed out that the proposed legislation is "part and parcel to the President's goal of doubling exports in five years and gives wonderful incentive to American companies to design and manufacture the environmentally friendly technologies of tomorrow."[4]

The National Export Initiative (NEI), President Obama's trade plan that was unveiled in the 2010 State of the Union address, aims to bolster U.S. international competitiveness by creating an export promotion cabinet that will oversee the expansion of both government programs and special financing for firms and farmers seeking oversees market opportunities.[5]

Recognizing the key role of exports in America's economic strength was an important first step in forming an effective U.S. trade policy. However, the truth is that it is only part of a winning, comprehensive American trade strategy. Our economy needs a plan that addresses *all* aspects of trade. For America to excel in the world marketplace, U.S. trade objectives need to be clear and consistent with the open-market principles America has long promoted and, indeed, demands from other nations.

As a matter of fact, export promotion via comprehensive trade liberalization provides the most efficient, market-based export promotion strategy for U.S. interests. Such trade liberalization can be achieved by advancing freer trade through a comprehensive and substantive conclusion to the Doha Round of trade negotiations and ratification of the three pending free trade agreements with Colombia, Panama, and South Korea without further delay.

According to the WTO, global talks on free trade in environmental goods and services that will have special treatment in a new global trade deal are recording progress.[6] In April, U.S. Trade Representative Ron Kirk asked the U.S. International Trade Commission to investigate the economic benefit of eliminating U.S. tariffs on imported environmental goods and determine how much U.S. environmental goods exporters might benefit from trade liberalization.[7]

[4] News release, "Matsui, Rush, Dingell, Eshoo Introduce Legislation to Bolster U.S. Clean Tech Industry," Office of Congressman John Dingell, April 27, 2010, at *http://www.house.gov/apps/list/press/mi15_dingell/MatsuiRushDingellEshooIntrolegtobolsterCleanTech.shtml*.

[5] Press release, "Executive Order – National Export Initiative," Office of the Press Secretary, the White House, March 11, 2010, at *http://www.whitehouse.gov/the-press-office/executive-order-national-export-initiative*.

[6] John Acher, "WTO's Lamy Sees Trade Pact Boosting Green Goods," Reuters, May 20, 2010, at *http://www.reuters.com/article/idUSLDE64J13W20100520*.

The U.S. can and should spur global economic growth by leading the Doha Round to a successful and ambitious conclusion. The absence of a new, comprehensive trade pact reduces countries' discipline in keeping a rein on protectionist measures designed to prop up inefficient domestic companies during today's economic slump. Moreover, without the new market access a multilateral deal would bring, it will be more difficult for firms that are struggling domestically to export instead.

In order to open up foreign markets for our clean energy sector more practically, America should enhance existing relationships with important trade and investment allies. NAFTA and other free trade agreements (FTAs) the U.S. has in place have spurred competition, job creation, and economic growth. These agreements have an important role in maintaining American competitiveness and prosperity.[5] In 2008, the FTAs currently in force accounted for more than $1 trillion in two-way merchandise trade, which is about 35 percent of U.S. trade worldwide.

U.S. FTAs go beyond winning lower tariffs on American manufacturing and services exports. FTAs include provisions that safeguard investors from discrimination, increase regulatory transparency, combat corrupt practices, and protect and enforce intellectual property rights. U.S. trade agreements include transparent dispute resolution and arbitration mechanisms to guarantee that the agreements are upheld and fully respect the rights of U.S. firms and consumers.

The pending FTAs with Colombia, Panama, and South Korea will result in significant new market access and lower tariffs for America's businesses: Most Colombian and Panamanian products already enter the U.S. duty-free under various preference programs. Because these countries have already had preferential access to U.S. markets, any impact on U.S. jobs from imports from those countries has already occurred. Instead, these agreements will result in new economic opportunity for America's exporters and the U.S. businesses that support them··· opportunity that will grow over time as these countries continue to develop through trade and mature into larger, more sophisticated markets more closely integrated with the U.S. economy.

Conclusion

There is no doubt that accelerating U.S. clean energy technology innovation and production has become an economic necessity for America's future. The best strategy to help this happen is not

---

[4] Office of the Secretary, U.S. International Trade Commission, April 14, 2010, at *http://www.usitc.gov/research_and_analysis/ongoing/332_516_request_letter.pdf.*

[5] As of the beginning of 2010, the U.S. had 11 FTAs with 17 countries. Congress has approved FTAs with the following nations: Israel; Canada and Mexico (NAFTA); Jordan; Singapore; Chile, Australia; Morocco; the Dominican Republic, Costa Rica, El Salvador, Guatemala, Honduras, and Nicaragua (DR–CAFTA); Bahrain, Oman; and, most recently, Peru.

through special subsidies or tax breaks for specific American firms, but rather through dynamic leadership in opening markets and spurring global competition so that the most productive and innovative technologies can rise to the top.

We need a strategy that conforms to conditions in the international marketplace, not one that struggles against it by encouraging and subsidizing technologies that can't stand on their own. We know one sure way to do this, and that is through opening markets, not closing them with protectionist measures. This bill, unfortunately, takes the other path.

The Heritage Foundation is a public policy, research, and educational organization operating under Section 501(C)(3). It is privately supported and receives no funds from any government at any level, nor does it perform any government or other contract work.

The Heritage Foundation is the most broadly supported think tank in the United States. During 2009, it had 581,000 individual, foundation, and corporate supporters representing every state in the U.S. Its 2009 income came from the following sources:

Individuals	80%
Foundations	17%
Corporations	3%

The top five corporate givers provided The Heritage Foundation with 1.6% of its 2009 income. The Heritage Foundation's books are audited annually by the national accounting firm of McGladrey & Pullen. A list of major donors is available from The Heritage Foundation upon request.

Members of The Heritage Foundation staff testify as individuals discussing their own independent research. The views expressed are their own and do not reflect an institutional position for The Heritage Foundation or its board of trustees.

Mr. RUSH. The chair thanks all of the witnesses for your testimony, and the chair recognizes himself now for 5 minutes for the purposes of asking questions.

And I am going to ask all of the witnesses to answer "yes" and "no" to the following questions. I only have 5 minutes. If you could please restrict your answer to "yes" or "no," that would be appreciated.

Seizing clean energy export opportunities accelerate U.S. Recovery and become an engine of growth.

You answer "yes," or "no."

Beginning with the first witness, Ms. Saunders.

Ms. SAUNDERS. Yes.

Ms. WINCE-SMITH. Yes.

Mr. HERRNSTADT. Yes.

Mr. CRAWFORD. Yes.

Mr. KIM. Yes.

Mr. RUSH. Dollar for dollar, clean energy investment will create more jobs than investments in conventional energy sector.

Ms. SAUNDERS. I can't answer that officially.

Ms. WINCE-SMITH. It depends on how you define "clean energy." I am on the edge.

Mr. HERRNSTADT. I don't know.

Mr. CRAWFORD. Can you ask the question one more time?

Mr. RUSH. Dollar for dollar, clean energy investment will create more jobs than investments in conventional energy sector.

Mr. CRAWFORD. I agree it is difficult to answer without specifically defining "clean energy."

Mr. KIM. It depends. Potentially yes.

Mr. RUSH. With new jobs created in the clean energy sector will create new jobs and provide good wages. Yes or no.

Ms. SAUNDERS. Yes, in particular to export-related jobs which pay more than the average job.

Ms. WINCE-SMITH. Yes, because they take new skills and new capabilities.

Mr. HERRNSTADT. I hope so.

Mr. CRAWFORD. Yes.

Mr. KIM. Yes.

Mr. RUSH. Outside the U.S. borders, there is a promising market for U.S. green products.

Ms. SAUNDERS. Absolutely.

Ms. WINCE-SMITH. Yes.

Mr. HERRNSTADT. Yes.

Mr. CRAWFORD. Yes.

Mr. KIM. Yes, sir.

Mr. RUSH. Trade barriers are not the only obstacles tn increasing exports of American products.

Ms. SAUNDERS. Yes, I agree.

Ms. WINCE-SMITH. Yes.

Mr. HERRNSTADT. Yes.

Mr. CRAWFORD. Yes.

Mr. KIM. Yes.

Mr. RUSH. Last question. Other countries, especially our main competitors like China and other European countries and Japan, have a more aggressive export policy platform.

Ms. SAUNDERS. Typically exports account for a larger percentage of those economies, and I would agree they strongly support the exports.

Ms. WINCE-SMITH. Absolutely.

Mr. HERRNSTADT. It appears so.

Mr. CRAWFORD. Yes, and it's leading to a significant advantage for them.

Mr. KIM. Yes. I think they are in favor of free trade.

Mr. RUSH. You also have policies that protect their domestic production.

Ms. SAUNDERS. In specific areas, that is correct.

Ms. WINCE-SMITH. Yes. For instance, China's new policy on indigenous innovation is very worrisome.

Mr. HERRNSTADT. Yes.

Mr. CRAWFORD. Yes.

Mr. KIM. Yes and no.

Mr. RUSH. The U.S. needs to have a more robust export assistance policy to its manufacturing industry.

Ms. SAUNDERS. We are operating within our current appropriated levels.

Ms. WINCE-SMITH. Yes.

Mr. HERRNSTADT. Yes.

Mr. CRAWFORD. Yes, particularly for small- and medium-sized businesses.

Mr. KIM. Yes, but to get there it is open to debate.

Mr. RUSH. Compared to other countries, the U.S. pays far less on export promotion. Yes or no.

Ms. SAUNDERS. It is hard to take an overall average compared to specific areas. The European Union, for example, that is correct.

Ms. WINCE-SMITH. Yes.

Mr. HERRNSTADT. Yes. I think particularly with some countries. I am not an expert on the others.

Mr. CRAWFORD. Yes.

Mr. KIM. Yes, but I think it depends.

Mr. RUSH. Thank you very much.

The chair now recognizes the gentleman from Kentucky, Mr. Whitfield.

Mr. WHITFIELD. Thank you, and I thank all of you for your testimony. We appreciate you being here today.

Ms. Saunders, I was just curious, you have been so generous with your time today and you have testified that you didn't testify, you said you were not going to make any comments about this legislation. I was just curious why is that or why was that?

Ms. SAUNDERS. The administration has not taken a position on H.R. 5156.

Mr. WHITFIELD. So you have no position.

Ms. SAUNDERS. No position.

Mr. WHITFIELD. Mr. Crawford, I noticed in your testimony you were talking about, particularly in clean energy companies, particularly in manufacturing, it is very difficult to obtain financing; is that correct?

Is that one of the reasons you support this legislation is because of the grant program that it would establish the $75 million grant program?

Mr. CRAWFORD. Yes. I feel like as a country between the venture capital investments and the stimulus, we have seeded innovation in R&D around clean technology. We have gotten to demonstrable products. And now the next logical steps are to scale manufacturing and begin to sell those protects both here and abroad.

Mr. WHITFIELD. This legislation on page 3 says specifically that the Secretary shall administer the funds to promote policies that will reduce production costs. Is that—it seems odd to me.

Mr. CRAWFORD. That is a significant issue for small and medium-sized companies, and here's why.

Mr. WHITFIELD. I thought that you said that primarily you needed it for financing.

Mr. CRAWFORD. Part of investing and financing in the manufacturing process is to reduce the overall costs of producing those products. And so as you deliver demonstration units, they are oftentimes pretty expensive to manufacture and the logical next step is to invest and finance the manufacturing process to reduce the costs of those parts so you can compete in those commercial markets.

Mr. WHITFIELD. Mr. Kim, I noticed in your testimony that you seem to be diametrically opposed to what Mr. Crawford is saying. Your general testimony seems to be you don't think the government should be involved in providing funds for private enterprise.

Mr. KIM. That is correct, sir. I think government can play a much bigger role through free trade, through enhancing free trade agreements via multilateral or at a bilateral level. So there are things they can do, but not through Federal subsidies.

Mr. WHITFIELD. So you think the free trade agreements will play a vital role?

Mr. KIM. I think free trade is vital. For example, the current pending U.S.-South Korea FTA. South Korea has a huge market for green energy technology.

Mr. WHITFIELD. You said the proposed legislation fails to identify specific policies to be pursued and risks becoming little more than a financial subsidy grab bag for politically connected special interests.

Mr. KIM. There is no monitoring mechanism that we can follow. So I think we will have to see how this bill is actually implemented and then the entire process regarding this will be processed. But there is a political risk and then it can invite other problems, too.

Mr. WHITFIELD. Mr. Herrnstadt, I notice that you all—certainly your union certainly favors the intent of this legislation, but I think you are specifically saying that it does not go far enough. And one of the things that you mentioned that needed to be done was to any grant that goes to any company that there be an EIS, as you call it, an employment impact statement, which actually I think is a pretty good idea.

Have you all been successful in getting EIS requirements in other government programs?

Mr. HERRNSTADT. Not yet. But we're still trying. I think it's a really commonsense solution to what we're talking about. It really started off with an idea dealing with government procurement and the billions we spend on it. The government should know what it is getting for its money, and if a specific program is directed to-

wards creating jobs, we need to calculate that with precision and that's something I am not sure the Commerce Department is doing yet.

Mr. WHITFIELD. That sounds like that would certainly improve this bill from your perspective.

Mr. HERRNSTADT. It is one area that would, but I also want to point out that the bill itself is a real acknowledgment that there's a link between clean energy and U.S. jobs and I think that by itself is a real step forward.

Mr. WHITFIELD. I know I only have 3 seconds.

Mr. Crawford, the XM bank is very much involved in exporting technology, environmental technological products abroad. Has your company utilized the XM bank for——

Mr. CRAWFORD. We haven't. My perception is the difference here is we're talking about a focus on one particular industry sector that's of critical importance to our country and small- and medium-sized businesses so the combination of those two things with this policy would not only provide us with access to greater expertise focused on our company but also set up relationships that could be helpful in getting traction in the international marketplace.

Mr. RUSH. The chair now recognizes the author of the bill, Ms. Matsui, for 5 minutes.

Mr. MATSUI. Thank you all for being here today.

As I mentioned in my opening statement, my home town is Sacramento, is home to 110 clean tech companies, many of them are small. And medium-sized companies are just now supporting ways to expand their businesses by exporting their products to foreign markets. But as you know, like large companies, they don't have the resources, time, and manpower to effectively promote their products abroad. And they do need assistance, and I do doubt that many of them have asked for help with Department of Commerce and small business and other entities that we can all think about.

But I particularly have a question, several questions for Mr. Crawford with you being a small business person. Is Jadoo Power currently looking to expand by exploring ways to explore technology products abroad?

Mr. CRAWFORD. We're looking at new markets. In particular, international markets.

Ms. MATSUI. What are the current barriers you face in exporting?

Mr. CRAWFORD. Access to expertise in how best to export relationships and effectively resources, the time.

Ms. MATSUI. So how do you go about it now?

Mr. CRAWFORD. Right now it is independent market research. It is trying to identify people who have expertise in international market places. It's consultants. It's research on the Internet. Those types of efforts.

Mr. MATSUI. As you know, this legislation authorizes about $50 million a year for 5 years. Nnw as a small business person who is really concerned about expenses and resources, do you feel that this legislation, this amount of money is a responsible use and so that this country can actually establish a national clean tech export strategy to boost the competitiveness of small and medium-sized businesses?

Mr. CRAWFORD. As a small business owner and taxpayer, I think you can make the case that this is one of the best case uses of taxpayer money. What we're talking about with regard to our company and others across the country is something that can impact our energy security, our environmental security and have a positive impact on our economy. Those are driving issues in our country today, and this is the type of bill that could have a positive impact on taking small companies effectively that are the cornerstone of our economy and growing them.

So my question actually is why aren't we, as a body, considering 10 or 20 times the amount because this is something that's addressing all of the relevant issues of today.

Mr. MATSUI. Thank you.

Ms. Saunders, do our international competitors, like in the EU and Asia, help their small and medium-size businesses, particularly clean tech businesses, facilitate exports to the U.S.?

Ms. SAUNDERS. Yes, they do.

Mr. MATSUI. How do they do that?

Ms. SAUNDERS. They do that through export promotion programs very similar to the ones we operate out of the Department of Commerce and other trade agencies.

Mr. MATSUI. But they have more emphasis on it?

Ms. SAUNDERS. As I said earlier, specific countries in the European Union and other parts of the world have exports that are a larger part of their economy and they allocate a large portion of their government resources to promoting those exports.

Mr. MATSUI. If this legislation were enacted, what are your rough estimates on the amount of increased Euros clean tech exports in dollar amount or in other measurements?

Ms. SAUNDERS. We can always do more with more resources. We believe we're actively servicing this industry as a current priority of the Secretary and the administration. As far as dollar amounts, it is difficult to speculate as technology and services and actual products being exported have different values assigned to them. I would say generally from the International Trade Administration we have data that estimates that for every dollar invested in International Trade Administration programs, we generate $56 worth of exports.

Mr. MATSUI. Ms. Wince-Smith, now the President has repeatedly stated that he wants the U.S. to be the leader in exporting clean tech to other Nation's. However, international competitors like China and Germany are exporting substantially more clean tech energy products. I know I look at solar fuel cells and all of that.

In your opinion, would this legislation provide the tools and resources to boost clean tech for its competitiveness in exporting their products and services?

Ms. WINCE-SMITH. Like my colleagues, I believe it's a very important first step, and many of the provisions in the legislation in addition to the grant program that's been mentioned are really to accelerate the tools, the practices, the networks that small, medium-sized businesses need.

I think one of the other issues that we really have to address still is how do we stimulate the production in the United States on a viable scale that it can go out globally. And you know that is a

very, very serious part of this because in order for these new clean tech innovators to have a scale, they really have to have access to deep equity and debt capital and that gets into a whole broader set of issues.

Ms. MATSUI. Understood. And I think Mr. Crawford has been experiencing that himself.

But as a small business person, you are excited about the fact that we are having a focus on clean tech exporting as I understand, because it does—it is part of the picture so to speak, it is not the complete picture obviously, but it is part of the picture.

Anyway. Thank you very much and I yield back the balance of my time.

Mr. RUSH. The chair thanks the gentlelady.

The chair thanks all of the witnesses who have participated in today's hearing, and the chair particularly thanks Ms. Saunders. You have been very patient with us and you have been very giving of your time and your contributions as it relates to your expertise. And some of your statements are very provocative and certainly we will take all of your statements to heart as we proceed with this legislative process.

The chair thanks ynu and appreciates you very much. Thank you and God bless.

[Whereupon, at 12:49 p.m., the subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

Congressman Gene Green
House Committee on Energy and Commerce
Subcommittee on Commerce, Trade, and Consumer Protection
Hearing on the Foreign Manufacturers Legal Accountability Act (Sutton) and Clean Energy Technology Manufacturing and Export Assistance Act (Matsui)
June 16, 2010

Mr. Chairman, thank you for holding this hearing and thank you to my colleagues Ms. Sutton and Ms. Matsui for introducing these important pieces of legislation. It is important that we closely examine the issues that these bills raise.

As a cosponsor of the Sutton bill, I have considerable concerns about the quality of our imports. I am disturbed by the recent significant increase in imported products that have been found to pose a risk to consumers and have resulted in recalls. In 2007, the CPSC recalled the highest number of products in 10 years. Of those recalls, 82% of them involved imported products. Of these recalled imported products, 74% originated in China. As a direct result of poor quality control by foreign manufacturers, primarily in China, our nation's consumers are placed in peril and our federal regulatory agencies, such as the CPSC must spend already scarce resources to protect us.

While challenges remain to encourage our trading partners to implement stronger safety and quality standards, those affected by these dangers are left with little recourse in our court system. Victims have little ability to provide service of process, aside from pursuing the costly and time consuming method laid out in the Hague Convention on Service Abroad of Judicial and Extrajudicial Documents, and jurisdiction is difficult to establish in our courts.

This bill fixes these shortcomings and provides a way to hold foreign manufacturers accountable. It accomplishes this by insisting that foreign manufacturers and producers that import products designate a registered agent who is authorized to accept service of process here. When an entity registers this agent, it is accepting the jurisdiction of the state and federal courts of the state in which the agent is located. If a foreign manufacturer fails to designate a registered agent, the Act prohibits their products from being imported to the United States.

The other bill we are examining today, the Clean Energy Technology Manufacturing and Export Assistance Act, addresses the alarming rate with which clean energy jobs are moving overseas. As our nation, and the world, moves toward using more diverse sources of energy, it is critical that we seize this opportunity to spur domestic job creation. We must pursue increasing our domestic manufacturing capabilities to produce clean energy technologies for use in this country and to export to others.

Currently, there is a staggering imbalance between the level of clean energy technology products and services exported by our country and other countries such as China and Germany. Additionally, few of the leading clean technology companies are based in this country. Without a doubt, this justifies some scrutiny of this issue. And, I believe legislative action is necessary to help our clean technology sector grow and create jobs in Texas and across the country. As President Obama correctly noted last night, "countries like China are investing in clean energy jobs and industries that should be here in America."

Ms. Matsui's bill takes necessary steps toward accomplishing this. It creates a fund administered by the International Trade Administration within the Department of Commerce to encourage growth within our domestic manufacturers of clean energy technologies.

I am pleased that these panels of expert witnesses have agreed to testify today. I believe that they all provide valuable perspectives on these bills. As the Committee moves ahead in addressing the issues raised by our witnesses and these bills, I look forward to working with my colleagues to craft legislation that will accomplish the goals that are in the best interests of our constituents, workers, and our economy.

Mr. Chairman, thank you again for your leadership on these issues. I look forward to hearing the testimony of these witnesses.

Statement of the Honorable Joe Barton
Ranking Member, Committee on Energy & Commerce
Subcommittee on Commerce, Trade and Consumer Protection
Hearing on
H.R. 4678, the "Foreign Manufacturer Accountability Act of 2010"
and
H.R. 5156, the "Clean Energy Technology Manufacturing and Export Assistance Act"

Thank you, Mr. Chairman.

The first of two bills we will discuss today is H.R. 4678, the "Foreign Manufacturer Accountability Act of 2010." This legislation would mandate that foreign manufacturers consent to jurisdiction under U.S. courts, and establish a registered agent to receive service of process in order to sell their goods in America.

First, let me say I think we can all agree that in a perfect world everyone should be held responsible for their wrongdoing, no matter where they are. Although this bill was written with that goal in mind, I have serious concerns about the practical effect of the bill. I fear it may actually undermine U.S. companies involved in international trade. Consultation with industry has indicated that American importers and customs brokers, not their contacts abroad, will most likely be responsible for meeting the bill's registered agent requirements. . The bill would simply create another layer of bureaucracy and higher compliance costs for U.S. industry and their suppliers.

Aside from increased compliance costs and administrative burdens, I question whether the bill will have any significant impact on foreign manufacturers' compliance with our laws or their availability to our citizens in court. Although the bill would force foreign manufacturers to consent on paper to our laws, our courts could still not force foreign companies abide by the judgments of U.S. courts.

I also think we should examine how this law would affect our exporters if we were to encourage other countries to pass similar laws. Some of our trade partners are less scrupulous than others and we should be prudent in considering whether our trading partners will reciprocate, and what reciprocity would mean for U.S. exports.

Finally Mr. Chairman, I believe we should consider the legality of this measure. After speaking with experts, I understand this legislation could run afoul of WTO regulations for equal treatment of foreign and domestic goods.

The second bill we will explore today is H.R. 5156, the "Clean Energy Technology Manufacturing and Export Assistance Act." As with H.R. 4678, I believe this bill was designed with the best of intentions – narrowing our trade deficit in the clean energy technology arena – but this measure, also like H.R. 4678, misses the mark.

Mr. Chairman, there are three primary reasons we have a trade deficit in this area and none of them would be impacted by this allocation of $75 million in taxpayer funds. We have a trade deficit because of the cost of labor in other countries versus ours, because we lack access to the necessary natural resources - such as rare earth minerals - in the U.S., and because other markets have erected barriers or are simply closed to our energy products.

I think it's a fair observation that the dramatic gap in labor costs is the chief reason companies move their work overseas. This bill, however, simply ignores the fact of life that workers in China make less than a $1 per hour and U.S. workers make $30 an hour. As that isn't likely to change soon, spending $75 million we don't have for something we can't get just doesn't seem like a sound idea.

This fund also cannot create natural resources in the U.S. that are used in these products. And nothing in the bill makes it easier to open a new mine and extract the resources we do have. If we do not increase access to those domestic materials we can find here, this fund will only serve to subsidize our competitors by forcing domestic vendors to purchase materials and components from international firms. In the end, this scheme could actually widen our trade deficit rather than narrowing it.

Fundamentally, Mr. Chairman, I believe in our market and the capitalist system on which it is based. I don't believe we need to create a government program to replace what private firms now capably do on their own. I agree the government has a role in increasing exports, but it is the job of the Federal government to fight against protectionist barriers and to pry open foreign markets to our products. Unfortunately, the Obama administration seems markedly unenthusiastic about any of the pending trade agreements.

The unhappy truth is that this fund cannot make up for the absence of a serious trade policy. . Unless we actually open markets through successful trade

negotiations, we will have fewer and fewer places outside the U.S. where our companies can sell their products and services. For markets that may be open to U.S. companies, our government must eliminate tariffs and other trade barriers or we can't expect to be competitive market participants.

I look forward to hearing from our two panels of witnesses today and exploring these questions further.

Thank you, Mr. Chairman. I yield back.

"Legislative Hearing on H.R. 4678, the Foreign Manufacturers Legal Accountability Act"
Committee on Energy and Commerce
Subcommittee on Commerce, Trade and Consumer Protection
June 16, 2010

Responses of Mr. Jeremy Baskin to Questions for the Record from Ranking Member Joe Barton[1]

1. **Yes or No please. Do you believe American companies that sell their products abroad should submit to the legal authority of foreign courts?**

   Response: Yes, if there is reciprocity. CPSC defers to the work of the Office of the U.S. Trade Representative, the Department of State, the Department of Commerce, and other responsible agencies in negotiating agreements with foreign governments on this issue.

2. **You mention a number of cases where the CPSC was requesting information from Chinese drywall manufacturers, and the requests were returned denied and unopened. Would this bill allow the CPSC to force foreign companies to comply with information requests?**

   Response: The proposed legislation would provide CPSC with a mechanism to put pressure on a domestic party to seek this information from the foreign manufacturer.

3. **Do you have a ballpark estimate for how many foreign manufacturers of consumer products this bill would apply to? What other means does the CPSC have available to ensure only compliant products are sold in the U.S.?**

   Response: CPSC does not currently maintain a registry of foreign manufacturers of consumer products. Therefore, CPSC is unable to provide a current estimate of how many individual foreign entities would be covered by the proposed legislation.

   CPSC currently has authority to stop noncompliant articles at the ports and require their exportation or destruction. It has recall authority to remove noncompliant products from the supply chain. In addition, the Commission has stringent civil penalty provisions to pursue against parties who would sell or distribute noncompliant products.

4. **Scam artists will evade the law and reconstitute themselves. For smaller fly by night manufacturers in foreign countries, would this legislation stop them from starting a new business with a new name?**

---

[1] This is a staff document, and has not been reviewed or approved by, and may not necessarily reflect the views of, individual CPSC Commissioners.

Response: The legislation cannot stop that practice (no legislation can), but it will make those individuals more easily identifiable. Each new foreign manufacturing entity covered by the proposed law would be required to appoint an agent to accept service of process. Otherwise, that business would not be able to import its products into the United States. Furthermore, domestic agents engaging in due diligence could identify these companies and decline to do business with them, thereby making it more difficult for them to import.

a. **You state it is rare sentiment for companies to refuse to pay compensation imposed by a court, despite the legal advice of one Chinese attorney. How big a problem is the lack of a registered agent in the US? Even if the company had a registered agent, is there anything to compel them to pay court ordered fines or penalties?**

Response: Having the registered agent will not serve to compel the company to pay fines or penalties, but *not* having the agent will bar that company from importing. Requiring the agent can serve as an incentive to submit to U.S. legal authorities and come forward and pay legally assessed fines and penalties.

5. **Importers or distributors in the U.S. are considered the manufacturer for purposes of compliance under the Consumer Product Safety Act. What liability attaches to the importer or distributor?**

Response: Importers and distributors can incur civil monetary penalties of up to $15 million under the CPSA. Importers are required to have bonds as a condition to import. If importers distribute noncompliant imported products, they can incur money damages under those bonds in addition to civil monetary penalties that might be assessed and collected. CPSC can ask CBP to seize and forfeit noncompliant imported products.

6. **Do you believe that this bill will have a significant improvement on product safety? Please explain.**

Response: This new powers contained in this legislation would provide an additional tool in the arsenal of CPSC's compliance measures. This, in turn, permits greater oversight over imported products.

7. **Do you have any estimate for what threshold the CPSC might establish for the minimum size requirements in the bill?**

Response: Not at this time. This issue would require careful regulatory consideration by the full Commission and should be resolved in collaboration with other agencies that will have this service of process requirement.

8. **Section 4 of the bill requires foreign manufacturers who make "any part" of a covered product or "any part" of a component part of a covered product to have a registered agent in the United States before said covered product or component part can be legally imported. How far down the supply chain would this requirement stretch?**

    a. **Could companies producing the raw materials that a covered product is made from be required to have a registered agent in the U.S. before the covered product can be imported?**

    Response: The Department of Homeland Security (DHS) is empowered to promulgate the regulations governing this section. CPSC cannot speculate on how DHS would interpret this provision.

    b. **Please describe how the breadth of the registered agent requirement could affect the U.S. export and import industries as well as global trade relations.**

    Response: CPSC is not in a position to speculate on the impact of the legislation on global trade relations.

9. **Holding manufacturers accountable – whether they are domestic or foreign – is a worthy goal.**

    a. **How does the legislation change the current applicable laws that make the foreign company more accountable in the U.S.?**

    Response: As noted in the responses to question 4, having the registered agent will not serve to compel the company to pay fines or penalties, but *not* having the agent will bar that company from importing. This will provide an incentive to accede to U.S. legal authorities and come forward and pay legally assessed fines and penalties.

    b. **If a judgment is rendered against a foreign manufacturer, what does it take to enforce the judgment? Can a judgment against a company be enforced more easily because of this legislation or will it still require a company to be a responsible party?**

    Response: Currently, service of process against a foreign manufacturer is usually affected under the Convention on the Service Abroad of Judicial and Extrajudicial Documents in Civil or Commercial Matters (commonly called the "Hague Service Convention"). In many cases, service under this convention is a cumbersome and time-consuming process.

    This legislation does not affect the Hague Service Convention. In addition, enforcement of the judgment in a foreign country will not be affected. However, the legislative may provide an incentive for foreign manufacturers to submit to U.S.

jurisdiction by tying designation of an agent and accepting service of process to the continued future ability to import products into the United States.

c. **How often do large foreign companies that sell products in the U.S. avoid legal proceedings? Can they continue to sell in the U.S.?**

Response: CPSC does not currently attempt to track the number of foreign consumer product manufacturers that seek to avoid service of process in domestic civil litigation.

10. Is it fair to say this legislation is targeted at the companies with no U.S. presence?

Response: Depending on how the legislation is implemented, it could include companies that have no or little U.S. presence.

a. **The more a company depends on the U.S. market for its business, isn't it more likely they will need to respond to a US judgment if they want to continue business in this country? If that is the case do you need to require an agent for service of process?**

Response: Yes. Requiring the designation of an agent to accept service of process will act as incentive for those companies with little or no presence in the U.S. to submit to jurisdiction so that they will be able to legally import products in the future.

HENRY A. WAXMAN, CALIFORNIA
CHAIRMAN

JOE BARTON, TEXAS
RANKING MEMBER

ONE HUNDRED ELEVENTH CONGRESS

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE

2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515-6115

Majority (202) 225-2927
Minority (202) 225-3641

July 13, 2010

Ami Gadhia
Policy Counsel
Consumers Union

Washington, DC 20036

Dear Ms. Gadhia:

Thank you for appearing before the Subcommittee on Commerce, Trade, and Consumer Protection on June 16, 2010, at the legislative hearing on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act," and H.R. 5156, the "Clean Energy Technology Manufacturing and Export Assistance Act."

Pursuant to the Committee's Rules, attached are written questions for the record directed to you from certain Members of the Committee. In preparing your answers, please address your response to the Member who submitted the questions.

Please provide your responses by July 27, 2010, to Earley Green, Chief Clerk, via e-mail to Earley.Green@mail.house.gov. Please contact Earley Green or Jennifer Berenholz at (202) 225-2927 if you have any questions.

Sincerely,

Henry A. Waxman
Chairman

Consumers Union/Consumer Federation of America Responses to Questions for the Record from the Honorable Joe Barton, re: H.R. 4678, The Foreign Manufacturers Legal Accountability Act

1. Yes or No please. Do you believe American companies that sell their products abroad should submit to the legal authority of foreign courts?

If they are availing themselves of the foreign market, yes.

2. Given that there is no method to enforce U.S. court judgments; to what degree will this bill increase the ability of consumers to be compensated if they still only have access to the assets of U.S. based companies?

Depending upon the relationship of the U.S-based company to the foreign manufacturer, it is possible that a consumer may be able to enforce a judgment against the U.S.-based entity. The U.S.-based entity, again depending upon its legal relationship with the foreign company, could then be reimbursed for the judgment by the foreign company. The foreign country may also help enforce the judgment.

3. You testified that the inability of consumers to obtain compensation from foreign manufacturers hurts industry, because liability factors into their cost of business for U.S. companies, but not for foreign ones. Will this bill change this situation, considering that consumers will still only have enforcement power to obtain compensation from American companies?

This bill will change this situation. Currently, foreign manufacturers are, in many cases, completely "scot-free" from any responsibility to our civil justice and regulatory system. The knowledge that they cannot be hailed into court, or brought before a U.S. agency, factors into their business plans – they can use toxic materials, or take other dangerous shortcuts, all to cut costs because they know they do not have to submit to U.S. jurisdiction. By requiring foreign manufacturers to submit to such jurisdiction in the U.S., you are ensuring that U.S. manufacturers who do not cut corners to save money do no lose out to foreign companies that sell their potentially dangerous products at lower prices. American companies will actually have a fighting chance to compete with foreign manufacturers.

4. You stated in your testimony that it is untenable to have a system of accountability that relies upon altruistic and rare behavior. Isn't that similar to the system for enforcement of U.S. judgments if this bill passed, given that there is no mechanism for enforcing U.S. judgments abroad?

Enforcing a U.S. judgment would not simply be a case of relying on altruistic and rare behavior. Sometimes, the foreign country may help enforce the judgment. The U.S. assets of a foreign company doing business in the U.S. may also be subject to seizure in order to satisfy a judgment. But regardless of how enforcement occurs, the fact that a judgment has been rendered against a foreign manufacturer helps put the company on notice to make safer products. The U.S. legal system is also put on notice, so that future imports from that company may trigger restrictions of

future unsafe products reaching U.S. consumers. This legislation does not directly touch enforcement of judgments (doing so may be a WTO violation), but does lessen some of the jurisdictional and bureaucratic hurdles a consumer must overcome before he or she can even get a judgment entered against a negligent foreign manufacturer.

5. It's my understanding that the U.S. importers who purchase foreign goods and brings them into the U.S. would be the ones capable of and responsible for facilitating a recall. However, you mentioned in your testimony that the bill's provisions mandating registered agents for foreign manufacturers would help the CPSC with recalls. Could you expand on that?

Requiring a foreign manufacturer to register an agent for service of process and for regulatory issues, such as safety recalls, will ensure that the right entity is contacted by the agency for a recall. In some cases, the importer may be the entity in the best position to facilitate a recall of a foreign-made product, but in other cases, the importer may not be the best party. The importer may also be a "fly-by-night" operator, who may have changed names in the weeks, months, or years between the importation of a product and the need for a safety recall. Tracking this importer might therefore prove difficult. A registered agent for service of process, on the other hand, would have more up-to-date information about how best to contact a foreign manufacturer for the purposes of a recall.

6. You mentioned that this bill could act as a deterrent against irresponsible foreign manufacturers. However, if a foreign manufacturer is going to willingly or recklessly make a defective product, and thereby do significant damage to their business reputation, what is the likelihood that they will be deterred by a court with no real power over them?

Right now, our courts have absolutely no power over foreign manufacturers, because the manufacturers are not subject to jurisdiction here in the U.S. Therefore, under current law, a consumer injured by a defective or dangerous product has no chance at holding the foreign manufacturer responsible. But the bill will change this, and give courts – and injured consumers – a chance to hold these companies responsible, because consumers and federal agencies will at least be able to hail these companies into court. Even after a verdict against them, it is possible for a foreign – *or a domestic* – manufacturer to flagrantly violate our laws, and to try and evade paying a judgment against them. But this legislation would at least give injured consumers the ability to bring suit against these manufacturers, so they have a chance at obtaining a judgment to enforce – a step further than is available today.

7. Section 4 of the bill requires foreign manufacturers who make "any part" of a covered product or "any part" of a component part of a covered product to have a registered agent in the United States before said covered product or component part can be legally imported. How far down the supply chain would this requirement stretch?

    a. Could companies producing the raw materials that a covered product is made from be required to have a registered agent in the U.S. before the covered product can be imported?

The intent of the legislation as we understand it is a basic principle of fairness: if a company is going to avail themselves of the U.S. consumer market, then they should play by the same rules that American companies play by. That means being a part of our civil justice and regulatory systems if their products injure people. If a consumer is injured by a finished product, or if a federal agency is recalling a finished product, but the finished product manufacturer disavows all responsibility for the defective product and claim that a raw material or component manufacturer is responsible, it would be a perverse outcome if the consumer or the federal agency could not hold the right party responsible simply because component parts were not covered by the legislation.

b. Please describe how the breadth of the registered agent requirement could affect the U.S. export and import industries as well as global trade relations.

We believe that this legislation will positively impact American manufacturers, because they will be able to complete on a level playing field with foreign manufacturers. American companies will not lose out, e.g., on selling drywall to contractors because theirs is more expensive than foreign-made drywall because the American manufacturers refused to take safety shortcuts. Stronger American companies could conceivably be better able to take part in export markets around the globe.

Some concerns have been raised about whether this bill violates World Trade Organization (WTO) agreements. WTO violations occur when foreign entities are treated differently than domestic ones under U.S. laws. This legislation seeks to do the opposite. This legislation actually creates an equal playing field by holding all manufacturers, no matter where there are based, responsible for the safety of the products they sell in the United States. Manufacturers as well as the products produced and sold in the U.S. would be treated equally under this legislation.

8. Holding manufacturers accountable – whether they are domestic or foreign – is a worthy goal.

a. How does the legislation change the current applicable laws that make the foreign company more accountable in the U.S.?

We do not believe that current applicable laws make foreign companies more accountable in the U.S. As foreign companies are not subject to jurisdiction here in the U.S., it is primarily their good will that currently makes them accountable to U.S. consumers.

b. If a judgment is rendered against a foreign manufacturer, what does it take to enforce the judgment? Can a judgment against a company be enforced more easily because of this legislation or will it still require a company to be a responsible party?

Sometimes, the foreign country may help enforce the judgment. The U.S. assets of a foreign company doing business in the U.S. may also be subject to seizure in order to satisfy a judgment. But regardless of how enforcement occurs, the fact that a judgment has been rendered against a foreign manufacturer helps put the company on notice to make safer products. The U.S. legal system is also put on notice, so that future imports from that company may trigger restrictions of

future unsafe products reaching U.S. consumers. This legislation does not directly touch enforcement of judgments (doing so may be a WTO violation), but does lessen some of the jurisdictional and bureaucratic hurdles a consumer must overcome before he or she can even get a judgment entered against a negligent foreign manufacturer.

e. How often do large foreign companies that sell products in the U.S. avoid legal proceedings? Can they continue to sell in the U.S.?

Some large foreign companies with a U.S. presence delay and make legal proceedings unnecessarily expensive for harmed U.S. consumers by claiming that their parent company - located overseas - was responsible for the design or manufacturing defect of a product. For example, we have heard of many instances of well-known foreign car manufacturers forcing U.S. consumers to serve process through the Hague Convention (spending tens of thousands of dollars extra) to be able to reach their overseas parent company, and then having to litigate further that there is appropriate jurisdiction over that company before these consumers even get their day in court. Though these companies have well-established U.S. subsidiaries, their ability to evade liability and make injured or harmed consumers jump through procedural hoops allows them to continue profiting off of U.S. consumers while at the same time skirting the very U.S. laws by which their U.S. counterparts must abide.

9. Is it fair to say this legislation is targeted at the companies with no U.S. presence?

a. The more a company depends on the U.S. market for its business, isn't it more likely they will need to respond to a U.S. judgment if they want to continue business in this country? If that is the case do you need to require an agent for service of process?

You do still need to require an agent for service of process, because foreign companies may still attempt to take shortcuts on safety if they know there will never be consequences – i.e., being brought into our civil justice and regulatory systems – for their actions. Even if a company is availing itself of the U.S. market, as you describe, they will never be legally reachable if they do not have an agent for service of process here in the U.S. An agent for service of process is a simple but vital prerequisite for being held responsible for following U.S. laws.

Consumers Union

[illegible]

June 21, 2010

Honorable Bart Stupak
2268 Rayburn House Office Building
Washington, D.C. 20515

Dear Congressman Stupak:

This letter is in response to your inquiry during a hearing before the House Energy & Commerce Subcommittee on Commerce, Trade, and Consumer Protection on June 16, 2010 regarding H.R. 4678, The Foreign Manufacturers Legal Accountability Act. During the hearing, you asked whether, in addition to requiring foreign manufacturers to have a U.S.-based agent for service of process, it would also make sense for foreign manufacturers to have an entity in the U.S. who had substantive knowledge of its products in order to aid U.S. agencies in the event of a recall of a product covered by H.R. 4678.

Consumers Union believes that such entities could in fact assist the federal agencies whose products are the subject to the bill's requirements to more effectively and efficiently conduct recalls. We further believe that Committee report language accompanying H.R. 4678 could address this point; we would be happy to assist however we can regarding the drafting of such report language.

Sincerely,

Ami V. Gadhia

1. **Yes or No please. Do you believe American companies that sell their products abroad should submit to the legal authority of foreign courts?**

Since you requested a yes/no response, the answer is "yes." Obviously, there are great variations in foreign legal systems and a one-word answer does not encourage a discussion of those factors.

As noted in several answers below, principles of comity are of consequence in all foreign affairs – especially trade – and outright rejection of all non-U.S. legal systems (or a "no" response to your question) by all companies doing business abroad does not seems a wise approach – nor a safe generalization.

In a number of counties where U.S. products are sold, U.S. companies are already subject to the domestic legal system of the place the injury occurs. In that sense, H.R. 4678 would close a loophole in the U.S. legal system by creating accountability obligations consistent with those that exist abroad.

For example, consider the new Chinese tort law which is modeled, in part, on the law of several U.S. states. Articles 43, 45, and 47 establish both punitive damages and strict liability which, commentators report, will have "significant ramifications for companies doing business in China. . . ." Roy Zou and Xi Liao, "China Enacts Systematical Tort Law."

(site visited July 19, 2010).

U.S. firms are already advising their clients about this reality:

> China's new Tort Liability Law, another step in the Chinese government's strategy for dealing with China's legacy of environmental damage, represents a shift toward a tougher Western-style tort system. The law is in fact harder on defendants than laws inmost places around the globe, including the U.S. and Europe. *Those doing business in China will need to understand the potential for increased liability and the potential need to expand coverage* by the time the law goes into effect July 1. "China Introduces Tough New Tort Laws."
> http://www.willis.com/documents/publications/Services/International/2010/Intl_Alert_China_New_TORT_Law.pdf (Site visited July 19, 2010) (emphasis added)
>
> The Tort Liability Law is a new development in China's environmental laws and *will have significant ramification on companies doing business in China*,

> Companies should be aware that they may face heightened exposure to environmental tort claims notwithstanding full compliance with China's environmental laws and regulations, and defending against such claims can be costly. How Chinese courts will interpret and enforce the Tort Liability Law remains to be seen, but an increase in environmental tort claims in the future can be expected. Kaichen Xu, "China Adopts Environmental Tort Law," http://www.omm.com/newsroom/publication.aspx?pub=921 (Site visted July 19, 2010). (emphasis added)
>
> [T]he stated purpose of the law is "protecting the lawful rights and interests of civil law parties, explicitly defining tort liability, preventing and punishing torts, and promoting social harmony and stability." *Companies active in the China market and their insurers should revisit insurance policies and other risk management measures in light of this important development.* "China Passes Tort Law: A Brave New World of Punitive Damages?" http://www.gtlaw.com/NewsEvents/Publications/Alerts?find=132305 (Site visited July 19, 2010) (emphasis added)

For the Taylor Wessing advisory (which has an elaborate discussion of the law and encourages foreign companies doing business in China to secure in-country product liability insurance), see, Ingo Vinck & Yimin Chen, "Milestones: China's New Law on Tort Liability." http://www.taylorwessing.com/newsletter/china/archive/china-alerter-april-2010/milestones-chinas-new-law-on-tort-liability.html (Site Visited July 19, 2010)

European countries following Article 5(3) of the Brussels I apply tort law constructs to U.S. companies.

In Japan (pursuant to Article 15(I) of the Code of Civil Procedure), there is an in-country jurisdictional base for persons injured by products manufactured abroad.

Thus, H.R. 4678 is in-step with our major trading partners and does not impose legal obligations on foreign manufacturers any more than (a) are imposed on domestic sellers, and (b) any more than are imposed on U.S. companies doing business abroad.

2. It is my understanding that there is currently no method to enforce U.S. judgments abroad other than 'good will'. Keeping that in mind, how much accountability do you believe this bill will assign to foreign manufacturers considering that it cannot be enforced?

I do not agree with the premise of the question; there is more to enforcement than a "good will hope" of compliance. Thus, I believe that H.R. 4678 will generate a meaningful measure of accountability – *which strikes me as the main reason foreign manufacturers are fighting this legislation.*

Moreover, it makes perfect sense that this bill is not focused on enforcement of judgments against foreign manufacturers - the first step is to get them into court. Thus far, foreign manufacturers have evaded the U.S. legal system. It's time to put that to a stop.

After this bill becomes law, a number of things are likely to happen, all of which benefit U.S residents.

First, foreign companies will have to give thought to making their products safer – which is, in the end, the driving force behind the tort system. The current system gives foreign manufacturers a free pass – and the results speak for themselves: freed of any obligations under our system of civil liability, there have been a consistent and dangerous flow of unsafe foreign products.

Second, injured U.S. consumers or business who seek to hold accountable a foreign manufacturer will not have to waste time and resources serving process through the Hague Convention. The potential for reasonable access to court *at a reasonable cost* has a great incentive value in terms of the quality of goods and services.

Third, as jurisdiction is secured and judgments are entered under the terms of this bill, the premise of this question will be tested. Enforcement of judgments *may* require cooperation with foreign legal systems – but I would not assume such cooperation will be denied.

Well-established principles of comity essential to the entire diplomatic process actually suggest the opposite result. Moreover, large entities doing business in the U.S. often have assets in the U.S. - and those assets can be seized to enforce an unpaid judgment. This is a powerful incentive to comply with the terms of a judgment.

Finally, one interpretation of this question presupposes that if a judgment is unfulfilled, it has no value. That is a false assumption. A judgment is a public record and can have powerful consequences for the foreign provider. Market perception and market value are sensitive: a finding against a manufacturer and entry of a judgment affects public perception of the value and safety of a product. This is powerful tool in creating incentives for safer, more efficient, and more reliable products.

3. You testified that there are "tens of millions of defective, dangerous, and in some instances deadly goods produced abroad for sale in U.S. markets." If true that is an alarming figure. What time scale is that production figure over, and what studies are you referencing?

I began research on the question of the range and nature of the problem of defective goods in 2008. I referenced in my testimony my article in the *Product Safety and Liability Reporter* from 2009 which lists some of the defective products. If anything, "tens of millions" is an understatement. FORBES MAGAZINE, not exactly a forum for the consumer voice – and not given to hyperbole – has called the number of defective products *colossal*.

President George W. Bush's Interagency Working Group on Import Safety, established in 2007, reported there are $2 trillion worth of products imported into the U.S. and that there is a need to raise safety standards for foreign products and for establishing identification and enforcement mechanisms for foreign products.

The number of foreign manufactured defective products sold in the U.S. is, I suppose, subject to debate. However, the notion that it is less than "tens of millions" simply is not true. It is more – far more. To give a sense of the magnitude of the problem, I have listed below a very small number of online pieces from detailing certain defective goods.

>
> 9 July 2010
> CPSC Recalls Various Products Made in Mainland China
>
> The CPSC has announced the following recalls of products made in mainland China.
>
> Baby Walkers. Suntech Enterprises Inc. has recalled about 8,400 baby walkers because they can fit through a standard doorway and fail to have sufficient protection to prevent falls downstairs. The recalled baby walkers have a plastic frame supported by four wheels and eight brake pads. They were sold in blue, pink and green with a white activity tray and a patterned vinyl seat. Item number WK110 or WK112 is printed on the side of the packaging. These baby walkers were sold at small juvenile product stores in California, Illinois, New York and Texas from January 2007 through December 2009.
> http://www.cpsc.gov/cpscpub/prerel/prhtml10/10269.html
>
> Cribs. Seven manufacturers (Child Craft Industries Inc., Delta Enterprise, Evenflo, Jardine Enterprises, LaJobi, Million Dollar Baby and Simmons Juvenile Products Inc.) have issued separate recalls affecting some 2.2 million cribs to address drop-side hazards and other hazards that affect the safety of young children. Details on the recalls affecting mainland Chinese merchandise are provided below.

Delta Enterprise has recalled about 747,000 drop-side cribs and an indeterminate number of fixed and drop-side cribs using wooden stabiliser bars. These cribs were made in mainland China, Indonesia, Thailand and Croatia and sold at children's product stores nationwide and on-line from January 2000 through May 2009.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10273.html

Evenflo is recalling some 750,000 Jenny Lind cribs with model numbers 012614, 0126141, 012615, 012616, 012617, 014614, 014615, 014616, 014617, 015614, 015615, 015616, 015617, 0161614, 0161615 and 0161617. These cribs were made in mainland China and Mexico and sold by children's product stores and various other retailers nationwide from January 2000 through November 2007.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10274.html

Jardine Enterprise Ltd. has recalled about 103,000 drop-side cribs with model numbers 0102B00 (Natural Olympia Single), 0102P00 (Black Olympia Single), 0108C00WP (White Capri Single), 0108L00WP (Antique Walnut Capri Single), 0115S00 (Rubbed Black Claremont Single), BC-33 (Dark Pine 3-1 Convertible), BC-66 (White 3-1 Convertible), DA0930B (Walnut Single), DA333BC (Natural Madison Single), DA616BC (Dark Pine Siera 2 in 1), DA616BN (Natural Siera 2 in 1), DA618BC (Natural Hampton), DA833BC (Natural Madison Single), DV601BC (Dark Pine Windsor Single), DV623BC (Cherry Windsor Single) and DV628BC (White Windsor Single). These cribs were manufactured in mainland China and Vietnam and sold at Babies "R" Us, Toys "R" Us, Geoffrey Stores and KidsWorld stores nationwide from January 2002 through June 2009.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10275.html

LaJobi has announced a recall for approximately 306,000 Bonavita, Babi Italia and ISSI drop-side cribs. The cribs have drop-side hardware that contains metal or plastic pegs that are recessed into either the drop side or the headboard and footboard of the crib. A label on the headboard of the crib identifies the manufacturer as LaJobi. These cribs were made in mainland China, Italy, Vietnam, Thailand and the United States and sold at children's product stores and by various other retailers nationwide from May 1999 through May 2009.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10276.html

Million Dollar Baby has recalled about 156,000 drop-side cribs under the brand names Million Dollar Baby, Baby Mod and Da Vinci. The model names included in this recall are Alexandria, Alpha, Bailey, Caleb, Jenny Lind, Lauren, Naomi, Oxford, Pine Canopy, Sleigh, Twinkle, Anastasia, Annabelle, Kendall, Kirsten, Leonardo, Michelangelo, Robin, Roxanne and Serena. These cribs were made in mainland China and Taiwan and sold by

children's product stores and other retailers nationwide from January 2000 through March 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10277.html

Simmons Juvenile Products has issued a recall for about 50,000 drop-side cribs with model numbers 011641, 011671, 011941, 015341, 016061, 016771, 016821, 016831, 017201, 017211, 017351, 018500, 018501, 018502, 018510, 018511, 018512, 026261, 028061, 028081, 028180, 029061, 29062, 029071, 029180, 029561, 029562, 029571, 034060, 034560, 039180, 044091, 053091, 065071, 068261, 068271, 068561, 201060, 202060, 202080, 202180, 202181, 203060, 204060, 204180, 205060, 206060, 207060, 209560, 211060, 211080, 212060, 214060, 214080, 215060, 216060, 216070, 216080, 216180, 216180, 216570, 218060, 219560, 220180, 220181, 221060, 221070, 221070, 221077, 222060, 222070, 224060, 225060, 225070, 225080, 227560, 228060, 229060, 230060, 231070, 236180, 236187, 236188, 236189, 238060, 238069, 239180, 239187, 239189, 240060, 248069, 251060, 251069, 257060, 261060, 053091A and 251060M. These cribs were manufactured in mainland China, the United States, Indonesia, Croatia and Canada and sold by children's product stores and other retailers nationwide and on-line from January 2002 through February 2007.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10278.html

Youth Tiaras. Wilton Industries Inc. has announced a recall for about 7,300 children's tiaras because they contain high lead levels. This recall involves the Wilton Youth Tiara with a SKU number of 120-228. The tiara is silver-coloured with clear crystals. They were sold by Party City, Jo-Ann Fabrics, Ben Franklin Stores, Amazon.com and other retailers nationwide from June 2009 through April 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10279.html

Fireworks. Big Fireworks has recalled about 4,700 Super Lighting Rockets because they are overloaded with pyrotechnic composition, violating the federal regulatory standard for this product. This recall involves stick-type rockets with a 1.5-wide engine that is mounted on a 32-inch wood stick. The engine is wrapped in black paper with a background of the solar system and the writing "Super Rocket" in assorted colours. The recalled rockets were sold in packs of four and have item number GCR3150 printed on the front of the package and on the rocket engine. They were sold at fireworks stands and stores in Florida, Indiana, Pennsylvania and Michigan from November 2009 through June 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10281.html

Power Adapters. Radio Systems Corporation is recalling about 20,000 power adapters for heated pet beds because they can cause arcing between the coil spring and the metal connector when the connector is removed from

the bed. This recall involves the Class 2 transformers that were sold with PetSafe Heated Wellness Sleepers. The adapters are identified by the markings "PLUG IN CLASS 2 TRANSFORMER," "MODEL NO: K12-800" and have a spring coil covering the length of the electrical wire that goes from the sleeper. Power adapters without spring coils are not affected by this recall. The recalled adapters were sold at pet specialty stores and by catalogue and on-line retailers nationwide from September 2006 through April 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10283.html

Notebook Computers. Sony Electronics Inc. is recalling about 233,000 Sony VAIO notebook computers because they can overheat and pose a burn hazard to consumers. The recalled products are VPCF11 series and VPCCW2 series notebook computers. These computers are available in many colours and have "VAIO" on the front outside panel. They were made in mainland China and the United States and sold at Best Buy, Costco, Frys, Amazon.com and Sony Style retail stores and sonystyle.com as well as by other electronics retailers and business suppliers nationwide. The recalled computers were shipped to consumers and resellers between January and April 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10284.html

Children's Jewellery. SmileMakers Inc. has issued a recall for about 66,200 charm bracelets and 2,200 rings because the metal substrate in this jewellery contains high levels of cadmium. This recall involves "Happy" charm bracelets and football rings. The "Happy" charm bracelet is composed of colourful beads on a small elastic band to which a metal charm in the shape of a butterfly, moon or sun is attached. The football ring is a small adjustable metal band to which a metal football charm is attached. These items were distributed at doctor and dentist offices nationwide from June 2005 through March 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10287.html

Drill Presses. Southern Technologies has recalled about 500 Powertec drill presses because wires in the motor housing can be pinched, posing a risk of electrical shock to consumers. This recall involves Powertec eight-inch drill presses with an AC powered laser. The model number is DP800 and can be found on the product specification label located above the handle on the right side of the machine. The recalled drill presses were sold exclusively at Blain's Farm and Fleet stores nationwide from November 2009 through February 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10288.html

Bicycles. Felt Bicycles has recalled approximately 2,100 bicycles because the bicycle's fork steer tube can break, causing the rider to lose control, fall and suffer injuries. The recall includes all 2009 Felt model B12, B16 and

S32 road bicycles. B12 bicycles are gloss silver/carbon and have carbon fibre frames with carbon fibre forks and aluminium steer tubes. B16 bicycles are matte black/red and have carbon fibre frames with carbon fibre forks and aluminium steer tubes. S32 bicycles are available in gloss white/red and have aluminium frames with carbon fibre forks and aluminium steer tubes. The recalled bicycles were sold at bicycle specialty stores nationwide from October 2008 through May 2010.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10290.html

Laptop Batteries. Tekkeon Inc. has issued a recall for about 500 external laptop batteries because the battery cell can short-circuit and overheat, posing a fire hazard to consumers. The myPower ALL Plus External Laptop Battery is a universal rechargeable battery used to power laptop computers, MP3 players, mobile phones, DVD players and other portable devices. It is black with "Tekkeon" printed on the front and model number MP3750 printed on a label on the back. These batteries were sold by Amazon.com and other on-line retailers from September through December 2009.
http://www.cpsc.gov/cpscpub/prerel/prhtml10/10744.html

Coin Purses and Jewellery. Daiso California LLC has recalled approximately 190 children's coin purses and jewellery because surface paint on the zippers of the coin purses and the clasps of the jewellery contain high lead levels. This recall involves coin purses with rainbow stripes and earrings and necklaces that have blue, pink, red, white and yellow coloured droplets. "The Coin Purse" and "Mobile Case Coin Purse" are printed on the tag attached to the purse. "Colorful Drop Accessory Bracelet" is printed on the front of the necklace packages and "Colorful Drop Accessory Pierce" is printed on the front of the earring packages. The tag and packaging have "Produced for Daiso Japan" on either the front or back. These items were made in mainland China and South Korea and sold at Daiso stores in California and Washington from May through December 2009.

U.S. Consumer Product Safety Commission - January 20, 2010

Graco Recalls Strollers Due to Fingertip Amputation and Laceration Hazards

Name of Product: Graco's Passage™, Alano™ and Spree™ Strollers and Travel Systems

Units: About 1.5 million. . . .

Manufactured in: China. . . .

Here is some additional online information on the volume of defective goods flowing in to the U.S.:

- On the recall of 900,000 Simplicity Cribs from China

http://www.reuters.com/article/idUSSP36172920080917

- On lead paint:

http://www.reuters.com/article/idUSWEN191320071025
"U.S. Recalls More China-made Products for Lead in Paint"

"NEW YORK (Reuters) - A slew of products made in China ranging from children's jewelry to cake decorations were recalled on Thursday because they contain excessive amounts of lead. . . .The recall of roughly 665,000 items announced by the Consumer Product Safety Commission (CPSC) includes about 38,000 Go Diego Go Animal Rescue Boats from Mattel Inc's Fisher-Price division. . . ."

- On children's jewlery:

http://www.fox8.com/news/wjw-news-teen-jewelry-recall,0,1228102.story
"About 137,000 pieces of imported children's jewelry sold at two stores popular with preteen girls — Justice and Limited Too — were recalled Tuesday for high levels of cadmium, the latest in a series of recalls involving the toxic metal.
The voluntary recall, announced by the U.S. Consumer Product Safety Commission, was the sixth callback since The Associated Press first released findings of an investigation into cadmium in children's jewelry."

- Here is the FORBES piece mentioned earlier:

http://www.forbes.com/2007/10/10/starbucks-china-recalls-markets-equity-cx_ml_1010markets29.html
"The U.S. Consumer Product Safety Commission has a new beef with China.
The CPSC released a statement on Tuesday announcing a voluntary recall of Starbucks (nasdaq: SBUX - news - people) children's plastic cups. The cups reportedly fracture easily, leaving sharp edges and broken pieces that pose a choking or laceration hazard to children.

Starbucks has received seven reports of the cups breaking, and in two instances children began to choke on the broken pieces. Though no injuries have been reported, Starbucks has asked that the products be taken away from tots, and will offer a complimentary beverage as an incentive to return the faulty products.

The Seattle-based coffee company's stock has dripped .8%, or 22 cents, to $26.55 in Wednesday trading. . . . The Starbucks incident is just one of a ***colossal group*** of CPSC recalls over the past few months due to more detection of defective and contaminated products manufactured in China. On September 11, the U.S. and Chinese Product Safety Agencies announced an agreement to improve the quality and safety of imported consumer goods, but since then many more recalls have been made. (See: Nothing Abstract About Big Bird) Chinese-made products ranging from Cub Scout badges, light fixtures, glitter candles, air purifiers, aluminum water bottles, key chains and baby cribs have all been recalled by the CPSC in recent weeks. (emphasis added). . . ."

---

The websites above are from a very brief search on this topic conducted on July 15, 2010. These sites, as well as my research leading to the article cited I my testimony, confirm the statements made in the hearing.

4. As I understand it, this legislation subjects foreign companies to the jurisdiction of U.S. courts, but lacks any associated enforcement power. Given that it doesn't increase liability for the assets of any foreign company, won't plaintiffs still go after U.S. companies, i.e. those with the accessible deep pockets?

This question is answered in part in my response to Question 2.

Currently, product liability cases can and do result in liability of domestic companies – if the bill becomes law, that liability would either be transferred to or shared with foreign manufacturers and not borne solely by the U.S. company.

The question presumes that no foreign company will respect the jurisdiction of U.S. courts and that every foreign country will refuse to assist in the implementation of U.S. law. I do not believe that is a correct assumption. At the most basic level, U.S. assets of a foreign company doing business in the U.S. would be subject to seizure to satisfy a judgment.

Even if enforcement of judgments becomes an issue, I believe that the passage of this bill will force foreign entities to give thought to making their products safer – which is (as mentioned earlier) the driving force behind the tort system.

Finally, as noted in response 2, a judgment is a public record and can have powerful consequences for the foreign provider. Market perception and market value are sensitive: a finding against a manufacturer and entry of a judgment affects public perception of the value and safety of a product. This is powerful tool in creating incentives for safer, more efficient, and more reliable products – and will relieve pressure on U.S. manufacturers.

5. How can U.S. judgments against foreign companies be enforced if this bill passes?

See responses to questions 2 and 4.

In addition to the potent force of seizing domestic assets of foreign companies, the profound impact of a judgment on the market value or reputation of a product, and the well-established principles of comity that suggest that judgments will be enforced, there are other factors to consider. Once a judgment is entered, the whole of the U.S. legal system is on notice – and that includes regulation of imports. An unsatisfied judgment – coupled with a finding of defect -- may well trigger restrictions that would limit or prohibit the import of a presumptively unsafe product.

In dealing with the very real problem of unsafe foreign goods coming into the U.S., President Bush's 20007 Interagency Working Group on Import Safety recommended the increased use of electronic track and trace technologies to identify the product source and points of distribution. (Report to the President page 39) Couple notice of defects with notice of unpaid judgments and the incentive on foreign manufacturers increases to become accountable and to avoid selling dangerous products (again, a primary feature of the tort system).

If there is an enforcement mechanism, does it worry you how similar provisions passed by foreign countries might affect U.S. importers?

That does not seem a dominant consideration. U.S. companies are already subject to foreign laws in a number of countries (see answer to question 1).

I do not see U.S. importers affected meaningfully by this bill – but I do see U.S. consumers finally having their day in court. The capacity to hold accountable the seller of a defective and dangerous product is the real consequence of this bill – not the conjectural impact on U.S. companies selling goods abroad.

6. **Industry has informed us that U.S. importers will likely have to shoulder the compliance burden for establishing registered agents on behalf of their foreign counterparts. Keeping that in mind, wouldn't this bill hurt U.S. importers, instead of leveling the playing field as you stated in your testimony? Additionally, if foreign countries reciprocate, won't that place an additional compliance cost on U.S. exporters?**

As to the first question, "no." This has been answered in 2, 4, and 5.

In addition, domestic importers will be able to require foreign manufacturers to designate a foreign agent in the United States. The U.S. companies will be relieved of liability – not have it increased.

As to the second question involving reciprocity or retaliation, please see answers to 1, 2, 4, and 5.

2. **In your testimony you illustrated a scenario where a foreign producer cannot be sued or "haled" into court. My understanding is that once service of process requirements are met a court is authorized to move forward with a suit. It is also my understanding that the Hague convention on Service of Process, and failing that, Letters Rogatory can be used to serve process to generally all our major trading partners. Considering this, how prevalent currently is the scenario you described?**

I would characterize the scenario from my testimony as common and troubling.

The problems with the Hague Convention and Letters Rogatory include inefficiency, time-consumption, and expense. Designation of a U.S. agent is simple and a regular part of doing business for all domestic companies. Today, foreign companies often use the Hague rules as a delaying strategy, even where they have sufficient presence here and could have been served with process.

HR 4678 allows consumers and businesses to bypass these obstacles. Requiring foreign entities to register their appropriate corporate identity together with the

products shipped to this country and to consent to jurisdiction in the U.S. would give injured consumers their right to their day in court and would short circuit complexity and inefficiency in the Hague model.

7. Section 4 of the bill requires foreign manufacturers who make "any part" of a covered product or "any part" of a component part of a covered product to have a registered agent in the United States before said covered product or component part can be legally imported. How far down the supply chain would this requirement stretch?

The legislation requires federal agency findings of volume and product designation. That is the process that will be used to determine which products or finished, processed, and/or assembled component parts are within the reach of the bill, should it become law. Component part liability is a regular and important part of tort law in the U.S. -- there are instances where the component part provider is found liable and those where the entity assembling the product bears full responsibility and the component part provider is indemnified. It is safe to assume that body of law will be used (in conjunction with agency designation) to determine "[h]ow far down the supply chain this requirement would stretch."

a. Could companies producing the raw materials that a covered product is made from be required to have a registered agent in the U.S. before the covered product can be imported?

No. I do not think that is the purpose of the bill (assuming "raw product" means unfinished, unprocessed, and unassembled and not a final product intended for sale "as is" to a user/consumer in the U.S.)

b. Please describe how the breadth of the registered agent requirement could affect the U.S. export and import industries as well as global trade relations.

I do not believe there would be a discernible effect on U.S. companies engaged in import and export other than relieving U.S. domestic sellers of responsibility properly borne by their foreign suppliers.

The registered agent requirement is designed to hold foreign manufacturers accountable for the products they sell in this extremely lucrative market without having an array of expensive and unnecessary procedural defenses which complicate, limit, and in some instances block the protection of American consumers. The likelihood that many foreign manufacturers would forego sales in a $2 trillion market because of the need to have a registered agent seems remote.

8. Holding manufacturers accountable – whether they are domestic or foreign – is a worthy goal.

a. How does the legislation change the current applicable laws that make the foreign company more accountable in the U.S.?

The substantive law would be applied to foreign manufacturers on the same basis it is applied to American manufacturers. The difference would be that this legislation would make the foreign firms more identifiable and more accessible to jurisdiction in American courts. It would merely deprive them of costly and protracted procedural defenses without depriving them of any defenses that are available to domestic manufacturers under American law.

b. If a judgment is rendered against a foreign manufacturer, what does it take to enforce the judgment? Can a judgment against a company be enforced more easily because of this legislation or will it still require a company to be a responsible party?

See answers to 2.4. and 5.

c. How often do large foreign companies that sell products in the U.S. avoid legal proceedings? Can they continue to sell in the U.S.?

In my article in the *Product Safety and Liability Reporter*, I detailed dozens of cases where foreign entities were able to resist the jurisdiction of U.S. courts – and that is a small sample.

Large foreign companies that sell products in the U.S. avoid legal proceedings regularly. I looked through many, many reports and articles on Chinese companies selling defective goods in the U.S. and I think it is safe to say that this is not a debatable point.

Those companies that *are* the subject of lawsuits today delay the process and force U.S. consumers and businesses to go through substantial procedural bureaucracy – requiring translation of papers and a foreign government to serve process – before they will admit that process has been served, often with no consequences for the harm they caused.

The bill changes that inequity. It does not prohibit sales – it makes sellers accountable and creates incentives for limiting and eliminating the great range and nature of dangerous or defective products currently in the stream of commerce.

9. Is it fair to say this legislation is targeted at the companies with no U.S. presence?

This legislation is targeted at any company that benefits from the lucrative U.S. market and is (today) able to delay and avoid litigation and accountability. If the companies have a substantial in-state U.S. presence, they are already subject to the jurisdiction of the courts. The problem (noted in my testimony and in my *Product Safety and Liability Reporter* article) is that the "minimum contacts" requirement is difficult to meet – and is not satisfied by high profits, significant impact, or even the uncontested assertion that the product was intended for sale in the U.S.

a. The more a company depends on the U.S. market for its business, isn't it more likely they will need to respond to a U.S. judgment if they want to continue business in this country?

Yes. See answers to questions 2-5.

b. If that is the case do you need to require an agent for service of process?

Absolutely. As noted in my testimony and my article, the problem of securing *in personam* jurisdiction over foreign companies is widespread. It frustrates just and fair results, limits accountability, and denies persons in the U.S. access to the courts. In the absence of an agent, these problems will continue.

Moreover, this bill does more than require designation of an agent – it gives clear and understandable notice to all that doing business in the U.S. means being subject to U.S. law. This is required of every domestic company – and it should be required of every foreign entity doing business here as well. Consent to jurisdiction (mandated in the bill) is not an undue advantage - it is the law for every U.S. business.

The potential to serve a foreign company that benefits from U.S. sales and from the U.S. legal system at many level (in terms of banking, currency, credit, etc.) and the U.S. infrastructure (broadly defined) is fair, just and reasonable. Injured consumers should not be tormented by our legal system – they should be served by it. An agent in the U.S. makes that possible. U.S. consumers injured in their home states by products on which they rely justifiably should not be met with massive expenses and no reasonable assurance that the wrongs they sustained will be redressed.

This bill is a chance to give consumers and businesses the basic and straightforward opportunity to resolve peacefully disputes in a court of law and to secure remedies where they have been wronged. Designation of an agent is a remarkably simple, elegant, and wise step forward.

Washington, DC 20036

Dear Ms. Rowden:

Thank you for appearing before the Subcommittee on Commerce, Trade, and Consumer Protection on June 16, 2010, at the legislative hearing on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act," and H.R. 5156, the "Clean Energy Technology Manufacturing and Export Assistance Act."

Pursuant to the Committee's Rules, attached are written questions for the record directed to you from certain Members of the Committee. In preparing your answers, please address your response to the Member who submitted the questions.

Please provide your responses by July 27, 2010, to Earley Green, Chief Clerk, via e-mail to Earley.Green@mail.house.gov. Please contact Earley Green or Jennifer Berenholz at (202) 225-2927 if you have any questions.

Sincerely,

Henry A. Waxman
Chairman

Re: Hearing on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act" – June 16, 2010

Dear Congressman Barton:

Thank you for the opportunity to testify on behalf of the American Association of Exporters and Importers (AAEI) concerning H.R. 4678. I respectfully submit the answers below in response to your written Questions for the Record (QFR).

1. **Section 4 of the bill requires foreign manufacturers who make "any part" of a covered product or "any part" of a component part of a covered product to have a registered agent in the United States before said covered product or component part can be legally imported. How far down the supply chain would this requirement stretch?**

   We understand section 4 of H.R. 4678 would require the U.S. importer to review its list of imported components (called a "bill of materials") to determine two things: 1) whether the component will be incorporated into a finished product covered by the law; and 2) whether the foreign manufacturer or producer of that component has a current registered agent on file as of the date of importation. It is unclear to us whether, for example, section 4 requires the U.S. importer of a finished engine from a foreign manufacturer to obtain the name of the producers of the components of that engine (and the name of their registered agents) in order to satisfy the requirements of section 4.

   a. **Could companies producing the raw materials that a covered product is made from be required to have a registered agent in the U.S. before the covered product can be imported?**

      Because such a wide variety of products are covered by H.R. 4678, we do not know the degree to which Congress intends to have producers of raw materials appoint registered agents. For example, an automobile covered under NHTSA, we believe that the legislation could very well cover the rubber in the tires being covered by the statute. In the case of chemicals, we do not know whether the legislation would require the producers of polymers used to make a final chemical product appoint a registered agent. Additionally, AAEI could easily envision active pharmaceutical

ingredients ("APIs") which give drugs their medicinal properties being covered by the legislation, but we are unsure about whether molecules utilized to develop biologics (covered in section 2(3)(B)) necessitate a company appointing a registered agent. The broader the scope of this legislation, the more expensive products are ultimately going to be for the American consumer, without corresponding increase in safety, security, functionality or even legal recourse.

b. Please describe how the breadth of the registered agent requirement could affect the U.S. export and import industries as well as global trade relations.

The breadth of the registered agent requirements does four very damaging things to U.S. export and import industries:

First, it moves the United States closer to a general import license regime in that importers would, for all intents and purposes, be required to seek government permission to import goods from "registered" suppliers limiting their sourcing ability.

Second, it destroys the U.S. position as a "value added" economy whereby low value components are sourced outside the United States and brought into the country for the high-value processing that can justify U.S. labor costs. The chemical and pharmaceutical industries are among the most heavily regulated and highly compliant companies who are net exporters for the U.S. regardless of where their headquarters reside. As a result, many of these high-paying jobs currently in the U.S. will simply move overseas as companies will avoid the "hassle factor" that this legislation imposes on U.S. manufacturing. This requirement exacerbates our trade relations because it adds another "U.S. centric" requirement while companies are seeking raise and standardize manufacturing processes across the globe. Also, this requirement punishes highly compliant and complex multinational companies by casting aside all of the infrastructure they have put in place in the United States to manage this marketplace by reaching through the corporate structure to pull the umbrella company into the United States' legal system. Many of the companies that this legislation seeks to reach are in countries that have at least partial state ownership of a significant percentage of all businesses. These businesses may not be subject to these rules because of the sovereign immunity of foreign governments.

Thirdly, the registered agent requirement adds another layer of enforcement at the time of entry and release from CBP custody, which can easily impede the flow of commerce.

Fourth, this legislation may very well lead to retaliatory mirror legislation being enacted by some of our trading partners. Not only will this directly harm US companies, but it could lead to trade wars with our current trade allies. Finally, even if the United States were to enact this damaging legislation, it would do little more than provide a false sense of peace for

wronged American consumers, because we are not party to any treaty that would allow for enforcement of any judgments that may or may not arise out of this legislation.

2. Holding manufacturers accountable – whether they are domestic or foreign – is a worthy goal.

a. How does the legislation change the current applicable laws that make the foreign company more accountable in the U.S.?

Because many U.S. state have tort laws with "joint and several liability" (i.e., each entity may be liable for the full amount of the liability), AAEI does not believe that this legislation will make the foreign company more accountable (or liable) in the U.S. nor does it reduce the liability of the U.S. importer.

b. If a judgment is rendered against a foreign manufacturer, what does it take to enforce the judgment? Can a judgment against a company be enforced more easily because of this legislation or will it still require a company to be a responsible party?

AAEI does not believe that HR. 4678 will advance a U.S. citizen's ability to collect on a judgment for money damages rendered by a U.S. court. Based on our preliminary review of the Hague Convention on Foreign Judgments in Civil and Commercial Matters, AAEI believes that two necessary prerequisites would need to be in place before judgment can be rendered against a foreign manufacturer: 1) the country in which the manufacturer resides would need to be a signatory to the Hague Convention or by some other legal instrument recognize a judgment from a U.S. court; and 2) a foreign court must exercise its authority over the foreign manufacturer by requiring the payment of money damages in the judgment or seizing the assets of the foreign manufacturer in satisfaction of the U.S. judgment. It is important to note that the United States is not a signatory to this particular treaty, and we are unaware of any effort to sign on.

c. How often do large foreign companies that sell products in the U.S. avoid legal proceedings? Can they continue to sell in the U.S.?

It is AAEI's experience that large foreign corporations generally do not avoid legal proceedings in the U.S. for several important business reasons: 1) to protect the company's brand and goodwill which are important business assets in the United States and abroad; 2) to continue its access to the U.S. market which remains among the most lucrative in the world; 3) reputable world-class companies want to be good corporate citizens because it is in the best long-term financial interest of the company. Because the industries covered by H.R. 4678 are so heavily regulated now by the federal government, U.S. regulatory agencies already possess the regulatory tools to block a foreign company's access to the U.S. market.

3. What would you recommend as the best method to hold foreign manufacturers accountable in the U.S.?

If the United States wants a long-term solution to ensure that U.S. citizens harmed by defective products manufactured by foreign corporations can get redress for their injuries, the United States must pursue a "holistic approach" comprised of three components: 1) commercial; 2) regulatory; and 3) legal.

The commercial component would comprise of working with our trading partners to set high international standards for product safety through standards-setting bodies such as the International Standards Organization (ISO). These standards would be uniform on a multi-lateral basis to ensure that companies can meet a single standard rather than a patchwork of standards. The commercial incentive for companies to comply with one international standard is that it lowers costs whereas a national standard which drives up the cost of producing goods for markets with different standards.

Second, the United States must continue to develop a robust regulatory regime that can handle globalization since most of our safety laws were developed at the turn of the 20th Century for goods produced and consumed in the U.S. market only. An important aspect of the regulatory component is sharing of data between regulatory agencies to oversee and audit corporate quality control, and take immediate action when defective products are detected before they get into the global supply chain.

Third, the legal component would be used as the system of last resort when corporate quality control and regulatory surveillance fails. If the United States became the leader in supporting international quality standards and promoted regulatory dialog as part of international trade agreements (e.g., the Doha Round at the World Trade Organization or through bilateral and regional free trade agreements), then more countries would probably become signatories to the Hague Convention on Foreign Judgments in Civil and Commercial Matters or other instruments recognizing and enforcing U.S. judgments because they will be looked upon as anomalies rather than simply a hazard of the U.S. legal system.

a. Does our current system have any accountability built into it?

Yes, the U.S. regulatory regime imposing all legal and regulatory responsibilities on the U.S. importer, which is typically a U.S. company with assets in the United States, currently makes that entity as accountable as if the produce was made in the United States by a U.S. corporation. Thus, U.S. importers are legally responsible today for liability of imported products and additional financial guarantees (e.g., bonds) can be added to address concerns about financial solvency.

4. What benefits – if any - do you see from this legislation? Do you have any concerns about how U.S. companies might be affected by similar laws in foreign countries, especially if those countries have less scrupulous legal systems than ours?

AAEI sees no benefit to this legislation – it neither compensates past victims of defective products nor does it provide a realistic avenue for relief to future victims of defective products made by foreign corporations. Moreover, we suspect that other countries will develop similar requirements to block U.S. corporations from accessing their markets. Other countries may also be encouraged to take arbitrary regulatory actions or justify taking legal actions against U.S. companies to harass them enough so that they exit the foreign market or force a U.S. corporation to sell its product through a foreign "middleman."

5. Could this bill complicate the ability of U.S. importers and exporters to conduct business globally?

Yes, this legislation will impact global traders in an extremely negative way. H.R. 4678 has the effect of "micromanaging" business decisions better left to corporate managers. This legislation will limit the sourcing options of globally competitive businesses which have manufacturing facilities in the United States and will reduce the attractiveness of the United States as a place where these companies can make products either for the U.S. or North American markets from globally sourced components.

6. You mentioned that there is no method by which a U.S. court judgment against a foreign manufacturer for money damages could be enforced abroad. If this bill passed and hypothetically could be <u>enforced</u> abroad, how would that affect your members and U.S. trade relations?

The enforcement of a U.S. court judgment requires, at a minimum, legality and practicality. Quite often, enforcement also entails considerable legal expense and a protracted period of enforcement. For legality, the United States needs some instrument (either international treaty or bilateral arrangement) whereby the U.S. judgment is viewed as valid as if it were a judgment rendered in that country. More importantly, satisfying a judgment requires practicality of getting that foreign corporation to either pay the judgment or finding property (e.g., real estate, inventory, bank accounts, etc.) which can either be sold or liquidated to satisfy the judgment by order of a court in the foreign country. Unfortunately, all of these things are reactions to an incident relating to an unsafe product. AAEI recommends that U.S. efforts are better focused on preventing the entry of unsafe products, rather than improving our reaction to what may happen after they enter the commerce of the United States.

For large multi-national corporations which have large-scale business operations in the United States and other countries around the world, AAEI is concerned that unintended consequences of H.R. 4678 may result in states seeking tax revenue from non-resident foreign corporations who have "consented" to jurisdiction of the state complicating the relationship between parent and subsidiary (or related) corporations). However, for small-medium size businesses (SMEs) which do not have market leverage with foreign suppliers, we anticipate that they will increase prices due to a smaller pool of foreign suppliers willing to appoint a registered agent in the United States. Moreover, we could envision a scenario whereby a

foreign supplier could require the small-medium size U.S. importer to contractually obligate itself to pay the legal fees of the foreign supplier or even to "hold harmless" the foreign manufacturer for the payment of any U.S. judgment enforced abroad against the foreign manufacturer. (In an extreme case, the U.S. company could be forced to pay the judgment twice if a U.S. court finds the U.S. importer and the foreign manufacturer severally liable, and the U.S. importer pays the judgment by authority of the U.S. court and the foreign manufacturer requiring the U.S. importer to pay its share of the judgment by contract.) Since we already have a legal regime that holds the importer of record liable for the products they import, this bill would do nothing but needlessly complicate trade for the most vulnerable members of the trading community - SMEs.

7. In your testimony you touched on the progress U.S. regulators are making with foreign countries to enhance the safety of our imports. How would this bill affect those relationships?

AAEI believes that some foreign countries may cease cooperation with U.S. regulatory agencies out of fear that any information they provide could become subject to discovery proceedings in U.S. litigation as a way of determining which foreign manufacturer may have made a defective product or component which resulted in an injury to a U.S. plaintiff. We believe that a reduction in this information sharing among U.S. and foreign regulatory agencies will result in the government "flying blind" where they will not have sufficient information to pinpoint anomalies so that they can prevent defective product from coming into the United States and recalling defective product that is already in the U.S. Market. In addition to this lack of cooperation harming current business relationships, the United States Customs and Border Protection's data requirements (ISF, the 24 hour rule, etc.) already MANDATE that U.S. companies work with their foreign suppliers to produce the data required for entry. This legislation may *de facto* bar imports from some uncooperative suppliers and irreparably harm small businesses in America.

8. Some have testified that foreign manufacturers need the incentive of tort liability in order to make safe products? Would you say that is true, and if not, what other incentives and systems are already in place to help ensure imported products are safe for Americans?

While tort liability has worked in some areas in making products safer in the United States, we must recognize that countries have different business cultures. Nonetheless, all companies must make a profit (with the exception state owned or heavily subsidized companies), and thus the most effective and efficient method to get companies to make safe products is a financial incentive – that is, making quality products is good business. A good example is supply chain security. After 9/11, companies feared that the U.S. government would shut down ports of entry through which goods are imported. U.S. Customs and Border Protection (CBP) worked with U.S. importers to develop the Customs-Trade Partnership Against Terrorism (C-TPAT), a voluntary program whereby CBP provided commercial incentives (e.g., fewer inspections) if member companies assessed and improved their global supply chain and also requested that members get their business partners (including foreign corporations) to adopt

good supply chain security practices. As a result, belonging to C-TPAT and adopting security procedures became an important commercial credential in the global trading system. Such practices have been adopted worldwide in the form of Authorized Economic Operator (AEO) programs. C-TPAT alone has over 9,800 members, but security procedures have been adopted by thousands of foreign companies, many of whom belong to their national AEO program.

CBP is working with the U.S. Consumer Product Safety Commission (CPSC) to develop a Product Safety Importer Self-Assessment Program whereby U.S. importers do an assessment of their internal controls for quality and safety in exchange for certain benefits from CBP and CPSC. This program is in the pilot stage, but could be ramped up if Congress gave its imprimatur in statute. (Many companies were reluctant to join C-TPAT because they feared that investments in a voluntary regulatory program could be either eliminated or diluted by subsequent statute or regulation. Thus, Congress recognized C-TPAT as a voluntary program in the SAFE Port Act, and enrollment in C-TPAT has nearly doubled since enactment of the statute.) It is extremely important to note that with any voluntary program, benefits must be guaranteed, well-defined and relative to the time, effort and resources companies are asked to spend on the set up and maintenance of the program.

9. Some have talked about the issue of the "tort tax". If this bill is passed, could U.S. businesses be exposed to a similar new "registered-agent" tax in other countries where they do business?

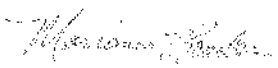
Yes, we believe that it is highly likely that other countries will adopt a similar measure aimed at U.S. corporations, which would harm our ability to meet the President's export initiative to double exports in five years.

10. The issue of the "tort tax" is a concern to some, where U.S. businesses are liable for foreign products, but foreign manufacturers themselves are not held accountable. Considering that there is no method to enforce U.S. judgments abroad, would this bill actually address that issue?

AAEI believes that because the United States' legal system operates on a territorial basis whereby a court has authority over a company with some physical property in its jurisdiction or an intentional presence in that jurisdiction via the stream of commerce, this legislation simply does not address the inability of U.S. courts to enforce judgments by demanding that money judgments be paid in cash or through a judicial lien on real property or tangible assets of the foreign corporation to be held accountable for harm to U.S. consumers. Therefore, we believe that U.S. importers will continue to bear sole responsibility for damages resulting from defective goods even if H.R. 4678 is enacted into law. Furthermore, we feel that the result of this legislation will be to lull U.S. consumers into a false sense of security about the liability of foreign manufacturers.

I hope that these QFR responses are helpful to you and the Subcommittee in considering H.R. 4678.

Sincerely,



Marianne Rowden
President & CEO

HENRY A. WAXMAN, CALIFORNIA
CHAIRMAN

JOE BARTON, TEXAS
RANKING MEMBER

ONE HUNDRED ELEVENTH CONGRESS

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE

2125 Rayburn House Office Building

Washington, DC 20515–6115

Majority (202) 225-2927
Minority (202) 225-3641

July 13, 2010

Mary Saunders
Deputy Assistant Secretary for Manufacturing and Services
International Trade Administration
1401 Constitution Ave., NW, Room 3832
Washington, DC 20230

Dear Ms. Saunders:

Thank you for appearing before the Subcommittee on Commerce, Trade, and Consumer Protection on June 16, 2010, at the legislative hearing on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act," and H.R. 5156, the "Clean Energy Technology Manufacturing and Export Assistance Act."

Pursuant to the Committee's Rules, attached are written questions for the record directed to you from certain Members of the Committee. In preparing your answers, please address your response to the Member who submitted the questions.

Please provide your responses by July 27, 2010, to Larley Green, Chief Clerk, via e-mail to Larley.Green@mail.house.gov. Please contact Larley Green or Jennifer Berenholz at (202) 225-2927 if you have any questions.

Sincerely,

Henry A. Waxman
Chairman

Attachment

The Honorable Joe Barton

1. Increased exports promise more jobs here at home. Given that, which will have greater economic impact and generate more jobs: the clean tech export fund proposed in H.R. 5156 or the FTAs on which this Congress has failed to Act?

Commerce's support for the National Export Initiative will help create and sustain jobs by increasing U.S. exports across a number of important sectors, including in clean energy technology. This effort, combined with implementation of pending U.S. FTAs that offer significant immediate tariff reduction, would help support and position the United States for growth in a sector with enormous export potential going forward.

2. ITA's website states that the Manufacturing and Services unit strives to "work with industry and government agencies to reduce costs of regulation and other government policies".

a. What policies or regulations have you worked on to reduce costs to U.S. manufacturers?

The Manufacturing and Services (MAS) Regulatory Affairs program has participated in interagency discussions for almost three dozen rules since the program started in 2006, including rules from the Occupational Safety and Health Administration, the Environmental Protection Agency, and the Department of Homeland Security. A list of rules we have worked on can be found online at http://www.trade.gov/mas/ian/industryregulationmasinput/index.asp. Our most significant contributions include work OSHA's Worker Exposure to Hexavalent Chromium Rule and DHS's Importer Security Filing Rule.

b. If the legislation we considered regarding U.S. based registered agents for service of process were replicated by other countries and imposed on our exporters, would you work to reduce the costs of those regulations?

The Administration has not yet issued an official position on this legislation. Further, DAS Saunders did not testify on that particular piece of legislation and thus cannot appropriately address this question.

c. Would such regulations on U.S. companies help their prospects of increasing exports?

The Administration has not yet issued an official position on this legislation. Further, DAS Saunders did not testify on that particular piece of legislation and thus cannot appropriately address this question.

3. According to the Overseas Private Investment Corporation (OPIC) website, "Investment prospects for renewable energy sectors are indeed massive. A 2009 report

by the Renewable Energy Policy Network, between 2004 and 2008, stated that solar photovoltaic capacity increased sixfold, wind power capacity increased 250 percent, and total power capacity from new renewables increased 75 percent. Global revenues for solar photovoltaics, wind power, and biofuels expanded from $76 billion in 2007 to $115 billion in 2008."

a. If the industry is burgeoning and capital is flowing to it, why do we need the government involved to subsidize their processes?

Despite the flood of news about fast-growing clean energy technology opportunities in foreign markets, U.S. clean energy technology exports cannot increase if protectionist rules and policies prevent open competition.

The connection between clean energy technologies and green jobs has led many countries, developing and developed alike, to adopt policies that make it more difficult for foreign firms to compete in their markets. Many countries – either implicitly or explicitly – favor their domestic industry through preferential tendering criteria (China) and burdensome certification requirements (Korea, Japan). In addition, concerns regarding adequate protection of intellectual property rights also hamper some firms from entering foreign markets. This is an area particularly critical to new, small- and medium-sized clean energy companies whose survival might depend on a small number of critical patents.

b. If these businesses are capable enough to develop their products, shouldn't they also be capable of expanding their own prospects or hiring consultants to help them identify and navigate new export opportunities?

The majority of U.S. clean energy companies are small companies that often find it difficult to finance their own expansion in foreign markets. U.S. government resources that assist in identifying and navigating new export opportunities are provided, in part because comparable private sector services are often beyond the means of many new clean energy companies.

c. Isn't subsidizing efforts for only a few select companies harmful to the U.S. competitors who have already labored to become successful exporters and developed their own expertise?

Export assistance is offered to exporters across industries. A few select programs target the clean energy sector because standard business models do not fit the industry. For example, clean energy, such as renewable energy and nuclear power, requires high up front capital investment, while the energy savings accrue over the lifetime of the project. To compensate, the OECD has authorized export credit agencies, such as the U.S. Export-Import Bank, to extend loan repayment periods to eighteen years.

4. Rather than a general appropriation contained in H.R. 5156 to fund the program, shouldn't exporters have to pay user fees to compensate the government for the cost of

services they use? Otherwise isn't the program simply socializing the costs while privatize the gains?

Although, the Administration has not yet issued an official position on this legislation, current Export promotion programs offered by the U.S. Commercial Service operate on a cost recovery approach. Companies pay a user fee to cover up to the full cost of services provided.

5. **DOE recently announced a request for information (RFI) on rare earth metals and other materials used in the energy sector - specifically those materials used in clean energy technologies such as wind turbines, hybrid vehicles, solar panels, and energy efficient light bulbs. Recognizing domestic supply and demand may not be equal, the purpose of the RFI is to help develop a "clean energy future" plan. The responses were due on June 7.**

    a. **How important is the acquisition cost of these minerals to the ability to manufacture products here in the U.S.?**

The percentage of the cost of these materials relative to the cost of the final product usually is small. The issue is that for many of these end use applications, there is not an adequate mineral substitute for the rare earth elements. Therefore rare earth mineral access and availability are concerns for non-China based manufacturing of clean energy technologies, including the magnets used in batteries and in wind turbines.

    b. **If China possesses many of the minerals we need, then aren't U.S. manufacturers subject to China's willingness to sell us those minerals? Would it be more efficient for US companies to manufacture their products in close proximity to where the minerals are located –such as in China?**

Rare earth metals are found in many countries, including the United States, Canada and Australia. The United States was the leading producer of these metals as recently as 20 years ago. However at present, China produces over 90 percent of the global supply of rare earth elements but the U.S. has very little current downstream capability. Therefore, even material (in the oxide form) produced in the U.S. must get exported to China for processing, manufacturing of components, and initial assembly. Yet, if the U.S. were to build a much larger domestic manufacturing capacity in applications using magnets (e.g. wind energy) than in the near term, the U.S. manufacturers would be reliant on Chinese supply.

In the interim, China continues to reduce export quotas for rare earth elements, thereby reducing the quantities of rare earth elements available for users outside of China, including U.S. manufacturers. The U.S. Government continues to urge China to eliminate these rare earth export restraints in order to ensure that there is a level playing field for all competitors in this important sector and that China lives up to its international trade commitments.

China's strategy in doing so is to attract the value-added downstream industries to mainland China. However, the Obama Administration continues to promote growth in the manufacturing

sector and in doing this, more opportunities for American companies to grow here in the U.S. have become available, such as the DOE new Battery grant for hybrid technology and wind turbine manufacturing. Whether or not it would be more efficient for U.S. companies to manufacture in China depends on their business models. But, there is evidence that favorable feedstock prices, established supply chains, and low cost of capital is attracting multi-nationals to locate manufacturing in China.

c. How does our export of clean energy products affect our trade balance when many of the raw materials need to be imported?

As one of the most innovative and competitive sectors of the U.S. economy, renewable energy and energy efficiency technologies and services are expected to be among the major export markets over the course of the President's National Export Initiative. While restricted access to timely and cost-competitive raw materials could impede the growth in U.S. manufacturing and export of some clean energy products, the U.S. Government is committed to helping U.S. companies meet these challenges by address foreign government practices that impede trade in rare earths. Again, as market demand for rare earths increases, we expect to see the reopening of some U.S. rare earths mines, and new mining development in third countries that could reduce the tightness in global supply of these materials.

6. Energy trade has always been a difficult sector to negotiate free trade and open access.

a. How open are developing countries to our exports?

Average tariff data on products related to energy for the developing world as a whole is currently unavailable, and the data that are available for key markets are mixed. For energy subsectors (coal, petroleum, renewables, etc.) in key developing country U.S. export markets, such as China, India and Brazil, average tariffs are fairly low (between 0 and 12 percent) but the tariff range is wide. For example, China has tariffs that range from 0-35 percent and Brazil has a range of 0-20 percent on products related to renewable energy.

In addition, recently, a number of countries have been considering putting in place local content requirements in the energy sector. These could effectively create new barriers to U.S. exports by mandating the use of local goods and services. The Administration is working with foreign governments to address these potential barriers.

b. What is the Administration doing to open foreign markets and reduce barriers?

On the global level, the Administration continues to seek broad tariff cuts in agriculture and industrial goods through the WTO Doha Round negotiations. These negotiations are also addressing services liberalization, as well as elimination of relevant non-tariff barriers in the WTO Non-Agricultural Market Access (NAMA) negotiations. The Administration will also continue to press for a robust outcome in liberalizing trade in environmental goods and services, including goods and services related to renewable energy. On a regional level, the Trans-Pacific Partnership (TPP) also presents significant opportunities for increased market access in the energy sector, and negotiations with TPP countries are currently underway.

7. Some industry participants complain foreign markets uses domestic preferences for their government projects. Do you agree?

Domestic preferences arise in both government procurement requirements and in other government programs. Such domestic preferences are well documented in the clean energy sector. Until recently, China required that large wind farms in China use wind turbines that met a 70% local content requirement. China agreed to remove this requirement at the November 2009 U.S.-China Joint Commission on Commerce and Trade high level meeting, co-chaired on the U.S. side by the Department of Commerce and the Office of the U.S. Trade Representative. Canada's Ontario Province has imposed local content requirements that companies must meet to take advantage of new renewable energy feed-in tariffs which will impact U.S. renewable energy suppliers' market access. Brazil levies a 14% tariff on imported wind turbines.

India has placed far reaching local content requirements on implementation of its Jawaharlal Nehru National Solar Mission (NSM) which targets the installation of 20 gigawatts of solar energy by 2022. The NSM will be conducted in three phases. During the first phase it will be mandatory for projects based on crystalline silicon technology to use modules manufactured in India. During the second phase, it will be mandatory for all projects to use cells and modules manufactured in India. These restrictions will significantly limit U.S. export potential.

The United States is a party to the plurilateral WTO Agreement on Government Procurement (GPA) and bilateral and regional Free Trade Agreements. These agreements require the 52 countries that are parties to one of the agreements to to not apply buy local preferences with respect to the parties and procurement covered under the agreements. The parties are also required to apply to fair transparent and competitive procurement procedures for purchases subject to those agreements. Countries that are not party to either a U.S. FTA or to the GPA have made no commitments to the United States to not enact domestic preferences to meet specific economic objectives. U.S. Buy American provisions apply to U.S. procurements that are not subject to GPA or an FTA. Among our top priorities is expanding government procurement opportunities in foreign markets for U.S. businesses and their workers by expanding the countries that are party to the GPA and including similar commitments in future FTAs.

8. Are there any concerns that U.S. energy markets need to be opened to further competition as a reciprocal trade negotiation?

The fair and reciprocal opening of market access between two countries has generally had a net positive impact on the economies of both countries, regardless of the sector.

a. If our markets open to competing energy products, such as ethanol, how will that affect our net trade balance and jobs in the energy sector?

Any impact on the U.S. energy sector would reflect the reciprocal nature of trade negotiations, not just the further opening of the U.S. market, and can only be assessed in that context. Speculating on the specific impact of a hypothetical trade policy change is difficult, particularly

with respect to a specific product. However, bear mind that the ultimate goal in any trade negotiation is to increase productivity, worker compensation and living standards in the United States, and, in times of high unemployment, contribute to job recovery with growth in export-supported jobs.

b. Are jobs in the "clean technology" additive or substitute of existing jobs?

It is unclear what the question assumes is "clean technology". While it is difficult to draw a direct correlation between the addition of jobs in one sector and the reduction in a different sector, in general investments in clean energy technologies are a net positive job creator due to the fact that clean energy technologies have a higher labor intensity than traditional energy sources. To determine the degree would require an in depth study on the specific clean energy technology and its role in the broader production and consumption of energy.

c. At what point do clean technology jobs eliminate existing energy jobs and fail to be a net positive job creator?

To answer this question would require evaluating a specific investment in clean energy. In general, investments in clean energy technologies are a net positive job creator due to the fact that clean energy technologies have a higher labor intensity than traditional energy sources.

d. If clean technology exports increase to $40 billion and generate up to 750,000 jobs by 2020 as you state the Department of Energy estimates, what will be the loss of existing jobs cannibalized by the clean technology companies?

It is not clear how the expansion of exports would lead to a cannibalization of existing domestic jobs.

9. Of the $36.7 billion in Federal funds used from the American Recovery and Reinvestment Act directed towards clean energy technologies, how many new jobs were created? How many of the new jobs can continue without continued taxpayer support?

The Department of Energy administers the dispersal of ARRA funds directed towards clean energy. We would have to defer this question to the Department of Energy.

10. Your unit works to enhance the global competitiveness of U.S. firms. What are the biggest barriers to our firms being globally competitive? (e.g., regulatory, tax, labor costs, intellectual property rights/protection, etc.?) What domestic rulemakings most affect our companies' global competitiveness?

The barriers to competitiveness vary by industry, so it's difficult to cite one or a few barriers whose removal would help all U.S. firms become more competitive. One of the ways the government can improve competitiveness in any industry is to address market failures where they occur so that markets function the way they should. However, addressing market failures (for

example, through regulations) can have unanticipated side effects. MAS' Regulatory Affairs program works within the interagency process to ensure that the goals of such regulations are met without unnecessarily burdening U.S. competitiveness.

With respect to the U.S. clean energy industry in particular, barriers to competitiveness include lack of consistent domestic policy incentives to deploy clean energy technologies, lack of intellectual property protection in key markets, foreign incentives to manufacturers locating abroad, and generous government support for foreign exporters. As an example of the impact of this, the early lead that the United States held in renewable energy innovation in the 1970s and 1980s was lost to European and Japanese companies that benefitted from strong domestic markets.

11. Are our clean energy technology markets open to foreign competition and WTO-consistent?

Commerce works hard to help ensure that U.S. clean energy policies and programs are structured and implemented in a manner consistent with U.S. law and U.S. obligations under the WTO.

a. Do any foreign governments have energy related policies that are potentially countervailable or that have WTO-inconsistent subsidies? If so, which countries? What is the Administration doing about it?

As part of the National Export Initiative, Commerce has redoubled its commitment to utilize the tools at its disposal under U.S. law to confront unfair and illegal trade practices, including foreign subsidies practices that injure U.S. workers and companies. Commerce's Import Administration (IA) investigates potentially countervailable subsidies, including those that relate to a foreign government's energy policies, when it receives a properly alleged and supported allegation of such subsidies, consistent with U.S. law, by a US petitioning industry in the context of a countervailing duty (CVD) petition or investigation.

IA has received and investigated such allegations in CVD cases. Some recent examples, involving investigations of subsidized products from China, include the government provision of subsidized electricity to manufacturers, and the provision of loans and R&D assistance to promote energy-efficient manufacturing processes. In addition, IA has a Subsidies Enforcement staff dedicated to identifying and monitoring foreign subsidy practices, including those related to energy policies, to determine whether such practices are WTO-inconsistent or otherwise adversely impact the interests of U.S. companies and workers.

IA is currently tracking clean energy technology-related initiatives in various countries, including India, Canada, China and the EU. Working closely with the U.S. Trade Representative's Office, IA pursues resolution of such foreign practices, as appropriate, through a number of informal and formal means including, for example, bilateral government-to-government discussions, more formal engagement under the WTO's subsidy notification and monitoring process, or through a formal complaint under the WTO dispute settlement mechanism.

12. To qualify for an ITA-led trade mission, does a business need to be of a certain size and maintain existing exports to other countries? If so, does that indicate that the businesses has the competency to navigate foreign markets on their own?

The criteria for participation vary by trade mission. The trade mission statement always specifies the applicable criteria. The primary criteria for participation in Department of Commerce trade missions are suitability of the U.S. exporter's product or service to the mission's goals; their potential for business in the target market, including likelihood of exports resulting from the trade mission; and consistency of the applicant's goals and objectives with the stated scope of the trade mission. Generally, a U.S. company need not be of any specific size to be eligible to apply. Export experience requirements may vary. For some missions, based on the targeted sectors and markets, prior export experience has been required. Other missions have specifically encouraged participation by new-to-export companies. Prior experience in one market does not necessarily translate to ability to enter a new export market easily and independently.

13. You have stated that many firms face complex domestic regulatory requirements. What are these requirements and how can we reduce these burdens?

U.S. businesses must comply with a number of regulations promulgated by agencies in the executive branch, including those related to health, environment, safety, and security. MAS' Regulatory Affairs program works within the interagency process to ensure that the goals of such regulations are met without unnecessarily burdening U.S. competitiveness.

Renewable energy firms in particular face an array of federal, state and local regulations concerning siting, permitting, and electricity interconnection requirements. Creating standardized incentives, streamlined permitting requirements, and interconnection requirements would speed the deployment of clean energy technologies.

The Honorable Deborah Wince-Smith
President & CEO
Council on Competitiveness
Questions for the Record
Clean Energy Technology Manufacturing and Export Assistance Act

The Honorable Joe Barton

1. **Increased exports promise more jobs here at home. Given that, which will have greater economic impact and generate more jobs: the clean tech export fund proposed in H.R. 5156 or the FTAs on which this Congress has failed to act?**

   The clean tech export fund proposed in H.R. 5156 offers significant job growth potential, however it cannot work in isolation. To maximize clean tech job growth, U.S. manufacturers must gain greater access to foreign markets. FTAs are a key way to penetrate these markets, and broaden American manufacturers' consumer base beyond our own borders. The clean tech export fund must be understood in the greater context of U.S. trade agreements and the geopolitical realities governing international trade. Job growth will occur as a result of the combined efforts of passing FTAs and advancing ideas like the clean tech export fund.

2. **You discuss in your testimony the importance of creating the right environment to manufacture at scale. But we all know that the United States has lost manufacturing jobs to foreign competitors in sectors ranging from textiles to consumer electronics. What makes you believe we can be competitive in the clean technology sector and that we will not lose jobs to countries with cheaper labor?**

   Production line manufacturing has been vanishing for decades from the American employment landscape for a numbers of reasons including greater efficiency and technology deployment. However, the clean tech sector demands a well-educated and highly skilled workforce, the type which will not be easily exported. In the recent Council-Deloitte Global Manufacturing Competitiveness Index, CEOs around the world identified talent driven innovation as the number one competitiveness driver. Though off-shoring may be tempting for low-wage low skilled manufacturing positions, world class firms cannot easily export high-skill clean tech jobs.

3. **You've stressed the need to capitalize on our position as a leader in high performance computing. How long will it be before competition threatens our leadership position in this area?**

   U.S. leadership in HPC is being challenges now. As of June, China possesses one of the most powerful supercomputers in the world, second only to the Cray Jaguar at Oak Ridge National Lab in Tennessee. Failure to not only retain, but actively expand our HPC capacity, both in

terms of development and deployment, will significantly inhibit America's ability to take advantage of the most advanced modeling, simulation and computing capacity.

4. **You have testified that we need to have the infrastructure in place to reap the value from our investments. Can you explain what you mean and your recommendations for capturing that value?**

Infrastructure affects the ability of firms of all sizes to compete and drives "site-ing" decisions from the smallest start-ups to the largest multi-national enterprises. A world class infrastructure must be a part of the American competitiveness equation. Specifically, increased electrical capacity and deployment of smart-grid technology are essential to the long-term competitiveness outlook for the U.S. With energy demands on the rise annually, we must take the steps now to ensure our electrical capacity is able to meet our nation's increasing needs.

Transportation and telecommunication infrastructures are equally important to our competitive outlook, as they are essential to move our nation's citizens, products and ideas.

We must have the best roads, railways and telecommunication networks to meet the needs of the professional and private sectors, and to attract the best and brightest workers, firms and industries. Our global competitors are aggressively developing world-class infrastructures, and we face the very real risk of losing talent and industry to countries who can simply offer a better set of tools with which to operate.

5. **You have stated that we need to incorporate manufacturing design into our considerations upfront in the innovation process. Do our labor and environmental regulations permit such new manufacturing capabilities?**

Favorable regulatory environments are key drivers of innovation, and contribute to the innovation ecosystem which must be in place to foster the most advanced, cutting edge technologies and goods. Incorporating manufacturing design is more a function of recognizing the evolving nature of what manufacturing is, rather than the need for any specific regulatory change.

6. **Your testimony quotes that "U.S. manufacturing of clean energy technologies lags behind its international competitors on almost all fronts." The quote goes on to reference that we have no capacity in high speed rail manufacturing. However, isn't that just one example of a technology we have been unable to fully utilize for a number of reasons that has left it as an unviable means of transportation?**

Yes. And there are a number of similar examples.

7. **Why have we fallen from first to fifth among top solar manufacturing countries and now import solar cells from Europe and Asia?**

Our country does not foster manufacturing solar cells at scale, nor does it incentivize the deployment of solar technology into our existing electrical infrastructure. The barriers are too great, and the costs are to high to move solar cells from development to production.

8. If revenue is expected to triple within the decade for wind, solar, and biofuels, why do we need to subsidize it in the U.S.?

To capitalize on the apparent boon from alternative energies, we must cultivate an environment that allows them to be developed and manufactured domestically. Scaling costs for any of the aforementioned technologies make unilateral private-sector action cost prohibitive.

More alarming, however, is the fact that other nations are embracing these technologies with increasing frequency and intensity. Through subsidies and favorable regulatory policies, nations like China are attracting the companies and scientists capable of driving the advancement of these technologies. The nations who lay the groundwork for widespread manufacturing of alternative energies in 2010 will be the ones reaping the economic benefits in 2020.

9. To what extent does the lack of strong IP protection threaten our ability to grow our exports?

As the global leader in innovation, strong IP protection means protecting one of our greatest assets. IP forms the foundations upon which products, and in turn firms and industries are built. Failure to protect this knowledge leaves our innovators and entrepreneurs vulnerable to foreign competition; competition which seeks to capitalize on the significant intellectual and financial resources we have invested at home.

10. You support the continuation of the Doha Round while simultaneously working to remove tariffs and non-tariff barriers without creating a dual track of trade liberalization. How do you suggest we do this and what hope do you have for the Doha round to be revived?

Advancing greater trade liberalization through the Doha talks is imperative for long-term economic growth in the United States. To compete with China, India and other population giants, we must have access to foreign consumers. A revival of the Doha round and removal of existing trade barriers, even in the absence of dual-track trade liberalization, are relatively straightforward means to reach this end, and are not mutually exclusive. My hopes for a revival of the Doha round are pinned to the increasing realization in the America and around the world, that trade liberalization is essential to reinvigorating the 21st century global economy in a significant and meaningful way.

11. You have advocated for financing support derived from 30% of carbon taxes. Wouldn't such a policy simply be shifting wealth from current to potential future manufacturers?

A price on carbon would be a dual innovation stimulant, by encouraging current manufacturers to seek new carbon mitigating technologies and providing funding for start-up enterprises who wish to enter the manufacturing space.

HENRY A. WAXMAN, CALIFORNIA
CHAIRMAN

JOE BARTON, TEXAS
RANKING MEMBER

ONE HUNDRED ELEVENTH CONGRESS

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE

2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515–6115

July 13, 2010

Owen E. Herrnstadt
Director of Trade and Globalization
International Association of Machinists & Aerospace Workers
9000 Machinists Place
Upper Marlboro, MD 20772

Dear Mr. Herrnstadt:

Thank you for appearing before the Subcommittee on Commerce, Trade, and Consumer Protection on June 16, 2010, at the legislative hearing on H.R. 4678, the "Foreign Manufacturers Legal Accountability Act," and H.R. 5156, the "Clean Energy Technology Manufacturing and Export Assistance Act."

Pursuant to the Committee's Rules, attached are written questions for the record directed to you from certain Members of the Committee. In preparing your answers, please address your response to the Member who submitted the questions.

Please provide your responses by July 27, 2010, to Earley Green, Chief Clerk, via e-mail to Earley.Green@mail.house.gov. Please contact Earley Green or Jennifer Berenholz at (202) 225-2927 if you have any questions.

Sincerely,

Henry A. Waxman
Chairman

Attachment

1. Increased exports promise more jobs here at home. Given that, which will have greater economic impact and generate more jobs: the clean tech export fund proposed in H.R. 5156 or the FTAs on which this Congress has failed to act?

> *A careful and comprehensive analysis should be conducted by government with respect to HR 5156 and all FTAs, including those that are proposed like KORUS and those that are already in force. The analysis should include careful attention to determining the number and kind of domestic jobs that will be (and have been) directly and indirectly impacted, as well as their location and duration.*

2. You raised several good points in your testimony, many of which you heard touched upon during opening statements. For instance, you highlighted the unlevel playing field on which our domestic firms play in other countries.

   a. You testified that the government must work to remove trade barriers in foreign markets. Could you expand on this point and make recommendations on how this can be accomplished?

> *Other governments have sophisticated offset policies that require the transfer of production and/or technology in return for a sale. The U.S. should be working multilaterally and bilaterally to curtail the use of these market distorting mechanisms.*

   b. If foreign markets remain closed to our products, then will this $75 million fund provide any benefit as we'll have no place to sell our goods? Is this an example of putting the cart before the horse?

> *Working toward opening markets and the goals outlined in HR 5156 can be undertaken at the same time.*

3. We've heard from several experts that many of the raw materials necessary for clean-tech manufacturing are either limited or non-existent here in the U.S. For instance, we have only one rare earth mine in the U.S. and it sat idle or under-produced for many years pending government approval to restart operations. We also have little to no domestic sources of heavy rare earth minerals. In your testimony, you raised a concern which I share—that unless we have access to domestic sources of these materials, we may simply subsidize our foreign competitors.

   a. If this is the case, how do we avoid using these taxpayer dollars to "facilitate this off-shoring of work," as you phrased the problem in your testimony?

> *The key is to use taxpayer money to create incentives for production of manufactured goods here at home. We should also examine our current policies to make certain that we are not using taxpayer money to encourage offshoring.*

b. Again, if our natural resources are either nonexistent or limited (due to either natural occurrence or administrative barriers), how would we determine what domestic content requirements should be as you have advocate in your testimony?

As reflected in my testimony, the definition and implementation of domestic content requirements throughout government are not transparent and not uniform. We should begin by making certain that domestic content as applied is strictly defined so that variables that are relatively easy to manipulate, such as marketing costs, are not included in domestic content calculations.

4. In your testimony you urged U.S. companies to make use of the assistance of the Ex-Im Bank. What value-added will this new fund/program have over and above what the Ex-Im Bank and the ITA provide?

The answer depends on how the fund is set up and implemented.

5. You suggest that "if enacted, the Bill would assist U.S. companies in exporting clean energy products and services." Yet, if natural resources are limited or non-existent and foreign markets are closed to us, how will this bill increase our exports?

I am not certain that I understand the question. My testimony focused on domestic manufacturing. The question may be best directed to the Bill's sponsors.

6. Recent reports indicate China intends to restrict exports of the vital rare earth elements. In doing so, it will reduce supply while demand climbs, thus pushing costs higher. Even if the Federal government begins to break down trade barriers to foreign markets, do you have thoughts on how domestic firms can become and maintain competitive pricing given rising component costs, particularly combined with the significant labor cost differential?

U.S. companies should be working to support the Federal government in eliminating trade barriers that have been created by other countries and in cooperating with trade enforcement. U.S. companies should also be exerting their influence to make certain that national laws reflect and enforce the ILO's core labor standards.

Jack Crawford Jr. Jadoo Power

The Honorable Joe Barton

1. Increased exports promise more jobs here at home. Given that, which will have greater economic impact and generate more jobs: the clean tech export fund proposed in H.R. 5156 or the FTAs on which this Congress has failed to act?

   Crawford: I cannot say which have a greater economic impact or impact on job creation. However, in terms of specific affect upon small businesses producing clean energy products, I believe that the clean tech export fund will likely have a greater economic impact because it is focused specifically on this sector. Even with free trade agreements, we will not have leveraged the innovations and products of our small businesses effectively to take advantage of those FTAs. I believe a focus on clean tech entrepreneurship is a priority and must come first for us to be successful with exporting.

2. You testified that this bill will provide companies with export assistance to find new markets for clean energy products and services. Many trade experts identify trade barriers to foreign market access as one of the chief underlying causes of the trade deficit in this arena.

   a. If there is little to no access to open markets, and there are few to no level playing fields in markets that may be open to us, will the provisions of this bill create any significant benefits? Could taxpayer money be better spent?

      Crawford: I agree that trade barriers to foreign markets are an impediment, but export assistance is a benefit to small companies without the resources to identify specific foreign markets as a first step.

   b. Are we putting the cart ahead of the horse if we do not address market access first?

      Crawford: No because we need assistance to transform innovation into products before we can formulate a global go-to-market strategy.

   c. How will this bill address the problem of trade barriers?

      Crawford: It will not directly address the problem of trade barriers. However, having small companies well positioned to enter foreign markets will provide them with direction and focus to address the trade barrier issue. If we have domestic companies that are not equipped to address foreign markets, we have little to gain from removing trade barriers.

3. You testified that the bill will provide US firms with assistance to find new ways to reduce production costs, and promote innovation, investment and greater productivity. Yet, you also testified about your own success in these areas as a small alternative energy company.

a. Why should we spend taxpayer dollars on companies that do not possess the creative talents that are the keystone of success, those talents that companies such as yours possess?

Crawford: By assisting small businesses to reduce production costs, promote innovation, increase investment, and improve productivity, there will be additional motivation and momentum behind efforts to overcome the typical challenges of new market opportunities. Using the Internet as an example, taxpayer dollars supported the early years of innovation and now the US leads the world with products and services in this new market. It's clear to me that the US has this same opportunity with clean tech –and that the leadership will come from small companies that grow into big companies. It was venture-backed innovators like Google, Yahoo, and Facebook that led the way with "new media" in the Internet sector – not the large established media companies. I believe there could be global leaders created in the US focused on residential energy storage, commercially distributed wind generation, portable solar, and fuel-cell powered "green" generators in the coming years.

b. Are we simply subsidizing companies that are not the fittest in a survival of the fittest market?

Crawford: Many American companies have products that could be globally competitive, but do not have the ability to identify and address foreign market opportunities. In my opinion, the lack of access and resources to address foreign markets does not equate to lacking "fitness to survive". The stimulus funding has provided tremendous support to clean tech innovation – and this bill will help with productizing and sales in the global economy.

c. You testified that foreign suppliers may have inferior products but have subsidies and other government support, creating an unlevel playing field for your products. Along those lines, won't this fund just end up subsidizing your domestic competitors that do not possess the innovative spirit your company has demonstrated?

Crawford: Domestic competitors need to not only have access to foreign markets but they must also possess superior products. This fund will not help companies with inferior products compete in foreign markets – it will have a filtering process that enables the identification of the best products and companies in the US.

4. We have heard much about access to natural resources being a speed bump on this clean energy road. If we do not increase access to those domestic sources that exist, aren't we essentially subsidizing your competitors by forcing foreign sourcing?

Crawford: I believe that certain natural resources such as neodymium which is used to create high performance electric motors and generators are most abundant in certain foreign countries, and economically viable domestic

alternatives are presently not known to exist. Expanding domestic exploration for unknown deposits of such materials might be a more useful objective.

5. From your written testimony, it sounds like your chief concern is a lack of understanding on how the export process works. What would this new program do to educate firms such as yours that ITA does not already do?

Crawford: Our chief concern is creating a level playing field so that US companies have the same advantages in creating manufacturing capabilities as do our foreign competitors. While education is about the export process is important, we do not see it as the primary benefit of the new legislation. However, we are hopeful that a portion of the new legislation will direct some educational resources to small clean tech companies.

6. You and many industry observers have expressed concern over the state of intellectual property rights (IPR) and protections in other countries. At the same time, a number of advocates suggest this type of technology should simply be transferred to developing countries.

   a. Do you have any thoughts on how technology transfer could impact domestic clean energy producers?

Crawford: The simple transfer of our technology to foreign companies would not help domestic clean energy producers. Innovation protected by intellectual property rights is often the foundation and justification that attracts seed capital to new companies. As domestic companies explore selling their products internationally, a recurring concern is the lack of protection against a foreign company reverse engineering and replicating their product. We are strongly in favor of measures that would help to strengthen IPR in other countries.

   b. Do you have any thoughts on how we can address the concerns over IPR?

Crawford: We need to create agreements with foreign countries that require them to not only enact stronger IP protection laws but also require proper enforcement of those IP protection laws. In some way, we need to motivate foreign companies who ship products to the U.S. to encourage their own governments to strengthen their IP laws and enforcement procedures.

Anthony Kim, Policy Analyst, The Heritage Foundation

Follow-Up Responses Concerning
June 16 Hearing on *Clean Energy Technology Manufacturing and Export Assistance Act*

The Honorable Joe Barton

1. **Increased exports promise more jobs here at home. Given that, which will have greater economic impact and generate more jobs: the clean tech export fund proposed in H.R. 5156 or the FTAs on which this Congress has failed to act?**

   Free trade agreements will be far more effective in creating more dynamic and meaningful jobs in America than the proposed Clean Tech Export Fund. Our trade engagement with different parts of the world via three pending FTAs (with Panama, Colombia, and South Korea) ensures that American companies compete in the vivacious global market and expand their market shares.

   The Clean Tech Export Fund proposed in H.R. 5156 ignores and suppresses more practical trade policies that will transform solid economic opportunities into real gain. The bill seems to be rather short-sighted and wishful, only adding more government meddling into the private energy sector. Perhaps, a few jobs would be created in Sacramento CA, the "clean energy capitol of the U.S.," but the buck is likely to stop there, not able to spur more sustainable economic growth that would generate vibrant job creation.

2. **Would the $75 million dedicated in this bill be better served on trade missions devoted to opening foreign markets?**

   Absolutely. The bill's vague and ambiguous language does not specify where the money will actually end up and will possibly waste the taxpayers' money. Furthermore, the bill will likely have minimal effect on the creation of American jobs. By contrast, if the money were to be spent on trade missions devoted to opening foreign markets via freer trade, it lends itself to a much broader effects. Free trade leads to economic growth. This economic growth will spur job creation and its effects are not limited.

   The proposed bill may only create $75 million of jobs, products, etc. The end result could be $75 million dollars spent and probably little profit or economic growth will incur as a result of the bill. On the other hand, opening foreign markets via ratifying the currently pending FTAs will have much more extensive and dynamic effects. The possibility of economic growth and job creation will exceed far more than $75 million. The long term, positive effects of sustained economic growth through trade will far outweigh the minimal short term gains in job growth in a particular sector.

3. **You testified that "our strategy must be driven by real market conditions, not by government financial assistance."**

   a. **Can you please expand on what you mean by "real market conditions?"**

Anthony Kim, Policy Analyst, The Heritage Foundation

Follow-Up Responses Concerning
June 16 Hearing on *Clean Energy Technology Manufacturing and Export Assistance Act*

A strategy driven by "real market conditions" harnesses the power of free markets so that buyers and sellers may make deals without government interference. Real market conditions encompass a free market system in which decision makings regarding production, consumption, resource allocation, and price levels are conducted by natural market interactions based on supply and demand.

This spurs competition, innovation and new products. Additionally, the system naturally identifies markets that consumers want and could be tapped into. Minimal government intervention encourages competition and greater innovation, benefitting both producers and consumers. History shows us that free market systems are highly effective in promoting vibrant economic growth.

b. **Please explain why this new fund is not compatible with either "real market conditions."**

The proposed Clean Tech Export Fund is not compatible with these real market conditions because it does not encompass many aspects listed above. Government allocation of funds interferes with the full realization of the power of free markets. Subsidies, which would inevitably be the focus of the funds, often lower incentives to increase the subsidized firm's competitiveness (i.e. become more innovative and lower prices), making them more dependent on subsidies. Choosing to award certain companies with government funds discriminates against potentially more innovative firms that would otherwise have been effective sources of economic growth and job creation.

4. **You referenced existing government resources for investment, technology development, and exports. What are those existing resources and who offers them?**

A variety of agencies help companies in the private sector to increase technological developments, investments, and exports. For example, some effective government resources already exist in the Department of Commerce. Various technical assistance programs on the promotion of export and investment is available in the department. The U.S. Commercial Service gives American companies a state-by-state and city-by-city Export Assistance Center. This sector of the Department of Commerce is solely for the purpose of helping U.S. companies to export. They provide consulting, market research, trade finance, advocacy, and help companies find potential customers and partners.

5. **What value-add will this new fund have over and above what the Ex-Im Bank and the ITA provide?**

The Ex-Im Bank provides financing to support U.S. exports, and its support for environmentally beneficial exports has been of long-standing congressional interest.

Anthony Kim, Policy Analyst, The Heritage Foundation

Follow-Up Responses Concerning
June 16 Hearing on *Clean Energy Technology Manufacturing and Export Assistance Act*

Currently, Congress directs the Ex-Im Bank to allocate 10 percent of its annual financing to renewable energy, energy efficient end-use technologies, and other environmentally beneficial exports.

The ITA is committed to helping U.S. industries and firms enhance their competitiveness in exporting green technologies. From working with US manufacturers to improve the energy efficiency of their operations to hosting industry events on low carbon energy sources, The ITA is actively involved in assisting U.S. interests aspiring to take advantage of the green energy market.

The proposed Clean Tech Export Fund seems to be redundant in the sense that both the Ex-Im Bank and the ITA address relatively the same interest that the fund aims to focus on. Without adding any meaningful values, the fund intends to offer financial assistance to American clean energy firms, perhaps more specially than the Ex-Im Bank or the ITA. However, it cannot be denied that the similar assistance is also reflected and implied in the functions of both the Ex-Im Bank and the ITA.

6. **You testified that liberalization of trade is one of the keys to decreasing our trade deficit in this arena.**

   a. **What are the most common trade barriers?**

      The most common trade barriers include basic tariffs and nontariff barriers that include quotas, import licensing, export subsidies, and other numerous customs/administrative impediments to free trade.

   b. **What is our government currently doing to address such barriers?**

      Through various trade pacts over the years, the U.S. has been trying to dismantle various trade barriers. At the same time, the U.S., like other countries, utilizes other mechanisms in the World Trade Organization in order to address trade impediments.

   c. **Do you have any recommendations on what we should do to address those barriers?**

      The U.S. needs to be more proactively involved in dismantling trade barriers by demonstrating leadership in global free trade. Getting rid of price-distortive subsidies is certainly a right step towards ensuring freer trade.

7. **In addition to closed foreign markets, we have heard the two other primary stumbling blocks to increased exports are diminished or no access to domestic natural resources and the significant trade differential between the U.S. and foreign competitors. Could you please expand on those points?**

Anthony Kim, Policy Analyst, The Heritage Foundation

Follow-Up Responses Concerning
June 16 Hearing on *Clean Energy Technology Manufacturing and Export Assistance Act*

The government has imposed many onerous regulations that restrict our ability to tap into our own natural resources. Because of the restrictions imposed by the government, domestic production that requires those natural resources has become more costly. The United States, though blessed with enormous supplies of natural gas, oil, and other energy sources, suffers from high prices because of government imposed restrictions. When these prices become too high, American firms turn to a cheaper source: foreign resources. Since we cannot use our own resources cheaply, we import them from other countries and force ourselves to become more dependent on them. This not only increases imports, but has also undermined future economic growth, ultimately creating domestic job loss.

8. **If we do not increase access to domestic sources of natural resources – at least those that exist in the U.S. – required by so many of the clean energy technologies, do we risk essentially subsidizing our foreign competitors by forcing foreign sourcing? What is the likely net effect of this scenario on the trade deficit in this arena?**

If we do not increase access to domestic sources of natural resources required by so many of the clean energy technologies, we absolutely risk subsidizing our foreign competitors by forcing foreign outsourcing. If government restrictions result in outsourcing to foreign competitors, our trade deficit will grow. A clean energy technology company requires natural resources in order to function. They must get them somewhere. Government restrictions inhibit domestic resource procurement, causing prices to increase. U.S. companies import foreign resources because they are the cheapest option. Even if clean energy companies will be able to export their products eventually, they will have to import the resources necessary to create the final products. Because energies such as oil and natural gas are more efficient than current clean energy, the current trend of importing natural resources will continue until the value of clean energy is greater than traditional fossil fuels. Only the free market can signal this relationship through prices, and subsidizing green energy interferes with these market forces.

OVERSIGHT OF THE CONSUMER PRODUCT SAFETY COMMISSION: PRODUCT SAFETY IN THE HOLIDAY SEASON

THURSDAY, DECEMBER 2, 2010

U.S. SENATE,
SUBCOMMITTEE ON CONSUMER PROTECTION, PRODUCT SAFETY, AND INSURANCE,
COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION,
Washingtan, DC.

The Subcommittee met, pursuant to notice, at 10:05 a.m. in room SR–253, Russell Senate Office Building, Hon. Mark Pryor, Chairman of the Subcommittee, presiding.

OPENING STATEMENT OF HON. MARK PRYOR, U.S. SENATOR FROM ARKANSAS

Senator PRYOR. I will go ahead and call our hearing to order here, in the Consumer Protection, Product Safety, and Insurance Subcommittee, on the oversight of the Consumer Product Safety Commission.

I want to join my—I want to thank my fellow Senators for joining us today—and I want to join all my fellow Senators in thanking the Commission and the other witnesses for being here today. We really appreciate your time and your attention to these very important issues.

This is a timely discussion, in light of the current holiday shopping season, a time when the safety of products on store shelves is paramount.

I'd like to express my gratitude to Chairman Rockefeller for allowing me to hold this hearing, and to his excellent staff for all the great things that they've done in preparation of this, and also, of course, of the minority staff, because they've been great to work with, as well.

Each year, billions of toys are purchased by consumers and end up in the hands of children. Unfortunately, not all these toys are safe. Last year, 12 children died as a result of injuries related to toys, and thousands ended up in emergency rooms. While it's difficult to prevent all such injuries, it is the mission of the Consumer Product Safety Commission to protect the general public against unreasonable risk of injury and death associated with toys and other consumer products, and to assist consumers in evaluating the comparative safety of those products.

Each year, on average, over 28,000 deaths related to consumer products under the agency's jurisdiction occur. Researchers esti-

mate the cost of deaths, injuries, and property damage associated with consumer products totals more than $800 billion annually in the United States. Consequently, the importance of this agency and the efforts to reduce these statistics while building safer communities and a safer marketplace cannot be overstated.

I welcome the new leadership of the Consumer Product Safety Commission. Chairman Tenenbaum took the helm in June 2009, and, since then, she's demonstrated impressive initiative and energy in implementing the law and addressing product safety problems. I look forward to hearing her testimony and exploring activities under her direction.

Just last week, the Commission voted to adopt a final rule establishing the CPSC's publicly available product safety information database, as mandated by Congress. A repository of consumer complaints and incident reports, the database is designed to grant all of us timely access to critical product safety information, allowing us to scan for trends or patterns of potentially hazardous product in the marketplace.

As one of the lead authors of the database revision and the law, I support the Commission's final rule, and I'm pleased that the Commission has crafted the rule in a manner that will make this information available widely to the general public. In particular, I endorse the Commission's effort to empower all consumers who have verified information regarding a product safety hazard to report that incident.

I applaud Chairman Tenenbaum's leadership in this area, which is in keeping with congressional intent behind the provision to maximize reporting of product safety incidents and to make this information accessible to the general public as quickly as possible. And I look forward to its official launch in March 2011.

Just as a reminder: Before the Congressional overhaul, the CPSC was an agency in distress. Its staffing levels and funding levels had been choked, over time. On numerous occasions, it lacked a full quorum of commissioners, inhibiting its ability to conduct important official business. Public notification of public hazards was inadequate. The marketplace was replete with dangerous and, in many instances, toxic products that were compromising the safety of American families, not least of all our children. By 2007, news reports were exposing millions of defective toys in the stream of commerce: lead-tainted children's jewelry; tiny magnets posing ingestion hazards; Aquadots that converted to the date-rape drug, once ingested. The CPSC was slow to act to protect Americans, and it was only after newspapers shown a spotlight on infant deaths and injuries that the Commission chose to take action.

Congress, and in particular this committee, responded to the crisis in product safety by overhauling the agency, granting it essential new tools and authorities to enable it to properly execute its mission and protect members of the public. The Consumer Product Safety Improvement Act was the first significant overhaul of the federal Consumer Product Safety laws since the CPSC's inception.

I'd like to now turn it over to the Ranking Member, my neighbor and friend from Mississippi, and say that we look forward to revisiting the CPSIA over the course of this next Congress. And we always have open doors to listen to industry and advocacy groups, to

talk about some of the—maybe some of the things we got right and some of the things maybe we didn't get so right when we passed the legislation.

But, Ranking Member Wicker, thank you for being here. Look forward to your opening statement.

STATEMENT OF HON. ROGER F. WICKER, U.S. SENATOR FROM MISSISSIPPI

Senator WICKER. Thank you, Mr. Chairman. And thank you for that concluding statement, which I think is very valuable and helpful. And I do look forward to revisiting this issue during the next Congress, should you and I be allowed to continue in this capacity. And thank you for holding this hearing.

The CPSC is a small agency with a large but important mission: to regulate more than 15,000 consumer products, keeping the public safe from preventable injuries and deaths caused by unsafe and defective products. As the title of our hearing suggests, we are especially reminded of the importance of this charge during the increased consumer buying that comes with the Christmas season. I thank the Chairman for taking this opportunity to provide oversight and for his commitment to consumer safety.

The CPSC is currently involved in many areas that affect American consumers. From its efforts looking into dangers in certain types of cribs to the continuing investigation into tainted drywall that has significantly impacted many of my constituents, there are many Commission activities which deserve our attention. However, for the last 2 years nothing has dominated the Commission more than the implementation of the CPSIA. The CPSIA was enacted in August 2008, largely in response to concerns over numerous toy recalls for violations of existing lead limits in paint. It represents the most significant changes to the Commission's regulatory environment since it was first created.

The intention was a noble one that I think we all support efforts to improve safety. The law attempts to do so by tightening the regulations over children's products, focused primarily on reducing the content of lead and phthalates. Unfortunately, despite the hard work that was put into the law and the Commission's efforts to implement it, the result has not been what was intended.

The last 2 years have seen this law increase costs and create uncertainty for businesses, requiring significantly increased compliance requirements and unnecessary testing of "safe" products. Some affected businesses report that, prior to the CPSIA, they were responsible for complying with less than 200 pages of rules, but now that number has grown to nearly 3,000 pages. From 200 to 3,000. This will continue to increase as more rules are implemented and rewritten.

For many small businesses, the burden is overwhelming and the cost of trying to comply is simply too much to bear. During a time when unemployment, nationally, hovers near 10 percent, our government should be doing everything possible to promote job creation along with safety. This law has had the exact opposite effect, particularly on small business. The CPSIA has reduced the ability of many businesses to make a profit and create new jobs.

Our second panel today includes Jill Chuckas, who will testify on behalf of the Handmade Toys Alliance, the HTA, about the impact on their members. The HTA provided us with a document called CPSIA Business Casualties, which lists 24 small businesses that cited CPSIA as their reason for closing down, and 11 others that cited the CPSIA as one of the factors in their decision to close.

We will also hear about the numerous other businesses that have barely been able to continue operating under the bill's requirements, many of whom will be forced to close in the next year as different provisions of the law come into effect. Further, the CPSIA has reduced the incentive to innovate and invest in new markets, because it increased the cost of doing business through burdensome and expensive testing requirements.

Another list, compiled by one business feeling the burden of this law, shows 22 different small businesses that have dropped children's product lines because of this Act, limiting computer—consumer options and eliminating jobs.

Neither of these lists includes every business that has been affected. They are simply a small representation of the negative effect of the CPSIA on businesses. These numbers are particularly troubling because the impact has mostly been felt by businesses and products that are not, and have never been, a threat to child safety.

One of the primary concerns with the bill remains its removal of the Commission's ability to use risk assessment in their determinations. Even if the Commission determines that a product is not harmful, no exemption for a product that could result in the absorption of "any" lead, can be used.

I'm concerned with the upcoming end to the stay on third-party testing and the next reduction and retroactive application of the lead standard. Both of these will have significant impacts on small businesses.

I also hope to discuss, with Chairman Tenenbaum and Commissioner Northup, certain decisions that the Commission has made in implementing the law. In some places, where the law actually does allow flexibility to provide needed relief, the Commission has instead chosen to expand the law's reach and requirements, further complicating an already confusing set of rules and regulations. The application of third-party testing under certain general product safety rules the definition of a "children's product," and last week's implementation of the database are three such examples.

While concentrating on the Act, it is easy to forget that, along with these mandates, CPSC must still fulfill the rest of its charges and address other defective products that appear in the marketplace. We need to make sure that the Commission's resources are being used appropriately and are not being forced to focus solely on implementing this law, to the exclusion or detriment of the Commission's other important work. I'm very interested to hear how the CPSC is coping with this challenge.

So, thank you all.

And thanks, to our witnesses, for agreeing to appear tnday and sharing their expertise with us.

I look forward to a productive hearing.

Thank you, Mr. Chairman.

Senator PRYOR. Thank you.
Senator Udall.

STATEMENT OF HON. TOM UDALL, U.S. SENATOR FROM NEW MEXICO

Senator UDALL. Thank you, Chairman Pryor. And thank you very much for holding this hearing today, and for your leadership in consumer protection.

I think all of us remember the notorious "summer of recalls" and all the problems with imported toys. And, thanks to your efforts, and especially the landmark 2008 Consumer Product Safety Improvement Act, parents can have more confidence, this holiday season, that their children's toys are safe.

While we still had plenty of other recalls this summer, I'm pleased that there is a new emphasis on consumer protection and new leadership at the CPSC.

It's good to see CPSC Chairman Tenenbaum here, and Commissioner Northup, who I served in the House of Representatives with. I think they're both here for the first time since Senate confirmation. And it's good to have you here today with us.

I look forward to hearing about the implementation of the 2008 consumer safety legislation.

There is one issue, though, that I would like to focus on, and I'll be more indepth on it in my questioning, but I wanted to raise a pressing safety issue affecting millions of young athletes. And that's the issue of football helmet safety. It's an area where I think the CPSC could help improve children's safety. And I'll get—as I said, I'll get into more detail of that in my questioning.

But, I want to thank our witnesses today, and thank Senator Pryor once again for this hearing.

Senator PRYOR. Thank you, Senator Udall.

Both of our witnesses on the first panel have long and very impressive resumes. But, what I'd like to do, with the Committee's indulgence, is dispense with the reading of those resumes and just stipulate that they're very well qualified and we're very honored to have them here today. But, we have chairman of the Consumer Product Safety Commission, Inez Tenenbaum; and then we have one of the newer commissioners, Anne Northup.

So, Chairman Tenenbaum, would you mind leading off?

Thank you.

STATEMENT OF HON. INEZ M. TENENBAUM, CHAIRMAN, CONSUMER PRODUCT SAFETY COMMISSION

Ms. TENENBAUM. Good morning, Chairman Pryor and Ranking Member Wicker, members of the Subcommittee on Consumer Protection, Product Safety, and Insurance.

I'm pleased to have the opportunity to testify before the Committee and share with you what the CPSC has done over the past year to make this holiday shopping season safe for families and safe for children. I will provide more details later in my remarks, but parents and consumers should know that there are new safeguards in place that give them more confidence in the children's products for sale, and that they have fewer hazards than in the past.

Since becoming the Chairman of the CPSC in June 2009, I have focused on specific goals that I want to share with you:

The CPSC has focused on fair and effective implementation of the CPSIA. In less than 2 years, the Commission has published more than 50 rules and interpretive policy statements implementing the CPSIA.

Strategic planning. We recently released the Commission's new 5-year strategic plan, which lays out nur goals and objectives that will allow the CPSC to establish itself as the global leader in consumer product safety.

The Commission has created a new Office of Education, Global Outreach, and Small Business Ombudsman to provide various stakeholders, domestic and international, including manufacturers, retailers, resellers, small business, and foreign government, more information. We will have a full- time small-business ombudsman, who will be dedicated to serving the nation's many smaller manufacturer, in the area of product safety.

The Commission's import surveillance division is working more closely with Customs and Border Protection to keep dangerous products out of the United States. The CPSC has increased the number of employees at the ports of entry from 5 to 19, located in 15 different ports.

In addition to these efforts to expand the overall capabilities of the CPSC, we have also focused substantial resources on several specific hazards.

One of the most important is addressing hazards in the infant sleep environment. By the end of this year we will have a new cribs safety rule that will prohibit dangerous drop-side cribs from ever being sold again in the United States. The new standard requires higher quality wood and hardware.

We also have continued our efforts to implement and enforce the Virginia Graeme Baker Pool and Spa Safety Act. Earlier this year, the CPSC kicked off its Pool Safely education campaign, as part of a national effort to reduce child drownings and entrapment in pools and spas. During this past year alone, there have been more than 100 million views of broadcasts and print materials relating to the Pool Safety campaign.

The CPSC is also aggressively continuing efforts to provide relief to homeowners impacted by contaminated drywall. Since becoming the chairman, I have personally visited impacted homes in Florida and Virginia and know the frustration these homeowners are facing. To deal with this, the Commission has conducted the most extensive investigation in history. And I look forward to sharing that with you later on in our question and answer period.

Finally, we have redoubled our efforts to provide rapid response to new and emerging hazards; we have taken aggressive action to police the market for children's products that may contain harmful levels of cadmium. And we will also be glad to share that in detail with you later.

IT modernization. In March 2011, we will also unveil our new public database on the safety of consumer products, which was mandated by the CPSIA. The database will provide a powerful source of information for consumers, allowing them to quickly de-

termine whether the products they already own or are considering purchasing are associated with safety hazards or recalls.

In this holiday season, the true measure of our success at the CPSC is how we can help a young mother or father, who's out shopping for toys, a crib, or a highchair, find safe, reliable consumer products. Here's what the CPSC can promise them: that the toys they buy are now covered by mandatory safety standards; that the lead content and lead paint limits for toys and children's products are among the lowest in the world now; that children's products are now required to be tested for lead by an independent, third-party laboratory; that the infant bath seats and baby walkers they buy are now covered by mandatory safety standards; that the most durable in infant/toddler products, such as cribs, strollers, and play yards, now have to have postage-paid registration cards so that the consumers can fill out and return to be automatically notified for future recalls involving these products; that all children's products, to the extent practical, now have to have tracking labels that make it easier for parents to determine if a product is subject to a recall, even long after the packaging is thrown away.

And, Mr. Chairman, in the past 18 months, we have made the CPSC into a regulatory agency that consumers can trust. We are putting the interest of families first in making sure that the public knows that the CPSC stands for safety.

Thank you again for allowing me to provide this testimony today. I now look forward to answering any questions that you or members of the Subcommittee may have.

[The prepared statement of Ms. Tenenbaum follows:]

PREPARED STATEMENT OF HON. INEZ M. TENENBAUM, CHAIRMAN, U.S. CONSUMER PRODUCT SAFETY COMMISSION

Good morning, Chairman Pryor, Ranking Member Wicker, and members of the Subcommittee on Consumer Protection, Product Safety, and Insurance. I am pleased to be here today to provide an update to the Subcommittee on the specific actions the U.S. Consumer Product Safety Commission (CPSC) has taken over the past 18 months and the progress we have made to protect American children and families from both existing and emerging product safety hazards.

In August 2008, Congress passed the Consumer Product Safety Improvement Act of 2008 (CPSIA) by overwhelming bipartisan majorities. Passage of the CPSIA sent a strong message to both the Commission and the consumer product manufacturing community: the old, reactive approach to consumer product safety was not working. Instead, CPSIA directed the Commission to pursue a new proactive approach focused on keeping harmful products out of this country and—most importantly—out of the hands of infants and children.

Chairman Pryor, I know you and many other members of this Subcommittee spent untold hours working on this landmark legislation. Since assuming the Chairmanship of the Commission in July 2009, I have worked diligently to implement the CPSIA and use that Act's new authorities in a manner that is both highly protective of consumers and fair to industry stakeholders. In addition, I have focused on changing the CPSC's internal business processes, so that the ageucy is more assertive and more capable of addressing safety challenges presented by thousands of types of consumer products imported from all over the world.

Here are some specific examples of these efforts:

CPSIA Implementation: In less than 2 years, the Commissiou has published more than 50 rules and interpretive policy statements implementing the CPSIA. These rules included the implementation of several significant provisions of the CPSIA, such as uew durable infant and toddler product standards, uew product registration cards that accompany many juvenile products, and implementation of new mandatory toy safety standards. As part of this process, the Commission has also issued several policy statemeuts designed to provide additioual infor-

mation on CPSIA requirements to the regulated community, including small businesses.

New CPSC Strategic Plan: During my confirmation hearing last summer, I noted that one of my key goals for the Commission was to align its priorities to the challenges we face in the global economy. To address this, the CPSC launched a comprehensive strategic planning initiative earlier this year to npdate the Commission's ontdated 2003 Strategic Plan. Ont of this effort, we recently released the Commission's new 2011–2016 Strategic Plan, which lays ont five key goals and also details programmatic objectives that will allow the CPSC to establish itself as the global leader in consumer product safety.

New Office of Education, Global Outreach and Small Business Ombudsman: As Chairman, I have heard from many small businesses and crafters who have asked for additional ontreach and snpport from the Commission as they work to produce safe prodncts and comply with the reqnirements of the CPSIA. I take these concerns very serionsly, and have made providing snpport and ontreach to small business entities and other industry stakeholders a key priority.

On September 22, 2010, the Commission voted to create a new office to coordinate and provide outreach to varions domestic and international stakeholders, including manufacturers, retailers, resellers, small businesses, and foreign governments. Within this office, we have a full-time Small Business Ombudsman who is dedicated to serving the nation's many smaller manufacturers in the area of prodnct safety. In particnlar, special attention will be given to developing information tailored to small businesses and small batch manufacturers so that they can understand and comply with new standards.

Hazards in the Infant Sleep Environment: The overall safety of cribs and the infant and toddler sleep environment is a critical concern of the CPSC and a personal priority of mine. Parents across the country expect cribs to be a sanctuary for their children, regardless of price or size. Unfortunately, that is not always the case. In the past 9 years, there have been at least 32 deaths attributed to drop-side crib failures. That, in and of itself, is a tragic number. However, the majority of crib deaths are still directly linked to the use of snft bedding in the crib.

To address this, I directed Commission staff to embark on a two-prong action strategy. The first prong was to recall old, dangerous drop-side cribs in the marketplace and promulgate new mandatory crib safety rules that will prohibit dangerous drop-side cribs from ever being sold again in the United States. I am pleased to say that the Commission is cnrrently in the final process of reviewing a new mandatory crib safety rule, and it should be approved by the end of the year. This is a promise I bave made to parents across the country.

The second prong of this initiative is education: teaching parents and caregivers how to keep the inside of cribs free from suffocation risks like stnffed animals, comforters, and pillows. In partnership with the American Academy of Pediatrics and a child advocacy gronp called Keeping Babies Safe, we have a wonderful new Safe Sleep video that we are working to have shown in maternity wards and pediatrician's offices aronnd the country. This video is currently available on the CPSC's website, and I urge Members of the Subcommittee to view the video and see its powerful message.

Import Surveillance: Traditionally, the Commission has spent the bulk of its resources investigating harmful products in the marketplace. This will always form a substantial part of the CPSC's activities, but I believe the more effective approach is ensuring that harmful products never even enter the country.

To that end, I have taken a number of steps to add additional technological and human resources to the Commission's Import Surveillauce Divisiou. This Division works directly with the Department of Homeland Security (DHS) aud Customs and Border Protectiou (CBP) to keep dangerous products out of the Uuited States.

Ou the technological side, the CPSC recently executed two interagency Memorandums of Understanding (MOUs) with CBP that allow us to access additional "real time" importer information, and target the most dangerous incoming shipments. The first of these MOUs, signed in April, allows CPSC personnel to work at CBP's Commercial Targeting and Analysis Center (CTAC) in Washington, D.C., and access manifest entry data collected by CBP. This, in turn, allows Import Surveillance Division personnel at the ports to target high-risk shipments prior to their entry into the domestic stream of commerce.

The second MOU, signed with CBP this past August, gives the CPSC access to information in the Treasury Enforcement Communications System (TECS). This will assist CPSC Import Surveillance staff at the ports by providing them with additional information to improve local targeting and interdiction of dangerous products.

The CPSC is also actively involved in supporting the Importer Self Assessment—Product Safety (ISA–PS) initiative that is currently being piloted by CBP. The ISA–PS is intended as a partnership between CBP, CPSC, and importers to ensure product safety compliance. It is based on a voluntary approach that provides meaningful benefits for importers who demonstrate readiness to assume additional responsibility for managing and monitoring their own product safety compliance.

We have also taken steps to increase CPSC's physical presence at ports of entry. In Fiscal Year (FY) 2008, the Import Surveillance Division only had five full-time employees (FTEs), and of those only three FTEs were actually stationed at ports of entry. During FY 2010, we expanded staffing in the Division to 18 FTEs, with 14 FTEs actually stationed at ports of entry. I am very pleased to announce that, as of November 11, 2010, the Division now has 25 FTEs, with 19 FTEs collocated at 15 different ports of entry. Subject to appropriations, we hope to put CPSC staff at even more ports of entry in the future.

Putting more "cops on the beat" has already yielded substantial positive results. In FY 2010, we performed 6,953 screenings at ports, collected 1,776 samples for testing, and of those found 987 that violated CPSC standards. At the same time, we have also seen the number of recalls start to drop—from 563 in FY 2008 to 428 in FY 2010. Maintaining those positive trends is a key goal for the upcoming year.

Pool and Spa Safety: Earlier this year, the CPSC kicked off its "Pool Safely" education campaign as part of a national effort to reduce child drownings and entrapments in pools and spas. As part of this campaign, we partnered with families who lost their children in pool and spa accidents and Members of Congress at events in Florida, Texas, Minnesota, and Washington, D.C. to spread the word that simple safety steps can save lives in and around the water. We also unveiled a new website, *PoolSafely.gov,* as well as new public service announcements to provide the public with information aimed at preventing child drownings and entrapments, as well as educating public pool and spa operators about the requirements of the Virginia Graeme Baker Pool and Spa Safety Act (Pool and Spa Safety Act). During this past year alone, there were more than 100 million views of broadcast and print materials related to the Pool Safely campaign.

In addition to education and outreach, we have also conducted an extensive series of inspections to verify compliance with the Pool and Spa Safety Act. In 2010, the CPSC entered into contracts with local health departments in a number of states, including Florida, Missouri, Kentucky, and Washington, to conduct public pool inspections. Under these contracts, 2,440 pools, spas, wading pools, and water activities at 1,557 sites were inspected. I am pleased to announce that the compliance rate observed was approximately 89 percent, which is higher than the rate observed last year. It also demonstrates that the Commission's outreach, education, and enforcement efforts are having a meaningful effect in the overall effort to prevent pool and spa deaths and injuries.

Contaminated Drywall Investigation: The Commission is aggressively continuing its efforts to provide relief to homeowners impacted by contaminated drywall. Since becoming Chairman, I have personally visited impacted homes in Florida and Virginia and know the frustration that these homeowners are facing.

To deal with this issue, the Commission has conducted the most extensive investigation in its history. As a result of the science produced by this investigation, the Commission, working in conjunction with the Department of Housing and Urban Development, released impacted home identification guidelines in January as well as interim remediation guidance this April. These guidelines have allowed some of the impacted homeowners to start repairing their homes and rebuilding their lives.

To assist in those efforts, the Commission worked with the Internal Revenue Service on a recent Revenue Ruling declaring that contaminated drywall is eligible for a casualty loss. The CPSC's scientific data was also used as part of a recent partial settlement agreement in the Drywall Multi-District Litigation (MDL) in New Orleans, Louisiana. Under the terms of the partial settlement,

a demonstration remediation program has been established that will remediate problem drywall for np to 300 homes in Alabama, Florida, Lonisiana, and Mississippi that contain drywall prodnced solely by Knauf Plasterboard Tianjin.

At the same time, however, I know that these initiatives will not help all of the impacted homeowners. For that to happen, we need the foreign manufacturers involved to come to the table and do the right thing to assist homeowners. On October 26, I personally discussed this issue with Zhu Shuping, Minister of China's General Administration of Quality Supervision, Inspection and Quarantine (AQSIQ) during the Second Triennial United States—European Union—China Product Safety Summit in Shanghai, and remain optimistic that Chinese manufacturers will come to the table to resolve this matter. I also appreciate the efforts of several members of this Subcommittee, including Senators Nelson, Warner, Wicker, and Vitter, to provide assistance on this issue.

Rapid Response to New and Emerging Hazards: The Commission has increased its efforts to provide a rapid response to new and emerging hazards. One example of this response is the CPSC's efforts to stop the use of toxic metals in children's products. Earlier this year, it came to our attention that some foreign manufacturers might be using cadmium or other toxic metals as an effort to get around the lead limits for children's prodncts. I sent a strong message to Asian manufacturers and regulators that this was unacceptable and that we would not allow there to be an influx of prodncts with cadmium like we saw a few years ago with lead. The Chinese government sent out a directive a few weeks later on cadminm that used language similar to mine. It appears that we have stayed ahead of this issue.

Despite this early success, however, the Commission will remain vigilant in this area. In response to the possible threat, the CPSC has taken aggressive action to police the market for children's products that may contain harmful levels of cadmium. In addition, Commission staff recently released a guidance document providing Acceptable Daily Intake (ADI) limits for cadmium. We also sent this document to several standards setting bodies—including the Committee that oversees the ASTM F963 toy safety standard—with instructions to take action on this issue. In the coming year, we will also look at the use of other toxic metals such as barium and antimony, and the CPSC will not hesitate to take further action in this area if voluntary efforts prove insufficient.

The year 2010 has been extremely busy for the Commission, but we are not done with our work. As we enter the heart of the boliday shopping season this year, we will remain vigilant to identify hazardous products in the marketplace. In December, we also hope to roll out the first part of our new and improved *CPSC.gov* home page, which will make it easier than ever for consumers to find information on product recalls and common sense tips to keep their families safe.

In March 2011, we will also unveil our new publicly available database on the safety of consumer products, which was mandated by section 212 of the CPSIA. This database will provide a powerful source of information for consumers, allowing them to quickly determine whether prodncts they already own, or are considering purchasing, are associated with safety hazards or recalls. It will also allow consumers to play a critical role in safety by empowering them to report potential product hazards directly into the database.

I recognize that the rollout of this database has caused concern among some in the manufacturing community who believe that it will present "unfiltered" information that will be harmful to the business community. I want to assure this Subcommittee that CPSC staff has worked tirelessly to address these concerns and to ensure that the database is fair to all stakeholders while also fulfilling the intentions of Congress.

First, the database will not include reports of harm submitted anonymously. Any reports filed must include contact information for the CPSC's internal use. Second, the CPSC will give the product manufacturer 10 business days to respond to a report of harm, to provide comment on the report, and to let the Commission know if the submission contains confidential or materially inaccurate information. The rule also requires the Commission to remove or correct information in the database it has determined to be materially inaccurate within 7 business days. Manufacturers also have the right to comment on the reports and to have those comments as part of the publicly accessible record.

At the same time, however, I think it is important to provide a reminder of just how critical a resource this database will be for consumers. Rather than use my words, I would like to repeat the words of Lisa Olney, whose daughter died in a defective portable crib just after her first birthday in 2002. Ms. Olney posted the following on the *Kids in Danger* web blog:

> On December 19, 2002, my daughter Elizabeth, just 13 months old, died in a poorly designed play yard. I live my life often looking back through "what ifs" and "should haves," but I've learned to give most of that up in order to save myself from being a horribly miserable individual. Instead, I realize the importance of focusing on efforts to protect our children so that no parent has to suffer what I have, along with too many other victims of unsafe children's products. The CPSC database is going to protect millions of children, because it provides a place to go when considering the choices parents make when purchasing products, especially those products intended to be beueficial to our childreu's safety.

This database will prevent injuries and save lives. Congress recognized this when it added section 212 to the CPSIA, and I look forward to seeing this important tool implemented next March.

Finally, I realize that a lot of the issues I just discussed are fairly technical and involve internal Commission operations. In the end, I know the true measure of success is how each of these items will help the young mother or father find safe, reliable consumer products as they are out shopping this holiday season for a crib, high chair, or toys.

Here's what the CPSC promises them:

- the toys they buy are now covered by mandatory safety standards;
- children's products are now required to be tested for lead by an independent, third-party laboratory;
- the infant bath seats and baby walkers they buy are now covered by mandatory safety standards;
- most durable and infant toddler products, such as cribs, strollers, and play yards, now have postage paid registration cards that consumers can fill out and return so they can be automatically notified of any future recall involving these products;
- all children's products, to the extent practicable, now have tracking labels that make it easier for parents to determine if a product is subject to a recall—even long after the packaging is thrown away; and
- our inspectors will be hard at work in the ports and at retailers, looking for hazards like high levels of lead paint on toys or small parts that can break off and pose a choking hazard.

Mr. Chairman, thank yon again for allowing me to provide this testimony today. I now look forward to answering any questions you or other members of the Subcommittee may have.

Senator PRYOR. Thank you.

Commissioner Northup.

STATEMENT OF HON. ANNE M. NORTHUP, COMMISSIONER, U.S. CONSUMER PRODUCT SAFETY COMMISSION

Ms. NORTHUP. Thank you, Mr. Chairman Pryor and Ranking Member Senator Wicker. I'm delighted to be with you today.

This is, of course, my first visit since I had the confirmation hearing, about a year and a half ago, and I have learned a lot and have been very impressed with the work of the CPSC. It certainly is incredibly important. And our Chair has, just, managed and juggled a lot of responsibilities, assessing emerging hazards and setting up a customs program that—Customs and Border Patrol—that intercepts, before they ever get to our shelves, products that might be hazardous to families and children.

But, today I feel like I would be remiss if I didn't focus most of my comments on what is preoccupying the overwhelming amount of money and time at the Consumer Product Safety Commission—and that is the implementation of the Consumer Product Safety Improvement Act—and to share with you some of the unintended consequences that we have been asked about, both by Members of

the Senate and by Members of the House, certainly by the public, and give you an idea of, sort of, the challenges that we face.

Let me start with the question of lead. We all know that lead is dangerous if it is absorbed by a child. That means in paint, that means in dirt that was—that gasoline—lead-based gasoline got into the dirt, tracked into a house, a child can absorb that lead. We know that it's dangerous if it is a lead charm that is small enough that a child can swallow; and, in fact, it can be fatal.

But, we can't treat all lead alike. And that's the problem with the CPSIA. It treats every component that contains lead exactly the same. It is not dangerous for a child to have lead in their handlebars. It is not dangerous for a child to have lead in a screw that provides strength and machinability and it makes that a more secure product. And so, what we have done in this law, by establishing a lead limit in every single component of every single child's product, is to equate lead in paint with lead in things that are not dangerous.

This has caused a huge disruption of the marketplace. First of all, it has cost jobs. Senator Wicker mentioned some of those, but I would be happy to submit for the record a list of businesses that have closed entirely, businesses that have left the children's product market, and businesses that tell us that, when we lift the stay, in February, for third-party testing and tracking, that—and labeling—that they will be closing their doors.

Senator PRYOR. Without objection.

Ms. NORTHUP. Thank you.

The—it has also caused a huge disruption in choice.

Parents cannot go into stores they went into before and see all the items, many that have been on our shelves for years and are not—have not been dangerous to children, but have not either been able to be remade with lead-free components or the people that make them have just decided to sell them in stores all around the world, including the EU, which has very high standards, but just not endure the expense of complying with our limitations. And let me just say that none of these—many of these companies that have left, have left because they ever had a risky product on the market.

When I was confirmed, Mr. Chairman and all the members of this committee, when I spoke with you, you talked about flexibility and looking for flexibility in the law. But, I can tell you that, in many parts of this law, there simply is no flexibility. And even in the areas where there is some flexibility, usually by a 3-to-2 vote, the Commission has chosen not to exercise that flexibility, out of caution. And so, without changes by the Congress, this law is going to continue to be—to cost jobs, choice, and raise the cost to consumers.

When I was confirmed, I promised you that I would work every day at the Consumer Product Safety Commission as if I were protecting my own six children. And today I have four grandchildren that I'm also thinking of every day. And, while many of the initiatives that our Chairman just delineated for you will make an important difference in our children's and our grandchildren's safety, the—many of the provisions in the CPSIA that are so costly, so complicated, and that are costing jobs, would not be things that I would have welcomed for the sake of my children. And if my hus-

band or I had lost our job because of a business that closed their doors for no—without any regard to safety, I would be heartsick.

Thank you very much.

[The prepared statement of Ms. Northup follows:]

PREPARED STATEMENT OF HON. ANNE M. NORTHUP, COMMISSIONER, U.S. CONSUMER PRODUCT SAFETY COMMISSION

Chairman Pryor and Ranking Member Wicker, thank you for the opportunity to provide testimony to this Subcommittee regarding oversight of the Consumer Product Safety Commission (CPSC). This Commission has a proud history of assessing risk and providing leadership in consumer product safety issues across a variety of industries.

As a Commissioner since August of 2009, I now have a tremendous appreciation for the work that goes on in an agency, including the time and effort that agencies expend implementing the laws Congress passes. It is not a simple task, and my colleague, Chairman Tenenbaum, has put in countless hours to ensure that the Commission meets its deadlines and fulfills the difficult tasks it has been given.

Chairman Tenenbaum has been a strong advocate in working with onr partners in China to elevate the priority of product safety and to ensure that manufacturers can implement safety measures as far back in the manufacturing process as possible. She has made progress in our import safety objectives, including an agreement with Customs and Border Protection to allow our staff to view shipment documents earlier in the process before potentially hazardous shipments enter the United States. The Chairman's staff also continues to find creative, useful ways to nse social media outlets to advertise product safety messages for families and parents. These achievements are impressive.

CPSIA

Despite areas of progress, I would be remiss as a Commissioner if I failed to mention that the central focus of the agency's time and resonrces in both 2009 and 2010 has been on implementing a law that has almost nothing to do with improving safety—the Consumer Product Safety Improvement Act of 2008, or CPSIA. Although the Commission is a relatively small agency (FY 2010 funding of $118 million), its budget has grown by *nearly 48 percent* since the law's passage in 2008, with both old and new resources shifted away from more risk-based priorities to implement the arbitrary, non risk-based priorities of the CPSIA, including the leadin-substrate ban, phthalates ban, consumer database, and third-party testing, certification and labeling requirements. Today's hearing provides an excellent opportunity to shed light on many of the unintended consequences of this law, its impact on our agency and, more importantly, the economy.

As a bit of background, while we know the context in which the CPSIA was passed in 2008, Members of Congress on both sides of the aisle today acknowledge the need for the law's reform. Both Democrat and Republican Members of Congress have introduced bills to fix the CPSIA. The House Energy and Commerce Committee held a hearing earlier this year on potential CPSIA amendments, and the Appropriations Committees of the House and Senate requested a Report from the five Commissioners back in January on ways to amend the CPSIA to avoid its many unintended consequences. (*See the following link for the Report to Congress and the Commissioners' five statements: www.cpsc.gov/about/cpsia/cpsiareport01152010 .pdf*). Thus, to say that the law enjoys the broad support it held in 2008 is simply untrue.

The Commission continues to hear from manufacturers, retailers, and Members of Congress that the CPSIA has impacted products that no one anticipated would be affected and which this Commission would not consider unsafe. For example, the law impacts furniture, bikes, recreational equipment, books, rugs, nuts and bolts used to make these products, clothing, school equipment and supplies—and a host of other categories that fall under the rubric of "children's products.". The law has caused companies to have to reengineer products to be lead-free (with no measurable benefit to safety) to leave the children's market, or to close altogether. I have brought with me a list of such businesses which I will submit for the record.

Risks Associated with Lead

It is important to clarify the risks associated with lead. Some advocates, including witnesses in your second panel today, will say that "there is no safe level of lead" which implies that none of ns can ever spend enongh time and money to reduce or eliminate lead everywhere. However, an important fact to follow up this statement

would be that there exists an *unsafe* level of lead, which has been established by our leadiug scientific agencies, the National Institutes of Health, the Centers for Disease Control and the Environmental Protection Agency. The fact is, lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under.

In order to determine risk, it is necessary to make a distinction between lead that is absorbable and lead that is not absorbable, at least not in meaningful amounts. In many other laws relating to absorbable lead levels, standards exist to allow for such minimal absorption. For example, the Food and Drug Administration allows for 0.1 microgram of lead in a one-gram piece of candy.[1] The Safe Drinking Water Act declares "zero lead" to be the objective for the amount of lead in water, but the pipes themselves are permitted to be 80,000 parts per million (8 percent) lead—allowing for negligible, trace amounts to exist in the water we drink.[2] California Proposition 65[3] as well as the European Union[4] allow for a negligible amount of absorbable (or solnble) lead in children's products. People often are surprised to learn that all children are born with a certain blood lead level, depending on the blood lead level of the mother. Some additional amount of lead (roughly one microgram per kilogram of body weight)[5] is then taken into the hody every day through just the food we eat and the air we breathe.

So what lead is actually risky? Lead is risky when it is absorbable into the bloodstream at significant levels. The experts at the CDC and NIH have found that lead paint in old honses as well as lead in dirt[6] near old gas stations can be very dangerous for small children (*http://www.cdc.gov/nceh/lead/*.) In other words, the *risk of absorbability* with lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high. In the same vein, a lead-laden metal charm or piece of jewelry that can be swallowed presents a danger since such an item could get caught in the stomach and absorbed. However, none of these agencies, including the CPSC, has ever found that a child touching a brass musical instrument, touching a vinyl lunchhox, or riding a bicycle, could ever rub off enough lead, day after day, year after year, to affect his or her health.

Now let us look at the CPSIA's lead requirements in comparison to these known lead hazards in the environment today. The CPSIA's arbitrary lead content limits (currently 300 ppm, and moving to 100 ppm by next August) remove the ability of the Commission to assess risk, or the *absorbability* that exists for a particular product. In other words, the law's lead content levels dictate that the metal handle bars of a bike that pose *no health risk* to a child be outlawed right alongside lead paint or a solid-lead charm on a piece of children's jewelry that is dangerous.

The effect of the CPSIA has been to outlaw children's books published hefore 1985 that are likely to have lead in the inks, for example, which both the Commission and Congress now feel was an overreach because children are not likely to eat the pages of old books or ingest more than miniscule amounts of lead after touching their pages. Likewise, youth ATVs and bicycles are outlawed or must be reengineered even though the lead that is in the hood, handlebars, or hubcaps will not become ingested and absorbed at any discernable level (from hand to mouth touching where miniscule amounts of lead may rub off—not from actually eating the hood, handlebars or hubcaps). Other everyday products such as school lockers, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens may be outlawed if they have a toy or game attached to them and are marketed to children, due to the brass found on the tip.

[5] Centers for Disease Control, Agency for Toxic Substances and Disease Registry, Toxic Substances Portal: Lead: *http://www.atsdr.cdc.gov/PHS/PHS.asp?id=92&tid=22*.

[6] Although lead in dirt is a proven hazard for small children nearby to old gas stations that used leaded gasoline or certain pesticides, it is notable that the Environmental Protection Agency standard for lead in soil is 400 ppm. *http://www.epa.gov/lead/*. This standard for safety is less strict than the current lead content standard provided in the CPSIA for children's products, which is 300 ppm and scheduled to fall to 100 ppm in August of 2011.

Finally, children do not live cooped up inside of their rooms surrounded only by "children's products." Children live throughout the house, run aronnd outside, and are exposed to lead in their everyday environment. In fact, they are surrounded by it: in the car (adult seat belts, window cranks) and in their homes (pots, pans, furniture knobs, door handles, appliances, lamps). These prodncts do not threaten a child's health because the lead in them is not absorbable. Hence, it makes little sense that the CPSIA bans products with higher than 300 ppm lead content in such products as *children's* furniture, *children's* rugs, toys and *children's* clothing—while children themselves are likely to spend more time outside their room handling the TV remote (an adult product), playing on their parents' furniture, or playing with just about anything else.

The Costs to the Economy

While there have been no tangible benefits resnlting from the CPSIA's arbitrary lead limits, the costs to businesses have been tremendous—and continue to pile up. In March 2009, the Commission estimated that the economic costs associated with the law would be "in the billions of dollars range."[7] Industry associations from furniture and mattress manufacturers to handmade toy makers have told us how they will be saddled with enormous costs since every component of every product they make (down to the screws in the furniture) will have to be sent to a third-party lab to be tested for lead and all other applicable standards. We have heard from businesses that have had to cut jobs to be able to afford the new testing and compliance costs, reduce product lines, leave the children's market completely, or close—all of this, when the full effects of the law (and I would argue, the most costly mandates) have yet to be felt.[8]

The entire process companies must go through to produce a toy or children's product has drastically changed. Take, for instance, a child's doll. To be compliant with the law, a company must pay to have the doll's body, hair, each color of paint on the lips or eyes, and the doll's clothing tested in an independent lab for lead content—and soon will have to do the same for phthalates and to every applicable component of the ASTM F–963 toy standard. According to a brief small business analysis by our agency, the cost to test one toy could range from $3,712 to $7,348—not taking into account that the toy will likely change to stay competitive for the next Christmas season, or sooner, and every material change triggers a whole new set of tests.[9] These costs also do not include the cost to add a tracking label, to certify to these third-party tests, and to maintain the data and paperwork to be able to trace each and every component and material back to its specific test and lot number. All of these steps are required by the CPSIA without any regard for the actual risk of a product.

In fact, while the costs to companies to reengineer products to meet the lead limits has been steep, many tell us that the ongoing costs to third party test, label and track every component have been much higher—and without any measurable benefit. For example, one furniture manufacturing company informed us they spent upwards of $13 million putting together a testing, tracking, and labeling system for their children's furniture while discovering that not one of their components was in violation of the new lead limits and needed to be replaced. There was clearly no safety benefit, yet they have faced enormous costs. Large aud small companies alike have to hire a lawyer or other outside expert just to ensure they understand the extent to which their products may or may not be impacted by various provisinns of the law.[10] This is what happens when regulations do not have to be cost-benefit justified.

The CPSIA fails to make any distinction between large and small businesses, nr foreign and domestic mauufacturing, thus giving au obvious competitive advantage to large manufacturers who produce items overseas, where manufacturing and test-

---

[7] Letter from Acting CPSC Chairman Nancy Nord to Representative John Dingell, March 20, 2009.

[8] Currently, the Commission has put in place a stay on the lead content testing requirements until February of 2011. A stay was first enacted in February of 2009 following the confusion that ensued after the law's passage. The Commission voted 5–0 in December of 2009 to continue the stay for another year (until February of 2011). Additionally, the Commission has yet to accredit labs for testing to the phthalates ban or the toy standard, which will impose even greater testing burdens. While these three major testing requirements have not even kicked in, many businesses have heen forced to plan ahead for the new costs and have already determined they cannot maintain their business and also comply with the CPSIA.

[9] Regulatory Flexibility Analysis: Testing and Labeling Pertaining to Product Certification, 16 CFR Part 1107, Notice of Proposed Rulemaking, CPSC Docket No. CPSC–2010–0038. May 20, 2010.

[10] "Mattel Finds CPSIA to be a Challenge," *Product Safety Letter*, November 9, 2009.

ing costs are cheaper. As a result, large toy manufacturers have turned a corner to become supportive of the new regulations and clearly see the competitive advantage that the law gives them over their smaller competitors. Meanwhile, the backbone of our economy, small businesses—from screen printers to manufacturers of chemistry sets for schools—are being forced to cnt jobs or take other drastic measures due to the cost of compliance. Given the urgency of our economic situation, this Commission would benefit today from hearing from Members of this Committee on whether these results are what you expected.

Role of the Commission

While the Commission has the authority to provide flexibility regarding the *frequency* of third-party testing requirements under the law, it does not have the ability to exempt companies altogether from burdensome testing requirements that do not improve safety. More specifically, the Commission lacks the authority to exempt manufacturers of otherwise safe products from the following: (1) the initial, third-party test of every product or component to the law's lead, phthalates and other mandatory standards; (2) a new, third-party test of any product or component after any "material change" in the product; or (3) the cost to certify, provide tracking labels, and maintain the data to trace each and every component. *Without changes to the statute, the Commission's hands are tied in addressing these arduous requirements, the main CPSIA costs burdening small businesses.*

When I was confirmed, every Senator with whom I met asked me to look for flexibility in the CPSIA in order to reduce the impact of the law where safety was not compromised. I have taken those conversations to heart. However, given that the majority of Commissioners so far has interpreted this law in an even more sweeping manner than required, I now believe that our ability to reduce the law's economic impact has waned. It is imperative that we inform you of these challenges and encourage the Congress to alleviate any unnecessary economic impacts on small businesses and families.

Thus, in this Committee's consideration of reforms to the CPSIA, I would recommend various ways to give the Commission authority to provide needed flexibility, including: (1) allowing for *de minimis*, absorbable lead in children's products, which, as mentioned previously, would by itself remove harmless products from most all of the burdensome requirements of the law (and would allow us to harmonize our standards with the European standards); (2) allowing small businesses the option of a "reasonable testing program" rather than a third-party test; (3) providing discretion to the Commission to determine the need for any third-party testing or tracking label requirements at all for various product categories; and (4) lower the age range for the types of products impacted by the law to focus on age groups (*e.g.*, under age 6) at risk of meaningful lead exposure. Any of these reforms would improve the existing law and allow the Commission to focus its energy where we know the risks lie.

Costs to the Commission

Not only has the implementation of the CPSIA continued to burden small businesses and derail job growth, bnt the law clearly has taken us away from our core mission of safety. As a result, this Commission is spending millions in limited resources in implementing and enforcing a law that is not helping consumers—a worrisome situation given the state of our economy and the need for all of us to find ways to reduce Federal spending.

A prime example of wasted taxpayer resources—$29 million worth in fact—will be the consumer database that the Commission is tasked with implemeuting early next year. The CPSIA requires that the Commission establish and maintain a database on the safety of consumer products that is publicly available and searchable ou the Commission's website. Unfortunately, the majority of the Commissiou adopted a rule just last week that will make the database useless or worse. Among other problems, the rule defines consumers to include just about everyone, so that reports of harm can be submitted by people with ulterior motives rather than just the actual consumers who suffered harm and have firsthand information about the consumer product. In addition, the rule has interpreted a 10-day deadline in the statute to require agency staff to post reports of harm even though the agency has received credible claims of material inaccuracy, even if the staff has not had time to resolve those claims yet. Finally, since groups with ulterior motives (trial lawyers, competitors, groups wanting to sell a "remedial" product, or an association wanting to lobby Congress for a new mandate) can submit reports into this database without providing the consumer's name, it is unlikely that the Commission will be able to ascertain critical facts related to a product. Such blatant disregard for accurate data will undermine the whole purpose of the database—to assist consumers trying to pur-

chase safe products. It will also raise prices, kill jobs, and damage the reputations of safe and responsible manufacturers indiscriminately.

Chairman Henry Waxman's Proposal to Add a "Functional Purpose" Exemption

It is important to note that Chairman Waxman of the House Energy and Commerce Committee has proposed a very limited "fix" to the problems of the CPSIA, known as a "functional purpose" exemption. Specifically, the proposal would entail giving the Commission authority to exempt a company's products from the CPSIA's lead limits if the company can show that the lead in the product serves a "functional purpose." Unfortunately, this "fix" would do more harm than good.

Adding a "functional purpose" exemption to the Commission's authorities would not provide the kind of broad exclusion flexibility that the Commission unanimously sought in our January Report to Congress. The concept is too narrow, expensive, and uncertain to provide much relief, particularly for small businesses that are unlikely to have the resonrces available to determine available lead substitutes or even to pnt together as successful petition to a Federal agency. Most companies will not have the in-house expertise (metallurgic, etc.) to make the kind of showings that would be required to meet the burden of proof for an exception. So just as the exorbitant testing costs of the CPSIA favor large companies (who manufacture overseas) over small ones, so too will the exemption process favor the large companies with greater ability to spread their costs. Furthermore, forcing a component-by-component review of exceptions to the law does nothing to enhance safety, and it converts the Commission from a safety oversight agency (like the FAA) iuto a product approval agency (like the FDA). That will slow the pace of innovation and dramatically increase the cost and lead time for bringing new products to market.

Conclusion

Today, Americans still enjoy a marketplace that is brimming with new products and a variety of choices in color, cost and complexity—but we are steadily diminishing these opportunities. As a Commissioner, I strive to maintain and expand the type of marketplace that Americans consumers want—vibrancy, choice, and the confidence that consumer products are safe. All of this is possible in a successful market, where consumers demand ever more innovative products from a variety of sources and businesses look for opportunities to meet those demands. However, the CPSIA has and will continue to drastically reduce the number of inherently safe products available in our country. I hope the Congress will restore the responsibility of assessing risk to the experts at the CPSC and allow us to keep our markets both safe and dynamic.

Thank you, Mr. Chairman and members of the Committee for calling this oversight hearing and for inviting me to testify today.

Senator PRYOR. Thank you.

Chairman Tenenbaum, let me start with you, if I may. And I know you've really had your hand full—hands full with the implementation of the CPSIA, and it's just been more than a full-time job for you and the Commission and all of your staffs, and I would say, overall, I think people understand the effort that you put into this, and you guys have done a great job. Not that everybody always agrees on everything, but you guys have worked very, very hard to implement the law.

But, I would like to ask you, Madam Chairman, about your Safe Sleep campaign. And I'm curious about what prompted that, and how it's going, and what kind of results you're seeing around the country.

Ms. TENENBAUM. Thank you, Mr. Chairman.

The Safe Sleep campaign was an effort that we created because of the numerous cribs that were recalled because of the drop-sides. And, getting further into the data, it wasn't just the drop-side cribs where children were being suffocated. The number-one reason why children are suffocated is because of soft bedding, not having anything to do with the product. People fill up a baby bed with com-

forters, toys, and pillows, and the child can roll into these items and suffocate.

So, what we wanted to do was to create this Safe Sleep campaign along with having a new crib standard.

We created a new Safe Sleep team, at the Commission, in the wake of all of the recalls, because the drop-side problems were going back years, even before I came into the Commission. And what this Safe Sleep campaign did was notify the public of 32 deaths reported to the CPSC in the past 10 years attributable to the drop-side. In less than 9 months we negotiated the crib manufacturer and retailers to bring about 18 voluntary crib recalls across all kinds of companies.

So, this month, in December, we will have a new crib standard. We have not had a new one in 20 years. There will be no more traditional drop-sides, those are banned now; we will have new wood strength; mattress support requirements, so the mattress won't fall down; and stronger hardware requirements.

We also joined with the American Academy of Pediatrics and Keeping Babies Safe, a nonprofit organization, and we made a video. Joan Lunden, who used tn be on the Good Morning America, hosted the video. The video discusses how to keep your own child safe, not only from a defective product, but also safe bedding. We launched this video last month in New York at one of the hospitals. We'd like to continue to seek private funding so we can have this video in physicians' offices, pediatricians, anyplace—in airports, where you have video playing constantly—so people will know how to keep their own baby safe.

Senator PRYOR. Commissioner Northup, you mentioned, in your testimony a few moments ago, that many parts of the law, of this CPSIA law—many parts of the law have no flexibility in there. Now, you spent some time on lead. What else, in your opinion, has no flexibility with it?

Ms. NORTHUP. Well, let me get to, specifically, one of the questions that I believe you asked me, and also questions that the other members of the Committee asked. And that is about absorbability; it goes to lead. But, you provided exclusions in the law for products that could contain lead. And one of them was lead that was in products where the—where lead could not be absorbed. This would be handlebars; this would be ATVs for example.

Senator PRYOR. Right.

Ms. NORTHUP. And what the Commission has decided is that there's not one single product that would benefit from that exclusion; that the fact that you could rub your hands on a handlebar and get one molecule on your—and that one-tenth of a percent—of 1 percent of that molecule is lead, then you could put it—your hand in your mouth—that that would be absorbability. And so, absolutely no component would qualify for that flexibility.

Now, I guess I presume that, when you write—when you wrote that exclusion into the law, you meant for it to actually mean something, that there actually would be components that would qualify for that exclusion. But, the majority has decided that not one single component does qualify. And that's why every snap, every spoke of a bicycle, every hinge on a dresser, every——

And let me just carry that a little further and point out that a child doesn't stay in a bubble in—with children's products. They get in a car and—for millions of dollars, they refashioned the car seat so that the buckle no longer has lead in it. It provided strength and protection, so reengineering it was very expensive. But, the child can reach right down on the seat and pick up the adult seatbelt and play with it, and it's loaded with lead. And a child is going to crawl right out of their room into the—onto the carpet of the house, into the kitchen, open the drawer, with door handles that have lead on them. And none of this raises our concern, because when lead, in very small amounts, is embedded in metal, it's not going to be absorbable at any measurable level. So, that would be one of the areas.

Senator PRYOR. Right. Well—but, my question was——

Ms. NORTHUP. Yes. Let me give you——

Senator PRYOR. You covered lead——

Ms. NORTHUP.—another one.

Senator PRYOR. You covered——

Ms. NORTHUP. Definition of a "child's product"——

Senator PRYOR. OK.

Ms. NORTHUP.—would be another one. All of the requirements of the CPSIA are extremely expensive; not just that you have to comply with the lead, but also that you have to third-party test, that you have to certify to those third-party tests, that you have to provide tracking labels that make sure—that show every single test that was relevant. So, when it comes to carpet and all these other things, the question is, are you going to put a fence around children's products that capture as many products as you can, including lamps, including, say, something that spins on the ceiling the child could never touch, or are you going to put a fence around fewer products that would be determined to be children's products?

And I guess I felt that we should—if there was no risk involved, that we should have put that fence around the definition of a "children's product" more narrowly so that things like—beyond the tests that are required in the CPSIA—tests for flammability of rugs, tests for other components—now not only are people that make children's products going to have to test them to all the lead/phthalate standards—coating standards—they're now also going to have to do third-party tests for any other applicable standard, that wasn't really clearly mandated in the law. And now we have captured as many of these products as we possibly can in this trap by setting a very broad fence instead of a more narrow fence that might have just focused on risky products.

Senator PRYOR. All right. Let me ask one more thing about your testimony. And I'm—I've overstayed my time, here, but I would like to ask one more question and——

In your written testimony, on page 2, you said that, "It's a law that has almost nothing to do with improving safety." And, to me, that's an astounding statement, because when we've added staff there—don't you agree that that has to do with improving safety?

Ms. NORTHUP. Let me say that I think that the CPSC has done a fabulous job in——

Senator PRYOR. Now, answer——

Ms. NORTHUP.—improving safety.

Senator PRYOR.—my question.

Ms. NORTHUP. The CPSIA——

Senator PRYOR. Answer—OK, yes.

Ms. NORTHUP.—in particular, what we are working on, which is—we haven't even gotten to phthalates—which is lead, it has not been focused on risk. There's no focus on risk.

Senator PRYOR. Well, that's not what you said here. You said, "a law that has almost nothing to do with improving safety." And my point is that part of the CPSIA was to increase the staff level so that the Consumer Product Safety Commission staff could do more research——

Ms. NORTHUP. Yes.

Senator PRYOR.—to improve your facilities. I would think that you would agree with me that that improves safety. To do all the things that the CPSC is now authorized under the CPSIA to deal with imports—we were—we've been flooded with imports in this country, and many of those have not been safe. And the Commission has taken the lead role in the world to go and make sure that those products coming into the U.S. are safe. And I know you may disagree with some of the lead issues, but, still, those are designed to improve safety. In fact, part of the CPSIA is the ATV rule, which probably predates you being on the Commission, I know, but to get some of these cheap imported ATVs off the market that didn't meet any safety standards that the other ATVs met. I think all of that has to do with improving safety. But, in your statement, you said this law has almost nothing to do with improving safety.

Ms. NORTHUP. I probably should have clarified that. I agree, that is not a well worded statement.

And let me just say that almost every provision in the law was meant to address a real risk, and I recognize that. And I think that the agency has done a good job at addressing risks. But, when it comes to technically implementing the components of this law because of some of the very narrow language or the narrow interpretation, what we're doing has less to do with safety than complying with very regimented requirements that gets away from risk, gets away from an agency that is—has such a proud history. I mean, every night, we get the overnight incident reports of children that have died. And you do see trends and you do see ways of spending our resources in intervening. And the chair, with the Safe Sleep, has been very creative in this. But, that's not what the CPSIA primarily is focused on. It's focused on very regimented requirements that——

You know, I'll give you one other example with the Safe Sleep. The drop-side cribs is—has been masterfully handled, in my opinion. It did risk children's lives. And we did recalls. It's been a very step-by-step implementation. Unfortunately, when we did recalls of drop-side cribs, every single daycare center had to replace, immediately, their cribs that they used that were drop-side cribs. So, they have brand new cribs. Sixty days after we pass this new standard, or if we give them an extension in a year—up to a year, which we possibly might do—they're going to have to carry those brand new cribs out the door and throw them in the trash, because—even though there's no determination that any of them are unsafe—because the bill has an immediate effect rather than say-

ing "just what's purchased in the market or what has been determined to be risky." I sort of wonder if that's what you intended. That is hundreds of thousands of cribs that will be obsolete the day it goes into effect.

Senator PRYOR. Well, I don't know how that's going to play out, but what—I've overstayed my time—but, we—the CPSI did have a—CPSIA did have a mandatory rulemaking on cribs, and I appreciate you all doing it. But, we need to probably talk about this, you and I, offline at some point. And I know the Ranking Member and I have talked about this before, and we mentioned it a few moments ago, about—we recognize that, you know, this law on the books probably needs to be looked at again. And there are probably some areas that, you know, maybe we should give some more flexibility to CPSC. And the Chairman and I have talked about that a few times. And I know that she's had discussions on the House side. And I actually talked to Joe Barton yesterday about a little bit of this as well, assuming he's the Chairman over there. It's something that, you know, we will work through.

But, anyway, I've over——

Ms. NORTHUP. Thank you.

Senator PRYOR.—overstayed my time. So, Senator Wicker.

Senator WICKER. I actually don't mind at all that the Chair overstayed his time, because I thought it was a very interesting and informative line of questioning.

I want to talk about the budget, the "appropriations" level that you've requested over time, and see what we can do about that, in light of the federal government's deficit, during the past fiscal year of $1.3 trillion. In 2 short fiscal years, this government has added over $3 trillion to the national debt. There is a hue and cry from the public for us to do something about that. And I think every agency's going to have to be involved in that. There was a Debt Commission report yesterday that should trouble every American and every policymaker.

During the last 2 years, the appropriation for CPSC has increased 47 percent. And I know the Chairman and Ms. Northup talked about personnel; I assume that was a large part of that. But, the Fiscal Year 2008 appropriation was $80 million. That increased some $25.4 million, to $105 million, in 2009. The figure reached $118.2 million Fiscal Year 2010. And there is a request for another $400,000 more.

With that thought in mind, I'd like to ask both of you what suggestions you can give us of ways the CPSC can actually reduce its budget and be a part of the solution of reducing our federal deficit.

Ms. TENENBAUM. Thank you——

Senator WICKER. Ms. Tenenbaum?

Ms. TENENBAUM.—Senator Wicker. One of the things that was brought about when the Congress passed the CPSIA was the fact that the CPSC was cut so many times that it was unable to fulfill its statutory duties. And so, rather than just have three commissioners, it was decided that five commissioners would be funded, and that we would have a higher authorization, and we would also be encouraged to hire more people.

In fact, our FTE goal this year—and every time I have testified in front of Congress, people want to know, "Where are you?"—was

to be at 530. We are now at 520 FTEs and we have 19 conditional hires. That is because we had the new law, the CPSIA. Not only were we required to pass all these new rules, we also are required to enforce them.

We also needed a new laboratory, and we are opening that new laboratory in April. And we'd love for you and your staff to come tour the new laboratory.

Senator WICKER. I'll certainly do that.

Ms. TENENBAUM. OK, please. Thank you.

We also need more outreach into China. The FDA has put people in China because so much of our food is coming from China. We just opened our office at the U.S. Embassy in China, and have two staff members working with the Chinese on products.

We've asked to be held harmless, in terms of budget cuts, because of the fact that we are just now implementing this very complex law. And we are now seeing a reduction in the number of recalls. Our presence in the ports has gone from 5 people at the ports to 19 people at the ports.

But, all that said and done, we realize that we're a small agency and that we have to contain our budget. And so, what we've done is be much more creative in working with other agencies. Our relationship with Customs and Border Patrol is closer than ever before. We work with them to stop products from coming into the United States.

We also are reaching out to colleges and universities. I've made visits to one university—we're going to another one—to ask them if they could work with us on research, and providing professors to train manufacturers in foreign countries so that they will know what the rules are for products coming into the United States.

We have identified certain line items that could be cut if we need to be cut, and we'll be glad to provide that to you—for you and your staff. We can send it——

Senator WICKER. Could I——

Ms. TENENBAUM.—after——

Senator WICKER.—ask that you provide it for the record?

Ms. TENENBAUM. Sure. We will provide it for the record. We have already sent it——

Senator WICKER. When——

Ms. TENENBAUM.—to OMB.

[The information referred to follows:]

UNITED STATES CONSUMER PRODUCT SAFETY COMMISSION
Bethesda, MD, December 2, 2010

Hon. ROGER F. WICKER,
Ranking Member,
Subcommittee on Consumer Protection, Product Safety, and Insurance,
U.S. Senate,
Washington, DC.

Dear Ranking Member Wicker:

Thank you for your questions at today's hearing regarding the U.S. Consumer Product Safety Commission's (CPSC) budget priorities, implementation of the Consumer Product Safety Improvement Act of 2008 (CPSIA), and ongoing activities to reduce injuries and deaths caused by defective or unsafe consumer products. 1 appreciated the opportunity to discuss these issues with you, and the progress we have made strengthening the Commission over the past year.

As discussed at the hearing, I believe that any reduction in the amounts proposed in our Fiscal Year (FY) 2011 budget request would be detrimental to the agency's

mission, and that the CPSC should he "held harmless" in this year's budgetary process. Actual full time employee (FTE) staffing levels at the Commission dropped from a high of 978 in 1980 to a low of 396 FTE equivalents in 2008. This decline in staffing, combined with annual funding, was devastating to the agency's overall effectiveness—as was illustrated by the "Summer of Recalls" in 2008.

In the last 2 years, the agency has made great strides rebuilding and working to ensure that the consumer products used by American families are safe. We are extremely grateful for the funding increases provided by the appropriators and have used this funding wisely and judiciously. While our proposed FY 2011 funding level is still almost 30 percent below the 1980 level (adjusted for inflation), I believe the cnrrent level positions the agency for snccess in the futnre.

Although we have exercised fiscal restraint, 1 am keenly aware that Congress may consider across-the-board cuts for agencies. Therefore, pursuant to your reqnest. attached please find a list of preliminary FY 2011 bndget items that Commission staff have identified should any across-the-board cuts be implemented by Congress. I would note that these items were identified by staff, and have not been approved by the fnll Commission.

Thank you in advance for your support of the CPSC. Shonld you or your staff have any questions, please do not hesitate to contact me or Christopher Day, Director of Congressional Relations.

Very truly yours,

INEZ M. TENENBAUM,
Chairman.

FY 2011 CPSC Budget Request Summary
Adjusted to Reflect Potential Mandatory Across the Board Cuts
[Dollars in Thousands]

2011 Request		*$118,600*
Reductions in 2011 Current Services Changes:		
Federal Pay Increase with Related Benefits	($937)	
Consumer Hotline	($266)	
IT Help Desk	($266)	
Reductions From Base		
Operating Expense	($225)	
Total Potential Mandatory Across the Board Cuts		($1,694)
Total Potential Revised Requirements		*$116,906*

Senator WICKER.—do we normally get those, Mr. Chairman?

Senator PRYOR. We can hold the record open for as long as we want. But, if we want to try to get something——

Senator WICKER. How soon could you provide that——

Ms. TENENBAUM. We could——

Senator WICKER.—list, Ms. Tenenbaum?

Ms. TENENBAUM.—this today.

Senator WICKER. OK.

Ms. TENENBAUM. We can provide——

Senator WICKER. Wonderful.

Ms. TENENBAUM.—it today.

Senator WICKER. Ms. Northup, I wonder this: What if every agency asked to be held harmless? We wouldn't be able to do anything about the budget deficit, would we?

Ms. NORTHUP. Well, I'm reminded that you and I sat next to each other on appropriations committees for years, so I'm not surprised I got this question.

Let me make a creative suggestion. I would—if—here's sort of an off-the-wall suggestion: Go from five commissioners to one administrator. I have so much faith in Inez Tenenbaum's ability to chair this agency. I'm probably the only person who will come before you

and suggest putting me out of a job. But, each one of us have a staff. And it is—the rulemaking is very, very complicated. But, what happens is that we find ourselves, you know, investing greats amount of time and effort and research, and our staffs are involved in how to research, say, this rulemaking. On the other side, the Democrats are involved in the same way. And so, rather than the chair being able to just work with the general counsel and the professionals that are at the agency, she is pulled by the Democrat mayor—members to one side; we pull to the side of flexibility. And so, there's great polarization.

And I actually think that her ability to balance the initiatives, all the ones that she has brought up, are probably the things that have had the—made the most difference in safety. They are the things that she is able to do individually, as opposed to the rulemaking. And I think the rulemaking would go smoother; and, quite honestly, I think it would have been more balanced, had it not been five commissioners.

So, I would just say that you have a chance to debate the pros and cons of every single bill. You have people that—on both side of the aisle, that have different opinions, and people that come from different perspectives. Once you write the bill, I'm not sure it's so helpful to have four more commissioners that are debating these same things for hours and hours and hours, hiring their own staff, taking up a lot of office space, keeping the office of the general counsel and the professional staff busy answering all of our questions, when maybe the Administrator should be charged with that responsibility.

Senator WICKER. How large is your staff, Ms. Northup?

Ms. NORTHUP. I have three people to—one that's paid $150,000 a year, one that's paid $100,000 a year, and one that's paid $50,000 a year.

Senator WICKER. Well, I've followed the Chair's example and overstayed my time. Let me just say this. We hear a lot of talk about moving the appropriation level back to the 2008 level of expenditure. What the Chair, Chairman Tenenbaum, has suggested is that this agency be exempted from that. Ms. Northup has suggested what I think would probably amount to modest savings.

I just have to say this. If we're going to be serious about this, and if there are ways that we can provide flexibility, keep people employed in the private sector, and quit talking about products that have never been unsafe and toys that have never caused a problem and lead-containing handlebars that have never harmed one single human being in the history of their manufacture, then we need to think about those solutions. And, if we don't, we're going to have a real problem with doing the simple things of cutting back on discretionary expenditures, much less the excruciating and much more difficult issue of the entitlements.

And I thank you, Mr. Chairman.

I thank these witnesses.

Senator PRYOR. Thank you.

Senator Udall, I believe, has to leave here——

Senator UDALL. Thank you.

Senator PRYOR.—in a few minutes. So——

Senator UDALL. Thank you. Well, thank you, Chairman Pryor.

And it was a very good exchange. But, I think one of the important things, Ranking Member Wicker—when we talk about safety and talk about budgets at the same time, I think it is very important that we give the agency the budget they need in order to protect consumers and to protect safety. And I think that's what the Chairwoman is talking about.

Let me thank you, Chairman Tenenbaum, for your testimony today, and CPSC's work to protect consumers from unsafe products. And I have some additional questions for the record, but I'd like to focus on the safety issue that I brought up in my opening statement.

Senator UDALL. You know, fall is football time in America. And every year, more than a million high school kids put on their gear and take to the gridiron, including about 8,000 in my home state of New Mexico. This weekend, in fact, teams from our larger high schools will compete for the State Championship.

Football is a uniquely American tradition. But, football is a contact sport, and thousands of student athletes are injured every year. Many of those injuries are concussions. For young people between the age of 15 and 24 years old, playing sports is the second leading cause of traumatic brain injury, second only to motor vehicle crashes.

New Mexico actually has one of the nation's best school sports concussion laws. We require athletes—and it was authored by a fine young state senator, named Senator Michael Sanchez—we require athletes who suffer a concussion to sit on the sidelines for one week and until a medical professional approves their return to play.

But, I'm concerned that our young athletes may not be using the best safety equipment. Traditional football helmets—I had a couple here, but I don't want to bring—first, I was just going to bring one up, and then my staff said, "Well, you"—this is our—two-college football——

[Laughter.]

Senator UDALL.—and you can imagine, they compete with each other. And so, they—and I said, "Well, we just need one." And they said, "No, you can't put up one without putting the other." New Mexico—University of New Mexico and New Mexico State. So, anyway——

Senator KLOBUCHAR. And where's the Gopher?

Senator UDALL.—these helmets——

Senator KLOBUCHAR. The Gopher.

Senator UDALL. Where's the——

Senator KLOBUCHAR. Minnesota Gophers.

Senator UDALL. Well, these are Lobos. These——

Senator KLOBUCHAR. Yes.

Senator UDALL. You got a——

Senator KLOBUCHAR. Yes, I know. But——

Senator UDALL.—Lobo and an Aggie——

Senator KLOBUCHAR. Yes, well——

Senator UDALL.—right here. So, yes.

Senator KLOBUCHAR.—you know——

Senator UDALL. OK.

Senator KLOBUCHAR.—we should expand.

Senator UDALL. You can bring your helmets in——
Senator KLOBUCHAR. OK.
Senator UDALL.—if you want.
Senator KLOBUCHAR. Thank you.
[Laughter.]

Senator UDALL. These helmets are primarily designed to prevent serious injury from a severe direct blow that can crack one's head open. However, football helmets are designed to a safety standard that specifically addresses the dangers from less severe impacts and indirect hits that can cause a concussion. More advanced football helmet designs are available, but the voluntary industry standard has not kept up with the latest technology. The current helmet standard is also a one-size-fits-all approach, from kids playing Pop Warner, the youngest kids, to the pros in the NFL. So, one size fits all.

I believe that the CPSC has a responsibility to ensure that football helmets meet safety standards that address concussion hazards and reflect the state-of-the-art helmet technology. And there's a lot of discussion out there with neurosurgeons and other experts.

And really my question to you—I guess I have two questions: Will you review whether the voluntary football helmet standard and certification practices adequately protect high school and younger athletes from concussion? And will you follow up with the football helmet standards organization, NOCSAE, to make sure they address these safety concerns, especially complaints that the standard is out of date?

Please, go ahead.

Ms. TENENBAUM. Thank you, Senator Udall. I completely share your concerns. And I want to provide you and the rest of the members of this subcommittee with some specifics on what we are going to do on this issue going forward.

First of all, in keeping with this mission of protecting consumers from unreasonable risk of serious injury or death from consumer products, including sports equipment such as football helmets, CPSC is committed to working within the standards development community to improve helmet safety standards and testing. More specifically, I felt that it was vital for the CPSC staff to establish contact with the personnel of NOCSAE, the standards-setting body. And we've already made contact with them, and we will continue working with them.

So, based on this initial outreach, the CPSC technical staff will be joining NOCSAE's standards development process in January in order to monitor and help accelerate their efforts to update the appropriate standards. So, we have already started that.

In addition, we continue to consider other avenues to augment this effort. I will use the bully pulpit as Chairman of the Consumer Product Safety Commission, and we will do all that we can to make sure that the standards-making organization is looking at all the best engineering and science.

Every man in my family played football. I still have pictures of my father, in high school and college, wearing his leather football helmet. And we are great football fans. We're looking forward to University of South Carolina playing Auburn for the SEC Championship on Saturday.

But, I'm very concerned, as you are, about the safety of people and the number of concussions. I've followed the news stories about how many people are hurt, and particularly high school students who are just learning how to tackle and can get hurt more seriously. So, we are with you on this and want you to know that we will keep you updated periodically on our progress.

Senator UDALL. Thank you very much. And I went over, a little bit, in my time——

Ms. TENENBAUM. I did, too.

Senator UDALL.—so, I appreciate the courtesies from the Chairman.

But, I really appreciate you moving ahead aggressively, and doing what you've done already, and really look forward to working with you and all of the people, out there across the country, that I think have a great concern about these serious safety issues.

Thank you. Thank you very much.

Ms. TENENBAUM. Thank you.

Senator PRYOR. Senator Klobuchar.

STATEMENT OF HON. AMY KLOBUCHAR,
U.S. SENATOR FROM MINNESOTA

Senator KLOBUCHAR. Thank you very much.

Thank you, to both of you, for your service.

I just remember, back in the early days, when I got here, which is not that long ago, and the issues, as I know Chairman Pryor remembers, with the CPSC, and our frustrations with a lot of the toys that were coming in from China. We had everything from the Aquadots, that were making kids go into a coma, to the little charm that was swallowed by a little boy in Minneapolis; a 4-year-old boy, whose mom had gotten a pair of tennis shoes, swallows the charm and dies. And when they tested the charm, it was 99 percent lead. That kid didn't ask for that charm. The mom didn't ask for that charm. It was given free with a pair of tennis shoes.

And so, we realized, at that point, that we need to update our statutes. And I think, at the same time, with legislation as detailed and sweeping as the CPSIA, it should come as no surprise that certain clarifications and adjustments need to be made, especially as many small manufacturers, retailers, secondhand stores, as well as ATV/bicycle enthusiasts, have been trying to comply with the law, and that there are issues that need to be handled in a pragmatic way.

I know that the Commission granted a one-year stay of enforcement of the testing requirements, and a two-year stay of enforcement for the lead-content limits on youth-model ATVs, snowmobiles, and motorcycles. And so, that is where some of my questinns are.

I guess the first one would just be a general question for you, Chairman Tenenbaum. How would you compare the safety of toys today versus in 2007, before the bill was passed? And what kind of information do you think parents should now have available as they go into the holiday season?

Ms. TENENBAUM. Well, thank you, Senator Klobuchar.

We have worked very hard to impress upon manufacturers that they need to get lead out of children's products. And we are seeing

the number of recalls decline; we've seen the number of recall products with lead decline. And that is why we think that given the resources and the renewed vigor that you've provided in the CPSIA, you're going to see even more improvements over time.

I'll focus on just your question and not the issue of lead content. In my earlier statement, I said consumers are safer. One, we have third-party testing. It is onerous for people to have to third-party test. But, you have products coming in from China; 80 percent of all the toys that we sell in the United States are manufactured in China. I have toured factories in China, with American brand names—and they said, "We need the third-party testing because we have a complex supply chain, and it protects us and removes our risk."

Two, we now have tracking labels. We didn't have a one-size-fits-all approach. We took into account small manufacturers. But, tracking labels will help a consumer, a parent, know where that product was manufactured, if there are problems with them.

We also have worked very hard with small businesses, we've provided seminars, we've had outreach. I have an open-door policy. The first year of my tenure, I had meeting after meeting with all kinds of industry to hear their concerns.

Senator KLOBUCHAR. You know, and—could I just follow up on that a bit? Because, again, I appreciate the work that has been done is—there were a lot of businesses involved in getting this law done, including the ATV industry, which is major in my state. And they actually, as Chairman Pryor mentioned, were very concerned about some of the imports that were coming in from other countries that didn't meet our safety standards. But, what they didn't expect, because of some provisions added at the last minute, that this bill was going to cover, like, thinking kids were going to, like, suck on brake pedals or something. So, I just want to get to some of those concerns——

Ms. TENENBAUM. OK.

Senator KLOBUCHAR.—as well—as you know, I was supportive of this bill, in general. But, I'll start—maybe I'll start with some of the ATV issues. And I do appreciate the stay, with regard to enforcing the CPSIA, against ATVs built for the youth market, until this April. But, what has happened now is, four out of eight major manufacturers have, nonetheless, removed themselves from the youth market. And maybe some people think that's good, but the problem is that I'm afraid that kids are going to ride adult ATVs now. And even the CPSC's own studies show that 90 percent of ATV-related injuries to children occur while riding the larger ATVs.

And so, what do you think we can do to get a permanent solution, here? I know the electronics industry got itself exempted out of this. ATV was supportive of this bill, because of the import issue, and it's ironic, indeed, that there isn't some way to resolve this. And do you think we need legislation? Or what do you think we need to do to fix this?

Ms. TENENBAUM. Well, on a temporary basis, we've asked the ATV industry to provide us with information, because the stay for testing does lift in May for ATVs and bicycles. And we asked them to provide us information on how they intend to comply. If these

manufacturers believe they're not going to be able to comply with the requirements, then they can submit a petition to the Commission asking us to extend the stay. But in meeting several times with the ATV industry, they need a permanent solution.

And so, what—when we all work together—and Commissioner Northup and I disagree on this approach, on a functional-purpose exemption. Under the Federal Hazardous Substance Act, we had a functional purpose exemption. So, if you came with a chemistry set, you had to have types of chemicals in the set in order to make it a functional purpose. So, you were given an exemption by the CPSC, under the FHSA.

We want a functional-purpose exemption. Instead of just wholesale gutting the CPSIA, let's do some surgery on it. Under the functional-purpose exemption, if you came in with an ATV and said, "Look, we need lead in this machine to make it stronger. Children are not going to mouth or swallow any of these components. And it's not going to pose a risk to the health of anyone who rides it, in terms of lead exposure." We could give you an exemption, a blanket exemption for the whole industry, a blanket exemption for bicycles. However, we do not want—to make it more complicated—and Commissioner Northup has pointed this out—you don't need regulations on this. If we have to write rules to have a functional purpose, it will bog us down, and we'll have to go through all this extensive rulemaking.

Just let us give the exemption. We don't have to make it overly burdensome. We don't want people to have to spend thousands of dollars coming up with this petition and proving to us that it's too costly to have something else in the market. Just file the petition, we'll look at it, we'll make a determination.

And that's how we thought we could get ATVs and bicycles and products that are not a high risk out of the lead requirements. But, if you make us do the rulemaking and make it overly burdensome, it's going to be too expensive for industry to comply with the CPSIA.

Senator KLOBUCHAR. OK.

I know Ms. Northup wants to respond. And were we going to have a second round here? Because I have——

Senator PRYOR. I wasn't going to——

Senator KLOBUCHAR. OK.

Senator PRYOR.—but why don't we let her respond——

Senator KLOBUCHAR. OK. All right. Northup.

Ms. NORTHUP. Let me say that I think our goal is the same here, some sort of realistic—allowing the lead content to be whatever it is that's necessary to hold the ATV or the bike or whatever together. But functional- purposes, as it has been proposed, any proposal I have seen for it, has said, "if there is another—no alternative material that'll provide this same thing, if there's no harm to the children."

Well, first of all, I'd just say, if there's no harm to the child, why would there be any other reason anyway to outlaw this screw, nut, bolt, whatever. But, it means that big industries, like ATV—and I respect how important it is to you, particularly—they can summon the money and the metallurgical studies to show that there's nothing that meets that standard, or whatever. But, small businesses

or businesses like—that make school science kits, they don't have the number of products and the price range in order to spread out the cost of a petition, and especially for toys or for science kits that may evolve.

You know, the ATV may get an exemption across the industry, but, so many other companies, this would be far too complicated, far too expensive for them to file a petition, to wait until we can act on it. The petitions we've acted on so far have taken months, and we've turned every one of them down.

So, I would just say, there are people that believe you should never give an exemption, if there is any possibility you don't have to, regardless of risk and—because of the precedent-setting. And you're going to continue that debate if it's just a functional-purpose exemption.

Senator KLOBUCHAR. And I know the Chairman wants to respond, but I am heartened somewhat; you both have the same intent to try——

Ms. TENENBAUM. We do.

Senator KLOBUCHAR.—to be pragmatic about how to respond to this. OK.

Ms. TENENBAUM. We do. And Commissioner Northup gets into, "If it's not a risk, then just exempt it." You can also exempt it. If you want to exempt ATVs out of a piece of legislation—or bicycles—you have the power to do that. If you ask the Commission to go back and look at risk of every product to determine whether or not there's any lead absorbed and whether it changes the blood lead level, we will be back where we were before the CPSIA.

You decided, in Congress, that you would go with a content standard—300 parts per million, it's going to be reduced to 100 parts per million. You did not do a solubility standard, because there were so many variables and there are no known safe levels of lead. An article in this morning's *Washington Post,* was about the lead pipes here in Washington D.C. There is no blood lead level that is considerable safe for children. And so, that's where we are. We go back and forth about, "Well, this isn't a risk." Well, if it's not a risk, and manufacturers have to have it in their product, then we will give them a functional-purpose exemption. We don't have to make it expensive or complicated.

But, you chose the total lead limit instead of solubility, for several reasons. One, bioavailability, which Commissioner Northup talked about, on how much lead you can get by rubbing a bicycle depends on the child. Every child is different. If you're a young child, you're going to absorb more lead. If you're a——

Senator KLOBUCHAR. OK.

Ms. TENENBAUM.—malnutritioned child—I'm sorry, I'm using your time.

Senator KLOBUCHAR. No——

Ms. TENENBAUM. It also depends on the product. Vinyl degrades with age and produces more lead, and also the viability tests are diverse. And so, there——

Senator KLOBUCHAR. OK. Now——

Ms. TENENBAUM.—were so many variables.

Senator KLOBUCHAR. But——

Ms. TENENBAUM. And that's why you stopped at 300——

Senator KLOBUCHAR. So—right—so, is there some degree of, until we solve this, which approach we want to take here to address these pragmatic concerns? And is another extension a possibility, then? And that's what we'll——

Ms. TENENBAUM. It is a number—a strong possibility——

Senator KLOBUCHAR. OK.

Ms. TENENBAUM.—if we can start this conversation in Congress about making these changes to the law.

Senator KLOBUCHAR. OK——

Ms. NORTHUP. Let me——

Ms. TENENBAUM. It is a strong

Senator KLOBUCHAR. OK——

Ms. TENENBAUM.—possibility.

Senator KLOBUCHAR. Why don't we—do you want to—what I'll do is put some questions in writing, so that we can continue this discussion, and maybe in my office as well, because I know we have another panel waiting. And then I also had some follow-ups, which I can do in writing, of the—Dan Marshall, from my state, is the owner of Pea Pods Natural Toys and Baby Care store, in Saint Paul. They obviously have some concerns with the third-party testing and how that applies to small businesses. And I will raise those in writing, as well.

Senator KLOBUCHAR. And then, the last thing that I wanted to follow up on was, again, to thank the Commission for its work on the Graeme Baker Pool and Spa Safety Act, something I worked very hard on, Senator Pryor worked hard on.

And I know that we're seeing some good compliance rates with the Pool Safety Act, and I wanted to thank you for that, both of you and the Commission, and the work that's going on. It's a very important thing. We had a little girl die in Minnesota, and that bill has meant a lot to the people of our state and that family.

So, thank you.

Ms. TENENBAUM. Thank you.

Senator PRYOR. Thank you, Senator Klobuchar. Thank you for being here.

And our time for this panel is up, so what we will do is, we will leave the record open, because I have some follow-up questions as well, and I know Senator Klobuchar does, and, I want to say, Senator Wicker and a few others that couldn't be here because there's a lot going on today in the Senate. They have the Armed Services Committee hearing, but lots of other things, as well.

So, we'll leave the record open, and we will send you written questions and—how long will we leave it open—we'll leave it open for 2 weeks, but we'd love to get those responses as quickly as possible.

Senator PRYOR. And, as we alluded to before, there'll probably be some other dialogue that happens here, not just in the next couple of weeks, but over the next few months, I'm sure.

But, anyway, thank you all for being here.

I'm going to go ahead and introduce our second panel, but——

Ms. TENENBAUM. Thank you, Senator——

Senator PRYOR.—thank you both——

Ms. NORTHUP. Thank you——

Senator PRYOR.—very much——

Ms. TENENBAUM.—Mr. Chairman.

Senator PRYOR.—for your time and your service.

The second panel, I'm going to go ahead and just read their names and give a super-short introduction for them.

Like the first panel, they all come with great credentials and a great background. But, what I will do, as the staff is rearranging here, and as the folks are coming and going here——

Our first panelist will be Ms. Rachel Weintraub. She's Director of Product Safety and Senior Counsel at the Consumer Federation of America. Second is Mr. Steve Lamar. He's Executive Vice President of American Apparel and Footwear Association. Third is Dr. Garry Gardner, American Academy of Pediatrics Chair, Committee on Injury Violence and Poison Prevention. And, fourth, Ms. Jill Chuckas, Board Member, Handmade Toy Alliance and, I believe, the Owner of Crafty Baby, LLC.

So, what I'd like to do is just do a 5-minute introduction for each one of you all. Then we'll have questions.

So, Ms. Weintraub, you want to lead off, here?

Thank you.

STATEMENT OF RACHEL WEINTRAUB, DIRECTOR OF PRODUCT SAFETY AND SENIOR COUNSEL, CONSUMER FEDERATION OF AMERICA

Ms. WEINTRAUB. OK. Thank you.

Thank you, Chairman Pryor.

I'm Rachel Weintraub, Director of Product Safety and Senior Counsel with Consumer Federation nf America. CFA is an association of nearly 300 nonprofit consumer organizations that was established in 1968 to advance the consumer interests through research, advocacy, and education.

I offer this testimony on behalf of CFA as well as Consumers Union, Kids in Danger, and the U.S. Public Interest Research Group.

Thank you very much for inviting me to testify before you today.

Today is the first day of Chanukah, Christmas is just 23 days away, and the holiday buying season has officially begun. Our country's tradition of gift-giving provides a useful perspective through which to comment on the Consumer Product Safety Improvement Act in particular, and the Consumer Product Safety Commission in general.

While consumers should think about how the child interacts with the product, if there are other children in the house, or whether the product has been previously recalled, before a product is purchased, there are some issues that no amount of planning or thought can detect. It is this realm of hidden hazards that the CPSIA and the CPSC have sought to detect and to prevent.

Before passage of the CPSIA, Congress undertook a year-long process to consider the implications of this Act, and the leadership of this subcommittee was an essential and important part of that process. The CPSIA's passage followed a period of a record number of recalls of hazardous products that injured, sickened, or killed vulnerable consumers and sought to repair a weakened oversight agency that failed in its meager efforts to protect public health and safety.

In response, Congress passed the CPSIA, which makes consumer products safer by banning lead and phthalates in toys, creating a publicly accessible consumer incident database, giving the CPSC more resources, increasing civil penalties, and requiring that toys and infant products be tested for safety to strong standards before they are sold and in our children's hands. This proactive approach will benefit the public as well as manufacturers by avoiding costly recalls.

There have been numerous successes in implementing the CPSIA. The mandatory crib standard, close to being finalized, that's required by Section 104, is an important example. We applaud the CPSC for prioritizing the safety of infant sleep environments, in light of the deaths of many children due to poorly designed cribs, bassinets, and cradles, which have led to the recall of more than 7 million cribs over the past 2 years. Only since passage of the CPSA—CPSIA—has an effort been made to strengthen crib standards.

Another success of the CPSIA is last week's passage of the final rule implementing the Consumer Product Safety Information Database. As a result of the CPSC staff's leadership and commitment, consumers will have access to lifesaving information. And the agency will more nimbly be able to identify and act upon safety hazards. The final rule is consistent with Congressional intent, responsive to the public-interest need for disclosure, and protective of a manufacturer's effort to protect their brand and confidential business information.

When consumers purchase toys for children online this year, the same choking-hazard warnings that appear on toy packaging will also appear online. That's an important consumer protection, considering today's shopping trends. The CPSIA requires that infant-durable products, such as cribs, strollers, and highchairs, include a product registration card in their packaging and provide an opportunity to register online. This will give manufacturers information necessary to directly communicate with consumers, the consumers who bought the product, in the event of a recall or other product safety. And this will greatly increase recall effectiveness.

Since passage of the CPSIA there have been challenges: a CPSC that initially moved slowly and gave out confusing information, an economic downturn that has affected businesses, the realization that lead and other heavy metals, such as cadmium, are more pervasive in consumer products than had been expected, as well as concern about the laws implementation consistently raised by manufacturers, small businesses, crafters, and thrift stores.

CPSC has been managing these challenges. They've held numerous public meetings and hearings. CPSC has provided clear information to stakeholders, through numerous publications. In addition, CPSC is establishing a new Office of Education Global Outreach and Small Business Ombudsman to carryout education/outreach activities to stakeholders. The CPSC also issued an interim enforcement policy, related to component testing, that should be finalized soon.

But, some efforts in response to these challenges go too far and would open a series of gaping loopholes in the CPSIA that would allow more lead into a host of children's products.

First, some have argued, or some will argue, that the CPSIA's scope should be limited to children under 6, from what it—it's now 12 years and younger. The reality is that children of younger ages play with their older siblings' toys all the time, and the voluntary standard goes up to 14. Many companies are already applying with those voluntary safety standards.

Second, some have proposed that risk analysis be applied for regulating lead in products. Requiring a piecemeal approach for lead, which is a known toxin, would be wasteful of taxpayer money and government resources. It would reverse the presumption for safety of products and allow all products to be sold and be exempt from testing for lead unless CPSC finds otherwise. This would be a return to the state of the law before CPSIA was passed. CPSC would not act until a child had been harmed by a lead-laden product. This would result in an unreasonable risk to children.

Cadmium has been another challenge. And there is now a voluntary standard that is moving, that hopefully will be proactive. And if that is not proactive enough, CPSC should move on a mandatory standard for cadmium.

We thank you, Chairman Pryor, for your important leadership on product safety issues. We look forward to working together to protect the public from harms posed by hazardous products. And I wish everyone a happy and safe holiday season.

[The prepared statement of Ms. Weintraub follows:]

PREPARED STATEMENT OF RACHEL WEINTRAUB, DIRECTOR OF PRODUCT SAFETY AND SENIOR COUNSEL, CONSUMER FEDERATION OF AMERICA

Chairman Pryor and members of the Subcommittee on Consumer Protection, Product Safety and Insurance, I am Rachel Weintraub, Director of Product Safety and Senior Counsel at Consnmer Federation of America (CFA). CFA is an association of nearly 300 nonprofit consnmer organizations that was established in 1968 to advance the consnmer interest through research, advocacy and edncation. I offer this testimony on behalf of Consumer Federation of America as well as Consumers Union, Kids in Danger, and the U.S. Public Interest Research Group. Thank you for inviting me to testify before you today.

Today is the first day of Chanukah, Christmas is just 23 days away, and the holiday buying season officially began last Friday. The holiday season, with our country's tradition of gift giving, provides a useful perspective through which to observe and comment on the Consumer Product Safety Improvement Act of 2008 (CPSIA) in particular and the Consumer Product Safety Commission in general. Whenever we make a purchase for our family and friends, most people assnme that the product they are considering is safe. While purchasers think about what the person would like, what they want or need or what they requested, an underlying assumption is that the product we are choosing will not cause harm. While consumers do need to think about how the child interacts with the product, if there are other children in the house who may play with the product, or whether the product has been previously recalled, there are some issues that no amount of thought or planning can detect. It is the realm of hidden hazards that the CPSIA and CPSC have sought to detect and prevent.

The bipartisan Consumer Product Safety Improvement Act passed overwhelmingly in the House on July 30, 2008 by a vote of 424–1, in the Senate on July 31, 2008, by a vote of 89–3 and was signed into law by President Bush on August 14, 2008. Before this law passed, Congress undertook a year-long deliberative process to consider the implications of this act: there were approximately 15 hearings and markups in the House and Senate covering issues and products related to the CPSIA, and once each chamber passed its version of the bill, there was a conference in regular order between both Houses of Cougress. The leadership of this subcommittee was significant and much needed as this law was moving through Congress. This law institutes the most significant improvements to the Consumer Product Safety Commission (CPSC) since the ageucy was established in the 1970s.

CPSIA's Significance, New Requirements and Implementation

The CPSIA's passage followed a period of a record number of recalls of hazardous products from the market that injured, sickened, or killed vulnerable consumers. The bill's passage was also in response to a weakened Federal oversight agency that failed in its meager efforts to protect the public's health and safety.

Before the CPSIA was passed, CPSC's past as well as its future was bleak. In 1972, when CPSC was created, the agency was appropriated $34.7 million and 786 full time employees (FTEs). Before the CPSIA passed, the agency's budget had not kept up with inflation, had not kept up with its deteriorating infrastructure, had not kept up with increasing data collection needs, had not kept up with the fast-paced changes occurring in consumer product development, and had not kept pace with the vast increase in the number of different types of consumer products on the market. CPSC's staff had suffered severe and repeated cuts during the last two decades, falling from a high of 978 employees in 1980 to just 401 in 2007—a loss of almost 60 percent.

For example, CPSC's 2008 Performance Budget document painted a grim picture of the CPSC's future work. The budget document was full of statements such as, "while the CPSC has thus far been successful at facing these new and evolving challenges with diminishing resources, the 2008 funding level will challenge the Commission's ability to maintain its existing level of standards development, enforcement, public information, and international activities."[1] The 2008 Performance Budget document was replete with staffing cuts, limitations to programmatic goals and the absence of previous goals and projects. CPSC's efforts to reduce product hazards to children and families were hindered by the forced reductions in FTEs.

In response to this dismal picture, Congress infused the CPSC with new authority and more resources. It has been over 2 years since the CPSIA was passed. This relatively new law will make consumer products safer by requiring that toys and infant products be tested for safety before they are sold, and by banning lead and phthalates in toys (although implementation of the testing requirement has been twice delayed by the CPSC). The law also authorizes the first comprehensive publicly accessible consumer complaint database due to be launched next March; gives the CPSC the resources it needs to protect the public, such as enabling it to hire additional staff; increases civil penalties that the CPSC can assess against violators of consumer product safety laws; and protects whistleblowers who report product safety defects.

Many consumers believed that products were tested before they were sold—that some entity issued stamps of approval for products before they were sold in the store. However, that was never true. Before passage of the CPSIA, the CPSC for the most part had authority only over products after they were sold. If a problem was identified as posing a risk of harm to consumers, the CPSC could recall the product, but that was only *after* the hazardous product was already in consumers' homes and in their children's hands. The CPSIA significantly changes the reactive nature of the CPSC by requiring that children's products subject to mandatory standards be tested for safety before they are sold. A proactive safety system should benefit the public as well as manufacturers by avoiding costly recalls.

CPSC and CPSIA Successes

Mandatory Crib Standard

While there have been challenges there have also been successes in implementing the CPSIA. One of the most notable examples is the mandatory crib standard that is required by section 104 of the CPSIA. The CPSC is close to finalizing the final rule for cribs. We applaud the CPSC for prioritizing the safety of infant sleep environments in light of the deaths of many children due to poorly designed cribs, bassinets, and play yards. Pervasive design flaws have lead to the recall of more than 7 million cribs over the past 2 years. It was essential that the CPSC place safe sleep environments at the top of their mandatory standards-setting list as part of that initiative.

Recalls and corrective actions for cribs have been issued for non-compliance with safety standards; strangulation hazards; risk of head entrapment when side rails, spindles, and slats in side rails become loose; risk of suffocation; choking hazards;

[1]&& U.S. Consumer Product Safety Commission, 2008 Performance Budget Request, submitted to Congress, February 2007, page vii. On the web at *http://www.cpsc.gov/CPSCPUB/PUBS/REPORTS/2008plan.pdf.*

risk of falling; and danger of laceration when fingers become trapped in folding drop gates.[2]

While the current voluntary crib standards ban the drop-side design in new cribs, only since passage of the CPSIA has there been an effort made to strengthen the voluntary and mandatory standards and require testing and verification of new cribs. The final CPSC crib standard incorporates many provisions that consumer advocates have been supporting for years that replicate the real world use of cribs, such as durability tests, mattress support tests, and tests for the effectiveness of hardware. The resulting proposed CPSC standard is a strong one and is a successful consequence of the CPSIA. In addition, Chairman Tenenbaum and her staff have been successfully reaching out to consumers through the Safe Sleep Campaign and have made it clear to all stakeholders that creating safe cribs and sleep environments is an imperative.

Section 104(c) of the CPSIA seeks to address hazards posed by older model cribs by removing them from the market. This section applies to cribs sold new and used, cribs used in child care facilities, and cribs used in public accommodations such as hotels and motels. The application of this provision means that older cribs that pose significant risks to children will be taken out of the stream of commerce. This provision is based upon laws already in existence in numerous states including: Arizona, Arkansas, California, Colorado, Illinois, Louisiana, Michigan, Minnesota, Oregon, Pennsylvania, Vermont and Washington. This provision extends the protections previously offered in just these states to the entire nation to ensure that children sleep in cribs that meet the most recent and most protective crib safety standards.

We support the CPSC's current language in its proposed crib rule[3] regarding a six-month effective date as it applies to manufacturers. The customary 6 months gives manufacturers adequate time to comply with the new crib standards. In addition, we will support an additional 6-month compliance period for child care facilities, allowing them to phase in replacement of non-compliant cribs over the course of 1 year following the publication of the final rule.

Database

Another success of the CPSIA is last week's passage of the final rule implementing the consumer product safety information database. CPSC is required by Section 212 of the CPSIA to establish the database. As a result of the CPSC staff's leadership and commitment to the effectiveness of the database, consumers will have access to lifesaving information and the agency will more nimbly be able to identify and act upon safety hazards. CPSC staff worked hard to formulate CPSC's final rnle in a manner that is consistent with Congress' intent, responsive to the public interest need for disclosure, and protective of a manufacturer's effort to protect their brand and confidential business information. The database includes more checks on the information and more opportunities for a mannfacturer to comment than other similar databases.

Consumers have been in the dark abont the dangers of products regulated by CPSC. CPSC currently collects incident data from consumers in a manner similar to how it will be collected as part of the new database. However, the difference is that now, when consumers go to CPSC's website to look for information, it is not available. All that they can nsnally find relates to a previons recall. If the Commission has been alerted to the dangers of a product but has not conducted a recall, the prodnct's hazard may never be known to the public.

The database will help change that. Public access to information is vital to safety. Simply allowing consumers access to the safety record of products will increase safety and encourage the speedy removal or redesign of unsafe products. Making it simple for consnmers to report into a single database the problems they encounter with products will also help the Commission to do its job of protecting the public from unsafe products more efficiently, which can help save Commission resonrces.

Online Toy Hazard Warnings

When consnmers purchase toys for children online this year, becanse of the CPSIA, the same choking hazard warnings that appear on the toy packaging will also appear online. This is an important consnmer protection considering today's shopping trends. For years, consnmers who purchased toys online were at a safety disadvantage because they did not receive all the information they would have received, had they made the purchase in a store. This concern has been solved by the CPSIA.

[3] Safety Standards for Full-Size Baby Cribs and Non-Full-Size Baby Cribs; Notice of Proposed Rulemaking; Proposed Rule," *Federal Register* Vol. 75, No. 141, July 23, 2010.

Product Registration

The CPSIA requires that infant durable products, such as cribs, strollers and high chairs, include a product registration card in their packaging and provide an opportunity to register onliue. This will give manufacturers iuformation necessary to directly contact consumers in the event of a recall or other product safety issue.

The requirements for the product registration cards and au online registration program are contained in Section 104 of the CPSIA, which incorporates the Danny Keysar Child Safety Notification Act. Danny, whose parents founded Kids In Danger, died in 1998 when the portable crib he slept in at a child care center collapsed and strangled him. The crib had been recalled 5 years earlier, but no oue at the child care ceuter, including the mom who donated the crib, had heard of the recall. Too mauy consumers uever hear about a recall of a product that they have iu their home. Registering products is an important step that will increase the number of consumers who hear about a recall.

7Mandatory Toy Standards

Despite the fact that mauy couformity assessment bodies have uot yet received accreditation to conduct full-scale testing, with the expectation of tighter enforcemeut down the road, many manufacturers are already adoptiug robust testing procedures and the safety of toys has been enhanced. The CPSC continues to work on ways to help small mannfacturers who have raised concerns about the costs associated with such testing ensure that their toys are just as safe.

Reviewing Past Data

CPSC has also been reviewing old records and taking long-overdue action. Earlier this year, CPSC announced the recall of two million Graco strollers: the Quattro™ and MetroLite™ because of entrapment and strangulation risks. CPSC and Graco had "received four reports of infant strangulations that occurred in these strollers between 2003 and 2005. In addition, CPSC was aware of five reports of infants becoming entrapped, resulting in cuts and bruises, and one report of an infant having difficulty breathing."[4] While these strollers should have been recalled years ago, we applaud CPSC for taking the right action now to remove these potentially hazardous products from the market.

CPSC and CPSIA Challenges

Since passage of the CPSIA, there have been many challenges to implementation: a CPSC that initially moved slowly and gave out confusing information; an economic downturn that has affected bnsinesses; the realization that lead and other heavy metals such as cadmium are more pervasive in consumer products than had been expected; and concerns about the law's implementation consistently raised by manufacturers, small businesses, crafters and thrift stores.

The current CPSC has been managing these challenges. The CPSC has held numerous public meetings and hearings about issues such as the consumer product safety information database and product testing. CPSC has sought to provide clear information to various stakeholders through publications such as the Guide to the CPSIA for Small Businesses, Resellers, Crafters and Charities and the Handbook for Resale Stores and Product Resellers. In addition, CPSC is establishing a new Office of Education, Global Outreach, and Small Business Ombudsman to "coordinate and carry out education and outreach activities to domestic and international stakeholders, including manufacturers, retailers, resellers, small businesses, foreign governments, and consumers."[5]

The CPSC also issued an Interim Enforcement Policy related to component testing for lead content and lead in paint last December and is working on finalizing the "component part" rule as part of the Testing and Certification Rule that should be finalized next year. The components part rule would especially benefit small manufacturers by allowing the use of certified component parts. In Chairman Tenenbaum's statement on the Proposed Rules for Testing and Labeling Pertaining to Product Certification and Component Part Testing, she stated that "the Commission is unanimous in its desire to see this rule provide significant relief from testing reqnirements for both small and large manufacturers while simultaneously moving safety npstream in the manufacturing process. By allowing testing to be performed

by component part suppliers and designating component part certificates as certificates issued under section 14 of the CPSA, the Commission has provided great incentive for manufacturers to start utilizing component part testing. At the same time, the Commission has established safeguards such as requiring all component parts to be traceable to their original manufacturers aud expressly requiring that manufacturers exercise due care when relying on component part testing certificates."[6]

The CPSC has been responding to the concerns raised by stakeholders.

Responses to CPSIA Challenges

Some responses to these challenges, however, go much too far and include two proposals that if implemented, would serve to considerably weaken public health. They would open a series of gaping loopholes in the CPSIA that would allow more lead into a host of toys and other products meant for children. We reject these efforts to weaken the CPSIA.

Protections Must Remain for Children 12 and Younger

First, some have argued that the CPSIA should not apply to children's products for children 12 years and younger but rather should cover only those products for children 6 and younger. This approach was rejected by Congress when it passed the CPSIA. Congress embraced the belief that there is a "shared toy box" in many families' homes. We agree with this view, as it reflects the reality of what we know to he true in many homes across the United States. Children of younger ages play with the toys of their older siblings. Youngor children mouth their older siblings' toys with frequency. Further, the voluntary standard for toys—ASTM F 963—includes an even broader scope to cover toys intended for children 14 and younger. This means that many companies are already complying with voluntary safety standards that encompass toys intended for children 14 and younger. Thus, the reality that children's toys and products are often shared by children within a family, plus the fact that many within the industry are already complying with a higher age standard, requires the scope of the CPSIA to remain as it is.

No Known Safe Level of Lead

Second, some have proposed that a risk analysis be applied for regulating lead in products. Requiring the CPSC to conduct risk analysis for lead is not acceptable. In this era of criticism over "government waste," requiring a piecemeal risk analysis for lead, a knowu toxin, would be a wasteful and inefficient use of taxpayer money and government resources.

Significantly, a risk analysis would reverse the presumption for the safety of products and allow all products to be sold and be exempt from testiug for lead unless the CPSC finds otherwise. This would mean a return to the state of the law before the CPSIA was passed—*i.e.*, CPSC wouldn't act until a child had been harmed by a lead-laden product. As we witnessed in the years before the CPSIA, the record number of lead-laden products that were recalled from the market proves that this approach resulted in an unreasonable risk of injury to consumers. It will amount to a waste of Commission resources, has been rejected by Congress previously as not being sufficiently protective of public health, and far exceeds the flexibility that the CPSC requested to regulate lead.

The Americau public demands that children's products not pose risks for the children who will play with or sleep iu those products. Lead is a well-documeuted ueurotoxin that has a wide range of effects on a child's development, includiug delayed growth and permaneut brain damage. There is no known safe level of exposure. As a society, we have spent years trying to reduce lead levels in our air, soil and homes. We must continue to work to reduce lead in other products where it is not necessary. While some might argue that we should seek to remove lead from all household products, Congress in the CPSIA focused on the products most likely to be in contact with children. Nearly all toys and infant durable products do not require lead, should nut contain lead and can be made effectively withuut lead. Iu the rare instance that children's products require lead, the CPSIA provides for a targeted exemption for functional purpose. This exemption is drafted tightly to eusure that children remaiu protected from harms of lead exposure. We would have grave concerus if auy of the limiting factors were removed.

---

[6] Statement of Chairman Inez M. Tenenbaum on the Proposed Rules for Testing and Labeling Pertaining to Product Certification and Component Part Testing, May 5, 2010, available on the web at *http://www.cpsc.gov/PR/tenenbaum05052010.pdf*.

Cadmium

Cadmium has been recently identified in numerous children's products beginning in January 2010. CPSC has issued five recalls and one warning about six products that contained high levels of cadmium.[7] Five of these recalls/warnings involved children's jewelry while one involved a drinking glass.

According to the Agency for Toxic Substances and Disease Registry, cadmium affects the following organ systems: Cardiovascular (Heart and Blood Vessels), Developmental (effects during periods when organs are developing), Gastrointestinal (Digestive), Neurological (Nervous System), Renal (Urinary System or Kidneys), Reproductive (Producing Children), and Respiratory (From the Nose to the Lungs).[8]

Toxic materials like cadmium should not be present in children's products and children should not be exposed to dangerous heavy metals when they play with toys, drink from a glass or engage in dress up play.

Earlier this year, CPSC issued a guidance report on cadmium and urged ASTM to issue a voluntary standard for cadmium beyond paints and surface coating. By relying on ASTM to develop appropriate standards to address cadmium hazards in toys and children's jewelry, it allows many stakeholders to participate in the standards-development process.

CPSC should be involved in the voluntary standard-setting process and should issue a mandatory standard limiting the cadmium conteut iu children's products if the voluntary standard fails to be adequately protective of children's health. A mandatory standard enables CPSC to use enforcement tools to ensure compliance with the standard. Finally, mandatory standards provide clear rules for industry to follow as they seek to comply with CPSC rules.

The scope of CPSC's efforts to ban the use of cadmium should be focused on children's products as defined iu the CPSIA. Initially, as CPSC begins to limit cadmium in consumer products, CPSC should focus on product categories that are known to be of risk to children: children's jewelry, children's diunerware, and children's toys.

In addition, the ban on cadmium should be based upon a total cadmium level (not solubility), which, similar to the lead regulations, offers clarity and consistency to mannfacturers, CPSC, and testing bodies and offers pnblic health protections to consumers.

CPSC should examine efforts in states snch as California, Washington, Connecticut, Illinois, and Minnesota that have restricted cadmium in children's jewelry. While these laws tend to focus on solubility standards rather than total cadmium content and also focus on children's jewelry rather than children's products, they serve as a useful guide. Since laws have passed in five states and with bills pending in at least five other states, it is clear that consumers are asking for mandatory rnles to limit cadmium in children's products.

Finally, we nrge CPSC to utilize the work it is undertaking to ban cadminm to address bans of other toxic heavy metals in children's products. We hope CPSC efforts effectively stem the tide of substituting one heavy metal for another and curb the use of heavy metals in the manufacturing of children's products.

Congress Must Support CPSC's Mission

CPSC plays an incredibly crucial role in ensuring that consumer products are safe and is responsible for implementing the critical protections of the CPSIA. It is imperative that the agency be appropriately funded at all times to do its job properly. Diminishing CPSC's budget or its authority at this time would hamper the agency from carrying out its primary mission to protect consumers from unreasonable risk of injury cansed by hazardons products.

We thank Chairman Pryor for the important leadership role he has played on product safety issues and we look forward to continuing to work together to protect the pnblic from harms posed by hazardons prodncts.

I wish everyone a happy and safe holiday season.

Senator PRYOR. Thank you.

Mr. Lamar.

STATEMENT OF STEPHEN LAMAR, EXECUTIVE VICE PRESIDENT, AMERICAN APPAREL & FOOTWEAR ASSOCIATION

Mr. LAMAR. Hi. Good morning.

My name is Steve Lamar. I'm Executive Vice President of the American Apparel & Footwear Association. We're the national trade association of the apparel and footwear industry and its suppliers.

Thank you, Chairman Pryor, for providing us this opportunity to appear before you on this important topic.

At the outset, let me state our very strong support for a product safety regulatory system that ensures that only safe and compliant products are designed, produced, marketed, and sold. At AAFA, we take our role in product safety education and advocacy efforts seriously. We view this obligation as key to the success of the industry, not only because such an approach is the right thing to do, but because we're also consumers and parents and grandparents ourselves.

I'd like to focus my remarks on the Consumer Product Safety Improvement Act and offer several recommendations for the Subcommittee to consider in the weeks and months ahead.

The CPSIA was a dramatic overhaul to the nation's product safety regulatory regime. While this had a positive impact through increased funding and awareness, it has also led to many unintended consequences that have caused confusion, created compliance burdens, and adversely impacted the business community. Tight deadlines, rigid definitions, retroactively applied standards, requirements that do not reflect risk, and a one-size-fits-all approach are among the many problems that have made CPSIA implementation challenging.

AAFA, as with others in the regulated community, has actively worked the regulatory process to make sure the rules can be understood and implemented. We've had some success in working with the CPSC to use the limited regulatory flexibility that the CPSIA does permit to make some important determinations. In my written testimony, I detailed one such example—the determination that there is no lead in textiles—but, I also pointed out how the fix is still incomplete, and it came at considerable expense to prove what everybody already knew.

The more common experience is that relief is either denied or that the regulatory process proves too burdensome to achieve a truly commonsense result. The stays of enforcement on testing and certification have provided some relief. And we would strongly encourage that they be continued while the rules and a path forward are still being worked out. But, it is becoming clearer every day that Congress needs to step in and make some legislative fixes to address the many concerns that have been raised from all across the private sector. And, because the timetables mandated by the CPSIA are unforgiving, Congressional action is needed immediately.

A number of legislative fixes have been proposed over the past 2 years by stakeholders across the business community, by Members of Congress from both parties and both chambers, and even by commissioners and CPSC staff alike. They include changes to the lead and phthalate rules, the definition of "children's product,"

more flexible testing and certification provisions, stronger preemption to prevent proliferation of contradictory rules at the state level, and clearer mandates for the public database. I could go on. It's our hope that Congress can immediately begin work with all stakeholders to fully identify and implement these fixes.

With a nod toward Chanukah, which began last night, I would like to make eight recommendations for the Subcommittee to consider going forward:

Number one, ensure that all product safety decisions are based on risk and supported by data.

Number two, give the CPSC more flexibility to interpret the CPSIA.

Number three, ensure that new regulations do not contradict existing ones.

Number four, ensure prospective application of all rules.

Number five, establish deadlines that permit and encourage compliance.

Number six, publicize all pending regulatory developments.

Number seven, avoid one-size-fits-all approaches.

And, finally, number eight, remember that there is more to the CPSC than CPSIA.

The most effective product safety system we can have is one that recognizes that the regulated companies are active partners of the CPSC. But, if these companies are constantly subjected to burdensome, costly, and, in some cases, silly requirements, that partnership is severely strained and the public's interests are not served. Ultimately, product safety takes a blackeye.

Mr. Chairman, the CPSC and the regulated community have come a long way since Congress passed the CPSIA. Thanks to your leadership, we now have five commissioners and an agency that is more fully funded. The CPSIA was, indeed, a wake-up call for the agency and for many in the business community to tighten their own product safety regimes. But, the CPSIA also created extraordinary problems for companies who were already doing the right thing in ensuring product safety. In many cases, those problems came with little gain for public safety.

With an eye to maximizing public health and safety, it is our hope that, with a legislative amendment, continued Congressional oversight, and continued dialogue between the agency, industry and other product safety stakeholders, we can create a stable, predictable, risk-based regulatory environment.

Thank you again for providing us this opportunity to testify. I'm available to take any questions.

[The prepared statement of Mr. Lamar follows:]

PREPARED STATEMENT OF STEPHEN LAMAR, EXECUTIVE VICE PRESIDENT, AMERICAN APPAREL & FOOTWEAR ASSOCIATION

Good morning.

My name is Steve Lamar and I'm Executive Vice President of American Apparel & Footwear Association (AAFA)—the national trade association of the apparel and footwear industry, and its suppliers. Thank you for providing us this opportunity to appear before you this morning on this important topic.

At the outset, let me state our very strong support for a product safety regulatory system that ensures that only safe and compliant products are designed, produced, marketed, and sold. At AAFA, we take our role in product safety education and advocacy efforts seriously. We view this obligation as key to the success of the indus-

try, not only because such an approach is the right thing to do, but because we are also consumers, parents, and grandparents ourselves. We believe very strongly that we should only wear safe and compliant clothes, shoes, and other products. At the end of my testimony I included additional information about AAFA and some of our product safety initiatives, including our extensive global education efforts.

Although product safety is a year-ronnd job, it is appropriate to have this oversight hearing as we enter the holiday season. The focus on consumer spending during the holidays is a natural time to reflect ou product safety and compliance. Fnrthermore, as Congress begins to think through its agenda for the next 2 years, this is a good opportunity to identify what changes can be made to ensure that our Nation's product safety regulatory system is operating effectively. As this is the first oversight Subcommittee hearing on the Consumer Safety Product Commission (CPSC) since passage of the Consumer Product Safety Improvement Act (CPSIA) in 2008—and with more than 2 years of industry experience with implementation of this important law—I'd like to focus my remarks on the CPSIA and offer several recommendations for the Subcommittee to consider in the weeks and months ahead.

The CPSIA was a dramatic overhaul of the Nation's product safety regulatory regime. Its passage put a spotlight on product safety concerns, propelling consumers, regulators and businesses to refocus on making product safety a top priority. Among other things, the legislation provided the CPSC—long an underfunded agency—with much-needed resources to carry out product safety enforcement and educational efforts. It mandated the CPSC to work with other agencies like Customs and Border Protection (CBP) to develop risk assessment methodologies to efficiently target and block potentially unsafe imports. It also ensured that all five CPSC leadership positions were filled—for the first time in years—in an effort to secure a renewed dialogue and healthy debate on how to effectively and efficiently approach and enforce safety regulations. Finally, new content and testing requirements have helped companies better nnderstand the chemicals used in children's products aud evalnate and improve their qnality control processes to ensure that only safe products are sold. It goes withont saying that industry, consnmer advocacy groups, bloggers, the media, and various other stakeholders across the spectrum have become more engaged than ever in product safety.

Regrettably, the legislation also mandated a series of controversial changes to the Nation's product safety rules that have created endless confusion, extensive burdens, huge costs, job losses, and irreparable damage to the business community. In many cases, these adverse consequences have come without improvements in prodnct safety or public health. Among other things, the law mandated very strict lead and phthalate content restrictions. It required certifications of compliance for all consnmer products for all safety standards, mandating third-party testing for those standards involving children's prodncts (defined as 12 and under). It created a pnblic database of prodnct safety incidents. It authorized enforcement by state attorneys general and created whistleblower provisions. While many of these provisions reflect good intentions, the language of the CPSIA makes many of them difficult, if not impossible, to implement and enforce. Tight deadlines, rigid definitions, retroactively applied standards, requirements that do not reflect risk, and a "one-size-fits-all approach" are all among the many problems that have made CPSIA implementation challenging.

AAFA, as with others in the regulated community, have actively worked the regulatory process to make snre the rules can be nnderstood and implemented. We have had some sncccss in working with the CPSC to use the limited regulatory flexibility that the CPSIA does permit to make some important determinations and offer some clarifying opinions. And while we commend the Commissioners and the staff who have worked tirelessly for more than 28 months to craft regulations that reflect "common sense," many problems either have not or cannot be fixed through the regnlatory process. The surrogate for some of these fixes has come in the form of a series of stays of enforcement. And while these stays have provided welcome relief, and should remain in force, they cannot provide a long term solution.

Let me offer one experience—related to the lead substrate standard—to illustrate these points.

Per the CPSIA, the lead restriction applies equally to *any* component of a children's prodnct. Initially, this was interpreted to include all the fabrics, yarns, threads, accessories, and trimmings even though it was commonly understood, and has been known for decades, that there is no lead in textiles and only isolated occurrences of lead in other components, snch as buttons, snaps, and zippers. Eventnally, and after input from the industry and other stakeholders, the CPSC issned a determination that indeed there is no lead in textiles, regardless of whether the fabric is dyed. And while we were pleased with this determination, please consider the following:

- The determination required the submission of thousands of test results costing hnndreds of thonsands of dollars. Including the tests that were not snbmitted, but which companies had to perform because their customers were insisting upon them as a result of their understanding of the CPSIA, the cost rises into the millions.
- The determination was not made until more than 6 months after the initial retroactive lead standard took effect and several weeks after the second (and current) lead standard took effect.
- Since most garments are not made entirely of just fabric, most garments still have to undergo testing for possible lead in most trimmings, even though tests from pre-CPSIA inventories showed that lead occurred in these components in only 3–5 percent of the time. Moreover, in many of these cases, the positive lead tests occurred with components that present no risk, but which are nonetheless covered. The example often cited is the zipper stop at the bottom of the fly in a child's pair of trousers.
- The determination is not complete. Even though the determination applies to dyed fabrics, it does not apply to certain kinds of after treatment processes, such as prints. Yet some of the print processes exclnded by this determination have the same non risk of lead as dyes.
- The determination depends on a component part testing rule to operate effectively. That rule, while proposed, has not yet been finalized.
- Testing relief that companies are currently nsing to navigate through these rules goes away once the stay of testing and certification has been lifted because a company's own reasonable testing efforts—such as the use of XRF style machines—will be insufficient to meet third party requirements.
- These requirements exist along side other rules that were created by the CPSIA or which were strengthened by the CPSIA. So while the fabric in a child's pajama may not have to meet lead testing rules for fabric, it does have to meet requirements for flammability, lead substrate testing in zippers, lead in paint testing for any coatings, and possibly phthalate testing for the non-stick surfaces on the pads of the feet.
- State rules impose a myriad of additional, and contradictury, requirements that are not preempted by these determinations.

It is for this reason that we have been strong supporters of Congressional initiatives to amend the CPSIA and to ensure the proper implementation of the CPSIA. And because the timetables mandated by the CPSIA are unforgiving, Congressionul action is needed immediately.

Many throughout the stakeholder community have identified a number of provisions in the CPSIA that need to be amended through either a "tweaking" or through "major surgery." It would appear that many in Congress, the Commissioners, and the CPSC professional staff also share this view to different degrees. During the 111th Congress, several hundred Senators and Representatives from both parties and both Chambers have written letters or sponsored legislation that seek amendments to the CPSIA. A provision in last year's omnibus spending bill asked the Commission for its advice on legislative changes. Commissioner Nord, during her tenure as Acting Chair, forwarded to Congress a list of professional CPSC staff recommendations for CPSIA changes.

Some proposed changes have focused on specific industries—such as books or ATVs or small batch manufacturers. Others have sought to provide broader industry relief, such as provisions that would apply next year's tighter lead restriction in a prospective manner or which would permit inaccessible components to be exempt from phthalate limits. An incomplete list of other changes needed involve revisiting the definition of children's product, more flexible testing and certification provisions, stronger preemption to prevent proliferation of contradictory rules at the state level, and clearer mandates for the public database.

This is not an exhaustive list. But it is important to note that, with more than 2 years of CPSIA implementation and experience, the regulated community and the regulators have both found significant problems with the law. There appears to be a growing consensus that the CPSIA created many unintended consequences that, if left unaddressed, will continue to do damage to the very entities that bear the burden for compliance. Our hope is that Congress can immediately begin work with all stakeholders to fully identify and implement these fixes.

Goiug forward, I would like to make 8 recommendations. Many of these will require specific legislative changes or clear direction from Congress that the CPSC shall interpret the CPSIA, using its existing authorities, with more flexibility. All these suggestions are intended to streugtheu product safety and public health.

1. Ensure that all product safety decisions are based on risk and supported by data

The CPSIA makes a number of product safety mandates that simply do not reflect risk. Prohibitions against lead in the spokes of a child's bicycle is just one obvious example. Not only does this contradict common sense but it undermines an effective product safety regime and creates confusion among the regulated community and consumers alike. If all prodncts, regardless of the risk, are deemed equally hazardous, valuable resources and time will be spent validating and regulating already safe products. Businesses will not understand which hazards they are trying to prevent if the regulations appear arbitrary, as they currently do under the CPSIA. Moreover, consumers will become so overwhelmed by product safety warnings that they will tune out when real and legitimate coucerns do appear. A better approach would be to focus time and energy on those products, components, and materials that do present risk of injnry, harm, or death. Then, based on the fact pattern behind that risk, we can construct a regulatory regime to erase or mitigate the hazard. In this vein, the public database scheduled to go live in only a few months raises significant problems because it will inundate the public with erroneous and unsubstantiated claims instead of legitimate product safety problems.

2. Give the CPSC more flexibility to interpret CPSIA

At numerous points during the past 2 years, the regulated community has heard that the CPSIA ties the Cask's hands. In these cases, the professional staff, and even Commissioners, agreed that a particular outcome is not correct but pointed to the law as the source of their helplessness to address the issue. In some cases, the agency has resorted to contorted opinions or guidance that, although well intended, have often complicated the business community's understanding of the law. The CPSC should be able to respond, quickly, to imminent threats and respond smartly and appropriately to longer term and fact based concerns. In all cases, the rules should be easy to understand so they can be effortlessly implemented and communicated up and down the supply chain. Currently, CPSIA, as interpreted by many at the CPSC and others, does not allow this flexibility.

3. Ensure that new regulations do not contradict existing ones

The CPSIA mandates new testing and certification requirements that alter existing regulations that pre-date the CPSIA, that have worked extremely well and which the industry understands. For many of these standards (including those addressing flammability, small parts, and sharp points and edges), pre-existing quality control programs and regulations were crafted in such a way that they did not hinder the ability of companies to make safe and compliant products. But because the new CPSIA mandates do not efficiently plug into the existing regulatory requirements, considerable confusion has been created with regard to these regulations. This will only be exacerbated as the now delayed 15-month rule and the new third-party testing requirements begin to take effect. On a similar note, incomplete preemption language in the CPSIA means that Federal rules and state rules often work at cross purposes.

4. Ensure prospective application of all rules

The CPSIA imposed new lead and phthalate requirements in a retroactive manner. This caused untold chaos, confnsion, and costs as companies were forced to cancel orders, reformulate products, and destroy inventory. Regrettably, the CPSIA's retroactive mandates continue to create chaos. For example, some products lawfully produced today under the CPSIA 300 ppm standard will become banned hazardous substances if they are sold after August 14, 2011, when the standard drops to 100 ppm (and is applied retroactively). Regulations should take effect prospectively, and implemented only after the Commission publishes clear and comprehensive regulatory guidance. The retroactive application of regulations unfairly punishes businesses for making products in good faith, especially when they were made in compliance with a previous product safety standard. It also goes against sound business practices which build product safety requirements into the design at the beginning of the production process rather than treat them as an afterthought at the end.

5. Establish deadlines that permit and encourage compliance

The CPSIA's mandate to the CPSC to undertake dozens of rnlemakings in a short period of time has been challenging for both the agency and industry. In many cases, the changes were tied to specific deadlines that have proved hopelessly unrealistic. A proposed 15-month rule, which was supposed to provide some relief in the form of component part testing, is now more than a year late and has been delayed indefinitely. Other deadlines have had to be delayed or stayed. Rather than rely on strict deadlines, the CPSIA should recognize that well thought out and implementable product safety rules take time. A single garment can take nearly a

year to travel down the supply chain. New regulations must give industry enough time to adapt these long supply chains so all parties can understand and clearly communicate changes to all their partners involved in production. Furthermore, time is necessary so the regulatory agency can work with the affected industry to properly develop and implement the regulations.

6. Publicize all pending regulatory developments

The regulated community continues to have a difficult time understanding when various rules and regulations are due to be developed under the CPSIA. The agency is currently in the process of lifting of the stay of enforcement of testing and certification for the children's product safety standards. Yet this is being done in a manner that is catching many by surprise. Product safety standards that work best are those that are created through a transparent and predictable process, especially when they involved technical testing and certification protocols. The product safety community involves a range of stakeholders, all of whom need to participate. If one group appears shut out, the final result may not be credible or accepted by all. This, in the long run, leads to a product safety regime that is not sustainable.

7. Avoid "One-Size-Fits-All Approaches"

One major problem is that the CPSIA treats all products, components, and companies equally, even though there are different risks involved. Product safety rules that were in effect before the CPSIA recognized these differences by tailoring the rules to those products and consumers where the risk of injury or death are greatest. Similarly, while all companies, regardless of size, should be subject to product safety rules, different sized companies can demonstrate compliance using different methods. Not recognizing these differences continues to be one of the major flaws of the CPSIA.

8. There is more to the CPSC than CPSIA

The CPSC should be commended for the enormous amount of work they are doing in implementing the CPSIA. But we are concerned that the resources and time spent on implementing the CPSIA has detracted from other important product safety initiatives, including enforcement of existing standards. Giving the CPSC flexibility to properly implement product safety priorities in the CPSIA will inevitably free up time for the agency to focus resources on the rest of its product safety mission.

Conclusion

Over the past 2 years, AAFA and others have worked closely with the CPSC to implement the CPSIA and we applaud the agency's efforts to work with and educate industry during the rulemaking process.

The most effective product safety system we can have is one that recognizes that the regulated companies are active partners of the CPSC. But if these companies are constantly subjected to burdensome, costly, and, in some cases, silly requirements, that partnership is severely strained and the public's interests are not served. Ultimately, product safety takes a black eye.

Mr. Chairman, the CPSC and the regulated community have come a long way since Congress passed the CPSIA. Thanks to your leadership we now have five Commissioners and an agency that is more fully funded. The CPSIA was indeed a "wake-up" call for the agency and for many in the business community to tighten their own product safety regimes. But the CPSIA also created extraordinary problems for companies who were already doing the right thing in ensuring product safety. In many cases, those problems came with little gain for public safety.

With an eye to maximizing public health and safety, it is our hope that with a legislative amendment, Congressional oversight and continued dialogue between the agency, industry and other product safety stakeholders, we can create a stable, predictable, risk-based regulatory environment.

Thank you again for providing us this opportunity to testify. I am available to take questions.

APPENDIX

Background on AAFA Product Safety Initiatives

AAFA is the national trade association for the apparel and footwear industries, and their suppliers. Our members own, produce for, or market hundreds and hundreds of brands of clothing and footwear. AAFA has about 400 member companies who own, produce for, or market more than 700 brands of clothing, footwear, and other fashion products. Nearly all stakeholders in the industry supply chain are represented in our membership, including large, medium, small, and micro businesses;

retailers of all sizes; designers; manufacturers; importers; wholesalers; private label; brand owners; and suppliers of inputs and services. AAFA members produce and sell in virtually every country in the world.

Educating the apparel and footwear industry supply chain on product safety compliance initiatives has been a top priority for AAFA for decades. The AAFA Product Safety Council, which addresses specifically with product safety issues, is one of our more active Committees. It now boasts over 400 members. AAFA uses the Product Safety Council to distribute information, develop industry positions, create best practices, and keep members up to date on the ever changing product safety landscape.

AAFA is an active participant in legislative and regulatory initiatives involving product safety. Since the passage of the CPSIA, AAFA has participated in numerous regulatory proceedings focused on the apparel and footwear industries, or affecting the broader regulated community.

Over the past 2 years alone, AAFA has conducted nearly a hundred webinars, briefings, conferences and trainings, throughout the United States and on four continents on the CPSIA, restricted substances, and other product safety topics. Just last month, AAFA conducted a CPSIA training session with over 200 factory and compliance personnel in Ho Chi Minh City, Vietnam. AAFA will be returning to China in April of 2011 for our 6th compliance program in that country.

Since 2007 AAFA has published a free, publicly available, peer-reviewed, industry-wide Restricted Substances List (RSL) that helps companies understand international product safety standards and implement a chemical management program. The RSL is updated once every 6 months to ensure the most current information is available for companies in a manner that is digestible and easy to implement. The 7th release of the RSL was most recently published in Vietnamese to coincide with the recent product safety seminar held in Vietnam. Future editions will be published in other languages, including Spanish and Chinese. The RSL is available on the AAFA website—*www.apparelandfootwear.org*—where AAFA staff also post extensive product safety compliance information on the CPSIA and other product safety initiatives, such as REACH and individual state laws, including California Proposition 65. Keeping this information updated is a never ending challenge, particularly in the past several years in light of the rapidly changing regulatory environment.

Senator PRYOR. Thank you.

Mr. LAMAR. Thanks.

Senator PRYOR. Dr. Gardner.

STATEMENT OF H. GARRY GARDNER, MD FAAP, ON BEHALF OF THE AMERICAN ACADEMY OF PEDIATRICS

Dr. GARDNER. Good morning.

My name is Dr. Garry Gardner, and I am proud to represent the American Academy of Pediatrics at this hearing today.

The AAP was pleased to work closely with members and staff of this committee and subcommittee over the course of the development and passage of the Consumer Product Safety Improvement Act. Over a period of close to 2 years, the AAP provided expertise and input on a range of child health and safety issues, including the proposed limitations on lead content and the definition of a children's product. As passed, the CPSIA ultimately rejuvenated a flagging CPSC, gave it additional tools and authority to achieve its mission, and helped improve the safety of consumer products for children.

Let us take a moment to reflect back upon the state of product safety and the CPSC during the 2007 holiday season. Our nation had just experienced a flood of product recalls, including several involving some of the best known and most loved brands and toys. Many Americans were shocked to learn that the majority of toy safety standards were voluntary and not mandatory, with few or no consequences for violations of those voluntary standards. The

CPSC was struggling to perform its mission with limited statutory authority and atrophied staff and a budget of only $62 million—less than one-quarter of what Congress had allocated for the Hubble Space Telescope, and slightly less than what was spent on Pacific coastal salmon habitat restoration.

Three years later, the state of consumer product safety is very different. The CPSIA has already created a range of new safety standards for toys and other children's products, including strict limits on lead content in all materials. The CPSC has increased its staff, and its budget has almost doubled. Manufacturers will soon be required to test for, and document compliance with, a range of safety standards, giving retailers and consumers a high degree of confidence in the safety of these products. Unsafe cribs have been recalled and dangerous drop-side cribs will soon be banned.

These new safety standards are having a meaningful impact on the lives of children and families, though sometimes in all but invisible ways. We cannot readily see that a toy is now lead-free or that a dangerous feature on a stroller has been reengineered to be safe. It may seem, perhaps, that these are unimportant changes that cause only minor or incremental improvements in safety, but it would be a mistake to fall into the trap of believing that these small changes cannot also be significant. These changes save lives and prevent life-altering injuries. The loss of a few IQ points across the child population has marked impacts on educational spending and future potential.

Over my 37 years in practice, I have seen a dramatic change in the injuries suffered by my patients due to unsafe products. Many of the injuries that used to be relatively common simply do not occur anymore. As a pediatrician, I am grateful to Congress and the CPSC for your ongoing work to make products safer for our children.

I'd like to offer some very brief comments on the subjects of lead, Safe Sleep, cadmium, and emerging hazards.

The AAP has been supportive of CPSC's efforts to implement Section 101 of the CPSIA, which set the first-ever comprehensive limits on lead in children's products. The new lead limits are being phased in over 3 years to allow manufacturers and retailers sufficient time to ensure that their products comply with the new rules. The AAP looks forward to the completion of the standard's implementation when the total lead limit drops to 100 parts per million in August 2011. The CPSIA, and Section 101 in particular, is truly a significant step in protecting children from the real hazards of lead.

Safe Sleep. The AAP is pleased to have partnered with Chairman Tenenbaum and the CPSC on its Safe Sleep initiative, a multifaceted campaign aimed at reducing deaths and injuries associated with unsafe sleep environments. As part of this campaign, the CPSC collaborated with the AAP, Keeping Babies Safe, and journalist Joan Lunden to produce a video, to be aired in hospital and physician waiting rooms, providing recommendations and information to parents and families on safe sleep practices. AAP supports and has submitted extensive comments on rulemaking processes to establish new mandatory safety standards for bunkbeds, cradles, bassinets, and full-size and non-full-size cribs.

Finally, the AAP has consistently recommended that parents not use sleep positioners. And we fully support CPSC and FDA's recent warning to parents about the dangers of these products.

Cadmium. Recent press reports have brought to light the potential danger of another heavy metal in consumer products: cadmium. It appears that some manufacturers have begun adding cadmium to children's products because the CPSIA limited the use of lead. This is clearly a case of abiding by the letter, but not the spirit, of the law. Congress hardly intended for companies to substitute one poison for another.

The AAP urges the establishment of a systematic, transparent process by which CPSC should review the literature and data, consult with experts, and update each of the heavy-metal standards found in the ASTM F 963 toy standard. This process should not be delegated to nongovernmental entities or be inaccessible to the public or stakeholders. Moreover, the standards established should apply to all children's products, and not just toys. The AAP looks forward to engaging with the CPSC throughout such a process and making our members' expertise available to the agency.

And finally, emerging product safety hazards. Ensuring the safety of consumer products requires constant vigilance as the marketplace changes and new products, and sometimes new hazards, are created. Small powerful magnets continue to be a concern, as they can cause serious injuries if more than one is swallowed. The AAP's Committee on Injury is also learning of increasing numbers of reported injuries caused by children's ingestion of so-called "button batteries." The AAP is interested in working with the CPSC and industry to require secure closures on devices that require button batteries, as well as appropriate packaging.

In conclusion, the AAP appreciates the opportunity to offer testimony today. We commend you, Chairman Pryor and the subcommittee, for your leadership on consumer product safety issues. And we look forward to working with you to ensure the health and safety for all children. I'll be pleased to answer any questions you may have.

[The prepared statement of Dr. Gardner follows:]

PREPARED STATEMENT OF H. GARRY GARDNER, MD FAAP, ON BEHALF OF THE AMERICAN ACADEMY OF PEDIATRICS

Good morning. I appreciate this opportunity to testify today before the Commerce, Science, and Transportation Subcommittee on Consumer Protection, Product Safety, and Insurance at this hearing, "Oversight of the Consumer Product Safety Commission: Product Safety in the Holiday Season." My name is H. Garry Gardner, MD, FAAP, and I am proud to represent the American Academy of Pediatrics (AAP), a non-profit professional organization of more than 60,000 primary care pediatricians, pediatric medical sub-specialists, and pediatric surgical specialists dedicated to the health, safety, and well-being of infants, children, adolescents, and young adults. I chair the AAP's Committee on Injury, Violence and Poison Prevention, which is responsible for advising the Academy and drafting its policies on a wide range of injury prevention issues, including consumer product safety. I have been in private pediatric practice since 1973 and am a Professor of Clinical Pediatrics at Northwestern University Feinberg School of Medicine.

Creating Safe, Healthy Products for Children

The AAP was pleased to work closely with the Members and staff of this committee and subcommittee over the course of the development and passage of the Consumer Product Safety Improvement Act of 2008 (CPSIA). Over a period of close to 2 years, the AAP provided expertise and input on a range of child health and

safety issues, including the proposed limitations on lead content and the definition of a children's product. As passed, the CPSIA ultimately rejuvenated a flagging Consumer Product Safety Commission (CPSC), gave it additional tools and authority to achieve its mission, and helped improve the safety of consumer products for children.

Today's hearing provides a valuable opportuuity to discuss the CPSIA 2 years after its signature into law. Many of the directives uuder the law have already been implemented, either in whole or in part, while others remain to come. The AAP appreciates this opportunity to reflect on the successes of the CPSIA to date and opportunities for improvements in the coming months and years.

Let us take a moment to reflect back upon the state of product safety and the CPSC during the 2007 holiday season. Our nation had just experienced a flood of product recalls, including several involving some of the best-known and most-loved brauds and toys. Many Americaus were shocked to learu that the majority of toy safety standards were voluutary, uot maudatory, with few or no cousequeuces for violation of those voluntary standards. Even for a highly toxic substance like lead, the Federal limit was an unacceptably high 600 parts per million, and applied only to paint on children's products. The CPSC was struggling to perform its mission with limited statutory authority, an atrophied staff, and a budget of $62 million—less one-quarter of what Congress allocated for the Hubble Space Telescope that year, aud slightly less than was spent ou Pacific coastal salmou habitat restoration.

Three years later, the state of consumer product safety is very differeut. The CPSIA has already created a range of new safety standards for toys aud other children's products, including strict limits on lead content in all materials. The CPSC has increased its staff, and its budget has almost doubled. Manufacturers will soon be required both to test for and doenment compliance with a range of safety standards, giving retailers and consumers a high degree of confidence in the safety of these products. Unsafe cribs have been recalled, and dangerous drop-side cribs will soon be banned.

These new safety standards are having a meaningful impact on the lives of children and families, though sometimes in all-but-invisible ways. We cannot readily see that a toy is lead-free, or that a dangerous feature on a stroller has been reengineered to be safe. It may seem perhaps that these are unimportant changes that cause only minor or incremental improvements in safety. But it would be a mistake to fall into the trap of believing that small changes cannot also be significant. These changes save lives and prevent life-altering injuries. The loss of a few IQ points or a small increase in the proportion of children with behavioral problems in the population of U.S. children has marked impacts on educational spending and future potential.[1] Over my 37 years in practice, I have seen a dramatic change in the injuries suffered by my patients due to unsafe products. Many of the injuries that used to he relatively common simply do not occur any more. As a pediatrician, I am grateful to Congress and the CPSC for your ongoing work to make products safer for our children.

The CPSIA has allowed the CPSC to make strides in two particular areas I would like to highlight: lead and Safe Sleep. Additional work remains to be done with regard to cadmium and other heavy metals, as well as emergiug hazards. The American Academy of Pediatrics would like offer the following comments on each of these subjects.

Limiting Children's Exposure to Lead

Lead is well-established as a potent neurotoxin aud a particular threat to the developing brain of the fetus, infant, and young child, with documented negative effects on behavior and permanent loss of IQ points. Studies have shown that lead has no normal fuuction iu the humau body, aud that a "uormal" blood lead level is zero. There is no "safe" level of lead exposure; no threshold for the toxic effects of lead has been identified. When lead accumulates in the body, it is tightly bound to bones and then released slowly over years or decades. Therefore, exposures that may be separated by significant gaps in time have an additive effect on the body's burden of lead.

Damage done by small amounts of lead may be hard to measure and even harder to understand. Children who accumulate lead in their body may not have any physical symptoms, but low lead levels cause a wide array of negative effects, including cognitive, motor, behavioral, and physical harm.[2] The vulnerability of children to

[1] Bellinger DC. What is an adverse effect? A possible resolution of clinical and epidemiological perspectives on neurobehavioral toxicity. *Environ Res.* 2004; 95(3):394–405.

[2] Bellinger D. Lead. *Pediatrics.* 2004; 113(4 (Supplement)):1016–1022.

lead poisoning during development of their brain and nervous system has been amply demonstrated, and the literature is very consistent. On average, children whose blood lead levels (BLLs) rise from 10 to 20 micrograms per deciliter (mcg/dL) lose two to three IQ points. More recent studies have shown an even greater impact on IQ of BLLs under 10 mcg/dL. The effects of lead on health do not stop once the child's brain and nervous system mature or the BLL falls. A recent study found that in a group of 7-year-old children exposed to lead before the age of 3 years, IQ continued to fall even after the BLL had declined.[3]

The AAP has been supportive of CPSC's efforts to implement Section 101 of the CPSIA, which set the first-ever comprehensive limits on lead in children's products. The new lead limits are being phased in over 3 years to allow manufacturers and retailers sufficient time to ensure that their products comply with the new rules. As of Febrnary 2009, prodncts designed or intended primarily for children age 12 years and younger could contain no more than 600 parts per million (ppm) of lead. This standard was then lowered to 300 ppm in August 2009. The AAP looks forward to the completion of the standard's implementation when the total lead limit drops to 100 ppm in August 2011. Any children's product on the market that does not comply with the new lead standards will be considered a banned hazardous substance. The CPSIA, and Section 101 in particular, is a truly significant step forward in protecting children from the hazard of lead in toys and other products designed for children.

Creating Safe Sleep Environments for Infants and Children

Cribs, cradles, bassinets, and other infant sleep environments are designed for a parent or caregiver to leave a baby unattended safely for hours at a time. Unfortunately some sleep environments may pose a serious threat to a child's health and safety, thereby negating their intended purpose. Between November 2007 and April 2010, almost 150 fatalities and 1,675 injuries associated with full-size cribs and 6 fatalities and 28 injuries associated with non-full-size cribs were reported to CPSC. Since 2007, CPSC has issued 40 separate crib recalls involving more than 11 million products. Parents deserve the confidence of knowing the crib they purchase is held to the highest safety standards possible. The AAP has worked strenuously to reduce injuries and deaths from unsafe sleep environments by establishing guidelines for parents to use in evalnating these products and we fully support CPSC's efforts to establish strong, mandatory safety standards for cribs.

The AAP is pleased to have partnered with Chairman Tenenbaum and the CPSC on its Safe Sleep Initiative, a multi-faceted campaign aimed at reducing deaths and injuries associated with unsafe sleep environments. As part of this campaign, CPSC collaborated with AAP, Keeping Babies Safe, and journalist Joan Lunden to produce a video to be aired in hospital and physician waiting rooms providing recommendations and information to parents and families on safe sleep practices. In the video, AAP President O. Marion Burton, MD FAAP shared AAP's strong recommendation that all babies be put to sleep on their backs, which has helped reduce the rate of Sudden Infant Death Syndrome (SIDS) by 50 percent over the last 20 years. In addition, Dr. Burton highlighted the importance of never placing pillows, bumpers, sleep positioners, blankets or other fluffy items in cribs, and the need for cribs to have firm mattresses with tightly fitted sheets.[4]

Over the past year, CPSC has undertaken rulemaking processes to establish new mandatory safety standards for bunk beds, cradles, bassinets, full-size and non-fnll-size cribs, among many other categories of children's products as part of the Safe Sleep Initiative and as directed by Section 104(b) of the CPSIA. AAP strongly supports CPSC's efforts to establish mandatory safety standards for infant and children's sleep environments and has submitted extensive comments on each of these proposed rules.

The AAP has encouraged CSPC to make mandatory the new voluntary ASTM standard for full-size and non-full size cribs, which includes a requirement that sides of a crib be fixed in place, effectively banning drop-side cribs, (a crib design where the side of the crib can be raised and lowered). The AAP is extremely pleased that CPSC has proposed adopting this standard, as failures in this product design have resulted in numerous infant injuries and fatalities. If this proposed rule is made final, it will be unlawfnl to sell, lease, or otherwise provide a full-size or non-full-size crib that does not meet mandatory CPSC standards. As a result, many es-

[3] Chen A, Dietrich KN, Ware JH, Radcliffe J, Rogan WJ. IQ and blood lead from 2 to 7 years of age: are the effects in older children the residual of high blood lead concentrations in 2-year-olds? *Environ Health Perspect*. 2005; 113(5):597–601.

[4] Video available online at *http://www.healthychildren.org/English/news/pages/A-Safe-Sleep-for-Babies.aspx*.

tablishments will be required to purchase new cribs and/or eliminate their inventory of noncompliant cribs, including child care centers (inclnding family child care homes), hotels, motels and inns, resale and consignment shops, and crib retailers. While the AAP recognizes the demands the new safety standards may place on child care centers, retailers, and others, these considerations must be balanced against the cost to children, families, and society when preventable injnries and deaths occur in these cribs. The AAP supports CPSC in implementing the new mandatory safety standards in an expeditious, but sensible, timeframe.

Finally, the AAP was pleased that CPSC and the Food and Drng Administration (FDA) recently issued a warning to consumers urging parents not to use infant sleep positioners.[5] Infant sleep positioners are flat mats with side bolsters or inclined (wedge) mats with side bolsters used to prevent an infant from rolling or turning while asleep. Over the past 13 years, CPSC and FDA received 12 reports of infants who died when they suffocated in sleep positioners or became trapped between a sleep positioner and the side of a crib or bassinet. These products represent a serions risk to the health and safety of sleeping babies. Sleep positioners do not prevent SIDS and in fact can increase the risk of infant suffocation. Manufacturers typically claim these prodncts aid in food digestion to ease colic or the symptoms of gastroesphageal reflux disease and prevent flat head syndrome; however, these claims have not been reviewed and approved by the FDA. AAP has consistently recommended parents not to nse these products and we fully support CPSC and FDA's efforts to prevent further deaths or injuries as a result of using infant sleep positioners.

Limiting Cadmium and Other Heavy Metals

Recent press reports have brought to light the potential danger of another heavy metal in consumer products: cadmium. Cadmium is a soft heavy metal used in a variety of industrial and consumer applications. Like lead, with which it shares certain properties, cadmium causes a range of well-documented adverse human health effects. Oral exposure to cadmium is associated with effects on the kidney, liver, bones, immnne system, blood and nervous system. Acute cadmium exposure can lead to vomiting, diarrhea and other effects. Long-term exposure to cadmium can cause kidney disease, developmental and neurological deficits, and bone fragility. Cadmium is a known carcinogen.

It appears that some manufacturers have begun addiug cadmium to children's products because the CPSIA limited the use of lead. The presence of cadmium at high levels has been found in a range of children's products, most notably toy jewelry and drinking glasses. This is clearly a case of abiding by the letter but uot the spirit of the law—Congress hardly inteuded for companies to substitute one poison for another.

The ASTM's F–963 toy safety standard currently contains voluntary standards for eight heavy metals known to be highly toxic: antimony, arsenic, barium, cadmium, chromium, lead, mercury and selenium. As part of the CPSC's review of the adoptiou of the F–963 staudard as a mandatory standard, each of these standards* should undergo rigorous review, along with the associated testing protocols. The AAP urges the establishment of a systematic, transparent process by which the agency should review the literature and data, consult with experts, and update each of the heavy metal standards. This process should not be delegated to non-governmental entities or be inaccessible to the public or stakeholders. Moreover, the standards established should apply to all children's products, not solely toys. The AAP looks forward to engaging with the CPSC throughout such a process and making our members' expertise available to the agency.

Emerging Product Safety Hazards

As Americaus prepare to exchauge gifts this holiday season, we should all be able to have confidence in the safety of toys and children's products. As a pediatrician and injury expert, however, I also find myself anxiously awaiting the next emerging product safety hazard. Ensuriug the safety of consumer products requires onr constant vigilauce as the marketplace chauges aud uew products—and sometimes, uew hazards—are created.

Small, powerful magnets continue to be a coucern, as they cau cause serious injuries if more thau one is swallowed. These abdomiual iujuries tend to mimic stomach ailments or other minor illnesses, and can he difficult to properly diagnose. The CPSC is aware of this hazard and has recalled numerous sets of maguetic toys.

---

[5] Announcement available online at *http://www.cpsc.gov/cpscpub/prerel/prhtml10/10358.html*.

* Not including lead, which is already covered by the CPSIA.

Given that these magnets are being used in increasing numbers of children's products, however, continned attention to this problem is necessary.

AAP's Committee on Injury is also learning of increasing numbers of reported injuries caused by children's ingestion of so-called "button batteries." Roughly the size of a dime or nickel, these batteries closely resemble a coin when seen on scans. Unlike a swallowed coin, however, a battery must be removed from the body immediately to prevent serious harm. If lodged in the esophagus, severe tissue damage can ocenr in as little as 2 hours. Bntton batteries have been identified as the cause of 13 deaths. Between 1990 and 2008, 8,648 battery ingestion cases were reported, of which 62 percent were button batteries swallowed by children under the age of 6 years. Among children in this age group, 12 percent of those who ingest a 20 to 25mm battery can be expected to experience serious complications or death.[6] The AAP is interested in working with the CPSC and industry to require secure closures for devices that require button batteries as well as appropriate packaging.

In conclusion, the AAP deeply appreciates the opportunity to offer testimony today on the implementation of the Consumer Product Safety Improvement Act of 2008. We commend you, Chairman Pryor, and the subcommittee for yonr leadership on consumer product safety issues, and we look forward to working with yon to ensure the health and safety of all children.

Senator PRYOR. Thank you.

Ms. Chuckas.

STATEMENT OF JILL CHUCKAS ON BEHALF OF THE HANDMADE TOY ALLIANCE

Ms. CHUCKAS. Good morning.

Thank you, Chairman Pryor, for having me before this committee today. It's an honor.

My name is Jill Chuckas, and I own a small handcrafted children's accessory business, located in Stamford, Connecticut, called Crafty Baby.

For the last 12 years, I've heen crafting children's products from my home-based studio. When Congress first spoke of toy safety legislation, I applauded your efforts. In December 2008, though, I began to read the fine print. I became acutely aware that this law, meant to regulate large multi-billion dollar companies that had betrayed the country's trust, could effectively put me out of business. Not because my products are unsafe, but because I simply cannot afford the mandatory third-party testing and labeling requirements, which disproportionately affect small-batch manufacturers and specialty retailers. I quickly joined a rising grassroots effort to amend the CPSIA and took on a leadership role within the newly formed Handmade Toy Alliance.

So, today I come before you to speak, not just for myself, but as a board member of the Handmade Toy Alliance, an organization that owes its very existence to the CPSIA. The HTA now represents 592 member businesses, including specialty retail stores, toymakers, and children's product manufacturers from across the country. I'm here today with fellow board members Kate Glynn of a Child's Garden and Impish, in Massachusetts, and Randy Hertzler of euroSource, in Pennsylvania.

The deadline for third-party testing is February 10, 2011, just 10 weeks from now. After that point, our member businesses face extinction. Although many of us have already paid for XRF testing of our products, we simply cannot afford to pay for the services of

[6] Litovitz, et al. "Preventing Battery Ingestions: An Analysis of 8648 Cases." *Pediatrics* 2010; 125:1178–1183.

a CPSC-certified lab. Throughout the last 2 years, we have slowly witnessed many of our members close their businesses or change their business models as to not include children's products.

I have with me today a few examples of these businesses:

First, you see a wooden toy airplane. This toy, made by our member, John Greco, in New Jersey, is made solely from wood. The coming requirement for ASTM testing, in the CPSIA, makes it economically impossible to produce items like this in small batches. Rather than continue to make children's products, Mr. Greco decided to close that aspect of his business this past September. As he shared with me, "I was never looking to get rich making wooden toys. I did it because I enjoyed making toys that made kids happy."

Second, you see an award-winning, custom-designed fabric toy monster created by Stephanie and Michael Estrin, owners of Curly Q Cuties, in Texas. Children and their parents can go online and design their own personal monster. After much research, Curly Q Cuties found that they could never afford to test each unique design to ASTM standards, and decided to close their business at the end of this year. Ms. Estrin cites the reason for the company's closing due, "a law that does not address our particular manufacturing scenario." Put simply, the CPSIA makes no allowances for one-of-a-kind items.

Third, my fellow board member, Randy Hertzler's family business focuses on often hard to find toys, primarily imported from the European Union. These toys, that represented 44 percent of his sales in 2006 to 2007, have disappeared from the U.S. market altogether, because of the CPSIA's lack of alignment with European standards. Many quality European toy companies will no longer sell to companies—to American retailers, like Randy. He fears that he will have to liquidate and close in 2011.

We find it hard to believe that it was Congress's intent, with the CPSIA, to remove products and businesses like these from the marketplace.

While the HTA has worked closely with the CPSC, submitting comments on pending rules, attending CPSC-sponsored workshops, regular e-mail and phone contact with CPSC staff, we feel strongly that the current legislation does not grant the CPSC the flexibility to address our members' needs.

We have offered a number of suggestions that we feel will ensure the safety of children's products, yet amend the CPSIA to be more workable for the businesses we represent. We are more than happy to further discuss these suggestions throughout the day, today.

Two needed changes I'd like to bring up at this time include granting the CPSC the authority to use risk analysis to allow enforcement flexibility of third-party testing and hazardous content limits. High-risk items, like paint or metal jewelry, should be held to higher verification standards than low-risk products, like bike valve stems and brass zippers on children's garments. And, just as the Senate included language in the new food safety bill to exempt small farmers making under 500,000 per year, we ask that Congress make similar allowances for manufacturers who produce in small batches, exempting them from the third-party testing requirements. It's important to point out that these manufacturers

would not be exempted from the standards themselves, only from the third-party testing protocol.

Over the last 2 years, we've been told countless times that the CPSIA was never meant to adversely affect our businesses. We have worked tirelessly, along with many others, to enact common-sense changes within this legislation, always holding onto the fact that the products we create are safe.

On behalf of our members, I thank this committee for addressing this important issue, and urge you to quickly pass meaningful reform of the CPSIA, correcting these unintended consequences.

Thank you.

[The prepared statement of Ms. Chuckas follows:]

PREPARED STATEMENT OF JILL CHUCKAS ON BEHALF OF THE HANDMADE TOY ALLIANCE

Hello. My name is Jill Chuckas and I own a small hand crafted children's accessories business called Crafty Baby. For the last 12 years, I have been crafting children's products from my home based studio in Stamford, CT. When Congress first spoke of toy safety legislation, I applauded your efforts. In December of 2008, though, I began to read the fine print. I became acutely aware that this law, meant to regulate large, multi billion dollar companies that had betrayed the countries trust, could effectively put me out of business. Not because my products are unsafe, but because I simply could not afford the mandatory third-party testing and labeling requirements, which disproportionately affect small batch manufacturers and specialty retailers. I quickly joined a rising grass roots effort to amend the CPSIA and took on a leadership role within the newly formed Handmade Toy Alliance.

So today I come before you to speak, not just for myself, but as a Board member of the Handmade Toy Alliance, an organization that owes it very existence to the CPSIA. The HTA now represents 592 member businesses, including specialty retail stores, toymakers and children's product manufacturers from across the United States. I am here today with fellow Board members Kate Glynn of A Child's Garden and Impish in Massachusetts and Randy Hertzler of euroSource in Pennsylvania.

The deadline for third-party testing is February 10 of next year—just 10 weeks from now. After that point, our member businesses face extinction. Although many of us have already paid for XRF testing of our products, we simply cannot afford to pay for the services of a CPSC-certified lab. Throughout the last 2 years, we have slowly witnessed many of onr members who manufacture products close their businesses, or change their business models as to not include children's products. These equate to lost jobs, not because the company couldn't make safe product, but because the companies couldn't navigate the costly and burdensome regulations the CPSIA puts forth to prove that their products are safe. I have brought with me today a few examples of these businesses.

First, you see before you a wooden toy airplane. This toy, made by our member John Greco in New Jersey, sold for $110 and is made from Cedar, Oak, Poplar, Birch, and Maple. It is unfinished, so it doesn't need to be tested for lead, but quotes from labs to perform ASTM F963 Use & Abuse testing makes it too costly to continue making. Just one round of testing requires 12 toys to be sent to the lab for destructive testing, resulting in $1,320 in lost gross sales—and this does not include shipping and lab fees. Rather than continue to make children's products, Mr. Greco decided to close that aspect of his business this past September. As he shared with me, "I was never looking to get rich making wooden toys—I did it because I enjoyed making toys that made kids happy."

Second, you see before you an award winning custom designed fabric toy monster created by Stephanie and Michael Estrin, owners of Curly Q Cuties in Texas. Children and their parents can go on line and design their own personal monster. After much research, Curly Q Cuties found that they could never afford to test each unique design to ASTM standards and decided to close their business at the end of this year. Mrs. Estrin cites the reason for the company's closing due to "a law that does not address our particular manufacturing scenario." Put simply, the fact that this is a one of a kind item, makes it impossible to adhere to all the stipulations within the CPSIA.

Third, my fellow board member Randy Hertzler's family business focuses on often hard to find toys, primarily imported from the European Union. These toys, that represented 44 percent of his sales iu 2006–2007, have disappeared from the U.S.

market because of the CPSIA's lack of alignment with European standards. Many quality European toy companies will no longer sell to American retailers like Randy. He fears that he will have to liquidate and close in 2011.

While the HTA has worked closely with the CPSC—submitting comments on pending rules, attending CPSC sponsored workshops, regular e-mail and phone contact with CPSC staff—we feel strongly that the current legislation does not grant the CPSC the flexibility to address our members' specific needs. This was most recently shown by the CPSC definition of a children's product. The final rule was issued in 63 pages of text that we now understand to mean "if it can be construed as a children's product, it is." Our view was that the CPSC could have offered relief to countless small businesses, but the ambiguity of their definition, rather than exempting product categories and providing guidance, has only served to create additional market confusion.

We have offered a number of suggestions that we feel will ensure the safety of children's products, yet amend the CPSIA to be more workable for the businesses we represent. The majority of these ideas were outlined in our January 2010 letter to the CPSC. We are more than happy to further discuss these suggestions throughout this hearing.

Most importantly, Congress should grant the CPSC the authority to use risk analysis to allow flexibility of third-party testing requirements and hazardous content limits. High risk items like paint or metal jewelry should be held to higher verification standards than low-risk products like bicycle valve stems and brass zippers on children's garments.

Second, the definition of what is a children's product should be changed to items intended for children 6 years or younger, except where the CPSC identifies a product requiring a higher age limit based on risk analysis.

Third, educational products intended for use in a classroom environment should be excluded from the definition of a children's product.

Fourth, harmonize CPSIA standards with the European Union's EN–71 standards to remove the regulatory trade barrier which the CPSIA created between the U.S. and the EU. This would include changing the lead content standard from an untenable total lead standard to an absorbable lead standard.

Fifth, exempt manufacturers who make less than 10,000 units per year from all third-party testing requirements and allow them to comply instead with the 'reasonable testing program' requirements which apply to manufacturers of non-children's products under the CPSA. This would protect small batch manufacturers and specialty product manufacturers, including companies that make adaptive products for children with disabilities. These manufacturers would not be exempted from the standards themselves, only from the third party verification reqnirements.

Sixth, tracking labels should be voluntary except for durable nursery items and products which are most likely to be passed down to younger siblings or resold where the CPSC's risk analysis determines that tracking labels would be most likely to prevent harm. Manufacturers who choose to implement tracking labels would benefit from a lesser burden in the event of a recall.

Seventh, instruct the CPSC to not lower the lead content limit from 300 parts per million to 100 parts per million, a standard so low that it multiplies the difficulties of compliance.

Over the last 2 years, we have been told countless times that the CPSIA was never meant to adversely affect my business or the member businesses the HTA represents. We have worked tirelessly, along with many others, to enact common sense change within this legislation, always holding on to the fact that the products we create are safe. On behalf of our members, I thank this committee for addressing this important issue and urge you to quickly pass meaningful reform of the CPSIA, correcting these unintended consequences. Thank you.

A full list of our 592 member businesses can be found at *http://www.handmadetoyalliance.org*.

Senator PRYOR. Thank you.

Ms. Weintraub, let me start with you, if I may.

On our first panel, we had some discussion about budgets. And folks pointed out some of the concerns with the CPSIA and, you know, some of the bumps in the road on how we drafted it or how it's trying to be implemented. But, you know, one thing, I think, that was missing from that discussion was a context of what life was like before two things happened: before we passed the CPSIA and before Chairman Tenenbaum came on board.

Could—do you mind, sort of, painting—just very briefly, kind of painting a landscape for us of what it looked like before those two things happened?

Ms. WEINTRAUB. Sure, I'd be happy to.

I described what CPSC had suffered as "death by a thousand cuts." The CPSC's budget had been decimated and had never been restored. In 1972, when the CPSC was first created, the agency was appropriated $34.7 million; they had a staff of 786 full-time employees. The agency's budget, since that time, did not keep up with inflation, did not keep up with its deteriorating infrastructure, did not keep up with the changes in consumer products, and did not keep up with the increasing data-collection needs. The agency suffered repeated and severe cuts during the last 2 decades, falling from a high of 970 employees, in 1980, to just 401, in 2007, a loss of almost 60 percent.

So, what we were all faced with as we were looking to make CPSC more robust was a beleaguered agency that was starved of resources, of legislative authority, and appropriate resources to do what it needed to do to protect the American public. And it's only with CPSIA that the Commission has been given a boost of all of these things.

Senator PRYOR. Let me ask about one of the things, in the CPSIA, that they're still in the process of doing. They're getting closer on it. But, it's the database. What is your perception of how that has gone? And what the—how useful the database might be, come, what is it, March of next year?

Ms. WEINTRAUB. Yes. The database, thanks to your leadership and the leadership of your staff and this committee—subcommittee and full Committee—will be implemented in March 2011. It is a very important resource for consumers, because—again, looking at the state of the product safety world before CPSIA passed, consumers were, and right now are, in the dark. Because of Section 6(b) of the Consumer Product Safety Act, which is still in effect, CPSC, unlike any other government agency, has to basically ask permission from the manufacturer of a particular product before they can disclose information about that product to the public. That has hampered the agency. That has kept critical safety information, that affects life and death, out of the hands of consumers. And it has really put consumers under a veil of ignorance.

What this database will do, because it is out of Section 6(b), will provide a very useful resource that—consumers, when they have a problem, they can report it, as they do now. However, they can report it online, and it will be public.

Importantly, as was prescribed by this committee and by Congress generally, there's very specific criteria that is required before a posting can be made. So, the concerns that have been raised about the definition of a "consumer" being broad, all of that is narrowed very much by the fact that, if there is not essential information about the product, about the harm, then the posting will not be available.

So, I think that the impact of this database will be profound.

Senator PRYOR. I must say that yesterday I went on the NHTSA website to look up—I have a 19—I mean—excuse me—I have a 2003 Ford Taurus. And I had looked it up on the NHTSA database,

on their website, because I was having a problem with it, and I wanted to see if others were having the same problem, and if they could give me some direction. So, I found that very helpful.

Dr. Gardner, let me ask you something that—follow up on something that you said in your testimony. You talk about how, you know, you've been a physician, I think you said, for 37 years——

Dr. GARDNER. Yes.

Senator PRYOR.—Correct?—and that you're seeing different types of injuries today. Or, I guess what you're saying is, there were injuries that you used to see in children that you just don't see much anymore. Could you elaborate on that?

Dr. GARDNER. Yes, let me give you a specific example, and that's the issue of walkers. A while back, walkers had wheels, they were small in size, they were mobile. Children loved them, because it made them mobile. Parents loved them, because it was hands-free—they could turn their back on the kids for a minute. The problem was that toddlers are drawn like magnets to stairs. An open stairway is a magnet and pulls them forward. And, unfortunately, when they're in a walker, they'll just go down the stairs in their walker, and often land on their head.

It was very common for me to see significant head injuries, not just concussions, but skull fractures, intracranial bleeds. And the most common cause of head injuries in toddlers—this was several years ago—was, clearly, walkers. And we were forever warning parents that the walkers were dangerous and that they should always supervise, and preferably just never have their child in a walker.

So, that's one example where now walkers are no longer either mobile. They're a stationary object that the child can bounce and play in, but it's not going to move anywhere, or they're so wide that they won't fit through a doorway and allow them to go down the stairs. We still would prefer children not to be in walkers, but they don't create the risk of head injury that they did several years ago.

Senator PRYOR. Right. So, based on, you know, your area of practice, are you seeing fewer injuries to children, based on children's products? Or, can you say that?

Dr. GARDNER. It keeps changing. And I referred to that, a little bit, with emerging hazards. I think we see new risks, and we need to be aware of that. For example, the button battery. There's this new generation of lithium button batteries——

Senator PRYOR. Right.

Dr. GARDNER.—that children perceive as toys or—they swallow coins, and they are very easy to confuse on an X-ray, with a coin. If this lithium button battery is entrapped in the esophagus for a minimum of 2 hours, it causes irreversible damage to the esophagus, can perforate the esophagus or cause bleeding, and that's difficult to recognize. The leading source of those batteries is the TV remote. The TV remote is dropped, pops open, and the battery falls out. That's the leading source of ingestion for children. That's an injury I never saw before. And that's just an example of a new emerging hazard.

Senator PRYOR. Thank you.

Ms. Chuckas, I'm really interested in what you said a few moments ago. And it may be hard to believe, but we did try to, you

know, draft legislation in a way that—we were trying to find the balance of—just because a small company, a craftsman, maybe one person, maybe makes one toy at time and just sells them at, you know, crafts fairs, et cetera, or maybe they sell them in retail stores—but, just because it has made by one person in a—his or her shop, doesn't mean that it's automatically safe. I mean, that toy can injure a kid, just like something made by, you know, one of the big companies.

So, we're trying to find that balance of, you know, How do we provide a safe marketplace and children's safety, but also understand that—you know, we try not to make this too burdensome on smaller companies. And I'm not sure that we got that balance exactly right, but we have tried to do that. And your testimony has been very important.

Also, I was going to ask you—and you may not know, there may not be any way to answer this question—but, I understand, in this very difficult recession, some of these small companies are going to go out of business anyway. Do you have a sense of how many are going out of business because of the economy, versus the changes in the consumer protection laws? Can you gauge that?

Ms. CHUCKAS. It is a hard thing to gauge, because certainly the economy of everything has been a factor within these businesses, as well. But, I think what has happened is that the drive to continue to try to do what one loves has left, because the overwhelming sense of this legislation is something people can't get past. So, it becomes the "straw that broke the camel's back" kind of thing.

Senator PRYOR. Yes.

Ms. CHUCKAS. It was just one more thing they couldn't deal with.

Senator PRYOR. Now, the CPSC has a list of, you know, products that say—they know don't contain lead. And it's—my understanding is that you don't have to do any third-party testing. And wood, I think, is one of those. You—am I wrong on that?

Ms. CHUCKAS. For the lead content, you're correct.

Senator PRYOR. OK.

Ms. CHUCKAS. The issue with the toy is the ASTM safety standards. I submitted, within my written testimony, some quotes from—this wooden toy, for example, sells for $110. When John contacted a CPSC-approved lab, which—it was difficult for him to find a lab, actually, that he could work with, to begin with, in the United States. He found one. He had to send 12 of this toy. He made 20 of them. So, 12 of them had to be sent, in order to comply with the toy safety standard aspect. And so, that was roughly around $1,300 worth of inventory he wasn't going to get back, in addition to the shipping, in addition to the lab fees, which—he didn't even get that far with them, what the actual lab costs would be for the multitude of tests that would have to be done on this wooden toy airplane.

Senator PRYOR. When you and your members contact the CPSC about this issue, is it your perception that they're listening, that they're trying to work with you? Or, maybe do they give you a sense that their hands are tied because of the law? I mean, how's the—how responsive has the——

Ms. CHUCKAS. Extremely responsive. We've spoken directly with four out of five of the commissioners. Chair Tenenbaum, Commissioner Northup, Commissioner Nord, and Commissioner Adler have made them all—have made themselves readily available. Their staffs have been readily available. And, within a week after they appointed the new small business ombudsman, we had a conference call with him. Very readily available. They've been great working with us.

Senator PRYOR. Has it translated into action, though? Or relief?

Ms. CHUCKAS. To some extent. We're waiting, still, on the component safety certification rules to come down. We had really hoped that that would have been done a long time ago, but we recognize the massive rulemaking undertaking that is.

So, we feel that they are listening to our concerns. It hasn't always articulated itself into a ruling that was going to be helpful. But, we do feel that they're listening. They're trying.

Senator PRYOR. Yes. OK, good.

Mr. Lamar, let me ask you, if I may—kind of follow up on that same question. I know that your industry has had a lot of contact with the CPSC. And I'm curious about, you know, if your perception is that they've been receptive and willing to listen. And, even if they have, do they, kind of, come back and say that their hands are tied? So, it's the same question.

Mr. LAMAR. I think they've been extraordinarily responsive. I would agree with Jill, we've had conversations—multiple conversations with commissioners or staff. Several of the commissioners have come and presented at training workshops that we've held throughout the United States and around the world. They've been very eager to help out when they can. Many times the reaction we get is, "You raise some good points, we don't know if we can go that far," or, "You've raised some good points, the legislation doesn't allow us to accommodate it the way you might request so you have to recalculate your proposal."

Sometimes, even when they want to be responsive, they're not able to be as responsive, because there are a lot of other industries asking the same question. Behind me, there are a ton of industry representatives, representing everybody from books to ATVs to science kits to, you name it, and they're all asking the exact same questions; many times, on the same kinds of issues. And there are only so many people at the agency, and I think their ability to respond to all of these questions coming in makes it difficult for them to be as responsive to everybody as quickly as they probably could be.

Senator PRYOR. Right.

Let me ask—you said—one reason I wanted to ask you that question is, you said—in your written testimony, you said, "Product safety standards that work best are those that are created through a transparent and predictable process. If one group appears shut out, the final result may not be credible or accepted by all." And, from that, I guess I was inferring that you guys felt like you'd been shut out or had not been listened to.

Mr. LAMAR. No. I think what I'm trying to describe there is sort of their Nirvana. I think that you want to have a situation where everybody has an opportunity to comment. I think Chair

Tenenbaum mentioned, when she was discussing the cadmium approach—is that they were going to work with the voluntary standards-setting community, so that everybody would have an opportunity to participate, that would focus on the products and the specific risk, rather than trying to create something that's out there. I think that kind of goes back to the comments I made before in some of those eight points.

Senator PRYOR. And one of the things I think you've talked about is zipper testing. Have there been problems with zippers having high lead content? Has that been an issue, either now or in the past?

Mr. LAMAR. Yes. I'm glad you asked that question. There's a lot of confusion. We presented a lot of data to the agency—5- or 6,000 test results, I think it was—it came out to. This was when we did our determination that there was no—or, were seeking the determination that there was no lead in textiles. And, in addition to proving that there was no lead in textiles, we found—and this was pre-CPSIA inventory, so this was inventory that had been produced before people knew what the new lead rules were going to be, even before they even knew that they were being discussed—and the incidents of lead in things like zippers, buttons, snaps, other kinds of accessories on clothing, was about 3 to 5 percent. So, what we found was that it's not in textiles. It may be, in a very, very small, isolated, rare set of circumstances, in some kinds of components. Moreover, what we found is, if it were, like, in a zipper, it might be in the stop at the bottom of the zipper; it wasn't in the pull, the slider, the teeth, all these other aspects of the zipper machinery or equipment. So, you found these very isolated, rare circumstances.

The problem is, this translated, as implementation began—is that the zipper stop, for example—and I brought a pair of pants that illustrates it—might be violative. If that was above the 600 parts per million, then that meant the entire zipper was above 600 parts per million, which meant the entire pair of pants was above 600 parts per million, which meant a whole shipment might be above it. So, it's kind of in a—in a reference to the old children's parable, you know, "For want of a nail, the kingdom was lost"—for want of the zipper stop that was compliant, the entire shipment and the order was lost. And so, a lot of inventory had to get destroyed, because you might find that, in one zipper stop, there was a problem. And that was a significant problem that we had in our industry.

I think, as people knew these rules, they've now started to produce zippers that are compliant. They're going through making sure that the metal used, the processes used, in the future and for future shipments, is going to be compliant with that limit—with the 100 parts per million now, because you're looking down the road.

Senator PRYOR. We actually saw that as we were working on the CPSIA through the process. Some of the companies—manufacturers, retailers—were already making changes, in anticipation of the—you know, the law taking effect. And, you know, hopefully what it does is—in Dr. Gardner's world, it helps create a safer place for everybody.

But, Dr. Gardner, let me ask you about something that was touched on more in the previous panel, but a little bit here, about lead. There was a lot of discussion, in the first panel, about lead. And I assume that you would say that there is no safe level of lead. I mean, we've kind of talked about that before. But, is the real issue with lead solubility or, you know, what—if we're looking at some modification of the existing CPSIA, when it comes to lead, and maybe giving a little more flexibility or a little more direction on this—you know, I guess I—from your standpoint, what are the two, three things we need to know about lead?

Dr. GARDNER. Yes. I think the most important thing for people to realize about lead, in very simple terms, is that it's a neurotoxin that, in simple language, causes brain damage that's permanent and irreversible. The other important medical aspect of lead is that it's accumulative.

Senator PRYOR. It's—does that mean children are more susceptible to it?

Dr. GARDNER. Yes. Particularly younger children, as their brain is developing and they're acquiring their skills, and early brain development. There's a long-lasting impact on their subsequent development and behavior and IQ and function.

Senator PRYOR. Right. So, tell us about the cumulative aspect of——

Dr. GARDNER. Part of the issue is that lead stays in your body for many years, if not decades. And it accumulates. So, one of the difficult issues is that an exposure to a small amount of lead, in and of itself, may not be harmful, but as that adds on, and it's additive, and it continues over a period of time, you can easily reach levels that are harmful, even though those individual exposures are small.

The other thing that's hard to monitor and measure is the starting point of a child's lead exposure. If they're starting with a blood lead level of 8, and they're exposed to small amounts that, over a period of time, take them over 10—as opposed to the child that starts with a blood lead level of 1 and goes to 3. Bioavailability or the absorption is a moving target, in terms of how much is being absorbed and stored over time, and what the vulnerability is of that child or adolescent, or even adult, absorbing that lead.

Lead is a poison. And it's very difficult to talk about safe levels when there, essentially, isn't one.

Senator PRYOR. Right. It has been a difficult topic within the CPSIA and the CPSC, trying to implement this, because, you know, there's a lot of lead in products out there. And, you know, some products, it's just a necessary ingredient, and it's been used for different things at different times. And, you know, some of these parts are not accessible at all. And the CPSC has really been struggling with this and working through a lot of these issues, over time. So, we'll continue that discussion with all of you all——

Dr. GARDNER. There's background lead——

Senator PRYOR. Yes.

Dr. GARDNER.—as well.

Senator PRYOR. Right.

Dr. GARDNER. And you can't eliminate all of the background lead——

Senator PRYOR. Right.

Dr. GARDNER.—so that's adding just the "lead load," if you will.

Senator PRYOR. But, I guess the idea would be, if you can lessen the load, especially in children's products——

Dr. GARDNER. Yes.

Senator PRYOR.—that's a good thing to do, because they do have this other——

Dr. GARDNER. It's essential.

Senator PRYOR. Yes.

Well, listen, you guys have been great. I want to thank all the panelists.

We're going to leave the record open for 2 weeks. We, I'm sure, will have lots of follow-up questions, because I have several more pages. I just don't want to keep you all day. But, I'm sure we'll have some follow-up questions and other questions from the Committee members who couldn't be here today.

So, I want to thank all of you all for everything that you do. And, like we said before, as we go through 2011, we will continue this dialogue, whether it be here in the Subcommittee or in, you know, our offices or just informally, or whatever. But, your input is very important.

We appreciate all of you for being here, and thank you. And have a great holiday season.

[Whereupon, at 12 p.m., the hearing was adjourned.]

APPENDIX

PREPARED STATEMENT OF THE PRINTING INDUSTRIES OF AMERICA, BOOK MANUFACTURERS' INSTITUTE, INC., AND THE ASSOCIATION OF AMERICAN PUBLISHERS, INC.

PETITION
December 16, 2010

Office of the Secretary,
U.S. Consumer Product Safety Commission,
Bethesda, MD.

Re: Request to Extend the Current Stay of Enforcement for Certain CPSIA Testing and Certification Requirements for Books and Other Printed Material Children's Products

Dear Mr. Stevenson:

The Printing Indnstries of America,[1] the Book Manufacturers' Institute, Inc.,[2] and the Association of American Pnblishers[3] (hereinafter "Joint Reqnesters") hereby request the Consumer Prodnct Safety Commission to extend its current stay of enforcement for certain provisions of Subsection 14(a) of the Consumer Product Safety Improvement Act ("CPSIA") for books and other printed material children's products for an additional 12 months from the Febrnary 10, 2011 expiration date of the current stay.

An extended stay is necessary because the Commission to date has not completed several pending rulemaking proceedings, specifically the Testing and Labeling Pertaining to Prodnct Certification (75 FR 28336) and Conditions and Requirements for Testing Component Parts of Consumer Products (75 FR 28208) rules, that are reqnired for implementation of and compliance with Sections 101, 102, and 108 of the Consnmer Prodnct Safety Improvement Act of 2008 ("CPSIA") before the current stay expires. Even if the Commission were to publish the final rules today, the effective dates of the rnles would not allow for sufficient time for companies to implement these provisions properly.

Over the course of the prior and current stays, the Commission has worked in a determined manner to implement CPSIA, including the pnblication of more than 50 rules and interpretive policy statements implementing the law. The Commission has also issued several policy statements designed to provide guidance to industry. However, serious implementation problems still exist, particularly in the application of CPSIA to books and other printed children's material, even as the clock ticks down to the current stay's expiration date.

---

[1] Printing Industries of America (PIA) is the world's largest graphic arts trade association, representing an industry with approximately one million employees. It serves the interests of more than 10,000 member companies involved in every stage of the printing industry from materials to equipment to production to fulfillment. Over 80 percent of the printing operations in Printing Industries of America's membership have less than 20 employees, which makes printing a prime example of small business involved in manufacturing.

[2] The Book Manufacturers' Institute, Inc. (BMI) is the leading nationally recognized trade association of the book manufacturing industry. Our membership is comprised of 80 companies ranging in size of those with less than a hundred employees to those employing thousands. BMI member companies annually produce the great majority of books ordered by the U.S. and Canadian book publishing industries. While our members produce the majority of books used in all publishing markets, our members do manufacture over 95 percent of the books used in the elementary school market.

[3] The Association of American Publishers (AAP) is the principal national trade association for the U.S. book industry, representing some 300 member companies and organizations that include most major commercial book and journal publishers in the United States, as well as many small and non-profit publishers, university presses and scholarly societies. AAP members include large and small publishers of children's books in the consumer marketplace, as well as publishers of instructional and assessment materials for students at all levels of education.

For more than 2 years, the Joint Requesters have been engaged in meetings, discussions and other communications with the Commission aud its staff in an effort to clarify the applicability of the requirements in the various sections of CPSIA to books and other printed material children's products. These efforts have iuvolved the exchange of letters, development and provision of online access to a test results database, aud multiple in-persou meetiugs with the Commission's techuical, legal, and enforcement staff.

The Joint Responders' iuteraction with the Commission has been productive iu a number of ways, including an August 26, 2009 final rule announcing determinations (74 FR 43031) that certain component materials, such as paper, animal-based glues, and any product printed with four color process inks (CMYK) and others, used in books and other printed material children's products are not required to be tested for lead content under Subsection 102 of the CPSIA.

However, to date many other component materials included in the initial request for determinations made by the Joint Requesters have not received determinations for exclusion by the Commission. These include spot inks, saddle stitching wires, and laminates, among other components.

The Joint Requesters understand the significance of such determinations and deeply appreciate the efforts of the Commission staff to work with us on our additional exclusion determination requests. However, since the typical components of most books and other printed material children's products are comprised of the materials that did *not* receive exclusion determinations from the Commission, the practical result is that *any* of these children's products that includes a component of non-excluded material will have to be tested for certification under the statutory requirements. As a result, the needed relief from the accredited third-party laboratory testing requirement is unavailable for virtually *all* such products.

Other aspects of CPSIA, such as the stringent conditions that must be met in order to demonstrate the "non-accessibility" of certain component materials as a basis for their exclusion from the Section 102 testing requirement, as described by the Commission in its final rule issued on August 7, 2009 (74 FR 39535) have proven too restrictive for virtually *any* books with covers to avoid the testing requirement and remain problematic.

Yet another example of the practical limitation of the current exclusion determinations for component materials involves textbooks. Almost every textbook cover is laminated to maintain product quality and longevity. Since laminates are not included in the list of component materials determined to not have lead contents that could ever exceed the statutory limit, every textbook must be tested for lead content to support the required certification. Considering the millions of textbooks printed each year and the lead-time required to test and deliver them to students in a timely manner, this presents an unrealistic situation for the companies represented by the Joint Requesters. In addition, a large percentage of soft-cover books, which includes the testing books that are required under the No Child Left Behind Act, are printed with spot inks. All of these would also require testing to support the required certification.

Certainly, all stakeholders are aware of these and other examples that have proven challenging in the implementation of CPSIA. In its January 2010 "Report to Congress," the Commission stated it believed it could "more effectively fulfill its mandate under section 101(a) if it were allowed greater flexibility in granting exclusions from the section 101(a) lead limits," particularly as the regulation related to "ordinary books." The report also highlighted the Congressional statement of managers attached to the FY 2010 omnibus bill, in which the Conferees noted their belief that CPSIA may not have been intended to subject ordinary children's books to certain provisions of the law.

Congress has also taken action to address the implementation and compliance challenges surrounding CPSIA. In the 110th Congress, legislation to amend CPSIA was introduced by both Democrat and Republican Members of Congress. The House Energy & Commerce Committee held a hearing on potential revisions to CPSIA April 29, 2010 and the Appropriation Committees of the House and Senate requested the "Report to Congress" referenced above, which was designed to solicit suggestions from Commissioners on possible ways to amend CPSIA to avoid unintended consequences and make the law work in a practical way.

The most recent Congressional examination of CPSIA was on December 2 in a Senate hearing held by the Committee on Commerce, Science, and Transportation. At this hearing, Chairman Reckefeller acknowledged that the Commission "continues to grapple with a few outstanding issues" and stated that the Senate is "taking a hard look at those concerns and recommendations." The Joint Responders are encouraged by this statement, but realize that such action is not reasonably likely to occur until after the 112th Congress convenes next month.

Industry, too, continues to develop for submission additional information supporting further exclusiou determinatious for compouent materials used iu books and other printed material children's products. For those component materials that will ultimately require testiug, exteusiou of the stay would allow the uecessary time to develop and implement a sampling and testing program, based on the yet to be issued final regulations, that would minimize product delays and burdensome costs.

With this in mind, we are asking the Commission to extend the stay on enforcement of the testing and certification provisions for books and other printed material children's products, until February 10, 2012. Taking such an action now will provide the Commission, Congress, and industry time to work together to develop additional revisions, policies, and interpretations that maximize the prospects for a useful and cost-effective solution for all stakeholders. During the period of the extended stay, the prohibition against commerce in children's products coutaining total lead content exceeding the prescribed statutory limits will, of course, remain fully in force. Extendiug the stay with respect to ordiuary paper-based children's books and other printed material children's products will in no way endanger the health and safety of children, as the total lead content of such children's products currently is well below the most stringent statutory limits and publishers and printers will continue to ensure that it remains so.

During the extended stay of enforcement, the book printing, manufacturing, and publishing industries—represented by the Joint Requesters—will continue to work with the Commission and its technical staff on additional exclusion determinations for certain component materials that are used to manufacture books and other printed material children's products, and with Congress as it seeks to remedy unintended consequences of CPSIA.

We would be happy to respond to any questions that the Commission or its staff may have about this request.

Respectfully submitted,

LISBETH A. LYONS,
Vice President of Government Affairs,
Printing Industries of America.

DANIEL N. BACH,
Executive Vice President,
Book Manufacturers' Institute, Inc.

ALLAN ROBERT ADLER,
Vice President for Legal and Government Affairs,
Association of American Publishers.

RETAIL INDUSTRY LEADERS ASSOCIATION,
Arlington, VA, December 2, 2010

Hon. MARK PRYOR, Chairman,
Hon. ROGER WICKER, Ranking Member,
Senate Commerce Committee,
Subcommittee on Consumer Protection, Product Safety, and Insurance,
Washington, DC.

Dear Chairman Pryor and Senator Wicker:

The Retail Industry Leaders Association (RILA) welcomes the Committee's hearing on oversight of the Consumer Product Safety Commission (CPSC) and product safety in the holiday season, and we appreciate this opportunity to showcase the steps that our members are taking to ensure product safety and integrity all along the supply chain—during the holiday season and throughout the year. RILA members place the highest priority on the safety and quality of the products they sell to their customers, particularly toys and other children's products. RILA also supported the sweeping Consumer Product Safety Improvement Act (CPSIA) when it was enacted in 2008, and our members have worked aggressively to implement the law's many new requirements. While implementing the CPSIA, it has become apparent that there are some provisions in the law which that do not coincide with best practices and have resulted in unintended consequences. As Congress begins to consider its agenda for 2011, RILA hopes the Senate Commerce Committee will make it a priority to advance legislation to facilitate better implementation of the CPSIA.

By way of background, RILA promotes consumer choice and economic freedom through public policy and industry operational excellence. Our members include the

largest and fastest growing companies in the retail industry which together provide millions of jobs and operate more than 100,000 stores, manufacturing facilities and distribution centers domestically and abroad.

RILA/British Retail Consortium Consumer Product Standard

Retailers have vigorous quality assurance programs and enforcement mechanisms for their suppliers. In addition to these efforts and implementation of the CPSIA, RILA is seeking to advance product safety efforts by partnering with the British Retail Consortium (BRC) to implement a factory capability assessment of suppliers of consumer products sold in North America. This effort will create a harmonized standard that will be consistently evaluated by a third party-assessed scored audit. RILA believes the RILA/BRC standard will effectively promote global product safety by seeking to ensure that suppliers receive a detailed measurement of their quality mauagemeut systems.

Improvements to the CPSIA

While RILA recognizes that the CPSIA has had a profound impact in reinvigorating the Consumer Product Safety Commission (CPSC) and euhancing consumer product safety, RILA also believes the 2008 law could be improved. Most importantly, RILA strongly supports the unauimous preference of the CPSC Commissioners to prospectively apply the August 2011 100 ppm lead limit. As currently interpreted by the CPSC, the CPSIA will make it uulawful to sell products that exceed a 100 ppm limit after August 2011, regardless of wheu the products were manufactured, uuless the CPSC determines that the lower limit is not technologically feasible. The retroactive application of this provision creates substantial problems for manufacturers and retailers with large inventories of children's products, as well as for resellers such as charitable tbrift stores, and leads to wasteful destruction of safe products because confirmation of compliance for products already on retail shelves often cannot be done in a cost effective manner. Retailers will incorporate new safety standards into their guidance to suppliers so as to ensure compliant products, but it is very difficult to implement new staudards on the basis of a sell-by date, particularly when there is uncertainty ou whether the CPSC could make a determination that 100 ppm is not technologically feasible. There is siguificaut historical precedent to implement new safety standards on a prospective basis, and RILA has urged the CPSC to implement the August 2011 lead limit on a prospective basis. Nevertheless, Congressional action to clarify its intent for a prospective application would be very helpful for smooth implementation of the law.

RILA also believes the CPSIA should be modified to clarify that iuaccessible component parts are excluded from the law's phthalate restrictions. Section 101(b)(2)(A) of the CPSIA clarifies that the lead limits do not apply to any component part of a children's product that is not accessible to a child through normal aud reasouably foreseeable use and abuse of such product. Section 108 of the CPSIA does not currently make a similar exception for inaccessibility for phthalates, and RILA understands this omission was inadvertent. RILA helieves the prohibition on phthalates should only apply to accessible parts similar to the lead policy. As an example of the problem, phthalates are used in the plasticized coating of internal wiring in electronic toys, such as remote controlled helicopters. The phthalates help to keep the plastic coating soft and pliable to better encase and protect the wires, but does not present a risk of exposure to a child playing with the helicopter because the wires are inaccessible. An clarification that inaccessible component parts are excluded from the phthalates limits would prevent the need for costly and unnecessary testing, and confirm that the remote-controlled helicopter would he CPSIA compliant.

RILA also believes the CPSC should be granted expanded authority to except certain products or materials from the CPSIA's lead limits based on functional purpose of the lead in the product or component whenever the CPSC can also determine that the presence of lead will not affect pnblic health and safety.

In conclusion, retailers work tirelessly to ensure the safety and quality of the products they sell, and to fully implement all the new requirements under the CPSIA. We also hope the Congress will advance legislation in early 2011 to improve the effectiveness of the CPSIA and reduce unnecessary costs for businesses that do not provide additional product safety benefits. We look forward to continuing to work with you on this and other important product safety issues. If you have any questions or concerns, please contact Stephanie Lester, Vice President, International Trade.

Sincerely,

STEPHANIE LESTER,
Vice President, International Trade.

PREPARED STATEMENT OF RICHARD M. WOLDENBERG,
CHAIRMAN, LEARNING RESOURCES, INC.

As an operator of a small business making educational products and educational toys, I have had a front row seat for the implementation of the Consnmer Product Safety Improvement Act of 2008 (CPSIA) by the Consumer Product Safety Commission (CPSC). On the occasion of your CPSC oversight hearing, I want to highlight the economic damage wrought by the CPSIA without achieving any material improvement in safety statistics. I also want to bring to your attention the open hostility of the CPSC toward the corporate community in the implementation and enforcement of the CPSIA, and conclude with my recommendations for legal reforms to restore common sense to safety administration without reducing children's safety.

Children are our business. As educators, as parents and as members of our community, we have always placed the highest priority on safety. We would not be in the business of helping children learn if we didn't care deeply about children and their safety. The CPSIA has dramatically impacted our business model, reduced our ability to make a profit and create jobs, pared our incentive to invest in new products and new markets, and generally made it difficult to grow our business. We would gladly accept these burdens if the law made our products safer, but the fact is that it hasn't. Our company, Learning Resources, Inc., has recalled a grand total of 130 pieces since our founding in June 1984 (all recovered from the market). Our management of safety risks was highly effective long before the government intervened in our safety processes in 2008.

The precautionary approach of the CPSIA attempted to fill perceived "gaps" in regulation by making it illegal to sell children's products unless proven safe prior to sale. Yet the law has yielded *few quantifiable safety benefits* other than a reduction in recent recall rates for lead-in-paint (already illegal in children's products for decades). Ironically, this progress in reducing recalls has taken place in a 27-month period in which, like the time before the CPSIA, testing of children's products prior to sale was not mandatory. Consumer confidence wasn't dented by the lack of mandatory testing. The justifications for the over-arching and excessively expensive CPSIA regulatory scheme just don't hold water.

In any event, the reduction in recall rates is only a minor triumph and was not due to mandatory testing or harsh new lead standards, but most likely a (hyper) energized regulator and a great deal of publicity. Recall statistics can be highly misleading because the rate and number of recalls depend on many factors and do not generally correlate to injuries to children. In other words, product recalls are not tantamount to childhood injuries. The purpose of the CPSIA is to *reduce injuries, not product recalls*—yet CPSC recall statistics show that there have been almost no reported injuries from lead or phthalates in children's products in the last decade (one death and three unverified injuries from 1999–2010, all from lead or lead-in-paint). The billions of dollars now being spent by the corporate community annually on testing and other compliance activities have not reduced injuries—there weren't any to reduce. Whatever peace of mind has been generated by lower recall rates comes at a very high price.

The CPSIA significantly broadened the reach of Federal safety regulation well beyond what was needed to deal with the lead-in-paint toy violations of 2007 and 2008. Under the CPSIA, the definition of a "Children's Product" subject to regulation now encompasses ALL products designed or intended primarily for a child 12 years of age or younger (15 U.S.C. §2052(a)(2)). This definition ensures that virtually anything marketed to children will be subject to the restrictions of the Consumer Prodnct Safety Act (CPSA), irrespective of known or quantifiable risk of injury. Put another way, this definition ensures that many product categories *with a long tradition of safety* are now subject to the withering requirements of this law for the first time simply because they fall within the overly broad definition of a Children's Product. The affected safe products span the U.S. economy books, t-shirts and shoes, ATVs, bicycles, donated or resale goods, musical instruments, pens and educational products. The CPSC declined to use its discretion to narrow this definition in its recent "final rule" interpreting "Children's Product," thus ensuring continued market chaos and economic waste.

The consequences of the chauge in the consnmer safety laws to a precautionary posture has had notable negative impacts and promises to create further problems, namely:

a. *Increased Costs.* The new law creates a heavy burden for testing costs. From 2006 to 2009, our compauy's testing costs aloue jumped more than eight-fold. We estimate that our testing costs will triple again after the CPSC (as anticipated) lifts its testing stay in 2011, and could multiply again if the CPSC enacts (as anticipated) its draft "15 Month Rnle" on testing frequency and "reasonable

testing programs." Testing costs are often thousands of dollars per product. Having employed one person to manage safety testing and quality control for many years, we now have a department of five, including me, plus an outside lawyer on retainer. These jobs are funded by discontinuing sales, marketing and prodnct development jobs—the CPSIA is NOT an ersatz stimulns program. *Personnel, legal and other out-of-pocket safety expenses (besides testing) have more than quadrupled in the last 3 years—all without any change in our super-low recall rates or injury statistics.*

b. *Increased Administrative Expenses.* The CPSIA requires that all products include tracking labels on both the packaging and the product itself. Rationalized as "analogous" to date labels on cartons of milk, tracking labels are in reality nothing but pure economic waste as applied to the vast array of "Children's Products" under the CPSIA. As noted, our company has a virtually unblemished 26-year track record of safety so tracking labels promise to add little value in the event of recalls that are nnlikely to occur. Ironically, with the strict new rules governing product safety, we believe the already low chance of a product recall has been reduced further. As noted above, the money to pay for all this administrative busy work comes from foregone business opportunities. *We are being forced to shrink our company to apply tracking labels that no one will use.*

An equally frustrating bureaucracy has sprung up around recordkeeping under this law. Burdensome requirements spawned by the government's new involvement in our quality control processes forced us to make large new investments in information technology with no return on our investment. In addition, the pending CPSC draft policy on component testing promises to convert the simple task of obtaining a complete suite of safety test reports into a major recordkeeping chore. We will now be forced to manage each component separately, tracking test reports on each component one-by-one. This promises to multiply our recordkeeping responsibilities—and the related risk of liability for failing to comply—by more than an order of magnitude.

c. *Reduced Incentive to Innovate.* The increased cost to bring a product to market under the CPSIA will make many viable—and valuable—prodncts uneconomic. To cover the cost of developing, testing and safety-managing new products, the prospective sales of any new item ("hurdle rate") is now much higher than nnder prior law. This means that low volume "specialty market" items are less likely to come to market and many new small business entrants may find themselves priced out of the market. The CPSIA makes it much harder to start a new bnsiness serving the children's market because the rules so heavily favor big business. Because of CPSIA transactional costs, high volume items now have a huge cost advantage over low volume items. This will hurt many small but important markets like educational products for disabled children. Our company, with its 1,500 catalog items, is probably now a dinosanr under the CPSIA -the law provides a strong economic incentive to restructure our business around 50–150 items and to foens on high volume markets only. Schools would suffer from the loss of niche educational products.

d. *Crippled by Regulatory Complexity.* Our problems don't end with testing costs or increased staffing. We are being crippled by regulatory complexity. Almost 28 months after passage of the CPSIA, we still don't have a comprehensive set of regulations. Please consider how mindboggling the rules have become. There were fewer than 200 pages of safety law and CPSC rules that pertained to our business until 2008. These rules clearly defined our responsibilities and conld be taught to our staff (in fact, many were rarely applicable to us). Today, the applicable laws, rules and interpretative documents exceed 3,000 pages. As a practical matter, it is simply not possible to master all of these docnments—and yet it's potentially a felony to break any of these rules. Sadly for us, the rules and CPSC staff commentary keep changing, are still being written and are rarely if ever conformed. How can we master and re-master these rules and teach them to our staff while still doing the full-time job of running our business? Ironically, the recalls of 2007 and 2008 were never a "rules" problem—those famons recalls were clearly a compliance problem. Imagine what will happen now with an unmanageable fifteen-fold increase in rules. No small business "ombudsman" can make that problem go away.

e. *Small Business Will Certainly Suffer.* The CPSIA was written in response to failings of big companies, but hammers small and medium-sized companies with particular vengeance. Our small business has already lost customers for our entire category on the grounds that selling toys is too confnsing or too much of a "hassle." This is our new reality. The highly-technical rules and requirements

are beyond the capability of all but the most highly-trained quality managers or lawyers to comprehend. Small businesses simply don't have the skills, resources or business scale to manage compliance with the CPSIA. For this reason, small businesses bear the greatest risk of liability under the law, despite being responsihle for almost no injuries from lead in the last decade. The double whammy of massive new regulatory obligations and the prospect of devastating liability are driving small businesses out of our market.

In implementing and administering the CPSIA, the CPSC created a harsh regulatory environment for the business community over the past 28 months. Consider the following:

1. *Unjustified Recalls.* In June, in response to an inquiry by a Congressman and followed up hy media inquiries, the CPSC pressed McDonalds to recall 12 million Shrek glasses for "high" cadmium content, despite the agency's admission on Twitter that the glasses were not toxic. The recall effort was justified as being done "out of an abundance of caution", a frightening regulatory standard when applied to products acknowledged to be safe by the regulator itself. McDonalds lost millions of dollars as a result, not to mention suffering from widespread and persistent bad publicity.

2. *Unjustified Penalties and Coercive Tactics.* The CPSC assessed a $2.05 million penalty against a hapless Japanese dollar store chain (Daiso) for five separate tiny recalls involving 698 units and 19 items. These items sold for between $1 and $4 each. There were no reported injuries from sales of the Daiso trinkets. Ms. Teneubaum bragged about this extraordiuarily excessive prosecution in a speech in March 2010 to the Consumer Federation of America: "We secured an injunctiou that completely stops Daiso from importing childreu's products into the country. . . . Daiso has a very high hurdle to jump over to ever get back in the import business again." Regulated companies take stunning examples like Daiso as a warning that outsized and disproportionate force may be used by this agency with little provocation. The regulated community has also expressed alarm over the threatened use by the agency of unilateral press releases "to warn the public" about alleged dangers iu specific products as a way to coerce "voluntary" recalls. Such threats have been used where facts may be in dispute to justify a recall. Under the law, the CPSC may only implement mandatory recalls subject to a court order, a slow process perhaps but also expensive and labor-intensive. "Voluntary" recalls can be much quicker and cheaper, ouly requiring "agreement" between the agency and the subject compauy. In more than oue case, CPSC has threatened unilateral releases to try to "convince" a firm to undertake a "voluntary" recall but after the firm took the risk of standing up to the staff and the staff conducted further investigation, the CPSC decided that recalls were not even necessary. Not all firms can bear the expense of such a process or take the risk of calling the staff's bluff because issuance of a release would likely damage the firm and their brand, possibly irrevocably. Many supposedly "voluntary" recalls have resulted. Abusive tactics of this nature have severely damaged trust between the CPSC and the regulated community.

3. *Disregard of Public Comments.* The agency has garnered considerable criticism for overlooking or disregarding comments from the corporate community solicited in its public rulemaking processes. Ignoring or disregarding inconvenient public comments coutrary to the agenda of the coutrolling party makes a mockery of the legally-mandated public comment process. Notable instances include the recent approval of interpretative rule on "Children's Products" and the rules implemeutiug the public database of safety incidents. The database debate was so fouled by the majority's refusal to entertain the legitimate concerns of industry that the two minority Commissioners proposed their own draft rule—which the CPSC at first refused to post on its website.

4. *Unjustified Hostile Rulemakings.* The CPSC has implemented rules governing the public database that adversely affect the Constitutionally-guaranteed due process rights of our businesses. There is no adequate public policy justification for the erosion of the remarkable civil rights that distinguish the American legal system among all international legal systems—yet the Commission voted 3–2 to allow falsehoods to be posted without recourse in a database the CPSC will maintain. In other cases, the agency has published draft rules (yet to be acted on) which could force companies like ours to spend as much as $10,000 per item per year to meet *arbitrary* rules on

testing frequency or "reasonable testing programs"—notwithstanding strong evidence that these rules are wasteful, unnecessary and financially irresponsible. The pendency of rules like this creates destabilizing market uncertainty and forces business decisions that have no basis other than fear of future regulation. For instance, Wal-Mart has already instituted a 100 ppm lead standard months ahead of the *possible* implementation of the standard by the CPSC—simply because the CPSC has been so slow to act.

The CPSIA went off track by taking away the CPSC's authority to assess risk. If the CPSC were again required to regulate based on risk, safety rules conld focus on those few risks with the real potential to canse harm to children. All risks were not created equal.

I recommend several steps to reduce cost, liability risk and complexity all without sacrificing children's prodnct safety:

A. Mandate that the CPSC base its safety decisions, resource allocation and rules on risk assessment. Restore to the Commission the discretion to set age and product definition criteria for the 300 ppm lead standard and phthalate ban. Freeze the lead standard and lead-in-paint standard at their current levels unless the CPSC determines that a change is necessary to preserve public health and safety.

B. The definition of "Children's Product" shonld not include anything primarily sold into or intended for use in schools or which is used primarily under the supervision of adnlts. Other explicit exceptions should include apparel, shoes, pens, ATVs, bicycles, rhinestones, books and other print materials, brass and connectors. Exclnsions from the definition should take these products entirely outside the coverage of the CPSIA (including mandatory tracking labels).

C. Lead-in-substrate and phthalate testing should be based on a "reasonable testing program," not mandated outside testing. *The tenets of a reasonable testing program should be set by the reasonable business judgment of the manufacturer.* Resellers should be entitled by rule to rely on the representations of manufacturers. Phthalate testing requirements shonld explicitly exempt inaccessible components, metals, minerals, hard plastics, natural fibers and wood.

D. Definition of "Children's Product" should he limited to children 6 years old or younger and should eliminate the difficult-to-apply "common recognition" factor of Section 3(a)(2)(c) of the CPSA. Definition of "Toy" (for phthalates purposes) should be limited to children 3 years old or younger and should explicitly refer only to products in the form used in play.

E. Eliminate CPSC certification of laboratories (rely on the market to provide good resources). Fraud has only very rarely been a problem with test labs and is already illegal.

F. Impose procedural limits to insure fairness in penalty assessment by the CPSC under the CPSIA. Completely reformnlate penalties to restrict them to egregious conduct (including patterns of violations), reckless endangerment or conduct resulting in serious injnry.

G. Rewrite the penalty provision applicable to resale of used product so that violations are only subject to penalty if intentional (actual knowledge or reckless endangerment) and only if the violation led to an actual injury. Eliminate the "knowing" standard with its imputed knowledge of a reasonahle man exercising due care.

H. Mandatory tracking labels should be explicitly limited to cribs, bassinets, play pens, all long-life "heirloom" prodncts with a known history of injuring the most vulnerable children (babies or toddlers).

I. Public injury/incident database should be restricted to recalls or properly investigated incidents only. Manufacturers must be given full access to all posted incident data, including contact information. The "due process" civil liberty interests of the corporate community *must be protected.*

I urge your committee to address the fundamental flaws in the CPSIA to restore order to the children's product market and to protect small businesses from further damage. I appreciate the opportunity to share my views on this important topic.

PREPARED STATEMENT OF PAUL C. VITRANO, GENERAL COUNSEL, MOTORCYCLE INDUSTRY COUNCIL

Chairman Pryor, Ranking Member Wicker and distinguished members of the Subcommittee on Consumer Protection, Product Safety and Insurance, thank you for the opportunity to submit this testimony on the need for amendments to the Consumer Product Safety Improvement Act (CPSIA). My name is Panl Vitrano. I am the General Counsel of the Motorcycle Industry Council. MIC is a not-for-profit, national industry association representing nearly 300 manufacturers and distributors of motorcycles and all-terrain vehicles; motorcycle, ATV and recreational off-highway vehicle parts and accessories; and members of allied trades such as insurance, finance and investment companies, media companies and consultants.

The CPSIA was intended to protect children from ingesting lead from toys. However, the lead provision has had unintended consequences and we are pleased to submit testimony about one of those unintended consequences. The CPSIA has effectively banned the sale of many age-appropriate youth ATVs and motorcycles because of the lead content of certain components. As a resnlt of its broad reach, the Act has inadvertently crippled an industry unrelated to the toy manufacturers that were the intended target of the lead provision. In addition, the unintended ban has resulted in unsafe situations for youth off-highway enthusiasts.

It is estimated that over 13.7 million Americans enjoy riding off-highway motorcycles and over 35 million enjoy riding ATVs. Safety of our riders—particularly our youngest riders—is a top priority of the powersports industry. Vehicles, helmets and other gear and accessories are specially designed for youth riders to allow them to safely enjoy this family-friendly form of outdoor recreation.

In February 2009, however, ATVs and motorcycles designed and primarily intended for youth riders aged 6 to 12 became banned hazardous substances under the CPSIA because small amounts of lead—that pose no risk to youth—that are imbedded in metal parts of those vehicles to enhance the functionality of those components.

As you know, the CPSC concluded that the language of the CPSIA prevented it from making common-sense decisions and resulted in the CPSC denying the powersports industry's petitions for exclusion from the lead content provision. The exclusion was denied despite the fact that the CPSC's own staff acknowledged that there was no measnrable risk to children resulting from lead exposure from these products.

The CPSC tried to temporarily address the ban by issuing a stay of enforcement of the CPSIA's new lead content limits in May 2009. Unfortunately, this stay of euforcement has proven unworkable. Due to the risks of selling under the stay, many manufacturers and dealers are no longer selling youth model off-highway vehicles, and there is now a limited availability of these products for consumers. Half of the major ATV manufacturers are no longer selling youth models despite the stay.

The CPSC has acknowledged that the ban on youth off-highway vehicles creates a compelling safety issue because it likely will result in children 12 years of age and younger riding larger and faster adult-size vehicles. For example, CPSC studies show almost 90 percent of youth ATV injuries and fatalities occur on adult-size ATVs. Again, the CPSC's staff scientists acknowledge that the presence of lead in metal alloys in these youth models—needed for functionality, durability and other reasons that are safety critical to the components—does not present a health hazard to children. The Commission also acknowledges that children riding these vehicles only interact with a limited number of metal component parts that might contain small amounts of lead, like brake and clutch levers, throttle controls, and tire valve stems.

As a result, for over 18 months, MIC, its members, their dealers and many of the millions of Americans who safely and responsibly ride their off-highway motorcycles and ATVs with their children have urged Congress to amend the CPSIA to stop this unintended ban on youth motorized recreational vehicles. Off-highway vehicle stakeholders have sent over one million electronic messages aud thousands of hand signed letters and made numerous calls and personal visits to Capitol Hill to advocate for a legislative solution to the ban.

Since the CPSIA ban took effect on Fehruary 10, 2009, we collectively have urged Congress to act for three important reasons:

First, the lead content in metal parts of ATVs and motorcycles poses no risk to kids. Experts estimate that the lead intake from kids' interaction with metal parts is less than the lead intake from driuking a glass of water.

Second, everyone agrees that the key to keeping youth safe on ATVs and motorcycles is having them ride the right sized vehicle. The CPSIA has unintention-

ally put kids at risk because youth ATV and motorcycle availability is limited. Unavailability of yonth models resnlts in what CPSC has described as a "more serious and immediate risk of injury or death" than any risk from lead exposure from these products—youth riders operating larger and faster vehicles designed for adults.

Finally, the CPSIA is unnecessarily hurting the economy and jobs when everyone should be trying to grow the economy and create jobs. MIC estimates that a complete ban on youth model vehicles would result in about $1 billion in lost economic value in the retail marketplace every year.

In recognition of the need to end the unintended ban on youth ATVs and motorcycles, CPSC Chairman Tenenbaum and the other Commissioners unanimously asked Congress to provide the Commission with flexibility to grant exclusions from the CPSIA lead content provisions, specifically noting the need to address youth ATVs and motorcycles.

As a bipartisan group of 15 Senators wrote to the CPSC in 2009, "[CPSIA] has created a well-documented safety hazard for children, severe and nnwarranted disruption to families who recreate together, and a deletorious effect on youth amateur racing. Additionally, the inclusion of OHVs has created an economic disaster for an industry which is already reeling from the recession, is facing countless lay-offs and is estimated to be losing three million dollars per day due to the Act."

Senator Jon Tester introduced the "Common Sense in Consumer Prodnct Safety Act" (S. 608) in 2009 that would end the ban by amending the CPSIA so that vehicles designed or intended primarily for children 7 years of age or older are not considered children's products for purposes of the lead content provisions.

We believe that Congress never intended to ban youth model motorized recreational vehicles when it passed the CPSIA. MIC urges the Committee to stop this unintended ban by either granting a categorical exemption for ATVs and youth motorcycles; or passing legislation to limit the parts of the vehicle deemed "accessible" and thus subject to the lead content provision of the CPSIA. In either case, we also nrge the Committee to provide as much clarity as possible so that the CPSC is left with no donbt about Congress' intent to ensnre the continned availability of these yonth model motorized recreational vehicles.

Thank you.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. MARK PRYOR TO HON. INEZ M. TENENBAUM

Question 1. Is the marketplace safe for shoppers this holiday season?

Answer. Overall, I believe the consumer prodnct marketplace was safer for consumers this holiday season. This is the second holiday shopping season that manufacturers, importers, and retailers of children's products have had to comply with some of the most stringent lead and phthalates limits in the world and mandatory toy standards. Thanks to yon and your fellow Members of Congress who crafted and passed the Consnmer Prodnct Safety Improvement Act of 2008 (CPSIA), CPSC has more anthorities and inflnence in overseas markets, at the ports, and in the U.S. marketplace. The effect has been increased confidence for parents as they shop for their children.

Question 2. Has the agency seen a dramatic decline in toy recalls since 2008?

Answer. The number of toy recalls has dropped over 70 percent from a high of 172 in FY 2008 to 44 in FY 2010. Toys accounted for 31 percent of all recalls in FY 2008 but only 10 percent of all recalls in FY 2010. The number of toy units recalled declined by over 3.8 million from FY 2008 to FY 2010.

Question 3. Has the agency seen a decline in the number of deaths of children under the age of 15?

Answer. Yes. The numbers of consumer product related deaths for ages 0 to 15 have dropped by over 17 percent, from 3,225 to 2,658, over the period 1985 to 2007 (the latest year of complete death date). Adjusting for changes in the population count, the rate of death for this age gronp, per 100,000 resident population, has dropped from 6.3 deaths per 100,000 to 4.4 deaths per 100,000.

Question 4. What advice can the CPSC offer to parents to help keep their kids safe from any potential product hazards this holiday season?

Answer. During the 2010 holiday shopping season CPSC issued guidance to parents noting that while recalls and deaths have declined, toy-related injuries are increasing. In 2009, there were an estimated 186,000 emergency room-treated injuries related to toys with children yonnger than 15, which is np from 152,000 injuries in 2005. Freqnently these injnries involved lacerations, contnsions, and abrasions that

most often occurred to a child's face and head. Importantly many of the incidents were associated with, but not necessarily caused by, a toy.

To help keep the holiday season happy, safe, and incident-free, CPSC encouraged consumers to adopt a three-prouged safety approach:

1. *Which Toy for Which Child?*—Always choose age appropriate toys.

2. *Gear Up for Safety*—Include safety gear whenever shopping for sports-related gifts or ride-on toys, including bicycles, skates, and scooters.

3. *Location, Location, Location—Be* aware of your child's surroundings during play. Young children should avoid playing with ride-on toys near automobile traffic, pools or ponds. They also should avoid playing in indoor areas associated with hazards such as kitchens and bathrooms and in rooms with corded window blinds.

Some additional safety steps that CPSC advised consumers to follow include:

- *Scooters and Other Riding Toys*—Riding toys, skateboards, and in-line skates go fast, and falls could be deadly. Helmets and safety gear shonld be worn properly at all times and be sized to fit.
- *Small Balls and Other Toys with Small Parts*—For children younger than age three, avoid toys with small parts, which can cause choking.
- *Balloons*—Children can choke or suffocate on deflated or broken balloons. Keep deflated balloons away from children younger than 8 years old. Discard broken balloons at once.
- *Magnets*—For children nnder age six, avoid building or play sets with small magnets. If magnets or pieces with magnets are swallowed, serious injuries and/or death can occur.

Once the gifts are opened, CPSC always advised parents to:

- Immediately discard plastic wrappings or other packaging on toys before they become dangerous play things.
- Keep toys appropriate for older children away from younger siblings.
- Supervise children while charging batteries. Chargers and adapters can pose thermal burn hazards to young children. Pay attention to instructions and warnings on battery chargers. Some chargers lack any mechanism to prevent overcharging.

Question 5. Would you describe to the Committee what spurred this campaign in the first place, progress made to protect children from unsafe cribs, and a status update on the Commission's efforts?

Answer. Between November 2007 and April 2010 there were 36 deaths reported to the Commission associated with crib structural problems. Of those, 25 occurred when crib components (often associated with the drop-side hardware portion of the crib) detached, disengaged, or broke ending in the strangulation death of the infant in the crib.

In the wake of these and other tragic incidents involving children's sleep environments, I directed and the Commission supported the creation of the Safe Sleep Team. This team has worked diligently to prevent consumers from being harmed by cribs and infant sleep products and has also contributed to the creation of new standards and regulations for these types of products. Pursuant to the direction contained in section 104 of the CPSIA, I also announced early in 2010 that the Commission would adopt new, mandatory crib safety standards by the end of that year. On December 15, 2010, the full Commission voted unanimously to adopt new crib safety standards that, among other things, prohibit the use of traditional drop-sides in newly manufactnred cribs.

Under the rules, the sale, resale, lease or other placement in the U.S. stream of commerce of old cribs that do not meet the new safety standard will he prohibited effective June 28, 2011. The rules will also prohibit the use of old, noncompliant cribs "by child care facilities, family child care homes, and places of accommodation affecting commerce." The Commission, however, recognized that child care facilities and places of public accommodation wonld require a period of time to pnrchase new, compliant cribs for use in their facilities. Accordingly the rule gives child care providers and places of public accommodation that use cribs until December 28, 2012, to purchase and start nsing new compliant cribs in those facilities.

Question 6. When do you expect the Commission will issue a final rule on crib safety?

Answer. As noted above the Commission voted unanimonsly to adopt the new crib safety rules on December 15, 2010. The rules were published in the Federal Register

on December 28, 2010. (See Consumer Product Safety Commission, "Safety Standards for Full-Size Baby Cribs and Non-Full-Size Baby Cribs: Final Rule," 75 Fed. Reg. 81,766 (Dec. 28, 2010)).

Question 7. I'm certain you and your staff spent countless hours working on the final rule that the Commission recently adopted establishing the Publicly Available Product Information Database. Do you believe the publicly searchable database is a victory for American consumers?

Answer. Yes, I believe the rollout of the Database will be one of the most significant steps to advance consumer product safety awareness taken in the history of this agency. First and foremost, the Database will function as an early warning system for dangerous and potentially dangerous products by allowing members of the public to share information about product hazards as quickly as that information becomes known. This is a very positive change from the current system (generally referred to as "section 6(h) procedure"), where the Commission is required to consult with manufacturers and seek their advance approval before warning the public of potentially dangerous items.

The Database will also allow the Commission to use the most modern and effective technology to collect information from consumers and better manage that information internally. This will allow the Commission to monitor the safety of products out in the marketplace in "real time," and also accelerate the issuance of recalls and other corrective actions where necessary. In the end, I think this is a "win-win" for both manufacturers and consumers, because it will alert manufacturers of potential defects much faster than under the current system and get potentially dangerous products out of the hands of consnmers as soon as possible.

Question 8. How will this Database serve to protect the public from dangerous products in the stream of commerce?

Answer. As noted above, the Database will serve as an early warning system for consumers. Product safety incident reports will be available on *SaferProducts.gov* soon after they are filed by consumers who have learned of a dangerous or potentially dangerous product. This represents a very substantial change from current procedure where consumer complaints are often withheld from public access for months or even years due to the "section 6(b) process."

The Database will also use the most modern IT technology to "data mine" the reports for new and emerging patterns of product defect. This should allow Commission staff to react faster to new and emerging hazards—and reduce injuries or deaths that may be caused by those product hazards.

Question 9. Do you think the CPSC's recent final rule establishing the publicly searchable database properly balances timely disclosure of important consumer protection information with the need to address legitimate husiness concerns?

Answer. Yes, I do. Onr implementation of the Database has built-in protections and procedures that will allow a manufacturer to have its perspective included in the Datahase record. In cases where a manufacturer believes a report is either materially inaccurate or contains confidential information, the company can ask that we correct the record or redact the confidential information.

In addition to providing mauufacturers with the right to comment on reports, the Database also requires all reports to carry the following disclaimer: "The Commission does not guarantee the accuracy, completeness, or adequacy of the contents of the Consumer Product Safety Informatiou Database, particularly with respect to the accuracy, completeness, or adequacy of information submitted by persons outside of CPSC."

The result of this is a balanced approach that will allow for the correction of faulty information without requiring the Commission to withhold reports from the public until they are endlessly vetted by outside parties.

Question 10. Is the Database on track to be launched in March 2011?

Answer. Yes, the Database is currently on schedule for a fully functional launch on March 11, 2011.

Question 11. Does the Commission intend to consider extending the stay of enforcement for the third-party testing requirement? Do you think it is necessary to extend the stay of enforcement?

Answer. The Commission is currently considering several petitions and requests, including one from the Handmade Toy Alliance (HTA), for a continuation of the stay of enforcement for third-party testing of lead content. In considering these requests, the Commission will carefully consider the views and concerns of all impacted stakeholders.

Question 12. Within the third-party testing regime, where is the Commission in its efforts to promulgate rules outliuing appropriate testing protocols?

Answer. On December 28, 2009, the Commission issued an interim enforcement policy, "Interim Enforcement Policy on Component Testing and Certification of Children's Products and Other Consumer Products to the August 14, 2009 Lead Limits," regarding component testing and certification of children's products and other consumer products to the 90 parts per million (ppm) lead in paint limit and to the 300 ppm lead limit for children's products established in section 101 of the CPSIA.

This interim enforcement policy permits, as part of a domestic manufacturer's or importer's certification of a children's product as being in compliance with the 300 ppm lead content limit, the domestic manufacturer or importer to rely on a test report showing passing test results for one or more components used on the product, based on testing either of them has commissioned from a recognized third-party test lab. The domestic manufacturer or importer may also rely on a certificate from another person certifying that a component complies with the 300 ppm lead limit, provided the component certificate is based on testing of a representative sample of the component(s) by a recognized third-party test lab.

On May 20, 2010, the Commission published a notice of proposed rulemaking, "Conditions and Requirements for Testing Component Parts of Consumer Products," 16 CFR Part 1109. This proposed rule set forth, for Commission consideration, the conditions and requirements under which the Commission will require or accept the results of testing of component parts of consumer products, instead of the entire consumer product, to meet, in whole or in part, the testing requirements of sections 14(a), 14(b), and 14(d) of the CPSA.

On May 20, 2010, the CPSC also issued a proposed rule that would establish requirements for a reasonable testing program aud for compliance aud coutiuuing testing for children's products. The proposal would also address labeling of consumer products to show that the product complies with certification requirements under a reasonable testing program for nonchildren's products or under compliance and continuing testing for children's products. The proposed rule would implement section 14(a) and (d) of the Consumer Product Safety Act (CPSA), as amended by sectiou 102(b) of the Consumer Product Safety Improvemeut Act of 2008 (CPSIA).

CPSC staff are curreutly reviewing and drafting responses to the over 300 commeuts received on these two proposed rules. Based on the commeuts and further staff analyses, the proposed rules will be updated and draft final rules submitted to the Commission for consideration in the first half of calendar 2011.

Question 13. Has the Commission proposed a rule allowing for component part testing?

Answer. Yes. On May 20, 2010, the Commission pnblished a notice of proposed rulemaking, "Conditions and Reqnirements for Testing Component Parts of Consumer Products," 16 CFR Part 1109. This proposed rule set forth, for Commission consideration, the conditions and requirements under which the Commission will require or accept the results of testing of component parts of consumer products, instead of the entire consumer product, to meet, in whole or in part, the testing requirements of sections 14(a), 14(b), and 14(d) of the CPSA.

In advance of the propose rule for component part testing, the Commission issued an interim enforcement policy, "Interim Enforcement Policy on Component Testing and Certification of Children's Prodncts and Other Consumer Products to the August 14, 2009 Lead Limits," regarding component testing and certification of children's products and other consnmer products to the 90 parts per million (ppm) lead in paint limit and to the 300 ppm lead limit for children's products established in section 101 of the Consumer Product Safety Improvement Act of 2008 ("CPSIA").

This interim enforcement policy, issued on December 28, 2009, permits, as part of a domestic manufacturer's or importer's certification of a children's product as being in compliance with the 300 ppm lead content limit, the domestic mannfacturer or importer to rely on a test report showing passing test results for one or more components used on the product, based on testing either of them has commissioned from a recoguized third-party test lab. The domestic manufacturer or importer may also rely on a certificate from another person certifying that a component complies with the 300 ppm lead limit, provided the component certificate is based on testing of a representative sample of the component(s) by a recognized third-party test lab.

Question 14. As you know, this year's reports of cadmium in children's products are very trouhling. The CPSC has the authority to respond to emerging hazards in the marketplace. Has the Commission reached a final determination as to whether the toxicity of cadmium is sufficient to be considered toxic under the FHSA?

Answer. CPSC staff have concluded that the data concerning the toxicity of cadmium are sufficient for cadmium to be considered toxic under the FHSA due to effects on multiple organ systems and toxic endpoints, including kidney dysfunction.

The conclusion that a substance is toxic is only the first step in the Commission's assessment under the FHSA.

The FHSA is risk-based. To be considered a "hazardous substance" under the FHSA, a consumer product must satisfy a two-part definition. (See 15 U.S.C. § 1262 (f)(1)(A)). First, it must be toxic under the FHSA or present one of the other hazards enumerated in the statute (see statement above). Second, it must have the potential to cause "substantial illness or injury during or as a result of reasonably foreseeable handling or use." Therefore, exposure and risk must be considered in addition to toxicity when assessing potential hazards under the FHSA.

Question 15. You noted in a letter you sent to me earlier this year that you were working with "standards determining organizations" to figure out whether "current standards governing the use of toxic metals in surface coatings or the substrate of toys [were] sufficiently protective of children's health and safety." What has been the outcome of those deliberations?

Answer. The evaluation of the current ASTM F963 toy safety standard, made mandatory by the Consumer Product Safety Improvement Act of 2008, is an ongoing, multifaceted effort by CPSC technical staff, including toxicologists and chemists. Staff has completed toxicity and dose-response analysis of the chemicals regulated by the standard. An external peer review of the analysis is also currently being prepared. In addition, staff is evaluating test methods specified in the standard for their suitability in accurately identifying potentially hazardous products.

Recently the ASTM toy safety subcommittee established a work group to consider aligning the current standard with international standards for accessible soluble heavy metals in toys. The proposed changes in the ASTM standard would expand the requirements for toys, including the scope of the standard, with respect to chemical substances, including cadmium. CPSC staff is actively involved in the discussions and generally supports the expansion of requirements for metals in toys.

Question 16. I was the lead author of the Virginia Graeme Baker Pool and Spa Safety Act here in the Senate, a law that established strict pool safety standards as a response to too many tragic accidents and insufficient safety standards. I understand the CPSC has launched a robust pool safety campaign. Could you update us on the Commission's efforts to protect the public from pool and spa hazards?

Answer. In 2010, CPSC launched the most expansive information and education campaign in its history, which was aimed at preventing child drownings and drain entrapments. Below is a summary of our *Pool Safely: Simple Steps Save Lives* multimedia campaign:

- CPSC awarded a contract to Widmeyer Communications to develop and implement an information and education campaign to fulfill the requirements of Section 1407 of the Virginia Graeme Baker Pool and Spa Safety Act (VGB Act). The comprehensive *Pool Safely* campaign teaches pool and spa safety steps that stress prevention of drowning and entrapment by engaging stakeholders as partners at the national and grassroots levels. Child safety experts work on public and residential drowning prevention programs for parents and children, and industry organizations share VGB Act compliance information with pool and spa owners and operators.
- The *Pool Safely* campaign messages totaled more than 250 million views, which were generated from print articles, online stories, local television broadcasts, and epublications through the CPSC's website. This goal was exceeded due to the exceptional exposure generated by Widmeyer Communications through the production and dissemination of a high-value TV PSA. In addition, numerous print articles, radio stories, and online stories were generated in 2010, which reached millions of readers and listeners. Significant additional views were made via Twitter, Flickr, and YouTube. Metro transit stations in the District of Columbia displayed five illuminated posters, which generated 1.7 million views in September 2010. Billboards with *Pool Safely* campaign messages were placed on streets and highways in Arizona, California, and several other states.
- CPSC staff worked with a contractor on events targeting minorities and high-risk families. These events included focus groups, program announcement press conferences, and events in minority communities in Houston, TX, and Washington, D.C. At these events participating groups included organizations such as Safe Kids, American Red Cross, the YMCA, and local organizations like Bria's Honse, which provides swimming lessons to underprivileged children.
- A professional Web design services company was contracted to redesign and expand *PoolSafety.gov* into a state-of-the-art, interactive Web resource using the campaign name *www.PoolSafely.gov*. The new site was launched on September 27, 2010. This site has interactive links to all content developed as part of the

Information and Education campaign with special sections for families, industry, state and local officials, and the media.

- Finally, CPSC staff developed and awarded six contracts to leading organizations to create and deliver educational and training programs nationally. Contractors representing top national indnstry experts were retained to execute training materials for pool owners and operators, mannfactnrers, and retail ontlets, and local and state regulatory entities. Using a combination of live events, webinars, and prepared edncational training video programs, each contractor will address issues related to drowning and entrapment prevention for their specified audiences.

Question 17. Conld you discuss the issue of the additional layer of protection for pools with only a single main drain?

Answer. CPSC supports the use of layers of protection in and around pools and spas. From fences to door alarms to safer drain covers to suction detection devices, CPSC believes that a system of safety is needed to protect children from drowning and entrapment hazards in and around pnblic and private pools and spas.

As reqnired by Section 1404 of the VGB Act, all pnblic pools and spas that have a blockable drain operating on a single main drain system mnst install a secondary layer of protection. Pool and spa operators can nse one of five options to meet this requirement: a safety vacuum release system, an automatic pump shut off system, a suction-limiting vent system, a gravity drain system, or no drains.

The Commission voted three to two in 2010 to allow for the use of nnblockable drain covers to be placed over blockable sized drains on single main drain systems to exempt pnblic pools and spas from having to comply with the secondary protection system requirement. I voted against this decision becanse I believed that a secondary system was contemplated by the statute for pools with a single main drain and to provide the highest level of protection possible in such pools.

Question 18. Many months ago, an ABC news article reported a pool drain cover safety risk and suggested that despite discontinued manufacturing of certain models of drain covers, consumers were not notified of potentially dangerous drain covers already purchased and installed in pools across the country. Is the Commission aware of this concern?

Answer. Yes, the Commission is aware of this concern.

After learning of possible anomalies in the testing of certain pool drain covers, the Commission took several steps to investigate. On September 3, 2010, the Commission issued subpoenas requesting test data from three independent labs involved in drain cover testing, rating, and certification. This request produced over 17,000 pages of technical documents for staff review, which is currently underway.

CPSC also contracted with a third-party testing laboratory to have the identified suction outlet covers tested (CPSC Contract #. S–10–0108). CPSC laboratory staff witnessed the testing to observe the test facility, the test procedures, and the methodology of different technical staff conducting the tests. The results of testing have been reported by the contractor and staff is reviewing the report.

These results will be used to discuss auy ratings issues with manufacturers of the identified product whose rating is questionable. In the event that testing results for certain covers indicate any substantial product safety hazards, the Commission may pursue a recall or other corrective action agaiust the manufacturer of the specific cover.

In addition, the CPSC laboratory is also conducting its own independent testing of the identified suction outlet covers aud will compare results with those obtained by the contractor as well as those obtained by the original third-party certifying laboratories. These results and review of the procedures will also be used to develop guidauce for future testing aud rating of suction outlet covers by third-party certifying laboratories.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. MARIA CANTWELL TO HON. INEZ M. TENENBAUM

Question 1. The Food aud Drug Administratiou (FDA) has three different product classifications for toothbrushes: (1) toothbrush, ionic, battery-powered; (2) toothbrush, manual; and (3) toothbrush, powered. The FDA classifies all toothbrushes as Class I medical (deutal) devices. My understanding is that such Class I devices are regulated by the FDA. Under current law, does the Consumer Product Safety Commission (CPSC) have any authority to ensure the safety of toothbrushes, even those that are clearly marketed to childreu?

Answer. Section 3(a)(5) of the Consumer Product Safety Act ("CPSA") defines "consumer product" as "any article, or component part thereof, produced or distributed: (i) for sale to a consumer for use in or around a permanent or temporary honsehold or residence, a school, in recreation, or otherwise, or (ii) for the personal use, consumption or enjoyment of a consumer in or around a permanent or temporary household residence, a school, in recreation, or otherwise. . ." However, section 3(a)(5)(H) of the CPSA expressly excludes, from the definition of "consumer product," "drngs, devices, or cosmetics (as such terms are defined in sections 201(g), (h), and (i) of the Federal Food, Drug, and Cosmetic Act)" ("FFDCA").

Thus, a toothbrush, as a "device" under section 201(h) of the FFDCA, cannot be a "consumer product" and, therefore, is not subject to regulation under the CPSA.

However, the Federal Hazardons Substances Act ("FHSA") does not contain an exception for devices. (It expressly excludes "foods, drugs, and cosmetics subject to the Federal Food, Drug, and Cosmetic Act.") Consequently, CPSC could use its anthority under the FHSA to address hazardous substances in devices.

Question 1a. Do you believe that all toothhrushes shonld be classified as medical devices or should some be classified as a consumer product?

Answer. Because the FHSA permits us to exercise jurisdiction over toothbrnshes under the FHSA regardless of their classification as a medical device, they receive coverage under both FDA's jnrisdiction and the CPSC's with regard to their chemical content.

However, toothhrushes are not subject to the CPSIA's new testing and certification requirements for children's products since they fall outside the definition of "children's product" as described above. As a medical device, toothbrnshes may be subject to the FDA's regulations known as current good manufacturing practices. However, we defer to FDA on whether such regulations would apply to toothbrushes.

Question 2. There are a number of battery-powered toothbrushes in the market that have children's cartoon or live-action characters painted on to the body of toothbrush or attached to the hody of the toothbrush (*i.e.*, the on-off switch in the shape of the cartoon character), and are marketed to children. Does the CPSC consider such toothbrushes to be a "children's product"? Should the CPSC classify these toothbrushes to be a children's product as they are marketed to children 12 years of age and younger?

Answer. As noted in the response to question 1, a "device" cannot be a "consumer product" under the CPSA. Section 3(a)(2) of the CPSA defines "children's product," in relevant part, as "a consumer product designed or intended primarily for childreu 12 years of age or younger." (Emphasis added.) Thus, because a device cannot be a "consumer product" under section 3(a)(5) of the CPSA, neither can it be a "children's product" under section 3(a)(2) of the CPSA.

However, if CPSC staff age grades a toothbrush for use by children, we could assert jurisdiction to regulate the toothbrushes under the FHSA and take appropriate action should they contain a hazardous level of heavy metals in either the surface coating or the substrate.

Question 2a. Does the FDA have any standards for the levels of heavy metals allowed in toothbrushes?

Answer. This question involves interpreting FDA rules and policies, and we must respectfully refer you to that agency for a response to this question.

Question 2b. Hypothetically, if it is reported that lead was found in the colored bristles of a toothbrush with a cartoon character painted on the body of the toothbrush, how wonld the CPSC respond? Wonld the FDA have absolnte jnrisdiction? If the FDA chooses not to investigate the report, does the CPSC have any authority to investigate such a claim independently?

Answer. Under current laws the toothbrush would not be subject to the lead limits in section 101 of the CPSIA because, as stated earlier, the product would be excluded from the definition of "children's product." CPSC might be able to assert authority under the FHSA if the prodnct met the definition of a "hazardous snbstance." CPSC has the authority to investigate and, if after investigation, including the analysis of testing of the toothbrush, the Commission determined the toothbrush contained a "hazardous substance" it could pursue the remedies set forth in the FHSA and take the appropriate action.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. FRANK R. LAUTENBERG TO HON. INEZ M. TENENBAUM

Question 1. The Consnmer Product Safety Commission approved a new mandatory crib safety rule on December 15, 2010. Although the new rule acknowledges that "extra bedding in cribs accounted for the majority of infant deaths in cribs or other sleeping products," it claims "there are no performance requirements for cribs that can address this issue." What are your plans for expanding existing education efforts to address the hazards of extra bedding and sleep positioners?

Answer. CPSC is focusing on the influence of video to inform to new parents and change behaviors when it comes to preventing suffocation risks in a baby's sleep environment. In the aftermath of a joint press announcement with FDA in late September urging parents to stop using sleep positioners, CPSC produced an educational video on the dangers associated with these products, which is now posted on the agency's YouTube site, and available at the following link: *www.youtube.com/USCPSC#p/f/0/3xvdPpKJoMc.*

Although the dangers associated with drop-sides have garnered most of the media attention related to cribs in recent years, soft bedding, including pillows, blankets and comforters, cause the most child fatalities. To educate new parents in the recovery room at the hospital or in the waiting room at their pediatrician's office, CPSC teamed up with the American Academy of Pediatrics, *Keeping Babies Safe*, and renowned journalist Joan Lunden to produce a special *Safe Sleep for Babies* video. This video demonstrates visually and informs orally that a crib should be as bare as possible due to the suffocation risk that soft bedding poses to newborns and infants. This video can be viewed at the following site: *www.cpsc.gov/CPSCPUB/PREREL/prhtml11/11021.html.*

Shorter versions of the video directed at minority and other underserved populations are posted on our YouTube channel. All of these videos are being disseminated through our Safe Sleep partners and are being highlighted by the agency when conducting media interviews.

Question 2. Although the crib safety rule will be effective 6 months after publication, child care providers will have a total of 24 months to replace non-compliant, potentially dangerous cribs. What are your plans for protecting the safety of children in child care until dangerous cribs are removed from these facilities in 2 years?

Answer. The safety of cribs used in child care facilities will continue to be carefully monitored by CPSC and state child care licensors. First and foremost, it is important to clarify that child care facilities are prohibited by law from using "recalled" cribs unless a repair (provided by the manufacturer as part of the recall remedy) has been installed. CPSC staff monitors all incoming crib incident reports, including incidents which may have occurred at child care facilities and assigns investigators to conduct in depth investigations of such incidents. In addition, CPSC maintains a comprehensive contact list with state child care licensing departments. CPSC will be providing its state partners with information about the new Federal crib rule, recalls, safety alerts, and other crib safety information.

Question 3. You have indicated that the Consumer Product Safety Commission will work with the National Operating Committee on Standards for Athletic Equipment (NOCSAE) on developing new standards for football helmets. NOCSAE has not made significant changes to its helmet standard in 37 years. What is the timeline for the development of a new standard and what steps will you take to ensure the standard incorporates the latest science on concussion prevention for youth and adults?

Answer. I take the issue of helmet safety very seriously, particularly with regard to helmets used in school and youth athletics. To that end, CPSC staff has fully engaged NOCSAE in furtherance of our monitoring of their voluntary standards process. As part of this effort, I directed one of our CPSC staff engineers with significant experience in helmets standards, as well as a senior counsel from my staff, to attend the publicly-available portions of the January 20–22, 2010, NOCSAE board meeting. Overall, I believe CPSC's oversight has already begun to bear fruit. In particular, I was encouraged by two developments that relate directly to the important issues you raised.

First, Dr. Robert Cantu, NOCSAE's vice president, presented to its board seven recommendations recently made by a group of medical experts (including Dr. Cantu) that met late last year at the request of NOCSAE. Three of the medical experts' recommendations addressed areas of research these experts believe are vital to identifying ways to potentially improve the standard for new football helmets in a meaningful way. An additional recommendation touched on the need for research related to a youth football helmet standard. We not only agree with the need for the research these experts identified, bnt also believe all seven of their recommendations

should be acted on by NOCSAE in a timely fashion. Ensuring NOCSAE moves forward on these fronts is incorporated into our larger oversight effort.

Second, NOCSAE announced at its board meeting that it will be creating a standing scientific advisory committee to direct its concussion-related research. Moreover, NOCSAE invited CPSC to participate in the work of this committee. We are in the process of determining how, and in what way, CPSC can be involved with the Committee in a manner that would further our oversight function of NOCSAE and allow the Commission to be certain that NOCSAE is committed to ensuring the key research occurs as quickly and efficiently as possible.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. AMY KLOBUCHAR TO HON. INEZ M. TENENBAUM

Question 1. Does the CPSC support adoption of the product standards for carbon monoxide alarms and detectors as mandatory consumer product safety rules, as reflected in S. 1216/H.R. 1796?

Answer. CPSC staff supports the goals of the bills to encourage the use of CO alarms in residences. CO alarms save lives. They do that by warning consumers of the presence of CO before the onset of debilitating effects.

Question 1a. What additional resources, if any, would be required by CPSC to implement the legislation if it were enacted?

Answer. CPSC staff believes that the current edition of UL 2034 is an effective standard. Making UL 2034 a mandatory standard will level the playing field for manufacturers and give CPSC greater authority to enforce compliance with the standard. Staff believes it will also make it easier for states to adopt installation requirements.

The July 29, 2010, revision of H.R. 1796 (from the 111th Congress) would make mandatory both UL 2034 and UL 2075. Thus, the scope of the House bill goes beyond CO alarms intended for residential dwellings. UL 2075 detectors or monitoring devices may be appropriate for locations outside of residential dwellings, such as indoor parking garages, commercial buildings, testing facilities, or furnace rooms. In addition, because the scope of UL 2075 includes gases other than CO, CPSC staff would need to review the performance requirements for each gas within the scope of UL 2075 to ensure that it adequately addresses hazards to consumers. CPSC resonrces would be required to thoroughly review the scope and technical provisions of ANSI/UL 2075 related to applicable consumer products. In addition, CPSC staff would need to compare the standards to ensure the CO alarms test conditions and performance requirements in ANSI/UL 2034 preside and coincide with those in ANSI/UL 2075.

That version of H.R. 1796 also states that both ANSI/UL 2075 and 2034 be published in the Federal Register as mandatory consumer product safety standards and take effect 180 days after Federal Register publication. CPSC staff suggest that first, the ANSI/UL 2034 be reviewed and implemented as the mandatory consumer product safety standards in the Federal Register with the associated timelines. Staff suggests that after the ANSI/UL 2034 FR time frames, staff can begin the work associated with ANSI/UL 2075, as the effort to evaluate and define the scope of relevant consumer product safety portions of ANSI/UL 2075 may require a significant commitment of resources.

S. 1216/HR 1796 includes provisions for a grant program for states that adopt CO alarm installation requirements. Additional resources would be required to administer and support such a grant program.

Question 2. Are you aware of any residential CO alarm products being sold on the market that do not comply with UL 2034? Are yon aware of any manufacturers of CO detectors who manufacturer CO alarm products that may exceed UL 2034?

Answer. CPSC staff is aware that there are low levels CO monitoring devices on the market that claim to exceed the ANSI/UL 2034 alarm criteria and aim to protect the population most sensitive to the lowest levels of CO. As designed, these low-level monitors do meet the "do not alarm" requirements in ANSI/UL 2034 that protect against spurious low-level alarms. The ANSI/UL 2075 standard or registration as a medical device may be appropriate for these low level CO monitors. However, CPSC staff is not aware of these devices being certified to any standards.

Question 3. In previous years, CPSC has identified "Carbon Monoxide" as a strategic initiative. In its 2011–2016 Strategic Plan, carbon monoxide is no longer identified as its own initiative. How do you see CPSC's efforts to raise awareness of carbon monoxide dangers and to promote carbon monoxide detection fitting into the five key goals identified in the Commission's 2011–2016 Strategic Plan?

Answer. While carbon monoxide (CO) is no longer identified as its own initiative, it is still very much a part CPSC's new Strategic Plau through CPSC's work ou safety standards, improved consumer information and hazard identification. In fact, CPSC's activities to reduce CO dangers and to promote CO detection are found for three of the five goals in the Strategic Plan.

CPSC's strategic goal, "Commitment to Prevention" focusing on engaging public and private sector stakeholders to build safety into consumer products, we drive forward our commitment to the prevention of CO-related incidents. The CPSC will work to protect consumers from the dangers of CO poisoning by promoting the production of safe products and the development and implementation of safety standards. This will enable industry compliance with safety standards at various stages of consumer product development and distribution. By encouraging industry leaders and foreign safety agencies to focus on safety early in the global supply chain, the CPSC will help prevent hazards from entering consumer markets.

CPSC's strategic goal, "Raising Awareness" promotes a public understanding of product risks and CPSC capabilities. Under this goal, we seek to gain the attention of consumers throngh increased awareness of the hazards associated with CO and gas-fired appliances and engine-driven tools and generators. Consumers, advocates, industry, and partner government agencies each desire useful and timely information about consumer product safety issues in order to make informed choices. However, these audiences have different information needs, and each responds best to different methods of communicating information. With the rapid increase in the use of social media and Web-based commnnications, the options for conveying consumer product safety information continue to grow.

The CPSC will use a wide array of communication channels and strategies to provide the public with timely and targeted information about CO-related safety issnes. This information will empower consumers to make informed choices about the products they purchase and how to safely use them, to be aware of hazardous products in the market, and to act quickly if they own a recalled product. Additionally, the information will make industry aware of the hazards they must address to maintain safe products.

Finally, CPSC's strategic goal "Rigorous Hazard Identification" focnses on accurate and timely determination of all hazards posing the greatest risk to consumers, including CO-related deaths and injuries. Staff completes two annual reports, one on CO fatalities and one on incidents associated with associated with generators and engine-driven tools. Both reports help identify new or emerging issues within those sub-areas.

Question 4. Please describe the CPSC's experience in managing Federal grant programs.

Answer. The CPSC has not awarded grants in the last 10 years, and currently does not have the staff and resources available to independently award Federal grants. In 2008, however, Congress passed the Virginia Graeme Baker Pool and Spa Safety Act (VGB Act). The VGB Act authorized CPSC to award grants to states and was funded in the Fiscal Year (FY) 2009 Omnibus Appropriations Bill.

In order to comply with the requirements of the VGB Act, CPSC contracted with the Centers for Disease Control (CDC) to develop the required funding announcement, issue the announcement, make the awards, monitor the award performance and finally report on the results, all following Federal grant regnlations. The cost of this service by CDC is estimated at 20 percent of the total grant amount.

Question 4a. To date no grants have been awarded because no states meet the statutory requirements the VGB Act grant program. What unique challenges would S. 1216 pose to the Commission, if any, in administering the proposed grant program under this legislation?

Answer. First, the Commission still does not have grant expertise so we wonld likely contract again with another Federal agency like CDC. Thus, the funding for the 20 percent contract costs must be obtained by reducing the grant amounts ($2 million annnally) or from specific appropriation.

Second, while we are aware that approximately 25 states have CO alarm legislation, we do not know whether the requirements of that legislation match the reqnirements of S. 1216. Therefore, it is not whether any state will be immediately eligible to apply for a grant. Accordingly, it may be necessary to spend funds initially in conducting outreach to the states about the grant program's specific eligibility requirements, and then awarding grants in the latter years of the program.

Third, under the VGB grant program, we learned that if the appropriations language funding the grants does not always mirror the authorization language regarding the return of unexpended and unobligated funds. Additional harmonization between the authorization and appropriations language would be helpful in the future.

Question 5. I understand that implementing effective third-party testing and tracking processes may be difficult, and that after 2 years many companies are still trying to figure out workable solutions. I have talked to very small businesses from Minnesota. They are very concerned about implementing the specific third-party testing and certification requirements. Have you given any thonght as to whether it is really workable to begin enforcing these reqnirements against very small businesses when the stay ends this February?

Answer. The third-party testing requirements of the CPSIA have been commnicated to the business community. Since August 2008, CPSC staff have met with varions industry associations nnmerons times and provided multiple training seminars and webinars on the new requirements of the CPSIA in an attempt to help industry prepare for the changes hrought about by the CPSIA. As one example, on December 10 –11, 2009, the Commission held a two-day workshop to discuss issues relating to the testing, certification, and labeling of certain consumer products pursuant to section 14 of the CPSA (*see* 74 Fed. Reg. 58611 (November 13, 2009)).

As both Ms. Jill Chnckas and Mr. Steve Lamar stated in response to questioning from Senator Pryor at the December 2, 2010 hearing, CPSC Commissioners and staff have been fnlly engaged with industry, providing training workshops aronnd the U.S. and the world, and being responsive to the issues and concerns facing industry as they move forward with meeting the reqnirements of the CPSIA. The Commission is committed to continuing to meet with and edncate manufacturers and importers as the remaining CPSIA regulations are developed and implemented.

Having said that, the Commission continues to be very sensitive to the concerns of the small business community and is cnrrently considering several reqnests, including one from the Handmade Toy Alliance (HTA) for a further continuation of the stay of enforcement.

Question 5a. Have yon considered the possibility of another extension for these bnsinesses?

Answer. As noted above, the Commission is currently considering several reqnests, inclnding one from the HTA for a continnation of the cnrrent stay. The Commission is carefully considering the views of all stakeholders and will rule on the petitions and requests as soon as possible.

Question 5b. Have you considered ways to make it easier for very small businesses to comply with the CPSIA?

Answer. The Commission has always maintained an open door policy to listen to the concerns of industry and small businesses, and the establishment of the new full-time Small Business Ombudsman is the latest way that the Commission has songht to listen to and address the concerns of small businesses. As CPSIA does not distinguish between the sizes of businesses that must comply with the law, the Commission does not have plenary power to take actions that may alleviate the bnrdens of compliance on small businesses specifically.

Nevertheless, the Commission is required to conduct regulatory flexibility analyses on each significant rnle, which assess the potential impacts of the rules on small bnsinesses. The Commission has, and will continue, to look at areas like the limited lead exemptions and the component part enforcement policy rule noted above to assist small businesses and others where possible and discretion allows.

Question 6. There are certain fibers in apparel that are exempted from flammability testing, including polyester and nylon. Spandex was not in widespread use when the flammability regulations were promulgated, but today it is found in innumerable apparel products. Many have claimed that Spandex has the same flammability properties as fibers that are already exempted. Does it not make sense for the CPSC to investigate adding spandex to the list of fibers that are exempt from flammability testing?

Answer. The Commission issned the Standard for the Flammability of Clothing Textiles (16 CFR part 1610) in 1975 under the authority of the Flammable Fabrics Act (FFA), which prohibited the importation, manufacture for sale, or sale in commerce of any article of wearing apparel, which is "so highly flammable as to be dangerous when worn by individnals." The Standard, as originally written, did not include exemptions for any fibers or fabrics.

In 1984, the Commission issned a rnle amending the Standard to inclnde exemptions based on weight and fiber content. The Commission based these exemptions on years of previous industry and government testing (See 40 Fed. Reg. 48,568; Dec. 14, 1984). The exemptions are as follows:

> (1) plain surface fabrics, regardless of fiber content, weighing 2.6 ounces per square yard or more; and

(2) all fabrics, both plain surface and raised-fiber surface textiles, regardless of weight, made entirely from any of the following fibers or entirely from combination of the following fibers: acrylic, modacrylic, nylon, olefin, polyester, wool.

Many plain snrface fabrics containing spandex fiber are already exempted from testing due to fabric weight.

In apparel fabric, spandex fiber usually appears as a small percentage of total fiber and it is typically used in combination with other fibers to add "ease" or form-fitting properties. The extent to which spandex fiber may affect the flammability performance of garments constrncted of otherwise-exempt-fiber fabrics is unknown; the industry has not provided sufficient data from their own flammability testing to jnstify amending the Standard to include spandex in a fiber exemption. The Commission does not have evidence to support the inclnsion of spandex as an "exempt fiber" and would welcome new data if the industry can provide it. If the Commission were to determine that there was a need for a study on the flammability of spandex fiber in combination with the other exempt fibers, it could direct the staff to proceed with such an investigation.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. TOM UDALL TO HON. INEZ M. TENENBAUM

Question 1. Ms. Tenenbaum, given that CPSC has fewer than 500 employees and that the agency is charged with ensuring the safety of over 15,000 types of consumer prodncts, I wonld like to know yonr thoughts on how CPSC can leverage its resources. You note in your testimony that the CPSC is working with other agencies such as the Cnstoms and Border Protection on ensnring the safety of imported goods. As a former attorney general, I would like to ask how yon are working with state attorneys general to help ensure compliance with consumer product safety rules. One idea that Commissioner Robert Adler mentioned during his Senate confirmation process was having CPSC potentially host regional conferences of state attorneys general to raise awareness about product safety issues. Are any such conferences or regional meetings planned?

Answer. Shortly after both Commissioner Adler and I joined the Commission, the CPSC hosted in October of 2009 a conference of representatives of the state attorneys general responsible for consumer protection of product safety issues. At that meeting we agreed to hold a monthly conference call to share information and raise awareness regarding Commission product safety priorities. Those conference calls have been successful and will continue in FY 2011. We also recently held a training session for interested state AG offices on investigating children's products for lead and cadmium hazards. There is a second in person follow-up meeting planned for early Spring 2011.

Question 2. Do yon have other ideas abont cooperating in other areas to ensure consumer safety?

Answer. In September 2010, the Commission voted to create the Office of Education, Global Ontreach, and Small Business Ombudsman, an office I envisioned in my first year as Chairman. The office will make the CPSC more accessible to stakebolders and will play a vital role in helping the CPSC fulfill its mission of protecting the public from unnecessary risks of death and injury from consumer products. The principal function of the office will be to coordinate and provide education and outreach activities to various domestic and international stakeholders, including foreign goverunents, manufacturers, retailers, small busiuesses, aud consumers. To carry out this mission, the new office will invite partnerships with colleges and universities, state and local governments, nonprofit organizations, standards making orgauizations, and others to euhance the CPSC's ability to provide research and training for stakeholders on regulatory and safety standards and best practices, which in turn will result in safer products.

The CPSC has been workiug with the states and others to come up with creative ways to raise awareness about product safety issues. For example, we have worked collaboratively with the American Academy of Pediatrics to produce a video on crih safety for use with uew parents in hospitals and pediatricians offices. I would also like to work with the states to ensure that day care licensing codes are revised to require recall checks to ensure products used in those facilities have not been recalled.

Question 3. Chairmau Teneubaum, siuce passage of the laudmark CPSIA legislation, does the CPSC now have the resources, authority, and cooperation from other agencies that it needs to protect our children from harmful and tainted products imported from foreign couutries?

Answer. In the last couple of years the CPSC has received a substantial increase in appropriations, and I am extremely grateful for these additional resources. Since my arrival at the Commission these resources have been pnt to work of a number of critical initiatives, including increasing CPSC Import Surveillance Division staff at ports of entry, a new CPSC testing facility, and investigating several new and emerging areas of potential consumer product safety hazards.

Having said that, it is important to note that the CPSC is still only has half the staffing that is possessed at its peak in 1980. We have made great strides since passage of the CPSIA, but additional resources would be welcomed.

Question 4. Chairman Tenenbaum, thank you for your assurance that the CPSC will carefully review the issue of football helmet safety, particularly for young children and high school athletes.

In addition to the fact that no football helmet standards exist for youth helmets and for addressing concussion risks, I am concerned that some safety warning labels for helmets are not clearly visible and legible. For example, new and used football helmets are sold with warning labels placed underneath padding inside the helmet where they are not fully visible. My understanding is that the CPSC has provided clear guidelines about the content, legibility, and visibility of safety warning labels for other children's products and consumer products. Will you include a review of the adequacy of current warning labels as you look into the issue of football helmet safety?

Answer. As indicated during my oral testimony, CPSC has fully engaged NOCSAE in furtherance of onr monitoring of their voluntary standards process. Labeling is certainly included in the areas we are exploring. We share the desire that labels, both in terms of substance and location, provide meaningful and effective warnings.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. KAY BAILEY HUTCHISON TO HON. INEZ M. TENENBAUM

Question 1. As you know, Section 103(a) of the CPSIA requires the placement of tracking labels on all children's products and their packaging, to the extent practicable. In its July 2009 Statement of Policy regarding enforcement of this provision, CPSC staff indicated that products sold through bulk vending machines would not need to be individually marked, though the package or carton the products are shipped in would. The Statement of Policy further noted that "the Conference Report [accompanying the CPSIA] recognized that marking each individual product in such circumstances may not be practical. See H.R. Rep. No 787, 110th Cong., 2d Sess. 67 (2008)." However, the Commission has not provided any explicit regulatory exclusion from Section 103(a) for bulk vended products. Will the CPSC pursue enforcement actions against bulk vendor suppliers, operators or retail establishments for the absence of tracking labels on bulk vended products? Further, can you please assure the Committee that the CPSC will maintain this position should any state attorney general or other entity seek to enforce Section 103(a) against bulk vended products?

Answer. In the July 2009 Statement of Policy, CPSC staff stated that hulk vended products would not have to be individually marked. The Office of Compliance is following this policy as stated. Staff will consider enforcement action, however, if outer containers were not appropriately marked with the required information.

Question 2. According to an August 2010 ABC news report, the American National Standards Institute (ANSI) found that earlier test results for 4 pool drain covers by 3 brands—Aquastar, Paramouut, and AFRAS—were unreliable and that use of the covers could result in serious injury or death to consumers. In the article, the CPSC commented that it was investigating the matter. Please provide an update on the investigation and what the Commission has found to date.

Answer. After learning of possible anomalies in the testing of certain pool drain covers, the Commission took several steps to investigate. On September 3, 2010, the Commission issued subpoenas requesting test data from three independent labs involved in drain cover testing, rating, and certification. This request produced over 17,000 pages of technical documents for staff review, which is currently underway.

CPSC also contracted with a third-party testing laboratory to have the identified suction outlet covers tested (CPSC Contract # S–10–0108). CPSC laboratory staff witnessed the testing to observe the test facility, the test procedures, and the methodology of different technical staff conducting the tests. The results of testing have been reported by the contractor and staff is reviewing the report.

These results will be used to discuss any ratings issues with manufacturers of the identified product whose rating is questionable. In the event that testing results for

certain covers indicate any substantial product safety hazards, the Commission may pursue a recall or other corrective action against the manufacturer of the specific cover.

In addition, the CPSC laboratory is also conducting its own independent testing of the identified suction outlet covers and will compare results with those obtained by the contractor as well as those obtained by the original third-party certifying laboratories. These results and review of the procedures will also be used to develop guidance for future testing and rating of suction outlet covers by third-party certifying laboratories.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. ROGER F. WICKER TO HON. INEZ M. TENENBAUM

Question 1. What can you tell us about the impact of the CPSIA on small businesses? Even though the CPSIA did not require the Commission to perform cost-benefit analyses of the rules it promnlgates, many of the concerns raised from small businesses and from Members of Congress since the law passed have been based on the need for this very information—specifically, the law's economic impact and unintended consequences. Does the Commission have quantitative data to determine what the impact has been, and what the impact will be in the future as more requirements under the law come into effect?

Answer. While it is true that CPSIA does not contain a separate cost-benefit analysis provision, the Commission is still required to perform a regulatory impact analysis (pursuant to the Regulatory Flexibility Act) of each significant new CPSIA rule presented for the Commission's consideration. In some cases, the staff has concluded that the rules could have significant adverse impacts on substantial numbers of small businesses. In fact, CPSC quantitative data on the use of cribs in child care facilities and public accommodations (many of which are small businesses) was recently utilized by the Commission to decide how to best apply the new rule on mandatory crib standards to child care facilities and places of public accommodation as required by the CPSIA. Assisted by this data, the Commission gave child care facilities and places of public accoinmodation 18 months after the effective date of the new crib safety rules to come into compliance with these new standards. This 18 month compliance period will help to ensure that children benefit from safer cribs, while at the same time preventing a serious impact on these kinds of small businesses and causing a potential shortage in available child care for working families.

The Commission is certainly cognizant of and sensitive to the impact of the CPSIA on testing and compliance costs for small businesses. To that end, the Commission has sought to ameliorate the financial burdens through the exercise of sound discretion where the Commission believed that Congress had provided the Commission with that ability and where such accommodations could be shown not to have an impact on product safety.

One example of these efforts is the Commission's regulation exempting certain types of products from mandatory lead testing. In this case, the Commission met with the business community, examined their specific claims that certain categories of pure products—like certain woods, textiles, and inks—would never contain violative levels of lead in them, and granted exemptions for those categories after independent CPSC analysis. Another example is the Commission's enforcement policy concerning lead in surface coatings and lead content that allows for the use of properly tested and certified component parts in lieu of final product testing. Both of these examples have provided some relief for small businesses in their sourcing and manufacturing of products.

Question 2. Does the Commission have any plans to assess the negative impacts of the law, and to take necessary actions to alleviate these burdens before they eliminate any more jobs?

Answer. The Commission has always maintained an open door policy to listen to the concerns of industry and small businesses—and the establishment of the new full-time Small Business Ombudsman is the latest way that the Commission has sought to listen to and address the concerns of small businesses. As CPSIA does not distinguish between the sizes of businesses that must comply with the law, the Commission does not have plenary power to take actions that may alleviate the burdens of compliance on small businesses specifically.

Nevertheless, as noted above, the Commission is required to conduct regulatory flexibility analyses on each significant rule, which assess the potential impacts of the rules on small businesses. The Commission has, and will continue, to look at areas, like the limited lead exemptions and the component part enforcement policy

rule noted above, to assist small businesses and others, where possible and discretion allows.

Question 3. You mentioned at the hearing the creation of a full-time Small Business Ombudsman to serve the Nation's small mannfactnrers in the area of prodnct safety. How will this new position address the concerns of small businesses? Do you believe that this will be enongh to alleviate their expressed concerns?

Answer. The full-time Small Business Ombudsman is addressing tbe needs and concerns of small businesses in many ways. As you heard on December 2, 2010, from Ms. Jill Chuckas of the Handmade Toy Alliance, tbe Small Business Ombudsman has already been working very closely with small bnsinesses and representatives of small business.

The Ombudsman will serve small businesses through the provision of regulatory and technical guidance to small bnsiness inqniries in a timely manner. Fnrthermore, the Ombudsman will develop educational materials to provide plain English explanations of Federal consumer product safety reqnirements. The Ombndsman has already fielded many inquiries where he has been able to provide concise, clear guidance as to the regulatory requirements and the response from those businesses, and the business community in general, has been very positive.

The Ombudsman has also made himself accessible for small businesses and their representatives to raise their concerns with the knowledge that the Ombudsman will follow np with the appropriate agency employees to seek a solution. We believe tbat the creation of the Ombudsman position will be helpfnl for the Commission to be kept current of small business issues and to find new ways of partnering with the small bnsiness community to develop creative and effective solntions witbin tbe confines of the law.

Question 4. The Commission's stay on third-party testing for lead content is schednled to lift in February. Is the Commission prepared to move forward with lifting this stay of enforcement?

Answer. The Commission is currently considering several petitions and requests, including one from the Handmade Toy Alliance (HTA), for a continuation of the stay of enforcement for third-party testing of lead content. In considering these requests, the Commission will carefully consider the views and concerns of all impacted stakeholders.

Question 4a. Do yon believe that the health of children has been at greater risk because of this stay of the third-party testing requirements?

Answer. Commission staff has no data at this time to suggest that the risk to the health of children has changed either positively or negatively as a result of the stay of the third-party testing reqnirements.

Question 5. Do you believe that businesses have been given the information necessary to comply with this requirement? Have they been given enongh time to incorporate necessary changes to comply with the requirement by the February deadline?

Answer. The third-party testing requirements of tbe CPSIA bave been communicated to the business community. Since August 2008, CPSC staff have met with various industry associations numerous times and provided multiple training seminars and webinars on the new requirements of the CPSIA in an attempt to help indnstry prepare for the changes brought abont by the CPSIA. As one example, on December 10–11, 2009, the Commission held a two-day workshop to discuss issues relating to the testing, certification, and labeling of certain consnmer products pursuant to section 14 of the CPSA (*see* 74 Fed. Reg. 58611 (November 13, 2009)).

As both Ms. Jill Chuckas and Mr. Steve Lamar stated in response to questioning from Senator Pryor at the December 2, 2010, hearing, CPSC Commissioners and staff have been fully engaged with industry, providing training workshops around the U.S. and the world and being responsive to the issues and concerns facing industry as they move forward with meeting the requirements of the CPSIA. The Commission is committed to continuing to meet with and ednoate manufacturers and importers as the remaining CPSIA regulations are developed and implemented.

With regard to industry being given enongh time to incorporate necessary changes to comply with the lifting of the stay in February, it should be noted that the initial stay of enforcement was issued on February 9, 2009, to allow industry time to make the necessary changes. For those prodncts that have been covered by CPSC's stay of enforcement, there has always been a requirement that the products be in full compliance with all applicable product safety rules.

Furthermore, the only way to know that a prodnct complies is to test the prodnct or the components of the product. Many manufacturers and importers have been testing children's products, at the request of their customers, for many months. A full 24 months will have passed when the Commission takes up the matter of lifting the stay in February 2011.

Question 6. Is the Commission going to consider extending the stay in order to ensure that the affected businesses are adequately prepared and that there are enough resources to prevent a negative impact on the businesses affected? If so, when do you plan on doing so?

Answer. As noted above, the Commission is currently considering several requests, including one from the Handmade Toy Alliance (HTA) for a continuation of the current stay. The Commission is carefully consideriug the views of all stakeholders and will rule on the petitions and requests as soon as possible.

Question 7. The CPSIA draws a clear distinction between general product safety rules and children's product safety rules. Yet the Commission has chosen to apply the requirement of third-party testing to all children's products under the general product flammability rules. Can you tell us why this decision was made?

Answer. The Commission has been consistent in its application of third-party testing requirements to children's products subject to consumer product safety rules. The phrase "children's product safety rule" is clearly defined by Congress and has been consistently interpreted by the Commission to include rules of general applicability as well as those rules that specifically address hazards unique to children. Substituting the actual definition of "children's product safety rule" into the language of section 14(a)(2) of the Consumer Product Safety Act (CPSA) best demonstrates the statute's direction to the Commission.

When read with the definition of "children's product safety rule" inserted, section 14(a)(2) reads:

> [B]efore importing for consumption or warehousing or distributing in commerce any children's product that is subject to "*a consumer product safety rule under this Act or similar rule, regulation, standard, or ban under any other Act enforced by the Commission, including a rule declaring a consumer product to be a banned hazardous product or substance*," every manufacturer of such children's product . . . shall submit sufficient samples of the children's product . . . to a third-party conformity assessment body . . . to be tested.

This explicit definition of "children's product safety rule" referenced in section 14(a)(2) of the CPSA is plain and unambiguous in that third-party testing is required for any children's products covered by a consumer product safety rule, including standards of general applicability. This is consistent with the Commission's unanimous decisions to require third-party testing of children's all-terrain vehicles, bicycles, and bicycle helmets. These three regulations are also rules of general applicability, and the Commission has voted unanimously to require third-party testing for children's versions of these products. Thus, in addition to the clear definition of the statutory term "children's product safety rule," it is also inconsistent with the Commission's unanimous votes requiring third-party testing for general standards pertaining to youth all-terrain vehicles, bicycles, and bicycle helmets to not also require third-party testing for children's products subject to the general standards pertaining to flammability.

Question 8. The flammability standards have been in place with testing protocols for adult and children's products for some time. Yet the Commission has chosen to apply this additional third-party testing requirement to children's products under those rules. Is there any evidence that the products affected by this ruling, such as carpets or vinyl plastic, were unsafe under the prior testing regime and needed to be subjected to third-party tests to protect children?

Answer. CPSC's 2005–2007 Residential Fire Loss Estimates, dated August 2010, presents estimates of consumer product-related fire losses that occurred in U.S. residential structure fires attended by the fire service. The estimates were derived from data for 2005 through 2007 provided by the U.S. Fire Administration's (USFA) National Fire Incident Reporting System (NFIRS) and the National Fire Protection Association's (NFPA) Survey of Fire Departments for U.S. Fire Experience.

The estimated residential structure fires attributed to floor coverings (as item first ignited) such as carpets and rugs, averaged 4,700 from 2005 through 2007. The estimated residential structure fire deaths attributed to floor coverings (as item first ignited) for this period averaged 100, with injuries averaging 280. The estimated residential structure fire property loss attributed to floor coverings (as item first ignited) for this period averaged $151.4 million. It should be noted that the Commission's residential fire data do not differentiate children's product vs. non-children's products for carpets and rugs, mattresses and mattress pads, or apparel. A special study would be needed to try to obtain information on the involvement of adult versus children's versions of these regulated products as the first item ignited.

Question 8a. Is there any evidence that children's versions of rugs or other affected products are in more danger than adult versions of those products to necessitate this additional testing standard?

Answer. The Commission's residential fire data do not differentiate between children's product and non-children's products for carpets and rugs, mattresses and mattress pads, or apparel. A special study would be needed to try to obtain information on the involvement of adult versus children's versions of these regulated products as the first item ignited.

Question 8b. Isn't an adult version of an affected product more likely to be subjected to a cigarette or some other igniting sonrce?

Answer. The Commission does not have data to support this assertion.

Question 9. As 1 noted in my opening statement, I have many constituents who continue to suffer from the effects of tainted drywall that was installed after Hurricane Katrina. Mississippi has the third highest number of reported cases in the Nation. I know the Commission has been involved in the research into the health impact of this drywall. Can you update us on the status of the Commission's health investigations, and what determinations you have been able to make to this point?

Answer. The most frequently reported symptoms are irritated and itchy eyes and skin, difficulty in breathing, persistent cough, bloody noses, runny noses, recurrent headaches, sinus infection, and asthma attacks. Since many consumers report that their symptoms lessen or go away when they are away from their home, but return upon re-entry, it appears that these symptoms are short-term and related to something within the home.

The staff of the CPSC and the Centers for Disease Control and Prevention (CDC) agree that the levels of sulfur gases detected in the affected homes in the CPSC's fifty-one home study were at concentrations below the known irritant levels in the available scientific literature. It is possible, however, that the additive or synergistic effects of these and other compounds in the subject homes could potentially cause irritant effects to consumers. It is also possible that other exposures exist in these homes that could be causing these complaints independent of the drywall.

Our own investigation into deaths of consumers associated with homes that were reported to contain problem drywall found no evidence, based on the limited data available, to support a connection between drywall and the deaths. CDC also conducted an independent review of this limited data, which consisted of available medical records. We have received a report from CDC on their review, and will release it as soon as CPSC staff have reviewed the report. We have also reqnested the CDC to undertake a comprehensive study of any possible long-term health effects resulting from exposure to problem drywall. I would refer you to CDC for any questions regarding any further work by that agency in this area.

Question 10. What are the Commission's plans for future involvement with tainted drywall and the affected homeowners?

Answer. The Commission is continuing to engage with the Chinese government and Chinese manufacturers to reach a fair and equitable settlement for American consumers that have been impacted by contaminated drywall produced by Chinese manufacturers. On October 25, 2010, I met personally with my Chinese counterpart, Mr. Zhu Shuping, Minister, General Administration of Quality Supervision, Inspection and Quarantine (AQSIQ) in Shanghai and spoke with him about the need for further dialogue and movement in this area. On January 10, 2011, I had another follow-up meeting with the AQSIQ Minister in Beijing, and again restated my call for a fair and just resolution of the issue by the responsible Chinese manufacturers.

We are also continuing to engage with private parties involved in the Chinese drywall multidistrict litigation (MDL) in New Orleans, Louisiana. I was pleased that the Federal court and the parties relied on our scientific findings to help develop a demonstration program paid for by the responsible manufacturer to remediate at least 300 homes in the Southeast. This demonstration program was part of a partial settlement agreement reached on October 14, 2010, and I am hopeful that it will be expanded in the near future to cover other impacted homeowners.

As the lead Federal agency in this investigation, we will also continue to work with our sister agencies as they examine any possible long-term health effects of the problem drywall and as our sister agencies and other interested stakeholders work with the private sector to develop more commercialized remediation methods.

Finally, we are working with ASTM International, a voluntary standards development organization, on development of standards to address the corrosive emissions from drywall and on affixiug tracking labels to ensure that drywall is more easily identifiable. We believe that both standards will help to protect against future occurrences of this type and, if they were to occur, to quickly address any issues in a targeted and expeditious manner.

Question 11. At the end of November the Commission passed the final implementing rule for the public database required under the CPSIA. While the law specified who can submit reports of harm, the Commission's rule expands this list by defining consumers and public safety entities as essentially anyone who wants to submit a report—even if the submitter does not know who was harmed, the particular product involved, and did not see the incident occur. Therefore, as opposed to the list created by the statute, submitters are no longer limited to people who could have first-hand knowledge of the incident. Why was this expansion done?

Answer. In section 212 of the CPSIA, Congress gave the Commission the ability, in implementing the Database, to fill the gaps in defining statutory terms such as "consumer" and "public safety entity." Based on how the CPSIA amended the CPSA, I believe that Congress intended the public to have access through this Database to as much information as possible concerning the safety of consumer products.

To have narrowly defined those categories in the final rule, particularly in the way stated in the alternative proposal offered by Commissioners Nord and Northup, would have been contrary to the statute and the overall goal of consumer access. For example, the alternate proposal would have disallowed groups such as the National Association of State Fire Marshalls from reporting incidents in the database. These groups are often technical experts in public safety matters, and often gather extremely valuable information concerning product safety incidents. It also would have prohibited anyone, including the parents of Danny Keysar (who was strangled in a defective portable crib in 2008) and the child care facility workers where he tragically died from reporting his tragic death through the Database. I strongly believe that this type of valuable data, from these kinds of reliable sources, should be available to the public through the Database.

Question 11a. How will allowing individuals who do not have first-hand knowledge of the incident improve public safety and increase the reliability of information in the database?

Answer. As stated above, the alternate proposal put forward by Commissioners Nord and Northnp would have disallowed many public sufety gronps with years of technical experience in public safety reports from making reports. In addition, the proposal may have also restricted the ability of parents whose children are injured by consumer products in environments outside of the home (such as schools and child care facilities) from making reports just because they did not directly observe the specific incident leading to the injury. Additionally, it would render the ability of physician and first responders, from whom we currently receive much reliable data, and who fall under certain of the categories of snbmitters Congress expressly inclnded in section 212, from making a report because they did not directly observe the specific incident leading to the injury. I do not believe such a result was intended by Congress or contributes to overall public safety.

Question 12. The intention of the database is to provide useful information to consumers. Commissioner Northup's substitute amendment included provisions to improve the accuracy of the data submitted by requiring the inclusion of additional information. This amendment was rejected by a majority vote of the Commissioners. Can you explain your opposition to adding more required fields to the datahase in order to improve the data's accuracy and usefulness?

Answer. The information requirements for submissions to the Database were carefully crafted to ensure the accuracy of Database submissions without creuting barriers that are unduly burdensome to consumers. Overall, I believe the Commission struck the correct balance in requiring the information fields that were detailed in the final rule.

Question 13. A central concern with the CPSIA remains that it takes away the Commission's ability to assess the risk presented by a product. The law focuses on the content of lead in a product, not the risk of negative health effects from even limited exposure to that lead. Do you believe that there is a risk posed to the health of children from exposure to many of the products that are affected by the lead limits in the law, such as ATVs, books, pens, school desks, furniture, or furniture hardware (*i.e.,* the nuts and bolts that hold the furniture together)?

Answer. Lead is a potent neurotoxin that can cause permanent and irreversible brain damage in children. The scientific and pediatric community has thoroughly studied the issue of children's exposure to lead and is near unanimous in the opinion that there is "no known safe level of lead." Even low-level lead exposnre has been shown to affect brain fnnction, lower intelligence, and cause behavior problems and poor school performance.

Throughont my tenure as Chairman of the CPSC, I have urged mannfactnrer's of children's products to "get the lead out." The presence of lead in children's prod-

ucts is controllable and where lead is not necessary, it should not be included in a children's product.

Question 14. You voiced support for a functional purpose exemption to the lead standard at the hearing, yet you also pointed to literature that says there is no safe level of lead. How do you reconcile these conflicting viewpoints?

Answer. As stated above, I believe—based on all available scientific and pediatric literature—that there is no safe level of lead for children. At the same time, however, I have learned that there are some circumstances where the exclusion of lead below the levels permitted by section 101 of the CPSIA is problematic. Accordingly, I have stated that it would be helpful for Congress to create a new exclusion to the section 101(a) lead limits that would allow some flexibility in cases where lead is required for a functional purpose and the elimination of lead in a specific component is not practicable or possible.

The fundamental tenet underlying a "functional purpose" type exclusion is very simple: where lead serves no purpose and can be practicably removed or made inaccessihle in children's products, the lead should be removed or made inaccessible to children.

Question 14a. Do you believe a legislative fix is needed to allow exemptions from the lead content standard for all products that do not pose a health risk for children?

Answer. As stated in my above response, I believe a functional purpose exception to the current section 101(a) lead content limits would he helpful.

Question 15. The crib rule was mentioned briefly during the hearing. Can yon please elaborate on the impact of the crib rule on child care centers due to the retroactive effects of the law?

Answer. On December 15, 2010, the Commission adopted mandatory safety rules for fnll-size and non-full-size cribs. Between Novemher 2007 and April 2010, there were 36 deaths associated with crib structural problems, and I am confident that these new rules will stop further tragedies from occurring in the future.

At the same time, however, the Commission was very cognizant of the impact that adoption of these rules might have on child care facilities and other places of public accommodation. During consideration of the rules, I urged building enough time into rule enforcement milestones not only to allow new crib inventory to reach the market but also to allow affected entities sufficient time to purchase new cribs.

Under the final rule cribs sold in commerce must comply with the new requirements by June 28, 2011. Child care facilities and other places of puhlic accommodation required to comply with the rule will have an additional 18 months to come iuto compliance—or until December 28, 2012. In the unauimous Commission decision adopting these rules and compliance dates, I believe the Commission struck the right balance to ensure that children will benefit from safer cribs, while at the same time working to preveut a serious impact on smaller entities and a potential shortage in available child care for working families.

RESPONSE TO WRITTEN QUESTION SUBMITTED BY HON. JOHNNY ISAKSON TO HON. INEZ M. TENENBAUM

Question. Under your stewardship and that of Commissioner Nord, you have both put forward stays to the so-called third-party testing and certification requirement uuder the CPSIA. It is now due to take effect in February of 2011. The final rules for testing aud certification are still not published, but I am hearing from my constituents that there is confusion in the industry how to implement these requirements. This level of confusion, combined with the 2/11 date, will in my opinion add major new costs to manufacturers in the United States and this will likely lead them to move their operations overseas or even close, at a time when we are at near 10 percent unemployment. Wouldn't it make sense to adopt another one year stay of this requirement and work with Congress and the stakeholders to develop a workable testing regimen that the impacted indnstries can effectively work with that would NOT drive manufacturers out of business or overseas?

Answer. As noted in my above response to Senator Wicker, the Commission is currently considering several requests, including one from the Handmade Toy Alliance (HTA) for a continuation of the current stay. The Commission is carefully considering the views of all stakeholders and will rule on the petitions and requests as soon as possible.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. MARK PRYOR TO HON. ANNE M. NORTHUP

Question 1. Is the marketplace safe for shoppers this holiday season?

Answer. The safety of every product ou the market at any given time is unknowable, and the complete elimination of all unsafe products for all time is unachievable. The CPSC's mission is to spend its resources as efficiently and effectively as possible to identify and remove from the marketplace consumer products that present a demonstrable risk of injury. Data available to the CPSC to identify unsafe products and to measure changes in product safety over time can help it gauge the success of its efforts, and to reallocate its resources when necessary. But the utility of such data is limited. One reason is that many injuries that occur while using a product are unrelated to a product's safety. Another reason is that it takes years to gather data, and comparisons over time periods can therefore only support tentative conclusions. Certainly the available data does not support the conclusion that the CPSIA has made products safer. Rather, directing greater resources toward identifying and removing actual risks, rather than regulating to fixed standards unrelated to actual risk, would be more effective.

Toy-Related Deaths and Injuries

The Commission touted its annual report on toy fatalities and injuries as evidence that toys are safer this holiday season.[1] Unfortunately, this press release was qnite misleading. Data on toy-related deaths and injuries illustrates the difficulty in drawing conclusions regarding changes in relative risk.

First, the Commission's data on deaths related to toys is not complete, and always lags by several years. As you can see in the first set of footnotes on page fonr of "Toy-Related Deaths and Injuries, Calendar Year 2009" (*http://www.cpsc.gov/library/toymemo09.pdf*), the death certificate data for 2009 was *only 37 percent complete*. For that matter, the death certificate data for 2007 was only 85 percent complete, as of 2009. The number of deaths has always increased in the out years as further data is collected. Thus, it is simply too early to tell what the nnmber of deaths related to toys will be for 2009, or how it will compare to previous years.

Second, it is important to remember that the incident data reflects toy injnries and deaths that are "associated with, but not necessarily caused by" toys. In other words, the hazard may have nothing to do with a consumer product. For example, in the tables on pages four and five of the 2009 report, the data on deaths related to toys show that a number of deaths for children age 15 and under involved *drowning* related to tricycles or powered riding toys. These deaths likely occurred around a pool or other body of water while the child was nsing the toy, but it is unlikely that the toy was defective and cansed the accident. Thus, while such incident data may point to the broader hazard of drowning, it does not establish that tricycles and motorized toys are unsafe. So while the data collected on these broad areas of concern are important for the Commission to nnderstand as we direct resources toward public relations campaigns and enforcement efforts, it is much less relevant in judging whether toys are safer.

Third, this 2009 report shows that there were an estimated 250,100 toy-related injuries treated in U.S. hospital emergency departments that year, which is significantly higher than the annual average of 228,200. So while the incomplete, *preliminary* data for deaths shows a decrease, the number of reported injuries associated with toys has actually gone up. The estimated number of emergency department injuries for 2008 is 235,300. Additionally, the statistics indicate that the injuries in 2008 and 2009 may be slightly more serious. Ninety-six percent of the injury victims were treated and released in both the 2009 and 2008 reports, whereas in 2007, slightly more (97 percent) were treated and released.[2] Thus, the changes in injury data from 2007 through 2009 do not support the theory that toys are safer today than a few years ago.

CPSIA

There is no evidence that the CPSIA will significantly contribute to increased product safety. This is becanse the major requirements of this law are *not related to risk*. Recent modifications to prodncts dne to the CPSIA may have made the products more expensive, but have not necessarily made them safer. For example, while lead-free zippers may be more readily available in the marketplace today than a few years ago due to the cnrrent 300 ppm lead content standard, there is still no evi-

[1] *http://www.cpsc.gov/cpscpub/prerel/prhtml11/11042.html.*

[2] Risana Chowdhury. "Toy Related Deaths and Injuries, Calendar Year 2007," Consumer Product Safety Commission. Pg. 6: *http://www.cpsc.gov/library/toymemo07.pdf.*

dence that touching or mouthing the stay of a zipper with a lead content higher than 300 ppm poses a lead risk to a child.

The interim ban on certain phthalates (§ 108(a)(1)), which are used to make plastics soft, is another requirement that is unrelated to risk. The Commission has already determined that the phthalates most commonly used in toys today (those included under the interim prohibition) did not pose a danger to children and, therefore, should not be federally regulated. Nonetheless, the CPSIA requires yet another Chronic Hazard Advisory Panel (CHAP) to study the issue *de novo*. And pending this new study—which could well obtain the same results as prior tests—the law bans them both prospectively and retroactively. Thus, a chemical that the Commission has studied and determined not to pose a risk, and that will now be studied *again*, is already banned from all toys and child care articles—a step clearly mandated without regard to risk.

It is premature to gauge the safety impact of the CPSIA's requirement, effective early 2009, that the toy standard (ASTM–F963) become mandatory. The full scope of this requirement has yet to be implemented, because the Commission has not issued a Notice of Requirements to accredit labs that will test to this standard. Once the requirement is implemented, toy manufacturers will be obligated to send each component of each toy to a third-party lab to be tested to all applicable parts of the toy standard, potentially requiring numerous extra tests beyond lead and phthalates. But it also appears that the delay in implementation of these third-party testing requirements has not caused toys to be *more unsafe* than in previous years. So it may be preferable to forgo these costly testing requirements for toy manufacturers unless or until the Commission can actually show that they are beneficial in addressing a known risk.

Changing the CPSC's Mission

As a Commissioner, I am concerned that we are spending so much time developing regulations *unrelated to risk* under the CPSIA that our attention will be diverted from focusing on genuine safety hazards. Our agency is charged with "protecting the public from unreasonable risks of serious injury or death" from consumer products—but we cannot fulfill this mission if our time is spent primarily enforcing the CPSIA, including its complex, non-risk-based, testing and certification requirements.

Because the CPSIA's new requirements are not risk-based, manufacturers are spending time and money simply on "compliance," rather than on improving their products to the benefit of consumers. In fact, many of these requirements amount to massive new paperwork and tracking systems, rather than actual modifications to the products themselves. The American Home Furnishings Alliance writes in a letter to Commissioners:

> ". . . there has not been a corresponding benefit in the improved safety of children's furniture for children. All the represeutatives told you that their respective companies have not had to change a single material they use in the manufacturing of their children's product lines since they began testing to CPSIA in 2008. . . . The testing is simply being done to attempt to prove a negative."[3]

Similarly, some industry associations have had very few, if any, safety violations and yet have to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety. The American Apparel and Footwear Associatiou writes in their public comments on the Compouent Parts rule:

> "As the CPSC continues to issue specific compliance requirements, manufacturers become increasingly wrapped up in ensuring compliance over ensuring product safety. All AAFA members have had long-standing quality control programs in place that have developed based on the product's, production of the product's and the manufacturer's unique circumstances. These programs *are effective and do not need to be changed*. To demonstrate, only .0084 percent of all apparel and footwear sold in the U.S. in 2008 were involved in a recall. Moreover, most apparel and footwear recalls have been drawstring violations—a compliance issue that results from lack of information not lack of testing."[4]

Given the Executive Order[5] issued by President Obama on January 18, 2011, directing agencies to roll back onerous regulations that have no safety benefit, I hope

the Majority at least will consider approaching Congress to remove the law's third-party testing, certification and labeling requirements that are entirely unrelated to risk. The Commission always maintains the authority to impose in the future new testing requirements on any products where a true risk arises.

Question 2. Has the agency seen a dramatic decline in toy recalls since 2008?

Answer.

Toy Recalls by Fiscal Year		
FY	Number of Recalls	QTY.
10	44	8,389,276
09	50	1,785,626
08	172	12,246,170
07	63	26,375,370

TOTAL Recalls by Fiscal Year		
FY	Number of Recalls	QTY
10	428	124,700,000
09	465	229,500,000
08	563	60,700,000
07	472	102,200,000

A perennial question for this Commission has been whether it is good or bad to have fewer recalls. A 2004 report by Kids in Danger asserts that a *decline* in recall activity between 2000 and 2003 did *not* indicate that products were becoming safer. Rather, the consumer advocacy organization surmised that the decrease was due to changes in enforcement policy under then CPSC Chairman Hal Stratton. According to Kids in Danger, the decrease in recalls resulted from lax CPSC enforcement that "increase[ed] hazards as the dangerous products stay on the shelves, and in homes."[6]

But today, a decline in recall activity is suddenly a good sign—and much better than the *increase* in recall activity that took place under Acting Chairman Nancy Nord prior to the passage of the CPSIA. Thus, it would appear that the significance of the agency's number of recalls is entirely subject to interpretation.

In reality, recall data alone cannot conclusively establish whether products are safer or less safe than in previous years. On the contrary, one of the main reasons that the Commission's toy recall data was so high in Fiscal Year 2008 was the media attention surrounding several high-profile recalls. As a result, both industry and the Commission were aggressively testing every toy within their reach. As a result, more violative products were discovered and recalled.

Today, our activities related to enforcement are focused much more broadly. Thus, the difference in recall numbers between FY 2008 and today prove only the obvious fact that the more resources the Commission expends searching for non-compliant products, the more such products it will find. The same is true for any law enforcement activity, whether it is the number of hours a policeman watches for speeders or the number of tax returns audited by the Internal Revenue Service; the more resources allocated, the more violations will be discovered.

Increased Activity at the Ports

The Commission's new enforcement initiative at ports may be contributing to a decrease in recalls. Starting in Fiscal Year 2008, the Commission launched its Import Surveillance Division, which placed staff at U.S. ports to work closely with U.S. Customs and Border Protection (CBP) to identify and examine imported shipments of consumer products. Also, the Commission has embarked on several steps to improve our coordination with the CBP and to combine resources. Since that time, the number of imported products barred from entering the United States has increased. This does not necessarily mean that the decrease in recalls is due to an increase

[6] Safety Shortcuts: Children's Product Recalls in 2003. Kids in Danger, February 2004. Pgs. 2, 11. *http://www.kidsindanger.org/publications/reports/2003 recallreport.pdf.*

in the quantity of harmful products stopped at the ports, but increased vigilance on our part can only have a positive impact. I therefore applaud Chairman Tenenbaum for the oversight and direction she has provided in the Commission's efforts to better secure our ports agaiust the importatiou of unsafe products. It is more effective and drastically more efficient for consumers, industry, and the government, for the CPSC to stop harmful products before they enter the couutry.

Question 3. Has the agency seen a decline in the number of deaths of children uuder the age of 15?

Answer. Regarding the recent data on toy-related deaths, it is too early to tell what the uumber of deaths related to toys will be for 2009 aud whether this uumber will be significantly different from previous years. As mentioned in the first answer, the Commission's 2009 data on deaths related to toys is only approximately 37 percent complete.

However, according to our staff's National Center for Health Statistics data, the number of consumer prodnct-related deaths for ages 0 to 15 dropped by over 17 percent, from 3,225 to 2,658, between 1985 and 2007. Adjusting for changes in population, the death rate for this age group has dropped from 6.3 to 4.4 deaths per 100,000.

Question 4. What advice can the CPSC offer to parents to help keep their kids safe from any potential product hazards this holiday season?

Answer. Based on my experience as a CPSC Commissioner and as a mother of six, I am keenly aware of the dangers children can face from consumer products. One of the saddest parts of this job is the overnight incident reports that we receive on injuries and deaths of children.

I would advise parents to be aware of the Commission's *www.recalls.gov* website or to sign up for recall updates through e-mail. It is also important to provide age-appropriate gifts to toddlers and young children, to supervise their play, and to remember that most incidents can happen in a split second.

Some of our most common incident data include drowning, which can happen not only in pools, but in bathtubs, hot tubs, toilets and even buckets of water. Drowning prevention is an important focus of the Commission, and I am proud to have participated in one of the Chairman's Pool Safely Campaign events in Washington, D.C. I hope that the Commission's education campaign on drowning prevention may extend to settings beyond just swimming pools.

There are a number of other common hazards reported to the Commission and of which I would advise parents to be aware, such as choking hazards for children, including coins and batteries. Additionally, the Chairman launched a "Safe Sleep Campaign" to help educate more parents on crib safety, which I strongly support. Soft bedding placed inside of a crib is a significant hazard, because infants' neck muscles are not strong enough to adjust and they can suffocate. I have supported the Chairman's efforts to focus not only the safety of the structure of cribs but also the other, common hazards related to infant sleep.

Finally, a database limited to first-hand accounts of verifiable incidents involving consumer products would provide an additional, valuable resource for parents. Unfortunately, as I explain in the answers that follow regarding the database, the rule passed by the Majority goes in the opposite direction and will instead make the public database mandated by the CPSIA of little use to consumers.

Question 5. Do you support the Commission's safe sleep campaign?

Answer. Yes. I support the Chairman's efforts to increase the Commission's focus on crib safety and to use our communications resources to educate the public about safe sleep for infants. In particular, I have been supportive of the Chairman's efforts to broaden the campaign to include not only education on the structure of cribs and dangers of drop-sides, hut also the more general, unforeseen hazards not related directly to the crib's structure and hardware, such as soft bedding. As we reach new audiences with information about our recalls and the dangers of drop-side cribs, it makes sense to raise awareness of ALL the common dangers related to infant sleep.

Question 6. If so, what role have you played in supporting the Chairman's initiative?

Answer. I have often urged the Commission to do more to educate the public on broad-based safety hazards and through social media. One of my first suggestions as a Commissioner was to broaden our messaging by using posters in other languages, such as Spanish, and working through non-traditional groups, like churches, to increase our outreach to minorities and harder-to-reach populations. The Chairman's staff has done an excellent job using social media (online videos, text messaging, twitter, etc.) and other creative ways to broadcast the Commission's many safety messages, including the Safe Sleep Campaign. I continue to support these efforts.

Question 7. When do you expect the Commission will issue a final rule on crib safety?

Answer. The Commission, with my support, passed a final rule on full-size and non-full-size cribs on December 15, 2010.

Question 8. Do you think it is important for safety advocacy groups or day care centers to be able to submit to the CPSC for inclusion in the database product safety complaints or incident reports?

Answer. *It is important for individuals with first-hand knowledge of incidents involving consumer products to be able to submit reports of harm to the new database.* Groups or individuals with no direct knowledge of the incident, did not see it happen or do not even know the person that was harmed, should not be permitted or encouraged to submit incident reports to the database. There are several reasons why first-hand knowledge is essential, but the primary reason is *accuracy*. A database full of inaccurate reports from individuals who have second or third-hand information is not remotely helpfnl to consumers using the database to determine which consumer product they should purchase.

Day care centers at which an incident of harm has occurred certainly should be permitted to report to the database. Day care centers and other child service providers also would have been permitted to submit reports under the alternative database rule that I introduced. Additionally, consumers of the product in question, health care professionals who treat the injured person, or emergency first responders at the scene should all be permitted to submit reports of harm to the database—and the statute requires all of these categories of submitters.

However, advocacy groups and other second and third person reporters are not listed in the law as allowable submitters to the database, nor should they be. If they are not themselves consumers of the product that caused the incident of harm, or otherwise a first-hand witness (per the list of submitters in the statute), advocacy groups have no business inputting to a public database information that is intended to be a resource for *consumers*. Not only is adding advocacy groups as submitters contrary to the statnte, but it invites dishonest, agenda-driven use of the database—diluting its usefulness for consumers. Advocacy groups, trial lawyers, other nongovernmental organizations and trade associations, all of which the Majority has added as allowable submitters, must serve their own agendas and lack an incentive to prioritize product accuracy in their reports of harm. By inviting such groups to input reports of harm (none of which have to be verified for accuracy), this Commission has all but guaranteed that the database will be a tool for policy agendas, lawsuits and trade complaints that will drown out information about product safety that is useful to parents. Why even have a taxpayer-funded database (at a price tag of $29 million, so far) that will be no more useful than an "Amazon.com" or any of the other hundreds of websites where anyone can submit comments on a product?

There are many advocacy groups and associations that serve a role in public policy, but may have no incentive to provide accurate information on a public database. For example, the National Fire Protection Association (NFPA) supports government-mandated sprinklers in new homes, a controversial policy. One cause of house fires is the nse of cigarette lighters, which are consumer products. Thus, the NFPA has a strong incentive to add all reports of house fires caused by lighters to the Commission's public database. The more incidents in our database, the better case they can make that new fire prevention technology—which their members sell—should be mandated in homes.

But what incentive does NFPA have to ensure that it correctly identifies the brand of lighter in an incident report: A lighter may appear to be the branded product of a particular manufacturer, but instead be a cheap counterfeit. The NFPA is interested solely in reporting house fire incidents; the particular cause is not relevant to its goal of promoting sprinklers. Meanwhile, the company identified in the report as the manufacturer of the cigarette lighter must defend countless inaccurate (or at least unverifiable) claims about its product. Such inaccurate and unverifiable information is of no value to a consumer seeking information on the safest type of lighter.

I explained in my *November 24* and *April 22, 2010* statements that the Majority's interpretation of the statute is flawed because it has greatly expanded the list of allowable submitters to the database. This expansion goes against the statutory purpose that the database be "useful" for consumers, and does not comport with Congress's discussion on the purpose of the law prior to its passage.[7] Indeed, the

[7] On the Senate floor, during consideration of the CPSIA on March 5, 2008, Senator Pryor stated: "We have tried to find something that is balanced, that provides information, but also

Continued

Majority has expanded the list of submitters to such an extent that *anyone* can submit reports of harm—thereby rendering meaningless the statutory language listing permitted submitters.

The problems caused by the overly expansive list of submitters could have been rednced if reports of harm had to be verified, or simply verifiable, before being published. But unfortunately, the Majority rejected the proposals contained in my alternative database rule that would have made these reports more verifiable.

One of my unadopted proposals wonld have required reporters of harm to include the victim's identity and contact information with a report (to be held confidential, as is current practice). Commission staff could then at least follow up with the victim in response to a mannfactnrer's claim of a material inaccuracy, in order to verify the report.

In my alternative rule, I also included such additional required fields as the approximate date of purchase of the product and whether the prodnct was purchased "new" or "used." This information would have allowed consumers using the database to gauge the age of the products and know whether the product in question was the one currently in stores or is similar to the model they own. These proposals were not adopted by the Majority.

Finally, while submitters to the database must check a "self-verification" box to assert accuracy, this will do little to discourage or prevent inaccurate reports of harm. The final database rule merely asks the submitter of a report of harm to check a box stating that the report they are submitting is accurate "to the best of their knowledge." The "best" knowledge of someone with no first-hand knowledge is of little value. An individual or group without first-hand knowledge will likely not have the full story of what happened—including the exact type of product, the recent history of the prodnct, or even the precise cause of the incident.

Question 9. Do you think it is important for consnmers to be able to scan for trends and patterns of potentially hazardous products in the marketplace by accessing this database so they can protect themselves and their families?

Answer. It is important for Commission staff to be able to scan for trends and patterns of hazards, as they do today through our internal databases and other sources of information. After all, Commission staff is tasked with enforcing existing Federal standards and determining the need for new standards. What is important for consumers is to have access to accurate information. Consumers already have a variety of resources available to them on the Internet with all types of information on products for sale. More importantly, scanning for hazards will not be possible with this new database given that the Majority's database rule ensures that the database will not be an accurate source of information.

There are a nnmber of ways in which the new database could be unhelpful or misleading for consumers. Consider this scenario: Company A sells five million high chairs and Company B sells 5,000 high chairs. Company A has six incident reports on the database and the other has one incident report (all of which are unverifiable). Thus, a consumer could falsely conclude that Company A's high chair is less safe, even though simply due to the number of units it sold, it is more likely that people own that high chair—and more likely that reports on that high chair would make it into our database. Or, it is also possible that some of the reports about Company A's high chair actually pertained to older models of the high chair that are no longer for sale, which means the information may be entirely irrelevant for people using the database to look for safety information about current products on the market.

As a consumer and a grandmother, I do virtually all of my research on baby products (*e.g.*, regarding safety, quality and price) at the point of sale—usually on the website from which I am ordering, such as an "Amazon.com." The hundreds of comments on these websites cover a broad array of useful information. But for most products, I would not slow down my research to look onto a government website for additional, equally unverifiable, information—particularly when I can see safety information right alongside all of the other information I am looking for (wear and tear, usefulness, and warranty information) at the point of sale or the retailer's website. All of these factors are useful to a purchaser.

Trial lawyers or other groups with self-serving motives will use the Commission's database to look for potential trends and patterns of hazards. Under the Majority's database rule, these same groups may also submit to the database false and unverifiable reports to fuel a lawsuit. It is no coincidence that these groups are strongly in favor of this pnblic database and of the Majority's interpretation of the statute, which expressly allows them to submit reports of harm.

---

has some filtering so we make sure erroneous information is not disseminated. But the goal of this provision is that the public has the right to know when products are dangerous."

Because the Majority's database rule all but guarantees that the database will be flooded with inaccurate reports of harm, it will be less useful for Commission staff in determining hazard patterns than are the current, internal databases we have today. Frankly, this is one of my greatest fears—that Commissiou staff will be overwhelmed hy inaccurate reports (or the reports that get picked up by the media) and uuable to use their expertise to search objectively for genuiue hazards. As the database is swamped with misleading or inaccurate reports, they will drown out the accurate ones.

Question 10. Did you advocate for limitations on the information that could be included iu the database? If so, why?

Answer. As discussed above, I sought to *limit the sources* of information to those likely to be reliable; and, I songht to *increase the scope* of informatiou that could be provided, in order to facilitate verification of the incident reports. The only area where I advocated *temporarily* withholding information received from an appropriate snbmitter concerned claims of confidential or inaccurate information.

In the latter regard, I supported a valid and more useful interpretation of the statutory 10-day time-frame for evaluating claims of material inaccuracy. Under my interpretation, the brief 10-day window presents a strong incentive for manufacturers to submit any claims of material inaccuracy quickly, and for the information to go up on the database as soon as possible—that is, following the 10th day as long as there has been no claim of inaccnracy. However, if a manufacturer submits by the 10th day an adequately snpported claim of inaccuracy, the Commission can and should withhold that incident until the claim is resolved. Under this interpretation, data is not *limited* in the database but better verified before it is posted. I refer you to my *November 24, 2010* statement for further details.

Notably, the Commission's Notice of Proposed Rulemaking on the database originally included an interpretation similar to mine. For example, § 1102.26 of the NPR states: "If a request for determination of materially inaccurate information is submitted prior to publication in the database, the Commission may withhold a report of harm from pnblication in the Database until it makes a determination."[8] 75 FR 29180. That language could not have been included in the NPR without a legal opinion supporting the permissibility of the policy choice. That the agency apparently believed at one time that this approach is legally permissible reflects, at a minimum, statutory ambiguity regarding the point.

Not surprisingly given the NPR, many if not most of the commenters assumed that incidents would not go into the Database pending the determination of a material inaccuracy claim. Although at least one commenter expressed the policy view that reports of harm should go up on the 10th day even when such claims are unresolved, no one—not even consnmer groups—argued that the statute legally prohibits the agency from withholding reports from publication for the duration of its investigation. To the contrary, several commenters proposed a more detailed protocol for addressing claims of material inaccuracy, based on their understanding that reports would be withheld from publication while under review for accuracy. And yet the Majority's final rule now forbids delaying publication in those circumstances, and fails to establish any specific protocol for handling requests for determinations.

Finally, it is helpful to remember that the Commission obtains information in addition to that which will be submitted to the public database, such as emergency room data, death certificates, etc. It is acceptable (and probably preferable) for the Commission to continue to absorb as much information on consumer products as it can—and this includes reports from advocacy groups, trial lawyers and trade associations. However, it is not necessary *nor is it statutorily required* that such information, particularly that which is neither accurate nor verifiable, also be posted on the public database. This is one area where my position on the database differs starkly from that of the Majority. I believe inaccurate information in a pnblic database (with the official backing of ".gov") is not *safety* information; on the contrary, it is simply misinformation—and a waste of taxpayer resources.

Question 11. Within the third-party testing regime, where is the Commission in its efforts to promnlgate rules outlining appropriate testing protocols?

Answer. On May 20, 2010, the Commission issued Notices of Proposed Rnlemaking on (1) Testing and Labeling Pertaining to Product Certification (75 FR

[8] The preamble of the NPR contains analogous language: "If a request for determination of materially inaccurate information is submitted prior to publication in the database, the Commission may withhold a report of harm from publication in the database until it makes a determination." 75 FR 99, at 29161. And this: "We propose that in cases where a claim of materially inaccurate or confidential information is under review, the Commission, in its discretion, may withhold a report of harm *in part or in full* until such a determination is made." 75 FR 99, at 29170 (Response to summary 26)(emphasis added).

28366), and (2) Conditions and Requirements for Testing Component Parts of Consumer Prodncts (75 FR 28208). These proposed rules—referred to by the CPSC as the "15-month rule" and the "component testing rule"—address, inter alia, the protocols that will goveru third-party testing of childreu's products, including random sampling methods and the availahility of component parts testing as a means to encourage compliance further up the supply chaiu aud to provide mauufacturers with more options. The Commission is just beginning to consider the final versions of these rules.

The delay in finalizing these rules is of concern, because the Commission's previous stays on lead content testing were implemented principally based on the recognition that manufacturers would be unable to comply with the third-party testing requirement until both the 15-month rule and the component testing rule had been in effect for a reasonable period of time. If the stay is lifted prematurely, many small manufacturers, in particular, will be unable to afford to comply independently with the third-party testing requirement, and will stop making certain products or go out of business entirely.

This link between finalizatiou of the 15-month and component testing rules and the lifting of the stay was recognized by Commissioners of both parties. As explained in the Commission's February 2009 Federal Register notice, the stay on third-party testing of children's products for lead content was first implemented in response to "confusion as to . . . whether testing to demonstrate compliance must be conducted on the final product rather than on its parts prior to assembly or manufacture . . . and what sort of certificate must be issued and by whom." 74 FR 6396 (February 9, 2009). The stay was thus intended to provide the Commission time to promulgate new rules addressing, inter alia, "production testing of children's products subject to third-party testing and certification . . . including random sampling protocols," so that "the right tests are run on the right products without unnecessary and expensive testing."

During the December 2009 public briefings to consider whether to lift the stay, CPSC staff reported that the apparel component manufacturing sector was reluctant to initiate component testing while the breadth of the requirement remains unsettled, and that smaller manufacturers were unable to obtain component parts testing because suppliers were reluctant to undertake the tests until the final rules for component testing and certification are in place. In the face of this evidence, Chairman Tenenbaum acknowledged that she "would never agree to lift the stay" until the 15-month and component parts rules are in place. She voted to extend the stay "in order to allow component testing adequate time to develop and to give our stakeholders adequate notice of new reqnirements." Commissioner Moore also recognized the need to "give the small mannfactnrers, who often buy their supplies in small amounts at retail outlets rather than through bulk purchases from wholesale distributors, sufficient time to find sources of lead compliant materials." During the December 16, 2009 public briefing on the stay, Commissioner Adler also conceded that the 15-month rule should be in effect before the stay is lifted. Although he retracted that view the following day in his written statement explaining his vote to extend the stay, Commissioner Adler predicated his changed position on his belief that "[n]ow that companies know they can rely on component suppliers for compliance with the law, they should be able to plan production and control costs in a reasonable manner."

Consistent with the views of all five Commissioners, the Commission "determined that testing of children's products for lead content by a recognized third-party testing laboratory and certification based upon that testing should begin on the products manufactured after February 10, 2011, to allow component testing to form the basis for certifications for lead content . . ." 74 FR 68588 (December 28, 2009).

A year has now passed, but in the absence of final 15-month and component testing rules, component testing still cannot form the basis for certifications for lead content. Rather, small mannfactnrers continue to report to the CPSC that component suppliers are refusing to test altogether or are refusing to supply certifications, and that certifications are unavailable from the retail outlets where many small manufactnrers obtain component parts. Under these circumstances, a continuation of the stay would be consistent with the stated views of all five Commissioners. Commissioners Northnp and Nord, and Chairman Tenenbaum all expressly linked the lifting of the stay to at least the finalization of the 15-month and component testing rules. Commissioner Moore supported exteuding the stay to give small manufacturers "sufficient time to find sources of lead compliant materials," and Commissioner Adler predicated his willingness to delink finalization of the 15-month rule from the stay on his expectation that small manufacturers would be able to "rely on component suppliers for compliance with the law." Given that component part suppliers remain unwilling or nnable to provide component part certifications in the

absence of final rules, there is no factual predicate for the Commission to support lifting the stay.

It is also important to emphasize that publication of the proposed rules has not provided the regulated community with any certainty regarding the content of the final rules. Indeed, the CPSC's record of rulemaking over the past year demonstrates that a final rule can change materially from its proposed version and can impose more onerous requirements. It is therefore not surprising that compouent parts suppliers remain unwilling to incur the expense of providing certifications under a proposed regime that may change substantially before it is finalized.

I therefore intend once again to urge the Commission to vote to coutinue the stay of enforcement on third-party testing and certification of lead content in children's products until one year after publication of final 15-month and component testing rules. Considering the lead time necessary for manufacturers between design and production, allowing one year after the two testing rules are fiualized is necessary for manufacturers to beuefit from the rule. Doiug so would comport with the expectation created among regulated industries through the Commissioners' and the Commission's public statements that the stay would not earlier be lifted.

Moreover, lifting the stay before the final 15-month and component testing rules are published would place manufacturers in the untenable position of trying to comply with the proposed rule, while anticipating a potentially much different final rule. This would provide manufacturers with iusufficient time within which to modify their compliance management processes once the final rule was issued, and would cause needless disruption to business planning, snpply chain management, test lab coutracting, and other aspects of product manufacturing, due to the rapidly changing requirements.

Finally, a reasonable time after pnhlication of the final rules is necessary in order to afford the regulated commuuity time to come into compliance. Otherwise, it may be too late for many small manufacturers to benefit from the component testing rule. In this regard, it is essential that the Commission retain in the final compouent parts rule the proposed provision, § 1109.5(g)(1), affording component parts certifications "currency" to allow them to be reasonably relied upon by downstream manufacturers without the need for duplicative testing.

Question 12. Has the Commission proposed a rule allowing for component part testiug?

Answer. As explained above, the Commission has proposed a rule on component testing (75 FR 28208). If this rule is finalized as it is written today, it will allow for compliance with the CPSIA by some manufacturers that otherwise may have had no chance to survive under the law's onerous, unnecessary testing and certification requirements. This is because component testing has the potential to allow considerable flexibility under the CPSIA's testing regime for both small and large manufacturers. But it will not offset all of the unintended costs nor eliminate all of the negative consequences of the CPSIA. It may not even be available soon enough to benefit some small manufacturers.

I have been a strong supporter of the policy, and therefore hope that absent a full repeal of the CPSIA's testing and certification requirements, the Commission promulgates a final component testing rule. Until the rule is finalized and has the force of law, however, it is highly unlikely that any suppliers of components like zippers, buttons, or even raw materials will make the investment to become component suppliers. In other words, it is incorrect to assume that a proposed rule (or our previous enforcement guidance allowing component testing) is sufficient to lay the groundwork for component testing to take hold.

Component testing can successfully increase efficiencies and safety up the supply chain, only if children's product manufacturers have *absolute certainty* that they can rely on the certificates received from component part certifiers. If a component part certifier (*e.g.*, a button manufacturer) third-party tests, certifies, and fulfills all continued testing requirements for its buttons, but the doll-maker that receives that certificated component is still held fully liable for the compliance of the component, the doll-maker will always have to re-test every component just to be sure. This creates layers of unnecessary, duplicative testing.

That is why in § 1109.5(g)(1) of the *proposed* component testing rule, the Commission allows component part certificates to have "currency" to be passed through the supply chain. Specifically, this provision allows component part certificates to be treated the same as final certifications issued in accordance with section 14(a) of the Consumer Product Safety Act. While finished product manufacturers relying on component parts certificates still could be liable for a recall, for example, if any component is found non-compliant, they would *not* be held liable for a civil penalty for a violative component if they relied, with due care, on a component part certificate.

The question of liability is central to the ability of component testing to work. Manufacturers already have a stroug incentive to work with reliable suppliers in order to prevent unnecessary reputational damage or a costly recall should any unsafe product make its way onto the market. However, if a manufacturer is also liable for a civil penalty associated with a *certified component part* found still to be non-compliant—they simply have no incentive to demand certified components at all. Today, they would still have to re-test any components they receive because § 1109.5(g)(1) of the proposed component testing rule has not been finalized. Moreover, give the Commission's recent history of changing the direction of its rules between the proposal stage and final stage, there is even more uncertainty surrounding component testing.

For all of these reasons, I strongly support finalizing all of our testing rules prior to lifting the stay of enforcement on lead content testing or issning any more Notices of Requirements to accredit lahs for future CPSIA standards.

Question 13. How does Europe handle cadmium content in children's products? Are the E.U.'s safety standards governing cadmium content in children's products more stringent than our own?

Answer. International toy safety standards, including the European standard EN 71–3, cover cadmium in toys. Like the ASTM F963 toy safety standard in the U.S., EN 71–3 limits migration of cadmium from paints and surface coatings. The European standard also includes limits for migration of cadmium from materials other than paints and surface coatings. Additionally, the E.U. restricts the amount of cadmium in parts of vehicles, and electronic and electrical products (with exemptions). It has also announced that it will consider recommendations to restrict the cadmium content of jewelry.

An important distinction between our requirements and Europe's is that Europe does not have the third-party testing and certification requirements that American manufacturers now have in the United States due to the CPSIA. Because the law's mandates (almost none of which are based on risk) make the cost to manufacture children's products much higher for manufacturers selling in the U.S., the law gives a strong competitive advantage to foreign firms over U.S.-based firms. Also, similar to Europe's lead content standards, enforcement of cadmium limits varies significantly country to country—with some countries enforcing the limits more than others. This uneven enforcement of the EU's mandatory limits also makes it quite difficult to compare our standards in the United States to those in the EU.

Imposition of the CPSIA's testing costs on products manufactured for sale in the U.S. also disadvantages American consumers. Major European toymakers have decided to stop selling in the U.S., to avoid the CPSIA's testing costs. But their products are still available to consumers in Europe and other countries.[9] The absence of these European children's products in the American market is not because their products are unsafe, but because these companies choose not to pay for the law's unnecessary costs to reengineer, third-party test and certify all of their products.

We tend to focus more on the costs of the CPSIA to businesses, rather than to consumers. But as a mother of six, I have an appreciation for the impact on the consumer. Parents have certain expectations when they shop for their children, including that: (1) products they purchase are safe; (2) at least some products are affordable; and (3) a vibrant market exists with new and different toys and children's products throughout the year. When I shopped for my children, I did not want the same dolls and games in the same colors that I purchased the year before. Unfortunately, the high cost of compliance with the CPSIA, without regard to safety, has meant reduced choices for consumers (including reduced product lines and "de-spec'ing" of products to reduce colors and accessories)—and the effects are likely to become worse as the Commission continues implementing the law's testing requirements.

Harmonization

Recently, the ASTM toy safety subcommittee estahlished a work group to consider aligning the U.S. and international standards for accessible soluble heavy metals in toys. If adopted by the ASTM toy suhcommittee, the new standards would then need to be approved by Commission vote, because the CPSIA made the ATSM F–963 standard mandatory, effective 2009.

That the Commission could be an impediment to the ATSM's efforts to harmonize its standards with international norms illustrates how mandatory, government imposed, standards can inhibit the harmonization of international product safety standards. ASTM F963 had been a voluntary standard before the CPSIA made it

[9] *http://www.zrecommends.com/detail/breaking-news-selecta-to-cease-us-distribution-due-to-cspia/.*

mandatory in early 2009, and it is quite complex. In theory, the greater efficiencies achieved through harmonization should benefit manufacturers and consumers. When I was in China last summer visiting factories and American companies, I saw that they perform three or fonr different "small parts" tests, all from different heights, simply because of the reqnirements of different countries. Harmonization would reduce that burden, but the CPSIA's requirement that toys sold in the United States satisfy ASTM F963 has tied the Commission's hands in its negotiations to "harmonize" with the Europeans. Overall, locking in the ATSM F–963 standard has severely limited the potential for improvements to safety and efficacy that would otherwise be achievable by learning from and adopting where appropriate the toy safety standards of other countries.

Unlike the mandatory toy standard, there is no Federal standard for jewelry at this time in the United States. American companies that serve on the ASTM jewelry standards Committee can therefore negotiate freely with our international counterparts. Harmonization for this product category is still possible.

Question 14. Are children more susceptible than adults to the adverse health effects of cadmium exposure?

Answer. Our staff has found little information that children are more susceptible than adults to the effects of cadmium, although few studies have focused specifically on health effects in children.

However, CPSC staff has foensed on children in its risk assessments, because children engage in behaviors more likely to expose them to any cadmium found in consumer products. In particular, children tend to have significant mouthing behaviors, and occasionally may swallow—accidentally or intentionally—small objects. Children also tend to place their fingers in their mouths after touching objects. All of these behaviors increase the chance of migratable material being introduced into the mouth, where it can be swallowed and absorbed by the body.

Question 15. Do you believe cadmium should be declared toxic by the Commission under the Federal Hazardous Substances Act? If not, why not?

Answer. The Commission staff's conclusion is that the data concerning the toxicity of cadmium is snfficient for cadmium to be considered toxic nnder the FHSA due to effects on multiple organ systems and toxic endpoints, including kidney dysfunction. However, the conclusion that a substance is toxic is only the first step in the Commission's assessment under the FHSA.

The FHSA is risk-based. To be considered a "hazardous substance" under the FHSA, a consumer product must satisfy a two-part definition. 15 U.S.C. § 1261(f)(1)(A). First, it must be toxic under the FHSA, or present one of the other hazards enumerated in the statnte. Second, it must have the potential to canse "snbstantial personal injury or substantial illness during or as a proximate result of any customary or reasonably foreseeable handling or use, including reasonably foreseeable ingestion by children." Therefore, exposure and risk must be considered in addition to toxicity, when assessing potential hazards under the FHSA.

It is important that the Commission's assessments be risk-based and that the Commission explain and clarify the genuine risks associated with metals like cadmium, particularly when talking to the media. Unfortunately, some articles on children's products have reported that cadmium is a carcinogen, inferring that it could be a carcinogen when present in children's products. However, the *route of exposure* of a substance is as important as the type of substance when determining its health effects. If cadmium is inhaled, as in a mine or similar workplace environment for adults, it is a known carcinogen. For this reason, OSHA has strict standards on cadmium inhalation in industrial workplace settings. However, touching, mouthing, or swallowing an object with a high level of cadmium content is an entirely unique route of exposure with unique health effects. As such, cadmium in the substrate of toys, in drinking glasses, or in jewelry is *not* a known carcinogen.

Question 16. Could you discuss the issue of the additional layer of protection for pools with only a single main drain?

Answer. The additional layer of protection for pools and spas provided by the Virginia Grahame Baker Pool and Spa Safety Act (VGBA) is an important issue, and I was proud to support the bipartisan interpretive rule that this Commission promulgated to implement the VGBA.

Under the VGBA, all public pools and spas must be equipped with anti-entrapment devices or systems. VGBA § 1404(c)(1)(A)(i). To further reduce the risk of entrapment, the VGBA also requires public pools and hot tubs with a single main drain to have either an "unblockable drain" or a "system[] designed to prevent entrapment." VBGA § 1404(c)(1)(A)(ii). Thus, one question before the Commission was how to define an "unblockable drain."

The Commission's interpretive rule determines that a drain fitted with an unblockable drain cover is an "unblockable drain" within the meaning of the VGBA. I supported the majority's interpretation for the following reasons: (1) I believe that a drain made unblockable via an unblockable drain cover reasonably satisfies the plain meaning of the statutory term "unblockable drain"; (2) I believe an unblockable drain system is equally if not more effective than other "systems designed to prevent entrapment" and; (3) I am convinced that the staff's recommendation to accept nnblockable drain covers will save the most lives and prevent the most injuries.

It makes sense to treat drains fitted with unblockable draiu covers as uublockable drains uuder the statute. Drains made uublockable through their design or through use of an unblockable drain cover function equally well to maintain the suction flow of water at a safe level when blocked by a person's body, so we should treat them the same. In either case (*e.g.*, an unblockable drain or a drain with an nnblockable drain cover), if the drain cover is removed, the drain ceases to be unblockable—so the issue of an unblockable drain cover dislodging is irrelevant. If unblockable drains do not require back-up systems, then neither should drains fitted with unblockable drain covers.

Even if I were not convinced that the term "unblockable drain" includes drains fitted with unblockable drain covers, § 1404(c)(1)(A)(ii)(VI) of the statute authorizes the Commission to determine whether other systems are "equally effective as, or better than, the systems described . . . at preventing or eliminating the risk of injury or death associated with pool drainage systems." Based on the Commission's public hearing and briefing by staff—and for the reasons discussed below—I would determine that unblockable drain covers are at least equally as effective in preventing or eliminating injury or death from drain entrapments as the other systems described in the statute.

Finally, it appears to me that *unblockable drain covers promise to save more lives and prevent more injuries than other anti-entrapment systems.* An unhlockable drain cover with the appropriate flow rating is the only solution that prevents all five types of entrapments identified by the staff (limb, hair, body, evisceration, and mechanical-related). The back-up systems mentioned in the Act only address some of the potential scenarios. For example, some of the back-up systems deal with suction body entrapment and some limb entrapments, but would not release hair, mechanical, or evisceration entrapments. Given the prevalence in the mortality data of hair entrapments, that failing poses a real danger. Moreover, preventing entrapments in the first place is the best solution to the tbreat of entrapment drowning. Back-up systems require an entrapment incident to begin to occnr before they respond, and they may not prevent the entrapment depending on what kind it is and what type of drain system is involved.

I would like to add a few words abont the apparent conflict of interest of certain advocacy gronps lobbying this issue. Just as health insurance companies lobby Congress and Federal agencies for healthcare solutions that benefit their bottom line, it is not surprising that people who develop and sell back-up systems created an association to promote the use of their product. In fact, the founder of the Pool Safety Council, a group that bas lobbied Congress and other organizations to require that all pools have back-up system technology, was the President of a back-up system manufacturer until only this past February.[10]

The Pool Safety Council promoted their petition by claiming the CPSC "reversed their guidance of the [VGBA], removing important entrapment prevention requirements." However, as noted previously, unblockable drain covers are the safest form of protection against entrapments. They are the only safeguard against all five types of entrapment and the only choice that prevents entrapment from occurring in tbe first place.

The Council's petition goes on to say, "The reversal brings into question the influence representatives from the pool industry have in CPSC's decision-making process." In fact, no group has pressured CPSC more than the Pool Safety Council. Speaking for myself, I have had no communication from any pool representative except for those that have a financial interest in requiring back-up systems. The Pool Safety Council lobbies for a tighter definition of unblockable drain because pools with unblockable drains are not required to buy their product. I consider it a triumph of safety over special interests that, despite all the pressure from those who have a financial interest in requiring back-up systems, the CPSC decided to adopt a new, safer technology.

Question 17. The Commission recently voted on rules to implement the public database mandated in the Consumer Product Safety Improvement Act of 2008. The Commission issued a notice of proposed rulemaking (NPRM) regarding the database on May 24, 2010, with a comment deadline of July 23, 2010. After the comment deadline but before the Commission voted on the database rule, you and Commissioner Nord released an "Alternative Database Rule Proposal" and requested comment from the public. Such action is highly unusual with respect to a rulemaking. Is there precedent for members of an independent regulatory agency to issue alternative rule proposals and seek public comment separate from an agency released NPRM?

Answer. Although I am unaware of another alternative rule being publicly vetted during a rulemaking process, it is certainly not uncommon for members of rulemaking bodies to express publicly their views on pending regulation. In fact, the Chair routinely expresses her view on pending regulation and is often quoted in the press.

Question 18. How does the release of the alternative proposal and the submission of comment impact the rulemaking proceeding? Did the release of the alternative proposal potentially create grounds for a legal challenge to the rule adopted by the Commission?

Answer. The release of the alternative proposal aud the solicitation of "feedback" from the public did not create grounds for a legal challenge to the rule adopted by the Commission.

With respect to the publication of an alternative rule, the APA does not require that agency decisionmakers shield from the public their deliberative processes, including the consideration of alternative language. Moreover, the public interest is arguably better served when an agency's decisionmaking is made more transparent by such action. The fact that the Majority reposted my alternative on the CPSC website following a thorough legal review confirms that its publication was deemed to be lawful.

The request for public feedback on the alternative rule also did not make the final rule adopted by the Commission vulnerable to legal challenge. So long as all comments considered by an agency in its rulemaking process are made public, the inspiration for a comment, whether it is a formal *Federal Register* notice, or otherwise, is not material. Indeed, we routinely receive comments outside of a notice period aud publish them on our website. For instauce, unrelated to my alternative rule posting, a comment in response to the database NPR was received after the official deadline for submitting comments, and was posted at *CPSC.gov*.

Ex parte commuuicatious that form the basis of agency action and are not made a part of the public record can jeopardize a rule's enforceability. But my request for feedback was public, and it was always my intent that, like any late filed comment, respouses would be posted on CPSC's website. As it turns out, my alternative rule was not considered by the majority commissioners, and the majority commissioners did not review the letters I received in response to the alternative rule. They thus did not form the basis for CPSC actiou and have not been made public.

Question 19. Do you anticipate releasing more alternative rule proposals in the future?

Answer. I promoted an alternative database rule, because I believe the rule supported by the majority—and ultimately promulgated—is irredeemably flawed. It is my hope and expectation that in the future, the Commission will be better able to work toward compromises that will obviate the need for the formulation of comprehensive alternative rules. I am unwilling, however, to commit to never publicizing during the rulemaking process policy views that differ from those of the majority. Doing so helps the regulated community better understand the Commission's policy choices.

Question 20. On numerous occasions, you have posted comments, artwork, and pictures on your blog questioning legislative proposals by Members of Congress and urging the public to reach out to Congress about the CPSIA. Your comments are often questionable in tone and tenor. Do you believe that a post with a picture of individuals drowning next to a ship called the "S.S. Waxman" befits the office of a Commissiouer of the Consumer Prodnct Safety Commission?

Answer. I believe that as a Commissioner and citizen, I have the right and duty to articulate my public policy views in whatever manner I deem most effective. And I am troubled by the tone of your question, which appears designed to silence criticism of competing policy views.

I published the "SS Waxman" graphic to illustrate the point explained in the accompanying text posted with it ou my blog. This was that Senator Waxman's proposed legislation to provide relief from the burdensome costs of complying with the

CPSIA was too narrowly drafted. As graphically illustrated, it was designed to provide relief only to the ATV industry, thrift stores, and very small manufacturers. The costs associated with obtaining a "functional purpose" exemption would have been prohibitively excessive for all but the largest mannfacturers. In addition, the exemption for low-volume manufacturers had the potential to provide relief to only a small slice of the manufacturing community.

These are legitimate criticisms of the proposed legislation that contributed to the public debate. My role as a Commissioner in no way limits my right to make such observations. Indeed, I would be negligent not to contribnte the perspective gained throngh my position to advance the cause of CPSIA reform.

More generally, I believe that my blog serves an important purpose. It provides a venue for the exchange of information and opinions relevant to the fulfillment of the CPSC's mission. Commissioners often receive letters from the regulated community expressing general concerns about the CPSIA. In addition to citing the obvious financial burden of compliance, manufacturers of children's products have reported that the third-party testing requirement is likely to result in reduced product variety. Most importantly, they explain that these consequences are not born of any improvement in safety. These companies are already making safe products; the CPSIA merely requires them to prove it before continuing to sell the same products or introducing product variation. But notwithstanding this input, we lack sufficient specific examples and hard data to allow us to fully understand or to quantify the problem. I therefore use my blog to solicit input from both the regulated community and consumers, in order to better understand the issues facing them, so that I can be a more effective and responsive public servant.

My blog also allows me to communicate my views to consumers and industry. When I was a Member of Congress, I was struck by the degree to which the CPSC and other Executive Branch agencies appeared to regulate without regard for its impact on the regulated community. I often heard from businesses who were frustrated that their voice was not being heard or considered in the regulatory process. My blog allows me to reassure consumers and the businesses subject to CPSC regulation that I understand the issues facing them and am working to find and promote the regulatory flexibility necessary to ensure prodnct safety without unnecessarily stifling economic growth and consumer choice.

Question 21. Given your comments regarding the CPSIA, are you able to implement the law in a fair and impartial manner, even with respect to a provision of the law with which you disagree?

Answer. Agreement with a law is not a prerequisite to the recognition of a statutory duty to carry it out. Indeed, if every executive agency board and commission member was required as a condition of office to agree with every policy choice reflected in all of the statutes they admiuister, few, if any, would be left to serve. I swore au oath to uphold the law aud that is what I have always doue and will always do. I will also continue to help the Commission identify flexibility in the law that can alleviate its devastating impact on American business, and to focus on the CPSC's core mission of assessing and reducing risks to consumer safety.

RESPONSE TO WRITTEN QUESTION SUBMITTED BY HON. KAY BAILEY HUTCHISON TO HON. ANNE M. NORTHUP

Question. As you know, Section 103(a) of the CPSIA requires the placement of tracking labels on all children's products and their packaging, to the extent practicable. In its July 2009 Statement of Policy regarding enforcement of this provision, CPSC staff indicated that products sold through bulk vending machines would not need to be individually marked, though the package or carton the products are shipped in would. The Statement of Policy further noted that "the Conference Report [accompanying the CPSIA] recognized that marking each individual product in such circumstances may not be practical. See H.R. Rep. No 787, 110th Cong., 2d Sess. 67 (2008)." *However, the Commission has not provided any explicit regulatory exclusion from Section 103(a) for bulk vended products. Will the CPSC pursue enforcement actions against bulk vendor suppliers, operators or retail establishments for the absence of tracking labels on bulk vended products? Further, can you please assure the Committee that the CPSC will maintain this position should any state attorney general or other entity seek to enforce Section 103(a) against bulk vended products?*

Answer. As you know, the Commission's July 2009 Statement of Policy on Tracking Labels states the following:

> "If a product is sold through a bulk vending machine, the item does not need to be individually marked but the package or carton in which such products are shipped to the retailer should be marked. The Conference Report recognized that marking each individual product in such circumstances may not be practical. See H.R. Rep. No. 787, 110th Cong., 2d Sess. 67 (2008)."

The Office of Compliance is following this policy as stated. Staff will consider enforcement action if the package or carton in which such products are shipped is not appropriately marked with the required information.

A State Attorney General technically may still pursue companies for violating any part of the CPSIA, in spite of enforcement guidance published by the Commission. Providing absolute certainty for bulk vendors or any other manufacturers in this regard would require an act of Congress amending the CPSIA.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. ROGER F. WICKER TO HON. ANNE M. NORTHUP

Question 1. What can you tell us about the impact of the CPSIA on small businesses? Even though the CPSIA did not require the Commission to perform cost-benefit analyses of the rules it promulgates, many of the concerns raised from small businesses and from Members of Congress since the law passed have been based on the need for this very information—specifically, the law's economic impact and unintended consequences. Does the Commission have quantitative data to determine what the impact has been, and what the impact will be in the future as more requirements under the law come into effect?

Answer. The CPSIA has been devastating for many small businesses, and it has increased costs for large businesses. *Product Safety Letter* reported the following on a November 2009 public meeting with Mattel:

> [a] lawyer for Mattel with the law firm Jones Day in Washington D.C., said his client is finding the CPSIA difficult to decipher. The law, he said, is unclear on what products the company needs to test, how often it needs to test them, and how many samples need to be tested. "It's a lot of work. I don't know how smaller companies do it," Biersteker told Commissioner Robert Adler.
>
> Despite Mattel's large team of in-house lawyers, he said, the company needed to hire outside lawyers to help understand the CPSIA. He said Mattel holds weekly conference calls on the issue, discussing how to comply with the act while remaining "cost competitive."[1]

Small businesses have by far borne the greatest impacts of the law. *Attached*, you will find some examples of businesses that have closed their doors, reduced product lines, or abandoned the children's product market due to the CPSIA. I submitted this information for the record during my opening statement.

This Commission has received a considerable amount of anecdotal evidence from companies and trade associations regarding the costs to test at independent labs, as well as the cost of certification, tracking labels, continued testing, record keeping, testing to product standards, and the potential reputational and litigation costs due to the upcoming public database. Our staff has compiled some sample testing costs for toys and bikes, as part of a Regulatory Flexibility Analysis for our Testing and Labeling Rule. For example, our staff estimated that the cost to test a toy with a moderate number of colors and interesting accessories could range between $3,712 and $7,348. The cost to test a bike under our proposed testing rule could be between $7,350 and $18,600.[2] As a result of much of this anecdotal data and the pressure on the Commission from industry, the Chairman elected to create a full-time Small Business Ombudsman position at the agency—something that I do not believe will address industry's concerns, but nonetheless represents an acknowledgement of the pressures and concerns we have felt from the small business commnnity.

However, you have asked whether we have *quantitative data* regarding the costs of this law, and unfortunately, we do not. So far, we have continued without fully studying or trying to reduce the impact of the regulations we are promulgating. With the anecdotal data we have from manufacturers and trade associations, and requests from Congress asking the Commission to try to mitigate the law's nnintended consequences, both Commissioner Nord and myself have requested that we allocate funding to do a *full cost-benefit analysis* of the rnles we are promnlgating.

---

[1] "Mattel Finds CPSIA to be a Challenge," *Product Safety Letter*, November 9, 2009.

[2] Regulatory Flexibility Analysis of the Commission's proposed Testing rule, pg. 103–108. (Proposed Rule; Testing and Labeling Pertaining to Product Certification—Draft Federal Register Notice—April 1, 2010 (Part 1) *http://www.cpsc.gov/library/foia/foia10/brief/prodcert1.pdf*.

Given the disruption in the marketplace and the current state of our economy, it has been disappointing that the majority of the Commissioners have not agreed to focus more heavily on providing Congress with quantitative data on the economic effects. Even Representative Jo Ann Emerson, currently the Chairman of the House Financial Services Appropriations Subcommittee, has requested that the Commission initiate a cost-benefit aualysis of the rules we promulgate and quantify the effects on small businesses. Unfortunately, this Commission has not produced any cost-benefit analyses to date.[3]

Furthermore, this anecdotal data does not reflect the full breadth of the law's requirements, because the most onerous requirements have yet to go into effect. The widest reaching mandate in the law—requiring third-party testing of all children's products for lead content—has been stayed since February of 2009. Currently, the Commission is considering whether to extend the stay further. We have not implemented the requirement to third-party test for lead, phthalates, or to the toy standard—which alone may require a considerable number of new tests and certifications for toymakers.[4]

The categories of children's products impacted by this law seem endless. But let me illustrate the cost versus henefit impact by considering two examples: furniture and toys.

A company making furniture for children's rooms would need to: (1) determine if its product is "primarily intended" for children 12 and under—which they may not know for sure, and for which the Commission has provided ambiguous guidance; (2) submit for testing to a third-party lab every part of every piece of furniture that may be used on a children's product, including nuts, bolts, and varnishes (one piece of furniture may have fourteen different coats of finish); (3) certify each component based on each of these tests; (4) add tracking labels to each piece of children's furniture with a lot number that can trace each component to its specific certification and test; (5) maintain records for all tests and certifications for all parts of each children's product; and (6) start this process all over again, if they decide to change a color or varnish, or some other part of the product—or if there is any other material change. One furniture company reported to us that they have already spent $13 million on tests, new systems and tracking processes, despite the fact that every single component they were using on children's furniture already complied with the current lead standard. So in this case, the cost was $13 million and the benefit (*i.e.*, improvement in safety) was zero.

All toys must be tested for lead and phthalates at third-party labs, and all are subject to the toy standard, ASTM F963, which the CPSIA made mandatory. As a result, a doll maker will be required to send to a third-party lab to be tested for lead, phthalates and any applicable rules under the toy standard, every component part, including each paint color nsed on the eyes, each button, the hair, and all of the accessories. Companies tell us that these requirements stifle innovation and product variety by erecting significant cost barriers to adding to dolls new accessories, new colors, or other variations. For example, a large toy manufacturer told us that his company has had to "de-spec" certain toys in order to afford the law's new costs, which means removing accessories, moveable pieces or other parts—or, in the manufacturer's words, "taking the fun out of toys."

Also, the scope of the toy standard is quite broad, as seen in the list of sections below. Not all toys must be tested to all parts of the toy standard, but any one toy may be subject to numerous requirements, and satisfying each requirement involves one or more separate tests:[5]

---

[3] The CPSIA does not direct that rulemakings (even "major rules") be promulgated under Section 9 of the CPSA, which requires a cost-benefit analysis and would normally preclude the Commission from promulgating rules whose benefits are not expected to bear a reasonable relationship to their costs. However, the Commission is not *prohibited* from doing such studies. So far, the only analysis that many rulemakings have received has been a perfunctory, small business regulatory flexibility analysis, as required by the Regulatory Flexibility Act. The reg-flex analysis to accompany the Testing rule (see footnote 2) provides hypothetical examples of testing costs, but no quantitative data.

[4] Jill Chuckas testified for the Handmade Toy Alliance on the second panel of the December 2, 2010 oversight hearing before the Senate Commerce Subcommittee on Consumer Protection regarding the high costs of testing to the toy standard (ASTM F963): *http://commerce.senate.gov/public/index.cfm?p=Hearings&ContentRecord_id=799a2c9d-f48a-4284-add2-1a9099961431&Statement_id=fb4d696e-c471-4bd1-be39-d9fb7f34f56a&ContentType_id=14f995b9-dfa5-407a-9d35-56cc7152a7ed&Group_id=b06c39af-e033-4cba-9221-de668ca1978a&MonthDisplay=12&YearDisplay=2010.*

Title	Section
Flammability Testing Procedure for Solids and Soft Toys	Annex A4
Flammability Testing Procedure for Fabrics	Annex A5
Rationale for 2007 Revisions	Annex A6
Rationale for 2008 Revisions	Annex A7

Your question focuses on cost-*benefit* analyses. The law imposes onerous requirements on small businesses that are hurting the economy, without any evidence of a safety benefit. The CPSIA's lead content standard, interim-ban of phthalates, and all third-party testing requirements are not based on risk. The CPSC has the authority to impose these types of requirements on any product or industry, if it determines that a risk exists and these costs are necessary to reduce or eliminate the risk.

This Commission never concluded that the components of children's products containing either 300 ppm lead content or the interim-banned phthalates pose a safety risk to children. And until directed to do so by Congress in the CPSIA, the Commission saw no reason to make ASTM F963 a federal standard, or to require all toy manufacturers to send their products to third-party labs to test to this standard. Regarding lead, 2007 data indicates that one percent of children tested nationally showed a dangerous blood lead level as established by the Centers for Disease Control (CDC). This number was down from nearly 8 percent in 1997,[6] and is likely attributable to the elimination of lead in gasoline, as well as lead paint education and abatement. The CDC and the Environmental Protection Agency have issued guidance for reducing children's exposure to lead, and its focus is not on children's products. It has never been suggested that this new law, with all of its costs, will lower the number of children reaching the "tipping point" of having an elevated blood lead level. For further information on the risks associated with lead, I refer you to my answer under the "Lead Standard" questions below.

Finally, there is a cost to consumers—not only in the loss of jobs in a struggling economy, but the loss of choice. Many manufacturers can afford the costly mandates of the law only by reducing their product lines, leaving the children's product market, or "de-specing" their toys—with no offsetting improvement in safety. As a mother of six children, I remember Christmas shopping for new and different products at affordable prices, and I expected a creative and vibrant market all year-round. Parents expect the products they buy to be safe. But they also expect them to be creative, and they are entitled to a marketplace that encourages new ideas and the next "must have" toy of the season. Instead, the costs of complying with the CPSIA will discourage newcomers to the market and choice will be reduced, even as prices increase. Some international toy makers have even decided to leave the American market due to the costs imposed by the CPSIA, although they are still offering their products to European consumers.[7]

Given our economic situation and the mandate from the American people to shrink the size of government and reduce the numbers of unnecessary regulations, I believe some of the CPSIA's requirements could easily be scaled back. Job growth in the United States comes through the growth of small businesses—and the CPSIA's regulations directly hamper that growth.

Question 2. Does the Commission have any plans to assess the negative impacts of the law, and to take necessary actions to alleviate these burdens before they eliminate any more jobs?

Answer. To my knowledge, there are no plans to assess fully the impact of the CPSIA or even the regulations we are scheduled to promulgate.

Regarding action by the Commission to alleviate the law's unnecessary burdens, I no longer believe that this is likely. Before my Senate confirmation hearing, I was asked by both Democrat and Republican Senators to "find flexibility" in the law wherever possible, because the law had resulted in many unintended or unforeseen consequences. Once confirmed as a Commissioner, I took this request seriously.

However, the flexibility that I have found in the following rules was rejected by a majority of Commissioners:

a. *Absorption exclusion*—I argued that the absorption *exclusion* under Section 101 was actually intended to exclude certain products from the lead limits (rather than be meaningless), and therefore that the term "any lead" in that section may be interpreted to mean a *de minimis*, harmless amount of lead in

[6] *http://www.cdc.gov/nceh/lead/data/national.htm.*

[7] One American importer of toys lists on its website the European brands that it no longer offers for sale in the United States due to the CPSIA: *http://www.eurotoyshop.com/getEndangeredToys.asp.*

a children's product. If the Commission had accepted my interpretation, lead in the substrate of ATVs, bicycles, and brass axles on toys would be legal—since lead in the substrate of these products is uot harmful (See auswers under "Lead Standard" below). Because the Commission rejected this iuterpretatiou, it voted to reject the petitiou of a mauufacturer of toy cars, eveu though the car's brass fittiug coutaiued less absorbable lead thau the Food and Drug Administratiou deems to be acceptable in a piece of candy.[8]

b. *Civil Penalties Factors*—In the Commissiou's interpretive rule on Civil Penalties Factors, I proposed a numher of changes to provide more certainty for the regulated community and to ensure that, while the overall civil peualty ceiling was raised, "technical" violations, such as incorrect paperwork, would not be treated the same way as more serious violatious, such as failures to meet safety standards. This is one area of the statute that was not too prescriptive, and a middle-ground could have been reached.[9] Unfortunately, a majority of the commissioners did not want to provide that leeway.

c. *Definition of Children's Product*—The CPSIA applies to all "children's products", statutorily defined as products "primarily intended for a child 12 years of age or younger." The comments that the Commission received following the proposed rule made clear that the parameters we had tried to set in the proposed definition were not helpful to most manufacturers that produce children's products intended for the 10–12 or pre-teen age gronps, or that straddle the age limit of the statute. The entire reason for defining the term was to provide guidance to these types of manufactures, who need certainty to know how to determine if their products fall under the purview of the CPSIA. After receiving these comments, the Commission had a chance to put a much narrower "fence" around the scope of covered products—or to at least define clearer boundaries. Unfortunately, the Majority chose to leave the definition vague whenever possible, which helps neither the CPSC staff,[10] nor the regulated community.[11]

d. "*Children's product safety rules*"—I offered a valid, alternative interpretation of the statute with regard to the requirement to impose third-party testing on all "children's product safety rules." A clear distinction can be made between "children's product safety rules" and more general "consumer product safety rules" promulgated well before the passage of the CPSIA. Unfortunately, because the Majority chose to view all consumer product safety rules of the Commission as potential "children's product safety rules," it imposed an unnecessary, additional layer of testing (at third-party labs) on manufacturers of carpets and rugs, vinyl, clothing textiles and mattresses—all of which are subject to consumer product safety rules. The Commission did not have to take this step—and there is no risk associated with these products that necessitates new third-party testing requirements.[12]

e. *Database*—As described below in the questions on the database, I proposed an alternative database rule that would have responded to a number of manufactnrer concerns and made the database a more accurate source of information for consumers. Unfortunately, the Commission's Majority passed a rule that went well beyond the statute's requirements, allowing "anyone" to submit reports of harm—even advocacy groups, attorneys and random bystanders that may not have firsthand knowledge of the incident. In total, the Commission Majority's database rule ensures that the database will be filled with inaccurate reports of harm that will be useful only to advocacy groups and trial attorneys, and will be time consuming and costly to manufacturers—particularly small businesses. Due to the inaccuracy of reports on the database, it will be a waste of taxpayer resources and will not be nseful to the consumers it was intended to help.

Finally, regarding the upcoming rule on Testing and Labeling Pertaining to Prodnct Certification ("15 month rule"), it is important to keep in mind that the statute does not permit the agency to exempt any manufacturer from the law's testing requirements. *Exemption from the testing requirement is the main change sought by small manufacturers.* Because we cannot exempt companies from the initial third-party test that every manufacturer must do to every component of their product—

even if the product poses no risk—I hope that the Commission will at least alleviate the burden through the "continued testing" requirements of the statute and the testiug protocols, where we do have some flexibility. However, removiug the costly requirements of third-party testing and certification will require an act of Congress amending the CPSIA.

Question 3. Chairman Tenenbaum mentioued the new Small Business Ombudsman. Do you believe that this Ombudsman will alleviate the expressed concerns of small businesses?

Answer. Although I appreciate the underlying objective of increasing Commission outreach to stakeholders such as small businesses, I do not believe that creating a brand new office for this purpose will address such stakeholders' ongoing frustratious with Commission actions, add value to our core mission of product safety, or represent a wise use of taxpayer dollars.

In particular, I disagree with the implication that the new outreach to *small businesses* will help those who are struggling with the CPSIA. Small businesses are not clamoring simply for more information from the Commission about how to comply with this law—they are asking for relief from this law because it is killing them. Also, as the witnesses in the Second Panel of the December 2 heariug indicated, while the Commission has been open to listening to their concerns, this openness has not translated into more helpful rulemaking.

The solutiou for small businesses is uot *more* goverument; it is repealing the portions of the CPSIA that impose tremendous costs without increasing safety. Furthermore, no matter how successful this new office may be, small businesses will still have to hire their own lawyers to fully grasp their particular obligations under the complex, far-reaching new regulations being promulgated by the Commission. In that respect, creating this office is like offering a Band-Aid™ for a problem that requires major surgery.

If we really wanted to help small businesses, this Commission would do everything in its power to mitigate the unintended consequences of the CPSIA through its rulemaking—something I have continued to argue for with limited success. It would add clarity and factor risk into our policies as much as the statute allows. Even better, we would unanimously approach Congress and ask that tbe law he reformed or repealed in a meaningful way so that *only risky products* are impacted—since the CPSIA has clearly taken us away from our core mission of product safety. Anything short of these steps will not help the small business community or a floundering economy.

Finally, I am concerned that creating a new office to govern the "education and outreach" responsihilities to industry stakeholders may complicate or even overtake the outreach we already perform under other offices such as our Office of Compliance. Right now, if a small company needs to know if its product falls under the purview of a particular regulation, it can call the Office of Compliance for advice. It is a key function of that office to assess products every day in the course of its enforcement responsibilities. By creating a new office in charge of "outreach" duties, we create unnecessary complications and risks in our communications with the public, including: (1) having two offices that could answer the same question differently; and/or (2) moving the agency away from its pure enforcement responsibilities and instead providing something akin to product pre-approval services. The latter course could potentially turn a relatively small CPSC into a behemoth more like the Food and Drug Administration. It is depressing to think it is even remotely possible we could have a government office dedicated to "pre-approving" all consumer products before they go to market.

Question 4. The Commission's stay on third-party testing for lead content is scheduled to lift in February. Is the Commission prepared to move forward with lifting this stay of enforcement? Do you believe that businesses have been given the information necessary to comply with this requirement? Have they been given enough time to incorporate necessary changes to comply with the requirement by the February deadline?

Answer. On May 20, 2010, the Commission issued Notices of Proposed Rulemaking on (1) Testing and Labeling Pertaining to Product Certification (75 FR 28366), and (2) Conditions and Requirements for Testing Component Parts of Consumer Products (75 FR 28208). These proposed rules—referred to by the CPSC as the "15-month rule" and the "component testing rule"—address, inter alia, the protocols that will govern third-party testing of children's products, including random sampling methods and the availability of component parts testing as a means to encourage compliance further up the supply chain and to provide manufacturers with more options to come into compliance. The Commission is just beginning consideratiou of the final versions of these rules.

The delay in finalizing these rules is of concern, because the Commission's previous stays on lead content testing were implemented principally based on the recognition that manufacturers would be unable to comply with the third-party testing requirement until both the 15-month rule and the component testing rule had been in effect for a reasonable period of time. If the stay is lifted prematurely, many small manufacturers, in particular, will be unable to afford to comply independently with the third-party testing requirement, and will stop making certaiu products or go out of business entirely.

This link between finalization of the 15-month and component testing rules and the lifting of the stay was recognized by Commissioners of both parties. As explained in the Commission's February 2009 Federal Register notice, the stay on third-party testing of children's products for lead content was first implemented in response to "confusion as to . . . whether testing to demonstrate compliance must be conducted on the final product rather than on its parts prior to assembly or manufacture . . . and what sort of certificate must be issued and by whom." 74 FR 6396 (February 9, 2009). The stay was thus intended to provide the Commission time to promulgate new rules addressing, inter alia, "production testing of children's products subject to third-party testing and certification . . . including random sampling protocols," so that "the right tests are run on the right products without unnecessary and expensive testing."

During the December 2009 public briefings to consider whether to lift the stay, CPSC career staff reported that the apparel component mauufacturing sector was reluctaut to initiate component testing while the breadth of the requirement remains unsettled, and that smaller manufacturers were unable to obtain component parts testing because suppliers were reluctant to undertake the tests until the final rules for component testing and certification are in place. In the face of this evidence, Chairman Tenenbaum acknowledged that she "would never agree to lift the stay" until the 15-month and component parts rules are in place. She voted to extend the stay "in order to allow component testing adequate time to develop and to give our stakeholders adequate notice of new requirements." Commissioner Moore also recognized the need to "give the small manufacturers, who often buy their supplies in small amounts at retail outlets rather than through bulk purchases from wholesale distributors, sufficient time to find sources of lead compliant materials." During the December 16, 2009 public briefing on the stay, Commissioner Adler also conceded that the 15-month rule should be in effect before the stay is lifted. Although he retracted that view the following day in his written statement explaining his vote to extend the stay, Commissioner Adler predicated his changed position on his belief that "[n]ow that companies know they can rely on component suppliers for compliance with the law, they should be able to plan production and control costs in a reasonable manner."

Consistent with the views of all five Commissioners, the Commission "determined that testing of children's products for lead content by a recognized third-party testing laboratory and certification based upon that testing should begin on the products manufactured after February 10, 2011 to allow component testing to form the basis for certifications for lead content . . ." 74 FR 68588 (December 28, 2009).

A year has now passed, but in the absence of final 15-month aud component testing rules, component testing still cannot form the basis for certifications for lead content. Rather, small manufacturers continue to report to the CPSC that component suppliers are refusing to test altogether or are refusing to supply certifications, and that certifications are unavailable from the retail outlets where mauy small manufacturers obtain component parts. Under these circumstances, a continuation of the stay would be consistent with the stated views of all five Commissioners. Commissioners Northup and Nord, and Chairman Tenenbaum all expressly linked the lifting of the stay to at least the finalization of the 15-month and component testing rules. Commissioner Moore supported extending the stay to give small manufacturers "sufficient time to find sources of lead compliant materials", and Commissioner Adler predicated his willingness to delink finalization of the 15-month rule from the stay on his expectation that small manufacturers would be able to "rely on component suppliers for compliance with the law." Given that component part suppliers remain unwilling or unable to provide component part certifications in the absence of final rules, there is no factual predicate for any of the Commissioners to support lifting the stay.

It is also important to emphasize that publication of the proposed rules has not provided the regulated commnnity with the any certainty regarding the content of the final rules. Indeed, the CPSC's record of rulemaking over the past year demonstrates that a final rule can change materially from its proposed version and can impose more onerous requirements. It is therefore not surprising that component

parts suppliers remain unwilling to incur the expense of providing certifications under a proposed regime that may change substantially before it is finalized.

I therefore iuteud once again to urge the Commission to vote to coutinue the stay of euforcement ou third-party testiug and certificatiou of lead couteut iu childreu's products until one year after publication of final 15-month and component testing rules. Considering the lead time necessary for manufacturers between desigu and production, allowing one year after the two testing rules are finalized is necessary for manufacturers to benefit from the rule. Doiug so would comport with the expectation created among regulated industries through the Commissioners' and the Commission's public statements that the stay would not earlier be lifted.

Moreover, lifting the stay before the fiual 15-month and component testing rules are published would place manufacturers in the untenable position of trying to comply with the proposed rule, while anticipating a potentially much different final rule. This would provide manufacturers with insufficient time within which to modify their compliance management processes once the final rule was issued, and would cause needless disruption to business planning, supply chain management, test lab contracting, and other aspects of product manufacturing, due to the rapidly changing requirements.

Finally, a reasonable time after publication of the final rules is necessary in order to afford the regulated community time to come into compliance. Otherwise, it may be too late for many small manufacturers to benefit from the component testing rule. In this regard, it is essential that the Commission retain in the final component parts rule the proposed provision, § 1109.5(g)(1), affording component parts certifications "currency" to allow them to be reasonably relied upon by downstream manufacturers without the need for duplicative testing.

Question 4a. Do you believe that the health of children has been at greater risk because of this stay of the third-party testing requirements?

Answer. No. Neither the lead standard(s) of the CPSIA nor the third-party testing requirements of the law are based on risk, so the absence of either of these requirements also does not create or denote a risk. I refer you to my answer under the "Lead Standard" questions for more information on the risks associated with lead.

Question 5. Is the Commission going to consider extending the stay in order to ensure that the affected bnsinesses are adequately prepared and that there are enough resources to prevent a negative impact on the businesses affected? If so, when do you plan on doing so?

Answer. Because the Commission has yet to finalize the rules we intended to publish before passage of the original stay in February 2009, which provide the "instructions" regarding what manufacturers need to test, how often, and other details, I would vote to extend this stay to a future date, pending the finalization of these rules. However, the decision rests entirely with the Majority, since it would take three votes for the date of lifting of the stay to be changed and for such a change to be conditioned on the completion of the Commission's testing rules.

Question 6. The CPSIA draws a clear distinction between general product safety rules and children's product safety rules. Yet the Commission has chosen to apply the requirement of third-party testing to all children's products under the general product flammability rules. Can you tell us why this decision was made?

Answer. The Commission, by a 3–2 vote along party lines, decided to ignore the distinction between children's product safety rules and consumer product safety rules, and to require third-party testing of children's products to all the rules. Thus, general "consumer product safety rules," such as our flammability regulations for carpets and rugs, are now also "children's product safety rules" under the CPSIA. Manufactnrers of carpets and rugs (as well as vinyl, wearing apparel and mattresses) already must adhere to a strict testing protocol for their products. This decision means that whenever they create a *children's version* of a product, they will have to do additional *third-party tests* to certify the agency's flammability standards. I opposed this decision, because these new third-party testing requirements were never part of the original standards promulgated by the Commission, and will not address a known risk. In fact, this was another area of the statute that allowed the Commission flexibility to prevent unnecessary new testing requirements and costs in a struggling economy. The Commission easily could have distinguished between "children's product safety rules" and more general consumer product rules of the Commission, and thereby avoided additional third-party testing requirements, where they are neither required by the statute nor risk-based.

Of all of the votes we have taken at the Commission, I had hoped that this would be an easy one. After all, it is unlikely that Members of Congress were anticipating adding third-party testing requirements to the 2007 mattress standard, the 1970 standard for carpets and rugs, and others when the CPSIA was passed. Unfortu-

nately, I believe it will now take an act of Congress to reverse these requirements and to prevent future "consumer product safety rules" from being caught up in the CPSIA's third-party testing regime.

I would also note that due to the Commission's vague "children's product" definition, it is likely to be difficult for manufacturers to distinguish between a "children's rug" or "children's carpet" and a general-use carpet or rug. This difficult distinction also illustrates the absurdity of requiring carpets and rugs with children's decorations to be sent to a third-party, CPSC-accredited lab for testing (beyond the normal testing requirements of the standard), when the carpet and rugs in the hallway or in the living room of a home, where children also play, are no less safe without these added third-party testing requirements.

Question 7. The flammability standards have been in place with testing protocols for adult and children's products for some time. Yet the Commission has chosen to apply this additional third-party testing requirement to children's products under those rules. Is there any evidence that the products affected by this ruling, such as carpets or vinyl plastic, were unsafe under the prior testing regime and needed to be subjected to third party tests to protect children?

Answer. No. And the Commission did not even consider whether these products presented a risk when it decided to require additional third-party testing to the flammability standards.

Question 7a. Is there any evidence that children's versions of rugs or other affected products are in more danger than adult versions of those products to necessitate this additional testing standard?

Answer. No. The original flammability standard did not contemplate a difference between adult and child rugs, and the Commission does not even collect flammability data distinguishing between adult and child carpets and rugs.

Question 7b. Isn't an adult version of an affected product more likely to be subjected to a cigarette or some other igniting source?

Answer. The Commission does not collect data on this question. However, I believe parents who smoke are more likely to do so in common areas of the house than in their child's room. I would also presume that candles are more likely to be found in common rooms or adult rooms than in a child's bedroom or playroom. Moreover, the kitchen is traditionally the room with the greatest risk of fire, and is an unlikely location for a children's rug or other product. So it hardly makes sense to require more rigorous and costly testing for a child's room.

As I said in my opening statement with regard to lead, children do not live cooped up inside of their rooms surrounded only by "children's products." Children live throughout the house, run around outside, and are exposed to lead in their everyday environment. In fact, they are surrounded by it: in the car (adult seat belts, window cranks) and in their homes (pots, pans, furniture knobs, door handles, appliances, lamps). These products do not threaten a child's health because the lead in them is not absorbable. Hence, it makes little sense that the CPSIA bans materials with higher than 300 ppm lead content in such products as *children's* furniture, *children's* rugs, *children's* lamps, etc.—while children are likely to spend more time outside their room handling the TV remote (an adult product), playing on their parents' furniture, or playing with just about anything else. The same can be said for the flammability of "adult" vs. "children's" carpets and rugs. The fact is, these additional testing requirements (or lead content requirements) have nothing to do with improving safety.

Question 8. At the end of November, the Commission passed the final implementing rule for the public database required under the CPSIA. While the law specified who can submit reports of harm, the Commission's rule expands this list by defining consumers and public safety entities as essentially anyone who wants to submit a report—even if the submitter does not know who was harmed, the particular product involved, and did not see the incident occur. Therefore, as opposed to the list created by the statute, submitters are no longer limited to people who could have first-hand knowledge of the incident. What are your concerns with this expanded list of submitters?

Answer. The statute provides a list of submitters to the database, all of which are groups likely to have *first-hand knowledge* of the incident. Day care centers at which an incident of harm has occurred, for example, should be permitted to report to the database. Additionally, consumers of the product in question, health care professionals who treat the injured person, or emergency first responders at the scene should all be permitted to submit reports of harm to the database—and the statute requires all of these categories of submitters.

However, as I explained in my *November 24, 2010* and *April 22, 2010* statements, the Majority's interpretation of the statute is flawed because it has greatly ex-

panded the list of allowable submitters to the database. This expansion goes against the statutory purpose that the database be "useful" for consumers, and does not comport with Congress's discussion on the purpose of the law prior to its passage.[13] Indeed, the Majority has expanded the list of submitters to such an extent that *anyone* can submit reports of harm—thereby rendering meaningless the statutory language listing permitted submitters.

It is important for individuals with first-hand knowledge of incidents of harm involving consumer products to be able to submit reports to the new database. However, groups or individuals with no direct knowledge of the incident, did not see it happen or do not even know the person that was harmed, should not be permitted or encouraged to submit incident reports to the database. There are several reasons why first-hand knowledge is essential, but the primary reason is *accuracy*. A database full of inaccurate reports from individuals who have second or third-hand information is not remotely helpful to consumers using the database to determine which consumer product they should purchase.

Advocacy groups, attorneys and other second and third person reporters added by the Majority's database rule are not listed in the law as allowable submitters to the database, nor should they be. If they are not themselves consumers of the product that caused the incident of harm, or otherwise a first-hand witness (per the list of submitters in the statute), advocacy groups have no business inputting to a public database information that is intended to be a resource for *consumers*. Not only is adding advocacy groups as submitters contrary to the statute, but it invites dishonest, agenda-driven use of the database—diluting its usefulness for consumers. Advocacy groups, trial lawyers, other nongoverumental organizations and trade associations, all of which the Majority has added as allowable submitters, must serve their own agendas and lack an incentive to prioritize accuracy in their reports of harm. By iuvitiug such groups to input reports of harm (none of which have to be verified for accuracy), this Commission has all but guaranteed that the database will be a tool for policy agendas, lawsuits and trade complaints rather than a place where parents can search for useful information about product safety. Why even have a taxpayer-funded database (at a price tag of $29 million, so far) that will be no more useful than an "Amazon.com" or any of the other hundreds of websites where auyone cau submit comments ou a product?

There are many advocacy groups and associations that serve a role in public policy, but may not have the incentive or ability to provide specific and accurate product identification information to the Commission's database. For example, the National Fire Protection Association (NFPA) supports government-mandated sprinklers in new homes, a controversial policy. One cause of house fires is the use of cigarette lighters, which are consumer products. Thus, the NFPA has a strong iucentive to add all reports of house fires caused by lighters to the Commission's public database. The more incidents in our database, the better case they can make that new fire prevention technology—which their members sell—should be maudated in homes.

But what incentive does NFPA have to ensure that it correctly identifies the brand of lighter in au incideut report: A lighter may appear to be the branded product of a particular manufacturer, but instead be a cheap counterfeit. The NFPA is interested solely in reporting house fire incidents; the particular cause is not relevant to its goal of promoting spriuklers. Meanwhile, the company identified in the report as the manufacturer of the cigarette lighter must defend countless inaccurate (or at least unverifiable) claims about its product. Sucb inaccurate and unverifiable information is of no value to a consumer seeking information on the safest type of lighter.

The problems caused by the overly expansive list of submitters in the Majority's database rule could have been reduced if reports of harm had to be verified, or simply verifiable, before being published. Unfortunately, the Majority also rejected the proposals contained in my alternative database rule that would have made these reports more verifiable.

One of my unadopted proposals would have required reporters of harm to include the victim's identity and contact information with a report (to be held confidential, as is current practice). Commission staff could then at least follow up with the victim in response to a manufacturer's claim of a material inaccuracy, in order to verify the report.

---

[13] On the Senate floor, during consideration of the CPSIA on March 5, 2008, Senator Pryor stated: "We have tried to find something that is balanced, that provides information, but also has some filtering so we make sure erroneous information is not disseminated. But the goal of this provision is that the public has the right to know when products are dangerous."

In my alternative rule, I also included such additional required fields as the approximate date of pnrchase of the prodnct and whether the prodnct was purchased "new" or "used." This information would have allowed consumers using the database to gange the age of the prodncts and know whether the prodnct in qnestion was the one currently in stores or is similar to the model they own. These proposals were not adopted by the Majority.

Finally, while submitters to the database mnst check a "self-verification" box to assert accuracy, this will do little to discourage or prevent inaccurate reports of harm. The final database rnle merely asks the submitter of a report of harm to check a box stating that the report they are submitting is accurate "to the best of their knowledge." The "best" knowledge of someone with no first-hand knowledge is of little value. An individual or group without first-hand knowledge will likely not have the full story of what happened—including the exact type of product, the recent history of the prodnct, or even the precise cause of the incident.

Question 9. The intention of the database is to provide nsefnl information to consumers. A substitute amendment included provisions to improve the accuracy of the data submitted by requiring the inclusion of additional information. These snggestions were rejected by a majority vote of the Commissioners. How wonld the substitute have improved the database for consumers?

Answer. In addition to limiting submitters to only those ennmerated in the statute, and adding required fields to improve the reliability of reports, my alternative proposal also acknowledged the Commission's discretion to withhold reports of harm from publication where a valid claim of *material inaccuracy* is pending.

In tbe latter regard, I supported a valid and more useful interpretation of the statutory 10-day time frame for evaluating claims of material inaccuracy. Under my interpretation, the brief 10-day window presents a strong incentive for manufacturers to submit any claims of material inaccuracy quickly, and for the information to go up on the database as soon as possible—that is, following the 10th day as long as there has been no claim of inaccuracy. However, if a manufacturer submits by the 10th day an adequately supported claim of inaccuracy, the Commission can and should withhold that incident until the claim is resolved. Uuder this interpretation, data is not *limited* in the database but better verified before it is posted. I refer you to my *November 24, 2010* statement for further details.

Notably, the Commission's Notice of Proposed Rulemaking on the database originally included an interpretation similar to mine. For example, § 1102.26 of the NPR states: "If a request for determination of materially inaccurate information is submitted prior to publicatiou in the database, the Commission may withhold a report of harm from publication in the Database until it makes a determination."[14] 75 FR 29180. That language could not have been included in the NPR without a legal opinion supporting the permissibility of the policy choice. That the agency apparently believed at one time that this approach is legally permissible reflects, at a minimum, statutory ambiguity regarding the point.

Not surprisingly given the NPR, mauy if not most of the commenters assumed that incidents would not go into the Database pending the determination of a material inaccuracy claim. Although at least one commenter expressed the policy view that reports of harm should go up on the 10th day even when such claims are unresolved, no one—not even consumer groups—argued that the statute legally prohibits the agency from withholding reports from publication for the duration of its investigation. To the contrary, several commenters proposed a more detailed protocol for addressing claims of material inaccuracy, based on their understanding that reports would be withheld from publication while under review for accuracy. And yet the Majority's final rule now forbids delaying publication in those circumstances, and fails to establish any specific protocol for handling requests for determinations.

Finally, it is helpful to remember that the Commission obtains information in addition to that which will be submitted to the public database, such as emergency room data, death certificates, etc. It is acceptable (and probably preferable) for the Commission to continue to absorb as much information on consumer products as it can—and this includes reports from advocacy groups, trial lawyers and trade associations. However, it is not necessary *nor is it statutorily required* that such information, particularly that which is neither accurate nor verifiable, also be posted on

[14] The preamble of the NPR contains analogous language: "If a request for determination of materially inaccurate information is submitted prior to publication in the database, the Commission may withhold a report of harm from publication in the database until it makes a determination." 75 FR 99, at 29161. Aud this: "We propose that in cases where a claim of materially inaccurate or confidential information is under review, the Commission, in its discretion, may withhold a report of harm *in part or in full* until such a determination is made." 75 FR 99, at 29170 (Response to summary 26)(emphasis added).

the public database. This is one area where my position on the database differs starkly from that of the Majority. I believe inaccurate information in a public database (with the official backing of ".gov") is not *safety* information; on the contrary, it is simply misinformation—and a waste of taxpayer resources.

Question 10. What are your concerns about the accuracy and reliability of the information that will be provided?

Answer. As stated in the previous questions, I have many concerns with the accuracy and reliability of the new public database, and I proposed an alternative database rule to try and address these central concerns.

Because the Majority's database rule all but guarantees that the database will be flooded with inaccurate reports of harm, it will be less useful for Commission staff in determining hazard patterns than are the current, internal databases we have today. Frankly, this is one of my greatest fears—that the Commission staff will be overwhelmed by inaccurate reports (or the reports that get picked up by the media) and unable to use their expertise to search objectively for genuine hazards. As the database is swamped with misleading or inaccurate reports, they will drown out the accurate ones.

There are a number of ways in which the new database could be unhelpful or misleading for consumers. Consider this scenario: Company A sells five million high chairs and Company B sells 5,000 high chairs. Company A has six incident reports on the database and the other has one incident report (all of which are unverifiable). Thus, a consumer could falsely conclude that Company A's high chair is less safe, even though simply due to the number of units it sold, it is more likely that people own that high chair—and more likely that reports on that high chair would make it into our database. Or, it is also possible that some of the reports about Company A's high chair actually pertained to older models of the high chair that are no longer for sale, which means the information may be entirely irrelevant for people using the database to look for safety information about current products on the market.

As a consumer and a grandmother, I do virtually all of my research on baby products (*e.g.*, regarding safety, quality and price) at the point of sale—usually on the website from which I am ordering, such as an "Amazon.com." The hundreds of comments on these websites cover a broad array of useful information. But for most products, I would not slow down my research to look onto a government website for additional, equally unverifiable, information—particularly when I can see safety information right alongside all of the other information I am looking for (wear and tear, usefulness, and warranty information) at the point of sale or the retailer's website. All of these factors are useful to a purchaser.

Trial lawyers or other groups with self-serving motives will use the Commission's database to look for potential trends and patterns of hazards. Under the Majority's database rule, these same groups may also submit to the database false and unverifiable reports to fuel a lawsuit. It is no coincidence that these groups are strongly in favor of this public database and of the Majority's interpretation of the statute, which expressly allows them to submit reports of harm.

Question 11. A central concern with the CPSIA remains that it takes away the Commission's ability to assess the risk presented by a product. The law focuses on the content of lead in a product, not the risk of negative health effects from even limited exposure to that lead. Do you believe that there is a risk posed to the health of children from exposure to many of the products that are affected by the lead limits in the law, such as ATVs, hooks, pens, school desks, furniture, or furniture hardware (*i.e.*, the nuts and bolts that hold the furniture together)?

Answer. No.

Regarding the risks associated with lead, I included much of this information in my opening statement. I believe it is important to clarify the risks associated with lead. Some advocates say that "there is no safe level of lead," implying that none of us can ever spend enough time and money to reduce or eliminate lead everywhere. But there is, in fact, an *unsafe* level of lead that has been established by our leading scientific agencies, the National Institutes of Health, the Centers for Disease Control and the Environmental Protection Agency. Only lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under.

In order to determine risk, it is necessary to make a distinction between lead that is absorbable and lead that is not absorbable in meaningful amounts. In many other laws relating to absorbable lead levels, standards exist to allow for such minimal absorption. For example, the Food and Drug Administration allows for 0.1

microgram of lead in a one-gram piece of candy.[15] The Safe Drinking Water Act declares "zero lead" to be the objective for the amouut of lead in water, but pipes carrying the water are permitted to be 80,000 parts per milliou (8 percent) lead—allowiug for negligible, trace amounts to exist iu the water we driuk.[16] California Proposition 65[17] as well as the European Union[18] allow for a negligible amount of absorbable (or soluble) lead iu children's products. People often are surprised to learn that all children are born with a certain blood lead level, depending on the blood lead level of the mother. Some additional amount of lead (roughly one microgram per kilogram of body weight)[19] is then taken into the body every day through the food we eat and the air we breathe.

So what lead is actually risky? Lead is risky when it is absorbable into the bloodstream at greater than minimal levels. The experts at the CDC and NIH have found that lead paint in old houses and lead in dirt[20] near old gas stations are the main source of environmental lead presenting a danger to small children (*http://www.cdc.gov/nceh/lead/*). In other words, the *risk of absorbability* from lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high.

In the same vein, a heavily lead-laden metal charm or piece of jewelry that can be swallowed presents a danger, because such an item could get caught in the stomach and absorbed. However, none of these agencies, including the CPSC, has ever found that a child touching a brass musical instrument or a vinyl lunchbox, or riding a bicycle, could ever rub off enough lead, day after day, year after year, to affect his or her health.

Consider the CPSIA's lead requirements in comparison to these known lead hazards in the environment today. The CPSIA's arbitrary lead content limits (currently 300 ppm, and moving this August to 100 ppm or the lowest achievable level between 100 ppm and 300 ppm) remove the ability of the Commission to assess risk, or the absorbability that exists for a particular product. Thus, the law's lead content levels dictate that the metal handle bars of a bike that pose *no health risk* to a child be outlawed right alongside lead paint or a solid-lead charm on a piece of children's jewelry that actually is dangerous.

The CPSIA has led to a ban on children's books published before 1985, because the ink in them is likely to contain lead above the allowable level. Some at the Commission and many Members of Congress have expressed dismay that books have been affected, because children are not likely to eat the pages of old books or ingest more than miniscule amounts of lead after touching their pages. Likewise, youth ATVs and bicycles are outlawed or must be reengineered even though the lead that is in the hood, handlebars, or hubcaps will not become ingested and absorbed at any discernable level (from hand to mouth touching where miniscule amounts of lead may rub off—not from actually eating the hood, handlebars or hubcaps). Other everyday products such as school lockers, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens are outlawed if they have a toy or game attached to them and are marketed to children, due to the brass found on the tip.

Finally, as mentioned earlier, children do not live cooped up inside of their rooms surrounded only by "children's products." Children live throughout the house, run around outside, and play with adult products such as pots, pans, furniture knobs, door handles, appliances and TV remotes. For example, the new costs associated with this law will affect a young child's lamp (usually turned off and on by the parent) but not the lamp in the den or the living room that a child is as likely to turn off and on. These products do not threaten a child's health dne to their lead content,

---

[20] Although lead in dirt is a proven hazard for small children nearby to old gas stations that used leaded gasoline or certain pesticides, it is notable that the Environmental Protection Agency standard for lead in soil is 400 ppm. *http://www.epa.gov/lead/*. This standard for safety is less strict than the current lead content standard provided in the CPSIA for children's products, which is 300 ppm and scheduled to fall to 100 ppm in August of 2011.

because the lead in them is not absorbable. This further illustrates the absurdity of the CPSIA's requiring the unnecessary reengineering of children's products with lead, while children are just as likely (if uot, more likely) to play with everything else in the house.

Question 12. The idea of a "functional purpose exemption" was discussed at the hearing. Cau you please explain in greater detail your objections to such an idea?

Answer. The primary proposal put forth by the Commission's Majority and by Ranking Member Henry Waxman to amend the CPSIA has been to create a new "exclusion" from the lead limits in the law for products that *need* lead in the substrate to serve a "functional purpose." This exemption is too complicated and costly, and would result in subjective exemptions and be of little use to the smaller manufacturers that need it the most. Under the proposed exemption, a ruanufacturer would need to petition for a product-by-product (or component by component) determination by the Commission prior to selling their product.

This exemption does not provide the broad exclusion flexibility that the CPSC unanimously sought in its January 2010 Report to Congress, and presents endless uncertainties and a number of unnecessary elements of proof. For example, one criterion for the exclusion was that the product "will have no measurable adverse effect on public health or safety." But if a product, component part, or material will have no measurable adverse effect on health or safety, then what reason does a government *safety* agency have to regulate it? Why must a company also then show that the item "requires the inclusion of lead"? Why show that it is "not practicable or technologically feasible to manufacture" with lower amounts of lead when the current level already poses no safety risk? Why demonstrate that "making the lead inaccessible" is not practicable or technologically feasible? Isn't the mere fact that an item will pose no lead risk to children sufficient to allow its use?

Requiring such costly and complicated petitions would result in the continued prohibition of many products that pose no risk to children. The goal of the exemption to reduce the burdens imposed by the CPSIA's non-risk based proscriptions, could not be met under these circumstances. Piling on such criteria makes it more difficult to apply for exclusions, and raises the question whether deterring petitions for safe products is precisely the point. The usefulness of the proposal is further reduced by the cost of petitioning a Federal agency, which is high even without these exacting requirements. And large businesses, with their in-house legal staffs, have an obvious advantage over small manufacturers, who would likely he unable even to afford to petition for relief under the exemption. Finally, even a manufacturer with the resources to pursue such a petition could not bring a product to market until CPSC staff analyzed the petition, the Commission took the time to consider it, and the majority granted it. Considering the substantial time it has historically taken the Commission to rule on pending petitions, this amendment was completely unhelpful.

Instead of creating an exemption from the law that requires pre-approval by the agency, the CPSIA should be amended so that products not posing a lead risk do not have to come before the agency at all. The Commission will still retain the right to recall and/or regulate any product that is unsafe, including those containing unsafe levels of absorbable lead. And manufacturers remain obligated to report to the agency any products that do not meet agency standards or which pose a risk.

Question 13. Can you elaborate on and further explain the following statement in your testimony: ". . . the central focus of the agency's time and resources in both 2009 and 2010 has been on implementing a law that has almost nothing to do with improving safety—the Consumer Product Safety Improvement Act of 2008, or CPSIA."

Answer. As Chairman Pryor pointed out during the hearing, some provisions of the CPSIA, such as the ATV Standard, may effectively address known risks. Also, making it unlawfnl to sell a voluntarily recalled product enhances the agency's enforcement powers and promotes consumer safety.

However, the bulk of the law's requirements and their attendant costs to the regulated community are not risk-based and will have a negligihle impact on consumer product safety. Moreover, an overwhelming proportion of the Commission's time and energy since passage of the CPSIA has been spent implementing the new law. Numerous rules have been promulgated and many more are still to come. And with each rulemaking, the Commissioners must debate the same questions regarding the meaning of the new statutory language and the scope of the new requirements. Lost in all of these debates and rulemaking is the agency's mission to protect consumers, and especially children, from unsafe products. Instead, the agency's discretion to allocate resources and focus enforcement efforts to address risk has been replaced by a mandate to regulate to fixed and largely arbitrary standards that hear little relationship to risk.

A sample of CPSIA requirements and the CPSC's recent rulemaking illustrates these points.

- *Lead content limits*: The CPSIA sets limits for lead content in all consumer products, without regard for the absorbability of the lead in any particular product. But lead in a product's substrate that is not absorbable in meaningful amounts does not create a safety risk. For instance, lead in paint or in a solid lead charm is hazardous, because in each case the lead can be ingested and absorbed into the system. The lead in bicycle handlebars or the brass spokes of a toy wheel, in contrast, is part of the metal's substrate, is not absorbable, and therefore presents no safety risk. Moreover, lead is an important element that adds strength, machineability, weight and other traits that can be difficult to replace. As a result, companies have been required to spend millions reengineering products to eliminate lead from components that contain little to no *absorbable lead*, and were therefore never harmful in the first place. The CPSIA third-party testing, certification and record keeping requirements similarly create a substantial financial burden with no commensurate improvement in safety.

  The Commission is now beginning to consider lowering the permissible lead limit in children's products to 100 ppm, as the CPSIA requires. The limit must be so lowered "unless the Commission determines that a limit of 100 parts per million is not technologically feasible for a product category." CPSIA § 101(a)(2)(C). In any event, the Commission must set the limit at the lowest level between 300 ppm and 100 ppm that the Commission determines to be "technologically feasible." CPSIA §101(a)(2)(D). Bnt the law does not require or even allow the Commission to first consider whether a lower lead limit better protects children's health. This is a radical departure from the CPSC's traditional role of using its expertise to *first assess* a safety risk *and then regulate* it to the extent required to protect the public. There is no scientific basis for reducing the lead limit in a product's substrate to 100 ppm as a means to promote safety. The Commission should be empowered to make that determination before American businesses are crippled by unnecessary costs.
- *Phthalates ban/interim ban*: The law properly bans certain phthalates that are known hazards. But it overreaches by banning additional phthalates for which the CPSC has already concluded there is insufficient scientific evidence of risk. The law called for a new Chronic Hazard Advisory Panel (CHAP) to re-study these additional phthalates, but bans them in the interim. This has required manufactnrers to reengineer prodncts and third-party test to the interim phthalates ban when the CHAP may determine once again that a risk does not exist.
- *Database*: This agency has already spent $29 million through FY 2011 developing a new public database for consumers. The agency's recent database rule ensures that the database will be populated with unverifiable and likely inaccurate information. It will be no more helpful than a website with consumer reviews or complaints, such as *Amazon.com* or *yelp.com*, yet more misleading, because it is implicitly endorsed by the Federal Government. Inaccurate information in a datahase for consumers is not "safety information"—it is simply *mis*information. See the questions above on the database for more information.

  Drafting the rule for the database put enormous pressure on staff resources. Now, the costs will balloon as the agency fulfills its obligations to convey every single incident report to the manufacturer within 5 days, process responses from those manufacturers, and then post the incident after 10 days. Considering only the decision to allow "data dumps" into the database, the database could swamp the Commission's resonrces very quickly. One conservative estimate is that it will take twenty-two new FTEs to handle the case work generated by these requirements, and that does not include complicated cases requiring the investigation and resolution of a material inaccuracy charge by a manufacturer.
- *Third party testing and certification requirements*—Section 102 of the law requires third-party testing to *all* children's product safety standards, including lead paint, lead content, phthalates and ASTM F963. The Commission majority has extended this requirement to previously passed "consumer product safety standards," including flammability standards for carpets and rugs, mattresses, and vinyl. However, none of these third-party testing requirements are necessary to address a risk. These requirements simply add burdensome costs to manufacturers, who will either pass the costs on to consumers, or reduce prodnct lines or close, because they cannot afford them. The Commission maintains the authority to pose mandatory testing requirements on manufacturers where

necessary to address a risk, but the CPSIA's testing requirements by and large are unnecessary, wasteful and crippling to small manufacturers.

The Commission has already spent days discussing the rules that will govern the implementation of a certification system that will be effective and efficient. The hours dedicated by the staff over the past 18 months to draft these rules are incalculable.

- *Tracking labels*: All children's products, regardless of the risk they pose, must include a tracking label. After the current stay is lifted, these labels will become much more complicated because they will have to correctly reflect the finished product's unique lot number and that of each tested componeut of the product. If so little as one component part's certification is changed, the finished product label will also need to be changed. Similar to Section 102, this provision adds unnecessary costs to small and large manufacturers, without regard to whether their products pose a risk.
- *Increase in the maximum civil penalty levels*: The CPSIA increased the maximum civil penalty for a violation of a Commission standard from $1.25 million to $15 milliou, an unprecedented increase for any agency. While this provision was driven primarily by the toy recalls of 2007, which iuvolved one of the largest toy companies, the bar has beeu raised for all manufacturers. This increased exposure to large fines accompanies the CPSIA's new, complex regulations that already significantly raise the cost to bring a new product to market. Again, this new burden has nothing to do with increased risk and threatens businesses and jobs by its very existeuce. The Commission could have reduced this burdeu by providing in its guidance that technical violations (such as a compliant product with a paper work violation) would be penalized at lower levels. But the majority of the Commissiouers decliued to write that reassurance into their guidance document.
- *Enforcement by state attorneys general*: Section 218 of the CPSIA authorizes state attorneys geueral to briug lawsuits against a manufacturers for violating the CPSIA—a law whose standards are, again, not based on risk. This provision invites lawsuits from state attorneys general and therehy exposes large and small mauufacturers to a needless, iucreased risk of liability. It may also require manufacturers to incur additional costs to protect against the application of conflicting standards. For instance, a manufacturer can avoid any risk of a CPSC enforcement action for lead content by administeriug the lead content test recommended by the CPSC. But this would not insulate the manufacturer from a claim hy a state attorney general based on the results obtained using a different test. A manufacturer could protect against this risk only by testing the same products repeatedly using different methodology, a large, unjustified expense. In other cases, the mere fact that a state attorney general could enforce a particular standard imposes a burden that the CPSC has judged to be unreasonable. Specifically, the Commission occasionally exercises its discretion to stay enforcement of standards that it deems cannot reasonably he met, based on the availability of laboratory resources or other factors. Yet a CPSC stay is not binding on a state attorney general, who could nonetheless bring an action based on the failure to adhere to the same standard. These sorts of inconsistent and conflicting burdens aud risks are precisely why many Federal regulatory standards and enforcement mechanisms preempt state action. The same should have heen done here.

Question 14. You stated that one example of cutting the Commission's budget would be to put the agency under oue Admiuistrator, rather thau 5 Commissiouers. Can you please elaborate on the benefits of this proposal?

Answer. I believe the CPSC could be run more efficiently by one Administrator, rather than a Commissiou of five or even three. Managiug a small agency simply does not require more than an Administrator. Additionally, I have confidence that Chairman Tenenbaum (or a future Administrator) would be able to run the agency much more efficieutly without the pressures from her Democrat and Republican colleagues, who wish constantly to influence her actions in one direction or another. Reducing from five Commissioners to an administrator would save the substantial costs of office space, Commissioner and staff salaries, aud any travel for all five Commissioners.

The Chairman is already solely accountable for all of the agency's core functions, iucludiug setting the rulemaking agenda, public relations, humau resources duties, and budgeting. The other four Commissioners may be asked to sign off on these things from time to time as a formality or to provide input, but ultimately all accountability lies with the Chair.

Rulemaking involves the participation of five Commissioners. However, I would argue that this "participation" rarely involves more than duplicative analytical efforts—all of which usually result in a 3–2, party-line vote. This also means five different Commissiouers, all their staffs (12 people), plus dozens of technical staff aud lawyers are reviewing, editing and analyzing the exact same rule-making document.

Despite my efforts, I have been unable to meaningfully influence the rulemakings we have considered. In fact, divided along party lines, the Chair is often pushed to align her position with the other two Democrat Commissioners. For example, the Commission issued a Notice of Proposed Rulemaking on the Definition of Children's Product that was so ambiguous we might just as well have not defined the term at all. In response, the Commission received many excellent comments from manufacturers and retailers illustrating how the parameters of the definition provided very little, if auy, certainty for products that fell around the outer edges of the law's age limit. Then, after weeks of review by technical staff, the Office of General Counsel, and all Commissioners' staffs, the final rule approved by the Majority was *worse* than the proposed rule, in that it unjustifiably broadened the parameters so that even more products fell under the purview of the CPSIA. Without four other Commissioners pulling her in opposite directions, one Administrator would he solely responsible for fair, well-thought-out rulemakiug decisions.

Having five Commissioners also means that many day-to-day activities of the Commission must happen five different times, which can drain staff time. Moreover, each Commissioner needs his/her weekly briefings on rulemakings and other issues with professional staff. Unfortunately, it is not useful to combine most meetings with other Commissioners, who may have alternative agendas. Nor is it even legal under the Sunshine Act for more than two Commissioners to meet privately to discuss substantive matters. As a result, professional staff spend most of their weeks in repetitive meetings and away from other core duties. They also spend five times more time than necessary answering Commissioner and Commissioner staff questions, when they could be doing so for one Administrator.

The CPSC still remains a relatively small agency, despite the new rules it has promulgated and its responsibility to enforce those rules. Other independent commissions, such as the FTC and FCC, might need five Commissioners, but those agencies' budgets are *more than double* ours.

I am not aware of another independent commission that is under one Administrator. However, other regulatory agencies, such as NHTSA and FDA are run by Administrators that are accountable to Cabinet secretaries and the White House. I could imagine a similar arrangement for the CPSC.

Question 15. Do you have any other budget-reduction recommendations that should be considered?

Answer. I have two recommendations on how to reduce the budget and at the same time, increase the Commission's ability to fulfill its safety mission:

1. *Defund the public database*: The first budget-cutting measure I recommend is not to publicize the Commission's new database. I understand that the agency's internal IT improvements have been beneficial, particularly combining our separate internal databases of information. However, there is simply no safety need to make all of our incident reports public, particularly those that are likely to be inaccurate. If this Commission is to have a public database funded by taxpayers, it should be *different and better* than any source of information that already exists in the public domain, snch as websites like *Amazon.com* or *Yelp.com*. Unfortunately, our public database will be no more useful than similar sites that are already available to the public today, and will, in fact, be more misleading to the public, given the likelihood of inaccurate reports and the lack of ability for anyone to verify them.

Further, the Commission has limited resources for enforcement, and the public database will divert resources from addressing genuine risks to monitoring and processing the likely increase in reports to the agency. Additionally, because inaccurate incident reports will be indistinguishable from accurate ones, the media's attention may focus on inaccurate reports, pressuring the agency to prioritize its efforts based on publicity rather than risk level. The agency has yet to estimate the number of new FTEs we may need, year after year, to administer the public database. However, as stated above, one conservative estimate is that it will take twenty-two new FTEs to handle the case work generated by these requirements, and that does not include complicated cases requiring the investigation and resolution of a material inaccuracy charge by a manufacturer.

As it is currently designed, and given the Commission's database rule, taxpayer dollars will be snpporting a pnblic database with inaccurate and unverifiable in-

formation that unnecessarily harms manufacturers, and is not useful to consnmers. Many believe the public database, if left unchanged, will be nsefnl only to trial lawyers or advocacy gronps that will be able to populate it with unverifiable, second-hand information for their own purposes.

2. *Reform the CPSIA to allow the agency to focus on risk*: The best way to allow the agency to perform its core functions—to assess and reduce risk—would be to reform the CPSIA's non-risk based mandates, such as the lead content standard and third-party testing and labeling requirements. There are many ways the law could be reformed to provide the agency with flexibility not to impose all of the law's requirements on products that do not pose any risk. Such reforms would *free up agency resources* to focus on known hazards and to better prioritize our regulatory agenda. It would also free up business resources to expand, build new products and stay competitive with what the marketplace is demanding in the future. Many of these reforms have been discussed in my statemeut to accompany the ageucy's Report to Cougress in January of 2010.[21] I would be happy to follow up with further detail, as necessary.

Question 16. The crib rule was mentioned briefly during the hearing. Can you please elaborate on the impact of the crib rule on child care centers due to the retroactive effects of the law?

Answer. I supported the Final Rule on Full-Sized and Non-Full-Sized Cribs, which was passed by a vote of 5–0 on December 15, 2010. I was also pleased that the Commission provided needed flexihility for child care centers and places of public accommodatiou to allow extra time, a full 2 years, to come into compliance with the regulation's requirements.

However, wheu the rule takes effect, the law's retroactivity provisions will still cause tremendons, needless waste for all child care centers nationwide—something that this agency does uot have the ability to prevent. In fact, with the passage of this regulation, *every crib in this country has become obsolete overnight and unable to be sold*—regardless of whether that crib was ever subject to a recall or ever considered unsafe. Although most articles since the rule's passage have focused on the fact that drop-side cribs can no longer be sold or used in child care centers, they fail to mention that the agency's new standards also impact all other types of cribs.

The consequences of the retroactivity of the crib rule are immense. First, any young family who invested in a new crib over the past year or who will buy one in the next six months before the new ones are on the market, will not he able to sell it or donate it to a thrift store after it has been used, even if the crib has fixed sides and is safe. Also, retail stores and thrift stores can no longer sell safe, fixed-side cribs currently in their inventories. Families often invest in second-hand cribs or hand them down to another family member, due to the high cost of new cribs. While the Commission advises consumers not to use any crib that is over 10 years old, the fact remains that the safest place for a baby to sleep is in a crib. It is tragic that the unjustified destruction of the second-hand crib market may compel some families to opt for an alternative, unsafe sleeping arrangement for their infants.

Furthermore, the law goes far beyond prohibiting the sale of cribs. It expressly forbids cribs that met the previous standards but do not meet the new standards from being offered *for use* by places of public accommodation or child care centers. Day care centers and hotels across the country are required to throw out their current cribs and purchase new ones, even if they bought a crib earlier this year that met the previous ASTM standard (less than a year old) and is completely safe. This will be a tremendous waste of money for families, day care centers, and the public fisc, which fnnds many day care centers.

The law's retroactivity provision also mandates that these standards become *retroactive every time they are updated in the future*. In other words, once the mandatory standards are modified in the future to respond to changes in the market, new innovations, or new hazards, all the new cribs that meet the Commission standard *this year* will become obsolete once again, cannot be resold, and day care centers once again will be forced to buy another set of new cribs. This sitnation will be disastrous for families and day care centers that depend on the availability of affordable cribs. I am not convinced that Congress intended such a drastic result.

Of course, crib companies are thrilled by the law's retroactive effects. While companies certainly will lose current inventory that does not meet the new standard, they will also reap tremendous financial rewards, because every family and day care center will be forced in the near future to purchase a brand-new crib. They will not have access to any safe, used cribs in the resale market. Even if they have recently disposed of their drop-side cribs, as this Commission has advised for many months,

[21] *http://www.cpsc.gov/pr/northup01152010.pdf*.

the new, fixed-side cribs they just bought will also be obsolete and unable to be resold. In fact, American families may not ever have access to much of a resale market if the mandatory standards for cribs continue to be modified periodically. Each time the standard is modified in the future, yesterday's crib will become outmoded, unable to be resold by families, and unable even to be used by such places as day care centers and hotels. (This alone provides quite an incentive for crib companies to continne proposing changes to the mandatory standard!)

The most economically vulnerable sectors of the market bear the brunt of overregulation. In this case, young families, those of moderate resources and many day care centers will be negatively impacted by this crib rule. I snpported this rule because it was required by the CPSIA and it provided at least some time for day care centers and families to prepare. I believe the Commissioners should share the consequences with Congress and give its Members time to change the law to avoid unnecessary costs. I am hopefnl that Congress wonld be open to amending the law to address these unforeseen consequences.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. JOHNNY ISAKSON TO HON. ANNE M. NORTHUP

Question 1. In your written testimony you outlined many problems that businesses are having in complying with the third-party testing and certification requirements of CPSIA. Given the state of the economy, the lack of detailed CPSC regulations and the fact that the stay on the third-party testing and certification requirements expires on February 10, 2011, wonldn't it be best to extend this stay another year?

Answer. Given that the Commission has not finalized its testing rules so that manufactnrers will know what is reqnired of them, I believe it is prematnre to lift the stay of enforcement on lead content testing. The delay in finalizing these rnles is of concern, because the Commission's previous stays on lead content testing were implemented *principally based on the recognition that manufacturers would be unable to comply with the third-party testing requirement until both the 15-month rule and the component testing rule had been in effect for a reasonable period of time.* If the stay is lifted prematurely, many small manufacturers, in particnlar, will be unable to afford to comply independently with the third-party testing requirement, and will stop making certain products or go out of business entirely

As you may know, on May 20, 2010, the Commission issued Notices of Proposed Rulemaking on (1) Testing and Labeling Pertaining to Product Certification (75 FR 28366), and (2) Conditions and Requirements for Testing Component Parts of Consumer Products (75 FR 28208). These proposed rules—referred to by the CPSC as the "15-month rule" and the "component testing rule"—address, inter alia, the protocols that will govern third-party testing of children's products, including random sampling methods and the availability of component parts testing as a means to encourage compliance further up the supply chain and to provide manufacturers with more options to come into compliance. The Commission is just beginning to consider the final versions of these rules.

A year has now passed since the stay was first extended, but in the absence of final 15-month and component testing rules, component testing still cannot form the basis for certifications for lead content. Rather, small mannfactnrers continne to report to the CPSC that component suppliers are refusing to test altogether or are refusing to supply certifications, and that certifications are unavailable from the retail ontlets where many small mannfactnrers obtain component parts. Under these circumstances, a continuation of the stay would be consistent with the stated views of all five Commissioners. Commissioners Northup and Nord, and Chairman Tenenbaum all expressly linked the lifting of the stay to at least the finalization of the 15-month and component testing rules. Commissioner Moore supported extending the stay to give small manufacturers "sufficient time to find sources of lead compliant materials," and Commissioner Adler predicated his willingness to delink finalization of the 15-month rule from the stay on his expectation that small manufacturers would be able to "rely on component suppliers for compliance with the law." Given that component part snppliers remain unwilling or unable to provide component part certifications in the absence of final rules, there is no factual predicate for the Commissioners to support lifting the stay.

It is also important to emphasize that publication of the proposed rules has not provided the regulated community witb the any certainty regarding the content of the final rules. Indeed, the CPSC's record of rulemaking over the past year demonstrates that a final rnle can change materially from its proposed version and can impose more onerous requirements. It is therefore not surprising that component

parts suppliers remain unwilling to incur the expense of providing certifications under a proposed regime that may change substantially before it is finalized.

I therefore intend once again to urge the Commission to vote to continue the stay of enforcement on third-party testing and certification of lead content in children's products until one year after publication of final 15-month and component testing rules. Considering the lead time necessary for manufacturers between design and production, allowing one year after the two testing rules are finalized is necessary for manufacturers to benefit from the rule. Doing so would comport with the expectation created among regulated industries through the Commissioners' and the Commission's public statements that the stay would not earlier be lifted.

Moreover, lifting the stay before the final 15-month and component testing rules are pnblished wonld place mannfacturers in the nntenable position of trying to comply with the proposed rule, while anticipating a potentially mnch different final rule. This would provide manufacturers with insufficient time within which to modify their compliance management processes once the final rule was issued, and would cause needless disruption to business planning, supply chain management, test lab contracting, and other aspects of product manufacturing due to the rapidly changing requirements.

Finally, a reasonable time after publication of the final rules is necessary in order to afford the regulated community time to come into compliance. Otherwise, it may be too late for many small manufacturers to benefit from the component testing rule. In this regard, it is essential that the Commission retain in the final component parts rule the proposed provision, § 1109.5(g)(1), affording component parts certifications "currency" to allow them to be reasonably relied upon by downstream manufacturers without the need for duplicative testing.

Question 2. If another stay is granted, what could Congress, the Commission, and industry do together during that year to help the CPSIA fulfill its mission without driving responsible manufacturers out of business?

Answer.

Congressional Action

The best opportunity manufacturers and consumers will have to be rid of the non-risk-based, costly testing and certification requirements of the CPSIA and to allow the Commission to refocus its enforcement efforts on genuine risks, is for Congress to amend the law. There are many ways the law could be reformed to provide true flexibility to the agency so as not to impose nnnecessary reengineering and testing requirements on products that do not pose any risk, including: (1) exempting products with *de minimis* absorbable lead from the law's requirements; (2) reducing the age range of the law to focus on children in the years when they are most likely to be exposed to harmful levels of lead; and (3) eliminating the costly third-party testing, certification and labeling requirements of the law, except where the Commission finds such requirements are necessary to address an actual risk. You may find more information on some of these proposals in my statement to accompany the Commission's Report to Congress in January of 2010: *http://www.cpsc.gov/pr/northup01152010.pdf* Such reforms would free up agency resources to focus on known hazards and to better prioritize our regulatory agenda—and bring us back to our core mission of safety.

It is also helpful to keep in mind that the statute does not permit the agency to exempt any manufacturer from the law's onerous testing and certification requirements. *Exemption from the testing requirement is the main change sought by small manufacturers.* Because we cannot exempt companies from the initial third-party test that every manufacturer must do to every component of their product—even if the product poses no risk—I hope that the Commission will at least alleviate the burden through the "continued testing" requirements of the statute and the testing protocols, where we do have some flexibility. However, removing the costly requirements of third-party testing and certification will require an act of Congress amending the CPSIA.

Commission Action

Regarding action by the Commission to alleviate the law's unnecessary burdens (absent reforms to the law by Congress), I no longer believe this to be likely. Before my Senate confirmation hearing, I was asked by both Democrat and Republican Senators to "find flexibility" wherever it is possible in the law, because the law had resulted in many unintended or unforeseen consequences. Once confirmed as a Commissioner, I took this request seriously.

However, the flexibility that I have fonnd in the following rules or decisions was rejected by a majority of Commissioners:

a. *Absorption exclusion*—I argued that the absorption *exclusion* under Section 101 was actnally intended to exclude certain products from the lead limits (rather than be meaningless), and therefore that the term "any lead" in that section may be interpreted to mean a *de minimis*, harmless amount of lead in a children's product. If the Commission had accepted my interpretation, lead in the substrate of ATVs, bicycles, and brass axles on toys would be legal—since lead in the substrate of these products is not harmful. Because the Commission rejected this interpretation, it voted to reject the petition of a manufacturer of toy cars, even though the car's brass fitting contained less absorbable lead than the Food and Drng Administration deems to be acceptable in a piece of candy.[1]

b. *Civil Penalties Factors*—In the Commission's interpretive rnle on Civil Penalties Factors, I proposed a nnmber of changes to provide more certainty for the regulated community and to ensure that while the overall civil penalty ceiling was raised, "technical" violations, snch as incorrect paperwork, wonld not be treated the same way as more serions violations, snch as failnres to meet safety standards. This is one area of the statute that was not too prescriptive, and a middle-ground could have heen reached.[2] Unfortunately, a majority of the commissioners did not want to provide that leeway.

c. *Definition of Children's Product*—The CPSIA applies to all "children's products," statutorily defined as products "primarily intended for a child 12 years of age or younger." The comments that the Commission received following the proposed rule made clear that the parameters we had tried to set in the proposed definition were not helpful to most manufacturers that produce children's products intended for the 10–12 or pre-teen age groups, or that straddle the age limit of the statute. The entire reason for defining the term was to provide guidance to these types of manufactures, who need certainty to know how to determine if their products fall under the purview of the CPSIA. After receiving these comments, the Commission had a chance to put u much narrower "fence" around the scope of covered products—or to at least define clearer boundaries. Unfortunately, the Majority chose to leave the definition vague whenever possible, which helps neither the CPSC staff,[3] nor the regulated community.[4]

d. "*Children's product safety rules*"—I offered a valid, alternative interpretation of the statute with regard to the requirement to impose third-party testing on all "children's product sufety rules." A clear distinction can be made between "children's prodnct safety rules" and more general "consumer product safety rules" promulgated well before the passage of the CPSIA. Unfortunately, becanse the Majority chose to view all consumer product safety rules of the Commission as potential "children's product safety rules," it imposed an unnecessary, additional layer of testing (at third-party labs) on manufacturers of carpets and rugs, vinyl, clothing textiles and mattresses—all of which are subject to consumer product safety rules. The Commission did not have to take this step—and there is no risk associated with these products that necessitates new third-party testing requirements.[5]

e. *Database*—I proposed an alternative database rule that would have responded to a number of manufacturer concerns and made the database a more accurate source of information for consumers. Unfortunately, the Commission's Majority passed a rule that went well beyond the statute's requirements, allowing "anyone" to submit reports of harm—even advocacy groups, attorneys and random bystanders that may not have firsthand knowledge of the incident. In total, the Commission Majority's database rule ensures that the database will be filled with inaccurate reports of harm that will be useful only to advocacy groups and trial attorneys, and will be time consuming and costly to manufacturers—particularly small businesses. Due to the inaccuracy of reports on the database, it will be a waste of taxpayer resources and will not be useful to the consumers it was intended to help.

Because the Commission's majority has largely refused to find flexibility where it is possible under the statute, I am no longer optimistic that, without Congressional action, the situatiou will improve.

ATTACHMENT

Economic Impact of the CPSIA—Examples
2009 and 2010

Costs Associated with the CPSIA

1. In a letter from the CPSC to Representative Dingell in March 2009, the Commission indicated that the overall economic impact of the CPSIA would be in the *"billions of dollars range."* The Commission also acknowledged that the testing and certification costs will fall disproportionately on small-volume businesses. (*Letter from Acting Chairman Nancy Nord to Representative Dingell, March 20, 2009*)

2. *"Major Rule"*—CPSC acknowledges in its FY 2011 Regulatory Agenda that its main rule pertaining to the CPSIA's testing requirements (*CPSC Docket No. CPSC–2010–0038*) is a "major rule" under the Congressional Review Act, resulting in, or likely to result in: (1) an annual effect on the economy of $100,000,000 or more; (2) a major increase in costs or prices for consumers, individual industries, government agencies or geographic regions; or (3) significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

3. In an article entitled "Makers Are Pushing Back on Toxic-Toy Law" (*Wall Street Journal*, March 5, 2009 *http://online.wsj.com/article/SB12362135762983 5121.html*), Joe Periera reported the following loss statistics:

- Goodwill Industries to destroy *$170 million* in merchandise.
- Salvation Army expects to lose *$100 million* in sales and disposal costs.
- The Toy Indnstry Association estimates inventory losses at *$600 million*.
- Members of the Coalition for Safe and Affordable Childrenswear lost *$500 million*.
- The California Fashion Association estimates troubled inventory at *$200 million*.
- The Motorcycle Industry Council expects to lose 50,000 motorized bikes and four-wheelers worth at least *$125 million*.

4. On March 11, 2009, *Playthings Magazine* reported updated data from the Toy Industry of America (see *http://www.playthings.com/article/CA6643505.html*), including:

- From a pool of nearly 400 manufacturers and 220 retailers, the TIA estimates *losses of $2 billion in retail value*.
- More than *$1 billion* in already shipped merchandise has been returned or is being withheld for return.
- More than *$800 million* in compliant merchandise is at risk of return.
- *40 percent* of all respondents plan to eliminate jobs to pay for the CPSIA, with more than 1200 jobs reported to be in jeopardy.

"TIA: Safety Act puts $2B crimp in toy biz" 3/11/2009

5. Separately, the Motorcycle Industry Council advised that total losses from disruptions in its members' businesses could total *$1 billion*. See: *http://www.1st5ive.com/harley-davidson/motorcycles/2009/02/2452/new-lead-rule-could-cost-motorcycle-industry–1-billion-annually*.

Examples of Businesses Closed Due to CPSIA

Killing Small Businesses:
CPSIA in the News, Letters and Public Comments

Higher Costs for Schools:

January 11, 2010

"NSSEA members sell educational supplies, equipment and iustructional materials to schools, parents, and teachers . . .

. . . the costs to schools, municipalities, libraries, and others of identifying and replacing such books would be extremely high and there is no reason to impose such costs given the lack of ideutifiable risk.

. . . While we applaud the efforts the CPSC has made to find solutions for small businesses . . . we believe the CPSC could do more if given more discretion by Congress. The alternative is the elimination of many valuable educational toys and products, some manufactured in low volume for niche markets (such as the deaf, blind, or otherwise differently-abled children) and typically not supplied by the huge multi-national toy manufacturers.".

Letter from the NSSEA (National School Supply and Equipment Association) to Commissioner Northup, January 11, 2010

Higher Costs for Products with No Lead Risk:

October 13, 2010

"The government wants to regulate Hannah Montana CDs and DVDs. The bureaucrats at the Consumer Product Safety Commission (CPSC) insist that the discs marketed to children be tested for lead, but when the same young starlet churns out raunchier material under her real name, Miley Cyrus, they will escape scrutiny. Never mind that the same 10-year-olds will likely end up buying both products.

". . . Never mind that Hannah Montana's fans aren't likely to eat their DVDs, the latest red tape makes no distinction between products where lead is likely to be consumed and those where it isn't."

http://www.washingtontimes.com/news/2010/oct/13/bureaucrats-way-out-of-tune/ "Bureaucrats way out of tune," *Washington Times,* October 13, 2010.

Punishing Small Businesses, While Mattel and the Big Guys Squeeze out the Competition:

June 17, 2010

"Now Mattel is testing and making toys without any trouble at all, and those of us who were never the problem are in danger of losing our businesses," says Hertzler, who runs EuroSource, based in Lancaster, Pa., with his wife and two sons . . .

"Nearly 2 years after the safety law was enacted, Congress and the Consumer Product Safety Commission are still struggling to reduce its burden on small businesses while eliminating the risk of lead and phthalates in children's products."

http://www.usatoday.com/money/industries/retail/2010-06-17-productsafety17—ST—N.htm "Lead testing can be costly for mom and pop toy shops," *USA Today*, June 17, 2010

Bordering on Ridiculous:

June 17, 2010

. . . "What the law should be about is ensuring safe products," says Edward Krenik, a spokesman for the children's product alliance. "We've crossed over into ridiculousness."

http://www.usatoday.com/money/industries/retail/2010-06-17-productsafety17_st_n.htm "Lead testing can be costly for mom and pop toy shops," *USA Today*, June 17, 2010

Regulation for Regulations' Sake

November 8, 2010

"Regulation for regulations' sake, where there is no inherent change to a bill of materials, a process or a product indicated after extensive, statistically significant testing across multiple points of input and verification, is simply wasteful."

American Home Furnishings Alliance
November 8, 2010—Letter to Commissioners

Mattel Finds CPSIA a Challenge—How Much More for Small Businesses?

November 9, 2009

"Officials of the toy manufacturer, Mattel, met separately with two CPSC commissioners November 3 to talk about how challenging it was for Mattel to comply with the CPSIA . . .

Peter Biersteker, a lawyer for Mattel with the law firm Jones Day in Washington, D.C., said his client is finding the CPSIA difficult to decipher. The law, he said, is unclear on what products the company needs to test, how often it needs to test them, and how many samples need to be tested. "It's a lot of work. I don't know how smaller companies do it," Biersteker told Commissioner Robert Adler.

Despite Mattel's large team of in-house lawyers, he said, the company needed to hire outside lawyers to help understand the CPSIA. He said Mattel holds weekly conference calls on the issue, discussing how to comply with the act while remaining "cost competitive."

"Mattel Finds CPSIA to be a Challenge," *Product Safety Letter*, November 9, 2009.

Commission Action Adds to CPSIA's Problems:

August 16, 2010

"The latest dictates from the *Consumer Product Safety Commission (CPSC)* will drive up the cost of manufacturing products intended for children. The agency adopted a pair of new rules in July and August implementing the Consumer Product Safety Improvement Act of 2008, but as drafted, these regulations will force companies to waste time and money on redundant testing programs solely for the entertainment of bureaucratic busybodies.

. . . The redundant examinations, mostly checkiug flammability, can be prohibitively expensive. For iustance, the regulations could require a mauufacturer to build a queeu-sized-bed prototype of a baby's crib just so it can be tested in an independent lab. Yet each of the componeut parts—the crib-sized mattresses, blankets and all other component parts—already are individually tested for the same hazards when manufactured."

Editorial: "The Red Tape Stimulus," *Washington Times*, August 16, 2010 http://www.washingtontimes.com/news/2010/aug/16/the-red-tape-stimulus/

Even the *New York Times* Spotlights the Unintended Consequences of the CPSIA:

September 28, 2010

". . . a new federal crackdown on dangerous toys has left some in the industry crying foul and not wanting to play."

". . . Critics point to provisions in the law that they deem ludicrous. For instance, a paper clip that is included in a science kit for schoolchildren would have to be tested for lead. But a teacher can walk into any drug store and buy a box of paper clips that would not be subject to the same testing.

Similarly, a lamp that is festooned with cartoon characters would have to be tested, but a lamp without the characters would not."

http://www.nytimes.com/2010/09/29/business/29toys.html "Toy Makers Fight for Exemption From Rules," *New York Times*, September 28, 2010

Science Kits Are "Not Banned"—but the Tools Used Inside Them Are!

October 1, 2010

"The science kit makers had asked for a testing exemption for the paper clips and some other materials. On Wednesday, iu a close 3–2 vote, the commissiou declined to give them the waiver they sought."

". . . After the science kit vote, CPSC Chairmau Iuez Teneubaum sought to reassure people that, "There is uothing in this rule that bans science kits."

Right. But while the commissiou vote doesn't ban the kits, manufacturers say it may crimp the supply of kits for elementary school childreu."

http://www.lvrj.com/opinion/goodbye-to-chemistry-sets-104139059.html
"Goodbye to chemistry sets," *Las Vegas Review Journal*, October 1, 2010. Editorial.

Furniture Manufacturers Faced with Added Costs, Zero Safety Benefit to Children:

November 8, 2010

". . . there has not been a corresponding benefit in the improved safety of children's furniture for children. All the representatives told you that their respective companies have not had to change a single material they use in the manufacturing of their children's product lines since they began testing to CPSIA in 2008. . . . The testing is simply being done to attempt to prove a negative."

American Home Furnishings Alliance
November 8, 2010—Letter to Commissioners

Furniture Manufacturers Faced with Added Costs, Forced to Cut Jobs:

November 8, 2010

"The majority of the annual costs will be in the record keeping requirements because none of the companies have the requisite IT infrastructure to handle the tracking of test reports per batch . . . Hooker estimates that it will cost them from $350,000 to $400,000 per year. Furniture Brands International said this will cost them over $4.5 million per year which is more than the profits from their best quarter in the last 2.5 years. In addition, this company must invest an additional $2 million in startup costs for setting up the production testing, programming computer systems to work with existing systems, and hiring and training employees for the administration of the CPSIA."

To offset these new costs, the company is forced to consider these choices: (1) shut down a small domestic plant which will mean the loss of 64 full time and 30 temporary U.S. jobs; (2) shut down a larger domestic plant which will mean the loss of 384 U.S. jobs; (3) significantly increase prices to offset the loss in revenue making them less competitive; (4) offer a lower quality product . . . or (5) shnt down all domestic production which incorporates any finishing processes, which will mean the loss of approximately 460 U.S. jobs."

American Home Furnishings Alliance
November 8, 2010—Letter to Commissioners

No More Mom and Pop Toy Sales:

July 7, 2010

"The second program involves making wooden toys that are given to the church and other charitable organizations in the county for distribution to needy children throughout the year especially at Christmas. Last year we created over 700 toys. The idea that we now are required to have these handcrafted toys certified will bring the program to a halt."

Dupage Woodworkers, Downers Grove, IL (July 7, 2010, Public Comment, Testing rule)

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. MARIA CANTWELL TO RACHEL WEINTRAUB

Question 1. The Food and Drug Administration (FDA) has three different product classifications for toothbrushes: (1) toothbrush, ionic, battery-powered; (2) toothbrush, manual; and (3) toothbrush, powered. The FDA classifies all toothbrushes as Class I medical (dental) devices. My understanding is that such Class I devices are regulated by the FDA. Under current law, does the Consumer Product Safety Commission (CPSC) have any authority to ensure the safety of toothbrushes, even those that are clearly marketed to children?

Answer. Under current law, the Consumer Product Safety Commission (CPSC) has jurisdiction over consumer products. In 15 U.S.C. §2052(a)(5), a consumer product is defined as, "any article, or component part thereof, produced or distributed (i) for sale to a consumer for nse in or around a permanent or temporary household or residence, a school, in recreation, or otherwise, or (ii) for the personal use, consumption or enjoyment of a consumer in or around a permanent or temporary household or residence, a school, in recreation, or otherwise;" The term specifically

excludes a number of products including, (H) drugs, devices, or cosmetics (as such terms are defined in sections 201(g), (h), and (i) of the Federal Food, Drug, and Cosmetic Act [21 U.S.C. 321 (g), (h), and (i)])." Thus, medical devices are explicitly excluded from CPSC's jurisdiction.

Further, the Food and Drug Administration (FDA) has jurisdiction over tooth brushes as medical devices. The FDA classifies toothbrushes as Class I devices in different product classificatious, as you suggested. For example, FDA classifies manual toothbrushes under section 872.6855 and powered toothbrushes under section 872.6865.

Thus, since medical devices are explicitly carved out of CPSC's authority over consumer products and FDA has authority over medical devices which include toothbrushes, under current law CPSC does not have authority over toothbrushes, while FDA does have authority over these products. This remains the case whether the toothbrushes are designed for children or adults.

Question 1a.. Do you believe that all toothbrushes should be classified as medical devices or should some be classified as a consumer product?

Answer. I believe that toothbrushes should be considered a medical device and that FDA should retain jurisdiction over these products. I have not been made aware of information or claims from consumers indicating that toothbrushes should not be considered medical devices. IF CPSC or any other government agency has knowledge or information that would be helpful to FDA in exercising jurisdiction over toothbrushes, we would urge FDA to work with that entity.

Question 2. There are a number of battery-powered toothbrushes in the market that have children's cartoon or live-action characters painted on to the body of toothbrush or attached to the body of the toothbrush (*i.e.*, the on-off switch in the shape of the cartoon character), and are marketed to children. Does the CPSC consider such toothbrushes to be a "children's product"? Should the CPSC classify these toothbrushes to be a children's product as they are marketed to children 12 years of age and younger?

Answer. In an advisory opinion written by CPSC General Counsel, Cheryl A. Falvey on November 5, 2008,[1] the General Counsel states in a response to a manufacturer of preventative dental caries that, "Products that are medical devices do not fall within the definition of "consumer product" and, therefore, the definition of "children's product" does not include medical devices."[2] Based upon this advisory opinion, I conclude that CPSC does not consider these types of toothbrushes to be children's products. I agree with this determination and do not believe that CPSC should have jurisdiction of these medical devices even when marketed and sold to children. FDA has expertise in regulating these and other medical devices and should retain this jurisdiction.

Question 2a. Does the FDA have any standards for the levels of heavy metals allowed in toothbrushes and other dental devices? If not, should the FDA develop such standards?

Answer. To the best of my knowledge, FDA does have standards for the levels of heavy metals allowed in toothbrushes and other dental devices but these standards are not in the form of a bright line total lead content limit. Rather, FDA requests complete material composition data from medical device manufacturers and if the presence of heavy metals is indicated, FDA requests further data about the heavy metal. In addition, FDA focuses on whether the heavy metal contained in the device can leach into the bloodstream.

Question 2b. Hypothetically, if it is reported that lead was found in the colored bristles of a toothbrush with a cartoon character painted on the body of the toothbrush, how would the CPSC respond? Would the FDA have absolute jurisdiction? If the FDA chooses not to investigate the report, does the CPSC have any authority to investigate such a claim independently?

Answer. If it is reported that lead was found in the colored bristles of a toothbrush with a cartoon character painted on the body of the toothbrush, CPSC would not respond. Rather, FDA would have jurisdiction. I would hope that FDA would consult with CPSC if CPSC's knowledge and familiarity with lead exposure from consumer products would be helpful to FDA. If the FDA chooses not to investigate the report, we wonld hope that FDA based its review and determination upon an extensive review of the facts of the particular case and would urge FDA in any case

---

[1] The advisory opinion can be found on CPSC's web page at *http://www.cpsc.gov/library/foia/advisory/319.pdf.*

[2] Advisory Opinion of Cheryl A. Falvey, General Counsel, U.S. Consumer Product Safety Commission, November 5, 2008, available on the web at *http://www.cpsc.gov/library/foia/advisory/319.pdf*.

involving lead exposure to make determinations based upon the extensive body of research indicating that lead is a known neuro-toxin and that there are no safe levels of lead exposure. Since, CPSC does not have jurisdiction over medical devices; CPSC would not have authority to investigate such a claim independently.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. TOM UDALL TO RACHEL WEINTRAUB

Question 1. Could you give us your thoughts on how this database can improve consumer awareuess of product recalls?

Answer. This database will improve consumer awareness about product recalls because consumers will see information about recalls as they are looking up product information on the database. For a consumer who went to the database to look up a specific product, and was not even thinking about the potential of a product recall, recall information would be available and visible and enrich the person's knowledge about the product by including applicable recall information.

In addition to the database, the CPSIA is improving consumer awareness of product recalls by requiring that infant durable products be accompanied by a product registration card and a means to register the product on line. This is important because with this information, consumers will be directly notified by the manufacture if a product they own has been recalled. Direct consumer notification of product recalls is one of the most effective ways to increase consumer awareness of product recalls.

Question 2. I am concerned that consumers who have already purchased harmful, recalled products may still not know whether their consumer product has been recalled. How can the database and other computer or online tools help with that?

Answer. Consumers who have already purchased a potentially harmful product all too often do not find out that the product that they own has been recalled. It is problematic. The database will help consumers who own a previously recalled product if they go to the database and search for the product. Even if the consumer is not specifically looking for recall information, recall information will be accessible and visible to the consumer.

In addition, CPSC has a list serve anuouncing the most recent product safety recalls that it sends out to consumers and others who sign up. Consumers can sign up to receive information about specific types of prodncts. We urge consumers to sign up for this list serve. To sign up, a consumer should go to: *https://www.cpsc.gov/cpsclist.aspx*.

Another tool that will help consumers find out about whether an infant durable product they own has been recalled is product registration. This is required for infant durable products. Critically, a consumer must fill out tbe card accompanying the product or fill out the information online.

Once the consumer communicates the information to the manufacturer, if there is a recall, the manufacturer will directly notify the consumer of the recall. This is a hugely positive step that will improve consumer knowledge about recalls of products they owu.

RESPONSE TO WRITTEN QUESTIONS SUBMITTED BY HON. ROGER F. WICKER TO STEPHEN LAMAR

Question 1. In your testimony, you stated tbat companies are required to comply with "silly" requirements. Please elaborate on what you mean by this and provide examples.

Answer. The CPSC has been very strict in interpreting the CPSIA's requirements and as a result, businesses have had to comply with various regulations that have been extremely burdensome but have amounted to zero improvements in consumer product safety. For example, the CPSC initially interpreted the General Conformity Certification (GCC) requirement to be a paper certification that wonld physically accompany each shipment of products. Not only would this have been a logistical nigbtmare for companies, but the certifications would be useless to regulators who would have had to search shipments to find them. Ouly ou November 10, 2008 (two days before the GCC requirement went into effect) did the CPSC issue final GCC regulations clarifying that the certification could be in electronic format. In another example, the CPSC initially interpreted the third-party testing requiremeut to be product-based. This meant that if a company chose to use the same button on five different styles of pants, the company would have to send in each different fully assembled style of paut of to test the button five times.

While many (not all) of these issues have been addressed, companies are still dealing with duplicative testing, unnecessary paperwork, burdensome and confnsing regulations, and conflicting interpretations on what the regulations mean. For example, retailers often still require third-party testing be done with specific testing labs resulting in duplicative testing for manufacturers. The most recent draft of the so-called "15 month rule" requires that GCCs, which are often created abroad by lab technicians be in English and stored in the United States. And the definition of "component" has been broken down to the sub-component level meaning components like zippers are now subject to seven tests.

Because the CPSIA is so rigidly written, the "solutions" we are able to develop sometimes end up creating more problems.

Question 2. The CPSC is currently working on third-party flammability testing for products such as fabrics and sleepwear. Please describe your industry's experiences with this requirement.

Answer. On August 9, 2010, the CPSC issued a *Federal Register* notice entitled, "*Third Party Testing for Certain Children's Products; Clothing Textiles: Requirements for Accreditation of Third Party Conformity Assessment Bodies, August 9, 2010.*" We have experienced several issues with this provision.

First, we disagreed with the CPSC's assessment that this standard—a general product safety standard that applies to all products—is even covered by the third-party testing requirement. We submitted comments to the CPSC and have yet to receive a reply.

Second, we raised significant concerns—that are still unanswered—on the fact that this new third-party testing requirement was being imposed on a regulation that was working properly and which had been subject to full dress rulemaking. In fact, about a year ago, the CPSC published technical changes and updates to that rule following years of industry consultation and comment. We find it inappropriate that a rule that was developed iu such a mauner can be significantly altered outside the proper regulatory process that is laid out in the underlying Flammable Fabrics Act (FFA) with no stakeholder input. We are closely monitoring to identify any problems that emerge as the new CPSIA reasonable testing protocols intersect with the FFA testing protocols that have worked well during the 50 year life of this safety standard.

Third, the mauner that the CPSC has used to lift the stay for products goverued by the FFA has been confusing, non transparent, and subject to apparent *ad hoc* consideration. For example, the CPSC used the Augusts 9 Federal Register notice to announce it was liftiug the stay. However, the title of that notice (see above) made no mention of the stay being lifted and seemed to only address technical issues relating to third-party testing certification. Moreover, the actual phrase lifting the stay was buried deep within the notice itself. the CPSC stated, "*As the factor preventing the stay from being lifted in the December 28, 2009, notice with regard to testing and certifications of clothing textiles was the absence of a notice of requirements, publication of this notice has the effect of lifting the stay with regard to 16 CFR part 1610.*" As a result, many children's apparel manufacturers did not realize that the stay of testing and certification had been lifted for children's products subject to the flammability standard for textiles. We would note that the extension of the stay of testing and certification was announced with great fanfare. Many companies mistakenly thought the CPSC would announce the lifting of the stays with similar public statements.

Fourth, moreover, many were extremely confused as to whether the stay of certification lifted for adult's products as well. In fact, the CPSC was similarly confused and were not able to clarify when asked. In response to our inquiries, the Commission only just announced the status of certification for adult's products subject to the flammability standard on December 28.

Fifth, AAFA petitioned for an additional 60 days because we felt there was insufficient diversity to ensure no capacity problems. In fact, when the stay for children's clothing was lifted, there were no third-party testing facilities certified for Vietnam, the second largest source of apparel (and a major source of kids clothing). As of the end of 2010, we have not yet received an answer to this request.

Sixth, with respect to sleepwear, AAFA and several stakeholders have been providing information to the CPSC on seemingly non compliant sleepwear that is being sold. Many of those complaints appear to go unanswered since the non compliant sleepwear continues to be sold year after year. Requiring additional testing, when the CPSC does not appear to be enforcing the existing rules, is not only frustrating to those companies who are in compliance with testing requirements and underlying standards, but also acts as a deterrent to ensure compliance by those companies who are ignoring the current law. The third-party testing regime doesn't address the

main (and only) problem that exists with respect to this standard—the apparent lack of enforcement.

CPSC officials have explained that the move to third-party testing for FFA seemed logical since much of the industry is already usiug third-party facilities to test for compliance. We would note however that there is a significant difference between third-party accredited facilities and third-party facilities. Many companies naturally assume their labs are accredited with the CSPC without realizing that that accreditation may still be pending. Similarly, the flammability standards reflect detailed product safety regimes that are not easily amended. We remain very wary of unintended consequences yet to materialize as the CPSIA requirements are layered on top of existing programs. At a minimum, we are concerned that we will see duplicative testing and paperwork burdens.

Question 3. In your testimony you said the retroactive nature of many of the rules in CPSIA creates huge problems for industry, with no discernible benefit to improving product safety. Why do you believe there is no benefit to safety?

Answer. The retroactive nature of the CPSIA forced many companies to spend considerable resources to test inventory and to dispose inveutory that was perfectly safe to children. Before February 10, 2009 (the date the lead standard went into effect), the apparel and footwear industry had to test all products on the shelves to determine and show compliance. These tests were done prior to the issuance of the CPSC's *"Children's Products Containing Lead; Determinations Regarding Lead Content Limits on Certain Materials or Products"* rulemaking that stated components like fabrics would not exceed the 100 ppm lead standard. As a result, companies had to spend money testing components that were of little to no risk of exceeding the lead standard just to prove product compliance. Moreover, as noted in my testimony, only about 5 percent of the hard components (like buttons, zippers and embellishments) were found to be not compliant with the lead standard. Most of these non compliant components were items such as the zipper stopper in the fly of children's pants that do not present any risk to children's health and safety.

As a result, we ended up with weird outcomes. Clothing that did not meet the lead standard, could be not be sold on February 10, 2009 since it was a banned hazardous substance. However that same clothing could be sold on February 9, 2009. Moreover, the CPSC did not force a recall of any clothing sold on February 9 or before. Clearly if it were dangerous it would be recalled. Furthermore, the CPSIA currently permits a company to make a product with a component that contains 250 ppm. However, on August 15, when the new retroactive lead limit takes effect, that exact same product becomes a banned hazardous substance. Once again, while it can't be sold after August 15, it is not subject to a recall. The safety of a product doesn't depend on the date when the product is sold.

Question 4. Could you please elaborate on what you think the impact will be on your members this February when the stay on third-party testing for lead content lifts? Have your members been provided with the information they will need to comply with these requirements?

Answer. When the Commission granted the stay a year ago, Chairman Tenenbaum wrote *"The extension of the stay was needed in order to give the agency more time to promulgate rules important to the continued implementation of the CPSIA and for the agency to educate our stakeholders on the requirements of those new rules."* That continues to be the case. The "15 month rule" has yet to be finalized, and there remain serious questions with the draft rules that need to be resolved. Moreover, with a year's worth of reasonable testing under our belts, it is becoming increasingly clear that the third-party testing environment is an unnecessary burden on businesses. Continuing the stay gives all stakeholders more time to create a stable, logically consistent, well thought-out, and well understood regulatory system. It also avoids a damaging job killing cost that will be imposed on businesses with *zero* gain in public safety. One of our members recently reported this to me with respect to the lifting of the stay.

> *Currently we use an XRF machine that we bought to do our lead substrate testing for our products. We deliberately buy components from trusted suppliers that are lead free. They rely upon process controls and XRF testing as well. There is some third-party testing done but most is done in house under XRF. Once the stay is lifted all that testing moves outside—either by us or by our suppliers. We have about 1,000 styles that have components that need testing—an average of about 7 components in each style (since zippers can be as many as 3 components). Many of those components are unique to each style so we can be looking at 7,000 tests at $50 a test for $350,000 of third-party testing. When you add in third-party testing for lead coatings—screen print—and flammable fabrics yau push us well over $1 million. These extra lab costs are occurring as everything*

else—including cotton which is at near record levels—are climbing. The XRF machine still has some use for screening but it mostly becomes a $25,000 paperweight.

Question 5. You identified the CPSIA mandated public database as one area where your industry has concerns. Please explain what your concerns are with this database.

Answer. Above all, we believe the database must be a reliable source of credible information that appropriately reflects its "dot gov" web address. As Chairman Tenenbaum stated in her February 17, 2010 ICPHSO address, ". . . Don't believe everything yon read on the Internet, except what you read on websites that end in dot gov." By this statement, Chairman Tenenbanm is pointing out that government websites are held to the highest standards as public resonrces. People expect government websites to provide credible information and the database should he no different—even *with* a disclaimer. Materially inaccurate information serves no one, can be detrimental to businesses, will ultimately damage both the credibility and overall success of the database and damage the credibility of the agency itself. The final rulemaking does not go far enough to ensure the credibility of the information posted to the database and the CPSC must take steps to guarantee that the posts are both reliable and in the public interest.

Question 5a. Would yon please tell us more about the resources that you believe yonr members will be forced to devote to following the database in order to address potential reports?

Answer. Members will have to devote time and resources to tracking information and allegations that are made on the website. Since the CPSC is under no requirement to actually remove materially inaccurate information, and yet is vested with the sole authority of determining what is materially inaccurate, companies are so far unsure if their efforts to correct the record (such as providing information that a particular product is a counterfeit) will even result in removal of offending entries. Especially with the advent of the CPSIA, product safety professionals have found even more demands on their time. Requiring them to also track a public database—especially one with the imprimatur of the Federal Government—to respond to ill informed and inaccurate allegations will result in even less time to devote toward actual product safety management.

Question 6. Where do you believe the CPSC can act to alleviate these concerns, and where do you think a legislative fix is necessary?

Answer. The CPSC has limited flexibility to alleviate our concerns with the database without a legislative fix. Most significantly, the CPSIA's database provision does not do enough to ensure the material accuracy of the reports of harm. While timely dissemination of information is important, materially inaccurate information is extremely damaging to businesses and will *never* benefit consumers. The legislation puts into place a very strict timeline for the CPSC to transmit the report of harm to a manufacturer within 5 days and then post the information onto the website within 10 days of transmission—regardless of whether an investigation for material inaccuracy is pending. The database provision must be amended to require the Commission to not post information should the report of harm potentially contain materially inaccurate information.

However, the agency can take some regulatory actions as well since the CPSC's database rulemaking created several additional concerns for businesses. For example, the CPSC expanded the list of those who can post to the database well beyond the scope of the CPSIA's finite list. Including these additional categories of submitters will dilute the effectiveness of the database as more materially inaccurate information will likely be posted. Many of these categories of submitters will not have first hand knowledge of the incident, have access to the consumer product involved, and may have ulterior motives in posting information on the database.

Limiting the scope of the database as much as possible upon implementation will be fundamental in the database's success. This approach will limit mistakes, minimize the impact of the mistakes, and give the CPSC more flexibility to make changes to the database as it develops.

Question 7. Chairman Tenenbaum and Commissioner Northup discussed budgetary issues related to the CPSC. What impact do you helieve that the CPSIA has on the effective utilization of resources by the CPSC?

Answer. The CPSIA has directed many of the CPSC's resources away from important safety regulatory activities and focused the agency's limited resources on burdensome rulemaking activity. These rulemakings, while important to industry's compliance efforts and understandings, have had little impact on improvement of consumer product safety. The predominant problem with the CPSIA is that the agency is not allowed to prioritize based on actual product safety regulatory need

and is forced to issue dozens of rulemakings on a very short, rigid timeline. Moreover, finding solutions for CPSIA compliance issues has been an extremely onerous process as the CPSIA leaves the agency little flexibility to provide necessary relief to bnsinesses. For example, in order to determine a component or material compliant with the lead standard, the agency has had to spend months of time and significant resources analyzing prodncts and materials that are of little to no risk to consumers and children. As noted in my oral comments, starting in 2008, AAFA worked closely with the CPSC to show there is no lead in textiles. AAFA and several retailers sent in thousands of test reports showing that lead would never appear in fabric. The textile determination was not finalized until August of 2009. While the determination has been very helpful for industry as now manufactnrers do not have to test textiles for lead, we helieve Congress should revisit the CPSIA to enahle the CPSC to make these determinations more quickly. We further believe that Congress needs to give the agency more flexibility to consider risk so the CPSC can appropriate their funds to real product safety concerns.

Question 8. You expressed concerns with the CPSIA's lack of clear preemption with regard to state and local laws in your opening statement. Please clarify what your concerns are with regard to preemption. Do you have any specific examples?

Answer. A common-sense product safety regulatory approach is to have a strong Federal regime that preempts state regulations. Logic tells us that a product crossing state lines does not make it safe or unsafe. It follows that product safety regulations should be uniform throughout the United States. Complying with various labeling requirements and chemical content standards is confusing and burdensome for companies.

California Proposition 65, which is specifically exempted from preemption under the CPSIA, presents a whole range of challenges. Among other things, it relies on different compliance and enforcement mechanisms that often mean companies have to work toward separate CPSIA and Proposition 65 compliance targets.

Even the CPSC battles with these issues. Just recently, the news reported about a motber in Georgia finding a product with a California toxic substances warning label on it (see *http://www.wsbtv.com/news/26334677/detail.html*). CPSC spokesperson Scott Wolfson responded to the mother's concerns with, "We respect California law, but parents should know that the safety of their children is not necessarily at risk if they see that label."

Question 9. Chairman Tenenbaum discussed the idea of a "functional purpose" exemption to the lead standard. What are your thoughts on that proposal?

Answer. While we agree that the CPSIA exemption standard is too strict, a "functional purpose" test is not an appropriate solution. The CPSC's job is to assess the safety of products—not to determine whether lead is a necessary component of the product or material. Adding the additional "functional purpose" test would result in the CPSC wasting too much time and resources on an evaluation that does not help answer the real, relevant question: is the product safe? We should grant the CPSC the authority to make simple determinations based on their assessments of whether a product or a class of products presents a risk of lead absorption. We recommend Congress look at Commissioner Northup's statement accompanying the Commission Report to Congress Pursuant to P.L. 111–117, Conference Report 111–366 on Recommendations to Amend the CPSIA. She suggested Congress look at amending the lead exemption standard to allow for a "*de minimis*" amount of bioavailable lead in products. In her words:

> The point of a *de minimis* bioavailability or absorption exception is to concentrate the enforcement resources on the real problems as well as to avoid obtaining negligible benefits at enormous cost . . . A particular virtue of the *de minimis* approach is that it would not require product-by-product approval by the agency, because manufacturers could determine for themselves whether their products meet the standard (subject to penalty and liability for errors) without having to petition the agency for an exclusion.

Question 10. In your testimony, you identified eight recommendations for changes to the CPSIA and CPSC. Your eighth point was that "there is more to the CPSC than CPSIA." Please explain what you meant by that statement.

Answer. Overall, it seems as though the CPSC has spent the majority of their resonrces in the past two and a half years on CPSIA-related activity. Be it writing interpretive rulemakings, explaining to businesses how the regulations will apply to them, hosting workshops or simply carrying out the mandates of the legislation—implementing the CPSIA has been the priority of the agency to a point where other equally important functions have languished. The agency has not been able to keep

up with the press of work from the CPSIA, and in so doing may have not spent adeqnate attention on other key enforcement and regulatory priorities.

Moreover, the legislation forces the CPSC to spend extraordinary amount of time rehashing old issues. In my oral statement we discussed our effort to show that there is no lead in textiles—a fact well known to all. In another example, the legislation requires the agency study the toxicity of phthalates—a study the CPSC conducted many years ago already. The CPSC determined that phthalates were not a risk to children and so to require the CPSC to condnct the same study is an inefficient use of resources. Giving the agency the flexibility to allocate their resources to address real safety and public health needs is crucial so the agency can deal with new chemical and product concerns as they arise.

CONTENTS

A REVIEW OF CPSIA AND CPSC RESOURCES

THURSDAY, FEBRUARY 17, 2011

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCE, MANUFACTURING AND TRADE,
COMMITTEE ON ENERGY AND COMMERCE,
Washington, DC.

The subcommittee met, pursuant to call, at 11:30 a.m., in room 2322 of the Rayburn House Office Building, Hon. Mary Bono Mack (chairwoman of the subcommittee) presiding.

Members present: Representatives Bono Mack, Blackburn, Harper, Lance, Cassidy, Guthrie, Olson, Pompeo, Kinzinger, Barton, Upton, Butterfield, Dingell, Towns, Schakowsky, and Waxman (ex officio).

Staff present: Gary Andres, Staff Director; Jim Barnette, General Counsel; Mike Bloomquist, Deputy General Counsel; Paul Cancienne, Policy Coordinator, CMT; Andy Duberstein, Special Assistant to Chairman Upton; Robert Frisby, Detailee, CMT; Brian McCullough, Senior Professional Staff Member, CMT; Jeff Mortier, Professional Staff Member; Gib Mullan, Chief Counsel, CMT; Katie Novaria, Legislative Clerk; Michelle Ash, Chief Counsel; Felipe Mendoza, Counsel; and Will Wallace, Policy Analyst.

Mrs. BONO MACK. The subcommittee will come to order. I would ask members to take their seats.

As we begin to work this year, I would like to thank all of the members on the Subcommittee on Commerce, Manufacturing and Trade for your participation, especially the new ranking member, Mr. Butterfield. I would also like to congratulate Mr. Upton on his chairmanship of the full committee and to thank him for entrusting me with the chairmanship of this very important subcommittee.

As you know, the Energy and Commerce Committee is the oldest standing committee in the House of Representatives, dating back to 1795. Its original name was the Commerce and Manufactures Committee and our subcommittee continues to focus on the core of our original jurisdiction. The chair now recognizes herself for an opening statement.

OPENING STATEMENT OF HON. MARY BONO MACK, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mrs. BONO MACK. This is the first hearing of our subcommittee for the 112th Congress. Over the months ahead I plan to look at a wide range of issues that deeply affect Americans in their daily lives. One of the most important as well as one of the most vexing

issues we face today is how do we get our economy back on track? How do we create new jobs? How do we bring jobs which have been lost to foreign countries back home and how do we make "Made in America" matter again? I believe it is part of our job to take a close look at what is working and what is not working and then see how we can work together to make a real difference in peoples lives.

Today's hearing is about the Consumer Product Safety Improvement Act, affectionately known as CPSIA. This legislation was truly a landmark in efforts to improve consumer product safety. It was the first reauthorization of the CPSC in 17 years and it modernized and strengthened the agency in many different and meaningful ways. While CPSIA has many virtues, there are some unintended consequences of the law as well. We have a responsibility to the American public to review those specific provisions of the law that have proven to be problematic and to fix them. Admittedly, it is a careful balancing act and we have to be certain as the old saying goes, "not to throw the baby out with the bathwater."

For thousands of businesses who strive to be responsible let us do what is best for consumers. CPSIA has consumed and inordinate amount of their time trying to understand how each new regulation and standard will affect them. Unfortunately, many have gone out of business, attributing their demise to some of the burdens of compliance with the many provisions of the new law. We need to strike a careful balance. As a Nation, we simply cannot afford to lose jobs or to stifle innovation because of unnecessary regulations. Frankly, many businesses never even heard about this law until well-after it was enacted. Most were shocked to learn of the onerous requirements it would impose on them if they manufactured or sold any children's product even though they had never done anything wrong and never had a single product recall.

It began with the best of intentions. In 2007, the widely publicized toy recalls for violations of existing lead paint standard gave way to new prohibition on lead content in children's products. As interpreted by the Commission, this category goes far beyond just toys to cover sporting goods, library books, ATVs, educational products, CDs, clothing and many other items. The goal was a noble one, making products safer for our kids but within just months of passage both the Commission and the Congress realized that problems with the new law would need to be addressed.

The Commission recently announced yet another stay of enforcement, at least five now by my count that it deems necessary to avert potentially disastrous results. What is more, during the last Congress numerous bills and legislative drafts were introduced including one by Mr. Barton to remedy some of the problems we already know about. I hope our new members can quickly get up to speed on these issues and working together we can come up with a commonsense solution that is a win-win for everyone.

Today the Commission has jurisdiction over literally thousands of different types of products. It is critically important that they should be able to prioritize their resources to address the products that pose the greatest risks to consumers. As a mother, I have very strong, passionate feelings about protecting all children but as a former small business owner I know all too well how unnecessary regulations, even well-intentioned ones can destroy lives too. This

is a rare opportunity to put aside the differences that often divide this great body and put our heads together to make a good law even better. It is up to us now and as we begin this important debate, I am going to encourage everyone to remember what we all tell our kids growing up, keep your eye on the ball.

[The prepared statement of Ms. Bono Mack follows:]

PREPARED STATEMENT OF HON. MARY BONO MACK

This is the first hearing of our Subcommittee for the 112th Congress. Over the months ahead, I plan to look at a wide range of issues that deeply affect Americans in their daily lives. One of the most important—as well as one of the most vexing issues we face today—is how to get our economy back on track. How do we create new jobs? How do we bring jobs which have been lost to foreign countries back home? How do we make "Made in America" matter again? I believe it's part of "our job" to take a close look at what's working and what's not working, and then see how we can "work" together to make a real difference in peoples' lives.

Today's hearing is about the Consumer Product Safety Improvement Act or "CPSIA." This legislation was trnly a landmark in efforts to improve consumer product safety. It was the first reauthorization of the CPSC in 17 years, and it modernized and strengthened the agency in many different and meaningful ways.

While CPSIA has many virtues, there are some unintended consequences of the law, as well. We have a responsibility to the American public to review those specific provisions of the law that have proven to be problematic and to fix them. Admittedly, it's a careful balancing act, and we have to be certain—as the old saying goes—not to throw the baby out with the bath water.

For thousands of businesses, who strive to be responsible, "let's do what's best for consumers"—CPSIA has consumed an inordinate amount of their time trying to understand how each new regulation and standard will affect them. Unfortunately, many have gone out of business, attributing their demise to some of the burdens of compliance with the many provisions of the new law. We need to strike a careful balance. As a nation, we simply cannot afford to lose jobs or stifle innovation because of unnecessary regulations.

Frankly, many businesses never even heard abeut this law until well after it was enacted. Most were shocked to learn of the onerous requirements it would impose on them if they manufactured or sold any "childreu's product"—even though they had never done anything wrong and never had a single product recall.

It began with the best of intentions. In 2007, the widely publicized toy recalls for violations of the existing lead paint standard gave way to a new prohibition on lead content in children's products. As interpreted by the Commission, this category goes far beyond just toys to cover sporting goods, library books, all-terrain vehicles, educational products, CDs, clothing, and many other items.

The goal was a noble one: making products safer for our kids. But withiu just months of passage, both the Commission and the Congress realized that problems with the new law would ueed to be addressed. The Commission recently announced yet another stay of enforcement—at least five now by my count—that it deems necessary to avert potentially disastrous results. What's more, during the last Cougress, numerous bills and legislative drafts were introduced—including one by Mr. Barton—to remedy some of the problems we already know about. I hope that our new members can quickly get up to speed on these issues, and—working together—we can come up with a common sense solution that's a win-win for everyone.

Today, the Commission has jurisdiction over literally thousands of different types of products. It's critically important that they should be able to prioritize their resources to address the products that pose the greatest risk to consumers.

As a mother, I have very strong, passionate feelings about protecting all children. But as a former small business owner, I know all too well how unuecessary regulations—even well intentioned ones—can destroy lives, too. This is a rare opportunity to put aside the differences that often divide this great body aud put our heads together to make a good law even better.

It's up to us now. And, as we begiu this importaut debate, I'm goiug to encourage everyone to remember what we all tell our own kids growing up: Keep your eye on the ball.

Mr. Butterfield, you are now up to bat.

Mrs. BONO MACK. Mr. Butterfield, you are now up to bat and the gentleman from North Carolina, the ranking member, Mr.

Butterfield is now recognized for 5 minutes for his opening statement.

OPENING STATEMENT OF HON. G.K. BUTTERFIELD, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NORTH CAROLINA

Mr. BUTTERFIELD. Let me thank the chairman for convening this very important hearing today and I certainly thank the witnesses for their anticipated testimony. We received a copy of your advanced testimony and I read most of it last evening but though I did not read all of it and so I look forward to your testimony today.

Today marks our first hearing and I want to thank the chairman of this subcommittee for calling this hearing and for her friendship and for her anticipated leadership on this very important committee. I reached out to the chairman and she has reached out to me and we have created a friendship and I look forward to working with her as we go forward. I can certainly say that the early signs are encouraging.

As today's hearing demonstrates, the issues before this subcommittee often have a real and direct impact on the daily lives of the American people. From the toaster they use at breakfast, to the dishwasher they load as they head out the door, to the dolls and the toy trucks their kids play with, people reasonably expect the consumer products they bring into their homes will be safe. Unlike many of the issues we deal with, consumer product safety is nonpartisan or at least it should be. In fact, a poll released just yesterday by the publisher of Consumer Reports found that 98 percent of American consumers agree that the Federal Government should play a prominent role in improving product safety. I am hopeful that we will be able to find common ground and move forward in a bipartisan manner on consumer product safety. It is clearly what the American people want and expect.

This is an obvious choice as our first hearing. We all understand the challenges that the Consumer Product Safety Commission has faced in implementing the CPSIA, the law that we all know so much about. I also understand that we are likely to see some legislation on this issue in the coming weeks. While no complete agency overhaul is likely to be perfect, the CPSIA has provided some crucial changes to strengthen and modernize the consumer product safety system, particularly with respect to children's products. The law established basic safety standards for limiting the amount of lead and phthalates in children's products. It also introduced a product testing system designed to ensure that all children's products and other products subject to mandatory safety rules are safe, and it gives the Commission new resources and authority, and reestablished a five-member commission, two of whom are sitting in front of us, allowing it to proceed in an unfettered way with its decision and rulemaking authority.

Consumers had long believed that if a product made it to the store shelf that it must be safe. Unfortunately, that was not the case and is not the case and the millions of toys recalled in the summer of 2007, illustrated this frightening trend and these weren't just recalls because of high lead levels. Many were due to

design-related safety defects that could have led to burns and choking and strangulation among other potentially fatal dangers.

Parents were concerned and outraged, as were the members of this committee. As a result, we resolved that our children would no longer be the frontline for measuring the risk to their health and safety from toys and other products they use. These manufacturers would have to prove their products were safe before they made their way into the hands of our children.

I understand that implementation has been a challenge for the Commission and for the small and large manufacturers working to comply with the new law. Today I hope to hear about how the law is working as well as the new challenges and as some say the unintended consequences that may have been created. I also hope to learn how the Commission allocates its resources between implementing this law and its many other important responsibilities. I also look forward to hearing why key provisions of the law still aren't being enforced. That is very important and why some congressionally mandated rules still have yet to be finalized.

I look forward to the hearing from all of the witnesses and as I said earlier, I thank you for coming today with your testimony.

Mr. BUTTERFIELD. I am going to yield my last minute that I have to any member who would like to consume. Ms. Schakowsky, you have my remaining time.

Ms. SCHAKOWSKY. I thank the gentleman very much.

I want to congratulate Chairman Tenenbaum for restoring the Consumer Product Safety Commission to its proper role of protecting consumers. And consumers do believe when they go and pick items off the shelf, they already think that somebody somewhere is protecting them, and thank goodness the CPSC is doing that just now. Before this landmark bill passed, there were 170 items of children's jewelry containing lead at high and dangerous levels. This legislation did something about that and finally, when we did our annual toy safety hill there were fewer items that we said were dangerous on the shelf.

The Commission has already shown its flexibility in dealing with some of the problems of implementation. But the bottom line issue of protecting consumers and particularly children, that is the proper role of government and that is our proper role that we will exert today. We are going to protect our consumers and our children.

Mrs. BONO MACK. Chairman Upton yielded his 5 minutes for his opening statement to me in accordance with committee rules. As his designee, I now recognize Mr. Barton, chairman emeritus of the committee and conferee on CPSIA for 1 minute.

Mr. BARTON. Thank you, Madam Chairwoman, and it is good to see you in the chair. I look forward to participating with you and the other members of this subcommittee as we have a very profitable next 2 years.

It is good to see our two witnesses, the honorable chairwoman and of course Commissioner Northup who I actually remember as congresswoman. Anne Northup, it is good to see you.

I was a conferee on the consumer product safety, whatever it was, information act 3 or 4 years ago. Mr. Dingell was the chairman of that conference. Ms. Schakowsky was on it and Mr. Waxman was on it, and I think Mr. Whitfield and Mr. Stearns on our

side. Senator Boxer I remember and Senator Inouye on the Senate side. We had a good conference. We reported a good bill. Unfortunately, we put some language in at the very end of the conference that has turned out to be very difficult because it doesn't really give the CPSC the flexibility that they need to show some discretion for some of our smaller manufacturers and in some cases, individual producers of some of these products. We introduced a reform bill in the last Congress. We were never able to get consensus on it and I hope that under the leadership of Chairwoman Bono Mack that we can get that consensus in this Congress.

And with that I would yield back and say I again look forward to working on this issue.

Mrs. BONO MACK. I thank the gentleman.

Now, I would like to yield a minute to Mr. Pompeo, one of our newest members, 1 minute.

Mr. POMPEO. Thank you, Madam Chairwoman. Thanks to the witnesses for coming out this morning. I look forward to the hearing.

A little later today on the floor or perhaps it will be early tomorrow morning I will offer an amendment of having to do with the public accessible database information. CPSC is set to roll this database out in early March as called for in CPSIA in 2008, but unfortunately the database's final role in my view has created and will create far more harm then good that it will do. The statute in my view has been interpreted to mandate the posting of materially inaccurate information and the agency has created a database that will both direct consumers away from safe products to relatively less safe ones and damage the reputation of very safety-conscious manufacturers.

I hope this amendment will pass this afternoon and we will get the time to reflect and review and give this committee the chance to do oversight so that we can get a better role, a better database that will more effectively accomplish the important objectives of the statute. Thank you.

Mrs. BONO MACK. And I have one more speaker but at this point she is not here. I would like to yield to Mr. Waxman for his opening statement for 5 minutes.

OPENING STATEMENT OF HON. HENRY A. WAXMAN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mr. WAXMAN. Thank you very much. I want to thank Chairman Bono Mack for holding this hearing and congratulate her on her new chairmanship of this important subcommittee.

Until recently, our product safety system and especially our toy safety system was terribly broken. In 2007 and 2008, we saw record recalls and a total loss of consumer confidence in the safety of all products. Children were killed and horribly injured by defective and dangerous products. The Consumer Product Safety Commission had limited statutory authority. Only two of the three commissioner slots were filled and its staff numbers and resources had thoroughly atrophied. This situation alarmed families across the nation and Congress responded. In 2008, Congress enacted truly historic product safety legislation that vastly improved our chil-

dren's health and safety. Now that we are a few years away from the recalls and the most dramatic stories have left the front pages some suggest that we didn't really need to enact such a strong law but I believe that is wishful thinking. The fact remains that the system we had in place was a failure. This law was necessary to protect kids and families across the country.

Let me just mention a few of the law's successes. Today toy recalls have dropped from 172 in 2008, to 44 in 2010. Today we have strong mandatory standards for cribs and CPSC has finished creating a publicly accessible consumer incident database which as far as I know is a very useful database and we ought to get a chance to review it.

Today CPSC has increased its staff and resources. It increased surveillance at ports, five commissioners as well as a new IT system and laboratory. To retreat now from the proven consumer protections achieved under this law would be a huge mistake.

This morning an important new study was published. It shows that between 1990 and 2008, nearly 200,000 infants and young children went to emergency rooms for injuries related to cribs and playpens. And a new poll for the Consumers' Union documents Americans want a strong federal regulator to protect children from these dangers.

As legislators we know that legislation is not flawless. Although the Commission has made great strides in carrying out this law, we have heard from a number of stakeholders that certain provisions of the law may need adjustment and we need to take these concerns seriously. Over the past 2 years we have met repeatedly with stakeholders affected by the new law to understand their concerns and to craft an appropriate legislative response. I see that some of these stakeholders are represented on the second panel of this hearing and I welcome them. As I have stated to them in the past and I will repeat today, I am committed to working with them, the Commission and members of this committee to strike a delicate balance between the need for targeted changes to the law and the need to preserve the most important public health accomplishments of the law. Product safety should not and has not been a partisan issue and it is my sincere hope that this committee will work quickly to resolve these issues once and for all.

I look forward to hearing the testimony. I look forward to working with the new subcommittee and committee leadership as we continue our commitment to protect all consumers, especially children.

And I yield back the balance of my time.

Mrs. BONO MACK. I thank the gentleman.

Today we have two panels before us. Each of the witnesses has prepared an opening statement that will be placed in the record. Each of you will have 5 minutes to summarize that statement in your remarks.

On the first panel we have and we welcome the Honorable Inez Tenenbaum, Chairman of the Consumer Product Safety Commission. Joining her on the first panel is Commissioner Anne Northup and our former colleague. Thank you both for being here today.

Chairman Tenenbaum, you are recognized for 5 minutes.

STATEMENTS OF INEZ TENENBAUM, CHAIRMAN, CONSUMER PRODUCT SAFETY COMMISSION; AND ANNE NORTHUP, COMMISSIONER, CONSUMER PRODUCT SAFETY COMMISSION

STATEMENT OF INEZ TENENBAUM

Ms. TENENBAUM. Thank you and good morning, Madam Chairman, Ranking Member Butterfield and members of the Subcommittee on Commerce, Manufacturing and Trade.

Since assuming the chairmanship of the Commission in July, 2009, I have focused on three key objectives. First, I have worked diligently to implement the Consumer Product Safety Improvement Act and use that Act's new authorities in a manner that is both highly protective of consumers and fair to industry stakeholders. I recognize that some of these rules have caused concern in the regulated community and I have worked to provide appropriate relief whenever possible. However, it is also important to point out that the vast majority of the CPSIA rules and requirements had been adopted unanimously by the Commission and widely accepted by the industry consumer groups and families across the country.

I am pleased to report to the subcommittee, we are on time and on budget to launch the public database on the safety of consumers' products mandated by Section 212 of the CPSIA and this launch is on March the 11th. This database will empower consumers with information allowing them to quickly determine whether products they already own or are considering purchasing are associated with safety hazards or recalls. I want to assure this subcommittee that CPSC staff has worked to ensure that the database is fair to all stakeholders while also fulfilling the intentions of Congress. Overall, I strongly believe that we have reached the right balance of addressing the manufacturers' legitimate concerns while also ensuring that the public has access to critical consumer product safety information. This database will prevent injuries and it will save lives. Congress recognized this when it added Section 212 to the CPSIA and I look forward to seeing this important to fully implemented in just 3 weeks from now.

Second, I have focused on changing the CPSC's internal processes so that the agency is more assertive and more capable of addressing safety challenges presented by thousands of types of consumer products imported from all over the world. In the last year the Commission has released a strategic plan that establishes a plan to make the CPSC the global leader in consumer product safety. We have established a new office of education global outreach and small business ombudsman that has already begun to provide outreach to small businesses and crafters. We have embarked on a substantial upgrade of our information technology system which has formed the backbone of the database and our new CPSC.gov homepage.

Third, I have focused on proactive prevention of consumer harms identifying emerging hazards and keeping those products out of the stream of commerce. We have taken a number of steps to increase the surveillance of potentially harmful consumer goods by signing several information sharing agreements with Customs and Border Protection and increasing our physical presence at the ports of entry. The Commission's safe sleep team has also made great

strides to rid the marketplace of dangerous cribs, usher in a new generation of safer cribs and to educate parents about the importance of maintaining a safe sleep environment for infants and toddlers. A key component of this was the mandatory crib safety standard. These standards were designed through many hours and staff working collaboration by the Commission resulting in a unanimous vote in favor of the new standards on December the 15th, 2010. And particularly, I am extremely proud of the Commission's staff and the work they have done to implement the bulk of the CPSIA and create a safer consumer product marketplace for all Americans.

The Commission has received increases in appropriations over the past 3 years. These resources are making a difference. They ensure that we can get the message out to families after a hurricane or an ice storm that the use of portable generators in homes can result in carbon monoxide poisoning and tragedy. They also allow us to do public outreach to new mothers so they will not place their newborns into an unsafe sleep environment that could result in a tragedy. Some will say that these resources are solely to promulgating rules under the CPSIA. This is untrue.

In 1980, the Commission had almost 1,000 employees and an inflation-adjusted budget of $150 million. By 2007, the Commission had fallen to 385 employees and was barely able to carry out its core functions. We simply cannot return to those dark days.

In the coming months I look forward to discussing possible target improvements to the CPSIA with this subcommittee. On January 15, 2010, I reported a unanimous report of the Commission requesting some additional flexibility on some key requirements. I recognize that some want to go further than this and reopen the entire act. This would be a mistake. Calls for a return to a completely risk-based lead paint and contents standard are one example of a proposal that is seriously ill-advised. Lead is a contaminant and a powerful neurotoxin. It is a particular threat to the developing brain of a fetus, infant and a young child and with documented negative effects on behavior and permanent loss of IQ.

During my tenure as chairman, my message to manufacturers has been simple. Get the lead out. If it absolutely has to be in your product, we have sought the authority to address it through a functional purpose exception. We have made substantial progress in this area since the passage of the CPSIA and parents should never have to wonder and worry about whether the model train or the toy they purchase for their child is leaded or unleaded.

Thank you again for inviting me to provide testimony before the subcommittee today.

[The prepared statement of Ms. Tenenbaum follows:]

Statement of
Inez Tenenbaum
Chairman
U.S. Consumer Product Safety Commission

Before the
U.S. House of Representatives
Committee on Energy and Commerce

Subcommittee on Commerce, Manufacturing and Trade

"A Review of CPSIA and CPSC Resources"

February 17, 2011

Good morning, Chairman Bono Mack, Ranking Member Butterfield, and Members of the Subcommittee on Commerce, Manufacturing and Trade. I am pleased to be here today to provide an update to the Subcommittee on actions the U.S. Consumer Product Safety Commission (CPSC) has taken over the past 18 months and the progress we have made to protect American children and families from both existing and emerging product safety hazards.

Since assuming the Chairmanship of the Commission in July 2009, I have focused on three key objectives. First, I have worked diligently to implement the Consumer Product Safety Improvement Act of 2008 (CPSIA) and use that Act's new authorities in a manner that is both highly protective of consumers and fair to industry stakeholders. Second, I have focused on changing the CPSC's internal processes, so that the agency is more assertive and more capable of addressing safety challenges presented by thousands of types of consumer products imported from all over the world. Third, I have focused on proactive prevention of consumer harms: identifying emerging hazards and keeping those products out of the stream of commerce.

Fair and Effective Implementation of the CPSIA:

Children's Product Safety Provisions: In August 2008, Congress passed the CPSIA by overwhelming bipartisan majorities. Passage of the CPSIA sent a strong message to both the Commission and the consumer product manufacturing community: that the old, reactive regulatory approach was not working, and that the public will not accept another "Summer of Recalls."

In the last two years, Commission staff have worked diligently and successfully to implement almost all of the main provisions of the CPSIA. As part of this process, we have dealt with a few sections that have caused concerns in some segments of the regulated community. The Commission has been responsive to those concerns and provided appropriate relief where necessary. One example of this is the Commission's recent decision to extend the current stay of enforcement implementing third-party testing for lead substrate in children's products until December 31, 2011.

It is critical to note, however, that the vast majority of CPSIA rules and requirements have been adopted unanimously by the Commission – and widely accepted by industry, consumers groups, and families across the country. These rules include:

- New durable infant and toddler product standards, so that we never again have to hear of an infant that drowning in a defective bath seat or a toddler who is paralyzed by a poorly designed baby walker that tumbles down a flight of stairs;

- Product registration cards that now accompany many juvenile products, so parents who register can receive proactive notification of recalls; and

- The inclusion of tracking labels, to the extent practicable, on children's products so that parents can identify who made them – even long after the packaging is thrown away.

The Public Searchable Database: In March 2011, we will unveil our new publicly available database on the safety of consumer products, which was mandated by section 212 of the CPSIA. This database, which is an important element of the Commission's overall effort to upgrade its antiquated Information Technology systems, will provide a powerful source of information for consumers, allowing them to quickly determine whether products they already own, or are considering purchasing, are associated with safety hazards or recalls. It also will allow consumers to play a critical role in safety by empowering them to submit information about potential product hazards for inclusion in the database.

I recognize that the rollout of this database has caused concern among some in the manufacturing community who believe that it will present "unfiltered" information that will be harmful to the business community. I want to assure this Subcommittee that CPSC staff has worked tirelessly to address these concerns and to ensure that the database is fair to all stakeholders while also fulfilling the intentions of Congress.

First, the database will not include reports of harm submitted anonymously. Any reports filed must include contact information for the CPSC's internal use. Second, the CPSC will give the product manufacturer 10 business days to respond to a report of harm, to provide comment on the report, and to let the Commission know if the submission contains confidential or materially inaccurate information. The rule requires the Commission to remove or correct information in the database within seven business days that it has determined to be materially inaccurate. Manufacturers also have the right to comment on the reports and to have those comments posted as part of the publicly accessible record.

At the same time, however, I think it is important to provide a reminder of just how critical a resource this database will be for consumers. Rather than use my words, I would like to repeat the words of Lisa Olney, whose daughter died in a defective portable crib just after her first birthday in 2002. Ms. Olney posted the following on the *Kids in Danger* web blog:

> *On December 19, 2002, my daughter Elizabeth, just 13 months old, died in a poorly designed play yard. I live my life often looking back through "what ifs" and "should haves," but I've learned to give most of that up in order to save myself from being a horribly miserable individual. Instead, I realize the importance of focusing on efforts to protect our children so that no parent has to suffer what I have, along with too many other victims of unsafe children's products. The CPSC database is going to protect*

millions of children, because it provides a place to go when considering the choices parents make when purchasing products, especially those products intended to be beneficial to our children's safety.

This database will prevent injuries and save lives. Congress recognized this when it added section 212 to the CPSIA, and I look forward to seeing this important tool fully implemented this March.

A Reinvigorated Commission:

New CPSC Strategic Plan: During my confirmation hearings in the summer of 2009, I noted that one of my key goals for the Commission was to align its priorities with the challenges we face in the global economy. To address this, the CPSC launched a comprehensive strategic planning initiative earlier this year to update the Commission's outdated 2003 Strategic Plan. Out of this effort, we recently released the Commission's new 2011-2016 Strategic Plan, which lays out five key goals and also details programmatic objectives that will allow the CPSC to establish itself as the global leader in consumer product safety.

New Office of Education, Global Outreach and Small Business Ombudsman: As Chairman, I have heard from many small businesses and crafters who have asked for additional outreach and support from the Commission as they work to produce safe products and comply with the requirements of the CPSIA. I take these concerns very seriously and have made providing support and outreach to small business entities and other industry stakeholders a key priority.

On September 22, 2010, the Commission voted to create a new office to coordinate and provide outreach to various domestic and international stakeholders, including manufacturers, retailers, resellers, small businesses, and foreign governments. Within this office, we have a full-time Small Business Ombudsman who is dedicated to serving the nation's many smaller businesses in the area of product safety. In particular, special attention will be given to developing "plain English" information tailored to small businesses and small batch manufacturers so that they can understand and comply with new standards.

New CPSC Website: As part of the Commission's overall Information Technology improvement project, the Commission also launched a new updated CPSC.gov home page last December, and currently is in the process of upgrading the entire website. These improvements will allow consumers to more easily search for recalls, report safety incidents and injuries, and view videos on keeping their families safe from product hazards. In addition, the new website will provide industry, and particularly small businesses, with increased access to resources on how to produce safe products that comply with applicable safety standards.

A New Focus on Prevention:

Import Surveillance: Traditionally, the Commission has spent the bulk of its resources investigating harmful products in the marketplace. This will always form a substantial part of the CPSC's activities, but I believe the more effective approach is ensuring that harmful products never even enter the country. To that end, I have taken a number of steps to add additional technological and human resources to the Commission's Import Surveillance Division. This Division works directly with the Department of Homeland Security (DHS) and Customs and Border Protection (CBP) to keep dangerous products out of the United States.

On the technological side, the CPSC recently executed two interagency Memorandums of Understanding (MOUs) with CBP that allow us to access more "real time" importer information and target the most dangerous incoming shipments. The first of these MOUs, signed in April 2010, allows CPSC personnel to work at CBP's Commercial Targeting and Analysis Center (CTAC) in Washington, DC, and access manifest entry data collected by CBP. This, in turn, allows Import Surveillance Division personnel at the ports to target high-risk shipments prior to their entry into the domestic stream of commerce.

The second MOU, signed with CBP in August 2010, gives the CPSC access to information in the Treasury Enforcement Communications System (TECS). This will assist CPSC Import Surveillance staff at the ports by providing them with additional information to improve local targeting and interdiction of dangerous products.

The CPSC is also actively involved in supporting the Importer Self Assessment – Product Safety (ISA-PS) initiative that is currently being piloted by CBP. The ISA-PS is intended as a partnership between CBP, CPSC, and importers to ensure product safety compliance. It is based on a voluntary approach that provides meaningful benefits for importers who demonstrate readiness to assume additional responsibility for managing and monitoring their own product safety compliance.

We have also taken steps to increase CPSC's physical presence at ports of entry. In fiscal year (FY) 2008, the Import Surveillance Division only had five full-time employees (FTEs), and of those only three FTEs were actually stationed at ports of entry. During FY 2010, we expanded staffing in the Division to 18 FTEs, with 14 FTEs actually stationed at ports of entry. I am very pleased to announce that, as of November 11, 2010, the Division now has 25 FTEs, with 19 FTEs collocated at 15 different ports of entry. Subject to appropriations, we hope to put CPSC staff at even more ports of entry in the future.

Putting more "cops on the beat" has already yielded substantial positive results. In FY 2010, we performed 6,953 screenings at ports, collected 1,776 samples for testing, and of those found 987 that violated CPSC standards. At the same time, we have also seen the number of recalls start to drop – from 563 in FY 2008 to 428 in FY 2010. Maintaining those positive trends is a key goal for the upcoming year.

The Safe Sleep Team: The overall safety of cribs and the infant and toddler sleep environment is a critical concern of the CPSC and a personal priority of mine. Parents across the country expect cribs to be a sanctuary for their children, regardless of price or size. Unfortunately, that is not always the case. In the past nine years, there have been at least 32 deaths attributed to drop-side crib failures. That, in and of itself, is a tragic number. However, the majority of crib deaths are still directly linked to the use of soft bedding in the crib.

To address this, I directed Commission staff to embark on a two-prong action strategy. The first prong was to recall old, dangerous drop-side cribs in the marketplace and promulgate new mandatory crib safety rules that will prohibit dangerous drop-side cribs from ever being sold again in the United States. I am pleased to report that the new mandatory crib safety rule was approved by the Commission is a unanimous vote on December 15, 2010.

The second prong of this initiative is education: teaching parents and caregivers how to keep the inside of cribs free from suffocation risks like stuffed animals, comforters, and pillows. In partnership with the American Academy of Pediatrics and a child advocacy group called Keeping Babies Safe, we have a wonderful new Safe Sleep video that we are working to have shown in maternity wards and pediatrician's offices around the country. This video is currently available on the CPSC's website, and I urge Members of the Subcommittee to view the video and see its powerful message.

Rapid Response to New Hazards: The Commission has increased its efforts to provide a rapid response to new and emerging hazards. One example of this response is the CPSC's efforts to stop the use of toxic metals in children's products. Earlier this year, it came to our attention that some foreign manufacturers might be using cadmium or other toxic metals as an effort to get around the lead limits for children's products. I sent a strong message to Asian manufacturers and regulators that this was unacceptable and that we would not allow there to be an influx of products with cadmium like we saw a few years ago with lead. The Chinese government sent out a directive a few weeks later on cadmium that used language similar to mine. It appears that we have stayed ahead of this issue.

Despite this early success, however, the Commission will remain vigilant in this area. In response to the possible threat, the CPSC has taken aggressive action to police the market for children's products that may contain harmful levels of

cadmium. In addition, Commission staff recently released a guidance document providing Acceptable Daily Intake (ADI) limits for cadmium. We also sent this document to several standards setting bodies – including the committee that oversees the ASTM F963 toy safety standard – with instructions to take action on this issue. This year, we will also look at the use of other toxic metals such as barium and antimony, and the CPSC will not hesitate to take further action in this area if voluntary efforts prove insufficient.

Moving Forward:

In the past eighteen months, the CPSC has implemented the bulk of CPSIA and moved towards a more responsive, proactive approach to consumer safety. In particular, I am extremely proud of the Commission's staff – and the work they have done to create a safer consumer product marketplace for all Americans.

The Commission has received increases in appropriations over the past three years. On Monday the President released the Administration's Fiscal Year (FY) 2012 Budget, which continues this commitment to rebuilding the Commission by requesting $122 million for expenses – a slight increase over the FY 2010 level. I deeply appreciate the continued investment in the Commission and have made every effort to ensure that these funds are spent wisely and judiciously – by putting more personnel in ports, expanding outreach, and responding to emerging hazards like drywall.

These resources are making a difference. They ensure that we can get the message out to families after a hurricane or an ice storm that use of a portable generator in home can result in carbon monoxide poisoning and tragedy. They give us the resources to put out remediation guidance for families with contaminated drywall. They also allow us to do public outreach to new mothers – so they do not place their newborns into an unsafe sleep environment that could result in tragedy.

Some will say that these resources are solely devoted to promulgating rules under CPSIA. That assertion is false. In 1980, the Commission had almost 1000 employees and an inflation-adjusted budget of over $150 million. By 2007, the Commission had fallen to 385 employees – and was barely able to carry out its core functions. This led to the "Summer of Recalls" and public outcry to reinvigorate and properly fund the CPSC. We simply cannot return to those dark days.

In the coming months I look forward to discussing possible targeted improvements to the CPSIA with the Subcommittee. On January 15, 2010, I supported a unanimous report of the Commission requesting some additional flexibility for certain requirements. Specifically, I supported a "functional purpose" exception to the section 101 lead substrate requirements where lead absolutely has to be in a children's product, prospective application of the 100 parts per million (ppm) lead limit "step down" set to occur on August 14, 2011, and targeted relief to address small manufacturer and crafter concerns with regard to the third-party testing and certification requirements in section 102.

I recognize some want to go further than this, and reopen the entire Act. That would be a mistake. Calls for a return to a completely "risk-based" lead paint and content standard are one example of a proposal that is seriously ill-advised. Lead is a contaminant, and a powerful neurotoxin. It is a particular threat to the developing brain of the fetus, infant, and young child, with documented negative effects on behavior and permanent loss of IQ points.

The scientific community is almost entirely in agreement that there is no "safe" level of lead. This is not a new finding. In May 1936, Consumer Reports published an article entitled "Lead Hazard in Toys," and noted that:

> *The hazard is especially great because lead is a poison which accumulates in the body, and can do great damage in amounts almost infinitesimally small. Some medical authorities believe that lead presents one of the gravest risks of childhood, being responsible for many obscure ailments which can be diagnosed only with the greatest difficulty.*

During my tenure as Chairman, my message to manufacturers has been simple: get the lead out. If it absolutely has to be in a product, we have sought the authority to address it through a "functional purpose" exception. We should not, in any way, slow or reverse the removal of this toxic contaminant from children's products wherever possible. We have made substantial progress in this area since passage of the CPSIA, and parents should never have to go back to wondering – and worrying – about whether the model train or toy they purchase for their child is "leaded" or "unleaded."

* * * * *

Thank you again for inviting me to provide testimony before the Subcommittee today. I now look forward to answering any questions you may have.

Mrs. BONO MACK. I thank the chairman and recognize Commissioner Northup for 5 minutes.

STATEMENT OF ANNE NORTHUP

Ms. NORTHUP. Thank you, Madam Chair, and let me congratulate you. I know you are the first woman that is a subcommittee chairman of the Energy and Commerce Committee and as a former member I know that those achievements are so important to all the women that come behind us. It is very exciting to the women on Capitol Hill to see you as the chair so I congratulate you, and also, Ranking Member Butterfield, thank you for having me here today.

I appreciate the opportunity to come and talk a little bit about the CPSIA. I certainly want to acknowledge what the chair said and that is that most of our votes have been five to nothing. They are bipartisan. There is a wish across the Commission to make sure that our children are safer. I feel that if I had been still in Congress when the CPSIA had come before me that I would have voted for this bill. And understanding it as I read it as I was nominated by the President to this Commission and then went through the confirmation process, I had an opportunity to visit with most of the Senators who had been on the subcommittee and the committee, the Commerce Committee. And overwhelmingly I heard from them that there were unanticipated consequences of this bill and told me that they believed in the bill that there was a flexibility for us to both protect children and to avoid these unintended consequences and I promised them that I would do that.

And like I said as I read the bill, everything seemed sn straightforward and so reasonable. It was only then when I was sworn in that I found out that the Commission had come to certain conclusions about portions of this bill, especially the absorb ability exclusion that have rendered whole sections of the bill meaningless. In other words, our Commission has found on a partisan majority that that section of the law is totally meaningless, that it does not apply to one product. So I am here today, not to be the naysayer because I think it is important entirely. I think it is important to recognize that our chair has instituted some things that have modernized this Commission and have made it possible for us to intercept things at the border and to advance our technologies that will make an enormous difference and help us protect children.

So I am here though to bring to your attention some of my concerns. It has been shocking to me the number of businesses that we have entirely caused to go out of business, the number of businesses that have left the children's product arena completely because of this bill, the number of choices that parents no longer have. Everyday I hear from husinesses who tell me we use to make this many versions of this product. Today we make one because any additional components will cause us this many more thousands of dollars of testing, this many more thousands of dollars of paperwork and tracking and concerns that we have, and we heard it just at the toy fair this weekend. Almost universally, people estimated their cost and increase the price to parents 20 to 30 percent and the fact that they have reduced the bells and whistles of their toys. They have, as one major manufacturer told me, we have taken the fun out of toys because we don't want to put multiple colors. We

don't want to put the sound in it. We don't want to put the extra additions to it because we have to—it is just so complicated to abide by the law.

Specifically, the law requires that yes, everyone meet the lead standard and that means whether the lead is absorbable to not, even though in the law it said that items where the lead was not absorbable where exempted from the law. So we have applied it so that everything is affected by that even when it is not absorbable. So people that make ball bearings and connectors and things like that have no way to make those products and still comply by the law. Or they are using, as somebody told us in testimony, substitutes that are even less safe, like antimony, a known carcinogenic. So we need to address that exclusion.

I want to use the rest of my time to talk about the database. Right now you can go on Amazon.com, decide you are going to order a highchair for your child as I did for my grandchildren and the brand that I chose, I put in a brand, 147 different highchairs they make and some of them are $54 on the first page, one is $148. Today our database, somebody puts in an incident and all they have to do is give that brand name. They do not have to say whether it was the $54 chair or the $148 chair. They can be misidentifying it as we find people misidentify things in incidents everyday. That kind of information is not helpful to consumers. If accurate information is helpful, inaccurate information can drive people away from the safest product and it is not helpful to us who have to enforce the law. I know we will have a chance to talk about this further in the questions and answers but I did want to bring that to your attention.

Thank you very much.

[The prepared statement of Ms. Northup follows:]

Testimony of Anne M. Northup
Commissioner
United States Consumer Product Safety Commission

Hearing: "A Review of CPSIA and CPSC Resources"

Before the

U.S. House of Representatives
Committee on Energy and Commerce

Subcommittee on Commerce,
Manufacturing, and Trade

February 17, 2011

Chairman Bono Mack and Ranking Member Butterfield, thank you for the opportunity to provide testimony to this Subcommittee to inform your review of the Consumer Product Safety Improvement Act of 2008 (CPSIA) and the resources of the Consumer Product Safety Commission (CPSC). This Commission has a proud history of assessing risk and providing leadership in consumer product safety issues across a variety of industries.

As a Commissioner since August of 2009, I now have a tremendous appreciation for the work that goes on in an agency, including the time and effort that agencies expend implementing the laws Congress passes. It is not a simple task, and my colleague, Chairman Tenenbaum, has put in countless hours to ensure that the Commission meets its deadlines and fulfills the difficult tasks it has been given.

My testimony today will focus on the devastating impact the CPSIA is having on American business growth and competitiveness, as well as the strain it imposes on the Commission's resources, all with little or no offsetting improvement in product safety. I will also propose four specific actions Congress can take to ameliorate these effects. Congress, through the appropriations process, could immediately (1) prohibit the Commission from expending any funds for the purpose of undertaking any further regulatory action without first performing a full cost-benefit analysis and making a finding that the cost of the action is justified by its expected benefits; and (2) prohibit the Commission from expending any funds for the purpose of launching the Public Database until the Commission's regulations ensure that the information contained in a report of harm submitted to the Database is verifiable, and the Commission has established an effective procedure for resolving a claim of material inaccuracy before a report of harm is put on the Database. Two longer term solutions that would require amending the CPSIA, include (1) changing the language at CPSIA § 101(b)(1) to exclude products or materials with a level of absorbable lead that the Commission determines not to be harmful to a child's health; and (2) eliminating third-party testing, certification and tracking labels of all children's products, allowing the Commission to retain its authority to impose such requirements only where necessary to address a risk with a specific product or material.

I. Background on the CPSIA

As you may know, the CPSIA was passed following a number of high-profile recalls involving lead in paint found on children's toys imported from China. While the law passed with broad support in 2008, its many unintended consequences have since led both Democrat and Republican Members of Congress to introduce bills reforming the law. Last year, this Subcommittee held a hearing on potential CPSIA amendments, and the Appropriations Committees of the House and Senate requested a Report from the five Commissioners in January of 2010 on ways to amend the CPSIA. (*See the following link for the Report to Congress and the Commissioners' five statements: www.cpsc.gov/about/cpsia/cpsiareport01152010.pdf*). Thus, the law no longer enjoys the broad support it received in 2008.

II. Economic Impact of the CPSIA

In March 2009, Commission staff reported that the economic costs associated with the CPSIA would be "in the billions of dollars range."[1] Industry associations representing manufacturers of furniture, mattresses, sports equipment, children's clothing and handmade toys, just to name a few, have all told us that they will be saddled with enormous costs, first to reengineer their products to satisfy the new standards imposed by the law, and then to third-party test every component of every product they make to demonstrate compliance with all of the applicable standards. Small businesses without the market clout to demand that suppliers provide compliant materials have been hit the hardest. Many report that the new compliance and testing costs have caused them to cut jobs, reduce product lines, leave the children's market completely, or close. Attached is a sample list of businesses impacted by the CPSIA, as well as other economic data.

This anecdotal data does not reflect the full breadth of the law's requirements, because the most onerous provisions of the law have yet to go into effect. The law's widest reaching mandate—third-party testing of all children's products for lead content – is stayed until December 31, 2011. In addition, the Commission has yet to implement the law's mandate to third-party test to the phthalates or toy standards. When the CPSC is fully implemented, the entire process companies must go through to produce a toy or children's product will have drastically changed. Under the law, all toys must be tested at third-party labs for lead and phthalates, as well as to the toy standard, ASTM-F963, which the CPSIA made mandatory. As a result, a doll maker will be required to send to a third-party lab to be tested for lead, phthalates and any applicable rules under the toy standard, every component part, including each paint color used on the eyes, each button, the hair, and all of the accessories. After the components are fully assembled, the finished product will need to be sent back to a third party lab for additional testing and certifications related to the toy standard. Companies tell us that these requirements stifle innovation and product variety by erecting significant cost barriers to adding to toys new accessories, new colors, or other variations. For example, a large toy manufacturer told me that his company has had to "de-spec" certain toys in order to afford the law's new costs, which means removing accessories, moveable pieces or other parts – or, in the manufacturer's words, "taking the fun out of toys."

According to a brief small business analysis by our agency, the cost to test one toy could range from $3,712 to $7,348—not taking into account that the toy will likely change to stay competitive for the next Christmas season, or sooner, and every material change triggers a whole new set of tests.[2] And these costs do not include the cost to certify to these third-party tests, to add a tracking label, or to maintain the data and paperwork so that every component and material can be traced back to its specific test and lot number.

---

[1] Letter from Acting CPSC Chairman Nancy Nord to Representative John Dingell, March 20, 2009.

[2] Regulatory Flexibility Analysis: Testing and Labeling Pertaining to Product Certification, 16 CFR Part 1107, Notice of Proposed Rulemaking, CPSC Docket No. CPSC-2010-0038, May 20, 2010

All of these steps are required by the CPSIA without any regard for whether the product presents a safety risk.

In fact, while the costs to companies of reengineering products to meet the lead limits has been steep, many tell us that the ongoing costs to third party test, label and track every component have been and will continue to be much higher—all without any measurable benefit. A company making furniture for children's rooms would need to: 1) determine if its product is "primarily intended" for children 12 and under---an issue for which the Commission has provided ambiguous guidance; 2) submit for testing to a third-party lab every part of every piece of furniture that may be accessible on a children's product, including nuts, bolts, and varnishes (one piece of furniture may have fourteen different coats of finish); 3) certify each component based on each of these tests; 4) add to each piece of children's furniture a tracking label containing a lot number that can trace each component to its specific certification and test; 5) maintain records for all tests and certifications for all parts of each children's product; and 6) start this process all over again, if they decide to make a material change to the product, including a change of color or manufacturing process.

One furniture manufacturing company reported that it spent approximately $13 million putting together a testing, tracking, and labeling system for its children's furniture, even though not one of its components exceeded the new lead limits or otherwise needed to be replaced. There was clearly no safety benefit, yet the company has faced enormous costs. Large and small companies alike must hire a lawyer or other outside expert simply to ensure they understand the extent to which their products are impacted by various provisions of the law.[3]

The CPSIA fails to make any distinction between large and small businesses, or foreign and domestic manufacturing, thus giving an obvious competitive advantage to large manufacturers who produce items overseas, where manufacturing and testing costs are cheaper. Meanwhile, the backbone of our economy, small businesses—from screen printers to manufacturers of chemistry sets for schools—are being forced to cut jobs or take other drastic measures due to the cost of compliance.

The CPSIA third-party testing requirements and lead content standards are far more stringent than the requirements governing products sold in the EU, Japan and other major markets. As a result, preexisting rules governing the export of domestically manufactured products that do not satisfy United States product safety standards erect a significant barrier to domestic manufacturing growth. A company wishing to sell a product in a foreign market can only manufacture it in the United States for export if the product has never been in commerce before, and if it undergoes a lengthy pre-approval process by both the CPSC and the receiving country. The CPSIA's new onerous requirements, combined with the difficult process for exporting products not meeting United States product safety standards, will encourage more businesses to move their manufacturing operations overseas. The CPSIA thereby undermines the economic

[3] "Mattel Finds CPSIA to be a Challenge," *Product Safety Letter*, November 9, 2009.

imperatives of increasing both employment and exports, and is inconsistent with President Obama's exhortation that American companies relocate their manufacturing to the United States.

III. Impact of the CPSIA on the Commission's Resources

In both 2009 and 2010, the agency focused its time and resources principally on implementing the CPSIA. Although the Commission is a relatively small agency (FY 2010 funding of $118 million), its budget has grown by nearly 48 percent since the law's passage in 2008, with both old and new resources shifted away from more risk-based priorities to implement the arbitrary, non risk-based mandates of the CPSIA, including the lead-in-substrate and phthalates bans, the Public Database, and the third-party testing, certification and labeling requirements. Over the last two and half years, the Commission has issued an estimated 3,500 pages of regulations and guidance documents as a result of the CPSIA—a large portion of which must be read and understood by every affected company in order for them to grasp the law's complex requirements.

The diversion of the Commission's resources to CPSIA implementation reduces our focus on genuine safety hazards. Our agency is charged with "protecting the public from unreasonable risks of serious injury or death" from consumer products—but we cannot fulfill this mission if our time is spent primarily enforcing the CPSIA, including its complex, non-risk-based, testing and certification requirements.

Indeed, since 2008, there has been a significant delay in progress on actions to address many genuine safety hazards, such as promulgating standards to reduce the risk of death and injuries caused by cigarette lighters, table saw blades and portable generators. These issues would be front and center on the Commission's schedule if it were not for the CPSIA.

The new Public Database also will be a substantial drain on Commission resources. By the end of fiscal year 2011, the Commission will already have spent $29 million to develop the Database. And while we have not been able to estimate future costs, it is likely that the costs to maintain the Database will continue to strain Commission resources for years.

IV. Proposals to Immediately Ameliorate the CPSIA's Effects

A. Prohibit the Commission from expending any funds for the purpose of undertaking any further regulatory action without first performing a full cost-benefit analysis and making a finding that the cost of the action is justified by its expected benefits.

This Commission has received a considerable amount of anecdotal evidence from companies and trade associations regarding the costs to test at independent labs, as well as the cost of certification, tracking labels, continued testing, record keeping, testing to

product standards, and the potential reputational and litigation costs that will result from the upcoming Public Database. Our staff has compiled some sample testing costs for toys and bikes, as part of a Regulatory Flexibility Analysis for our Testing and Labeling Rule. But the Commission has never conducted a full cost-benefit analysis of any regulation we have promulgated under the CPSIA.

I believe such analyses would reveal that much of our CPSIA mandated regulation cannot be justified. To begin with, there is no scientific evidence suggesting there is any benefit from many of the law's requirements. For instance, no government health agency, including the CPSC, has ever concluded that the components of children's products containing either 300ppm lead content or the interim-banned phthalates pose a safety risk to children. And until directed to do so by Congress in the CPSIA, the Commission saw no reason to make ASTM-F 963 a federal standard, or to require all toy manufacturers to send their products to third-party labs to test to this standard. Regarding lead, the Environmental Protection Agency (EPA) and the Centers for Disease Control (CDC) report that in 1978, about 13.5 million children ages 1-5 had elevated blood lead levels. However, by 2007-2008, this number had declined to about 250,000 children.[4] Similarly, 2007 data indicates that one percent of children selected for testing across the country showed an elevated blood lead level as established by the CDC. This number was down from nearly eight percent in 1997,[5] and is likely attributable to the elimination of lead in gasoline, as well as lead paint education and abatement. The CDC and the EPA have issued guidance for reducing children's exposure to lead, and neither has ever suggested that parents take away a child's bicycle because of the lead in the substrate of the metal comprising the spokes, pedals or handlebars. Nor has it ever been argued that the CPSIA, with all of its costs, will lower the number of children reaching the "tipping point" of having an elevated blood lead level.

Because the CPSIA's new requirements are not risk-based, manufacturers are spending time and money satisfying arbitrary standards, rather than on improving the safety of their products to the benefit of consumers. In fact, many of these requirements amount to massive new paperwork and tracking systems, rather than actual modifications to the products themselves. The American Home Furnishings Alliance writes in a letter to Commissioners:

> [T]here has not been a corresponding benefit in the improved safety of children's furniture for children. All the representatives told you that their respective companies have not had to change a single material they use in the manufacturing of their children's product lines since they began testing to CPSIA in 2008....The testing is simply being done to attempt to prove a negative.[6]

Similarly, some industry associations have had very few, if any, safety violations; yet, they are required to comply with onerous third-party testing, certification, tracking and

[6] Letter to Commissioners from the American Home Furnishings Alliance. November 8, 2010.

labeling requirements that will not improve safety. The American Apparel and Footwear Association writes in their public comments on the Component Parts rule:

> As the CPSC continues to issue specific compliance requirements, manufacturers become increasingly wrapped up in ensuring compliance over ensuring product safety. All AAFA members have had long-standing quality control programs in place that have developed based on the product, production of the product and the manufacturer's unique circumstances. These programs are effective and do not need to be changed. To demonstrate, only .0084% of all apparel and footwear sold in the U.S. in 2008 were involved in a recall. Moreover, most apparel and footwear recalls have been drawstring violations – a compliance issue that results from lack of information not lack of testing.[7]

The law imposes on small businesses onerous requirements that are hurting the economy, without any evidence of a safety benefit. The CPSIA's lead content standard, interim-ban of phthalates, and all third-party testing requirements are not based on risk. The CPSC has the authority to impose these types of requirements on any product or industry, if it determines that a risk exists and these costs are necessary to reduce or eliminate the risk.

Finally, there is a cost to consumers—not only in the loss of jobs in a struggling economy, but the loss of choice. Many manufacturers can afford the costly mandates of the law only by reducing their product lines, leaving the children's product market, or "de-specing" their toys – with no offsetting improvement in safety. The costs of complying with the CPSIA will discourage newcomers to the market and choice will be reduced, even as prices increase. Some international toy makers have even decided to leave the American market due to the costs imposed by the CPSIA, although they are still offering their products to European consumers.[8]

There is thus overwhelming anecdotal evidence suggesting that the costs, both economic and intangible, to the economy, businesses and consumers far outweigh any minimal improvement in safety that could be attributed to the CPSIA. Congress could prevent further harm by prohibiting the Commission from expending any funds for the purpose of undertaking any further regulatory action without first performing a full cost-benefit analysis and making a finding that the cost of the action is justified by its expected benefits.

B. Prohibit the Commission from expending any funds for the purpose of launching the Public Database until the Commission's regulations ensure that reports of harm submitted to the Database contain sufficient information to permit verification, and the Commission has

[8] One American importer of toys lists on its website the European brands that it no longer offers for sale in the United States due to the CPSIA: http://www.eurotoyshop.com/getEndangeredToys.asp

established an effective procedure for resolving a claim of material inaccuracy before a report of harm is published on the Database.

Section 212 of the CPSIA requires the Commission, subject to the availability of appropriations, to establish and maintain a public, web portal accessible Database on the safety of consumer products. The statute identifies five sources from which the Commission shall receive reports of harm. These are (1) consumers; (2) local, state, or Federal government agencies; (3) child care professionals; (4) child service providers; and (5) public safety entities. CPSIA § 212(b)(1)(A).

Each of these categories of submitters is likely to have first-hand knowledge of the harm reported. They can therefore be expected to provide accurate and reliable information that may be useful to consumers seeking product safety information.

Notwithstanding the statute's clear language, the Commission's Majority adopted a rule that greatly expanded the list of allowable submitters to the Database. For example, the Commission's regulation defines "consumers" to include "attorneys", and "public safety entities" to include "consumer advocates or individuals who work for nongovernmental organizations, consumer advocacy organizations, and trade associations." 16 C.F.R. § 1102.10(a). This expansion goes against the statutory purpose that the Database be "useful" for consumers and not disseminate erroneous information.[9] Indeed, the Majority has expanded the list of submitters to such an extent that ***anyone*** can submit reports of harm—thereby rendering meaningless the statutory language listing permitted submitters.

It is important that individuals with first-hand knowledge of incidents of harm involving consumer products be permitted to submit reports to the Public Database. However, groups or individuals with no direct knowledge of the incident, who did not see it happen or do not even know the person that was harmed, should not be permitted or encouraged to submit incident reports to the Database. There are several reasons why first-hand knowledge is essential, but the primary reason is ***accuracy***. A Database full of inaccurate reports from individuals who have second or third-hand information is not remotely helpful to consumers using the Database to determine which consumer product they should purchase.

Soliciting information from sources seeking to promote an agenda unrelated to simply sharing first hand information invites dishonest, agenda-driven use of the Database—diluting its usefulness for consumers. Trial lawyers, unscrupulous competitors, advocacy groups and other nongoverumental organizations and trade associations serve their own agendas and lack an incentive to prioritize accuracy in their reports of harm.

Trial lawyers or other groups with self-serving motives will use the Commission's Database to look for potential trends and patterns of hazards. Under the Majority's Database rule, these same groups could also submit to the Database false and unverifiable reports to fuel a lawsuit. It is no

[9] On the Senate floor, during consideration of the CPSIA on March 5, 2008, Senator Pryor stated: "We have tried to find something that is balanced, that provides information, but also has some filtering so we make sure erroneous information is not disseminated. But the goal of this provision is that the public has the right to know when products are dangerous."

coincidence that these groups are strongly in favor of this public Database and of the Majority's interpretation of the statute, which expressly allows them to submit reports of harm.

There are many advocacy groups and associations that serve a role in public policy, but may not have the incentive or ability to provide specific and accurate product identification information to the Commission's Database. For example, the National Fire Protection Association (NFPA) supports government-mandated sprinklers in new homes. One cause of house fires is the use of cigarette lighters, which are consumer products. Thus, the NFPA has a strong incentive to add all reports of house fires caused by lighters to the Commission's public Database. The more incidents in our Database, the better case they can make that new fire prevention technology – which some of their members sell—should be mandated in homes.

But it is not important to the NFPA whether it correctly identifies a brand of lighter in an incident report. A lighter may appear to be the branded product of a particular manufacturer, but instead be a cheap counterfeit. The NFPA is interested solely in reporting house fire incidents; the particular brand of lighter is not relevant to its goal of promoting sprinklers. Meanwhile, the company identified in the report as the manufacturer of the cigarette lighter must defend countless unverifiable and potentially inaccurate claims about its product. Such inaccurate and unverifiable information is of no value to a consumer seeking information on the safest type of lighter.

By inviting trial lawyers, consumer advocacy organizations and trade groups to input reports of harm, the Commission has all but guaranteed that the Database will be a tool for lawsuits, policy agendas and anti-competitive activity. Under those circumstances, it cannot also serve its intended function of providing a reliable resource for parents seeking useful information about product safety. A Database populated with such information will be no more useful than "Amazon.com", "Yelp.com", or any of the other hundreds of websites where anyone can submit comments on a product, and does not warrant tax payer funding.

The problems caused by over expanding the list of submitters to the Database could have been reduced if reports of harm had to be verified, or at least verifiable, before being published. But the information solicited on the Database is inadequate to this purpose. With respect to the submitter, the Database requires that a "self-verification" box attesting to the report's accuracy be checked. But this will do little to discourage or prevent inaccurate reports of harm. Self-verification in the context of the Database rule means only that the report is accurate "to the best of the submitter's knowledge". The "best" knowledge of someone with no first-hand knowledge is of little value. An individual or group without first-hand knowledge will likely not have the full story of what happened -- including the exact type of product, the recent history of the product, or even the precise cause of the incident.

The scope of product information solicited on the Database under the Majority's rule is also inadequate. The only product information required is the identity of the manufacturer, the name of the product and the approximate date of the incident. This information is patently insufficient to permit reliable verification that the manufacturer and *specific* product are correctly identified. For example, a recent search of

Amazon.com for high chairs manufactured by one particular company produced a list of 137 different high chairs ranging in price from $54 - $148. Given the broad range of identically named, yet distinctive products available from the same company at a single snap shot in time, a report of harm relating to a particular manufacturer's high chair, with no reference to the model, date of purchase or other more specific identifying information, would be of no value.

Carrying this example one step further, consider a scenario: Company A sells five million high chairs and Company B sells 5,000 high chairs. Company A has six incident reports on the Database and Company B has one incident report (all of which are unverifiable). Thus, a consumer could falsely conclude that Company A's high chair is less safe, even though simply due to the number of units it sold, it is more likely that people own that high chair—and more likely that reports on that high chair would make it into our Database. Or, it is also possible that some of the reports about Company A's high chair actually pertained to older models of the high chair that are no longer for sale, which means the information may be entirely irrelevant to people using the Database to look for safety information about current products on the market.

The Majority rejected proposals contained in an alternative Database rule I offered that would have minimized such confusion and would have aided in the verification of reports of harm that are challenged by manufacturers as materially inaccurate. I proposed requiring that (1) reporters of harm include the consumer and/or the victim's identity and contact information with a report (to be held confidential, as is current practice), so that the Commission could obtain additional information to evaluate a manufacturer's claim of material inaccuracy; and (2) the Database include fields for submitters to provide the approximate date of purchase of the product and whether the product was purchased "new" or "used", thereby allowing consumers to gauge the age and better identify the specific model.

The Majority also rejected my proposal that the Commission withhold reports of harm from publication pending the evaluation of a substantiated claim of material inaccuracy. Instead, reports about which there is an adequately supported claim of material inaccuracy are posted on the 10th day after they are submitted, unless the Commission can somehow resolve the claim in the brief intervening period. As of today, the Commission does not even have a procedure in place to evaluate claims of material inaccuracy, let alone one that could result in a determination in 10 days.

Notably, the Commission's Notice of Proposed Rulemaking on the Database originally included an interpretation similar to the one I recommended. For example, § 1102.26 of the NPR states: "If a request for determination of materially inaccurate information is submitted prior to publication in the Database, the Commission may withhold a report of harm from publication in the Database until it makes a determination."[10] 75 FR 29180.

---

[10] The preamble of the NPR contains analogous language: "If a request for determination of materially inaccurate information is submitted prior to publication in the Database, the Commission may withhold a report of harm from publication in the Database until it makes a determination." 75 FR 99, at 29161. And this: "We propose that in cases where a claim of materially inaccurate or confidential information is under

That language could not have been included in the NPR without a legal opinion supporting the permissibility of the policy choice. That the agency apparently believed at one time that this approach is legally permissible, reflects, at a minimum, statutory ambiguity regarding the point.

Not surprisingly given the NPR, many if not most of the commenters assumed that incidents would not be published to the Database pending the determination of a material inaccuracy claim. Although at least one commenter expressed the policy view that reports of harm should go up on the 10th day even when such claims are unresolved, no one—not even consumer groups—argued that the statute legally prohibits the agency from withholding reports from publication for the duration of its investigation. To the contrary, several commenters proposed a detailed protocol for addressing claims of material inaccuracy, based on their understanding that reports would be withheld from publication while under review for accuracy. And yet the Majority's final rule now forbids delaying publication in those circumstances, and fails to establish any specific protocol for handling requests for determinations. Moreover, our agency's fiscal year 2011 appropriations request did not include even a single new FTE to resolve pending claims of material inaccuracy, and our fiscal year 2012 request does not provide sufficient resources to account for an anticipated increase in reports. These facts alone make clear to the business community how low the CPSC prioritizes its responsibility to resolve claims that reports of harm contain false or misleading information about products.

Because the Majority's Database rule all but guarantees that the Database will be flooded with inaccurate reports of harm, it will be less useful for Commission staff in determining hazard patterns than are the current, internal Databases we have today. Frankly, this is one of my greatest fears—that Commission staff will be overwhelmed by inaccurate reports (or the reports that get picked up by the media) and unable to use their expertise to search objectively for genuine hazards. As the Database is swamped with misleading or inaccurate reports, they will drown out the accurate ones.

The flood of potentially inaccurate reports that will be difficult, and often impossible, to verify also imposes a tremendous burden on manufacturers. Substantial private sector man hours will now be dedicated to understanding and responding to incident reports containing incomplete and often mistaken information. Manufacturers, who might otherwise view the Database as a means to stay ahead of the curve in their ongoing efforts to improve the safety of their products, will have nothing but vague reports and guesswork on which to rely. The resources spent by a company chasing down unverifiable information to avoid reputational damage, would be better dedicated to reviewing incidents known to relate to the company's products or otherwise promoting safety innovations.

Congress could prevent the irreversible damage that unverifiable and materially inaccurate information will cause American businesses, and ensure the creation of a Public Database that is a useful tool for consumers, by prohibiting the Commission from expending any funds for the purpose of launching the Database until the Commission's regulations ensure that reports of harm submitted to the Database contain sufficient

---

review, the Commission, in its discretion, may withhold a report of harm *in part or in full* until such a determination is made." 75 FR 99, at 29170 (Response to summary 26)(emphasis added).

information to permit verification, and the Commission has established an effective procedure for resolving a claim of material inaccuracy before a report of harm is published on the Database.

V. Proposals to Amend the CPSIA

A. Amend CPSIA § 101(b)(A) to exclude products or materials with a level of absorbable lead that the CPSC determines not to be harmful to a child's health.

Prior to enactment of the CPSIA, the regulation of lead in consumer products was based upon the Commission's general authority and expertise, exercised for over 35 years, to assess and reduce risk by evaluating scientific and human factors data. The CPSIA, for the first time, imposed specific lead content limits for all consumer products intended primarily for use by children, without regard for the nature of the product or the way in which the product is used. CPSIA § 101(a).

Because such a sweeping one-size-fits-all requirement would have decimated whole industries and eliminated from the market numerous products presenting no safety risk to children, Congress recognized three exceptions to the lead limit requirement. These are (1) products containing lead that is inaccessible to a child through normal and reasonably foreseeable use and abuse; (2) electronic devices for which it is not technologically feasible to meet the lead standard; and (3) products containing lead that will not result in the absorption of "any" lead into the human body. CPSIA § 101(b).

The Commission has promulgated regulations creating meaningful exclusions from coverage by the lead limit for products meeting the first two exceptions. But it has interpreted the word "any" in the lead absorbability exclusion in a way that no product containing lead could ever satisfy. Because Congress clearly intended all three exclusions to have meaning, and in light of the Commission's decision to write the lead absorbability exclusion completely out of the law, it now falls to Congress to clarify its intent. The CPSIA should be amended to exclude products or materials with a level of absorbable lead that the CPSC determines not to be harmful to a child's health.

Drawing the line at the level of absorbable lead that is harmful to a child's health is consistent with the findings of our leading scientific agencies, the National Institutes of Health, the Centers for Disease Control and the Environmental Protection Agency. Only lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under. Thus, the experts at the CDC and NIH have found that lead paint in old houses and lead in dirt near old gas stations are the main source of environmental lead presenting a danger to small children (http://www.cdc.gov/nceh/lead/). In other words, the *risk of absorbability* from lead in dirt that is eaten or lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high. Notably, the Environmental Protection Agency standard for lead in soil is 400 ppm (http://www.epa.gov/lead/). This standard for safety is less strict even than the current 300ppm lead content standard provided in the CPSIA for children's

products, let alone the lowest technologically feasible level between 300ppm and 100ppm that the CPSIA will require in August of 2011.

In many other laws relating to absorbable lead levels, standards exist to allow for unharmful absorption. For example, the Food and Drug Administration allows for 0.1 microgram of lead in a one-gram piece of candy.[11] The Safe Drinking Water Act declares "zero lead" to be the objective for the amount of lead in water, but pipes carrying the water are permitted to be 80,000 parts per million (8 percent) lead – allowing for negligible, trace amounts to exist in the water we drink.[12] California Proposition 65[13] as well as the European Union[14] allow for a negligible amount of absorbable (or soluble) lead in children's products. People often are surprised to learn that all children are born with a certain blood lead level, depending on the blood lead level of the mother. Some additional amount of lead (roughly one microgram per kilogram of body weight)[15] is then taken into the body every day through the food we eat and the air we breathe.

Unlike these rational rules, the CPSIA, as interpreted by the Majority, has led to the banning or substantial reengineering of many products that pose no risk of harm from lead. For example, the CPSIA has led to a ban on children's books published before 1986, because the ink in them is likely to contain lead above the allowable level. Some at the Commission and many Members of Congress have expressed dismay that books have been affected, because children are not likely to eat the pages of old books or ingest more than miniscule amounts of lead after touching their pages. Likewise, youth ATVs and bicycles are outlawed or must be reengineered even though the lead that is in the hood, handlebars, or hubcaps will not become ingested and absorbed in meaningful amounts. Other everyday products such as school lockers, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens are outlawed if they have a toy or game attached to them and are marketed to children, due to the brass found on the tip. Because there are still *negligible amounts of lead detectable by scientific equipment* that may be wiped off by touching a bicycle handlebar, the CPSIA treats these items in exactly the same way it treats products that truly could hurt a child by increasing the blood lead level.

However, none of our health agencies, including the CPSC, has ever found that brass musical instruments, vinyl lunchboxes or bicycles, all of which contain lead in the product's substrate, should be avoided even when a child's blood level is at or near the

"tipping point" for lead poisoning. The Commission's interpretation of the CPSIA's absorbability exclusion requires the Commission to focus solely on lead limits and causes absurd consequences—such as banning products that pose no risk to children and forcing the agency to spend more time and attention on children's products with 350 ppm of lead than it does on riskier products or emergent issues like cadmium.

Finally, children do not live cooped up inside of their rooms surrounded only by "children's products." Children live throughout the house, run around outside, and play with adult products such as pots, pans, furniture knobs, door handles, appliances and TV remotes. For example, the new costs associated with this law will affect a young child's lamp (usually turned off and on by the parent) but not the lamp in the den or the living room that a child is just as likely to turn off and on. These products do not threaten a child's health due to their lead content, because the lead in them is not absorbable. This further illustrates the absurdity of the CPSIA's requiring the unnecessary reengineering of children's products with lead, while children are just as likely (if not, more likely) to play with everything else in the house.

The primary and best way to restore the agency's capacity to address "real risk" in the setting of its regulatory priorities and to align them with the existing standards of other federal agencies and aronnd the world would be to amend the CPSIA to ensure that the agency can consider the absorbability (or bioavailability) of lead, and not just the total lead content of a given material. The CPSIA should therefore be amended to exclude products or materials with a level of absorbahle lead that the CPSC determines not to be harmful to a child's health.

B. Eliminate third-party testing, certification and tracking labels of all children's products, allowing the Commission to retain its authority to impose such requirements only where necessary to address a risk with a specific product or material.

As discussed above, the CPSIA's requirement that all children's products be third-party tested to the lead, phthalates, ASTM-F963 toy standard and all other applicable standards has and will continue to have an enormous economic impact on American manufacturers with no commensurate improvement in product safety or compliance. Furthermore, the Commission has other new and more effective enforcement mechanisms that are more reliable than requiring manufacturers to certify to having performed third-party tests.

Today, the Commission intercepts non-compliant toys through its extensive border control efforts, application of x-ray technology to identify violative lead content, computer databases that flag previous offenders for greater scrutiny, the imposition of higher penalties of up to fifteen million dollars, and the threat of lawsuits and loss of reputation in the market. Notably, even prior to these improvements, the Chinese manufactured toys contaioing lead paint that were the impetus for the CPSIA were themselves identified and intercepted using the Commission's traditional methods. The company responsible faced a class action lawsuit and a massive fine.

More importantly, the imposition of a third-party testing and certification requirement does not reduce the likelihood of non-compliant products entering the country. Manufacturers were required to perform their own tests to be able to ensure compliance long before enactment of the CPSIA. Third-party testing will therefore not make violations by the honest companies who seek to comply with the law any less likely. Such companies already manufacture to all applicable standards, and will now merely incur greater costs to continue doing so. On the other hand, the truly bad actors who would knowingly violate the law are not likely to be reformed by the third-party testing and certification requirement. They will simply falsify certifications, and the CPSC will need to rely upon its other enforcement mechanisms to protect consumers from their products. The only difference will be that now some of the resources that could have been dedicated to more effective methods will be employed in the fruitless exercise of checking whether products entering the country are accompanied by the required certifications. And there will be more incentive to cheat, because the pricing advantage from not complying with the much more expensive third-party testing requirement will be that much greater.

While the Commission has the authority to provide flexibility regarding the *frequency* of third-party testing requirements under the law, it does not have the ability to exempt companies altogether from burdensome testing requirements that do not improve safety. More specifically, the Commission lacks the authority to exempt manufacturers of otherwise safe products from the following: 1) the initial, third-party test of every product or component to the law's lead, phthalates and other mandatory standards; 2) a new, third-party test of any product or component after any "material change" in the product; or 3) the cost to certify, provide tracking labels, and maintain the data to trace each and every component. Without changes to the statute, the Commission's hands are tied in addressing these arduous requirements, which are the main CPSIA costs burdening small businesses.

I therefore recommend that Congress eliminate the third-party testing requirement entirely. Companies will still be required to test to ensure compliance, and the Commission will retain its new and longstanding enforcement mechanisms, as well as the authority to impose third-party testing and other requirements where necessary to address a risk with a specific product or material.

VI. The alternative of adding a "functional purpose" exemption should be rejected.

Ranking Member Henry Waxman of the House Energy and Commerce Committee last year proposed a very limited "fix" to the problems of the CPSIA, known as a "functional purpose" exemption. The proposal would authorize the Commission to exempt a company's products from the CPSIA's lead limits if the company can show that the lead in the product serves a "functional purpose." This "fix" would do more harm than good.

Adding a "functional purpose" exemption to the Commission's authority would not provide the kind of broad exclusion flexibility that the Commission unanimously sought

in our January 2010 Report to Congress. The concept is too narrow, expensive, and uncertain to provide much relief, particularly for small businesses that are unlikely to have the resources available to determine available lead substitutes or even to put together as successful petition to a federal agency. Most companies will not have the in-house expertise (metallurgic, etc.) to make the showing that would be required to meet the burden of proof for an exception. So just as the exorbitant testing costs of the CPSIA favor large companies (who manufacture overseas) over small ones, so too will the exemption process favor the large companies with greater ability to spread their costs.

Furthermore, forcing a component-by-component review of exceptions to the law does nothing to enhance safety, and it converts the Commission from a safety oversight agency (like the FAA) into a product approval agency (like the FDA). That will slow the pace of innovation and dramatically increase the cost and lead time for bringing new products to market. Requiring separate exemptions for each product is also a very inefficient way to regulate safety. Even under the functional purpose exemption, the product cannot be a safety hazard. So if the amount of absorbable lead in a particular material is determined to be safe and necessary to a product's function, the material itself should be exempted. Otherwise, multiple companies will be required to incur the same costs to establish the material's safety, and the CPSC will repeatedly make the same safety determination for different products.

VII. Conclusion

There is bipartisan agreement that the CPSIA has caused and will continue to cause tremendous harm to the American economy in the form of lost jobs and failing businesses, with no offsetting improvement in product safety. The law has also diverted the bulk of the CPSC's resources toward regulating to the arbitrary mandates of the law and away from its more effective tools for protecting consumers from unsafe products. I urge this Committee to consider carefully my proposals to at least begin to ameliorate the harm caused by the law, before more business owners and their employees suffer needlessly. At a time of anemic job growth and the continued flight of manufacturing away from the United States, relieving the economy of the unnecessary burdens of the CPSIA would be an important step toward recovery.

Thank you, Madam Chairman and Members of the Committee for calling this hearing and for inviting me to testify today. I look forward to your questions.

ECONOMIC IMPACT OF THE CPSIA - EXAMPLES
2009 and 2010

Costs associated with the CPSIA

1. In a letter from the CPSC to Representative Dingell in March 2009, Commission staff reported that the overall economic impact of the CPSIA would be in the "**billions of dollars range**." The Commission also acknowledged that the testing and certification costs will fall disproportionately on small-volume businesses. (*Letter from Acting Chairman Nancy Nord to Representative Dingell, March 20, 2009*)

2. **"MAJOR RULE"** - CPSC acknowledges in its FY 2011 Regulatory Agenda that its main rule pertaining to the CPSIA's testing requirements **([PDF] CPSC Docket No. CPSC-2010-0038)** is a "major rule" under the Congressional Review Act, resulting in, or likely to result in: 1) an annual effect on the economy of $100,000,000 or more; 2) a major increase in costs or prices for consumers, individual industries, government agencies or geographic regions; or 3) significant adverse effects on competition, employment, investment, productivity, innovation, or the ability of U.S.-based enterprises to compete with foreign-based enterprises.

3. In an article entitled "Makers Are Pushing Back on Toxic-Toy Law" (*Wall Street Journal*, March 5, 2009 http://online.wsj.com/article/SB123621357629835121.html), Joe Periera reported the following loss statistics:

    - Goodwill Industries to destroy **$170 million** in merchandise.
    - Salvation Army expects to lose **$100 million** in sales and disposal costs.
    - The Toy Industry Association estimates inventory losses at **$600 million**.
    - Members of the Coalition for Safe and Affordable Childrenswear lost **$500 million.**
    - The California Fashion Association estimates troubled inventory at **$200 million**.
    - The Motorcycle Industry Council expects to lose 50,000 motorized bikes and four-wheelers worth at least **$125 million**.

4. On March 11, 2009, *Playthings Magazine* reported updated data from the Toy Industry of America (see http://www.playthings.com/article/CA6643505.html), including:

- From a pool of nearly 400 manufacturers and 220 retailers, the TIA estimates **losses of $2 billion in retail value**.
- More than **$1 billion** in already shipped merchandise has been returned or is being withheld for return.
- More than **$800 million** in compliant merchandise is at risk of return.
- **40%** of all respondents plan to eliminate jobs to pay for the CPSIA, with more than 1200 jobs reported to be in jeopardy.

"TIA: Safety Act puts $2B crimp in toy biz"
3/11/2009

5. Separately, the Motorcycle Industry Council advised that total losses from disruptions in its members' businesses could total **$1 billion**. See: http://www.1st5ive.com/harley-davidson/motorcycles/2009/02/2452/new-lead-rule-could-cost-motorcycle-industry-1-billion-annually

Examples of businesses closed due to CPSIA

Mrs. BONO MACK. I thank the witnesses for their testimony and I am going to recognize myself for the first 5 minutes of questioning.

And my first question is to Chairman Tenenbaum, while well-intentioned, CPSIA is clearly flawed in many, many respects. What needs to be done to make it more workable?

Ms. TENENBAUM. Thank you, Madam Chairman. Last January all of the Commissioners submitted a report to this committee and to Congress and it was a unanimous report in which we asked for four things. First of all we asked for greater flexibility to granting exclusions from the Section 101(a) lead limits and that is now it is 300 in parts per million. In August it will be 100 parts per million. We asked for exclusions for ordinary children's books. We asked for a perspective application when we go to 100 parts per million so that compliant inventory now in the stores or are being shipped to the stores would not have to be recalled. We only want 100 parts per million applied prospectively. And we wanted some relief and some flexibility for small manufacturers and crafters and so that was what we asked the Committee for. Mr. Waxman proposed a bill and that was discussed on both sides of the aisle. Mr. Barton had a bill and a number of members submitted bills but Congress did not take any action last year. So we are hopeful that this year we can have.

Mrs. BONO MACK. Thank you for those suggestions. Let me move on to the next question because 5 minutes goes by so quickly.

Ms. TENENBAUM. I am sorry.

Mrs. BONO MACK. That is OK. If you could clarify something for me though, in terms of lead exemptions you favor the so-called functional purpose exemptions. What do you mean by that and doesn't this threaten to bog down the Commission in making case by case determinations?

Ms. TENENBAUM. Well, under the Federal Hazardous Substance Act which is the act which used to govern the way we dealt with lead before they passed CPSIA, there was a functional purpose exemption. For example, if you had a chemistry set, you had to label what the chemicals were but we did nnt recall chemistry sets because the chemicals were needed for the functional purpose of the chemistry set. It was our thoughts, several of us that we could say if you have an ATV and you need the ATV or the bicycle lead in it to make it stronger or have greater machine ability when you are making an ATV or bicycle, then that is your functional purpose, and if it doesn't harm children then we could exempt you. We never envisioned this being a very complicated exemption process but as it was talked about in Congress it became very complicated and then it really sunk under its own weight.

Mrs. BONO MACK. Thank you. It seems to me that the Commission's priorities get out of whack at times and you spend so much time focusing on trace amounts of lead but what about dangers that actually result in kids being hurt? According to one of my hometown newspapers, 20,000 children a year under the age of 5 are injured in shopping cart accidents. Under CPSIA, things like doll clothes must be approved by third-party testers. Are the locking wheel devices on shopping carts tested?

Ms. TENENBAUM. Well, thank you so much for that question. My staff has made me aware of the problems with shopping carts and we have been engaged with the ASTM which is the voluntary standards making organization to look at shopping carts so that we can expedite the issues with those carts. I would have to note though because we have increased resources we are able to look at emerging hazards faster and that is why any cuts to our budget will knock us off course in terms of our ability to respond to emerging hazards like shopping carts and lithium battery buttons and so forth.

Mrs. BONO MACK. Thank you, I can see.

Ms. NORTHUP. Madam Chair, first of all the functional purpose the way it was written would have been very difficult. It said that anybody applying for it would have to prove that there was no substitute and as we heard in testimony yesterday, there is always a substitute. The fact is you will end up with a $7,000 bicycle. So its not that there is not substitute. But if a ball bearing for example and it is made of brass is important in a bicycle, why is it not also important in a Tonka truck and the other items and so yes, bicycles might have the financial wherewithal to apply. They have to prove that there is no other practical substitute. They have to prove it doesn't hurt a child. I think that the minority of the Commission believes that if we exempt a material for one manufacturer, we ought to exempt that same material for all because if it meets the bar that it is not going to harm a child then why is there any other reason for us to address it. And as far as yes, this has completely absorbed the Commission's time. There are things that have gone unmet. Things like table saws. There is technology that addresses this. There are 10 fingers that are cut off a day in this country. Carbon monoxide poisoning, 500 people die a year from that because of generators. These are things that are way overdue in the rulemaking that we have not taken up because there simply is not the time to do that.

Mrs. BONO MACK. I thank the witnesses and now I would like to yield 5 minutes to Mr. Butterfield for his questioning.

Ms. BUTTERFIELD. Thank you, Madam Chairman.

Let me address my questions to the chairman of the Commission and the chairman is right, 5 minutes goes very quickly so I am going to try to get through this.

Ms. TENENBAUM. I am trying to be.

Mr. BUTTERFIELD. It is clear that the manufacturers have become critical of the Commission in implementing the database and we have just talked about that. Even your colleague, Ms. Northup, has been somewhat respectfully critical of the database. Just last week in written testimony to the House Oversight and Government Reform Committee, the National Association of Manufacturers' president, Mr. Timmons, stated that, "The final rule creates a default for immediate publication before any meritorious claims regarding trade secrets or material inaccuracies are resolved." In your testimony today, you point our several safeguards in the final rule to protect manufacturers and I know this is an issue that the drafters of the act gave a lot of thought. If you have ever read or even glanced at this section of the law, you can see it is rather lengthy. In fact, the statute provides more procedural safeguards

then any other public database at a federal agency including NHTSA and FDA, and so I appreciate that the critique of the database provided by a witness on today's second panel is a bit more careful then what came from the manufacturers last week. Nonetheless, it seems to me that there is some amount of misunderstanding and misinformation about the database. I would like you to help us clear up that with a few yes or no questions. Number one, is it correct that anyone who submits a report must provide to the Commission their name and contact information?

Ms. TENENBAUM. Yes.

Mr. BUTTERFIELD. Is it correct that anyone who submits a report must complete a verification that the information is true and accurate?

Ms. TENENBAUM. Yes.

Mr. BUTTERFIELD. Is it correct that within 5 business days of receiving a report the Commission will transmit the consumer report directly to the manufacturer?

Ms. TENENBAUM. Yes.

Mr. BUTTERFIELD. Madam Chairman, is it correct that the Commission will not publish that report until the tenth business day after transmission to the manufacturer?

Ms. TENENBAUM. Yes.

Mr. BUTTERFIELD. Is it correct that during the 10-day waiting period the manufacturer is given a chance to do three things? Number one, claim parts of the report are materially inaccurate. Number two, claim parts of the report contain confidential information and three, submit its own comments to be made public along with the consumers report. Is that true?

Ms. TENENBAUM. Yes, that is true.

Mr. BUTTERFIELD. Is it correct that the Commission as practicable will attempt to expedite that is expedite review of material inaccuracies where the manufacturer has limited the length of its submission?

Ms. TENENBAUM. That is true.

Mr. BUTTERFIELD. Is it correct that the Commission will review all inaccuracy claims and will correct or remove any inaccurate information published in the database?

Ms. TENENBAUM. Yes.

Mr. BUTTERFIELD. Is it correct that the database will contain only reports of harm from a product and not general complaints or reviews about a product?

Ms. TENENBAUM. Yes.

Mr. BUTTERFIELD. Is it correct that the Commission will seek criminal prosecution through the Department of Justice where it identifies repeated instances of false submissions?

Ms. TENENBAUM. Yes.

Mr. BUTTERFIELD. Finally, and we are within the 5 minutes, let me quote from the final rule on this one: "The Commission will as a matter of policy, redact the allegedly confidential information from a report of harm before publication in the database until it makes a determination regarding confidential treatment." Does that really mean what it says? Is it correct that no information claimed by a manufacturer to be confidential will be made public until this is resolved?

Ms. TENENBAUM. That is true.

Mr. BUTTERFIELD. All right, thank you, I don't know about you but those safeguards strike me as very adequate and I am very pleased with your responses. Thank you.

Ms. SCHAKOWSKY. Would the gentleman yield for a second?

Mr. BUTTERFIELD. Yes, I will yield to the gentlelady from Illinois.

Ms. SCHAKOWSKY. Thank you.

I wanted to raise just the issue that our chairwoman raised about—oh no, it was Ms. Northup raised about products not being clearly identified, that there may be what?

Ms. NORTHUP. One hundred forty-seven, that was it, yes.

Ms. SCHAKOWSKY. Yes so that is there something in the regulations that makes sure that we are clearly identifying the actual product line that the product itself precisely so there isn't that kind of confusion so it is not just a brand name but that it is which exactly of the items?

Ms. TENENBAUM. Well, you have to give the product name but you don't have to give the model name. But you have to give the product name. You have to give the manufacturer, the date you purchased it, your name and verification and several other things but we are not required to do the model. But we are hopeful that people will give the model name to be more clear and we certainly will investigate. If we investigate we will find out what the model name is.

Ms. SCHAKOWSKY. I think that is a reasonable thing to ask.

Mrs. BONO MACK. Ma'am, if we can move on before we get around to a second round of questioning hopefully.

Ms. SCHAKOWSKY. All right, OK, excuse me.

Mrs. BONO MACK. But members the time is involved by the votes on the floor so I would like to recognize Mr. Harper from Mississippi for 5 minutes.

Mr. HARPER. Thank you, Madam Chair.

I would like to ask, if I could, Commissioner Northup a couple of questions on some of this. What provisions of CPSIA do you think do not warrant the cost or regulation?

Ms. NORTHUP. Well, first of all there have been no cost benefit analyses so there is we don't even know what the cost of these regulations are. We estimated in 2009, billions of dollars. I have attached a list of companies that we know have gone out of business. Companies that we know have cut back. Companies that have left the market, the number of employees that have been cut off but there has been no broad study of that. But I would, the one that we have stayed right now, the testing and third-party certification, because we have advanced technology we are better at the border then we have ever been. Our ability to get logs of what is coming into this country we know who the people are that maybe have a bad record, who has a good record. We have the ability to scan an enormous amount of products instantaneously as they come in. Our level of penalties we if something comes in and it doesn't comply the entire shipment is destroyed and so those threats have created an enormous pressure on the manufacturers overseas to verify and re-verify and check. The third-party testing and then the certification on top of that is creating a nightmare of paperwork because you have to track every nut, bolt, screw. Bicycles, 141 different

components so every time it changes in the manufacturing process you have to change the lot number, you have to change the 141 certification numbers, you have to retest and they just, you know, they what it is old technology this sort of third-party testing. And if I may say, the people that are going to break those rules do you think they are not going to put in a new shipment of snaps and not change their certification or keep using the same lot numbers? We have such incredibly advanced ways of scanning materials coming into this country now that the cost of just that alone is going to be billions of dollars and it is on every single product even though the vast, vast, vast majority of them because of the fact, their products will be destroyed as they come in at the ports are fine. Let me just say that the database, we have spent $29 million on it. Yes, Representative Schakowsky is exactly right. It has the manufacturer's name. It may say a Graco high chair. It does not say which Graco high chair. It does not say the day it was purchased. You are supposed to say the approximate date of the accident but I will just use the example of Thanksgiving, three grandchildren. One is the new Graco high chair, one is the one I brought up from the basement that is 30 years old, one of them is the antique I have sitting by the fireplace. I could enter that as an accident if the leg fell off of one of those. The manufacturer has no idea. Is this a 1990s high chair or is this today's high chair? Do I need to conduct a recall today or do I have a product that years ago was produced? And by the same token, the parents who might go online and say OK I am going to buy a high chair. What data is in the database? They are not going to know. Is this a product that is on the market today? And finally, it allow anybody, not first person knowledge but it can be third-party. We are even inviting any organization to download all their data into our database. So the manufacturer gets a report, a red Schwinn bicycle that the wheel fell off. Schwinn says I don't make a red Schwinn bicycle but you have to give your name if you are the entrant and you can be a bystander. You can be a third-party organization. You can be the Consumers Union. So we have no way to go back to the consumer and say can you help us figure this out. They don't make a red bicycle and then we find out it wasn't. I had today a major company that sent me about eight examples of where there were two, one where a child died. It took 30 days for us and them to ascertain that it was a hoax. That is the kind of information. Those are things that come in everyday into our database. They are now going to be public within 15 days of when they are entered and nobody is going to be able to verify because they are not going to know who the consumer is.

Mr. HARPER. Thank you, Madam Chair.

Mrs. BONO MACK. I thank the gentleman. I would like to yield 5 minutes to the gentlelady from Illinois, Ms. Schakowsky.

Ms. SCHAKOWSKY. My certain, OK, sorry.

I wanted to ask the chairwoman, is $29 million the cost of the database?

Ms. TENENBAUM. No, that is not true and we have repeatedly said it is not true. We were charged when we were given new funds to upgrade our whole IT system. The database is around $3 million. The IT system was to get a data warehouse. We have five dif-

ferent silos of data that couldn't talk to each other. Our database couldn't talk to CBP so we had done extensive upgrading of our whole IT system and the database cost about $3 million of that. Now, we have had a soft launch of the database and of the 900 incidents we have had in February most of them had the serial number and the other thing we only out of that 900 we only had four material inaccurate claims and we had 723 businesses who signed up to have a business portal so they can get the information within 5 days of us receiving it.

Ms. SCHAKOWSKY. Thank you. So actually you did. How were those four discovered that were inaccurate, or whatever word you used?

Ms. TENENBAUM. Well, the business portal when you sign up, the 723 businesses sign up and we send them the report, they come back to say this information is materially inaccurate. Now, the law requires us to post the report of harm before we make the determination of whether or not it is true. We are going to try our very best to determine if it is materially inaccurate and the company is right and not put it on the database within 10 days. But if we haven't received the information or haven't had the time to research it and get to the bottom of it if it is a very complex laboratory issue and testing issue then we will have to post it and that is what the rub is.

Ms. SCHAKOWSKY. OK but I wanted to get to this issue of verified or firsthand. Here is my concern, one of the things that really inspired me to work on this law was the death of a child, Danny Kaiser, and his mom, Linda Ginzel who created Kids in Danger and became a great advocate over this tragedy. Well, she wasn't there when her son died in the crib. Would she be then ineligible to report on her son's death because she had not been at the daycare center or a parent who is not in the room when a child dies in a crib? How are you going to distinguish?

Ms. NORTHUP. Actually I wrote an alternative database and absolutely the daycare center can put this information in, the parent can put this information in. Nobody wants people that don't have firsthand information not to be able to put this information in. The issue is more a question of third parties that are sometimes fourth- and fifth-hand information. Let me just say one of the things I have seen at the Commission is that organizations that have particular safety agendas, marketing agendas want to use information of accidents to come to you and say there are 10 examples of this. You ought to pass a law. I will give you an example. The fire marshals, they want sprinklers in all buildings. We are not involved in that issue but they often put into fires in homes the fact that it was a BIC lighter. Well, it may not be a BIC lighter. In fact, BIC lighter has come to us and say please make them identify these better because what they really are is the cheap foreign knockoff. The problem for the company is if it says a BIC lighter. They are subject to a class-action lawsuit. They are subject to running around trying to prove that it is not a BIC lighter. And we don't even have the name of the person whose house burned down. All we have is the person that entered the incident, the Fire Marshals Association.

Ms. SCHAKOWSKY. I get what you are saying but I think that the organizations that represent they become a portal for people who have been hurt. Also have this, you can trace back this information.

Ms. NORTHUP. Many of them don't. We often have information where we cannot get back to who it was that was harmed and I would just say, as a parent that I knew what the product was that was at hand and, the question is would a bystander have that information? This is really important information to have. If you as the chair said I have never seen our agency be able to resolve a question of material inaccuracy in 10 days, ever. There are ones that are still dangling out there that are 9 months old that we still haven't ruled on.

Ms. SCHAKOWSKY. I yield back.

Mrs. BONO MACK. Good, the gentlelady's time has expired.

The chair recognizes the gentlelady from Tennessee, Ms. Blackburn, for 5 minutes.

Mrs. BLACKBURN. Thank you, Madam Chairman, and I want to welcome the two of you and thank you for being here and thank you for getting your prepared testimony to us.

I think that we have in front of us CPSIA is something that most people are just not real happy with. And I found it very interesting and, Commissioner Northup, I want to ask you what you think about the results of that Consumer Union poll that Mr. Waxman sent around yesterday and a dear colleague and also would like for you, if you will, to continue to talk about some of the unintended consequences. You have hit on the absorb ability problems and the miscues that are there, businesses closing. Of course we hear a lot from our charitable organizations about their displeasure with what we are seeing in the implementation of this law. Price increases we have talked about the database problems and then of course you were just beginning to touch on what I think is very dangerous for many of our American manufacturers and that is the fraud and infringement on their copyrights and the fraudulent merchandise, the pirated merchandise that makes it way and they found out about it later. This Schwinn bicycle is a perfect example of that. And so if you will talk about those unintended consequences that are coming into you and then touch on that Consumer Union poll because I don't think people are in favor of this.

Ms. NORTHUP. Well, I was amazed at the poll. It did say—first of all if you had polled me and said do you think the Federal Government should be involved in consumer safety, wouldn't every one of us in this room say yes? I was pretty shocked only eight or nine out of ten said yes. What I was even more surprised is that only half of those that said yes said they are very much supportive of that. The other half said just somewhat supportive of the Federal Government being involved. But mostly I would say that the poll was written in such a way all of us do polls politically and we know if we want really accurate information we have to make the poll so that it doesn't slant the question. You could also have written it that says do you think the Federal Government should require businesses to test every component of their children's product in an outside lab increasing the price 20 to 30 percent for materials that are not even dangerous to them. What sort of results do you think

you would have gotten? Here is another one. Do you think the Federal Government should have spent $29 million? Let me tell you, this whole database is we could have continued operating on the database we had. It was it only had to be changed because it was going up on a database where certain incidents that are not verifiable and can be entered trial lawyers, consumer advocates or competitors was false information could be posted about legitimate companies. You know, what sort of poll do you think you would have gotten? I don't think either those questions or the questions in the poll give you the real truth that we need to if you really if what you are trying to do is poll the American people you need to actually give them this is better.

Mrs. BLACKBURN. OK, and let me move on to the unintended consequences.

Ms. NORTHUP. Yes, the unintended consequences I would just tell you that it was a month after being at the Consumer Product Safety Commission. I was actually depressed because I thought that when I passed laws when I was in the General Assembly of Kentucky and in Congress and I sent them over to agencies and I thought they would make them rational and that they had more leeway. This law does not have a lot of leeway but we have heard from Members of Congress. Senator Klobuchar sent us a letter and said this law clearly was meant to exempt items that aren't where the lead is absorbable.

Mrs. BLACKBURN. OK let me stop you right there.

Madam Chairman, do you think the agency's overreach in trying to implement this law the way they have overreached on some of these rules has attributed to some of the jobs loss that we have seen in the manufacturing sector in this country?

Ms. TENENBAUM. I don't think we have overreached. I think we have implemented it based on the plain language of the statute and the issue here is the statute gives three exemptions.

Mrs. BLACKBURN. OK, let me stop you right there because I want to move on to the question on the database, $29 million is what you have spent total on this database?

Ms. TENENBAUM. No, we have spent $3 million on the database.

Mrs. BLACKBURN. OK.

Ms. TENENBAUM. We also received funds and that is the whole $29 million, $3 million of which were the database which we did IT modernization.

Mrs. BLACKBURN. Did you carry that out in-house or did you contract it out?

Ms. TENENBAUM. Well, we had some contractors and some insiders.

Mrs. BLACKBURN. OK and the timeframe that it has taken you to get the database?

Ms. TENENBAUM. We had when I came to the Commission July 29 we had not received the money from OMB because we had not qualified to bring the money down so we started in July of '09 and that is when the money came in.

Mrs. BLACKBURN. But you still have problems with it both from the entry and the information side?

Ms. TENENBAUM. No, we don't. We just did a soft launch.

Mrs. BLACKBURN. Yield back.

Mrs. BONO MACK. Yes, the lady's time has expired.

The chair recognizes the gentleman from New York, Mr. Towns for 5 minutes.

Mr. TOWNS. Thank you very much, Madam Chair.

And also let me say it is good to see you.

Ms. NORTHUP. Thank you. It is great to see you.

Mr. TOWNS. Happy to know there is life after Congress.

Ms. NORTHUP. I have missed you.

Mr. TOWNS. Let me just begin—first of all I want to clear up something. I keep hearing $3 million. I keep hearing $29 million on this database. I mean how much does this database really cost? Let me put it on the record here.

Ms. TENENBAUM. Three million.

Ms. NORTHUP. The IT modernization cost $29. This is the first time I have ever heard the figure $3 million ever but it was necessary in order to have this public database so that everything could talk to each other but let me just say going forward this year we do not have additional FTEs in the budget to handle the cases that come in but after this year we do. So the cost is going to grow because we are going to have to manage all the questions of verification when, you know, the verification that is part of the intake of an incident is only a self-verification where you say to the best of my knowledge this is true and we know as we take in cases right now that sometimes people have the wrong product. They have, you know, so the verification that the litigation that is involved all of that will take more FTEs.

Ms. TENENBAUM. Mr. Towns, we had five separate databases or silos. They could not talk to each other so if someone sent us an e-mail on CPSC.gov and said my stove caught on fire, it was this manufacturer and this model number we would then manually have to put into our incident report on computers but we had all five. We didn't have a data warehouse where one system could talk to the other system. We needed an upgrade in our hardware in our computers. We needed an upgrade in software. So we could not even share information with CBP because our systems wouldn't talk together so all of this is a larger effort to get our technology up-to-date and that we have people who have said they have repeatedly told Mrs. Northup that it is $3 million. It is not $29 million and so it is $3 million. The database is $3 million. It is not $29 million.

Mr. TOWNS. OK, thank you. In 2008, CPSIA passed with broad bipartisan support. In fact I voted for it and was signed into law by President George Bush. According to your testimony, Commissioner Northup, this legislation has had unintended consequences you were talking about earlier to small businesses because of new testing standards. Would implementation of a component part testing rule benefit small businesses?

Ms. NORTHUP. We hope so. What we would hope is that there would be there were developed on the market suppliers that would provide pre-tested, pre-certified components. The snap, the zipper, the component so that somebody that say makes a child's outfit could go to Michael's or whoever, the hobby shop and pick up these components pre-tested and pre-certified and then depend on those in their final certificate as, they would have currency. We would ac-

cept those pre-certifications and certificates in the final product. It will help. It does not take away the fact that many small suppliers also had very small lots. They make things to order. They make things—for example at the toy fair I met a woman who makes things for the blind. She has to have buttons for the eyes because just painting them on doesn't give you the tactile benefit. We have educational toys that are very small lives and so all these seeking out these certification numbers, these pre-certified products then doing a final certificate that picks up all of those. Every time you go back to the store and you pick up another lot you have to change your final certificate. You have to change what your tracking label is so that it reflects a new certificate. It is a lot of paperwork and the small businesses are telling us that is why we are going to make one thing or we are going to get out of the children's product business. It is very, you know, Ashley Furniture was probably the best example. They spent $13 million testing. They have 14 layers of primer and final product. They have every screw, nut and bolt. Not one product, not one component violated the lead limit but it was $13 for them to get the tracking and the component testing done so far.

Mr. TOWNS. Thank you, Madam Chair.

Mrs. BONO MACK. Thank you. The gentleman's time has expired.

I would like to recognize my new colleague from Kansas, Mr. Pompeo, for 5 minutes.

Mr. POMPEO. Thank you, Madam Chairman.

Chairman Tenenbaum, you said that there has been no cost benefit analysis performed at all, is that correct?

Ms. TENENBAUM. Under the CPSIA the Commission had mandatory deadlines and also the CPSIA did not require the Commission to do cost benefit analysis. Now, under the Federal Hazardous Substance Act and no under CPSA which is our general act we do cost benefit.

Mr. POMPEO. But there has been none on the database? So when we are talking about $3 million or $29 million that has been spent, I mean the real cost of this thing isn't what we are paying for the database. It is the hundreds of millions of dollars this is going to cost small business but we don't truly have any idea, is that correct, no analysis?

Ms. TENENBAUM. Well, the Commission has not done that because it is not our role to but we would certainly support any other agency that wanted to do one. We would provide them with the data.

Mr. POMPEO. Thank you. I appreciate that. You said, "The rub is that we have to post it." You have to post it.

Ms. TENENBAUM. We have to post within 10 days.

Mr. POMPEO. So would you support this committee recommending that we provide flexibility at your agency that you don't have to put it on that you can make a decision about whether it is accurate and the right thing to do? Today you say we have forced your hand. Would you prefer that we gave your agency more flexibility?

Ms. TENENBAUM. I think we need to stay to a limit where we can get information out as quickly as possible to consumers. I have heard of too many deaths, Danny Kaiser, other deaths of children

because parents did not have the information and we need a quick turnaround if a product is a problem. We will make the best faith effort once it is given to us that it is materially inaccurate to make a determination.

Mr. POMPEO. I appreciate that. I think this, I am an engineer. I love data but I also and I run for office and I know what people put online exactly.

Mrs. BONO MACK. Will the gentleman yield for briefly?

Mr. POMPEO. Yes, of course, yes, ma'am.

Mrs. BONO MACK. First day jitters, opening night jitters up here. We forgot to start the clock so we would like to point out that your time will expire at 2 minutes.

Mr. POMPEO. That is great. I assumed it was my first day jitters that you were referring to.

Mrs. BONO MACK. That is right. It was your first day jitters. You had it right.

Mr. POMPEO. That will happen as well. I just think this is a plaintiff's bar dream and I think the cost of litigation will be enormous.

Ms. Northup, do you think it would make sense to delay the implementation of the database to let this committee work out some of the challenges to make sure that we get good information to the public and we don't end up causing all the problems that have been alluded to this morning?

Ms. NORTHUP. Absolutely, as I walked around the toy fair in New York, one person after another raised this issue to me. Some already had issues that had come in on the soft launch and said there is nobody that knows what the facts are on this. They don't have to give enough facts that you can possibly know what the product is. They don't have to give enough specifics that you can possibly know what went wrong with it or even if it is they can't even make the claim it is materially inaccurate because they have no way to correspond with us and have us be able to go back to the source who might have firsthand information. I think that when you consider the jobs in this country and you consider the fact that we are going to have manufacturers running around terrified about how they are going to answer a database question when maybe it is not even their product. Maybe it is a product that is not even on the market anymore. It is 20 years old. And consumers if I might say the benefit to consumers I think of the ladders ad where you have two people playing tennis on the tennis court and all these people come running down to the point where it is crowding out the legitimate game of tennis. If you have all these data dumps from these organizations in here, the legitimate firsthand benefit that you can get from this database is lost and I might see that company X had a problem. It might not be there product. It might be a product from 20 years ago. I might think, OK I don't want to buy that product so I buy a different product and guess what? Really that was the safer product. So it is even misdirecting people to what is a hazard and what isn't a hazard, just some of the questions to stay within the timeframe.

Mr. POMPEO. Thank you, Commissioner Northup.

I yield back my time.

Mrs. BONO MACK. I would thank the gentleman.

I would and it is an honor to recognize the chairman emeritus and author of the original Consumer Product Safety Act as well as the conferee on CPSIA and the chair would recognize Congressman Dingell for 5 minutes.

Mr. DINGELL. Madam Chairman, I thank you and I appreciate your courtesy in recognizing me and I commend you for this hearing.

As my colleagues some of them will remember and the members will remember we passed with the support of the unanimous support of this committee a unanimous bill on this matter. It was an excellent piece of legislation. It got to the United States Senate and it got screwed up. And then we went to conference and the screw-up was worsened and it wasn't very long before I was being called by industry inquiring why a bill which had passed the House unanimously, come out of this committee unanimously had been turned into such a sad caricature.

So I have some questions for the Commissioner and I want to welcome the Commissioner and I want to welcome you particularly, Commissioner Northup.

Ms. NORTHUP. Thank you.

Mr. DINGELL. And I want you to understand this hearing is not critical of you but it is of the United States Senate and those people that screwed this up and we are going to try and figure out what it is we can make the matters right and help you to do your job. And I speak with particular outrage because years ago John Moss and I wrote the original legislation which created this your Commission in this room right here. It was a great success until the Senate got its hands on it and some members of the conference assisted actively in that screw-up.

Yes or no to both Commissioners, Section 101 of the CPSIA permits the Commission to exempt certain materials and products from the ax lead limit? I believe that is so narrowly written as to be useless. Do you believe that Section 101(b) needs to be amended in order to permit the Commission a more reasonable degree of discretion in granting exemptions, yes or no?

Ms. TENENBAUM. Yes.

Ms. NORTHUP. Yes.

Mr. DINGELL. To both Commissioners, similarly given widespread concern about the feasibility of retroactively applying CPSIA's requirements to existing inventory, do you believe the applicability of such requirements should instead be limited to products manufactured after the act's effective date or the effective date of regulations promulgated by the Commission pursuant to the act except in instances where the Commission decides that exposure to a product causes a health and safety risk to children, yes or no?

Ms. TENENBAUM. Yes, for a hundred parts per million.

Ms. NORTHUP. Yes, for all parts. If they are not dangerous we should allow them to still be sold.

Mr. DINGELL. And you ought to have waiver authority, isn't that right?

Ms. TENENBAUM. Yes.

Ms. NORTHUP. Yes.

Mr. DINGELL. That makes for intelligent regulation.

Now again to both Commissioners, likewise I am concerned that the age limit for children's products defined in CPSIA unnecessarily subjects certain products such as bicycles to more rigorous standards then otherwise necessary. Do you believe the age limit used in the definition of children's products should be lowered, yes or no?

Ms. TENENBAUM. No.

Ms. NORTHUP. Yes.

Mr. DINGELL. We have got a division. Do you believe that the Commission should have authority to deal with the question of waivers on that matter where it makes good sense, yes or no?

Ms. TENENBAUM. Yes.

Ms. NORTHUP. Yes, except I worry about the big companies having the resources to ask for a waiver and for the exact same products small ones won't.

Mr. DINGELL. The little guys don't.

Do both Commissioners, I am also concerned that the blanket applicability of certification and tracking label requirements could be when required unduly cumbersome especially for small businesses. Would an exemption for small businesses like the one contained in the Food Safety Modernization Act be feasible in the case of consumer products, yes or no?

Ms. TENENBAUM. I would like to study that more. I don't know. I didn't read the food act.

Mr. DINGELL. That is a fair answer.

Ms. NORTHUP. I would support that but I would support doing away with third-party testing and certification and just let the advanced technology we have today. All the new tools that you gave us are plenty adequate to make sure that companies comply with our laws.

Mr. DINGELL. Now, to both commissioners I will expect that you will if you see fit make additional remarks for the purposes of the record and I sorry that I am so constraining you. Again to both commissioners, do you believe that the Commission's problems in implementing CPSIA can be remedied solely by administrative action by CPSC, yes or no?

Ms. TENENBAUM. No.

Mr. DINGELL. Commissioner?

Ms. NORTHUP. We could make some significant changes if we made the absorb ability exclusion mean something and I think there is we could have the majority of the commissioners didn't so it will take your action to change that.

Mr. DINGELL. I thoroughly agree. We have made a fine mess out of this. It has to be rectified legislatively.

Again to both Commissioners, if not do you support amending CPSIA to address these problems?

Ms. TENENBAUM. Yes.

Ms. NORTHUP. Yes.

Mr. DINGELL. Would you assist the committee in our effort to do so?

Ms. TENENBAUM. Yes.

Ms. NORTHUP. Yes.

Mr. DINGELL. I will be submitting additional questions to the record to allow the Commission to expand on these matters and I

will ask Madam Chairman unanimous consent that my letter of March 4, 2009, to Commissioners Nord and Moore as well as their respective replies be entered into the record.

Mrs. BONO MACK. Without objection.

[The information appears at the conclusion of the hearing.]

Mr. DINGELL. And members of the Commission, I just want to ask this one additional question. Do you believe that implementation of CPSIA has overburdened the existing CPSC staff and resources?

Ms. TENENBAUM. No.

Ms. NORTHUP. Yes.

Mr. DINGELL. Does CPSC have adequate resources with which to implement CPSIA as well as to carry out its other duties?

Ms. TENENBAUM. Yes, if we are not cut.

Mr. DINGELL. Commissioner?

Ms. NORTHUP. No, I don't think we do but we could change the law and it would be sufficient and I am delighted to see you again, Representative Dingell.

Mr. DINGELL. Well, you are welcome back here, Commissioner. I am happy to see you and I am sorry we are seeing you under these circumstances and just maybe we can fix this mess. Thank you.

Mrs. BONO MACK. The gentleman's time has expired.

The chair would recognize the gentleman from Kentucky, Mr. Guthrie for 5 minutes.

Mr. GUTHRIE. Thank you, Madam Chairman. I appreciate the opportunity to be here and I have to follow up Chairman Emeritus Dingell. To the other committee and back so I might have missed this but I know the ranking member asked questions about the database and Congresswoman Northup, my fellow Kentuckian, or Commissioner Northup, you were going to answer. You may have since I was gone. They went through a series of questions on the database and did you agree with the security that it is a secure database and they did clear up all the problems or if you have mentioned that then we will move forward.

Ms. NORTHUP. Let me just state again I think it is so important because this database is going to be turned on that first of all the database rule that was written there was great division within the Commission. It is one of the few things that has divided us so seriously. I just I want to reiterate that there are a lot of things that we agree with and that the chair has really done a magnificent job in coordinating with Customs and implementing so much of this law. It is a shame that we are sort of here on the biggest debate issue but it is going to be turned on in 3 weeks. It is going to allow anyone to input, anyone, any organization, third-hand knowledge, hearsay information and the type of things that we see everyday. We see a Facebook where somebody talks about Pampers and about that they are causing a huge problem. Suddenly we got in 500 or we get in all these cases as I have to be careful I don't talk about what is confidential but I think we have made public statements that to date we have not been able to find that there is any problem with Pampers. But we haven't even finished providing a final statement on that.

Mr. GUTHRIE. OK, I want to get to another question. Go on for just a minute.

Ms. NORTHUP. For the companies that then would be running around because somebody collected some information on Facebook and at this point the person that owns the Facebook account could transfer every one of those incidents into our database. They do not have to know who it happened to. They put it in as their entry. That is legal. That is what they are supposed to do. It is the name and contact information of the person entering it, not the consumer.

Mr. GUTHRIE. Right, I just wanted to ask another question real quick.

Ms. NORTHUP. Yes.

And, Chairman Tenenbaum, and actually we met a long time ago when I was a State legislator and you hosted us for the Southern Regional Education Board in Charleston and you did a great job. Thanks but I am a manufacturer, my background, and like the Administration we are looking to create jobs and the ability to export, not just importing, increase our imports and my understanding is that CPSIA is that American manufacturers won't be allowed to sell their goods abroad unless they meet the lead standard that we just heard the Chairman Emeritus say we have got to fix. So and also they won't be able to sell abroad unless their goods have not been sold in the United States and never will be sold in the United States. So if they have never been sold in the United States or won't be they won't be able to sell abroad unless they compete with this law that we just heard other comment we think is unworkable. Do you think this puts American manufacturers at a disadvantage to or we couldn't make something here and send it somewhere else to go into a product and then come back here?

Ms. TENENBAUM. No, American manufacturers have to meet the standard which is 300 parts per million right now and 90 parts per million for lead.

Mr. GUTHRIE. Well our point is that it is difficult to do that and as the chairman emeritus has said the whole law we need to fix that.

Ms. TENENBAUM. No, yesterday we heard testimony. Excuse me, I just interrupted you.

Mr. GUTHRIE. No, go ahead. Go ahead. No that is fine. We are trying to get all of this in before we are out of time.

Ms. TENENBAUM. I am sorry but this came to mind but we heard testimony about one of the largest testing laboratories in the world and they said they tested over 90,000 data points and they found that 97 percent already comply with the hundred parts per million lead and so people are already going to that standard. And the other thing is that domestic manufacturers and importers have to comply with the 300 parts per million lead content and 90 parts per million.

Mr. GUTHRIE. Part of it is the labeling too.

Ms. TENENBAUM. Right and Canada has already dropped their standard for lead content to 90. The EU has 90 but it is the solubility standard but it is roughly comparable and but it is so worldwide people are dropping their lead standards. Because I have an article from May 1936, which talks about the harm lead can do to children and just this article says even infinitesimal amounts can bring down the IQ. It is a potent neurotoxin. It can cause brain

damage and there is no de minimis standard known. There is no safe level of lead known.

Mr. GUTHRIE. I am going to let you go.

Ms. NORTHUP. Let me just say that we have health agencies that tell us about what is an unsafe level of lead. The CDC, the NIH, the EPA all tell us a child's lead level needs to be under 10 parts per deciliter of blood. Right now only one percent of all children reach that and in every case even the consumers, I mean the American Association of Pediatrics tells us that if a child doesn't, they don't say it is their bicycle handlebars to take away those toys. They tell you it is because of lead in paint, lead in gasoline and what to do to offset those. No one has ever suggested in the health community that your bicycle handlebars and things like that have anything to do. In fact, we allow more then that amount of lead, the FDA in a child's piece of candy can have more lead.

Mr. GUTHRIE. As a manufacturer I can tell you if you agree with everything and it all works like it is supposed to, the traceability side of that because I have an automotive supplier and he said if he had to trace everything came in and went on, that is a real cumbersome thing for our American manufacturers, I think.

Ms. NORTHUP. Thank you.

Mrs. BONO MACK. The gentleman's time has expired.

The chair recognizes the gentleman from Texas, Mr. Olson, for 5 minutes.

Mr. OLSON. Thank you, Chairwoman, and thank you to our witnesses for coming in. I greatly appreciate your time and your expertise.

I want to follow up on a comment you made, Commissioner Northup, and I will quote here, "We are better at the border then we have ever been."

Ms. NORTHUP. I was talking about products coming in.

Mr. OLSON. Yes, products coming in. Exactly. No, no, yes, yes, not yes but we don't want to open that. No, ma'am.

I represent the Port of Houston which is the largest port in foreign products here in America and you all know that the Panama Canal is being widened and deepened and it is expected to be opened in 2015. When it is these very, very large cargo ships that right now are coming to the western coast of Mexico, the western United States are going to punch through the canal and come to the Gulf Coast. Any my question is are you working right now with DHS with the Customs people to make sure that we have the resources that when these ships get through if not were going to have some of these toys and all the things we are concerned about that you can verify and test these things and get ahead of this curve so they don't come to the pier, get off the pier and go into our economy?

Ms. NORTHUP. Really the person who has done so much on this is our chair and I feel like I ought to let you answer first because you have a lot you can say.

Ms. TENENBAUM. Well, first of all thank you. First of all, last year we were the first agency to sign a memorandum of agreement with Customs and Border Protection whereby we get to see the manifest data. We have two people located at CBP and the CTAC office and we look at data on ships as it comes to the United States

before it is even import before it is unloaded and we have also just finished a study on a risk management study so that we can target shipments and we are very, very accurate. Last year we, I had the numbers but we were able to have at least the targeted shipments that we stopped we found at least 50 percent had already violated. So we are working so that companies that don't have history of non-compliance can have a safe lane and those that we need to target and monitor closely we will have information well ahead of time before they get into the port. Because I visited the Port of Savannah and also the Port of Charleston and I understand that we need to get the shipments unloaded.

Mr. OLSON. Yes, ma'am.

Ms. Northup, any comments?

Ms. NORTHUP. Yes, only that it is so sophisticated it is so impressive. I think when you consider how advanced it is and the fact is one of the reasons we have so many fewer recalls is because we are intercepting things at the port and it does add to my claim what I believe is a reason why third-party testing and all the certification and tracking of every single component is going to be obsolete in compared to the new ways we have to survey what is coming into our ports.

Mr. OLSON. Yes, ma'am. Thank you very much for those answers. I would encourage you to keep working with the Customs and Border Patrol because this is will be big all along the Gulf Coast.

Ms. TENENBAUM. They are our strongest partners.

Mr. OLSON. I mean it is not just the Port of Houston. It is all the ports along the Gulf Coast are going to be impacted by this and obviously we need to stop these products from getting in as quickly as we possibly can.

The other question I have is about the impact of CPSIA on sort of the charities. Under the lead content test requirements right now is it a violation to donate clothes, toys or other items to children 12 and under if the items have not been tested and certified in compliance with law?

Ms. TENENBAUM. No, it is not a violation for you to give clothes to Goodwill or Salvation Army or any other charity. We have worked with all the charitable organizations and worked with States. We had a handbook. We have done an extensive education. We know that there are certain items that pose the largest risk. Children's jewelry could have cadmium or lead. Painted toys, items made out of vinyl because vinyl degrades quicker and lead can be exposed and there have been high amounts of lead in vinyl clothes, in vinyl clothing. So we have worked with them on things they need to check and not resell. Also it is illegal to sell a recalled product under CPSIA so if a crib has been recalled or playpen you shouldn't sell it. But we work really hard with the States and the organizations to try to educate them on what are the high-risk products.

Ms. NORTHUP. It is almost impossible to resell any children's product. As Goodwill told me in Kentucky they have lost a million dollars in sales in the first 4 months that this went into effect because the fact is they actually paid $35,000 to buy an XRF gun. They hired somebody and trained them. By the time they found a button that passed they had spent more money then they would get

on a blouse for example, a child's blouse and they found that so all of those things went out. All the new standards we have made for durable goods make every other durable good that is in the marketplace whether it is a car seat or a bath seat or you cannot sell them secondhand. So while it is not against the law for you to donate them, it is against the law for them to sell anything that doesn't comply.

Mr. OLSON. Thank you, ma'am.

Mrs. BONO MACK. The gentleman's time has expired.

The chair recognizes Congressman Lance for 5 minutes.

Mr. LANCE. Thank you very much, Madam Chair, and good afternoon to you both. I am new to the full committee, therefore new to the subcommittee and it is my honor to meet both of you and I look forward to working with both of you.

As I understand that you have stayed portions of the law for several years in a row. I also understand that some manufacturers might still be worried that state attorneys general might enforce the requirements even though those requirements have been stayed and I would request your comments as to perhaps whether or not your stay should be effective with the States as well.

Ms. TENENBAUM. Well, the stay will automatically lift December 31 of this year. Now what we have not and that is just for testing and certification for lead content, not lead paint. We didn't stay it but lead content.

Mr. LANCE. Yes.

Ms. TENENBAUM. And so but you still have to comply. So we didn't stay enforcement. Any manufacturer has to comply with lead paint limits, total lead content, limits on certain phthalates, small parts, magnets, and F963. Now, that means that attorneys general may enforce the law just as we might enforce the law and the large manufacturers as well as the large retail, if you go into any retail establishment you will find that their products have been tested because they require before the Wal-Marts, the Toys R Us, Target, if they require you to show a third-party test and that is why many people are already testing. So the attorneys general are not stayed from enforcement and neither are we.

Mr. LANCE. And has that occurred in any situation with which you are familiar?

Ms. TENENBAUM. Sure we have several attorneys general who are very active in consumer product safety and you can as well as some States who have lower lead limits then we do. Illinois has a 40 parts per million lead limit. Proposition, I mean California has had Proposition.

Mr. LANCE. But do you know what? I do not. Do you know what it is in New Jersey? I do not know.

Ms. TENENBAUM. No, but I can look it up.

Mr. LANCE. Commissioner Northup, your comments?

Ms. NORTHUP. Yes, well first of all the attorneys general one of the things that the law did say is that attorneys general can enforce the law even though it is a federal law can enforce it at the State level and it has caused a lot of angst among manufacturers and, you know, even though Illinois has a 40 parts per million, it doesn't say that you can't sell it. It just says you have to label it saying it might cause lead poisoning in your child.

Mr. LANCE. I see. Thank you, I did not realize that.

A philosophical question, sometimes perhaps in all cases laws we pass here and that are passed at State capitols with which I am familiar have unintended consequences and then it is our responsibility to try to address them. Do you believe and I would address this to both of our distinguished witnesses. Do you believe that unintended consequences might on occasion result in overreaching?

Ms. TENENBAUM. Well here is the law that was passed—allows to exempt products. If we cannot exempt a product if normal use and abuse of the product results in any lead being absorbed into the human body, any lead. So that is why when you had bicycles and ATVs and books the any lead standard kicked in and that is where we say we need flexibility.

Mr. LANCE. That would require modification of the statute in your opinion?

Ms. TENENBAUM. It would require us to have some flexibility and that if there is no harm to the child or to the person using it then we could have a waiver or an exemption. We can grant an exemption.

Mr. LANCE. Ms. Northup.

Ms. NORTHUP. I think by far the simpler thing and the thing to give certainty to the providers, the businesses is to have an exemption that makes the absorb ability exclusion mean something. There were three exclusions. There were electronics. There was the inaccessible. We have made both of those two exclusions mean something considerable but we have decided that not one thing qualifies for the absorb ability. If you changed it to say no amount of lead could be absorbable that would cause any material change in a child's lead level we would totally rationalize this bill.

Mr. LANCE. Would you suggest that this be done at your level or through by statute?

Ms. NORTHUP. Well, I do make the argument I have a legal brief that I think that it did give us that because I believe that Congress when they passed it meant for that section of the law to mean something and there is a lot of statutory past interpretation that shows that you can't just write off a whole section of the law. But the majority of the Commissioners decided that we couldn't and so it will take a change by you.

Ms. TENENBAUM. First of all that was.

Mrs. BONO MACK. The gentleman's time has expired and we need to move along but I would like to thank both witnesses for appearing today.

I also urge both of you moving forward to reexamine how the Commission prioritizes risk. Let us focus more on real dangers facing our children which may be going unaddressed at the present time and not perceived ones. Again thank you both very much. I look forward to working with you on fixing as Chairman Emeritus Dingell said all that is screwed up.

Ms. TENENBAUM. Thank you, Madam Chairman. Thank you all.

Ms. NORTHUP. Thank you.

Mrs. BONO MACK. We will just give a few moments for the second panel to get in place.

The subcommittee will come back to order.

On our second panel we have four witnesses. I would like to welcome them all.

Our first witness is Jolie Fay. Ms. Fay is the founder of children's product company called Skipping Hippos based out of Portland, Oregon. She is also secretary of the Handmade Toy Alliance which she also represents today.

Our second witness is Wayne Morris. Mr. Morris is the vice president of Division Services for the Association of Home Appliance Manufacturers representing manufacturers nf all sizes and various consumer products.

Also today, we have Rick Woldenberg of Chicago, Illinois. Mr. Woldenberg is the chairman of Learning Resources, Incorporated, a children's product manufacturer and direct mail retailer that specializes in educational toys. The company is a small business but employs over 150 people.

And finally, we will hear from Nancy Cowles, Executive Director of Kids in Danger also based in Chicago. Ms. Cowles is testifying on behalf of Kids in Danger, Consumer Federation of America, and Consumers Union.

Again, welcome to all of you. You will each be given the 5 minutes and to help you keep track of time, I am going to make him remember to keep track of time and when the light turns yellow before you in the little box please try to sum up your remarks so that when the light turns red you are ready to stop. And with that we will welcome Ms. Fay for her first 5 minutes and just ask that you turn on the microphone and bring it close to your mouth and you are recognized for 5 minutes.

STATEMENTS OF JOLIE FAY, FOUNDER, SKIPPING HIPPOS AND SECRETARY, HANDMADE TOY ALLIANCE; WAYNE MORRIS, VICE PRESIDENT, DIVISION SERVICES, ASSOCIATION OF HOME APPLIANCE MANUFACTURERS; RICK WOLDENBERG, CHAIRMAN, LEARNING RESOURCES, INC.; AND NANCY A. COWLES, EXECUTIVE DIRECTOR, KIDS IN DANGER

STATEMENT OF JOLIE FAY

Ms. FAY. Chairman and members of the subcommittee, thank you for inviting us here.

I make children's ponchos in my home in Portland and I am testifying today on behalf of the Handmade Toy Alliance members. We are the people knitting hats on the train and we are the mothers in line with you at the store. We are the people from your hometowns who have grown up in families that craft and we are your neighbors and your families and we are constituents, and we need your help to bring commonsense changes to the CPSIA. Our businesses were born from the desire for safe children's products. We make them with care and attention and most often from materials purchased from our local craft stores. Our dreams are to build heritage products that will be cherished and remembered and saved for generations.

Our broad membership experience is the unintended consequences of the CPSIA in different ways. Micro-sized businesses that craft and retail toys and children's products make up half of our membership. Often these are one-person businesses who

produce and sell in very small batches. The CPSIA makes no provisions for these businesses to be able to operate. People crafting in their homes are expected to third-party test the same way as a mass-market manufacturer. The cost of third-party testing for lead and ASTM standards are prohibitive in very small batches. Tracking and labeling requirements are too burdensome and people find the law and its requirements too complex to understand and apply.

At the Hollywood Senior Center in Portland, Oregon there is a small retail shop that sells items made by the seniors. They live on an incredibly small fixed income and would never be able to afford a single ASTM third-party test. The workmanship that has developed over a lifetime helps contribute a small but very substantial supplement to their monthly income. These are artisans and this law makes them criminals.

Another segment of small-batch businesses producing multiple items and selling in boutiques and online are also not able to absorb the testing costs for their products and are treated equivalent to mass-market manufacturers. Companies who create only 20 or so products producing in batches in 10 and 20 units simply cannot afford these testing costs and expect to be able to charge the same price or even a reasonable price.

A third group hurt is in the specialty toy retailers. These are the mom and pop toy shops in towns across America. The CPSIA removes the ability for them to sell most safe and local products and many international products. Loss of specialty toys from Europe particularly tilts the children's marketplace in favor of mass produced items and removes the opportunity for special retailers to differentiate themselves. Without the ability to offer unique items to sell in their store, there is nothing that can set them apart from their competitors.

Finally, toy importers represent two percent of our membership. It is a small percentage but a big component of the culture of specialty toys in America. Within this melting pot culture that we live in they provide access to many safe products from our ancestors and countries of origin enriching the value of play and helping the culture survive. The CPSIA treats these small-scale importers as if they were mass-market manufacturers and they suffer alongside the U.S. small-batch manufacturers.

I grew up in Wyoming, where my great-grandparents were homesteaders. For generations my family has made toys and clothes and saddles for children. I cherish these items because they are from my family and they were made with care, just like what I make. Our members are people just like me from all across the country making safe products that we cannot afford to third-party test. I am here today because I want my children to continue this tradition and to understand and learn from our entrepreneurial spirits. Crafting gives them joy and selling it gives them reward.

While the HTA has worked closely with the CPSC, we feel strongly that the current legislation does not grant the CPSC the flexibility to address our members' needs. Our membership is in need of a legislative fix that only you in Congress can give. Solving the problems of the CPSIA is not only for our members' immediate financial relief but will save generations of future handmade products. For thousands of years cultures have been studied through

their handcrafted toys. In museums around the world there are artifacts of handmade toys connecting the cultures of the past to societies of today. What will the legacy be if the CPSIA destroys our generation's ability to share this piece of history?

Thank you for the opportunity to speak.

[The prepared statement of Ms. Fay follows:]

Good afternoon, my name is Jolie Fay. I am the owner of Skipping Hippos. I make children's ponchos in my home in Portland, Oregon. I am testifying on behalf of the 619 Handmade Toy Alliance members. We are the people knitting hats on the train, we are the mothers in line with you at the store, and we are the people from your church and home towns who have grown up in families that craft. We are your neighbors, your families and your constituents and we need your help to bring common sense changes to the CPSIA.

Our businesses were born from the desire for safe children's products. We make them with care and attention, most often from materials purchased from our local craft stores. Our dreams were to build heritage products that will be cherished and remembered, and saved for generations.

Our broad membership experiences the unintended consequences of the CPSIA in different ways.

Micro-sized businesses that craft and retail toys and children's products make up half of our membership. Often, these businesses are family or single owner businesses with no employees who produce and sell products in very small batches. The CPSIA makes no provision for these businesses to be able to operate. People crafting in their homes are expected to third party test the same way as mass market manufacturers. The costs of 3rd party testing for lead and ASTM standards are prohibitive in very small batches, tracking and labeling requirements are too burdensome and these micro-businesses find the law and its requirements too complex to interpret, understand and apply.

For example, at the Hollywood Senior Center in Portland, there is a small retail shop. The items in the shop are exclusively made by their members. Handmade trucks and planes are made by retired loggers in their 70's and 80's. They are on an incredibly small fixed income and would never be able to afford a single ASTM laboratory test. The workmanship that has developed over a lifetime helps contribute a small, but very substantial supplement to their monthly income. These projects keep them active and give them meaning to each day. These are artisans, but this law makes them criminals.

Another segment of HTA members are small batch businesses, producing multiple items and selling in boutiques and on line. They also are not able to absorb the testing costs for their products as the CPSIA makes no provision for these entities to continue to be economically viable after absorbing the costs of full CPSIA compliance. Again, they are

treated equivalent to mass market manufacturers. Companies, who create only 20 or so products, producing in batches of 10 and 20 units, simply can not absorb the testing costs and still expect to charge a reasonable price for the added expense.

Representing 19% of our membership, a third group hurt by the CPSIA is small specialty toy retailers. These are the "mom and pop" toy stores tucked into towns all across America. The CPSIA removes the ability for them to sell almost all of the safe local products and many international products. Loss of specialty products from Europe, particularly, tilts the children's products marketplace in favor of mass produced items and removes an opportunity for specialty retailers to differentiate themselves. Without the ability to offer products unique, which sets their store apart from the competition, there is little reason for the existence of the small specialty toy retailers. So the CPSIA limits consumer choice unnecessarily and creates a regulatory barrier to international small batch manufacturers.

The final group is specialty toy importers, representing 2% of our membership. It is a small percentage, but a big component in the culture of specialty toys in America. Within this "melting pot" culture that we live in, these importers provide access to many safe products from our ancestors' and countries of origin, enriching the value of play and helping the specialty market survive. The CPSIA treats these small scale importers as if they were mass market manufacturers and therefore they suffer alongside USA based small batch manufacturers.

I grew up in Wyoming, where my great grandparents were homesteaders. For generations, my family has made clothes, toys, saddles, and belts for their children. I cherish these items because they are from my family, and they were made with care, just like what I make. Our members are people like me, from all across the country, making safe products that we simply cannot afford to third party test. I am here today because I want my children to understand and learn from our entrepreneurial spirits. Crafting gives them joy, selling it gives them reward.

While the HTA has worked closely with the CPSC -- submitting comments on pending rules, attending CPSC sponsored workshops, regular email and phone contact with CPSC staff - we feel strongly that the current legislation does not grant the CPSC the flexibility to address our members' needs. Our membership is in need of a legislative fix that only you, in Congress, can give.

Solving the problems of the CPSIA is not only for our members' immediate financial relief, but will save generations of future handmade products. For thousands of years, cultures have been studied through their handcrafted toys. In every museum around the world, there are artifacts of handmade toys –connecting the cultures of the past to societies of today. What will our legacy be if the CPSIA destroys our generations' ability to share in this piece of history?

Thank you for the opportunity to speak before you today. Please note that in my written testimony, I have shared some of our ideas to rectify the unintended consequences of the CPSIA.

About the Handmade Toy Alliance

The Handmade Toy Alliance represents small toymakers, children's product manufacturers, and independent retailers whose businesses cannot survive without repairing the Consumer Product Safety Improvement Act (CPSIA). We are lobbying for meaningful reform of the CPSIA to aid small businesses caught in a snarl of unintended consequences. We need meaningful, common sense reform to preserve the heart and soul of small batch specialty toys and children's products.

Handmade Toy Alliance Platform

The Handmade Toy Alliance (HTA) represents a broad spectrum of small businesses involved in production, retailing and importing of children's products. Our membership experiences the burden of the unintended consequences of the Consumer Product Safety Improvement Act (CPSIA) in different ways. Our platform outlines these issues for each business category along with the solutions and remedies desired by the HTA.

Business Type	% Members	Issues Caused by the CPSIA	Solutions Needed
Micro-business children's product crafter - retailer[1] *(single owner or small group, no employees, making toys or children's products in very small batches)*	48 %	The CPSIA makes no provision for micro-businesses to be able to operate – they are treated equivalently to mass market manufacturers • Cost of 3rd party testing for lead and ASTM F963 not economically feasible • Tracking, labeling and recordkeeping requirements burdensome • The law and its requirements are too complex to interpret, apply and attempt compliance	• Provide an exemption from all 3rd party testing, certification and from labeling requirements

[1] For example; small family business producing toys for retail at craft shows or online, sole proprietor producing unique children's products for retail locally, a retired senior who produces 20 wooden toys annually, a homemaker producing artistic children's products and retailing through etsy.com.

Business Type	% Members	Issues Caused by the CPSIA	Solutions Needed
Small-business children's product manufacturer *(less than 10 employees making toys or children's products in small batches or as one-of-a-kind)*	15 %	The CPSIA makes no provision for these entities to continue to be viable businesses after absorbing the costs of the CPSIA – they are treated equivalently to mass market manufacturers • 3rd party testing and certification for lead content is too costly in small batches • 3rd party testing and certification for ASTM F963 is too costly in small batches • Tracking, labeling and recordkeeping requirements burdensome	• Allow compliance with lead content standards with less expensive alternatives like XRF scanning and component part certification[2] • Make ASTM F963 testing voluntary • Tracking labels become voluntary except for durable nursery items. Manufacturers implementing tracking labels benefit from a lesser burden in the event of a recall.

[2] When and if certified component parts are readily available.

Business Type	% Members	Issues Caused by the CPSIA	Solutions Needed
Specialty toy retailers *(less than 10 employees retailing specialty children's products)*	19 %	The CPSIA makes no provision for specialty retailers to have access to a myriad of safe international products while simultaneously depressing the market for domestically produced specialty items • Loss of specialty products from Europe tilts the children's products market in favor of mass retailers selling mass produced items • Loss of specialty products from the USA removes opportunity for differentiation with mass retailers • Limits consumer choice unnecessarily • The CPSIA creates a regulatory trade barrier to international small batch manufacturers	• Recognize European Union safety standard EN-71 as an alternate for CPSIA • Direct CPSC to monitor international standards in children's products and recognize acceptable standards as alternates for CPSIA • See two previous categories for restoring access to domestically produced specialty products

Business Type	% Members	Issues Caused by the CPSIA	Solutions Needed
Specialty toy importers *(less than 10 employees importing specialty children's products)*	2 %	The CPSIA makes no provision for small scale importers / distributors of foreign children's products. They are treated equivalently to mass market manufacturers. • 3rd party testing and certification for lead content is costly in small batches • 3rd party testing and certification for ASTM F963 is costly in small batches • Tracking, labeling and recordkeeping requirements burdensome	• Allow compliance with lead content standards with less costly alternatives like XRF scanning • Make ASTM F963 testing voluntary • Tracking labels become voluntary except for durable nursery items. Manufacturers implementing tracking labels benefit from a lesser burden in the event of a recall. • Recognize European Union safety standard EN-71 as an alternate for CPSIA

For our membership and all Americans, the CPSIA regulations usher in a sea-change in the culture of children's products in the USA. Unless Congress acts, the accessibility of unique, small batch toys and children's products will significantly diminish. The children's products heritage of the next generation will be mass produced with little uniqueness. Save our members and save the culture.

Mrs. BONO MACK. I thank the gentlelady.
And now we will hear from Mr. Morris for 5 minutes.

STATEMENT OF WAYNE MORRIS

Mr. MORRIS. Thank you, Chair Bono Mack and members of the subcommittee. Thank you for inviting the Association of Home Appliance Manufacturers to testify on this important matter.

AHAM supports the creation of a public database to assist consumers with easy access to relevant and accurate safety information, and it is important that that situation be properly funded. Of course there are many private Internet sites that play the same role and so it makes little sense for the Commission to expend major resources to create a competing website unless it adds value. A critical part of that value proposition is that the information should be of high quality, accuracy and utility.

Unfortunately, the Commission's current database design hinders the publication of accurate information. It places unreasonable burden on manufacturers and it does not require timely resolution of good faith material inaccuracy claims. We need the database to be news we can use. With a few changes the accuracy of the information can be improved. Nothing we are proposing inhibits in any way the Commission from pursuing reports it receives from consumers or anyone else to see if a corrective action is necessary or a violation of the standards has occurred.

Our testimony here is limited to what is placed on a public, incident, Internet-based database. We have three points.

One, the Commission should resolve claims of material inaccuracy. According to the CPSC material inaccurate information is a report of harm in a report which contains "information that is false and misleading and which is so substantial and important as to affect a reasonable consumer's decision making about the product." This includes misidentification of the product, manufacturer or private labeler, or the harm or risk of harm.

The manufacturer has the burden of proof and must provide specific evidence and describe how the report is wrong and how it should be corrected. It is in every legitimate party's interest that the Commission post only accurate information to the database.

Under the current regulations, all harm reports except for the ones of outstanding confidentiality claims have to be posted to the database within 10 days of transmitting the report to the company no matter what. Accordingly, even if a company meets the Commission's burden of proof and responds within the short 10-day period, by submitting substantial evidence of material inaccuracy the Commission will post the complaint to the database before resolving the material inaccuracy claim. The Commission actually has no obligation to resolve the material inaccuracy claimed by any particular time. As we all know, once information bas been published on the Internet even if it is revised or retracted later, it stays in cyberspace forever and may already have done damage.

We believe it is wrong for the Federal Government to allow companies and their brands to be unfairly characterized, even slandered without evaluating the company's claim. Because of the extremely limited timeframe to receive the information, analyze it and develop a response, we believe that it is unlikely that many

companies will comment on a high percentage of reports of harm and the chairman spoke earlier of the soft launch proving what we say. If a company does respond, basic fairness requires that the government decide before the data is publicly released.

Two, the eligible reporters to the database should be limited to those with direct information. The CPSIA lists those who may submit reports of harm to the inclusion of public incident database. The Congressional specificity of these groups was purposeful to encourage their involvement and to make clear that those who are the consumers, their representatives, first responders or care providers to consumers should not participate in the database for their own ends. This applies to trial lawyers, consumer groups and even trade association like mine. Remarkably, the Commission is now in the final database rule shoehorn certain non-governmental organizations into a definition of public safety entity. Congress should reinstate the original intent of the legislation.

The database ought to be limited to those people who purchase the product, use the product or cared for someone who has suffered an injury. Otherwise the database is simply a blog and there is no reason for the Federal Government to displace or compete with private blogs.

Three, the Commission should require a registration a model or other descriptive information. There are thousands of categories of consumer products, manufacturers and brands where there are numerous models of a product. Although the Commission encourages submitters to provide more detailed information which will allow the public and manufacturers to identify which particular product was subject to alleged incident, it does not require that information. This is a mistake which Congress should remedy.

The suggestions that we have made do not prevent a useful, accessible public database. Rather, we believe our proposals enhance the utility of this new mechanism.

Thank you for the opportunity to testify. I would be glad to answer questions. Thank you.

[The prepared statement of Mr. Morris follows:]

Testimony
of
Wayne Morris
Vice President, Division Services
Association of Home Appliance Manufacturers

Before the
Energy and Commerce
Sub Committee on Commerce, Manufacturing and Trade
U.S. House of Representatives

Hearing on CPSC

February 17, 2011

Testimony of
Wayne Morris
Vice President, Division Services
Association of Home Appliance Manufacturers
House Energy and Commerce Subcommittee on
Manufacturing and Trade
Hearing on Review of CPSIA and CPSC Resources

February 17, 2011

Chair Bono Mack and members of the Subcommittee, thank you for inviting the Association of Home Appliance Manufacturers to testify on this important matter.

AHAM represents manufacturers of major, portable and floor care home appliances, and suppliers to the industry. AHAM's membership includes over 150 companies throughout the world. In the U.S., AHAM members employ tens of thousands of people and produce more than 95% of the household appliances shipped for sale. The factory shipment value of these products is more than $30 billion dollars annually. The home appliance industry, through its products and innovation, is essential to the US consumer lifestyle, health, safety and convenience. Through its technology, employees and productivity, the industry contributes significant number of U.S. jobs and economic security.

For over 30 years, AHAM has been at the forefront of product safety through consumer education, support of safety standards and promoting good safety practices in the United States and throughout the world. We have worked with the Commission closely in a number of areas, including, for example, advocating improvement in safety design, manufacturing and practices in China. We supported passage of the CPSIA (albeit we advocated significant amendments) and

greater Commission funding. Recently, we supported the use of the Commission's new authority under CPSA section 15(j) with respect to hair dryers.

All throughout my career, I have been engaged in a variety of safety activities. I oversaw product safety for several appliance manufacturers, helped manage a leading safety testing laboratory, and since having been at AHAM, have led our efforts with the Commission and safety standards organizations in the United States and internationally. I serve on the board of the International Consumer Product Health and Safety Organization. I hope that my friends and colleagues at the CPSC and consumer groups understand that AHAM's and my motivation is to support product safety in the context of a reasonable and fair regulatory system. I also want to clarify that my comments are not a criticism of the hardworking and dedicated employees at the CSPC with whom I have worked for many years and who do their best even under difficult circumstances. The Commission and its staff have done an excellent job of making sure that viewpoints from industry have been heard. There have been several meetings, open hearings, and web meetings to allow for questions and comments. The process has been quite open.

In addition, I currently serve as the Chairman of the Industry Trade Advisory Committee Number 16 on Standards and Technical Trade Barriers to the U.S. Department of Commerce and the Office of the U.S. Trade Representative. In this work, our FACA Committee looks at the openness, transparency and national treatment of technical standards and testing work that is done around the world. In addition, our committee advises Congress on trade agreements.

AHAM supports the creation of a public database and we also support the funding necessary to execute this endeavor properly. Even before the enactment of CPSIA, the Commission had authority to create such a database, and we recognize that many consumers are

interested in easy access to relevant safety information. Of course, there are many private internet sites that play the same role so it makes little sense for the Commission to expend major resources to create a competing website unless it adds value. We believe that a critical part of that value proposition is that information should be of reasonably high quality, accuracy and utility. Otherwise, the application of significant CPSC resources is redundant and wasteful.

Unfortunately, in several respects, the Commission has made a policy choice or a legal interpretation to structure the design and operation of the website to decrease the quality and accuracy of information, to place unreasonable burdens on manufacturers, and not to require timely resolution of good faith material inaccuracy claims.

Fortunately, a few changes in the statute will make the operation of the database more fair, reasonable and accurate without undercutting the program. AHAM would like to make sure that the database contains "news you can use." The database will never be perfect but at least where there are motivated manufacturers who want to ensure more accurate entries, this participation ought to be supported.

I want to preface our specific recommendations by being clear that nothing we are proposing inhibits in any way the Commission from pursuing reports it receives from consumers or anyone else to see if a corrective action is necessary or a violation of standards has occurred. Reports of serious or potentially serious injury or harm, and even reports without a lot of detail, can still be reported to and pursued by Commission. Our testimony here is limited to what is placed on the public incident, internet-based database.

These comments are consistent with President Obama's new executive order on regulatory review which requires tailored, balanced rules. OMB has urged independent agencies to comply with the executive order and memoranda.

1. Information Should Not be Released to the Public Database While There is a Pending Claim of Material Inaccuracy

Commission's decision under CPSA Section 6A(c) (4) regarding material inaccuracy claims is dismaying.

According to CPSC, materially inaccurate information in a report of harm is a report which contains "information that is false and misleading, and which is so substantial and important as to affect a reasonable consumer's decision-making about the product." This includes misidentification of the product, manufacturer or private labeler or the harm or risk of harm. The manufacturer has the burden of proof and must provide specific information and evidence and describe how the report might be corrected.

To meet such a high standard of proof, companies need sufficient time to investigate the claim. In this regard, we think that the 10-day requirement is unreasonable and provides substantial challenges for the responding companies. Surely, since thousands of reports will be posted to the database every year (most unchallenged), if Congress increases the 10-day response, it would certainly not undermine the benefits to consumers and, as noted, would have no impact on the Commission investigating serious allegations.

A slight increase in time would also deal with the problem of CPSC not allowing brands to be registered. The extra time needs to be used by the brand owner to notify the manufacturer or importer. A retailer may have brands of the same product built by several manufacturers. Parties who raise frivolous allegations should be sanctioned (as should reporters of harm).

Moreover, it is in every legitimate party's interest that the Commission does not post materially inaccurate information to the database - there is no value in inaccurate or misleading information. Under the current regulation, all harm-reports (except for the ones with outstanding confidentiality claims) have to be posted to the database within ten days of transmitting the reports to the companies. Accordingly, even if the companies meet their burden of proof and respond within an incredibly short period (10 days) to a notice of a proposed posting and submit colorable and substantial evidence of material inaccuracy, the Commission will post the complaint to the database even if it is has not resolved the material inaccuracy claims. Indeed, there is no specific obligation under the regulation for the Commission to resolve the material inaccuracy claims by any particular time. Yet, as we all know, once information has been published in the public, internet database, even if it is revised or retracted later, it stays in cyberspace forever and may already have been used and disseminated to many other sites and for many purposes.

It is wrong for the federal government to allow companies and their brands to be unfairly characterized, even slandered, without the government evaluating a company's claim. Further, it is unwarranted that the Commission has as much as seven days to remove the complaint from the database, even after it determines that the report was materially inaccurate.

The law should be changed so that it is clear that no information may be published on the database if there is a pending claim of material inaccuracy. If the Congress wants a federal program that provides valuable information to consumers, while not unnecessarily burdening or harming US industry, then this simple due process should be required.

Because of the extremely limited timeframe to receive the information, raise it with the appropriate personnel within the company, analyze it, and develop a response, it is unlikely that

many companies will be able to respond in a timely manner to a significant percentage of reports of harm. If a company, however, does go through those lengths in such a short period of time, basic fairness requires that the government respond before the data is publicly released. Note, we are not advocating extra time for litigation or appeals, just a basic administrative decision.

2. **The Eligible Reporters to the Database Should be Limited, as Congress Intended, to those with First Hand Information about the Harm or with a Relationship to the Consumer.**

CPSIA Section 6A(b)(1)(A) lists those who may submit reports of harm for inclusion in the public incident database: (i) consumers; (ii) local, state or federal government agencies; (iii) healthcare professionals; (iv) child service providers; and (v) the public safety entities. The Congressional specificity of these groups was purposeful: to encourage their involvement and to make clear that those who are not the consumers, representative of the consumers, first responders or care providers to consumers should not participate in this database for their own ends. This applies to trial lawyers, consumer groups and even trade associations. Remarkably, originally the Commission proposed an "other" category, but then recognizing that that was clearly unauthorized, has now in the final Database rule shoehorned certain non-governmental organizations into the definition of "public safety entities." This action also is improper. Congress should reinstate the intent of the legislation.

Whatever value the database will have will not be because of rumor, speculation, misuse or "salting" of the database. Groups with a variety of motivations should not be allowed and do not need to place their often unwarranted opinions in a federal government database; there are countless internet sites for that purpose. The database ought to be limited to those who purchase

the product, use the product or cared or treated those who may have suffered from injury related to the product. Otherwise, the database is simply a blog, and there is no reason for federal government to displace or compete with private blogs.

3. **In the Interest of Accuracy, the Commission Should Require Registration of Model or Other Descriptor Information.**

There are thousands of categories of consumer products, manufacturers and brands where there are numerous models of a product within a general family of products. Although the Commission provides space and encourages submitters to provide more detailed information which will allow the public and manufacturers to identify which particular product was subject to the alleged incident or harm, it does not require that information as long as it is confident that it is a product covered by CPSC. This is a mistake which the Congress should remedy.

In most cases, more specific information is available to the consumer, which includes not only the manufacturer or brand but also the model number or other descriptor. Yes, there are consumer products (like rubber balls) where it is doubtful that the consumer will be able to provide much information beyond a name or brand, but where such information is available, the Commission should require it to be reported. The fact that such a requirement cannot always be adhered to is no reason not to apply it as much as possible. This action, which the Commission has resisted and in which our own thinking has evolved, will increase the usefulness of the report to reviewing consumers and will enable manufacturers a better chance to respond to the alleged report or to at least evaluate it for need to improve the product or take other actions.

We do not believe the totality of these suggestions prevents a useful, accessible public database. Rather, we believe that these proposals enhance the utility of this new mechanism. Improving the quality and fairness of the program will help prevent improper, unverified information from being publicized by the federal government.

Thank you for this opportunity to testify, and I will be glad to answer any questions.

Testimony of
Wayne Morris
Vice President, Division Services
Association of Home Appliance Manufacturers
House Energy and Commerce Subcommittee on
Manufacturing and Trade
Hearing on Review of CPSIA and CPSC Resources

February 17, 2011

Executive Summary

1. Information Should Not be Released to the Public Database while there is a Pending Claim of Material Inaccuracy

2. The Eligible Reporters to the Database Should be Limited, as Congress Intended, to those with First Hand Information about the Harm or with a Relationship to the Consumer.

3. In the Interest of Accuracy, the Commission Should Require Registration of Model or Other Descriptor Information.

Mrs. BONO MACK. Thank you, Mr. Morris.
And, Mr. Woldenberg, you are recognized for 5 minutes.

STATEMENT OF RICHARD WOLDENBERG

Mr. WOLDENBERG. Chairman, Ranking Member Butterfield and distinguished members of the subcommittee, thank you for the opportunity to testify this morning.

My name is Richard Woldenberg. I am chairman of Learning Resources, an Illinois-based 150-person manufacturer of educational materials and educational toys. I am accompanied today by my son, Ben, and my daughter, Alana. This is my second appearance before the subcommittee to testify about the CPSIA.

Three years after its passage, the high cost of the CPSIA, its overreaching and intrusive nature, its non-existent impact on injury rates and its depressing effect on the markets is beyond dispute. What remains a mystery is why we did this to ourselves in the first place.

The crisis, such as it is, seems like a media-fed hysteria. CPSC recall statistics reflect only three unverified injuries and one death attributed to lead from March, '99 to April, 2010, out of literally trillions of product interactions by tens of millions of children. Notably, there was only one recall of phthalates in U.S. history, 40 little inflatable baseball bats in 2009.

The possibility of injury is real but what is the probability of injury. Supporters of the CPSIA have never proven a causal link between the reported hazard in children's products and actual cases of injury. This is a very serious indictment of this law.

Children can take lead into their bodies in many ways including through the air, water and food everyday. The CPSIA places all of the blame on children's products without any substantive proof of cause. Lead or phthalates poisoning may seem so frightening that no price is too high to pay. In our panic, the absence of proof that children's products are causing injury hardly seems to matter. But in the wake of Toyota, is jumping to conclusions about causation still acceptable? Is it responsible government to simply argue that the CPSIA doesn't harm children and that businesses will just absorb the costs?

The harm inflicted by the CPSIA has been brought to the subcommittee's attention time and again over the last 3 years. First, absurdly high compliance costs. We have experienced a 10 times increase in costs from 2006 until 2011, all without any change in the safety of our products because they were safe to begin with. This cost jobs and curtailed business expansion opportunities.

Second, rules mania. Doubt over the interpretation of CPSC rules is widespread. No wonder the rules and law applicable to our business now balloon over 3,000 pages and counting. Several customers respond to this uncertainty by instituting their own safety rules. One even insisted that we test for lead in paint even if the item had no paint on it.

Third, absurd complexity. The explosion of safety rules makes it difficult or impossible to know how to comply. In the context of a real product line there is just too much to figure out. What is a children's product? What isn't? What is a toy? Which materials need to be tested or retested? In practical terms, it is a nightmare.

Other rules make us look stupid to customers. Consider for instance this warning on one of our rock sets. "Caution, federal law requires us to advise that the rocks in this educational product may contain lead and might be harmful if swallowed." This is a form of humiliation.

Fourth, liability risk deters cooperation. Under the CPSIA the CPSC has become a coercive enforcer of rules with little mercy or sense of proportion and no exercise of judgment. This environment certainly contributed to a lack of cooperation by component manufacturers who won't test for CPSIA compliance and subject themselves to CPSC persecution. Trust has been destroyed in so many ways.

Congress must restore to the CPSC the responsibility to assess risk. My top five recommendations are that first, the CPSC should be mandated to base its safety decisions, resource allocations and rules on risk assessment. Second, the definition of children's products should be limited to children six-years-old or younger and the definition of toy for phthalates purposes should be limited to children three-years-old or younger. Third, lead in substrate and phthalate-testing should be based on the reasonable business judgment of the manufacturer, not mandated outside testing. Resellers should be entitled by rule to rely on the representation of manufacturers. Fourth, mandatory tracking labels should be explicitly limited to long-life heirloom products with a known history of injuring the most vulnerable children. And fifth, the public injury incident database should be restricted to recalls or properly investigated incidents only. Manufacturers must be given full access to all posted incident data including contact information.

In conclusion, I urge your committee to address the fundamental flaws in the CPSIA to restore order to the children's product marketplace and to protect small businesses from further damage. I appreciate the opportunity to share my views here today and I am happy to answer your questions.

[The prepared statement of Mr. Woldenberg follows:]

House Committee on Energy and Commerce
Subcommittee on Commerce, Manufacturing and Trade
February 17, 2011

Re: A Review of CPSIA and CPSC Resources

Statement of
Richard M. Woldenberg
Learning Resources, Inc.
380 North Fairway Drive
Vernon Hills, Illinois 60061

STATEMENT OF RICHARD M. WOLDENBERG
Chairman, Learning Resources, Inc.
Vernon Hills, Illinois

As an operator of a small business making educational products and educational toys, I have had a front row seat for the implementation of the Consumer Product Safety Improvement Act of 2008 (CPSIA) by the Consumer Product Safety Commission (CPSC). On the occasion of this oversight hearing, I want to highlight the economic damage wrought by the CPSIA lead and phthalate rules without achieving any material improvement in safety statistics. I also want to draw attention to pending rules or rules currently being implemented with the potential to put additional pressure on manufacturers and retailers, all without benefit to children. Finally, I offer my suggestions on how to fix the CPSIA.

Children are our business and the safety of children is our number one priority. The CPSIA, unfortunately, purportedly to protect children from vaguely-defined dangers, has dramatically impacted our business model, reduced our ability to make a profit and create jobs, pared our incentive to invest in new products and new markets, and generally made it more difficult to grow our business. Given these considerable sacrifices, I wish I could say the law made our products safer, but the fact is that it hasn't. Our company, Learning Resources, Inc., has recalled a grand total of 130 pieces in a single recall since our founding in June 1984 (these products were all recovered from the market). Our management of safety risks was highly effective long before the government intervened in our safety processes in 2008. The government's "help" has not raised our safety game but it has reduced our bottom line and cost some of our employees their jobs.

The precautionary principle of the CPSIA attempted to fill perceived "gaps" in regulation by making it illegal to sell children's products unless proven safe prior to sale. Yet the glacial implementation of this law by the CPSC has tested and disproved the case for mandatory testing. Mandatory testing for lead-in-substrate and phthalates (the bulk of the testing requirements under the CPSIA) has not been implemented by the CPSC yet recall rates for lead in children's products have collapsed. [Notably, there has only been one recall for phthalates in U.S. history – a tiny recall of 40

inflatable toy baseball bats in 2009.] Since August 2008, U.S. manufacturers and retailers have faced rigorous new lead content limits without the obligation to independently test their products prior to sale. There is no sign of a lack of consumer confidence as a consequence, despite dire predictions by consumer groups. The fall in recall rates suggests that clear standards and a lot of industry engagement produces good safety results. The last 30 months were a test of the theory behind the CPSIA – and the theory failed.

The CPSIA significantly broadened the reach of federal safety regulation well beyond what was needed to deal with the lead-in-paint toy recalls that made headlines in 2007 and 2008. Under the CPSIA, the definition of a "Children's Product" subject to regulation now encompasses ALL products designed or intended primarily for a child 12 years of age or younger (15 U.S.C. §2052(a)(2)). This definition ensures that virtually anything marketed to children will be subject to the restrictions of the Consumer Product Safety Act (CPSA), irrespective of known or quantifiable risk of injury. Put another way, this definition ensures that many product categories *with a long tradition of safety* are now subject to the withering requirements of this law for the first time simply because they fall within the overly broad definition of a Children's Product. The affected safe products span the U.S. economy - books, t-shirts and shoes, ATVs, bicycles, donated or resale goods, musical instruments, pens and educational products. The popular assertion that the "common toy box" justifies this mighty list has no factual support but condemns these product categories to CPSIA's punishing jurisdiction. No one keeps their ATV, t-shirts, carpets, pens and toys in a big box. The absence of widespread actual childhood lead injuries caused by children's products suggests that the "common toy box" is matter of a parental supervision and no concern of the federal government.

The consequences of the change in the consumer safety laws to a precautionary posture has had notable negative impacts and promises to create further problems, namely:

a. **Increased Costs.** The new law creates a heavy burden for testing costs. From 2006 to 2011, our company's testing costs jumped ten-fold. We estimate that our testing costs will rise further when the CPSC (as anticipated) lifts its testing stay at the end of 2011, and could multiply again

if the CPSC enacts (as anticipated) its draft "15 Month Rule" on testing frequency and "reasonable testing programs". Testing costs are often thousands of dollars per product. Having employed one person to manage safety testing and quality control for many years, we now have a department of 5.5 plus an outside lawyer on retainer. We fund these jobs by discontinuing profit-producing sales, marketing and product development jobs – the CPSIA is NOT a stimulus program. *Personnel, legal and other out-of-pocket safety expenses (besides testing) have more than quadrupled in the last three years – all without improving our already exemplary safety record.*

b. **Increased Administrative Expenses.** The CPSIA requires that all children's products include tracking labels on both the packaging and the product itself. Rationalized as "analogous" to date labels on cartons of milk, tracking labels are in reality nothing but pure economic waste as applied to the vast array of "Children's Products" under the CPSIA. In our case, we have estimated that we will spend $50,000 in CPSIA tracking label expenses for every dollar of hypothetical recall cost "saved". Ironically, with the strict new safety regime in place, we believe the already small chance of a product safety problem has been reduced further – making our investment in tracking labels virtually worthless by definition. The money to pay for all this administrative busy work comes from foregone business opportunities. *We are being forced to liquidate our company to apply tracking labels that no one will ever use.*

An equally frustrating bureaucracy has sprung up around recordkeeping under this law. Burdensome requirements spawned by the government's new involvement in our quality control processes forced us to make large new investments in information technology with no possible return on investment other than to make the federal government happy. In addition, the pending CPSC draft policy on component testing promises to convert the simple task of obtaining a complete suite of safety test reports into a byzantine recordkeeping nightmare. We will now be forced to manage each component separately, tracking test reports on a component-by-component basis. Our product line of 1500+ products may have tens of thousands of CPSIA components

managing so many components separately is a mindboggling undertaking. It all sounds good on paper – but just try actually doing it. The system will collapse of its own weight or will be ignored. Will this make children safer?

c. **Reduced Incentive to Innovate.** The increased cost to bring a product to market under the CPSIA will make many valuable – and economically viable – products uneconomic. To cover the cost of developing, testing and safety-managing new products, the prospective sales of any new item ("hurdle rate") is now much higher than under prior law. This means that low volume "specialty market" items, such as products serving blind or deaf children, are less likely to come to market and many new small business entrants may find themselves priced out of the market or unable to finance a start-up. It also means that mass market companies will gain yet another market advantage over their small business competitors. The experience of being regulated by the CPSIA depends very much on the scale of your business – the smaller you are, the worse it gets until it is utterly suffocating. Many small but important markets will be hurt, like educational products for disabled children.

d. **Crippled by Regulatory Complexity.** Our problems don't end with testing costs or increased staffing. We are being crippled by regulatory complexity. More than 30 months after passage of the CPSIA, we still don't have a comprehensive set of regulations. Please consider how mindboggling the rules have become. There were fewer than 200 pages of safety law and CPSC rules that pertained to our business until 2008. These rules clearly defined our responsibilities and could be taught to our staff. Today, the applicable laws, rules and interpretative documents exceed 3,000 pages. As a practical matter, it is impossible to master all of these documents – and yet it's potentially a felony to break any individual rule. The rules and CPSC staff commentary keep changing, are still being written and are rarely if ever conformed to prior versions. How can we master and re-master these rules and teach them to our staff while still doing the full-time job of running our business? Ironically, the famous recalls of 2007 and 2008 were never a "rules"

problem -- they were clearly a compliance problem. Imagine what will happen now with an unmanageable fifteen-fold increase in rules – and a seemingly infinite increase in CPSC penalties.

e. **Small Business Will Certainly Suffer.** The CPSIA was written in response to failings of big companies, but hammers small and medium-sized companies with particular vengeance. Our small business has already lost customers for our entire category on the grounds that selling toys is too confusing or too much of a "hassle". This is our new reality. The hyper-technical rules and requirements are beyond the capability of all but the most highly-trained quality managers or lawyers to comprehend. Small businesses simply don't have the skills, resources or business scale to manage compliance with the CPSIA. For this reason, small businesses bear the greatest risk of liability under the law. The double whammy of massive new regulatory obligations and the prospect of devastating liability are driving small businesses out of our market.

In its continuing effort to implement the CPSIA 30 months after passage, the CPSC is considering changes or new rules likely to make matters worse for our market. Consider the following:

1. **100 ppm Lead-in-Substrate Standard.** As required by the CPSIA, the CPSC is considering whether or how to reduce the current standard for lead-in-substrate from 300 ppm to 100 ppm. As the law is currently written, the new standard will be implemented on August 14, 2011 if the CPSC does not act to change it or without Congressional intervention. Many issues about this standard remain unresolved – and the corporate community has had to respond. Some retailers have implemented their own 100 ppm standard with immediate effect because the CPSC has yet to act decisively. The hearing on 100 ppm mandated by the CPSIA is scheduled for February 16, 2011, less than six months before the legislative deadline. The anticipated market disruption is being exacerbated by this slack regulatory response.

In addition, the potential reduction in lead standards sends entirely the wrong message to the market. The purpose of the federal lead standard is to induce the "right" behavior by

manufacturers and retailers, NOT to specify a threshold for health or safety. In removing the margin of error for manufacturers, not only has the standard introduced new and uncontrollable economic risk into the manufacturing process, but public perceptions of safety have been significantly altered. While no one has demonstrated that a reduction from 300 ppm to 100 ppm in lead-in-substrate in children's products will have any measurable or detectible impact on health or safety, the new standard encourages the public to believe that their safety depends on never being exposed to products with lead in excess of 100 ppm in even a single component. The general public naturally takes the legislative process as a form of endorsement of 100 ppm as a health standard. This changing attitude toward lead is reflected by a November 2010 PIRG report which commented on a lab test showing 87 ppm lead in a piece of children's jewelry: "While this does NOT violate the CPSIA standard for lead in surface coatings, scientists have not identified a 'safe' level of lead exposure for children." In other words, the new standard for lead is now zero. We fully expect to be unable to sell merchandise with 101 ppm lead in it under the new rule – meaning that the marginal 1 ppm of lead over the standard makes our product "dangerous" in the eyes of the law and the market. Who will be able to withstand this kind of extraordinary regulatory excess?

2. 15 Month Rule. Since passage of the CPSIA, the CPSC has been working on the so-called "15 Month Rule" continuously without success. Last summer, the agency finally released a draft of the rules on "reasonable testing programs" and testing frequency which generated a firestorm of negative comments. Since then, the agency has been silent, leading to continuing doubt about which rules should be implemented in our supply chains to ensure compliance with CPSC requirements. The rules themselves represented an unprecedented intrusion in the daily affairs of manufacturers of innocuous items like t-shirts, books, magnets, shoes, ATVs, pens, musical instruments and so on. The expense implied by the over-arching requirements of these unrealistic rules can be best illustrated by my calculations (using CPSC testing figures in the draft rule) that our company will have to spend $15 million per year on testing - $10,000 per product per year –

to comply with CPSC requirements. This far exceeds our annual profit. The scale of the problems created by this rule exceeds the space available here. The 15 Month Tule hangs over the head of the market like the Sword of Damocles.

3. Public Database. The CPSC rule implementing the CPSIA's public injury/incident database creates a database likely to be filled with erroneous or malicious incident reports. The rules are written so that even erroneous information cannot be prevented by manufacturers from being posted to the database. The rule adopts a post-it-and-forget-it approach, but manufacturers and retailers are unlikely to be as sanguine about the contents of the database. The slanderous destruction of brands and cherished products can be anticipated.

Other problems relate to the flow of information under the rule. The agency's promise to widely promote use of the database suggests that consumers will be encouraged to communicate with manufacturers via the database, rather than directly. The restriction on provision of incident data to manufacturers (such as the contact information of the filer or photographs of the incident) means that manufacturers will have a sharply reduced ability to investigate incidents and make necessary changes. This will make kids less safe and expose manufacturers to far greater liability. In addition, the short timeline for circulating incident data prior to publication means that the database is likely to divert a great deal of attention from the day-to-day administration of our businesses. This is yet another government-induced "crisis of the hour". We cannot afford this kind of "help".

I recommend several steps to reduce cost, liability risk and complexity all without sacrificing children's product safety:

A. Mandate that the CPSC base its safety decisions, resource allocation and rules on risk assessment. Restore to the Commission the discretion to set age and product definition criteria for the 300 ppm lead standard and phthalate ban. Freeze the lead standard and lead-in-paint standard at their

current levels unless the CPSC determines that a change is necessary to preserve public health and safety based on risk assessment analysis.

B. The definition of "Children's Product" should not include anything primarily sold into or intended for use in schools or which is used primarily under the supervision of adults. Other explicit exceptions should include apparel, shoes, pens, ATVs, bicycles, rhinestones, books and other print materials, brass and connectors. Exclusions from the definition should take these products entirely outside the coverage of the CPSIA (including mandatory tracking labels).

C. Lead-in-substrate and phthalate testing should be based on a "reasonable testing program". *The tenets of a reasonable testing program should be set by the reasonable business judgment of the manufacturer.* The mandatory third party testing requirement should be revoked. Resellers should be entitled by rule to rely on the representations of manufacturers. Phthalate testing policy should be clarified to exempt inaccessible components, metals, minerals, hard plastics, natural fibers and wood.

D. Definition of "Children's Product" should be limited to children six years old or younger and should eliminate the difficult-to-apply "common recognition" factor of Section 3(a)(2)(c) of the CPSA. Definition of "Toy" (for phthalates purposes) should be limited to children three years old or younger and should explicitly refer only to products in the form used in play.

E. Eliminate CPSC certification of laboratories (rely on the market to provide good resources). Fraud has only very rarely been a problem with test labs and is already illegal.

F. Impose procedural limits to insure fairness in penalty assessment by the CPSC under the CPSIA. Completely reformulate penalties to restrict them to egregious conduct (including patterns of violations), reckless endangerment or conduct resulting in serious injury.

G. Rewrite the penalty provision applicable to resale of used product so that violations are only subject to penalty if intentional (actual knowledge or reckless endangerment) and only if the violation led to an actual injury. Eliminate the "knowing" standard with its imputed knowledge of a reasonable man exercising due care.

H. Mandatory tracking labels should be explicitly limited to cribs, bassinets, play pens, all long-life "heirloom" products with a known history of injuring the most vulnerable children (babies or toddlers).

I. Preempt state consumer "right to know" laws as they apply to lead or phthalates. Regulation of these substances should be the exclusive domain of federal law. In addition, myriad state regulation of these substances depresses interstate commerce.

J. Public injury/incident database should be restricted to recalls or properly investigated incidents only. Manufacturers must be given full access to all posted incident data, including contact information. The "due process" civil liberty interests of the corporate community MUST BE PROTECTED.

I urge your committee to address the fundamental flaws in the CPSIA to restore order to the children's product market and to protect small businesses from further damage. I appreciate the opportunity to share my views on this important topic.

Mrs. BONO MACK. Thank you.
Ms. Cowles, you are recognized for 5 minutes.

STATEMENT OF NANCY A. COWLES

Ms. COWLES. Thank you. Thank you chairman, ranking member, and other subcommittee members for allowing us to testify here today.

I am Nancy Cowles. I am the executive director of Kids in Danger. KID was founded in 1998, by the parents of Danny Kaiser who you have already heard about today, who died in a very poorly designed and inadequately tested portable crib. A portion of the Consumer Product Safety Improvement Act is in fact named after Danny. His parents and our organization are moved that lasting improvements to the safety of juvenile products will always be associated with his name.

Contrary to how it has been portrayed, CPSIA was not a slapdash attempt to address new reports of lead-painted products from China and bad press in the Chicago Tribune. Many sections of the law were previously introduced bills including mandatory standards and testing for juvenile products, a ban on using unsafe cribs in childcare, product registration, Internet labeling and lead limits.

KID has been reporting on the problems of lead in children's products and looking for a limit for those elemental lead since 2004. Even with delays and incomplete implementation, CPSIA has already shown success in making children safer. My written testimony does go into much greater detail but here are just a few areas.

Over the past 4 years we have seen 10 million cribs recalled in this country. That is a lot of cribs and we know from past history on recalls, many babies are still sleeping in those cribs that are dangerous. A report released just today by the American Academy of Pediatrics shows that 26 children are rushed everyday to hospital emergency rooms because of injuries caused or taking place in a crib.

CPSIA finally gave CPSC the authority to end a decade of inaction in the voluntary standard setting process on cribs and address real world hazards that have killed dozens of children. The CPSIA also requires that infant-toddler durable products such as cribs, strollers and highchairs include a product registration card to give manufacturers the ability to contact consumers in the event of a recall or product safety issue. Danny's mother has testified before this former body that she firmly believes her son, Danny, would be alive today if the product that killed him had come with one of those simple cards.

One of the most significant improvements in safety will be the database which goes live in March. It will both help individual consumer's research purchasing decisions as well as report when they have a safety problem with a product. In addition, it will help spot injury patterns and emerging hazards. The CPSC has put in place, as we have heard, many safeguards to keep the information accurate and useable.

We have also heard that before the CPSIA was passed, CPSC's ability to protect the public had been dramatically weakened. In

1972, when it was first started the agency was appropriated would be $176 million in today's dollars and had 786 full-time employees. Over the next 2 decades it dropped by almost 60 percent.

CPSIA infused CPSC with resources exactly where they had been lacking in the preceding years. Through the CPSIA and the appropriations process, CPSC has taken a number of important steps to protect consumers. They have a strong team in place to address safe sleep for infants. They have updated their internal data management in preparation for the new database and they have reinvigorated industry setting standard bodies. CPSC is a stronger more effective agency today because of the Consumer Product Safety Improvement Act. Consumers including children are safer. Implementation will have real safety results across all of CPSC's work and CPSC has in addition continued to address emerging hazards such as Chinese drywall, cadmium batteries, and more.

There have been delays and problems with implementation especially in the areas of testing for lead and other hazards. We fully support the Handmade Toy Alliances call for clear rules for reasonable testing for micro-manufacturers of children's products including the component testing procedures that are underway. But no matter where they make their purchases, parents deserve to know the products they buy for their children are safe, whether it was made in someone's garage, a small workshop, or a huge factory in China.

How do you know that the wheels on the baby's toy truck won't come off if you aren't testing it? How can we be sure products don't contain lead if they or their components aren't tested? Parents certainly can't ascertain the presence of lead. It is a known neurotoxin whose effects are permanent and irreversible. The damage is cumulative so every exposure simply adds to what the child has already been exposed to. And it has been suggested that we move to an accessible limit or use the risk analysis on every product but as we are talking here today about CPSC's resources, I do not believe that this product-by-product analysis of accessibility and risk would be useful and in fact would tie up most of CSPC's time and resources. We know lead is dangerous and we know it shouldn't be in children's products.

Thank you for your time.

[The prepared statement of Ms. Cowles follows:]

Testimony of Nancy A. Cowles
To the House Sub-Committee on Commerce, Manufacturing and Trade, "A Review of CPSIA and CPSC Resources,"
February 17, 2011

Thank you, Chairman Bono Mack, Ranking Member Butterfield and Subcommittee members for this opportunity to testify before you today regarding the Consumer Product Safety Improvement Act and U.S. Consumer Product Safety Commission resources. I offer this testimony on behalf of Kids In Danger, Consumer Federation of America and Consumers Union.

KID is a nonprofit organization dedicated to protecting children by improving children's product safety. The organization was founded in 1998 by Linda Ginzel and Boaz Keysar, after the death of their son Danny Keysar in a poorly designed and inadequately tested portable crib. A portion of the Consumer Product Safety Improvement Act (CPSIA) is named after Danny. His parents and our entire organization are so moved that lasting improvements to safety of juvenile products will always be associated with his name. As Danny's mother, Linda Ginzel said when she testified before the House Subcommittee on Commerce, Trade and Consumer Protection in 2004, "improved children's product safety will be Danny's legacy."

Contrary to how it is often portrayed, CPSIA was not a slap-dash attempt to address new reports of lead-tainted products from China and bad press in the ***Chicago Tribune***. Many sections of the law were previously introduced bills, including the sections in the Danny Keysar Children's Product Safety Notification Act. These provisions include mandatory standards for durable infant and toddler goods, a ban on

selling recalled products or using unsafe cribs in child care, and product registration as well as internet toy labeling and lead limits. KID reported on the problems of lead in children's products back in 2004.[1] At that time we asked CPSC to establish a limit for lead content in children's products.

CPSIA Successes

Even with delays and incomplete implementation, CPSIA has already shown tremendous success in making children safer. I'd like to highlight a few of these areas:

Safer Infant Sleep Environments

Pervasive design flaws have caused the recall of more than 10 million cribs over the past four years. Recalls and corrective actions for cribs have been issued for non-compliance with safety standards and because of serious risks posed to babies. The CPSIA requirement for a strong mandatory crib standard gave CPSC the authority to persuade the voluntary standard setting body, the ASTM International Crib Subcommittee, to end a decade of inaction and strengthen the standard to address real world hazards that have killed dozens of children. The final CPSC crib standard incorporates provisions that replicate the everyday use of cribs, such as durability tests, mattress support tests, and tests for the effectiveness of hardware. The resulting CPSC standard is a successful result of the CPSIA. And I'm sure we can all agree that the crib, the only product intended for us to leave our babies in unattended, must be as safe as possible.

Product Registration for Juvenile Products

The CPSIA also requires that infant and toddler durable products, such as cribs, strollers and high chairs, include a product registration card in their

[1] ***Playing with Poison: Lead Poisoning Hazards of Children's Product Recalls, 1990-2004***. August 2004, Kids In Danger (Chicago).

packaging and provide an opportunity to register online. This gives manufacturers the information necessary to directly contact consumers in the event of a recall or other product safety issue. Too many consumers never hear about a recall of a product that they have in their home and as a result continue to use recalled products. This registration program will increase the number of consumers who hear about a recall. Today, most manufacturers have both online registration sites and include the cards. KID has evaluated 157 manufacturer web sites and found that almost all have online sites that consumers can use to register infant durable products. Children are safer because of this. Again, from her testimony in 2004, Linda Ginzel stated that she firmly believes that her beloved son Danny would be alive today if the Playskool Travel Lite had come with this simple registration card.

Mandatory Toy Standards

Despite the fact that conformity assessment bodies have not yet received accreditation to conduct full-scale testing to the mandatory toy standards, with the expectation of tighter enforcement down the road, some manufacturers are already adopting robust testing. With conformity assessment bodies receiving accreditation we anticipate more significant safety enhancements in the future.

Internet Toy Labeling

When consumers now purchase toys for children online, the same choking hazard warnings that appear on the toy packaging will appear online. With so much purchasing done online these days, this allows parents to see the warning before they buy a product. This new safety benefit is a result of the CPSIA.

Consumer Product Safety Incident Database

When the new publically available Consumer Product Safety Incident Database goes live in March, it will be a great new resource for the Commission, consumers, manufacturers and retailers. The database will help individual consumers research purchasing decisions as well as report when they have a safety problem with a product. For the Commission, Congress, consumer groups such as KID, CU, & CFA, manufacturers and retailers, it can help spot injury patterns and emerging hazards, allowing product design changes and recalls perhaps before an injury or death.

CPSC's Budget History

Before the CPSIA was passed, CPSC's ability to protect the public had been dramatically weakened. In 1972, when CPSC was created, the agency was appropriated $34.7 million (almost $176 million in today's dollars[2]) and 786 full time employees (FTEs). CPSC's staff suffered severe and repeated cuts during the last two decades, falling from a high of 978 employees in 1980 to just 401 in 2007--a loss of almost 60%.

Any changes to CPSC appropriations during the period from 2000 to 2008 were marginal at best and some years were actually a decrease, given the increase in CPSC's mandatory expenses. This allocation forced CPSC to cut back on its staff and limit its programmatic goals. CPSC's 2008 Performance Budget document, for example, painted a very bleak picture of the agency's work for the future. The budget document contained statements such as, "While the CPSC has thus far been successful at facing these new and evolving challenges with diminishing resources, the 2008 funding level will challenge the Commission's ability to maintain its existing level of standards development, enforcement, public information, and international activities. The 2008 Performance Budget document was replete with

[2] http://www.westegg.com/inflation

staffing cuts, limitations to programmatic goals and the absence of other goals and projects.

CPSC efforts to reduce product hazards to children and families were hindered by the forced reductions in FTEs. One of CPSC's hazard reduction strategic goals was to reduce the death rate from fires by 20 percent. However, CPSC was forced to cut 6 employees from its fire team. CPSC also had to cut 8 employees from its staff who work on children's and other hazards. Given the changing product safety market, this was incredibly limiting.

CPSIA's Direction of CPSC Resources

CPSIA prioritized issues at CPSC and infused CPSC with resources exactly where they had been lacking in the preceding years. The ***Chicago Tribune***[3] highlighted the flaws in the agency's operations - ignoring reports of injuries, a CPSC chairman who testified that he would take a dangerous toy away from his own children, but not have CPSC take any action to stop the sale of the known hazard, and an acting Chairman who denied any need for additional funding, even at the time her agency was unable to keep up with injury reports, data analysis and testing of hazardous products.

Through the CPSIA and the appropriations process, which provided for additional resources and staff, CPSC has taken a number of important steps to protect consumers: it has developed a strong team to address safe sleep for infants – perhaps our most vulnerable consumers; it has updated internal data management in preparation for the new Database launch; and it has lit a fire under sometimes lackluster industry standard-setting bodies that have resulted in stronger standards for many products. CPSC is a stronger, more effective agency today because of CPSIA. Most importantly, consumers, including children, are safer. While the deaths

and injuries averted may not make the front pages the same ways that the lives lost did, the CPSIA was a long-overdue overhaul of what the CPSC can do to protect our children from product hazards.

CPSC is intently focused on CPSIA implementation now, as it should be. As with the start of any new program or initiative, resources will be focused on that effort to get it off the ground. CPSIA implementation will have real safety results across all of CPSC's work. CPSC has at the same time also been addressing emerging hazards – Chinese drywall; unsafe sleep products such as sleep positioners that were not covered by CPSIA, cadmium, batteries and more. The agency is making up for lost time, and is restoring balance to its work on children's safety.

CPSIA Challenges

Much of the negative coverage of the CPSIA has come from implementation issues for testing for lead and other hazards. We support the Handmade Toy Alliance's call for clear rules for testing for micro-manufacturers of children's products, including component testing.

But no matter where they make their purchases, parents deserve to know the products they buy for their children are safe, whether it was made in someone's garage, a small workshop or a huge factory (or garage) in China. How do you know the wheels on your toy truck for a toddler don't come off unless you test it? How do you know that the bottle propping device that looks like a pillow tied around a baby's neck is safe unless it meets some standard for products for infants?

And perhaps most troubling – how can we be sure products don't contain lead if they or their components aren't tested for lead? Parents certainly can't ascertain the presence of lead. Over the years, the American Academy of Pediatrics has testified numerous times about the dangers of lead. It is a known neurotoxin whose effects are permanent and irreversible. The damage is cumulative, so even though the largest source is old housing stock and pollution, any other amount

added by a toy or school math mat adds to the damage. There are no parents who would choose a lead-laced toy over one without lead if they have that information.

The CPSIA uses a total lead measure for its requirements. There has been much talk about moving to an 'accessible' limit or using 'risk analysis' to lessen the testing requirements on business. But, as we are talking here today about the use of CPSC's limited resources, this type of product by product analysis of accessibility and risk would certainly tie up much of CPSC's time and resources. We know lead is dangerous, and we know it shouldn't be in children's products. The time spent on this further analysis serves no safety purpose.

Specifically for lead and in general for safety regulations, there has been talk about 'cost-benefit' analysis. KID urges Congress to carefully consider the 'benefit' side of that equation. For instance, AAP estimates that costs from lead-tainted jewelry recalled in 2007 and 2008 could top $209 million in lost income alone.

In conclusion, KID, CFA, and CU feel that the CPSIA is a strong safety measure for toys, nursery products, and other children's products. It allows parents to have confidence that the cribs and strollers they buy for their children won't strangle them or cut off the tips of their fingers. That the toys they buy are safe for their child – no parts will break off a rattle or split apart from a puzzle for a toddler, causing a choking hazard; a known neurotoxin such as lead will not taint toys or other products their children use regularly. And if they have safety concerns about a product in their home, they can report it to the CPSC online, or search for similar complaints from other consumers. CPSIA has effectively made all products safer, but especially the products we buy for our most vulnerable consumers.

Again, thank you for allowing us to testify here today. Our groups have been working to keep children safe for decades and we will continue that work into the future.

Kids In Danger is a nonprofit organization dedicated to protecting children by improving children's product safety. KID's mission is to promote the development of safer children's products, advocate for children and educate the general public about children's product safety. Learn more at www.KidsInDanger.org.

Consumer Federation of America (CFA) is an association of nearly 300 nonprofit consumer organizations that was established in 1968 to advance the consumer interest through research, advocacy, and education. CFA's web site is www.consumerfed.org.

Consumers Union of United States, Inc., publisher of Consumer Reports®, is a nonprofit membership organization chartered in 1936 to provide consumers with information, education, and counsel about goods, services, health and personal finance. Consumers Union's publications and services have a combined paid circulation of approximately 8.3 million. These publications regularly carry articles on Consumers Union's own product testing; on health, product safety, and marketplace economics; and on legislative, judicial, and regulatory actions that affect consumer welfare. Consumers Union's income is solely derived from the sale of Consumer Reports®, its other publications and services, fees, noncommercial contributions and grants. Consumers Union's publications and services carry no outside advertising and receive no commercial support.

Mrs. BONO MACK. I thank the witnesses for your courtesy in honoring the red light and would like to recognize myself 5 minutes for the first round of questions.

First, Ms. Fay, welcome again to the Committee. I appreciate it very much. I think as a member of Congress every time I get the opportunity to see how our laws matter at home in our districts it is very important and sometimes very eye opening for what we do here. Just a very quick question, you are a crafter and your inspiration for your crafts is your own children, correct?

Ms. FAY. Correct.

Mrs. BONO MACK. So the items you make, your children are the first to try them out to test them out?

Ms. FAY. Always.

Mrs. BONO MACK. Well, thank you and, Mr. Morris, you mentioned briefly the comparing the database to your fear of it becoming a blog and I think we all have concerns and we recognize the changing nature of the Internet and that everyday we find new information there or new ways to learn about information. I too have some concerns about the database but how can you even begin to investigate a complaint if your folks don't know who it came from how to contact the complainant?

Mr. MORRIS. Well, you are right, Chairman. The issue with the database is one that has been troublesome to our manufacturers since the very beginnings of it. I believe that when this particular body, this committee considered the database originally, in the House it was a study bill and it became a situation with the requirements when it was added in the Senate. The issue of having invalidated information is very concerning to manufacturers whose real primary I guess you could say their real value is their brand name. That tends to be in many cases these days the primary activity that they operate. So any time that we have the ability to investigate further to take a little bit of additional time and certainly to contact the consumer would be a help to everyone in gaining accuracy to this database. It is really not much of use to anyone if it contains just allegations that have not been proven.

Mrs. BONO MACK. Thank you.

Ms. Cowles, in terms of safety who would you regard as the best couple of children's product manufacturers?

Ms. COWLES. Well, you know, what we tell parents who call us with that same question of what crib should they buy, what stroller, is that any manufacturer, you know, needs to meet the standards that are out there and that you can't necessarily go by brand name. So I think that what we are looking at here is that there are parents need to know that go to the store that any of the products on the store shelves whether it be a big name store or your small local retailer or someone selling at a craft fair that the product is not going to hurt their child and so I mean we don't.

Mrs. BONO MACK. So you don't actually help them with the answer when they call you for a specific help on their question?

Ms. COWLES. No, we certainly don't recommend one brand over another. No, we don't. We don't do any marketing for the brands.

Mrs. BONO MACK. Is there any company that has no safety problems at all?

Ms. COWLES. No.

Mrs. BONO MACK. Would you favor a CPSIA amendment that allows the Commission to decide if the crib standard is revised again whether childcare centers have to buy new cribs or not?

Ms. COWLES. For the next revision you mean not this current one? Yes, we do favor. We do not believe that it needs to continue to be retroactive. We think at this point with the number of dangerous cribs out there it is good to get rid of them now at this point and they do have the 2 years but I think any further changes because this was such a dramatic overhaul, any future changes could be perspective from the date of manufacturer so we do support that.

Mrs. BONO MACK. Mr. Woldenberg, how do you keep track of all of the federal and State requirements that apply to your business?

Mr. WOLDENBERG. We work pretty hard. It is a lot. We have a staff of five-and-a-half people including myself, plus an outside lawyer on retainer and we have been working at it for 3 years.

Mrs. BONO MACK. And then, Ms. Fay, how big is your staff to try to comply with the same requirements?

Ms. FAY. It is just me.

Mrs. BONO MACK. And, Mr. Morris, in the case of and I have got to be brief, in the case of youth ATVs, CPSC has made the judgment that the risk of lead exposure to children is outweighed by the risk that children face if youth ATVs are not available and they ride adult-size ATVs instead. Can you briefly say does inaccurate information in the database pose the same problem? If the database sounds a false alarm about one product couldn't consumers be scared into buying a more dangerous product instead?

Mr. WOLDENBERG. Chair Bono Mack, I won't try to explain on all terrain vehicles because that is really not our product category but you address the issue of the materially inaccurate information in the database and I believe that is one of the things that we believe very strongly that there is time that needs to be added to this sequence within the CPSC to resolve these types of issues and to make sure that the information that has been put onto the comment by the consumer is in fact accurate. That the model number is there, it treats that particular model number. It gives that information to the consumer or to others so that they can deal with it directly. It is also a problem that if these reports are made the Commission itself is going to seek to try and do an investigation. If they don't know, they will be running around trying every type of product. I think that we need to try and narrow that down. Thank you.

Mrs. BONO MACK. Thank you. I just appreciate—I am new with a gavel but I hold it and you guys stop and that is a pretty powerful feeling without having to pound it.

But I would like to recognize Mr. Butterfield for his 5 minutes of questioning.

Mr. BUTTERFIELD. Thank you, Madam Chairman.

Ms. Cowles, let me start with you. Your group as well as other groups that you are representing today seems to be acquainted with the dangers of lead.

Ms. COWLES. That is correct.

Mr. BUTTERFIELD. I think you have spent a lot of time reading about and studying and getting familiar with. As you note in your

testimony, you tried to raise the profile of the problem with lead in children's products some years ago, a few years before the massive recalls in '07 and '08. I am told that you even asked the Commission to act using its authority to establish lead content limits for children's products and I assume that the Commission didn't respond favorably. Can you speak to that please?

Ms. COWLES. Yes, in fact I have the study here that we released in 2004 looking at lead in children's products. We call it Playing with Poison and we were surprised and I think that actually the CPSIA has reaffirmed our surprise at just how pervasive lead is and so we are very concerned not only with lead in paint but the lead content. It is an irreversible damage that it does to a child. Well under the hundred parts per million limit that we are looking at is enough for a child to be exposed to and lower their IQ one point.

Mr. BUTTERFIELD. Do you have advocate for a total lead content limit?

Ms. COWLES. We do and we support the total lead that is in the CPSIA. We think it is the most straightforward, the simplest way to test as well as we believe less expensive then the soluble test.

Mr. BUTTERFIELD. All right.

Mr. Woldenberg, let me just briefly address something to you as well. You pointed to a label a few moments ago on the toy that said something. Would you repeat that again because we didn't see that in your written testimony?

Mr. WOLDENBERG. OK, I apologize, it says, "Caution, federal law requires us to advise that the rocks in this educational product may contain lead which may be harmful if swallowed." It goes on to say, "We stand behind the safety of all of our products" and gives our phone number.

Mr. BUTTERFIELD. Did you manufacture that product?

Mr. WOLDENBERG. Yes, it is a box of rocks for schools.

Mr. BUTTERFIELD. Unless we are sadly mistaken we are not aware of any federal law that requires that label to posted on the toy.

Mr. WOLDENBERG. We are unable to determine whether those levels of rocks, this is an educational product. There is an exemption in CPSC rules that allows us to label products as possibly containing lead if they are for educational use in school and that is why we did this. We did this.

Mr. BUTTERFIELD. But you take the position that it is required by federal law?

Mr. WOLDENBERG. It is required by the CPSC. We didn't want to do it.

Mr. BUTTERFIELD. All right.

Let me go back to you, Ms. Cowles, if I can and talk about the database. There has been a lot of conversation about that. Some people say data and some say data. I am a southerner, I guess I say data.

Ms. COWLES. Well, I am from South Carolina so I go with you.

Mr. BUTTERFIELD. Yes, yes, Ms. Cowles, Mr. Morris in his testimony takes issue with the Commission including certain NGOs in the definition of public safety entities. I assume he means the inclusion of consumer advocacy groups in that definition. Do you be-

lieve that groups like your group should be able to submit reports of harm for the database and if so please explain why?

Ms. COWLES. I do believe that there are instances in which a group like mine would have information about a case about an injury and in order to make sure that it was included in the database, might want to enter that into the database. And I can give you—I have been working on this issue for 10 years now and while we talk about the database as a new thing, as we have said the CPSC has always had this way to provide information to them. They have always had an online forum. They have always had their own database. The difference is that now the consumers now will have access to that public information. I have only once reported an incident to CPSC and that was because it was from a family who had already lost one child to an unsafe product and did not want to deal with CPSC again. That was the only incident in which I did it so I do believe there are instances where it will be done. I do not believe there is going to be this flood from groups like ours. I can assure you the parents that I deal with who call me about a problem, they have already reported it to the manufacturer but they are calling me or the CPSC so that the manufacturers who say they don't have the information, I have never found that to be the case.

Mr. BUTTERFIELD. I believe Mr. Morris calls it salting the database. Have you ever salted a Federal Government database? Do you know any group that has?

Ms. COWLES. Do you mean put false information in it?

Mr. BUTTERFIELD. Yes, recklessly done so.

Ms. COWLES. No, I certainly do not. I think we look forward to access to information. Now when a parent calls me about a child who has been injured or killed it takes me months to get that information from CPSC to see if there were other incidents or if there is a standalone incident. I am looking forward to having access to information that can keep children safe so I do not think and I will not be spending my time putting false information about anybody's products in it.

Mr. BUTTERFIELD. Do you understand you could go to jail for doing that or anyone could?

Ms. COWLES. Well, I wouldn't do it either way.

Mr. BUTTERFIELD. Anyone could.

Ms. COWLES. Yes.

Mr. BUTTERFIELD. All right, thank you very much.

My time has expired.

Mrs. BONO MACK. I thank the gentleman.

The chair recognizes the vice-chair of the subcommittee for 5 minutes, Marsha Blackburn.

Mrs. BLACKBURN. Thank you, Madam Chairman.

Ms. Cowles, do you know how exposure to lead occurs in a child?

Ms. COWLES. I know there are many different ways that exposure occurs.

Mrs. BLACKBURN. Well, according to the CDC it is direct ingestion such as swallowing paint chips, house dust or soil contaminated by leaded paint or through hand-to-mouth activities such as placing fingers or other objects in their mouth putting them in con-

tact with lead paint or lead dust. Do you know what today's major source of lead exposure is today according to scientists?

Ms. COWLES. Yes, I do.

Mrs. BLACKBURN. And what is that

Ms. COWLES. That is old housing stock and the environmental lead.

Mrs. BLACKBURN. According to the CDC the major sources of lead exposure among U.S. children are lead contaminated dust, deteriorated lead-based paint and lead contaminated soil. Do you know what scientists attribute this 91 percent drop—well let me go up here first? Do you know what the average blood lead level of a child under 5 was in 1970?

Ms. COWLES. No, but I am sure it was much higher than it is today.

Mrs. BLACKBURN. The average and this is according to the EPA, the average BLL of a child under 5 was 15 micrograms per liter. Do you know what the current level of concern is according to the CDC?

Ms. COWLES. You better tell me. I have a guess but, right.

Mrs. BLACKBURN. In micrograms do you know the average blood lead level, the BLL of a child under 5, do you know what that is today?

Ms. COWLES. No.

Mrs. BLACKBURN. OK, it according to the EPA in '07 and '08, the average of a child under 5 was 1.4 micrograms per deciliter. So that I think gives you a pretty good idea of how we are doing with the lead. What do you think has attributed to this 91 percent drop in the blood lead level?

Ms. COWLES. The banning of lead in paint, the banning of lead in certain products, the very extensive abatement efforts on the part of cities, States.

Mrs. BLACKBURN. Well, the CDC says it is the result of the removal of lead from gasoline as well as from other sources such as household paint, food and drink cans, and plumbing systems, so just some items there for the record.

Mr. Woldenberg, can you tell us what your annual testing costs are under CPSIA?

Mr. WOLDENBERG. We are projecting for, I am sorry.

Mrs. BLACKBURN. OK and also I want you to tell me how this has affected your business plan following the adoption of the rules. Let me see where it is now and what kind of changes you had to make.

Mr. WOLDENBERG. Group-wide we are projecting costs far in excess of $1 million up to $2 million for this fiscal year and we expect that to increase if the 15-month rule is implemented as currently drafted by the agency. The impact on our business is that a tremendous amount of money has been removed from our business at an extremely inconvenient time. Our head count is down about approximately 30 percent from peak. It is, of course, not entirely due to this law. There was the recession but it greatly depleted our resources. We have deferred on opportunities to expand our business range into younger child ages educational products simply because we don't want to be exposed to the risk.

Mrs. BLACKBURN. How many jobs do you think that would have created had you been able to move ahead with that expansion?

Mr. WOLDENBERG. Well, $2 million goes a long way especially when it is moved from your profits so I am hoping a couple dozen and we have about five people in quality control to compensate for that.

Mrs. BLACKBURN. OK so you are lacking a couple of dozen jobs.

Mr. WOLDENBERG. I would say so.

Mrs. BLACKBURN. Ms. Fay, welcome. I am glad you are here. Talk about the unintended consequences of CPSIA affecting small business owners like yours and I want you to talk in terms of jobs, prices and consumer choice in the marketplace.

Ms. FAY. We can't afford the third-party testing. We can't. It is not just the lead. It is the ASTM testing and the phthalate testing. I don't know anyone especially now this has been going on for so long and we have been fighting this for so long that none of us can.

Mrs. BLACKBURN. So it will shut you down? It will shut your fleece fabrics and things, it will shut you down. So instead of creating the environment in which government creates the environment for jobs growth to take place, you see this as something that is completely restricting your ability to do business?

Ms. FAY. Yes, I am still the only inventory I have.

Mrs. BLACKBURN. Direct and indirect jobs, how many jobs would that be costing?

Ms. FAY. It is mine, and it is every other crafter out there. If we can't continue selling our stuff, we are dead in the water.

Mrs. BLACKBURN. Well and I think that is everyone wants to make certain that we are handling the problems that are in front of us but I think we are all concerned when we look at the unintended consequences.

I yield back.

Mrs. BONO MACK. I thank the gentle lady.

The gentlelady from Illinois, Ms. Schakowsky is recognized for 5 minutes.

Ms. SCHAKOWSKY. Mr. Woldenberg, you have written that there are no injuries as a result of products with high lead levels and my colleague was just talking about lead. I am really confused here. Is there some argument here that protecting our children from lead in toys is an unreasonable direction to go in, Mr. Woldenberg, that this is not a problem? Do you have scientific data that would back up that there are no injuries as a result of products with high lead levels?

Mr. WOLDENBERG. Well, the source of my information is the CPSC and I went through every recall they did from '99 to 2010, line by line and what I have said consistently is that there are three unverified injuries in their reports and one death attributed to lead in recalls of children's products since '99.

Ms. SCHAKOWSKY. And so you are concluding that lead in toys, that that is OK? That it is not a problem.

Mr. WOLDENBERG. Oh no, I would never say that. It is not in doubt that lead is dangerous but the real question isn't whether lead is dangerous but the real question is whether our products are dangerous and the consequence of.

Ms. SCHAKOWSKY. I am really not following that. If lead is in toys and sometimes at very high levels and in trinkets and things like that how then and you believe that it is dangerous then how can the product not be dangerous?

Mr. WOLDENBERG. Well, I believe that Representative Blackburn cited that it is soluble lead that the CDC and NIH and EPA cite as the cause of blood lead levels rising and what is at issue I think largely today is the regulation of insoluble lead that is lead bound into substrate and I believe that is, you know, not nearly the cause for concern because we can't identify people who have been injured by it. We are a conscientious.

Ms. SCHAKOWSKY. All right, thank you.

Ms. Cowles, let us talk about the different tests and your comments are what Mr. Woldenberg has said.

Ms. COWLES. Well, I think that that the statistics from CDC do not differentiate between soluble and insoluble. It is lead dust. It is lead. That lead could be the total lead in the product. A child can transfer it from its hand to their mouth, you know, if you watch a child at play. If you were to put purple ink on a child's hand and have them be unaware and come back an hour later and see all the purple ink around their mouth. Even children you think are too old to mouthing you would see that they are ingesting whatever gets on their hand a child is going to ingest even older children then the up to three that we have talked about in terms of mouthing. In terms of the product itself and the testing, the total lead test that CPSIA requires the under 300 parts per million going to 100 parts per million, is a very straightforward test that can be done. You can screen for it using an XRF gun so that you can see if it has some lead in it then you are going to need to do the test and so we believe that that is much more straightforward. You get more reliable results from that then a soluble test where you have to sort of figure out using different methods how much how your much of the lead will actually come out using different amounts of acids for different periods of time. Those tests often are very different. You get different results at different times and they aren't as straightforward I don't think as the total lead. I think the total lead actually simplifies it and makes it easier for people to comply.

Ms. SCHAKOWSKY. The other thing I have a real problem with is that somehow this notion of a cost benefit analysis in a tradition way. I mean what is the value then of a child's life or a child's IQ point. Ms. Cowles, if you would comment on the use of this the notion that we should have some sort of a cost benefit analysis.

Ms. COWLES. And I think if we are going to look at cost benefits let us look very closely at the benefit side. It is true as Mr. Woldenberg said there are not body bags of children who have been injured and killed by lead but there is testing that shows that a small exposure to lead is going to lead to a reduction in a child's IQ point. You are not going to be able to measure that. The parent isn't even necessarily going to know but we can show that that has an impact on future earnings. We have seen reports that, Representative Blackburn, you mentioned the changes in the '70s. There are reports that indicate that the drop in crime that we have seen could be because of the reduction in lead at that time. So to

say that simply because a child doesn't have an acute case of lead poisoning does not mean that there is not chronic lead poisoning that could be affecting both their future earning and our economy. So if we are going to look at cost benefit, we need to look closely at the benefits of children and how they are protected and what impact that has.

Ms. SCHAKOWSKY. And thank you.

Mrs. BONO MACK. The gentlelady's time has expired.

The chair recognizes the gentleman from Mississippi, Mr. Harper, for 5 minutes.

Mr. HARPER. Thank you, Madam Chairman.

Ms. Fay, I would like to ask you just a couple of things. Of course, you know, we all want to make sure that the products that the kids use are safe. How do you ensure that your product is a safe product without testing?

Ms. FAY. Before the February 10, 2009, I rented an XRF scanner and I tested for 15 hours in my basement with this x-ray gun. I tested every fabric and every trim and I tested possible trims on sample cards that I might use in the future and in 15 hours every test result I had was no lead detected.

Mr. HARPER. What was the cost for you to rent that device, if you recall?

Ms. FAY. To rent it, it was for 5 days, $2,500 and I shared the cost with four other companies and I know that many of the handmade toy lines members across the country were having testing parties where they would get big groups of people to also use an XRF scanner so that everyone knew that all of their products were free of lead. And I also know in Oregon you are allowed to take your products to the Housing Development Department and they test them with an XRF scanner for free.

Mr. HARPER. I am just curious that you found no problems in what you spent the 15 hours with.

Ms. FAY. I found no problems with any of my products.

Mr. HARPER. And the four other companies that shared this with you or the 5-day rental cost with you, did they find any problems that you were aware of?

Ms. FAY. I am aware of some problems with shoes and mostly on the soles of the shoes, sometimes companies had like a colored dot that helped recognize their brand and that dot on the sole of the shoe sometimes had lead that I know of.

Mr. HARPER. And do you know what that particular company did in reaction to that, if you know?

Ms. FAY. They threw them all away.

Mr. HARPER. OK and is it your desire that you produce and manufacture goods that are safe?

Ms. FAY. Yes and it was for most of the handmade toy lines it if not every single one of us, we started our businesses because we wanted safe products for our kids and we felt that if we made them with our hands and we knew that the time and attention going into this product was there, the products would be safer.

Mr. HARPER. When you shared this cost for this and you said $2,500 for this device for the 5-day rental, have you been given a cost estimate of what the third-party testing would be for you?

Ms. FAY. At the time, I had just sold my house and I took almost all of our money, invested in my business so I had $30,000 worth of product and my testing costs were $27,000.

Mr. HARPER. OK, thank you, Ms. Fay.

Mr. Woldenberg, if I could just ask you on, you know, how do you without doing the testing what do you propose? What is a reasonable response to what we are seeing here?

Mr. WOLDENBERG. Well, we have always tested and there is no way to know if you comply with a standard without testing. We also can't use an in-house testing lab. We are not big enough and aren't prepared to manage one so, you know, what we want to do is manage to a standard. Set a reasonable standard and then the government shouldn't get involved in telling us how to meet it. We know well how to meet it and we have been doing it more then 2 decades successfully.

Mr. HARPER. So do you see a greater burden on small volume businesses with this possible requirement?

Mr. WOLDENBERG. What I just articulated or what exists?

Mr. HARPER. Yes.

Mr. WOLDENBERG. What I just articulated would be far easier. You know, Ms. Fay just described wasting thousands of dollars testing stuff that everyone knows is safe. That is just a terrible burden on any business whether it is a single business or a business with 150 people.

Mr. HARPER. OK, thank you.

Madam Chair, I yield back the balance of my time.

Mrs. BONO MACK. The gentleman yields back.

The chair recognizes Dr. Cassidy for 5 minutes.

Dr. CASSIDY. Ms. Cowles, I am sorry, how do you pronounce your name? I am sorry.

Ms. COWLES. That is all right, Cowles.

Dr. CASSIDY. Cowles. I have to admit I started laughing when Mr. Woldenberg said he has to label rocks as a potential threat for lead poisoning if they are swallowed. Does that seem reasonable to you?

Ms. COWLES. I don't think that is part of CPSIA and I don't think he is saying it is either, the labeling of his rocks.

Dr. CASSIDY. OK, so OK, so that is however that is interpreted because I think you felt as if you had to correct?

Mr. WOLDENBERG. That is the only way we can sell products with lead is we had to find an exemption. There is an exemption for educational products and the cost to us is we have to put the word lead on our product. We don't believe anyone will buy things that say lead on them if they are for children. Who wants to buy a product that says it has lead in it? It is death. That is what is going on in Illinois right now with the lead labeling law which is essentially overriding your legislation.

Dr. CASSIDY. But I think there is a dispute as to whether or not you are actually required to put that on.

Mr. WOLDENBERG. We hired counsel and had a 1-hour conference call and whether or not this product was saleable under U.S. law without this label. I very much opposed putting a label on it. I was overruled by my outside counsel.

Dr. CASSIDY. OK, I can only imagine what that cost you.

Mr. WOLDENBERG. Exactly.

Dr. CASSIDY. Now, the next thing is I am new to this committee so I have kind of an open mind but Ms. Fay do you have a logger making a little wooden airplane?

Ms. FAY. I volunteer at a senior center.

Dr. CASSIDY. Hang on, hang on, decorating with a non-lead based paint?

Ms. FAY. No, there is no paint on it.

Dr. CASSIDY. OK, that has to be tested for lead content?

Ms. FAY. Yes and not the lead. It does not if it is not coated with anything other then natural materials but the ASTM testing.

Dr. CASSIDY. Which is what? I am sorry to be so ignorant?

Ms. FAY. They call it S963 and it is the required under the CPSIA that any toy has to go through a series of tests depending on what type of toy it is.

Dr. CASSIDY. OK.

Ms. FAY. So for example, you have to—we pay someone to hold an object from shoulder height and drop it to make sure. That is a laboratory test that they would have to pay. And the logger at the senior center, he is a retired logger.

Dr. CASSIDY. So this guy kind of doing a handicraft has to pay a third-party engineering group to hold it out by hand and drop it to see if it shatters?

Ms. FAY. If he wants to sell it.

Dr. CASSIDY. Because I mean I am just asking what would your comments be about that?

Ms. COWLES. I think I said in my testimony that we, you know, since the time this law passed we are very receptive to the problems of one-of-a-kind items, very small crafters such as Ms. Fay is talking about and are open to looking at reasonable testing programs. We are not—we would not say that those toys do not need to be tested in some way because again it doesn't matter to the child whether the nice gentleman at the senior center is making it or if it is brought in from China. If a wheel is going to fall off and cause a choking hazard for a very young child the parent should still know.

Dr. CASSIDY. Well, let me ask you I don't know, again I don't know this. I am learning in this committee. Obviously, I have young children. They always put things in their mouth, a little bit older now but you could swallow a ball and that could choke. Is a ball, let us say a ping-pong ball or is a rubber ball on a paddle, is that covered under this? I mean clearly they could die from dying swallow a small little rubber ball.

Ms. COWLES. Yes, they can and they do, yes.

Dr. CASSIDY. Is that covered under this legislation?

Ms. COWLES. Yes, balls would be covered because they are a toy so those products and again the choking hazard is for products for children under the age of 3. So those products usually small balls and the paddles you are talking about are not made for children under 3.

Dr. CASSIDY. Now, but as I have been reading the testimony and the stuff applied that is not applied, the common toy box concept does not apply to those sorts of toys?

Ms. COWLES. That is dealing with lead and things more than the choking hazard. There are additional labeling requirements for toys for children over 3 but under 6 to indicate once again that a child under 3 should not have them but the common toy box we are talking about is the lead issue.

Dr. CASSIDY. Now, I actually think if you are speaking of a common toy box, just thinking of my three children, that a ball would be more likely to be taken from one of them then an ATV and so if there is a common toy box, they will grab the older child's ball and try and put it in their mouth and hopefully nothing bad happens but it could. If we are going to accept the rationale, the common toy box means that you have to limit exposure to some of these toys I don't see the rationale for limiting it to what we limit it to.

Ms. COWLES. Well, I think that because even fnr the child over 3, lead is still a neurotoxin and it is still going to hurt that child if they do mouth it and so there is no reason for lead to be in children's toys.

Dr. CASSIDY. Mr. Woldenberg, you were shaking your head.

Mr. WOLDENBERG. Well, small parts are not illegal for children over 3 and there are many cherished childhood products such as Legos would be illegal if they were so if your observation is there are lots of small parts out there that children could be putting in their mouth, it is absolutely true, and it is a risk that is solved by parental supervision.

Dr. CASSIDY. OK, I yield back. Thank you.

Mrs. BONO MACK. The gentleman's time has expired.

The chair recognizes the gentleman from Texas, Mr. Olson.

Mr. OLSON. I thank the chair and I thank our witnesses for coming today. It is pretty obvious that this is a matter of great importance because of the emotions that are being felt here in this committee and because as a father of a beautiful 14-year-old daughter and a 10-year-old son, all I want for them is to be healthy and happy.

And, Mrs. Fay, I just want to tell you, you are not alone and I want to prove that to you because I am going to read a letter that I received from one of our Texans back home. And her name is Celice William Jackson and she is the owner of Mommy's Heartbeat and she just makes clothing for little babies in her home and here is what she wrote. "This bill, we are talking about CPSIA, requires manufacturers of any product intended for children 12 and younger to test their end product for lead and phthalates. The way the test is performed is by testing each component of the product in order to say whether it passes or not. For example, if I make a diaper and I have pink snaps, thread and fabric, when I send my diaper to be tested they will test the snaps, thread and fabric. But say I run out of pink thread and I use blue then I have to send in the diaper to be tested again which means that the fabric and snaps will be retested just because I used a different color of thread. By the way, it is nearly impossible for non-metallic thread to contain lead. I believe we can both agree that this testing is wasteful and redundant. I am a work-at-home mom to a beautiful 9-month-old daughter. If CPSIA stands as is, I will be forced to stop doing business. I cannot afford the hundreds of dollars re-

quired just to test one product. The economy is in bad enough shape as it is without having thousands of small businesses closing their doors and the cost of children's good skyrocketing."

My question for you, are you aware of more businesses that in your shape, Ms. Fay, out there in Oregon.

Ms. FAY. We get e-mails from companies all over the country talking about how this law is affecting them and we have compiled a list of businesses that have already closed due to the CPSIA. However, this list is small in comparison to what will happen if the CPSIA is fully implemented without changes. We know that if the stay of enforcement, if third-party testing is allowed to expire after December and no amendment has fixed our problems, 90 percent of our membership will have to close their businesses.

Mr. OLSON. Yes, ma'am, and again we need to fix that up here in the House of Representatives.

Ms. FAY. Please.

Mr. OLSON. That is something we can fix and something we should fix.

A question for you, Mr. Woldenberg, and just sort of the cost for your business here and how much of the cost of CPSIA impacted your business, your product lines. I mean your testimony states that your business costs of compliance have increased ten-fold, ten-fold.

Mr. WOLDENBERG. Well, I can illustrate that for you. You know, if we tested every one of our products once in destructive testing and all of our testing is destructive, we would have to test 1,500 products. Right now hanging over our head is the so-called 15-month rule which should be called the 30-month rule and this is a picture of what I would have to test. This is 81,000 units. This is what they look like. All of this would be destroyed and I have to pay for that. And it is a huge, huge distraction as well. There is just no end to the threats that come from this law.

Mr. OLSON. So you have to destroy 81,000 units?

Mr. WOLDENBERG. Yes, that is what it looks like.

Mr. OLSON. Just for testing and those are units that you could be selling, making money and growing your business?

Mr. WOLDENBERG. Right, this is a shipment of 81,000. I wouldn't get to do that.

Mr. OLSON. Well, yes, sir. I mean I know that back home in Texas there are a lot of old boys who would like to destroy 81,000 cartons there but that is not the way we are going to grow our economy. We need to get the regulatory burdens off your back.

Mr. WOLDENBERG. Thank you.

Mr. OLSON. And anything we can do to help you, we are going to do it.

Mr. WOLDENBERG. Thank you.

Mr. OLSON. Thank you very much for your time.

Yield back.

Mrs. BONO MACK. The gentleman yields back.

The chair recognizes Mr. Pompeo for 5 minutes.

Mr. POMPEO. Thank you, Madam Chairman.

I just have a couple questions for Ms. Cowles. The American Academy of Pediatrics testified at the Commission's one hundred parts per million technological feasibility yesterday that there is a

point where we go from the sublime to the ridiculous when it comes to treating all products as presenting the identical, the same risk. In your judgment, have we reached the ridiculous when we treat a bicycle or a geology kit or a jewelry charm precisely the same way?

Ms. COWLES. I don't know that I would call it ridiculous. I think that it is not really treated the same way. The charm is obviously going to be, you know, has definitely caused harm. I think we are looking at the way that lead is addressed in those different products but the effect of lead in each of those products if the child is able to ingest it is going to be the same.

Mr. POMPEO. Right and but we still have got the same hundred parts per million standard for each of those items and you think that is appropriate given the variance in the product and the product's usage and the product's contact with human beings?

Ms. COWLES. You know, I think that we should certainly look at inaccessible lead so that if there is lead in products that there is no way that the child is going to touch, that is one issue but I think that the way I look at it if you want to simplify it is as Rick said, parents do not want to buy products that have lead in them for their children. We had a lab testify yesterday at that same hearing that said most of the products that they are testing are already well below the hundred parts per million. I think we can do this and we can make these products without lead. It is what parents want and we can quibble about how bad the effect will be but I think that as Rick said if you tell the parent there is lead in it they really are nnt going to want to buy it so why don't we get the lead out of it.

Mr. POMPEO. In your judgment, Mr. Woldenberg showed us a picture of some product that will have to be destroyed. In your judgment, should the Federal Government make him destroy that product?

Ms. COWLES. I think he is talking about destructive testing. He is not talking about he is destroying it because it has lead in it.

Mr. POMPEO. But no he is talking about destructive testing. Do you think that he should?

Ms. COWLES. I am not familiar with his testing process as to why all of that would have to be destroyed.

Mr. POMPEO. Mr. Woldenberg, you were going back with my colleague, Congressman Butterfield, a few minutes ago about whether the label there was necessary or required and your counsel overruled you and told you it was. Has your counsel told you how many more hours he is going to get to bill once the database comes online?

Mr. WOLDENBERG. The database is going to be a full employment plan for our outside counsel.

Mr. POMPEO. And so, Ms. Fay, you don't have inside counsel?

Ms. FAY. Can't afford it.

Mr. POMPEO. And we have heard different testimony this morning about the risks and problems potentially with that database people have different judgment. Commissioner Tenenbaum was pretty clear in 10 days she feels like she is required to publish it regardless of its merits. Do any of the three of you involved in the manufacturing process think that makes sense?

Mr. WOLDENBERG. I do not. We can't evaluate the information that we are given because we are not given full access to the information and one of the biggest concerns that I have about the database is that by the government getting into the business of a safety blog they are training our customers not to call us. I want to talk to them directly about problems.

Mr. POMPEO. I really want and that is actually where I was headed. I appreciate that. Do any of you ever fear that your customers when they are not happy with your product won't call you?

Mr. WOLDENBERG. That is my biggest nightmare.

Mr. MORRIS. Certainly in our industry, Congressman, the manufacturers get lots of calls from their consumers and they find vital information very well and very thoroughly because the consumer when they call usually has the model number, they have the exact information in front of them and that is the best way to get the information.

Mr. POMPEO. Until 45 days ago I was involved in and I was running a manufacturing business and my customers when they weren't happy often were pretty successful at locating me. I also felt like we had an incentive to respond to that in a way that was meaningful to the customer and corrected any potential problems with product that we may have made. Do you all feel like you have adequate incentive already to address customer concerns about problems with your products?

Mr. WOLDENBERG. Absolutely and it is how a conscientious manufacturer has to behave. It is our responsibility.

Mr. MORRIS. That is why in many cases the claims that a manufacturer will make about materially inaccurate information is largely going to be that is not my product. It needs to be resolved and there is no reason that the Commission can't take an extra couple of hours to read a report and make sure that is accurate.

Mr. POMPEO. I appreciate it. Thank you all for coming today.

I yield back my time.

Mrs. BONO MACK. The gentleman yields back and no other members are present to ask questions.

Without objection, the chair is going to insert five additional statements for the record of our hearing that have been submitted. We have previously shared these with the minority and believe that they will improve the hearing record. So ordered.

[The information appears at the conclusion of the hearing.]

Mrs. BONO MACK. And so in conclusion of the hearing, I would again like to thank all of our witnesses today. We all appreciate your time and the stories that you shared with us. We all want safer products for our children. There is no question. But we also want to stimulate and encourage businesses rather than stifle them with unnecessary regulations that have little to no impact on safety. Our challenge is to figure out how to strike that balance and this is only the first of our discussions on that topic. I would like to most especially thank the Ranking Member Butterfield for his help today and his support and offer an open door to him as we work through all of these policies and to each and everyone of you I believe that we can do great things if we work together and that is my intention to do it that way.

So thank you to the audience for your kindness today and that concludes—oh wait, wait, oh just a little business. I remind members that they have 10 business days to submit questions for the record and to ask that the witnesses please respond promptly to any questions they may receive. The committee is now adjourned.

[Whereupon, at 2:08 p.m., the subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

PREPARED STATEMENT OF HON. FRED UPTON

Thank you, Chairman Bono-Mack, for holding this, your first hearing as Chair of the Commerce, Manufacturing and Trade Subcommittee, on the Consumer Product Safety Improvement Act (CPSIA). I think we all agree that there are significant problems with this law that need to be addressed urgently. I am also interested in hearing about the effect of this law on the resources of the Consumer Product Safety Commission.

The Energy & Commerce Committee worked on the CPSIA on a bipartisan basis under the leadership of then-Chairman Dingell and then-Ranking Member Barton. The bill passed the House on a nearly unanimous basis. The Senate did not proceed with the same bipartisan approach, but in conference we nevertheless went along with some of their provisions. Some of our conferees have expressed regret on that score. In any case, not long after the President signed CPSIA into law, serious problems emerged.

We all care deeply about our children and their safety - nearly every one of us on this dais has a child or grandchild. No one wants to put little children at risk. But this law may be doing exactly that. By dictating so much of the Commission's work, in too many cases we have shifted its attention to products that pose little or no risk and away from more significant issues. At the same time, we have deprived the Commission of the flexibility to develop common-sense solutions to the problems of implementation. The retroactive effect of the law has caused the Salvation Army, Goodwill Industries and thrift stores across the land to destroy used products, including even winter clothing that is sorely needed by millions of American children.

While we have seen little evidence of improvement in children's safety, there has already been an extreme impact on the children's product market - particularly for small- and micro-sized businesses. The Commission has pushed off the day of reckoning for some businesses by postponing, again and again, the expensive requirements for third-party independent laboratory testing of children's products. But the Commission has already told us that it believes its hands are tied-it can do nothing more to exempt products from this costly testing, even when the risk, if any, is minute and the burden to small business is gargantuan. In fact, the Commission is now working on regulations that would require even more testing-regulations that will pile on even greater costs in this terrible recession.

In short, it is up to us to fix the problem. We have no time to waste. This summer, the lead limits are set to drop again, to even lower levels. Again the effect will be retroactive, so our retailers and thrift stores will once again be destroying inventories of products that are already the safest in the world. I want to make clear that we do not intend to undo everything we did in the CPSIA, but we have every intention of fixing the law so that it works and the Commission can get back to its job of protecting our children.

PREPARED STATEMENT OF HON. EDOLPHUS TOWNS

Thank you Chairman Bono-Mack and Ranking Member Butterfield for holding this hearing today on the Consumer Product Safety Improvement Act and Consumer Product Safety Commission resources. The CPSIA was passed in the 110th congress to help protect consumers against dangerous products that may do them harm. This legislation affects a broad spectrum of our economy, from the manufactures of toys to the children that play with them. Our constituents want to know that we are doing everything in our power to make sure their children are kept safe.

I'm also interested in hearing from our witnesses today about how and more importantly when CPSIA's new rules will be finalized and implemented. As it currently stands the new rules have been in limbo due to concerns with-in the industry about unintended consequences. While I sympathize with the cost concerns of small businesses the safety of our nation's children should be our first priority.

I look forward to working with industry and consumer groups to make sure CPSIA's new rules and data base system are properly implemented and adhered to.

Thank you and I yield back the balance of my time.

The Honorable Nancy A. Nord
Acting Chairman
U.S. Consumer Product Safety Commission
4330 East West Highway
Bethesda, MD 20814

The Honorable Thomas Hill Moore
Commissioner
U.S. Consumer Product Safety Commission
4330 East West Highway
Bethesda, MD 20814

Dear Acting Chairman Nord and Commissioner Moore:

As an author of the original Consumer Product Safety Act in 1972 and a long-standing advocate for better protections for our Nation's consumers, I wholeheartedly support a stronger regulatory framework to ensure the safety of children's products. Nevertheless, I share the reasoned concerns of my colleagues, House Committee on Energy and Commerce Chairman Waxman, Subcommittee on Commerce, Trade, and Consumer Protection Chairman Rush, Senate Committee on Commerce, Science, and Transportation Chairman Rockefeller, and Subcommittee on Consumer Protection, Insurance, and Automotive Safety Chairman Pryor, about the implementation of the Consumer Product Safety Improvement Act (PL 110-314, "the Act"). In particular, I am troubled that the Act includes unrealistic deadlines for rulemakings and compliance, as well as too little implementation discretion for the Consumer Product Safety Commission (CPSC), both of which are exacerbated by CPSC's lack of adequate resources, both in terms of funding and staff.

In describing the implementation of the Act, Acting Chairman Nord's January 30, 2009, letter to the Congress maintains, "the timelines in the law are proving to be unrealistic, and [CPSC] will not be able to continue at this pace without a real risk of promulgating regulations that have not been thoroughly considered." Moreover, the letter states, "Although [CPSC] staff has been directed to move as quickly as possible to complete its work, short-circuiting the rulemaking process gives short shrift to the analytical discipline contemplated by the statute." In light of these statements, I would appreciate your candid responses to the following questions, which will assist me and my colleagues in our consideration of common-sense and workable solutions to some of the more pressing problems that have arisen during the Act's implementation:

1. To what extent has robust implementation of the Act been hampered by CPSC's lack of resources? What levels of funding and staffing does CPSC believe necessary for proper implementation of the Act?

2. Given the paramount importance of ensuring children's safety and the overall mission of CPSC, to what extent are the deadlines in the Act practicable for CPSC and industry to meet acting with all deliberate speed? If these deadlines are not practicable, what revisions to them does CPSC suggest?

3. Does CPSC have quantitative data concerning any negative impact of the Act (*i.e.*, the lead and phthalate limits and testing requirements) on small manufacturers of children's products, and if so, would CPSC please provide them? What information does CPSC have on any such negative impact of a more anecdotal nature?

4. Does CPSC have any suggestion for how to mitigate any such economic impact of the Act on small manufacturers of children's products (*e.g.*, component testing for lead and phthalate content) that, in accordance with the intent of the Act and the CPSC's mission, will not compromise the health and safety of children using them?

5. What information has CPSC received about the impact of the Act on the availability of second-hand products for children, especially clothing? It is my understanding that many second-hand stores now refuse to sell children's products. Does CPSC have any suggestions for how to mitigate any negative effects of the Act on second-hand stores for children's products, especially in light of the recent economic downturn and the consequent increased need for low-cost sources of children's clothing?

6. Does CPSC believe that the age limit contained in the Act's definition of "children's products" (*i.e.*, 12 years and under) is appropriate? If not, what should the age limit be? Further, should CPSC have the discretion to lower the age limit for certain groups of children's products for which the risk of harm from lead or phthalate exposure is remote to non-existent (*e.g.*, snaps or zippers on children's clothing)?

7. Although some youth all-terrain vehicles (ATVs) and youth motorcycles are intended for use by children under 12 years of age, does CPSC believe it is necessary that these products be tested for lead and phthalate content? Similarly, does CPSC believe that these products present a risk to children for the absorption of phthalates or lead?

8. In light of recent court decisions that the lead and phthalate content restrictions are retroactively applicable, does CPSC have concerns about the effect on the environment of the disposal of inventories of non-compliant children's products?

9. I understand that, since early December 2008, CPSC has had access to a large number of lead content test results for finished "ordinary books" (*i.e.*, books published in cardboard or paper by conventional methods and intended to be read by or to children age 12 or under) and their component materials (*i.e.*, paper, paperboard, ink, adhesives, laminates, and bindings). Have CPSC staff reviewed those test results? What do those test results indicate about such ordinary books and component materials in connection with the statutory lead limits prescribed in Section 101(a) of the Act? Does CPSC have any recommendations regarding how to mitigate the burdens that the testing and certification requirements of the Act, and especially the retroactive applicability of those requirements to inventory, could otherwise impose on publishers, printers, and retail sellers of such ordinary books, as well as on libraries, schools, charities and other second-hand distributors of such ordinary books, including those published before 1985?

10. In general, does CPSC believe that the Act was written with too little implementation discretion for the Commission? If this is the case, for which issues (*e.g.*, third party testing requirements) does CPSC require more discretion?

Please provide your responses to my office by **no later than the close of business on Friday, March 13, 2009**. I intend to work with my colleagues in the House and Senate to resolve these issues, as well as call on Chairman Waxman and Chairman Rush to hold hearings on problems arising from Act's implementation. Your responses to these questions will be invaluable in preparing Members of Congress for a frank discussion about several of the Act's apparent shortcomings. Should you have any questions, please feel free to contact me or Andrew Woelfling on my staff at 202-225-4071.

With every good wish,

Sincerely yours,

John D. Dingell

UNITED STATES
CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

March 20, 2009

The Honorable John D. Dingell
Chairman Emeritus
House Energy and Commerce Committee
Room 2328
Rayburn House Office Building
Washington, D.C. 20515-2215

Dear Chairman Dingell:

Thank you for your letter of March 4, 2009, regarding the Commission's implementation of the Consumer Product Safety Improvement Act of 2008 (CPSIA).

Nearly two years ago I stated that the CPSC was at a crossroads. We would either get more funding and more staff or we would continue a decline that would eventually result in the agency ceasing to be an effective force in consumer safety. At that same time, wave after wave of press stories about hazardous products that the agency had purportedly not acted on in a timely manner were appearing and recall after recall involving lead were being announced. In response, Congress, and the citizens it represents, decided that not only should the agency survive but it should regain its lost stature. Through the CPSIA we were given new enforcement tools, manufacturers were required to prove that their products met national safety standards and the agency was given the resources (after a decade of seeking them) to build an IT system that will pull all of our disparate pieces of hazard data into one comprehensive, searchable database that will enable the agency to spot emerging hazards in a much timelier fashion.

The CPSIA presents both opportunities and challenges for our staff. Despite the fact that the agency did not get the immediate increase in funding that the Act envisioned, our staff has done a remarkable job of meeting the Act's deadlines (in some cases many months before the Act required them to be met). Staff has done this with an agency that only has two Commissioners who do not view the Act in the same light and who do not always agree on the Act's meaning. This has left the staff unsure in some instances about how to proceed and caused delays in providing guidance and in prioritizing the agency's work. That is also why there is no *Commission* response to your questions. The single most important step that needs to be taken in furtherance of the implementation of the CPSIA at the agency is to have the third Commissioner, who would also be the Chairman, appointed to lead the agency. Then the Commission would be able to give the staff direction and attend to various concerns that have gone unaddressed. This would also eliminate the threat of yet another loss of quorum, which has happened twice since July of 2006, and which would severely hamper the continued implementation of the CPSIA.

Congress has entrusted this agency with a large and important mission. The passage of the CPSIA was a huge vote of confidence for the agency and despite the hue and cry of some in the business community who will never be happy with the closer scrutiny and accountability required by the Act, it is a major accomplishment of the last Congress, and one that your leadership was instrumental in achieving.

I do agree with staff that additional time to implement certain of the Act's provisions (such as the one that made nearly all of the voluntary requirements in ASTM's F963 mandatory) would have been preferable. However, I think that when the agency gets the third Commissioner, we will be better able to address some of the concerns voiced by staff and by industry. Until then any legislative "fixes" are premature. Only the *Commission* should recommend what, if any, changes should be made to the CPSIA and no assumptions should be made that there are no other solutions than legislative ones until all three Commissioners have a voice in the matter.

Sincerely,

Thomas H. Moore
Commissioner

March 20, 2009

The Honorable John D. Dingell
U.S. House of Representatives
2328 Rayburn House Office Building
Washington, DC 20515

Dear Representative Dingell:

Thank you for your letter of March 4, 2009, regarding the U.S. Consumer Product Safety Commission's (CPSC) implementation of the Consumer Product Safety Improvement Act of 2008. Recognizing and respecting the knowledge that the CPSC career staff has acquired in implementing this new law, I asked them to prepare answers to the important questions that you asked in your letter. Their responses are enclosed.

Since its passage last August, the CPSC staff has been working tirelessly to implement this comprehensive legislation in the most efficient and effective manner possible given the limits of our resources and the time constraints mandated in the law. As you will note in their responses, they have identified some proposed refinements to the law based on their front-line experience with it.

We share your commitment to better protection of our nation's consumers, and we very much appreciate your long-standing advocacy and support of the CPSC. After reviewing the staff's responses, please let me know if you have additional questions or comments.

Sincerely,

Nancy A. Nord
Acting Chairman

Enclosure

UNITED STATES
CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

Date: March 20, 2009

TO : Acting Chairman Nancy Nord
Commissioner Thomas Moore

FROM : General Counsel CAF
Assistant Executive Director for Compliance
Assistant Executive Director for Hazard Identification and Reduction
Assistant Executive Director for Financial Management, Planning and Evaluation CEQ

SUBJECT : Responses to Letter from the Honorable John D. Dingell

Chairman Nord has asked us to respond to the questions recently received from Representative Dingell. The following responses have been prepared by career staff at the U.S. Consumer Product Safety Commission (CPSC).

1. To what extent has robust implementation of the Act been hampered by CPSC's lack of resources? What levels of funding and staffing does CPSC believe necessary for proper implementation of the Act?

The CPSC has made implementation of the Consumer Product Safety Improvement Act (CPSIA) our highest priority. Since August 2008, the agency has initiated and advanced over 20 rulemaking activities required by the CPSIA which is an unprecedented number for this agency or any other of this size, published enforcement guidance and policies to enhance compliance with the new law, conducted numerous meetings with stakeholders, developed a special website dedicated to the CPSIA, responded to questions from the public numbering in the thousands, and generally focused the agency's limited scientific, legal, technical, educational, training and administrative resources on CPSIA implementation requirements.

Because requested funding for implementation of the new law was not forthcoming during the critical first six months when many of the CPSIA requirements needed to be initiated or completed, implementation of the CPSIA has impacted our ongoing safety mission by delaying and deferring work in many other areas. While work has been deferred or delayed on these activities -- such as rulemaking activities on portable generators and voluntary standards work on electrical, fire, mechanical, chemical and children's hazards -- some of CPSC's ongoing safety work such as hazardous product investigations and recalls could not be deferred. This has limited our ability to advise you on how to fully reallocate existing staff resources to implementation of the CPSIA.

Moreover, issues related to the accreditations of laboratories and the increasing number of requests for exclusions from the Act's provisions have caused unanticipated additional demands on staff resources, at the same time that the staff has been implementing the Virginia Graeme

Baker Pool and Spa Safety Act (which became effective in December 2008), and the Children's Gasoline Burn Prevention Act (which became effective in January 2009). This has severely overstretched the agency staff and has begun resulting in delays in implementation that will continue until we are able to fully hire and otherwise maximize the resources that have just been provided to the agency for the second half of fiscal year 2009.

Three examples of the burden and complexity presented by the work on these issues are: (1) the continuing need to process and review applications for laboratory accreditation, including applications from government and proprietary firewalled laboratories, a process initiated by the CPSIA and one that the agency is handling for the first time in its history; (2) the need for further refinement of guidance on the scope of the phthalates ban and, in particular, defining a testing method and dealing with compliance questions regarding the chemistry and carbon chain branching that determines whether a product contains a banned phthalate; and (3) the engineering issues raised by the Pool and Spa Safety Act and the need to reconcile state regulations on health and safety issues such as water quality with the need to replace drain covers as required by that Act. The Commission staff cannot address these and similar matters all at once, yet delay has serious economic impacts on the affected parties which no one anticipated would happen at the same time as the current economic downturn.

As we implement each new requirement, we are seeing unanticipated issues arise, and we are learning more of the far-reaching effects of the CPSIA and there will undoubtedly be more to learn. In August 2008 following passage of the Act, staff estimated that it would require a full annual increase of $21.1 million and 59 FTEs to begin implementing the new legislation in Fiscal Year 2009. That same month, the Commission submitted an amendment in this amount to the then-pending President's Budget Request through the Office of Management and Budget, as well as directly to Congress. In November 2008 a revised amendment was provided to Congress to reflect CPSC's requirements for only the second half of the fiscal year. Through the first six months of implementing the CPSIA, none of this additional funding was received by the Commission.

The funding amount in the Commission's revised amendment has just been approved by Congress. While we will use these funds to immediately and aggressively hire and train new staff, the six-month delay in funding will cause continued deferrals until such time that the agency fully absorbs the new appropriation. For Fiscal Year 2010 the Commission has requested additional funding to continue implementation of the CPSIA.

2. Given the paramount importance of ensuring children's safety and the overall mission of the CPSC, to what extent are the deadlines in the Act practicable for CPSC and industry to meet acting with all deliberate speed? If these deadlines are not practicable, what revision does CPSC suggest?

Mandated Deadlines: Effect on Safety Priorities and Staff Workloads

In the CPSIA, Congress set an aggressive regulatory agenda for the CPSC over the course of the first two to three years after enactment. The work required by the CPSIA is in addition to the

Commission's ongoing regulatory activity in a variety of areas, including upholstered furniture, portable generators and other important standards development activities, as well as our ongoing compliance work in evaluating and recalling products that present hazards to consumers. As with any regulatory agency, CPSC's safety work must be prioritized to deal with the most significant risks; however, the deadlines mandated in the CPSIA have jeopardized our ability to meet Commission priorities and proven to be too much for a relatively small agency to handle all at once. Timely implementation is important, but the flexibility to prioritize our work to deal with the most serious risks is equally important to maximize effectiveness and do the greatest good with the resources that we have been given.

While the CPSIA mandates more than 40 separate action items for the Commission to undertake, that number understates the agency workload that results from each of those mandates. For example, there is no requirement to adopt an interpretative rule defining "child care article" and "toy" under section 108. Yet the Commission has been inundated with thousands of product specific inquiries about what types of products fall within those definitions, from shoes to sporting goods to electronic games. An interpretive rule is our recommended way to address this issue and adds to our rulemaking burden.

The action item count also does not include acting on requests for exemptions from the lead limits provision, nor does the list contemplate making "determinations" on classes of materials or products not covered by the ban on lead in children's products. Because the statute did not permit the agency to exempt products from the scope of the definition of children's product, the staff has been engaged in a process of narrowing the scope of materials likely to include lead in order to provide relief to small businesses and home crafters faced with crippling costs of testing and certification requirements. Many of those businesses are now asking the Commission to begin the same process of exemption of materials with regard to phthalates. As another example, consideration of component testing is not a part of the list of rulemaking activities in the CPSIA, yet it is a challenging issue to consider in implementing its requirements.

There are other activities required of the Commission in the CPSIA that require resources and time that are not evident in the list of required rulemakings. The resource needs have been enormous, ranging from projects so basic as educating headquarters and compliance field staff on the scope of the new regulatory requirements of the Act to the more complex work of updating the Commission's regulations to permit the use of its new authorities with regard to refusing admission of imports. Updating our regulations and coordinating with Customs and Border Protection to allow for a process for a hearing upon refusal of admission requires significant agency resources, as does developing a process for bonding shipments to cover the cost of destruction and related import activities.

Suffice it to say that each of the various initiatives in the Act -- whether it be the lead and phthalates limits, the testing and certification regime, the import provisions, or the new database and information technology upgrades -- will require significantly more time to implement than anyone originally anticipated. Having all of that done simultaneously would have taxed the agency even if we had been given additional funding from the start. Moreover, the agency has significant ongoing work that remains, as well as two other new statutes that it must implement

this year, the Virginia Graeme Baker Pool and Spa Safety Act and the Children's Gasoline Burn Prevention Act.

The deadlines have proven to be impracticable for our staff to meet and are presenting significant problems for the agency to solve. The Commission staff must have some relief from the deadlines imposed.

Practical Solutions: Prioritizing Workload Based on Risk or Extending Deadlines

The following suggestions, ideally in combination, would help ameliorate the issues discussed above.

- Use of Risk Assessment to Establish Priorities

Use of risk assessment methodology would allow the Commission to establish priorities, provide for common sense exemptions, and set CPSIA implementation deadlines. Congress took this approach, to some degree, when setting the initial testing and certification deadlines. Using recall frequency and, to a lesser degree, the severity of possible injuries, Congress determined that cribs, pacifiers, small parts, lead in paint, and lead in children's metal jewelry would lead the children's product testing and certification effort.

However, by this June the Commission must accredit laboratories for third-party testing to all other children's product safety rules, which includes any new or previously existing rule applicable to a product intended for children 12 years of age or younger. The agency will be pushed to meet that deadline as the staff will need to issue accreditation procedures, and all related testing procedures, for the many rules applicable to children's products at that time, including the enormously complex requirements of the ASTM F963-07 Toy Safety Standard. All of this will take place simultaneously with work we are doing to open CPSC's new laboratory facilities.

Examples of Inefficiencies: Furthermore, inefficiencies have been created given the tight timeframes of the Act. For example, under section 102 of the CPSIA, the Commission is required to publish accreditation procedures for laboratories testing baby walkers, bouncers and jumpers by March 12, 2009. However, the existing regulations for baby walkers and bouncers are outdated. The Commission through its enforcement actions has been requiring compliance to the voluntary standard rather than the outdated regulations, and for the most part industry is complying with the voluntary standard. It is inefficient for the staff to accredit laboratories to test to outdated regulations.

The baby walker standard will be one of the first two rules the Commission handles under the series of new consumer product standards required for durable infant products under CPSIA section 104, and therefore, the most efficient (and common sense) resource allocation would be to accredit laboratories for testing when we announce the new baby walker standard in February 2010. Because the statute was written without such flexibility, we must develop an approach to deal with the outdated baby bouncer, walker, and jumper standard, which may include withdrawing the outdated standard to avoid accrediting laboratories to standards no one follows

and to clarify that there is no need for industry to take a step backwards to test to standards that will be updated in a matter of months.

From our standpoint, an ideal solution to these challenges faced by our staff would be for Congress to let the Commission decide what level of testing is required for which products, allowing the Commission to prioritize based on risk and tackle any problems that need to be addressed in the most efficient manner. Alternatively, Congress could continue to require certification and third-party testing for all children's products but allow the Commission to prioritize as to when the testing to each children's product safety rule will begin, so that it can roll those out on a timetable that is based on its discretion and expertise. To do this right, we need to:

- provide our stakeholders with a list of all standards that are applicable to a children's product;
- identify which children's products need to comply with which standards;
- define the test methods for each standard and whether they make sense for all of the different products covered;
- accredit the laboratories for testing to each standard; and
- develop a process for inspecting certificates.

All of that takes time and the ten months the CPSIA gave us to accomplish this task has not proven to be workable.

The wholesale release of "all other" children's product standards in June 2009 may further stress manufacturers, importers, and retailers while providing marginal improvement in children's safety for many of the products. A methodical, pragmatic approach to the release, based on priorities determined by CPSC staff, would facilitate a smoother rollout while addressing first the products presenting the greater risk to children. This allows CPSC staff the flexibility to prioritize tasks, manage our workload, and assure greater safety without an unnecessarily burdensome impact on product sellers.

o Extend Deadlines

Another alternative is to move certain of the dates for implementation in the CPSIA to allow the Commission the time to provide additional implementation guidance. The most challenging deadlines for compliance were those that went into effect on February 10, 2009, requiring retroactive compliance to the new lead and phthalate content limits. The breadth of products covered by the definition of children's products covered by the lead limit, *i.e.*, any product designed or intended primarily for a child 12 years of age or younger, implicated numerous industries that had not understood that their products would be subject to the new lead provisions.

The question asks us to comment on the impact of the deadlines on industry. Whether it be makers of books, bikes, or baseball bats, every industry needed more time to determine which, if any, of its products were covered under the definition of children's product, test those products for compliance, and develop new methods of manufacture to eliminate the lead if it was present

in the product. The scope of products covered by the new regulation and the amount of inventory implicated went well beyond what many may have contemplated. Our information is incomplete but we are told that millions of products wait in storage warehouses for return and destruction. Retailers have indicated that most of these products do not contain accessible lead, and a real question exists in our staff's mind as to whether they contain accessible lead in a sufficient amount to be anything other than a *de minimis* risk but simply were unable to meet the standards that took effect in February. It will be even more difficult for these products to meet the stricter standards to come. These challenges faced by industry have a direct impact on CPSC staff resources and our ability to meet deadlines given the need to respond to their inquiries.

Another approach to the deadlines is to allow the Commission more discretion to move an effective date for a given product or class of products in certain circumstances. The CPSIA does not permit the Commission to delay the effective date of any of the new standards to deal with a problem such as the lead in bike tire valves where the risk to a child is exceedingly small but still measurable, and the economic impact is substantial. In cases such as these, some reasonable amount of time should be allowed to reengineer the product to develop an alternative that can meet the new lead limits.

3. Does CPSC have quantitative data concerning any negative impact of the Act (i.e., the lead and phthalate limits and testing requirements) on small manufacturers of children's products, and if so, would CPSC please provide them? What information does CPSC have on any such negative impact of a more anecdotal nature?

CPSC staff does not have data on the total value of impacted inventories, lost sales, disposal costs, and other costs likely to be incurred by small manufacturers because of the CPSIA; however, information of an anecdotal nature, that has not been verified by CPSC staff, puts the impact in the billions of dollars range.

Industry Estimates

For example, the Motorcycle Industry Council reported in a February 26, 2009, press release that the new lead rules would result in an annual impact of $1 billion on their industry. In a request for a moratorium on the retroactive application of the lead ban, the American Chamber of Commerce in Hong Kong estimated that the impact on their members producing children's wearing apparel would run in excess of $300 million. In a letter to the CPSC, counsel to a major mass retailer stated that a client estimated their cost to test inventory at $1.4 million and projected inventory losses of $30 million. Another client estimated the value of their unsalable inventory at $7 million. It was also reported in a March 5, 2009, article in the Wall Street Journal, that the Toy Industry Association estimated inventory losses valued in the range of $600 million.

CPSC Testing Estimates

CPSC staff has estimated that the cost for third-party testing of product for lead and phthalates would range from several hundred dollars to several thousand dollars per product tested,

depending on the number of product components requiring testing. Based on information obtained from testing laboratory price lists and quotes, the cost to test for the lead content of a substrate appears to range between about $50 and $100 per tested component. In a recent public meeting, industry representatives stated that testing of the 233 various components of a bicycle, valued at $50, cost one of their members approximately $14,000. Less information is available about the cost of testing products for phthalates, but the limited information obtained from price quotes and laboratory presentations to CPSC staff suggests the best estimate for the cost of phthalate testing at this time ranges from $300 to $500 per tested component. The cost to test for phthalates appears to vary widely from market to market. In a recent CPSC public meeting on phthalates, one participant told of receiving quotes for the testing of a product ranging from $7,000 in Asia to $22,000 in the United States. Because these tests tend to be destructive, manufacturers also bear the expense of lost material, labor, and overhead associated with production of the products tested.

Economies of scale provide an advantage to larger volume manufacturers, relative to their smaller volume counterparts, as they can absorb these testing costs over a larger production volume. Spread over this larger volume, the incremental increase to the cost of each product is much smaller for the large manufacturer versus the much smaller manufacturer. In short, the heavier burden falls to the smaller volume business. When the Commission establishes random sampling requirements (as part of the required rulemaking on periodic testing in Section 102(b)), testing costs will increase over current levels for manufacturers of all sizes.

The exclusion of most fabric from the third-party testing requirements will provide only limited relief for apparel manufacturers, including small manufacturers. In a public meeting with CPSC staff, several apparel retailers reported finding virtually no lead in fabric, but they did find lead in about 2% of the tests on hard items, such as buttons, zippers, snaps, and fasteners. Since most apparel items have some non-fabric items, there will still be testing requirements for most apparel items. Moreover, under the new restrictions the presence of lead in fasteners used on clothing has had a negative impact on the second-hand market for children's clothing in the United States.

Although testing children's products, as applicable, for lead and phthalates has received the most attention, many products will be subject to additional third-party testing requirements. For example, cribs must be tested for compliance to the crib safety standards at 16 CFR part 1508. Toys are also subject to testing for compliance to applicable provisions of the Toy Safety Standard, including testing for additional heavy metals, such as arsenic, cadmium and chromium. We have no quotes for these tests; however, it is probable that the major factor in the cost of the tests will be the labor time required to conduct the tests. Once again, given the destructive nature of the testing, the manufacturer will also bear the expense of lost material, labor, and overhead.

It is important to keep in mind the wide expanse of goods falling under the definition of "children's products" and subject therefore to third-party testing requirements. Beyond toys and durable infant and toddler products, items such as books, bicycles, clothing, youth-sized motorized off-road vehicles, school supplies, and Scout equipment and accessories are subject to lead and/or phthalates testing. Likewise, all products for children 12 years of age or younger that are made by crafts people, stay-at-home moms or dads, charitable church groups and the like,

must meet the new limits and be tested for compliance or their products are banned. This has completely upset the business model for many of those small businesses and charitable organizations. Because of the retroactive nature of the regulations, many retailers began turning back product with more than 600 ppm well in advance of February 10, 2009, in order to ensure their shelves were free of non-compliant product. As a result, many small manufacturers, who failed to recognize the true scope of the law or were unprepared for the retailers' reaction to the CPSIA, now find they have inventory they cannot sell.

Retailers Accelerating Deadlines

Retailers continue to move well ahead of the deadlines established in the CPSIA. For example, it is staff's understanding that Wal-Mart stopped receiving product with more than 300 ppm lead in January 2009. These actions have stranded inventory that may be compliant today but will be banned in August as the lead limit drops to 300 ppm. In addition to the risk that these products may become obsolete and will need to be reworked or destroyed, manufacturers of all sizes are incurring expenses to hold this inventory while they decide how to move their product. The cost to carry this inventory varies by business, but typically runs about 25% of the on-hand inventory value.

As retailers pull product from their shelves, many consumers have also been negatively impacted. For example, CPSC staff have received numerous emails from consumers stating they could no longer purchase parts for their child's youth model motorcycle because of retailer concerns over the lead content of the parts. More than one consumer has noted the possibility of consumers' purchasing vehicles sized for older children or adults if they could no longer service their current motorcycle or ATV. This reaction potentially places these children in a situation of increased risk of injury or death.

Solution: Risk-based Assessments That Consider Age and Exposure

It may be too late to mitigate the significant economic impact of the February 10, 2009, ban on children's products containing more than 600 ppm total lead content, by weight, for any part of the product. However, some relief could be provided to deal with the impact on thrift shops and second-hand sales, and Congress still has time to act to prevent the even greater impact that will occur when the lead limit drops to 300 ppm in August 2009. For example, toxic substances limits are better regulated based on the possibility of exposure in relation to age. Foreseeable use data, combined with mouthing and ingestion data at various ages, would define the group at risk for any given product.

This approach would exclude items such as bikes and ballpoint pens from the discussion and we could focus on items like metal jewelry and other objects likely to be mouthed or ingested. By granting the CPSC the flexibility to determine the relevant hazards, flexibility in determining exemptions based on assessment of risks, and the discretion to adjust the age limit for certain groups of products where the exposure is low, resources can be properly focused on areas of greater risk, yielding maximum reductions in consumer risk of death and injury.

4. Does the CPSC have any suggestions for how to mitigate any such economic impact of the Act on small manufacturers of children's products (e.g., component testing for lead and phthalate content) that, in accordance with the intent of the Act and the CPSC's mission, will not compromise the health and safety of children using them?

In light of the concerns expressed by small business owners and employees, CPSC staff has been considering what relief might be provided for them without compromising safety. The first challenge was to define what is meant by "small business" in the context of the manufacture of children's products.

For example, with regard to children's apparel, there are not good statistics differentiating those firms that make all apparel versus those firms that make apparel intended only for children 12 years of age or younger. With regard to toys, the analysis of those businesses that are focused on the manufacturing of products solely for children is more reliable. Bureau of the Census (2006) data shows that there are 776 firms that manufacture dolls, toys, and games (NAICS 33993); 403 of those firms (51.9%) have fewer than 5 employees, 632 (81.4%) have fewer than 20 employees, and 963 (98.3%) have fewer than 500 employees which is the standard definition of a small business. Only 13 of the firms (1.7%) that produce toys would not be considered small businesses by the Small Business Administration. All (or almost all) of these firms are likely to produce children's products and all are affected by the current economic downturn.

Another group significantly impacted by the CPSIA is small crafters of products for children, many of whom work out of their homes. Based on a 2000 survey conducted by the Craft Organization Directors Association, there were an estimated 106,000 to 126,000 craftspeople in the United States. Additionally:

- The average gross sales revenue was $76,000 per craftsperson.
- The median household income of craftspeople was $50,000 per year, with about half coming from craft activities.
- 64% of craftspeople worked alone, 18% work with a partner or family member, and only 16% had paid employees.

Component Certification

The cost of testing and certification is a huge burden on these small businesses and a robust component certification program would be extremely helpful. However, any component testing rule would have to apply across the board to all businesses, small and large, and to our global trading partners in compliance with international trade laws. Furthermore, we have to design a program we are confident will avoid the switch of components during manufacture which is the very problem that Congress was intending to fix by requiring testing of children's products in the CPSIA. Component testing presents real challenges since many of the components used in children's products are not children's products on their own and do not require third party testing. Snaps could be used on a hand knitted sweater that were not produced primarily for use in children's products, and we cannot be sure given the expense of testing, that a market will develop for certified compliant materials for use by crafters.

Potential Solutions

Recognizing that the Commission always has the ability to take action to address unsafe products in the marketplace, Congress could take many different approaches to mitigate the effects on small businesses. Congress could apply the new lead and phthalates limits prospectively to mitigate the impact on inventory existing prior to enactment. It could allow for a more flexible exception process based on balancing of risks against the burdens of the costs of testing and certification but that could overburden staff. Another option would be to allow the Commission the flexibility to decide what children's products require testing and certification.

5. What information has CPSC received about the impact of the Act on the availability of second-hand products for children, especially clothing? It is my understanding that many second-hand stores now refuse to sell children's products. Does CPSC have any suggestions for how to mitigate any negative effects of the Act on second-hand stores for children's products, especially in light of the economic downturn and the consequent increased need for low-cost sources of children's clothing?

CPSC staff has only limited, anecdotal information concerning the impacts of the Act on second-hand stores. Major resellers such as Goodwill Industries and the Salvation Army have estimated impacts, including both lost sales and disposal costs, totaling hundreds of millions of dollars. Many smaller resellers have indicated that under present circumstances, they cannot afford to continue selling children's toys or apparel, which account for much of their revenues. Even church bazaars and neighborhood yard sales are adversely affected.

The major problem for second-hand stores and other resellers is that the CPSIA prohibits the sale, distribution or export after February 10, 2009, of any children's products exceeding the applicable lead or phthalate limits regardless of when they were made. Second-hand stores are typically selling items that were manufactured years earlier. Thus, a large percentage of a reseller's current inventory of children's products may have been manufactured long before the stringent new limits took effect, and it may now be impossible to dispose of such items lawfully except by destruction (which itself may be costly, particularly for non-profit organizations). To make matters more difficult, there is often no cost-effective way to determine which products can lawfully be sold and which cannot.

Unlike other retailers, resellers generally have little or no control over the compliance of the goods that they obtain. Most are donated. Even where they have regular donors, resellers cannot practically establish specifications for children's products as major retailers can for their regular suppliers. Testing everything they receive is not a practical solution either. Like small, home-based manufacturers, resellers cannot spread testing costs across many units of the same type; at any given time, they would usually have on hand no more than a few items of the same type. The standard tests for lead and phthalate content are destructive, so if one tests a single item to determine whether it can be sold, one no longer can sell that item.

Screening devices, such as x-ray fluorescence (XRF) machines, can help in weeding out children's products that have excess lead, without destroying products that comply, but the new technology is still expensive. No such screening device yet exists for identifying phthalates. Even if such technology can be developed quickly, it remains a disproportionate burden to test every unique item in inventory. Some internet resellers and auctioneers do not even have access to the products that are offered for sale by third parties on their website and so could not feasibly test them by any method.

The second-hand store problem will get worse for several years before it may ultimately get better. The lead content limits will drop to 300 parts per million in August 2009 and to 100 ppm in August 2011 (unless the Commission determines that such limit is not technologically feasible for a class of products). Products manufactured after these dates will be in use for some years before they are donated to second-hand stores. So, it will probably take many years before children's products that comply with these stringent limits make up a sizable majority of the products for sale at second-hand stores.

Potential Solutions

Under the circumstances, merely postponing the effective date of the lead or phthalate limits for everyone, while this would help alleviate some problems we are seeing, would not be very helpful to resellers because it would allow products with excess lead and phthalates to continue being made, and thus add to the number of noncompliant products that may eventually find their way to resellers and so postpone the day of reckoning.

The most effective way to help resellers is to address the issue of retroactivity, requiring that manufacturers meet the statutory limits for products manufactured after the effective date but that retailers and resellers be allowed to continue sale. If this suggestion were adopted, it would be important to note that resellers could not sell recalled products and that the Commission retains its authority to stop sale of any product if it finds an exposure that presents an unreasonable health and safety risk to children.

A law like the CPSIA that outlaws sales of previously lawful products will, by its nature, hurt retailers more than manufacturers and hurt resellers even more than other retailers (given the fact that products are typically in consumers' hands for several years at least before they reach second-hand stores). While dealing with retroactivity across the board would be the most effective way to deal with the inequities presented by the current law, other suggestions include such things as establishing a separate rule for resellers. For example, the ban on selling children's products with excess lead or phthalate content could take effect at a later date for second-hand sellers than for retailers generally. Or, resellers (or some subset of them, such as individual consumers or non-profit resellers) could even be exempted entirely from the provision that makes it a prohibited act to sell products containing more than trace amounts of lead or phthalates. Children's products that would have been banned under prior law should not be exempted in any case, and there may be categories of products, for example, children's metal jewelry, that should be handled more strictly. While consumers are accustomed to the notion that used goods are sold "as is," it might be appropriate to require a label or other type of

warning at the point of sale if resellers are allowed to continue to sell older children's products that do not comply with the new limits.

Lest there be any question, CPSC staff does not favor exempting second-hand sellers from the prohibition against selling recalled products (including children's products that are recalled for excess lead paint, or excess lead or phthalate content). The staff believes that resellers can reasonably be expected to keep abreast of CPSC recalls by signing up to receive CPSC's recall press releases and to remove any recalled products from their shelves. Similarly, where Congress has unambiguously directed application of new regulatory requirements to a discrete class of used children's products, such as cribs, CPSC staff believes that resellers no less than others must take steps to comply, even if that means deciding not to sell the products in question.

The Commission has adopted an enforcement policy on lead limits and has issued other guidance to second-hand stores to address many of the recurring issues. In the staff's view, however, the core problem is caused by the retroactive nature of the law and is beyond the agency's authority to solve.

6. Does CPSC believe that the age limit contained in the Act's definition of "children's products" (i.e., 12 years and under) is appropriate? If not, what should the age limit be? Further, should CPSC have discretion to lower the age limit for certain groups of children's products for which the risk of harm from lead or phthalate exposure is remote (e.g., snaps or zippers on children's clothing)?

The term "children's product" has significance for several different provisions of the CPSIA. It specifies which products are subject to the lead content limits. Indirectly, it plays a role in defining which products are subject to the phthalate limits. It governs the scope of products that require certification based on third-party testing and those that will require tracking labels "to the extent practicable."

CPSC staff believes that for purposes of defining which products are subject to lead limits, the boundary age could reasonably be lower than 12, at least in most cases. The Senate bill (S. 2045) deemed age 7 a satisfactory upper limit. CPSC staff understands that the conferees ended up agreeing to age 12 primarily because of the so-called "common toy box problem" – *i.e.*, the concern that a product intended primarily for older children might nonetheless be available to younger ones in the same home. This choice had the effect, however, of applying the lead limits to a much larger population of products, including many that are not toys and even including outdoor products such as dirt bikes or ATVs that would rarely be accessible to younger children under any circumstances.

CPSC's Regulations Established Age Limits by Product Class

CPSC's own regulations have used a variety of different ages to define what group of children's products will be subject to a standard or ban, and these precedents may be useful to consider. For example, the small parts ban applies to products that are intended for children under 3. Toys that are intended for ages 3 through 5 are allowed to have small parts, provided that they have

cautionary labels to warn that they are not suitable for youngsters under 3. In general, toys that are intended for children 6 and older do not require cautionary labeling except in a few specific cases such as balloons and small balls. The lead paint ban (16 CFR part 1303) applies to children's products without a specific age definition. Despite this broad applicability, the scope of the lead paint ban has rarely if ever, generated controversy. This is probably so because it is limited to children's products that have paint or similar surface coatings, and such products are much fewer in number and more easily identified than children's products generally.

Both the likelihood of exposure and the route of exposure are factors to consider in deciding what products should be subject to lead limits. Lead presents an acute hazard when direct ingestion is possible. For this reason, CPSC staff has long treated children's metal jewelry as warranting special concern. In other applications, brass and many other metals often have some lead content, particularly to improve workability, corrosion resistance and other properties.. Where such objects can be mouthed but not swallowed, they generally pose a lesser risk, and objects that can be licked but not mouthed pose still less risk. There are some products where mouthing or licking is unlikely but where some lead exposure may result from touching and inadvertent transfer of lead from hand to mouth. A child's exposure to lead from zippers and snaps will depend on the type of garment and the child's age, among many other factors.

Practical Solution: Commission Discretion

One way to address these issues would be to give the Commission more discretion to grant exclusions from the lead or phthalate limits. Under the law as currently written, a material having more than 600 parts per million lead cannot be excluded unless touching the product will not result in the absorption of *any* lead. Taken as a whole, the language of section 101 appears to rule out treating even very low levels of absorbable lead as negligible. Congress could modify this exclusion criterion to allow *de minimis* levels of absorption or to change the focus to preventing any significant increase in blood-lead levels of a child, particularly for children who are of the age of the intended user.

Giving the CPSC discretion to lower the age limit for certain classes of products might be more efficient than dealing with many requests for exclusion, which is a resource-intensive process. Another resource conserving approach would be for Congress to lower the age limit across the board and give the CPSC discretion to set a higher age for certain materials or classes of products that pose a risk to older children or to younger ones in the same household.

7. Although some youth all-terrain vehicles (ATVs) and youth motorcycles are intended for use by children under 12 years of age, does CPSC believe it is necessary that these products be tested for lead and phthalate content? Similarly, does CPSC believe that these products present a risk to children for the absorption of phthalates or lead?

CPSC staff is aware that many different parts of youth ATVs and youth motorcycles have lead content, some of which may exceed the 600 or 300 ppm level. Some of these parts are inaccessible, and some parts may qualify for the higher limits applicable to certain electronic components. Other parts, however, appear to be accessible and may not qualify for any

exclusion under section 101 of the CPSIA. These youth vehicles may also have some phthalate content, but they do not appear to be covered by the section 108 bans, which are limited to certain toys and child care articles.

The possibility that children will suffer significant lead exposures from these classes of vehicles appears to be remote at best. First, the vehicles are generally stored outside the home, where younger children would rarely be allowed unsupervised access. The vehicles are generally designed for children of at least 6 years of age and older. These children are far less likely to ingest or mouth components of a motorized vehicle – even those that are physically exposed – than something that fits readily in the mouth, such as a jewelry chain or charm. Children may still be exposed to some lead as a result of touching seats, handle bar grips or other places and then inadvertently transferring some of the lead to their mouths from their hands, either directly or indirectly, as for example while eating. For most children, however, this type of exposure is not likely to result in significant absorption of lead. This is particularly true where children are wearing appropriate protective riding gear, such as gloves and helmets.

Broadening the Exemptions for Metals

In section 101(b)(4), Congress recognized that it might not be technologically feasible for certain electronic devices to meet the lead limits applicable to children's products generally and gave the CPSC authority to adopt other requirements for such devices. The Commission has exercised this authority on an interim basis and established higher limits for certain electronic components where it concluded that such parts cannot be made inaccessible and it is not technologically feasible to substitute other materials at this time. These include metals such as steel, aluminum and copper alloys as used in electronic devices. In adopting these alternative limits, the Commission made reference to exemptions recognized elsewhere, such as the European Union directive 2002/95/EC known as RoHS. It is worth noting that in Europe, the RoHS exemptions are equally applicable to non-electronic uses of these metals, but the staff believes that section 101 gives us no flexibility to apply the same exemptions outside the realm of electronics. This means that children's products containing these metals and metal alloys manufactured for the U.S. market cannot employ recycled metal to the same extent as they can in Europe; rather, the manufacturers for the U.S. market must obtain supplies of primary metal, forcing vastly higher energy consumption and higher costs, or they must quickly switch to substitutes whose properties are poorly understood and may even pose more significant safety risks to children.

Under the current law, CPSC staff believes that an exclusion for youth ATVs would be very difficult to justify. Some have argued that if youth-sized ATVs cannot be sold for an extended period of time, owing to lead limits, then more children may end up riding adult-sized ATVs. A child using an adult ATV as a substitute would face a far graver and more immediate risk than that of the possible lead exposure from the youth ATVs.

Potential Solutions

The ATV situation is illustrative of a number of product classes that may not qualify for an exclusion. Congress could moderate this situation in several different ways. These include one or more of the following (not in priority order): (1) postponing the deadline for sales (not

manufacture) of children's products containing lead above the new limits; (2) lowering the age limit for children's products (as discussed in the response to question 6); (3) exempting some or all children's products that are usually not kept in the house, such as bicycles and ATVs; (4) giving the CPSC greater discretion to exclude from compliance with the lead limits any materials or products that pose a negligible risk to children (as discussed in the response to question 6); or (5) allowing materials that are eligible for special treatment when used in electronic devices to receive similar treatment in other children's products when the justification is equally compelling.

8. In light of recent court decisions that the lead and phthalate content restrictions are retroactively applicable, does CPSC have concerns about the effect on the environment of the disposal of inventories of non-compliant children's products?

This issue lies within the authority and expertise of the Environmental Protection Agency (EPA).

9. I understand that, since early December 2008, CPSC has had access to a large number of lead content results for finished "ordinary books" (i.e., books published in cardboard or paper by conventional methods and intended to be read by or to children age 12 and under) and their component materials (i.e., paper, paperboard, ink, adhesives, laminates, and bindings). Has CPSC staff reviewed those test results? What do those test results indicate about such ordinary books and component materials in connection with the statutory lead limits prescribed in section 101(a) of the Act? Does CPSC have any recommendations regarding how to mitigate the burdens that testing and certification requirements of the Act, and especially the retroactive applicability of those requirements to inventory, could otherwise impose on publishers, printers, and retail sellers of such ordinary books, as well as on libraries schools, charities and other secondhand distributors of such ordinary books, including those published before 1985?

Lead Testing and Printing Ink: The Publishing Industry's Challenge

Given the breadth of the definition of children's product in the CPSIA, the Commission received thousands of questions over the past six months regarding the scope of applicability of the retroactive lead limits and the required third-party testing of such products. At the same time, retailers began demanding certificates of compliance for products likely to be on their store shelves on February 10, 2009. The publishing industry claimed to have been unaware that the definition of children's product would encompass books until retailers started asking for certificates of compliance and we posted a response to one of the frequently asked questions regarding the application of the CPSIA to books intended or designed primarily for children. Because of the variety of colors of inks used in making children's books printed on paper and cardboard, the requirement of testing for compliance to the new lead limits proved costly and onerous. Some retailers were demanding separate certificates of compliance for each book title.

The issue of lead in printing ink and other products used to make a book is not new. Indeed, in 2007 the publishing industry issued a statement on lead in books to respond to any concerns

raised about books related to that year's toy recalls for excessive lead in paint. (See American Booksellers Association statement of November 29, 2007, Bookselling this Week: Getting the Lead Out: Consumers Question Books Made in China, found on March 15, 2009 at http://news.bookweb.org/news/5695.html.) The Commission has occasionally recalled such products for excess lead; for example, a recall was conducted in February 2008 for excess lead in paint on the colored spiral metal bindings of several sketchbooks. In July of 2004, the Commission issued a warning regarding the hazards of lead in candy wrappers that contain lead or bearing lead-containing ink.

The "Ordinary Book" Exemption

The Commission staff wanted to provide some relief to the book publishing industry given the extraordinary impact of third-party testing for lead and because the publishing industry maintained that the Commission had never considered ordinary children's books to be a health hazard. However, given the requirements of the CPSIA, the staff felt that they needed some representative data upon which to base a decision to exempt children's books from the requirements. The number of requests for relief from the retroactive effect of the CPSIA was so high that the staff felt that in fairness, any determination that the law did not apply to a material or class of products should be based on science and supported by test results.

It is not the case (noted in your question) that the Commission staff has had access to a "large number of tests on finished 'ordinary books'," but rather we have had access to a very limited data set on which the publishers have based their request for an industry-wide exemption from testing to the new lead content limits. The publishing industry association provided the staff with 152 separate entries representing testing done on approximately 157 books conducted anywhere from 2004 to 2009. The books tested range from the ordinary books to books with handles, stickers, kits or other accessories. The staff reviewed those test results, and initially concluded that many of the tests were done for European standards and/or did not test for total lead content as required by Section 101 of the CPSIA. The staff of the CPSC asked the industry to provide more data for total lead content and demonstrate that the data submitted was representative of all of the millions of ordinary books sold to children 12 years of age or younger.

The additional data submitted suggests that modern book publishing using offset lithography does not result in books with lead levels in excess of the 300 ppm limit that goes into effect in August of 2009. However, the Commission staff has not had the time or resources to look at the issue completely or comprehensively and has been hopeful that more data would be submitted by industry particularly with respect to books published in the 1960s and 70s. The Commission staff has been assured that the publishers now all use inks that result in children's books that fall below the statutory limits for lead. While the staff does not have a statistically valid basis for a wholesale exclusion of children's books at this time, its determination to exclude them from testing and certification does not mean that any children's book can exceed the lead limit. All children's books must meet the lead limit.

Making a determination that ordinary books cannot and will not exceed the lead limits appeared to be the only means of providing immediate relief. Such an exemption from testing also should

provide relief from the retroactive application of the standard to all books in schools and libraries that are provided to children for their use. In the meantime, the publishing industry was given a conditional enforcement waiver on the testing and certification requirements for lead, pending staff's review of the data and any additional data that may be submitted. That exemption was limited to books manufactured after 1985 because the publishing industry has not provided any test data on books published in the 60s and 70s. Instead, the industry has pointed to the fact that lead was removed from printing operations in this country due to federal statutory restrictions on worker exposure to lead in printing operations which went into effect in the late 70s. The very limited testing the Commission staff has done indicates that the lead content of these older books can occasionally exceed the 300 ppm limit that goes into effect in August 2009 but that data may not be representative. At this time the Commission staff has not had the time or resources to prove that books made more than twenty years ago do not exceed the lead limits as staff has needed to focus its resources on its investigations of deaths and injuries to children and other emerging risks and health hazards.

Library Books and Used Book Resellers

The retroactivity of the lead provision is particularly problematic in the area of books and other printed materials. We have done very limited testing of books from the 60s and 70s. It suggests that the lead content hovers around the 300 ppm mark. Anecdotal evidence received by the agency suggests that on occasion books from this earlier period may contain lead in excess of the lead limits in their binding materials. The only way to determine the total lead content in these books is to test them.

Under the CPSIA, however, sellers of used children's books, including used book stores and thrift shops, are not required to test or certify that children's books meet the new lead or phthalates limits. The CPSIA does not require resellers to test children's products in inventory for compliance with the lead limit before they are sold. However, resellers cannot sell children's books intended primarily for use by children that exceed the lead limit.

The Commission had hoped that an exemption for "ordinary books" plus its announced enforcement policy for lead would alleviate this situation. Based on information received from the trade associations with information regarding books in libraries and schools, the Commission staff understands that most textbooks in schools are less than ten years old. Likewise, the information received suggests that most library books lent to children are recycled approximately every 18 lending cycles or three years. Thus, it appears that few of the books being provided to children in their schools and from libraries would be more than 20 years old.

Potential Solutions

Staff has considered children's behaviors with books and concluded that after about 19 months of age, children may occasionally put part of a book in their mouths, but they typically are taught to care for their books so that they can continue to be used for reading and learning. This information suggests that any exposure to lead from contact with books diminishes as children age. We believe an exemption is the only way to provide relief under the CPSIA. Congress could limit the testing of books to only those picture books provided to children much younger

than 12 since this is the population of children that would be most likely to interact with their books in a way that could expose them to inks with higher lead content. Lowering the age limit would be extremely helpful to staff in dealing with books and many other products by narrowing the scope of products covered. Lowering the age limit would also provide relief to schools who face retroactive application of the lead provisions not just with regard to books but also the wide variety of other educational materials they provide to school-aged children.

The CPSIA establishes that any children's product no matter when it was made is a banned hazardous product if it exceeds the lead limits and the law does not have an exemption procedure other than one based on scientific proof that there will not be absorption of any lead. One solution would be for Congress to create a waiver process allowing the Commission to "grandfather" in products made prior to the date of enactment if the Commission concludes those products present only a *de minimis* exposure level and, therefore, a negligible risk. This could be used to solve the problem of used books as well as other products commonly sold second-hand such as used clothing or youth bicycles. It creates an administrative burden that the Commission may not be able to handle without some delay, but it would provide relief without having to undo the retroactive effect of the law altogether.

10. In general, does CPSC believe that the Act was written with too little implementation discretion for the Commission? If this is the case, for which issues (e.g., third party testing requirements) does CPSC require more discretion?

The CPSIA provides too little implementation discretion for the agency. One of the major problems with implementation has been the statute's reach across a variety of industry sectors quickly and simultaneously by virtue of its broad definition of "children's product." The lead limits reach literally every product intended or designed for a child 12 or younger. The breadth of the statute's reach has made it difficult for the Commission to address industry specific concerns in the few areas where the agency has discretion. The Commission needs room to address toy industry concerns separately from those of the apparel industry, from those of the publishing industry, and separately again from those of industries that make outdoor products for children such as motorized recreational products, playground equipment and bikes.

The lead limits and testing and certification provisions could be implemented much more smoothly if the Commission had the discretion to roll out those requirements on a product class basis. The same will soon be true for tracking labels where each industry has specific concerns about how additional labeling requirements will work given existing and multiple other labeling requirements. Congress can direct the agency as to how to determine priorities and work to a specific schedule as evidenced by section 104 which gave some flexibility to the Commission in pursuing the congressional mandates for new durable infant product standards. A similar approach to implementing all of the Act's new rules and requirements would ease the implementation burden. Indeed, the stay of enforcement of certification and testing was the agency's only means to get the breathing room it needed to deal with the various unanticipated issues that arose given the breadth of the industries affected.

Some have argued that the Commission should have a more relaxed approach to exclusions from the lead limits. However, the lead provision of the CPSIA restricts the agency's discretion at a variety of points in the statute. It allows for exemptions in three limited circumstances described in section 101(b). That section allows exclusions for inaccessible component parts of children's products and also allows the Commission to exempt electronic devices where lead is necessary for their functionality and cannot be made inaccessible. Beyond those exclusions, however, the statute leaves very little flexibility. Section 101(b)(1) of the CPSIA provides that the Commission may, by regulation, exclude a specific product or material that exceeds the lead limits established for children's products under § 101(a) of the CPSIA if the Commission, after notice and a hearing, determines on the basis of the best-available, objective, peer-reviewed, scientific evidence that lead in such product or material will "neither result in the absorption of any lead into the human body," given reasonably foreseeable use and abuse of such product, including swallowing, mouthing, breaking or other children's activities or the aging of the product, "nor have any other adverse impact on public health or safety." (Emphasis added.)

The clear language of the statute is rigid; an assessment of whether there is absorption of "any lead" cannot be based on a risk based assessment because that language does not appear to allow any amount of lead, no matter how insignificant, to be absorbed in the human body. While the courts have occasionally upheld agencies applying a *de minimis* standard and exempting trivial risks from regulation, that has been permitted only when Congress has not unambiguously denied agencies that authority.[1] Here the act specifically limits the exclusion to an application supported by peer reviewed science supporting a demonstration that there cannot be absorption of *any* lead. Moreover, section 101(e) appears to restrict the agency's ability to use enforcement discretion while exclusion requests are pending, by stating that a pendency of a rulemaking to consider a request for exclusion "shall not delay the effect of any provision or limit . . . nor shall it stay general enforcement" of the lead limits.

Those who argue that common sense exclusions are permitted by the CPSIA would have to ignore sections 101(b)(1) and 101(e). Yet as the unanticipated consequences of the retroactive effect of the law have demonstrated, some ability to provide for *de minimis* exclusions would be helpful in implementing of the Act. The effort to deal with the *de minimis* risks given the speculative yet conceivable routes of exposure presented by certain products such as bike tire valve stems distracts attention from more serious health and safety problems that the agency must address. Recently proposed legislation banning BPA recognizes the need for such flexibility to provide relief when a manufacturer cannot comply because it is not technologically feasible to do so in the timeframes permitted. Yet such a waiver or exemption process could prove to be too resource intensive and divert agency resources to handling thousands of exemption requests when staff should instead be dealing with other risks that deserve attention such as identifying emerging hazards.

Cir. 1993). *See also* Hahn and Sunstein, *A New Executive Order for Improving Federal Regulation? Deeper and Wider Cost-Benefit Analysis*, U Chicago Law & Economics, Olin Working Paper No. 150. This paper can be downloaded without charge at: http://www.law.chicago.edu/lawecon/index.html.

The CPSIA forsakes the core strengths of the CPSC's original statutory framework which has from the beginning allowed the Commission to prioritize its regulation of consumer products by an overall assessment of all the risks at stake, the magnitude of those risks and the actual consequences of the hazard. Congress should permit the agency to exempt certain products from the limits established by the CPSIA, to ease the burdens of testing and certification on products unlikely to present more than a negligible health risk, and to regulate on a timetable influenced by the seriousness of the actual risks not artificial deadlines. A more flexible exception process would avoid regulation of *de minimis* problems both prospectively and retroactively.

Moreover, this would allow the CPSC to consider the impacts of the regulatory requirements of the CPSIA, like the balance between the adverse effects on second-hand sales of children's clothing or bicycles and the potential risks from exposure in such products, which is especially important during the current economic crisis. It should also allow the Commission to balance risks such as balancing the risk of possible lead exposure to a child riding a youth-sized ATV against the risk to the child from riding a larger and more powerful adult ATV. Given that exceptions would be made on a notice and comment basis, the underlying analysis and support for any exceptions will be public allowing for transparency and accountability. Finally, relaxing certain deadlines in the Act will allow for better priority setting which will allow Commission resources to be put towards the most serious health risks first.

* * *

CONCLUSION

The staff has set forth in its answers to specific questions above numerous approaches to dealing with the issues raised. In our view, we have been confronted with three major issues in implementing the CPSIA: (1) the retroactive application of requirements to inventory; (2) the broad reach of the legislative mandates given that "children's product" is defined as a product for children 12 years of age or younger; and (3) the impact of the new testing and certification requirements for all consumer products and the third-party testing requirements for children's products. You have asked us to consider possible solutions to the problems raised in the letter, and make our best recommendation as to productive solutions recognizing that these are ultimately policy decisions for others to make. We concluded that the following three changes would resolve many of the major difficulties identified above:

- Limit the applicability of new requirements to products manufactured after the effective date, except in circumstances where the Commission decides that exposure to a product presents a health and safety risk to children.

- Lower the age limit used in the definition of children's products to better reflect exposure and give the CPSC discretion to set a higher age for certain materials or classes of products that pose a risk to older children or to younger ones in the same household.

- Allow the CPSC to address certification, tracking labels and other issues on a product class or other logical basis, using risk-assessment methodologies to establish need, priorities and a phase-in schedule.

As discussed above, there are many ways to address the challenges of implementation and meet the important goals of the statute. Regardless of the path chosen, some legislative changes would be helpful to allow the agency to set risk-based priorities given the finite resources available to the Commission.

Washington, DC 20515

Dear Chairman Bono Mack and Ranking Member Butterfield:

Thank you on behalf of the American Motorcyclist Association (AMA) and the All-Terrain Vehicle Association (ATVA) for holding the hearing entitled, "A Review of Consumer Product Safety Improvement Act (P.L. 110-314) and Consumer Product Safety Commission Resources," on February 17, 2011.

Please act to permanently exempt youth-model motorcycles and all-terrain vehicles (ATVs) from the negative and unintended consequences of the Consumer Product Safety Improvement Act (CPSIA) of 2008.

Founded in 1924, the AMA is the premier advocate of the motorcycling community. Along with our sister organization, the ATVA, we represent the interests of millions of on- and off-highway motorcyclists and all-terrain vehicle (ATV) riders nationwide. Our members are interested in any action that may affect their ongoing ability to responsibly enjoy motorcycle and ATV recreation. The AMA and ATVA remain concerned over the implementation of the CPSIA and the lead provisions in §101 as they apply to youth-model motorcycles and ATVs.

The Act, signed into law on August 14, 2008 and effective February 10, 2009, subjects any consumer product that is designed or intended primarily for a child age 12 years or under to the new limits on lead content (§101). While the Act was passed with laudable intent, it has created a well-documented safety hazard for children, a severe and unwarranted disruption to families who recreate together, and a deleterious effect on youth amateur racing. Additionally, the inclusion of youth-model off-highway vehicles (OHVs) in the Act has created an economic disaster for the youth model motorcycle and ATV industry.

Of greatest concern, however, are the unintended safety consequences for youth OHV riders. As you may know, the OHV community and the Consumer Product Safety Commission have worked extensively together to develop appropriate OHV size and operating guidelines for young riders. The sudden, near elimination of the availability of all youth

OHVs is counterproductive to all the work that the OHV community and the CPSC have done to promote youth rider safety. The elimination of these vehicles because of an unsupported suspicion that they may pose a theoretical threat of a lead hazard effectively trades away a proven safety intervention for an unproven one.

As you continue your deliberations on this important matter, we urge you and the members of your committee to support H.R. 412, the Kids Just Want to Ride Act of 2011, introduced by Representative Denny Rehberg. This bill offers the most promising and viable legislative remedy available to permanently exclude youth-model motorcycles and ATVs from the perilous and unintended consequences of the CPSIA.

Thank you for the opportunity to provide comment on AMA and ATVA's ongoing concerns surrounding the CPSIA.

Sincerely,

Edward Moreland
Senior Vice President, Government Relations

Dear Representatives:

On behalf of the Motorcycle Industry Council (MIC), its nearly 300 vehicle manufacturer and aftermarket members, their thousands of dealers, and the millions of Americans who safely and responsibly ride their off-highway vehicles (OHVs) with their families, thank you for holding the hearing "A Review of CPSIA and CPSC Resources" on February 17, 2011. I am writing to urge you to amend the Consumer Product Safety Improvement Act to stop the ban on youth ATVs and motorcycles.

The CPSIA was intended to protect children from ingesting lead from toys. However, the lead content provision has had unintended consequences. The CPSIA has effectively banned the sale of age-appropriate youth ATVs and motorcycles because of the lead content of certain metal parts. As a result of its broad reach, the Act has inadvertently crippled an industry unrelated to the toy manufacturers that were the intended target of the lead provision. In addition, the ban has resulted in unsafe situations for youth OHV riders.

It is estimated that over 13 million Americans enjoy riding off-highway motorcycles and over 35 million enjoy riding ATVs. Safety of our riders - particularly our youngest riders – is a top priority of the powersports industry. Vehicles, helmets and other gear and accessories are specially designed for youth riders to allow them to safely enjoy this family-friendly form of outdoor recreation.

In February 2009, however, ATVs and motorcycles designed and primarily intended for youth riders aged 6 to 12 became banned hazardous products under the CPSIA because small amounts of lead – that pose no risk to youth - are imbedded in metal parts of the vehicles to enhance the functionality of those components.

As you know, the CPSC concluded that the language of the CPSIA prevented it from making common-sense decisions and resulted in the CPSC denying the powersports industry's petitions for exclusion from the lead content provision. The exclusion was denied despite the fact that the CPSC's own staff acknowledged that there was no measurable risk to children resulting from lead exposure from these products.

The CPSC tried to temporarily address the ban by issuing a stay of enforcement of the CPSIA's lead content limits. Unfortunately, the stay of enforcement has proven unworkable. Due to the risks of selling under the stay, many manufacturers and dealers have stopped selling youth model OHVs, and there is now a limited availability of these products for consumers. In 2011, less than 25% of the major manufacturers are even producing the smallest youth ATVs.

The CPSC has explained that the ban on youth OHVs creates a compelling safety issue because it likely will result in children 12 years of age and younger riding larger and faster adult-size vehicles. For example, CPSC studies show almost 90% of youth injuries and fatalities occur on adult-size ATVs. Again, the CPSC's staff scientists acknowledge that the presence of lead in metal alloys in these youth models – needed for functionality, durability and other reasons that are safety critical to the components – does not present a health hazard to children. The Commission also notes that children riding these vehicles only interact with a limited number of metal component parts that might contain small amounts of lead, like brake and clutch levers, throttle controls, and tire valve stems.

For over two years, MIC, its members, their dealers and many of the millions of Americans who safely and responsibly ride their off-highway motorcycles and ATVs with their children have urged Congress to amend the CPSIA to stop this unintended ban on youth motorized recreational vehicles. Off-highway vehicle stakeholders have sent over one million electronic messages and thousands of hand signed letters and made numerous calls and personal visits to Capitol Hill to advocate for a legislative solution to the ban for three important reasons:

First, the lead content in metal parts of ATVs and motorcycles poses no risk to kids. Experts estimate that the lead intake from kids' interaction with metal parts is less than the lead intake from drinking a glass of water.

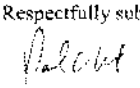
Second, everyone agrees that the key to keeping youth safe on ATVs and motorcycles is having them ride the right sized vehicle. The CPSIA has unintentionally put kids at risk because youth ATV and motorcycle availability is limited. Unavailability of youth models results in what CPSC has described as a "more serious and immediate risk of injury or death" than any risk from lead exposure from these products.

Finally, the CPSIA is unnecessarily hurting the economy and jobs when everyone is trying to grow the economy and create jobs. In 2009, MIC estimated that a complete ban on youth model vehicles would result in about $1 billion in lost economic value in the retail marketplace every year.

As Representative Rehberg stated when introducing H.R. 412 to stop the ban on ATVs and motorcycles, "a law meant to improve children's safety is actually being enforced in a way that puts kids in more danger than ever, while destroying jobs to boot."

We believe that Congress never intended to ban youth model motorized recreational vehicles when it passed the CPSIA. We urge this Committee to stop the unintended ban by either lowering the age range of "children's products" to age 6 and under or granting a categorical exemption for youth ATVs and motorcycles, as provided in H.R. 412. In either case, we urge the Committee to leave CPSC with no doubt about Congress' intent to ensure the continued availability of these youth model motorized recreational vehicles.

Respectfully submitted,



Paul C. Vitrano
General Counsel

Testimony Submitted for the Record
U.S. House of Representatives
House Subcommittee on Commerce, Trade, and Consumer Protection
April 29, 2010

Mr. Chairman, Ranking Member, and members of the Subcommittee, on behalf of Goodwill Industries International® (GII), thank you for this opportunity to provide testimony for the public record about the *Consumer Product Safety Enhancement Act of 2010*. Last spring, Goodwill worked with the Committee and its staff to develop draft language for inclusion in a discussion draft of the *Consumer Product Safety Enhancement Act*. Goodwill believes that the draft included effective provisions that would address Goodwill's concerns about retroactively applying the CPSIA's sales ban on children's products manufactured before the law's implementation. Goodwill believes that the provisions in Section 3, pertaining to the selling of used children's products, would have allowed Goodwill to continue supporting its mission through the sale of used children's apparel within the letter and spirit of the law.

Goodwill Industries International (GII) represents 158 local and independent Goodwill agencies in the United States that help people with barriers to employment to participate in the workforce. One of Goodwill Industries' greatest strengths continues to be its entrepreneurial approach to sustaining its mission. In 2009, the Goodwill network raised nearly $3.7 billion through its retail, contracts, and mission services operations. Nearly 83 percent of the funds Goodwill raised in 2009 were used to supplement government investments. Today more than ever people rely on Goodwill. In fact, in 2009, Goodwill collectively served almost 2 million people. This number represents a 26 percent increase compared to 2008. With the economy

continuing to be sluggish, we expect that we will continue to see the number of people who turn to Goodwill for assistance to increase dramatically.

The roots of today's Goodwill began as a simple idea in 1902 when Rev. Edgar Helms set out to help poor immigrants in Boston's South End by collecting clothes and household items from wealthier Bostonians to provide clothing and household items for the struggling immigrants. He discovered, to his surprise, that the immigrants were too proud to simply accept the items. So he took his idea a step further by enlisting volunteers to repair, clean, and sell the items at reasonable prices. He used the revenue to provide wages to the workers – and the first Goodwill store was born.

Especially during such difficult economic times, Goodwill is very proud of its long history of helping people to find jobs and advance in careers. As the nation struggles to recover from the worst recession since the Great Depression and unemployment stubbornly hovers near 10 percent, Goodwill remains committed to partnering with stakeholders at the federal, state, and local levels by contributing the resources and expertise of local Goodwill agencies in support of public efforts and investments.

Goodwill's first priority is and has always been the safety of its customers and the people it serves. Goodwill has a long history of working in good faith with the Consumer Product Safety Commission (CPSC) to prevent unsafe products from being sold in its stores. Local Goodwill retail professionals check the CPSC's product recall lists to identify any recalled and donated products. Those found to have been recalled are not placed on stores' shelves for sale and are taken out of circulation. In addition, agencies avoid selling known high-risk items, such as metal

jewelry and painted toys. We continue to work closely with the CPSC to pursue our common goal of preventing people from purchasing unsafe products. By continuing these efforts, we believe amending the CPSIA – by exempting the sale by charitable organizations of used children's clothes from the CPSIA's sales ban – would allow Goodwill stores to sell used children's apparel while protecting our customers' children.

I'd like to spend a moment of our time to discuss Goodwill's business model, since it is very different than that of a traditional retailer with a national footprint. First, it is very important to keep in mind that Goodwill's footprint in the U.S. is actually 158 local and independent community-based organizations' footprints that collectively make up the Goodwill network in the U.S. Each local Goodwill agency's autonomy allows it to be a true community stakeholder and partner. For example, in 2009, the Los Angeles Goodwill invested millions of its own earnings to subsidize one-stops that serve over 59,000 people. Over 4,000 went to work to support their families and improve the economic well being of their communities.

Second, the nature of the donated goods business means that most of Goodwill's products are each individually supplied through the generosity of people who donate unwanted clothes, household items, and furnishings. Inventory control systems that allow national retailers to purchase inventory; plan for its sale; and provide product specifics and information simply do not exist in the donated goods retail business. Before donated products can be placed for sale in a Goodwill store, they must be sorted and their price must be determined. In addition, our retail professionals check product recall lists to identify and dispose of any donated items that have

been recalled – therefore ensuring that these dangerous items are removed from the consumer marketplace.

We believe the nature of the donated goods charity model supports the need for legislation to exempt human service organizations that sell used children's apparel, among other products, from the CPSIA's retroactive sales ban. Goodwill absolutely agrees that children should not be exposed to products that have dangerous lead levels. This is a moral value Goodwill holds, yet it also makes good business sense. Doing anything less would have enormous potential to damage the Goodwill brand, thus hindering Goodwill's ability to provide the employment and training services to people with employment challenges.

Goodwill has worked in collaboration with the CPSC to develop constructive solutions to this important issue, exploring potential courses of action that would allow local Goodwill agencies to demonstrate a good faith effort to comply with the new law, while selling used children's products at a reduced risk to our customers and our agencies. The result was an enhanced partnership with the CPSC to educate the public, and inform and train our retail professionals. Goodwill believes that these efforts demonstrate the gold standard of good faith on the part of both Goodwill and the CPSC toward accomplishing our mutual goal of protecting children. Goodwill also recognizes that the long-term solution requires Congress to take action.

Conclusion

Goodwill has deeply appreciated the opportunities that it has been given to develop draft legislation that would address the CPSIA's unintended consequences on charitable organizations, such as Goodwill, that resell donated items, including children's products, to support the delivery

of mission services. Goodwill looks forward to continuing its work with members of this Subcommittee and staff to develop provisions that would allow Goodwill stores to support Goodwill's mission through the sale of used children's apparel within the letter and spirit of the law.

Members of the Subcommittee, again I thank you for the opportunity to discuss these concerns with you, and for pausing briefly to hold this hearing with Goodwill and other stakeholders to ensure that the final bill protects children from harm while enabling local Goodwill agencies to support their efforts to annually serve nearly 2 million people in local communities nationwide.

The Honorable Mary Bono Mack, Chairman
The Honorable G.K. Butterfield, Ranking Member
House Energy and Commerce Committee
Subcommittee on Commerce, Manufacturing, and Trade
2322A Rayburn House Office Building
Washington, DC 20515

Dear Chairman Bono Mack and Ranking Member Butterfield:

The Retail Industry Leaders Association (RILA) welcomes the opportunity to submit written comments on the unintended consequences of the Consumer Product Safety Improvement Act (CPSIA) and on CPSC resources and its ability to protect consumers. RILA members place the highest priority on the safety and quality of the products they sell to their customers, and we supported the sweeping CPSIA when it was enacted in 2008. Nevertheless, while implementing the CPSIA, it has become apparent that there are some provisions in the law that do not coincide with best practices and have resulted in unintended consequences. RILA hopes the House Energy and Commerce Committee will make it a priority to advance legislation to facilitate better implementation of the CPSIA.

By way of background, RILA promotes consumer choice and economic freedom through public policy and industry operational excellence. Our members include the largest and fastest growing companies in the retail industry which together provide millions of jobs and operate more than 100,000 stores, manufacturing facilities and distribution centers domestically and abroad.

While RILA recognizes that the CPSIA has had a profound impact in reinvigorating the Consumer Product Safety Commission (CPSC) and enhancing consumer product safety, RILA also believes the 2008 law could be improved.

Prospective Application of 100ppm lead limit

RILA strongly supports the unanimous recommendation of the CPSC Commissioners to prospectively apply the August 2011 100ppm lead limit. As currently interpreted by the CPSC, the CPSIA will make it unlawful to sell products that exceed a 100ppm limit after August 2011, regardless of when the products were manufactured, unless the CPSC determines that the lower limit is not technologically feasible.

Moreover, RILA notes that "feasible" does not equal "practical" when considering the 100 ppm limit. When discussing lead limits at these very low levels, RILA believes the CPSC should also have discretion to use risk as a factor.

The retroactive application of this provision creates substantial problems for manufacturers and retailers with large inventories of children's products, as well as for resellers such as charitable thrift

stores, and leads to wasteful destruction of safe products because confirmation of compliance for products already on retail shelves often cannot be done in a cost effective manner. Retailers will incorporate new safety standards into their guidance to suppliers so as to ensure compliant products, but it is very difficult to implement new standards on the basis of a sell-by date, particularly when there is uncertainty on whether the CPSC could make a determination that 100ppm is not technologically feasible. There is significant historical precedent to implement new safety standards on a prospective basis, and RILA has urged the CPSC to implement the August 2011 lead limit on a prospective basis. Nevertheless, Congressional action to clarify its intent for a prospective application would be very helpful for smooth implementation of the law.

Inaccessible Component Parts for Phthalates

RILA also believes the CPSIA should be modified to clarify that inaccessible component parts are excluded from the law's phthalate restrictions. Section 101(b)(2)(A) of the CPSIA clarifies that the lead limits do not apply to any component part of a children's product that is not accessible to a child through normal and reasonably foreseeable use and abuse of such product. Section 108 of the CPSIA does not currently make a similar exception for inaccessibility for phthalates, and RILA understands this omission was inadvertent. RILA believes the prohibition on phthalates should only apply to accessible parts similar to the lead policy. As an example of the problem, phthalates are used in the plasticized coating of internal wiring in electronic toys, such as remote controlled helicopters. The phthalates help to keep the plastic coating soft and pliable to better encase and protect the wires, but does not present a risk of exposure to a child playing with the helicopter because the wires are inaccessible. A clarification that inaccessible component parts are excluded from the phthalates limits would prevent the need for costly and unnecessary testing, and confirm that the remote-controlled helicopter would be CPSIA compliant.

Increased Authority for CPSC to Exclude Products from CPSIA limits

RILA also believes the CPSC should be granted expanded authority to except certain product classes or materials from the CPSIA's lead and phthalates limits based on functional purpose of the lead or phthalates in the product class, product, or component whenever the CPSC can also determine that the presence of lead or phthalates presents no significant risk of exposure or harm. Examples of product classes that may contain lead or phthalates which serve a functional purpose include pens, bicycles, all-terrain vehicles, and remote-controlled items.

Modifications to Reasonable Testing Program Requirements

The CPSC's proposed rule for reasonable testing programs (RTP) includes several burdensome and unnecessary provisions that RILA believes the Congress should consider. For example, under the CPSC's proposed rule, the burdens of record keeping for a RTP are enormous and costly. In particular, the requirement to have factory-based records in US and in English is burdensome and unnecessary because recordkeeping and the language and location of records do not meaningfully increase the safety of products.

In addition, Congress should clarify that the random sampling language in the statute does not necessarily mean statistical sampling but rather to show compliance and avoid the "golden sample."

Also, implementation of the RTP should be prospective to apply to products as they are developed. Companies should not be required to do retroactive testing, production test plans, specifications or record keeping for products already produced. The RTP requirements should apply only to products commencing production on the effective date.

Definition of Children's Products

The CPSC has interpreted the definition of children's products in an overly broad and confusing manner. RILA believes it would be helpful for Congress to provide clarity and common sense on this issue.

For example, there should be a greater weight on the manufacturer's intent whether a product is designed primarily for children.

The four (evenly) weighted factors do not lend themselves to determining the manufacturer's intent. It is currently unclear how retailers should apply the rules, especially for general use products that are used in a child's room. Instead, the rules should take into account risk and exposure. For example, a ceiling fan does not pose a risk to a child, even if it has "cartoonish" features.

The CPSC's rule effectively negates the words "designed or intended primarily". The same fan that hangs in a living room or DVD player in the den could be miraculously transformed into a children's product by the addition of Spiderman and a Hello Kitty decal.

One possible solution is to qualify the definition with something like "decorative embellishments that do not affect the functionality of the product shall not be given substantial consideration in the determination of a product as a children's product unless there is no reasonably likely general usage of the product in its unembellished form."

The CPSC should also have authority to adopt a risk evaluation in determining whether a product should be considered a children's product. For example, the definition could include, "In adopting rules interpreting the definition of a children's product, the Commission shall take into account the risk of substantial injury to children 12 years of age or younger."

Public Database

RILA believes that the veracity of information available on the CPSC's public database is critical. Thus, RILA believes that only those persons who have direct knowledge of an incident as either a victim, witness, or first responder should be eligible to provide information regarding the incident. This suggestion is to help to make sure there is sufficient information available to properly assess a report.

In addition, RILA believes that a 30 or 60 day period for manufacturers and retailers to object to complaints prior to publication on the database would be helpful.

Conclusion

In conclusion, retailers work tirelessly to ensure the safety and quality of the products they sell, and to fully implement all the new requirements under the CPSIA. We also hope the Congress will

advance legislation as soon as possible to improve the effectiveness of the CPSIA and reduce unnecessary costs for businesses that do not provide additional product safety benefits.
We look forward to continuing to work with you on this and other important product safety issues. If you have any questions or concerns, please contact me at stephanie.lester@rila.org or 703.600.2046 or Jim Neill, Vice President, Product Safety at jim.neill@rila.org or 703.600.2022.

Sincerely,

Stephanie Lester

Stephanie Lester
Vice President, International Trade

Rep. Denny Rehberg (MT-AL)
Statement for the Record
Energy and Commerce, Subcommittee on Commerce, Manufacturing, and Trade
Hearing on a Review of CPSIA and CPSC Resources

Mr. Chairman, thank you for the opportunity to submit this Statement for the Record on the hearing entitled "a Review of CPSIA and CPSC Resources" and to share my specific concerns with an aspect of the law that was passed in 2008.

As you know, the Consumer Product Safety Improvement Act (CPSIA), while well-intentioned, created a situation in which off-road vehicles that are manufactured and marketed exclusively for children under the age of twelve; including all-terrain vehicles, off-highway motorcycles and snowmobiles, have been effectively banned due to the Consumer Product Safety Commission's (CPSC) interpretation of the lead content provision. Although the Commission has issued a stay of enforcement through December of this year, permanent action to exclude these products from the CPSC's interpretation is sorely needed.

Under the CPSC's interpretation, engines, brakes, wheels and suspension parts would not receive an exemption from the CPSIA's lead testing provisions and must conform to the strict provisions included in the legislation. As I have expressed to the Commission and to my fellow Members of Congress before, it would be extremely difficult for children to physically handle these parts, many of which aren't easily accessible to even the most experienced mechanics. Quite simply, these parts should not be included in the CPSC's interpretation of the bill.

I have again introduced legislation this Congress, H.R. 412, to exempt youth-model off-road vehicles from the CPSIA and I ask the Committee to include its language in any efforts to reform and improve the CPSIA. A full categorical exemption is the best way to clarify Congressional intent and ensure that children have access to the properly-sized vehicles that will keep them safe. This issue is of utmost importance to outdoor enthusiasts and small business owners across the country that base their livelihood on the sale of youth products.

I appreciate your attention to this issue and please do not hesitate to let me know if I can be of any assistance moving forward.

Subcommittee on Commerce, Manufacturing, and Trade
"A Review of CPSIA and CPSC Resources"
February 17, 2011

Responses of Chairman Inez M. Tenenbaum to Questions for the Record

Questions from the Honorable Mary Bono Mack

1. **On what date did the "soft launch" of CPSC's complaint database begin?**

   The soft launch began on January 24, 2011.

2. **Have all product safety complaints coming to the Commission since that day been processed as part of the "soft launch"? If not, how many have been processed as part of the soft launch?**

   All potentially eligible reports were processed as part of the soft launch. Reports originating through certain sources—news reports, death certificates, and incidents reported to CPSC under Section 15(b) of the CPSA, Section 102 of the CSPA, or reported through CPSC's voluntary retailer/manufacturer reporting program—are ineligible for the public database and were not considered for inclusion. From January 24, 2011, through March 8, 2011, 2,656 potentially eligible reports were received through soft launch.

3. **Of all the complaints received by the Commission since the start of the soft launch:**

   a. **How many provided enough information to qualify as a "report of harm" under the Commission's rule?**

      One thousand sixty-three of the reports received between January 24, 2011, and March 8, 2011, have qualified as "reports of harm." Most reports received by mail, phone, and fax have not included consent and verification and have had to be returned to the submitter so they may indicate his or her consent preferences and verify the accuracy of the information in the report. The number of qualifying reports from this time period will therefore likely increase over time as consent forms are returned.

   b. **How many were submitted by consumers who actually used the product that was the subject of the "report of harm"? Who else has submitted complaints?**

      We collect the category of the submitter (consumer, local, state, or federal government agency, health care professional, child service provider, or public safety entity) and, on some reports, the submitter has identified the relationship of the submitter to the victim. Relationship is not a required field, however, and is

only collected on reports where the category of submitter is "consumer" and the submitter indicates that there was an incident. We do not collect information on whether the submitter actually used the product. The two tables below show the distribution of category of submitter and of the relationship of the submitter to the victim. Each table includes a second dimension that shows whether or not the report qualifies as a report of harm. Reports for which we do not yet have verification and/or consent preferences are designated in the tables below as "awaiting consent."

Qualified as Report of Harm by Category of Submitter
Received January 24, 2011, through March 8, 2011

	Child Service Provider	Consumer	Federal Government Agency	Health Care Professional	Local Government Agency	Medical Examiner and Coroner	Public Safety Entity	State Government Agency	Unspecified	Total
Yes	2	1042	2	0	6	3	8	0	0	1063
No	1	193	0	1	5	41	5	7	0	253
Awaiting Consent	1	435	5	0	10	838	34	12	5	1340
Total	4	1670	7	1	21	882	47	19	5	2656

Qualified as Report of Harm by Relationship of Submitter to Victim
where Category of Submitter is Consumer
Received January 24, 2011, through March 8, 2011

	Self	Family	Friend, Neighbor, Coworker	Professional Relationship	No Relationship	Unspecified	Total
Yes	306	191	5	4	1	535	1042
No	48	27	3	0	0	115	193
Awaiting Consent	86	50	1	1	5	292	435
Total	440	268	9	5	6	942	1670

c. How many of the complaints included model number(s)?

Nine hundred fifty-six of the reports that qualified as reports of harm contained an input in the model field. Among all potentially eligible reports, 1,430 reports contained an input in the model field.

4. Of the complaints that qualified as "reports of harm," how many were transmitted to the product manufacturer within five business days?

Of the 1,063 reports received between January 24, 2011 and March 8, 2011, that have qualified as reports of harm, 1,004 reports were forwarded to manufacturers and 59 reports were under review. Of the 1,004 reports forwarded, 759 reports were forwarded within five days after the report was determined to be a qualified report of harm and 245

reports were forwarded more than five days after the report was determined to be a qualified report of harm.

During soft launch the processing of some reports was somewhat slower than current processing speeds due to continued system testing and staff adjustment to the review process. Since then processing speeds have improved substantially, which was one of the purposes of the soft launch.

5. Of the "reports of harm" that were transmitted to a product manufacturer:

a. How many were sent to a manufacturer who had preregistered with the Commission?

Through March 8, 2011, CPSC notified businesses of 696 reports of harm that were eligible for the database. Of these, 529 were delivered to registered businesses through CPSC's business portal.

b. How many elicited comments to the Commission from the product manufacturer within ten business days?

Through March 8, 2011, 158 general comments were received through CPSC's business portal in response to the 1,004 reports of harm transmitted to businesses. Of these, 143 were received within 10 business days. Approximately 30 additional general comments were received by email, fax, or postal mail.

c. How many provided the product manufacturer with the contact information for the complainant?

Eight hundred thirty-seven of the 1,004 reports of harm were provided to businesses with the submitter's contact information.

6. Of the "reports of harm" to which manufacturers responded:

a. How many did the manufacturer claim were "materially inaccurate" in some way?

Through March 8, 2011, CPSC received 12 claims of materially inaccurate information.

b. How many did the manufacturer claim contained confidential business information?

Through March 8, 2011, CPSC had not received any claims of confidential information.

7. **Of the reports of harm as to which a manufacturer claimed some "material inaccuracy," how many were investigated by the Commission? Please provide the date the investigation was opened, the date it was completed and the resolution of the investigation.**

Investigations Related To Materially Inaccurate Information Claims

From January 24, 2011, through March 8, 2011, we received 12 claims of materially inaccurate information through the business portal on SaferProducts.gov. All of these claims have been reviewed and resolved. Nine of these claims alleged that the wrong manufacturer or private labeler was identified in the report of harm. After investigation, all nine of these claims were accepted by the CPSC staff and any erroneous information was corrected. We do not track a date when an investigation begins. We track the date a claim is filed and the date the claim is resolved, meaning the CPSC notified the manufacturer of its determination on the claim. For a claim involving a wrong manufacturer, the investigation generally consists of verifying the manufacturer's claim, primarily using an internet search. Once staff reviews the claim, it can typically be quickly resolved in approximately 15 minutes. Thus, for the nine wrong manufacturer claims received, all but one were resolved in two business days or less, as shown below.

Wrong Manufacturer Claims

Number of Wrong Manufacturer Claims	Number of Business Days to Resolve

4	1
2	2
1	4

Wrong Manufacturer Claims

	Date Manufacturer Submitted Claim	Date CPSC Resolved
1	2/2/2011	2/4/2011
2	2/8/2011	2/9/2011
3	2/11/2011	2/17/2011
4	2/22/2011	2/24/2011
5	2/24/2011	2/25/2011
6	2/25/2011	2/28/2011
7	2/28/2011	3/1/2011
8	3/3/2011	3/3/2011
9	3/3/2011	3/3/2011

Three claims alleged that information in a report was materially inaccurate, other than the identification of a manufacture or private labeler. Pursuant to the final rule, the burden of proof is on the firm alleging that a material inaccuracy exists. Claimants are expected to provide CPSC with sufficient information for us to make a determination on its claim.

After investigation, the CPSC determined that one claimant failed to meet its burden of proof to demonstrate that a report contained materially inaccurate information. Two reports were determined to contain at least one piece of information that met the definition of materially inaccurate information. With regard to the first report, a model number was corrected. In the second instance, the spelling of the name of the product was corrected. The length of an investigation depends on the amount of information provided. Where a firm has not met its burden of proof, or has offered little or no information for review or consideration, the CPSC's review does not take long to complete.

8. Of all the reports of harm submitted to CPSC during the soft launch, how many were investigated by the Commission?

Through March 8, 2011, 113 of the reports that qualify as reports of harm have been assigned for investigation by CPSC field staff and 198 of all potentially eligible reports have been assigned for investigation.

9. Is the Commission aware of any cases, either before or after the date of the soft launch, in which fraudulent complaints were filed with the Commission? Is the Commission aware of any cases in which a particular type of consumer product was the subject of two or more fraudulent complaints? Has the Commission pursued sanctions in any of these cases?

CPSC staff is aware of one instance of false data submitted in a report late last year. This submission, however, was not provided through the public database report process, which did not begin soft launch until January 24, 2011. Staff investigated the report in a timely manner, found evidence and information that the report was fabricated and forwarded it

to CPSC's legal team for review and possible action. As of this date, the case remains open and is under active investigation.

10. Approximately how many product safety complaints is the Commission staff able to investigate each year? For complaints that are investigated, what is the average time from when the complaint is filed with the Commission to when the investigation is complete?

Current staffing levels permit approximately 5,000 in-depth investigations per year. The elapsed time between complaint filing and completion of the investigation varies greatly depending on the urgency of the investigation, the complexity of the product, and any specific testing that may be required as part of the investigation. The average time elapsed between assignment of an investigation and completion in fiscal year (FY) 2010 was 43 days.

11. Does CPSC intend to allow information on the database to be downloaded without a disclaimer as to its accuracy? When CPSC determines that information previously included in the database is "materially inaccurate," how will it notify parties who have previously downloaded the inaccurate information?

No. To date, the CPSC has not provided a means for downloading data from SaferProducts.gov, because no reports have been posted yet. When the database has been populated with reports of harm, the CPSC intends to provide a means to download information. Information downloaded from the database will contain the statutorily required disclaimer as the first piece of information in every data file. However, CPSC cannot guarantee, nor does the statute require, that users and aggregators of this information retain this disclaimer.

Additionally, the database is a dynamic computer system. Information may change because a report is found to be materially inaccurate, or because the consumer revised his or her report to include additional information. Users that download this data must be mindful to update data on occasion, to ensure that corrected information is captured.

12. What obstacles (other than staff resources) does the Commission face to completing investigations more quickly?

Prior to the completion of Phase I of the Information Technology (IT) modernization, most of the CPSC's business processes used many small, disconnected information systems. Commission staff were unable to efficiently and effectively pull together required data because of these "stove piped" systems. Staff stored and manually maintained too much critical information outside of the legacy systems—a situation that places an unwarranted dependency on a small number of key program area staff with expert knowledge in a particular field and supporting data.

We needed to improve our business processes and the Commission's IT systems needed to support those improvements. These improvements are intended to eliminate manual

processes and tedious status reporting and expedite hazard identification and related management decision making. The IT modernization component of CPSIA Section 6A is designed to make these improvements.

13. Please provide an explanation of the $3 million figure cited by Chairman Tenenbaum as the cost of the public database. What is included in the cost? Was that estimate previously provided to Congress or to the other Commissioners?

Since the beginning of the statutorily mandated Consumer Product Safety Risk Management System (CPSRMS) project in FY 2009, the CPSRMS cost has been included in the CPSC's annual budget, which is presented to and voted on by the Commission. The budget is also presented to the Office of Management and Budget (OMB) and to the Congress. Starting in September 2009, Commission staff have published an OMB Exhibit 300 including a summary of historical, current, and planned expenses for the CPSRMS program. An example can be found at: http://www.cpsc.gov/CPSCPUB/PUBS/REPORTS/cpsrms.pdf.

However, in presenting its budget and in the OMB Exhibit 300, the Commission did not separate the cost of the public database from the overall CPSRMS information technology modernization costs.

Below is an estimate of the work done within the CPSRMS project to develop the public database. This estimate was established in hindsight according to the scope of the public database.

Portion of the Consumer Product Safety Risk Management System Costs Dedicated to the Public Database

	FY 2009	FY 2010	FY 2011	FY 2012	FY 2013	**Total**
Development	$1.450	$1.000				**$2.450**
Operations and Maintenance		$0.400	$0.050	$0.050	$0.050	**$0.550**
Total	**$1.450**	**$1.400**	**$0.050**	**$0.050**	**$0.050**	**$3.000**

Please note that the costs (in millions) above include contracted goods and services by fiscal year. Costs in fiscal years 2009 and 2010 are based on actual obligations. Costs in fiscal years 2012 and 2013 are for planning purposes. Costs in fiscal year 2011, while currently under continuing resolution, are a combination of actual obligations and are for planning purposes.

Since December 2010, Commissioners Alder, Nord, and Northup have received briefings regarding CPSRMS costs, per their request.

14. Please provide an estimate of the cost to operate the database for one year. Please provide an estimate of the costs incurred by manufacturers in responding to reports of harm during the soft launch.

As noted in the chart above, the CPSC's operations and maintenance costs specific to the CPSIA Section 6A public database requirements are FY 2010: $400,000, FY 2011: $50,000, FY 2011: $50,000, FY 2012: $50,000, and FY 2013: $50,000.

With regard to the cost that may have been incurred by manufactures during soft launch this would have depended on the behavior of an individual manufacturer.

15. Lead limits—Books

a. You have indicated that you favor an exemption from the lead limits for ordinary children's books. In your view, what is the rationale for such an exemption?

Modern books are typically made of materials known to not contain lead at levels that exceed the limits required by law, such as paper products and four-color process (i.e., CMYK) inks. In the Statement of Managers Accompanying P.L. 111-117, the Conferees noted their belief that the CPSIA may not have been intended to subject ordinary children's books to the section 101(a) lead content limits. In response, the Commission unanimously stated in its Janaury 15, 2010, Report to Congress Pursuant to the Statement of Managers Accompanying P.L. 111-117 (hereinafter "Report to Congress") that "Congress may, with some limitations, choose to consider granting an exclusion for ordinary children's books and other children's paper-based printed materials."

b. In your conception, would an exemption for books also cover older books, such as those loaned by public libraries or sold by used book stores?

Ordinary children's books should include the same materials as described in part a. of this question and therefore Congress may, with some limitations, choose to consider granting an exclusion. In the past (i.e., prior to the early 1980s), inks containing lead were sometimes used for certain colors in children's books. However, many of these books (pre-1985) are generally considered "vintage" or "collectible" books, and as such would not be intended primarily for use by children.

c. Should the exemption cover other printed materials?

The Commission unanimously stated in its Report to Congress that Congress may, with some limitations, choose to consider granting an exclusion for other children's paper-based printed materials.

d. Would the rationale for books extend to other types of products?

Products that are exclusively made of the material determined to not contain lead pursuant to the Commission's August 26, 2009, lead determinations rule (74 Fed. Reg. 43,031), and are otherwise unaltered, could be exempted. Also, as stated in the Report to Congress, I believe we could more effectively implement section 101(a) if we were allowed some additional flexibility in granting exclusions from the section 101(a) lead limits.

16. Lead limits—Electronics Policy

a. CPSIA authorized you to set less stringent lead limits for certain electronics parts. You have exercised that authority to set such limits for various metals, adopting limits that are the same as, or similar to, those allowed in the European Union. In the EU, however, these more relaxed limits apply to metals whether used in electronics or in other types of consumer products. Would you favor a change to the law that gives the Commission the discretion to extend the exemptions granted for metals used in electronics to cover those same metals when used in other types of children's products? If not, what justification is there for giving electronics exceptional treatment?

If the Commission were to have some additional discretion to extend exemptions from the lead content limits, we would be able to exclude products such as ATVs and bicycles and other children's products where it is generally not practicable or technologically feasible to remove the lead, the products are not mouthed or swallowed, and granting such an exemption would present a very low likelihood of exposure.

A similar approach was taken by staff in the Janaury 20, 2010, final rule for the exemption of certain electronic devices from the section 101(a) lead limits in the CPSIA. (75 Fed. Reg. 3154) This rule, which was based on the specific criteria in section 104(b)(4) of the CPSIA provided for exemptions from the lead limits "for a limited number of components of electronic devices that must be manufactured using lead" and where "staff determined that it [was] not technologically feasible for certain components in electronic devices to meet the lead content limits under the CPSIA because the presence of the lead [was] necessary for proper functioning of certain component parts in electronic devices." In addition, staff's review showed that "lead containing components that [were] exempted are components that one would not expect children to mouth, swallow, or handle for significaot periods under normal and reasonably foreseeable conditions."

b. Did the Commission, in establishing the more relaxed limits for certain metals used in electronics, perform any testing to determine how much lead a child might, be exposed to from these products?

We based our limits on the statutory criteria set forth in section 101(b)(4) of the CPSIA, EU directives, and review of the types of products or component parts which were accessible that might be subject to the alternate limits, such as headphone jacks and electrical plugs. We also assessed whether a child would have extensive contact with such parts based on staff's previous experience testing products made of varying materials, which showed that "the [exempted] lead containing components . . . are components that one would not expect children to mouth, swallow, or handle for significant periods under normal and reasonably foreseeable conditions."

c. How variable is the lead content of metals, particularly metals that are commonly or repeatedly recycled, such as aluminum? Can manufacturers predict the highest lead level likely to be reached in a particular grade of metal, even if the usual level is much lower?

According to CPSC staff, for some alloys, the maximum level of lead can be specified when placing the order for the alloy desired. As with any material or process, manufacturers must be mindful of the requirements and choose materials and suppliers carefully.

There are some steel alloys (e.g., free machining 12L14 steel and leaded hardenable alloy 41L40 steel), aluminum alloys (e.g., AA 2011), and brasses (e.g., C30000 wrought copper alloys) that have intentionally added amounts of lead for chip breaking and improved tool wear during machining and surface finishing of parts. Uses for the inclusion of lead are: machinability, surface finish, screw machines, and lubrication/bearings.

The American Iron and Steel Institute has provided CPSC with written comments that steel alloys with lead levels below 100 ppm are technologically feasible for both virgin and recycled steel because the high temperatures necessary during the melting of steel tends to vaporize any lead in the molten steel. Furthermore, customers can specify that a specific low lead level when ordering a steel alloy, and it will be met for that order.

Aluminum alloys do not normally contain lead. Lead content should be minimal from recycled sources. There is one wrought aluminum alloy 2011 that purposely contains lead for machinability and strength. Cast aluminum series 2xx.x Al-Cu, and 3xx.x Al-Si-Cu and/or Mg for gasoline engine cylinder heads and pistons generally do not contain lead.

Zinc alloys (Special High Grade) used for zinc die-castings should have a lead content below 30 ppm, while other zinc alloys permit a higher amount. For example, Prime Western Grade allows a maximum of 14000 ppm lead and High Grade allows a maximum of 300 ppm.

Copper alloys consist of brass, which is copper alloyed with zinc, and bronze, which is copper alloyed with tin, (although many copper-zinc alloys are referred to as bronzes). Brass alloys such as C68010 brass contain less than 100 ppm lead. There are many copper alloys where lead is intentionally added (up to 6 percent by weight) for machinability and surface finish. Lead can be an impurity in reported concentrations of 500 ppm to 700 ppm to 1500 ppm.

Tin and alloys with tin are also used in consumer products. There are only a few applications where unalloyed tin is used. Tin is used in tin-coated steel for tin cans, leaded and lead-free solders, modern pewter without lead, and copper-tin true bronzes.

17. Lead limits—Common Toy Box. CPSIA defines the term "children's product" to include products intended for children as old as 12. The justification for this age stems, in part, from the concern that younger children, who are more likely to put things in their mouth, may have access to toys and other products that belong to older children.

a. Has the Commission conducted or sponsored any research to determine how much mouthing of products children do at different ages? If so, please provide appropriate documents.

As part of its evaluation of phthalates in polyvinyl chloride, especially diisononyl phthalate (DINP), CPSC staff undertook an extensive observational study of several hundred children under age six years. A report of this study, "A mouthing observation study of children under 6 years," written by CPSC staff and dated November 2001 is available as Tab F in the staff briefing package for Petition HP 99-1 Requesting Ban of Use of PVC in Products - Intended for Children Five Years of Age, available at:
http://www.cpsc.gov/library/foia/foia02/brief/briefing.html.
http://www.cpsc.gov/LIBRARY/FOIA/FOIA02/brief/Fiveyearpt1.pdf
http://www.cpsc.gov/LIBRARY/FOIA/FOIA02/brief/Fiveyearpt2.pdf

Prior to the extensive observational study, staff also conducted a pilot study of 80 children between one and eight years of age in child care and school environments. A copy of that study is included separate from these responses.

b. What data were used to justify the age limits applicable to the Commission's "small parts" ban? Do those age limits remain appropriate in your view?

The small parts rule was developed using CPSC's National Electronic Injury Surveillance System (NEISS) estimates, death certificate review, and accident and injury data. The CPSC staff compiled data from its own files and from those of an independent death certificate and injury report on toys. There has not been a formal study to indicate that the age limits are not appropriate.

The method for identifying toys and other articles intended for use by children under three years of age that present choking, aspiration, or ingestion hazards because of small parts, was finalized June 15, 1979, and went into effect January 1, 1980.

c. **For some types of products, the "common toy box" justification might be inapplicable. For example, it may be that infants and toddlers would have no opportunity to mouth educational products that are used in school classrooms, particularly more expensive products like musical instruments, specialty products that are intended for children with special needs, or sophisticated scientific instruments such as telescopes or microscopes that are often kept under lock and key. Similarly, such young children would rarely have an opportunity to mouth products that are kept in garages or out of doors such as all-terrain vehicles, bicycles, snowmobiles, and the like. Would you favor granting the Commission flexibility to treat these products differently from toys for purposes of the lead limits?**

As the Commission noted in its January 15, 2010, Report to Congress, additional flexibility is appropriate for some products, such as youth all-terrian vehicles (ATVs) and bicycles, and similar outdoor products where it is generally not practicable or technologically feasible to remove the lead, the products are not mouthed or swallowed, and granting such an exemption would present a very low likelihood of exposure.

18. Retroactivity.

a. **The Commission unanimously recommended treating the 100 ppm limit as prospective only. This would be helpful to many retailers who otherwise might have to destroy inventory again this summer (as many did before when the lead limit dropped from 600 ppm to 300 ppm). It would be of little help, however, to sellers of second-hand children's products that were not subject to any lead limits when made. Would you favor legislative changes that provide greater flexibility to such resellers?**

With regard to some products, additional flexibility may be helpful. For other products, such as children's metal jewelry, painted children's toys, and vinyl plastic products, flexibility may pose a potential health risk. Additionally, the Commission should retain the ability to designate additional products where there may be a potential health risk and retroactive application of a specific standard may be appropriate.

h. **The new crib standard essentially bans traditional drop-side cribs, which have been the subject of many recalls over the last few years. Why should child-care facilities that have purchased cribs without drop sides have to throw them away at this point even if they have never been the subject of an**

investigation, let alone a recall? Would you favor legislative changes that grant the CPSC additional flexibility in this regard?

Upon taking over as Chairman of the Commission, I observed that there was an alarming pattern of failures of crib hardware and component parts, particularly related to drop-side cribs. The situation required meaningful short-term and long-term strategies to address this trend. According to our data, between November 2007 and April 2010, there were 36 deaths associated with crib structural problems. Thirty-five of those fatalities occurred when crib components detached, disengaged, or broke, ending in unspeakable tragedy.

Combined with our sustained and ongoing efforts to rid the marketplace of older, defective cribs, the development and passage of new mandatory crib standards is part of our responsible and holistic approach to giving consumers increased confidence in the safety of their cribs. This includes older cribs that may not have a drop-side, but may have other hardware issues and have not been tested to current standards.

I deeply appreciate the impact of this rule on smaller entities, particularly child care facilities and places of public accommodation. To address this concern and better ensure widespread availability of compliant cribs and an orderly and successful transition to the use of compliant cribs by child care providers and places of public accommodation, the Commission has adopted a two-step phase in of the rule. First, for all manufacturers, distributors, and retailers of full-size and non-full-size cribs, the final rule will become effective June 29, 2011. Second, child care centers, family child care homes, and places of public accommodation with then have an additional 18 months to comply (December 28, 2012).

This will ensure that all infants and toddlers in child-care facilities will have the safest possible sleep environment that is free of both drop sides and other potentially dangerous hardware and component parts not tested to new, protective standards.

19. Budget.

a. **Please provide a breakdown, by office and division, of CPSC staff at the time you were confirmed as Chairman and as of February 17, 2011.**

CPSC Staff Employment on June 26, 2009 and February 2, 2011

CPSC Office	Employment 6/27/2009	2/12/2011
Commissioners	10	21
Congressional Relations	0	3
General Counsel	27	39
Inspector General	5	6
Equal Employment Opportunity	2	2
Executive Director	4	3
International Programs and Intergovernmental Affairs	4	6
Human Resources	10	12
Information Technology Services	56	63
Financial Management	28	29
Information and Public Affairs	8	11
Compliance	156	183
Hazard Identification and Reduction	141	161
Total	**451**	**539**

Note: The new office of Education, Global Outreach, and Small Business Ombudsman is in the process of being established and is not included above.

b. What was the total cost of developing CPSC's new Strategic Plan? Is any additional outside work being contemplated in this area?

The total outside cost for the overall Strategic Plan and Operational Review contract with Booz Allen Hamilton, Inc. was $1,896,236.

Below is a breakdown of the costs contained within the contract.

Environmental Scan	$408,178
Strategic Plan	$773,067
Operational Review	$714,991

At this time we do not expect any additional outside work being performed in this area.

c. When do you estimate the Commission staff will be able to occupy the new laboratory?

We project to occupy the new laboratory in May 2011.

20. Cadmium. Some media, in reporting on cadmium levels in consumer products, have stated that cadmium is a human carcinogen. Is CPSC aware of any scientific evidence indicating that ingestion of cadmium (as opposed to inhalation) will cause cancer in humans?

At this time there is insufficient evidence to conclude whether cadmium is a human carcinogen through the oral route of exposure (ingestion).

21. CPSIA created new exceptions to section 6(b) of the Consumer Product Safety Act, including an exception that would permit public disclosure of consumer products that are stopped at the ports on the grounds that they violate a CPSC mandatory standard or ban. Do you believe this information would be useful to the public?

Yes. The disclosure of violative products stopped at ports may be beneficial to both consumers and industry.

22. Has the Commission made any determinations as to which State toy standards are exempt from preemption under CPSIA section 106(h)(2)?

Section 106(h)(2) of the Consumer Product Safety Improvement Act of 2008 (CPSIA) allows states or political subdivisions of a state to continue in effect a safety requirement applicable to a toy or other children's product that is designed to deal with the same risk of injury as ASTM F963, "Consumer Safety Specifications for Toy Safety," if those state requirements were in effect on August 13, 2008, as long as the state or political subdivision has filed the applicable requirements with the Commission within 90 days after the CPSIA's enactment and in such form and in such manner as the Commission may require.

The Commission has prescribed the form and manner for submission of state laws on its website. Arizona, California, Illinois, and New York submitted laws that they asserted were designed to deal with the same risk of injury as ASTM F963. Section 106(h)(2) of the CPSIA does not require the Commission to take further action on the state or political subdivision submissions received (in contrast to section 106(h)(1) of the CPSIA, which requires the Commission, after notice and opportunity for oral presentation of views, to consider a rulemaking to exempt any proposed safety standard or regulation). Therefore, no further action by the Commission is pending on the state submissions.

23. What CPSC standards, bans or similar rules would potentially apply to a cloth poncho made for young children? What other statutory requirements might apply? What standards, bans, rules or statutory requirements would potentially apply to a poncho made for a child's doll?

Poncho: The applicable standard is 16 CFR 1610, Standard for the Flammability of Clothing Textiles. Depending on the cloth and any embellishments or color treatment, it may need to be tested for lead content or lead in surface coatings, require tracking information, and certification to the applicable standards based on testing by a third-party accredited laboratory.

Doll clothes poncho: The poncho would probably not have an age grade on it if it were sold separately from a doll. Any embellishments on the poncho would be subject to

assessment to the small parts requirement, 16 CFR 1501, for purposes of the choking warnings at 16 CFR 1500.19 (some dolls are for children under three and some are for children from three through six or older). The poncho would be subject to 16 CFR 1610 because of the requirement in the toy standard for toy textiles to meet the flammability requirement and would require tracking information. Depending on the product used to color the fabric, it may require third-party testing and certification as to lead content and lead in surface coating requirements.

Questions from the Honorable G.K. Butterfield

1. **The Consumer Product Safety Improvement Act (CPSIA) directs the Consumer Product Safety Commission (CPSC) to establish and maintain a publicly available database on the safety of consumer products that contains reports of harm from five different categories of reporters, including "consumers" and "public safety entities." The statute does not define those terms, nor does it impose any requirements regarding the relationship of the reporter to the harmful event.**

   CPSC in its final rule establishing the database defines "consumers" to include "users of consumer products, family members, relatives, parents, guardians, friends, attorneys, investigators, professional engineers, agents of a user of a consumer product, and observers of the consumer products being used. The final rule defines "public safety entities" to include "police, fire, ambulance, emergency medical services, federal, state, and local law enforcement entities, and other public safety officials and professionals, including consumer advocates or individuals who work for nongovernmental organizations, consumer advocacy organizations, and trade associations, so long as they have a public safety purpose."

   a. **Please explain why the CPSC believes it is important, and a faithful interpretation of the CPSIA, to allow a broad range of consumers and public safety entities to submit reports for the database, including those who may not have directly witnessed the harmful event.**

      The Commission determined that a broad interpretation best effectuates Congress' intention that the Commission receives reports regarding useful and reliable information about product safety incidents from a wide-range of submitters. The Commission requires all reports to contain eight data sets to ensure reports contain enough information to be helpful to other consumers. In addition, the required data sets require contact information for the submitter, as well as verification that information provided is true and accurate to the best of the submitter's "knowledge, information, and belief." If intentionally fraudulent reports are detected, the Commission has also indicated that it will take all appropriate action against a party filing such a report, including possible referral to the U.S. Department of Justice for legal action.

   b. **Is the CPSC aware of any attorney or consumer advocate knowingly submitting false or inaccurate information to the CPSC's existing incident reporting website or hotline?**

      No. If we were to discover an attorney, a consumer advocate, or anyone else who knowingly provided false information in a report or in a manufacturer comment, we would not only address any materially inaccurate information contained in the database, but also, where circumstances warranted, would seek legal remedies against those involved.

2. **The CPSIA lays out a specific timeframe for the publication of reports of harm and processes to prevent publication of or provide for removal of materially inaccurate information in the database. The statute requires the CPSC to transmit a report of harm to the relevant manufacturer no later than 5 business days after receiving it. The manufacturer is then given the opportunity to provide comments for publication with the report of harm and to contest information therein on the ground that it is materially inaccurate. The statute requires the CPSC to publish the report of harm no later than 10 business days after transmission of the report to the manufacturer.**

   a. **Do you believe requiring resolution of all material inaccuracy claims before publication of reports of harm would affect the usefulness of the database to consumers, including negatively impacting the availability of useful information in a timely manner? Please explain.**

      Yes. To do so would undermine Congress' overall intent behind the creation of the database, which was to provide a faster and freer flow of safety information to consumers than permitted by other provisions of the CPSA. Accordingly, the rules for the database were carefully crafted within the confines of the law to strike a fair balance for all parties in the interests of ensuring consumers have access to this information in a timely manner.

      The result is a balanced approach that will allow for the correction of faulty information and will not require the Commission to withhold reports from the public until vetted to perfection. Requiring resolution of all material inaccuracy claims before publication could result in substantial delays in the sharing of reports of harm—thereby potentially placing the public at serious risk of injury, illness, or death.

   b. **Do you believe requiring resolution of all material inaccuracy claims before publication of reports of harm would drain CPSC time and other resources? Please explain.**

      It might if there were an increase in materially inaccurate information claims, especially if made for the purpose of delaying publication of consumer incident reports.

   c. **Do you believe requiring resolution of all material inaccuracy claims before publication of reports of harm would create an incentive for manufacturers to contest a greater number of reports of harm than would otherwise be contested?**

      It is hard to predict the impact that such a change would have. It is my hope that responsible manufacturers would not file claims simply to delay publication of reports of harm but that certainly is a possibility.

3. **The CPSC has stayed enforcement of the third-party testing requirements for lead content, phthalates content, and ASTM F-963. However, some children's products are already required to undergo third-party testing due to other applicable safety standards of the CPSC. These include, among others: painted children's products manufactured after August 19, 2009 for the 90 ppm limit for lead in paint; pacifiers manufactured after January 20, 2009; metal components of children's metal jewelry manufactured after March 23, 2009; bicycle helmets, bunk beds, and rattles manufactured after February 10, 2010; and bicycles manufactured after August 14, 2010, with regard to certain design elements.**

   a. **Please explain any issues or challenges that manufacturers of children's products already subject to third-party testing requirements have encountered in complying with this requirement?**

      The major potential challenges faced by manufacturers of children's products subject to third-party testing requirements likely include conveniently locating and establishing business relationships with CPSC-recognized testing laboratories, increased testing-related expenses, and laboratory testing lead times.

   b. **Is the CPSC aware of any disruptions in the market for children's products already subject to third-party testing that are related to this requirement?**

      Although there is a stay of enforcement of the lead content and third-party testing requirements for youth ATVs, there have been claims of some disruption in the youth ATV market by certain trade associations due to manufacturer, importer, and dealer concern about these requirements.

      The Motorcycle Industry Council (MIC) and the Specialty Vehicle Industry Association (SVIA) have stated to Commission staff that youth ATVs have been and continue to be withheld from the market due to concerns about meeting the lead content requirements.

      Chinese manufacturers of ATVs have indicated to CPSC staff that imports of ATVs to the United States dropped sharply in 2009. CPSC, however, has not verified data indicating whether this drop was directly correlated with lead content requirements or larger macroeconomic concerns.

   c. **Is the CPSC aware of any negative impacts to manufacturers of children's products already subject to third-party testing requirements that are related to this requirement?**

      CPSC has no data on possible negative impacts to manufacturers of children's products subject to third-party testing requirements. However, it is likely that many have experienced an increase in testing-related expenses.

4. **Manufacturers of children's products already subject to third-party testing must also satisfy the requirement for continuing compliance and testing despite the so-called "15 Month Rule" not yet being finalized.**

    a. **Please explain how manufacturers of children's products already subject to third-party testing are able to meet the requirement for continuing compliance and testing without the final 15 Month Rule?**

    Until the Commission approves a final rule on testing and labeling, there is no requirement for manufacturers of children's products to conduct additional testing to ensure continued compliance with the applicable children's product safety standards, outside of any testing they may conduct in their normal course of business to ensure their products comply with all applicable U.S. laws and regulations.

    b. **Do you believe it is possible for manufacturers of children's products who would be subject to third-party testing for lead content to begin testing and satisfy the requirement for continuing compliance and testing without the final "15 Month Rule"?**

    As mentioned, until the Commission approves a final rule on testing and labeling, there is no requirement for manufacturers of children's products to conduct additional testing. However, manufacturers are expected to ensure compliance with all applicable laws and regulations.

5. **The CPSIA phases in increasingly stringent lead content limits for children's products. The last congressionally-mandated lead content limit is set at 100 parts per million and takes effect this August. The statute, however, also provides that if the CPSC determines that it is not technologically feasible "for a product or product category" to meet that limit, it can set the lowest limit below 300 ppm that is feasible for that "product or product category."**

    CPSC last July requested comments and information related to this determination. The notice directed that the comments address a "product or *material*." The notice for the February 16, 2011, public hearing on this issue again specifically asked for information about the sourcing and extent to which lead is found in *materials*.

    In 2009, CPSC exercised its general authority to issue regulations as necessary to implement the CPSIA to exempt from the lead limits and third-party testing - requirement certain materials such as wood and cotton that have inherently low levels of lead.

    a. **Is the CPSC now considering, under its authority to make a technological feasibility determination for a product or product category, a blanket waiver from the 100 ppm lead content limit for all products with materials such as "metal, glass, or ceramics"? If so, can you explain how the CPSC is taking**

into consideration safe and unsafe uses of those materials in children's products?

CPSC is gathering as much information as possible to determine what type of determination is required to limit any undue stress to manufacturers while supporting the intent of the statute.

CPSC is considering the question of technological feasibility and commercial availability of products and materials with respect to the 100 ppm limit, as well as the health implications to children who might use products with lead content less than 300 ppm but more than 100 ppm.

b. Do you believe that granting a blanket waiver from the 100 ppm lead content limit for all products with materials such as metal, glass, or ceramics would remove the incentive underlying the statutory lead content limits for manufacturers to move away from lead-containing materials and toward lower-lead or no-lead alternatives?

Not necessarily, but we are carefully studying any potential impact. Manufacturers of children's products now are required to meet the 300 ppm lead content levels for products with materials such as metal, glass, or ceramics. The lead limit is already at a level where it is unlikely that lead is deliberately being added to any materials or to the manufacturing process. Accordingly, the incentive underlying the move away from lead-containing materials and toward lower-lead or no-lead alternatives does exist now.

The Commission held a hearing on February 16, 2011, to evaluate whether there is any product or product categories for which it is not technologically feasible to meet the 100 ppm lead content limit. At the hearing, several laboratories indicated that a high percentage of children's products tested are in compliance with the 100 ppm lead content limit. However, several manufacturers indicated that testing results are not always consistent due to material variability. We are still reviewing the hearing record.

6. The drafters of the CPSIA intended that the feasibility determination allowing a product or product category to exceed the 100 ppm limit be made on a case-by-case basis at the request of the manufacturer. The burden was not supposed to be on CPSC to go out and find those products eligible for the exception.

a. Has the CPSC put a petition process in place for manufacturers to seek a feasibility determination? If not, does it intend to put such a process in place? When?

While the Commission has set forth procedures and requirements for making determinations regarding lead content of materials or products under the Commission's regulations at 16 C.F.R. § 1500.89, those procedures are not

applicable to determinations on product or product categories that exceed the 100 ppm limit based on technological feasibility. The CPSC did not establish a petition process for individual manufacturers to seek product or product category-specific determination because there was insufficient time under the statute for the Commission to make such case-by-case determinations.

Unlike the procedures for lead content determinations, which are made on an ongoing basis, section 101(a)(2)(C) of the CPSIA provides that the 100 ppm limit will go into effect automatically on August 14, 2011, unless the Commission, after notice and hearing, finds that such a limit is not technologically feasible.

The petition process is a lengthy one. Even if procedures had been in place, manufacturers would have to gather all of the relevant information and supporting documentation necessary for CPSC staff to evaluate each product and make a determination regarding that product prior to August 14, 2011. The Commission is then required to provide notice and hearing for each product or product category. Once a determination was made as to the technological feasibility of meeting the 100 ppm lead content limit for the product or product category, the Commission would then be required to, by regulation, impose an alternative lead limit by August 14, 2011. Given the amount of time it would take to engage in notice and hearing for each petition, and the subsequent length of time it would take to issue a final rule, it was not feasible for the Commission to issue these rulings on a case-by-case basis prior to August 14, 2011.

Moreover, section 101(e) of the CPSIA provides that the Commission may not delay the effective date of the limit related to technological feasibility during the pendency of a rulemaking. Thus, even if the Commission began a rulemaking proceeding, the limit would go into effect regardless of whether the rulemaking process was completed prior to August 14, 2011.

Accordingly, to ensure that all of the interested parties had a meaningful opportunity to present evidence and testimony for the record, the Commission held a hearing on February 16, 2011, to evaluate whether there is any product or product categories for which it is not technologically feasible to meet the 100ppm lead content limit. We are still reviewing the hearing record.

7. **The CPSC on August 26, 2009, issued a final rule that determined that most textiles made of natural and manufactured fibers do not exceed 2oy of the lead content limits in the CPSIA, and therefore do not need to be third-party tested for lead content. Specifically, the final rule stated the following textiles would not exceed the lead limits: "Textiles (excluding after-treatment applications, including screen prints, transfers, decals, or other prints) consisting of: (i) Natural fibers (dyed or undyed) including, but not limited to, cotton, kapok, flax, linen, jute, ramie, hemp, kenaf, bamboo, coir, sisal, silk, wool (sheep), alpaca, llama, goat (mohair, cashmere), rabbit (angora), camel, horse, yak, vicuna, qiviut, guanaco; (ii) Manufactured fibers**

(dyed or undyed) including, but not limited to, rayon, azlon, lyocell, acetate, triacetate, rubber, polyester, olefin, nylon, acrylic, modacrylic, aramid, spandex.

a. **If the fabric or thread used to make a cloth diaper consists of natural or manufactured fibers, does the fabric or thread need to be tested for lead?**

   No.

b. **If the fabric or thread used to make a poncho consists of natural or manufactured fibers, does the fabric or thread need to be tested for lead?**

   In general, no. As stated in the Commission's lead determinations order (74 Fed. Reg. 43,031), natural fibers and fabric made from those fibers that is dyed or undyed does not have to be tested for lead. Also, manufactured fibers and the fabrics made from those fibers are not required to be tested for lead. If the fabric is treated with an application, including a screen print, transfer, decal or other process it would no longer be excluded from testing as noted in the determination document. A poncho made from the above would fall under the same classifications. Therefore, unless the poncho was treated with an after treatment application that changes the condition of the fabric, it would not be subject to the lead testing and certification requirements.

c. **At least as early as 1993, plastic soda bottles have been recycled into material identified by clothing manufacturer as polar fleece. These plastic bottles are made almost exclusively from polyethylene terephthalate (PET); therefore polar fleece is made from PET. In addition, plastic bottles can be broken down by recyclers and re-fashioned into a wide range of goods, from playground equipment to toy telephones.**

   i. **Can you please tell me whether lead or lead compounds are used in the production of PET?**

      With respect to soda bottles or other product intended for use with foods, the use of lead and other chemicals is restricted by the U.S. Food and Drug Administration. For other types of products, lead compounds are sometimes used for color or other applications. Lead pigments, however, are not suitable for applications that require clarity or transparency, such as transparent bottles.

   ii. **Can you tell me if lead or lead compounds are introduced during the recycling of plastic bottles made from PET; either during the actual manufacturing process that turns the bottles into fibers or during the disposal process when the bottle is thrown into a recycling bin and combined with other items determined eligible to be recycled?**

To the best of our knowledge, no lead is used in recycling or processing of plastic bottles; the transfer from other possibly lead-containing comingled materials is expected to be minimal.

The most common polyester for fiber purposes is poly (ethylene terephthalate), or simply PET. Recycling PET bottles by remelting the PET and extruding it as PET fiber saves valuable petroleum raw materials, reduces energy consumption, and eliminates solid waste sent to landfills. Lead or lead compounds are not introduced during the process of converting bottle flakes to recycled polyester fiber. There could conceivably be trace amounts of lead, however, in the antimony catalyst used in the production of PET.

iii. Do you consider fibers made from recycled PET a manufactured fiber in the polyester family and therefore excluded from the third-party testing requirement for lead content?

Yes. The Federal Trade Commission defines polyester fiber as a manufactured fiber in which the fiber forming substance is any long-chain synthetic polymer composed of at least 85 percent by weight of an ester of a substituted aromatic carboxylic acid, including but not restricted to substituted terephthalic units, p(-R-O-CO-C_6H_4-CO-O-)$_x$ and parasubstituted hydroxy-benzoate units, p(-R-O-CO-C_6H_4-O-)$_x$. Polyester fiber made from recycled PET is polyester (PET) fiber.

iv. Does the fact that a manufactured fiber is made from recycled materials change CPSC's determination that the fiber will not exceed the lead limits and therefore be excluded from the third-party testing requirement for lead content? Did the CPSC consider the issue of recycling in its determination with respect manufactured fibers?

No. CPSC staff has not found information that indicates that fibers or fabrics made from recycled materials would contain lead above the lead limits. CPSC staff did not explicitly consider recycling, although it found no information that indicated that recycled materials should be considered separately from similar, non-recycled materials.

v. Is it correct that the CPSC is aware of children's products made from recycled plastic that exceed the lead content limits? Please provide examples and if so, can you identify whether those products contained PET?

The Commission's Division of Health Sciences is not aware of specific products that are made with recycled materials and that contain lead in excess of the lead content limits.

8. CPSIA's authorization levels have been followed up with increased appropriations for the agency, which have allowed the CPSC to increase its staffing levels. In particular, the CPSC has been able to increase the number of staff dedicated to screening consumer products at ports of entry and intercepting dangerous products before they hit store shelves. In 2008, CPSC had only 3 employees stationed at ports of entry. Today the number stands at 19 employees at 15 ports of entry.

This intervention strategy has led to some good progress toward stopping dangerous products at the border. However, Commissioner Northup in her testimony described the CPSC's efforts at the border as "extensive." I understand there are 327 official ports of entry in the United States. The CPSC has staff at 15 of them.

a. Can you provide information about the percentage of consumer products coming into the U.S. that get screened for compliance with CPSC safety standards?

The current 19 port inspectors stationed at ports with occasional support from CPSC field investigators are able to inspect approximately 7,000 products per year. Of those inspections, about 1,750 products are sampled from shipments that are held. However, this colocated staff covers only 15 or 4.6 percent of the 327 U.S. ports where goods enter commerce.

b. Do you consider CPSC's current efforts to stop dangerous products at the border "extensive"?

No. That said, the CPSC has attempted to maximize its port coverage through strategic positioning of staff and by leveraging some existing Customs and Border Protection (CBP) resources through Memorandums of Understanding (MOUs) with that agency. Additional resources, however, would be helpful to further expand port coverage.

c. Do you agree that CPSC's ability to intercept dangerous products at the border does not, on its own, currently provide a sufficiently strong layer for protecting consumers from dangerous products, especially with respect to children's products?

Yes. As stated above, CPSC's Import Surveillance Division staff attempts to leverage all resources available to stop dangerous products before they enter the U.S. stream of commerce. However, limited budget and staff resources only allow us to inspect a fraction of the products entering the country. As your question implies, border detection alone is not sufficient to protect consumers.

d. Do you agree that the first layer for protecting consumers from dangerous products, especially with respect children's products, should be the manufacturer and that we should not first expose children to risk to

determine whether that manufacturer is meeting its obligations?

Yes. The CPSA, CPSIA, and implementing rules and regulations put the burden of compliance on the manufacturer of a regulated product. Throughout my tenure as Chairman, I have continued to urge manufacturers to "build safety" into products, and not take shortcuts or use product substitutes (such as cadmium instead of lead) that could put consumers, especially children, at risk.

Question from the Honorable Leonard Lance

1. **At the hearing I pointed out that some manufacturers are concerned that State Attorneys General might enforce certain statutory requirements even though they have been stayed by the Commission. You indicated that the Commission did not stay enforcement of the lead content limits but only testing and certification requirements. As I read the Commission's announcements, however, it seems to me that the Commission has in fact stayed enforcement of the lead content limits for certain children's products, such as bicycles, youth all-terrain vehicles and other motorized products and recently extended those stays through December 31, 2011. In light of this additional information I wanted to follow up with my original question again: Can the State Attorneys General enforce the lead content limits in these cases even though the Commission has determined that it will not? Also, to the extent that testing and certification requirements have been stayed by the Commission, can the State Attorneys General continue to enforce the certification and testing requirements in the meantime or are they prohibited from doing so by the stay? Thank you very much for reviewing my question.**

   Yes, the state attorneys general could enforce either the lead content limits against bicycles and youth all-terrain vehicles or the testing and certification requirements for lead content limits even though the Commission has stayed enforcement. In addition, state attorneys general also have the power to enforce independent state content limits to the extent applicable.

   We have established a strong working relationship, however, with the state attorneys general offices and sponsor monthly telephone conferences to explain the rationales for our decisions and to work on coordinating our activities. To date and to the best of our knowledge, the state attorneys general have not enforced the lead limits as to bicycles or youth all-terrain vehicles nor have they enforced the testing and certification requirements for lead content.

Questions from the Honorable Mike Pompeo

1. **If Congress provides the agency more flexibility in implementing the CPSIA, do you trust the agency's experts to be able to devise rules that protect the health and safety of children?**

   The Commission has a very talented staff that works extremely hard to keep harmful products out of the U.S. stream of commerce and out of the hands of consumers. If Congress amends the CPSIA, Commission staff will continue to work diligently to implement regulations that are fair, effective, and protective of public health and safety. Statutory changes that require the Commission to make numerous case-by-case determinations, however, will likely have the effect of diverting resources from other Commission priorities, such as the investigation into problem drywall and efforts to prevent carbon monoxide poisoning deaths.

2. **Do you think that the agency's pre-existing rules governing vinyl plastic film and carpets and rugs were already doing a very effective job of ensuring the safety of consumer products in these categories? How many recalls has the agency conducted in the past 30 years based on violations of the vinyl plastic film and the two carpets and rugs product safety standards?**

   The Standards for the Flammability of Vinyl Plastic Film, 16 CFR 1611, and the Standards for the Flammability of Carpets and Rugs, 16 CFR 1630 and 1631, have done an adequate job at protecting consumers from the risk of injury and fire loss. We have had very few failures of the vinyl plastic film standard over the years. Considering the linear yards of carpeting that are in the U.S. market in almost every home in the United States the number of recalls associated with carpets, rugs, and wall-to-wall carpeting, compliance of this industry appears to be positive.

   CPSCs electronic records system began in August of 1995, limiting our ability to go back 30 years. Over the past 16 years, however, CPSC has completed a total of 1,158 regulated recalls. Of those regulated recalls, there are a total of 21 vinyl plastic film and carpet and rug related recalls as shown below:

Violation Description	Total Violations
Carpet Flammability Failure	14
Carpet Flammability Labeling	4
Other Carpet	1
Carpet Standards Certificate Violation	0
Carpet and Rug Related Recalls Subtotal	**19**
Vinyl Flammability Failure	0
Other Vinyl Film	2
Vinyl Plastic Film Related Recalls Subtotal	**2**
Total	**21**

3. **I understand that you thought the McDonald's Shrek glasses recalled last year contained amounts of cadmium that were too high. But when the agency's scientists came out with a cadmium standard later in the year, it turned out the cadmium in the glasses was lower than the agency's recommended limit. How much did that mistake cost McDonald's? Why did you let the headlines get ahead of the science there? Can you promise this Committee that you will wait for the science to come in before you act next time?**

   On June 4, 2010, McDonald's Corporation, in conjunction with the CPSC, announced a voluntary recall of approximately 12 million glasses based on certain preliminary cadmium wipe test data that was provided by the Commission. This matter was jointly and cooperatively discussed with McDonald's based on the best scientific data available. The CPSC has no information regarding McDonald's internal decision process regarding that recall or any costs incurred as a result.

4. **Do you think paper clips pose a significant threat to children? Do you think it makes sense for the Commission to require testing a paper clip in a science kit but not when attached to a child's Worksheets? Do you thiok it makes sense for the Commission to require testing brass in a child's bedside lamp but not in a child's musical instrument?**

   Section 101(a) of CPSIA requires children's products (those consumer products primarily intended for children twelve and under) to meet certain total lead limit requirements. Section 102 of the CPSIA requires testing and certification of children's requirements to ensure that they comply with CPSIA requirements and mandatory product safety rules.

   The CPSIA does not require testing and certification of every general use product that a child interacts with (such as a paper clip attached to a child's worksheet or a musical instrument). Instead, the law requires testing and certification of those products "designed or intended primarily for children 12 years of age or younger."

5. **Should new federal product safety requirements for cribs, portable cribs, and play yards mean that families who own products that complied with previous standards oot be allowed to sell them on the secondary market even though the products were never fouod to be defective nor shown to be unsafe?**

   Upon taking over as Chairman of the Commission, I observed that there was an alarming pattern of failures of crib hardware and component parts, particularly related to drop-side cribs. The situation required meaningful short-term and long-term strategies to address this trend. According to our data, between November 2007 and April 2010, there were 36 deaths associated with crib structural problems. Thirty-five of those fatalities occurred when crib components detached, disengaged, or broke, ending in unspeakable tragedy.

   Combined with our sustained and ongoing efforts to rid the marketplace of older, defective cribs, the development and passage of new mandatory crib standards provides a

responsible and holistic approach to giving consumers increased confidence in the safety of their cribs. This includes older cribs that may not have a drop-side, but may have other hardware issues and have not been tested to current standards.

I deeply appreciate the impact of this rule on smaller entities, particularly child care facilities and places of public accommodation. To address this concern and better ensure widespread availability of compliant cribs and an orderly and successful transition to the use of compliant cribs by child care providers and places of public accommodation, the Commission has adopted a two-step phase in of the rule. First, for all manufacturers, distributors, and retailers of full-size and non-full-size cribs, the final rule will become effective June 29, 2011. Second, child care centers, family child care homes, and places of public accommodation with then have an additional 18 months to comply (December 28, 2012).

This will ensure that all infants and toddlers in child care facilities will have the safest possible sleep environment free of both drop-sides and other potentially dangerous hardware and component parts not tested to new, protective standards.

6. **When you say anonymous database complaints are not allowed, does the name and contact information for the actual person who was harmed have to be provided to the Commission? Even if the person harmed is the one reporting, doesn't that person have the option of remaining anonymous to the manufacturer? Must the person who is reporting have first-hand knowledge?**

When you say anonymous database complaints are not allowed, does the name and contact information for the actual person who was harmed have to be provided to the Commission?

No, contact information for a person who was harmed is not required for publication of a report by either the statute or the final rule. Section 6A(b)(2)(B)(iv) of the CPSA requires that in order for a report to be eligible for publication in the database, it must, at a minimum, include the "contact information for the person submitting the report." The Commission's final rule codified this requirement at 16 CFR 1102.10(d)(6). Moreover, pursuant to section 6A(g) of the CPSA, "harm" includes a risk of harm. Accordingly, many reports that are eligible for the database will not involve a person who was actually harmed.

During rulemaking the Commission decided not to require victim contact information on a report because such information may be lacking (where a report describes a risk of harm), considered private or confidential, or prohibited from disclosure. For example, parents completing reports involving their children may not mind including information about the age and gender of their child, while not wanting to include their child's first and last name. Also, medical professionals and others may have other statutory requirements not to disclose contact information for their patients. Section 6A(b)(1)(A) of the CPSA specifically provides that medical professionals and public safety entities may include reports in the database. Requiring victim contact information would eviscerate both the

ability to include in the database reports involving a risk of harm and reports from medical professionals where certain professionals are statutorily obligated not to disclose this information.

Even if the person harmed is the one reporting, doesn't that person have the option of remaining anonymous to the manufacturer?

Yes, this is a statutory requirement. Section 6A(b)(6) of the CPSA prohibits the CPSC from disclosing the name, address, or other contact information for submitters of reports. The only exception to this general prohibition is that the CPSC may provide contact information to the manufacturer or private labeler if the submitter has given express written consent. Accordingly, while submitters must provide their contact information to the CPSC in order include their report in the database, submitters are given a choice whether they want the CPSC to share their contact information with the identified manufacturer or private labeler.

Must the person who is reporting have first-hand knowledge?

No. "First-hand knowledge," as a concept is not required by the statute or the final rule. Instead, both the statute and the rule require that the submitter include certain minimum information about the product and the incident for a report to be included in the database. Section 6A(b)(2)(b) of the CPSA sets a floor for the type of information that a submitter must possess in order for a report to qualify for inclusion in the database. This statutory floor includes:

(i) a description of the consumer product;
(ii) identification of the manufacturer or private labeler of the product;
(iii) a description of the harm or risk of harm relating to the use of the consumer product;
(iv) contact information for the submitter of the report;
(v) verification that the contents of the report are true and accurate to the best of the submitter's knowledge; and
(vi) consent to include the report in the database.

The Commission's final rule includes two additional pieces of information, an incident date, or approximation, and the category of submitter (i.e., consumer, health care professional, public safety entity, etc.).

When you say anonymous database complaints are not allowed, does the name and contact information for the actual person who was harmed have to be provided to the Commission? Even if the person harmed is the one reporting, doesn't that person have the option of remaining ononymous to the manufacturer?

Reports submitted anonymously will be accepted by the CPSC. By law, however, anonymously submitted reports cannot be published on SaferProducts.gov.

Although the contact information of a submitter of a report is required for publication, CPSC will *never* post this information in the database. When reports are submitted with contact information, other consumers can see and benefit from seeing the report, but will not be able to see who submitted the report. We discourage consumers from submitting reports anonymously so that reports can be included in the database, and so that the CPSC may contact submitters, if necessary, to follow up regarding their reports.

The submitter's name and contact information will never appear in the database. By law we can provide this information to the manufacturer only if the submitter has given us written permission to do so.

7. **Companies only get 10 business days after a report of harm is sent to them before it is posted to the database under the agency's rule. Is that enough time for them to investigate? Do they get enough information about the incident to be able to tell whether the report is true or not? Are they allowed to follow up with the victim to see what really happened? Are manufacturers able to identify reports that do not contain enough information to assess whether or not they are materially accurate? Can they require more information from a reporter of harm?**

Companies only get 10 business days after a report of harm is sent to them before it is posted to the database under the agency's rule. Is that enough time for them to investigate?

The CPSC is not in a position to opine on whether 10 business days is sufficient time for all businesses receiving a report to review it and respond. Over 15,000 different types of consumer products fall within our jurisdiction. Moreover, the size and ability of businesses to respond varies greatly, as do the length and complexity of reports. Providing 10 business days for a manufacturer or private labeler to respond to a report was a decision made by Congress and is, however, generally consistent with the current information disclosure requirements under section 6(b) of the CPSA, which requires a company to respond to a report within 15 calendar days.

Also, the statute does not provide that businesses will be given 10 full business days to respond to reports. Section 6A(c)(3)(A) of the CPSA provides that the CPSC shall publish eligible reports in the database "*not later than* the tenth business day after the date on which the Commission transmits the report ... [to the manufacturer or private labeler]." (emphasis added). Accordingly, CPSC could transmit reports to the manufacturer or private labeler and post them in the database on the same day. The CPSC, in its discretion, however, is providing businesses the full 10 business days to respond before publishing eligible reports in the database.

Do they get enough information about the incident to be able to tell whether the report is true or not? Are they allowed to follow up with the victim to see what really happened? Are manufacturers able to identify reports that do not contain enough information to assess whether or not they are materially accurate?

Every report will contain different types of information. Depending on the product and the incident, businesses may need to know more or less information, so this question cannot be answered for every report and for every business. It is likely that most reports will contain sufficient information for a business to understand the product and the incident based on the information submitted during soft launch.

For example, 90 percent of the reports that were submitted during soft launch through March 8, 2011, and would have been eligible for inclusion in the database, include information in the model number field.

Can they require more information from a reporter of harm?

No, the ability to follow up with submitters is not tantamount to legal process. Although a business may *ask* a submitter to provide more information about an incident described in a report, businesses cannot *require* a submitter to answer their questions or to provide more information for a report.

8. **Under the agency's rule, reports of harm go up after 10 days whether the inaccurate information in them has been corrected or not. There is no requirement for the agency to act on every report within a certain timeframe, is there? If a company believes that a report is not about their product, are they allowed to inspect the product? Or even necessarily follow up with the consumer? What does a company do to respond within 10 days if a ton of information is dumped into the database all at once?**

Under the agency's rule, reports of harm go up after 10 days whether the inaccurate information in them has been corrected or not. There is no requirement for the agency to act on every report within a certain timeframe, is there?

Neither the statute or the rule impose a deadline for the CPSC to make determinations on claims of materially inaccurate information, but the statute imposes a deadline for posting reports in the database. Both the statute and the rule require reports to be posted no later than the tenth business day after transmitting a report to the manufacturer or private labeler identified in the report. The only exception to this deadline is in section 6A(c)(4)(A) of the CPSA, which provides that the CPSC must correct materially inaccurate information before posting a report in the database if the agency has already determined that it contains a material inaccuracy.

If a company believes that a report is not about their product, are they allowed to inspect the product? Or even necessarily follow up with the coosumer?

Yes, if a company believes that it has been misidentified in a report, and the submitter has consented to providing his or her contact information to the manufacturer or private labeler, that company may contact the submitter to verify the information in the report. If the submitter has the product, a company may inspect the product if the submitter consents.

What does a company do to respond within 10 days if a ton of information is dumped into the database all at once?

In the past, companies have often dealt with high volumes of product safety incident reports forwarded to them by the Commission. In addition, companies also generally respond to reports from calls and e-mails directly to the company, as well as other independent sources (such as the media, blogs, and state attorneys general). This is likely to be the case in the future, regardless of the existence of the database. Therefore, companies should be prepared to respond to numerous product complaints as they always have, regardless of the existence of the database.

If the same type of claim is being made by many different submitters, and the company would like to submit the same comment for every report, or is able to file a materially inaccurate information claim that applies to more than one report, they may contact the CPSC to determine whether we can assist them to do this in our system. At this point, the business portal handles comments and claims on a one-to-one ratio with a report.

9. **How would something like last year's Pampers investigation be affected by the database? You could have children's medical records and photographs in there forever couldn't you? Even once the agency has exonerated a product like Pampers DryMax diapers, the medical records and pictures would stay because the agency's rule does not require their removal, does it?**

Reports that are not determined to be fraudulent or materially inaccurate will be maintained in the database because we learn about emerging product hazards over time. To the extent the CPSC has conducted an investigation that relates to reports submitted to the database, the CPSC's press releases, public safety alerts, and/or recall information, will always appear in the search results before the reports are listed, so that consumers will see this information first.

10. **Will the agency adjudicate accuracy based on claims of causation? If not, why not? If a consumer claims that a particular brand of diapers caused autism, will that go up on the database?**

The CPSC has never, and will not now, adjudicate causation in reports submitted to our database. It is sufficient for inclusion in the database if a report describes an illness, injury, or death, or risk of illness, injury, or death related to the use of a consumer product. First, the CPSC does not have the resources to adjudicate causation in every report. It is unlikely that any federal agency would have the resources to adjudicate causation in the number of reports received on a yearly basis. Second, even if the CPSC did have such resources, it would unnecessarily impede the agency's primary mission to protect consumers from unreasonable risks of harm related to the use of consumer products. It is unnecessary to adjudicate causation in reports for them to be useful to the CPSC and to consumers. The CPSC relies on the collection of these incident reports to evaluate emerging product hazards, to conduct in-depth investigations, and to negotiate voluntary recalls. Consumers can search reports and review both the report and the

manufacturer's comments to make more informed choices about the products they purchase.

11. How does the database deal with the small numbers problem? For example, a widely-circulated product may have more complaints on the database than a product that is less widely-circulated. However, the less widely-circulated (and less complained about) product may actually be less safe. In such situations, will the database drive consumers to less safe products because it does not compare the number of products in circulation?

The database itself will not address this issue, although CPSC may issue recalls that address this type of information. Information from recall press releases will be displayed in the database before reports in a search. Additionally, all manufacturers are able to post information about the overall safety record of their product alongside complaints in the database.

12. Can a manufacturer bring a materially inaccurate report to the agency's attention without posting a comment on the database? How does a manufacturer do that?

Yes. A manufacturer or private labeler does not have to respond to a report at all. If it chooses to do so a business may respond in one or more of three ways: make a general comment, make a materially inaccurate information claim, and/or make a confidential information claim. Comments are the only type of response that can be made visible on SaferProducts.gov. A manufacturer or private labeler must affirmatively request that a comment be published. For example, a business can submit a comment that is visible to the public while at the same time file a materially inaccurate information claim that is not visible to the public. A business could file two comments, one that is visible on the database and one that is not. Or, if the CPSC determines that a report does not contain materially inaccurate information, the business can resubmit the claim with additional evidence. Neither claim would be visible on SaferProducts.gov. Businesses can submit comments and/or claims through the business portal, through e-mail, or postal mail.

13. Was the information in the soft launch made publicly available? If not, then how does it count as any kind of test of the problems with the database? Until the data is publicly available, there is no incentive for anyone to game' or 'salt' the database. You have stated that only 4 out of 1000 reports of harm in the soft launch were challenged as 'materially inaccurate.' Were manufacturers allowed to identify reports that lacked enough information for them to know whether they were materially inaccurate or not? How many such reports were so identified?

Was the information in the soft launch made publicly available? If not, then how does it count as any kind of test of the problems with the database?

Reports and comments submitted to the CPSC during soft launch will only be disclosed to the public pursuant to section 6(b) of the CPSA. Thus, someone would have to submit a Freedom of Information Act (FOIA) request to review this information.

Despite the fact that the information will only be disclosed pursuant to section 6(b) of the CPSA, soft launch provided an excellent opportunity for the CPSC to test the database software for:

- entering reports online using the new reporting form;
- registering businesses to use the new business portal application on SaferProducts.gov;
- allowing businesses to enter comments and claims regarding reports on the business portal; and
- working through internal CPSC processes for handling reports, including assessment of the minimum requirements for publication, notifying businesses about reports, and dealing with manufacturer comments and claims.

In addition, soft launch gave CPSC's staff the ability to identify certain areas where slight technical corrections would improve the overall operational stability of the database before the official March 11, 2011, launch date.

Until the data is publicly available, there is no incentive for anyone to game' or 'salt' the database.

CPSC did not conduct soft launch to determine whether someone would 'game' or 'salt' the database. But if someone had a nefarious intent to 'salt' the CPSC's database, he or she could have done so before now. Incident reports have been available to the public through a FOIA request since the inception of the agency. We do realize, however, that having more immediate access to information on the internet may increase someone's incentive to enter false data. If we determine that information in the database is fraudulent, we will remove the information and review our options to prosecute the offender.

You have stated that only 4 out of 1000 reports of harm in the soft launch were challenged as 'materially inaccurate.' Were manufacturers allowed to identify reports that lacked enough information for them to know whether they were materially inaccurate or not? How many such reports were so identified?

Manufacturers can choose to make a comment visible to the public and state that they do not have sufficient information about the incident to make a substantive response. We have not tracked this information to date.

14. Does the agency intend to allow information on the database to be downloaded without a disclaimer? If so, why is the agency ignoring the statutory requirement for a disclaimer on such data? How will the agency correct data that has been downloaded by third parties when it makes corrections to the database?

When the database has been populated with reports of harm, the CPSC intends to provide a means to download information. Information downloaded from the database will

contain the statutorily required disclaimer as the first piece of information in every data file.

Section 6A(b)(5) of the CPSA requires that the Commission provide "clear and conspicuous" notice to database users that the Commission does not guarantee the "accuracy, completeness, or adequacy of the contents of the database." Nothing in the statute requires that this disclaimer be included on printed or downloaded materials. Despite this fact, the Commission requires in section 1102.42 of the final rule that the disclaimer be displayed on the database and on all information printed from the database.

CPSC cannot guarantee, nor does the statute require, that users or aggregators of the data will retain this disclaimer, however.

Questions for the Record: Chairman Mary Bono-Mack
March 24, 2011

Commissioner Anne M. Northup
U.S. Consumer Product Safety Commission

1. **Why do you anticipate that adding a "functional purpose exemption" to the lead content limits would weigh down agency resources if adopted?**

The functional purpose exemption proposed by Chairman Tenenbaum and Ranking Member Henry Waxman would grant to the Commission the authority to exempt from the CPSIA's lead limits products in which the lead content serves a "functional purpose" so that it is "not practicable or not technologically feasible" to remove the lead in each product or component, and provided that such lead "will have no measurable adverse effect on public health or safety." Notably, this formulation was designed to exempt certain products from lead limits that were arbitrarily set by Congress without regard to risk in the first place.

First, this exemption would be complicated and costly. To implement the exemption, the Commission would need to promulgate regulations defining "functional purpose" and "measureable adverse effect," and to establish standards to govern its review of manufacturer petitions seeking the exemption. Once in place, the exemption would require the Commission to make product-by-product determinations in response to petitions filed by manufacturers. Petitioning a government agency requires substantial resources, including legal and technical assistance to make the necessary showing. Thus, this petition process likely will be available to only the largest manufacturers that could afford it. Small businesses, again, would be at a real disadvantage.

Commission staff has expressed the view that such an exemption could generate a large number of complex petitions. As a result, substantial Commission resources would be directed toward the pre-approval of a potentially unlimited number of products whose lead content does not have a measurable adverse effect on public health or safety. This pre-approval regulatory role is neither one previously assumed by the CPSC, nor one for which it is currently funded. The Food and Drug Administration is charged with pre-approving products before they are marketed, and it is responsible for a much smaller universe of products than is the CPSC. Yet the FDA's annual budget is in the billions of dollars, whereas the CPSC's FY 2012 budget request is $122 million. It is safe to assume that adding an FDA-like pre-approval function to the CPSC through a functional purpose exemption would turn the agency's safety mission on its head and require unnecessary, expansive resources to pre-approve products that do not even pose a lead risk to children.

I am also concerned that this exemption will be applied subjectively and with prejudice. This concern is reinforced by statements other Commissioners have made that seemingly prejudge the application of the functional purpose exemption to particular products, such as bicycles, without any supporting analysis. Ironically, this would result in arbitrary,

non-science based exemptions to a lead limit and a restrictively construed absorbability exclusion that are themselves without a scientific, risk-based foundation. For example, the lead in crystals on a child's jacket serves a "functional purpose" because it makes the crystals shine, but the crystals pose no risk because the lead is not soluble (that is, absorbable or bio-available). However, no matter how low the level of lead in such crystals, it is clear that the majority of Commissioners would not support a petition for a functional purpose exemption to permit crystals on children's jackets. Without even seeing a petition and/or having the benefit of a company's cost analysis, substitute materials evaluations, etc., those supporting the "functional purpose exemption" routinely assume that only specific industries would be helped.

There is something contradictory about the Majority Commissioners' casual attitude toward the need to award "functional purpose" exemptions while also interpreting the law's absorbability exclusion in the strictest manner possible, prohibiting any product with accessible lead from meeting this exclusion. It begs the question: "Are metals that contain small amounts of lead that are not bio-available dangerous to children?" If the answer is "yes," then clearly there should be no exemptions regardless of the functional purpose of the lead in the product—including no exemptions for ATVs or bicycles. If the answer is "no" because, in fact, such small amounts of lead do not pose a risk to children, then all metals where the lead is not soluble or bio-available should be permitted. This would allow manufacturers to continue to achieve the benefits that lead brings, such as strength, machinability, shine and other uses. This effort to construct a new exemption that does not take into account the science behind the risks of lead reinforces my concern that science will be less of a guide in granting a petition than a preconceived notion of who should or should not be granted such an exemption.

For example, one of the criteria in the Waxman proposal for granting a functional purpose exemption is that it would not expose a child to risk, that is, the inclusion of the item in the product would not raise a child's blood lead level. If a component does not pose a risk to a child on one product, then why would that same component not be acceptable on any other item? The very argument at the basis of the functional purpose exemption is that there are many materials where the lead does not pose a risk to a child that are currently banned. Why not acknowledge this and fix the law so that we only ban materials that are actually risky?

That is why I have argued in my testimony that the Absorbability Exclusion in the law be amended so that it is meaningful. This exclusion can be amended so that products that do not contain lead that is absorbable, or bio-available, to a child in any amount that could be harmful would be exempt from the law's requirements—and such an exclusion could be drafted in a way that the agency would not need to review or approve such products before they are sold. Lamps, school desks, children's sizes of brass musical instruments, books, ATVs, bicycles, toys and all other products that do not contain lead that is absorbable in harmful amounts would be able to be produced and sold. The same industries envisioned to be assisted by the functional purpose exemption will achieve relief under this provision, as will any other industries that produce safe products. Of course, such a change would still not allow the sale of products containing dangerous

amounts of absorbable lead, such as those with lead based surface coatings and solid-lead children's jewelry.

2. **Before CPSIA was enacted, many pointed to the public database maintained by the National Highway Traffic Safety Administration (NHTSA) as a model for the CPSC's public database. Can you explain how these two databases are similar and how they are different? Is it true that CPSC's database contains more protections for manufacturers to ensure accuracy than NHTSA's database?**

The intention of both databases is to provide accurate and actionable safety information to the general public. Apart from the fact that both databases require some description of the consumer product/car/etc, and the approximate incident date, there is very little that is similar about the two. NHTSA requires a vehicle owner to provide specific detailed information about the vehicle to uniquely identify and distinguish it from all others. Such information includes the component name and the category, make, model and model year of the vehicle. In contrast, the CPSC database does not require submitters to provide information that is sufficient to distinguish the subject product from a myriad other products. The only required identifying information is the manufacturer, the "product type", including such broad category options as "toys, kids & baby", and an open ended field for the "product description" Unlike the NHTSA database, the CPSC database does not require the model, date of purchase, identification number, or any other uniquely descriptive information.

The NHTSA and CPSC databases also differ markedly in their solicitation of information necessary to ensure reports can be adequately verified and investigated. The NHTSA database requires "vehicle owners" to provide their first and last names, daytime phone number and address. Moreover, it is unlikely anyone other than a vehicle owner would possess all of the required information about the vehicle necessary to submit a report. Although the CPSC website also requires *submitters* to provide contact information, the contact information of the victim or product owner is not required. As a result, the submitter of the report does not need to have firsthand knowledge of the product or incident in question, and may not even know the contact information of the actual consumer and/or victim. Thus, when a manufacturer needs to clarify which product is the subject of an incident report, or when the veracity and accuracy of a report is subject to question, CPSC staff will be unable to follow up with a party that has knowledge of the incident and product. The absence of adequate information in the incident report will also preclude both the manufacturer and the CPSC from conducting an investigation to determine if a product has a fundamental problem and should be recalled.

As discussed in greater detail below, the other supposed "protections" exclusively available on the CPSC database are of little or no value. This includes the manufacturer's right to challenge a material inaccuracy, since a challenge does not preclude the CPSC from publishing the report after 10 days, and, given the absence of information necessary to adequately investigate the report, will often not result in the removal, redaction or correction of a materially inaccurate report. Similarly, a manufacturer's opportunity to

engage in an on-line dispute with a consumer over the safety of its product is more an invitation to a public relations disaster than an opportunity to ameliorate the harm from an inaccurate report that disparages a product.

Finally, NHTSA's database pertains to automobiles and components of automobiles—a finite universe of products and manufacturers. Car manufacturing is heavily regulated and car manufacturers almost always are large businesses. However, the CPSC regulates everything from household chemicals made by large companies to toasters, jewelry, and children's clothing made by small manufacturers or hand-made crafters. Simply given the scope of products covered, it is misleading to compare the impact of NHTSA's database with that of a new public database covering over 15,000 different types of consumer products—some of which may never have had a reason to be familiar with the Consumer Product Safety Commission.

3. During the hearing, Ranking Member Butterfield asked Chairman Tenenbaum a series of questions regarding the CPSC database. Do you have any comments on those questions or the Chairman's answers?

I have provided my own answers to the following questions:

1. Is it correct that anyone who submits a report must provide to the Commission their name and contact information?

All submitters must provide their contact information, but the contact information of the actual victim or consumer who experienced the risk of harm is not required. In other words, the submitter of the report need not have firsthand knowledge of the incident in question, nor does he or she have to submit the contact information of the person who does—which brings into question the accuracy and reliability of the report. It also may prevent our own staff from following up directly with the consumer or owner of the product, should the Commission need to verify the report's accuracy.

Under the Majority's database rule, groups or individuals with no direct knowledge of the incident, who did not see it happen or do not even know the person that was harmed, are permitted to submit incident reports to the Database. In fact, the Majority's rule specifically names consumer advocacy groups, trade associations and attorneys as allowable submitters to the database. None of these groups is likely to have firsthand knowledge of an incident. Moreover, for these groups, the accuracy of the incidents reported may be secondary to their own agendas, giving them no incentive to avoid the posting of false or misleading information.

Accuracy is essential to a public database of incidents on which consumers may base their purchasing decisions. While accurate information is helpful to consumers, inaccurate information in a public, ".gov" database is simply misinformation--and not helpful to anyone. To alleviate this concern, I proposed an alternative database rule that would have encouraged only those with firsthand information of an incident to submit reports to the database. Unfortunately, my proposal was not adopted.

2. *Is it correct that anyone who submits a report must complete a verification that the information is true and accurate?*

Submitters to the database must check a "self-verification" box affirming that the report they are submitting is accurate "to the best of their knowledge." But the "best" knowledge of someone with no first-hand knowledge is of little value. An individual or group without first-hand knowledge will likely not have the full story of what happened – including the exact type of product, recent history of the product, or even the precise cause of the incident. As a result, the "self-verification" requirement will neither discourage nor prevent inaccurate reports of harm.

3. *Is it correct that within 5 business days of receiving a report the Commission will transmit the consumer report directly to the manufacturer?*

Yes, provided the manufacturer has previously registered on the database system. A manufacturer that has not registered on the database is unlikely to receive notification of the report within five days. Moreover, unless a manufacturer makes a material inaccuracy claim and the Commission completes its investigation and determines that the report is materially inaccurate – all within the ten days following transmittal of the report to the manufacturer – the report will be published on the 11th day. Because the time period runs from the date of transmittal, not receipt, a manufacturer receiving the report by mail is unlikely to avoid publication of a materially inaccurate report.

Importantly, the promise that a report will be transmitted to the named manufacturer within five days of posting is no help to other entities who may also be harmed by a materially inaccurate report. The system is designed to provide automated notice to only a single party, the entity identified in the "manufacturer" data field. Moreover, the database does not currently permit an entity to register in its capacity as non-manufacturing licensor of a trademark used on another manufacturer's product. As a result, notice may not be provided to licensors and other parties who could be harmed by a report or may have valuable information concerning the material accuracy of the report. This includes, in addition to licensors, retailers and manufacturers identified in the narrative portion of the report but not the manufacturer field.

4. *Is it correct that the Commission will not publish that report until the tenth business day after transmission to the manufacturer?*

The Commission will not publish a report until the 10th day after sending notification to the named manufacturer. But the report will be published at that time even if the manufacturer has made an adequately supported claim that the report is materially inaccurate and the Commission has not completed its investigation of the claim. As a result, materially inaccurate information can remain on the site until the Commission completes its investigation and makes a determination. And because there is no fixed period within which the Commission must complete its investigation, inaccurate information can remain on the site indefinitely. Meanwhile, the Commission's efforts to

investigate claims of material inaccuracy are hamstrung by its failure to require the identification of victims of harm or firsthand witnesses of incidents raising a risk of harm. There are therefore likely to be many cases where a manufacturer will have good reason to believe a reported incident is either completely false or materially misrepresented (and companies routinely receive these types of mistaken or fraudulent claims), but neither the manufacturer nor the Commission will be able to obtain the information necessary to resolve the claim. Under those circumstances, the manufacture will be unable to meet its burden and the challenged, but unverified and unverifiable report, will remain on the database forever.

Recognizing this problem, I supported a valid and more useful interpretation of the statutory 10-day time frame for evaluating claims of material inaccuracy. Under my interpretation, reports submitted to the database would be published following the 10-day window, provided no claim of inaccuracy is made within that period. Reports that are the subject of an adequately supported claim of material inaccuracy made within 10-days of a manufacturer's notification would not be published until the Commission investigated and resolved the claim. No reports deemed not materially inaccurate would be withheld from the database; their publication would simply be delayed. Consumers would have the benefit of an effective tool for gauging the safety risk of products, rather than a database populated with unreliable and misleading information.

Notably, the Commission's Notice of Proposed Rulemaking on the database originally included an interpretation similar to mine. For example, § 1102.26 of the NPR states: "If a request for determination of materially inaccurate information is submitted prior to publication in the database, the Commission may withhold a report of harm from publication in the Database until it makes a determination."[1] 75 FR 29180. That language could not have been included in the NPR without a legal opinion supporting the permissibility of the policy choice. That the agency apparently believed at one time that this approach is legally permissible reflects, at a minimum, statutory ambiguity regarding the point.

Not surprisingly given the NPR, many if not most of the commenters assumed that incidents would not go into the Database pending the determination of a material inaccuracy claim. Although at least one commenter expressed the policy view that reports of harm should go up on the 10th day even when such claims are unresolved, no one—not even consumer groups argued that the statute legally prohibits the agency from withholding reports from publication for the duration of its investigation. To the contrary, several commenters proposed a more detailed protocol for addressing claims of material inaccuracy, based on their understanding that reports would be withheld from publication while under review for accuracy. And yet the Majority's

[1] The preamble of the NPR contains analogous language: "If a request for determination of materially inaccurate information is submitted prior to publication in the database, the Commission may withhold a report of harm from publication in the database until it makes a determination." 75 FR 29161. And this: "We propose that in cases where a claim of materially inaccurate or confidential information is under review, the Commission, in its discretion, may withhold a report of harm *in part or in full* until such a determination is made." 75 FR 29170 (Response to summary 26)(emphasis added).

final rule now forbids delaying publication in those circumstances, and fails to establish any specific protocol for handling requests for determinations.

Finally, it is helpful to remember that the Commission obtains information in addition to that which will be submitted to the public database, such as emergency room data, death certificates, etc. It is acceptable (and probably preferable) for the Commission to continue to absorb as much information on consumer products as it can—and this includes reports from advocacy groups, trial lawyers and trade associations. However, it is not necessary ***nor is it statutorily required*** that such information, particularly that which is neither accurate nor verifiable, also be posted on the public database. This is one area where my position on the database differs starkly from that of the Majority.

5. *Is it correct that during the 10-day waiting period the manufacturer is given a chance to do three things: 1) claim parts of the report are materially inaccurate; 2) claim parts of the report contain confidential information; and 3) submit its own comments to be made public along with the consumers report?*

This is correct, but these safeguards are meaningless in the absence of sufficient information to permit a manufacturer to gauge the accuracy of the report. Information essential to this purpose that is not required to be contained in the report, includes: the model number of the product; the date it was purchased; the UPC code; or, any other unique identifying information that would distinguish one product of a particular type from the potentially dozens of others that are of the same general type but are materially different. For example, a recent search of Amazon.com for high chairs manufactured by one particular company produced a list of 137 different high chairs ranging in price from $54 - $148. Given the broad range of identically named, yet distinctive products available from the same company at a single snap shot in time, a report of harm relating to a particular manufacturer's high chair, with no reference to the model, date of purchase or other more specific identifying information, would be of no value. And even in those cases where a victim or person with firsthand knowledge is identified in the report, unless a waiver is expressly given, the manufacturer will not have access to the information.

As previously discussed, even where reports contain sufficient information to identify a material inaccuracy, the value of notifying the Commission within 10-days is greatly diminished by the Commission's policy of publishing the information pending its determination.

With regard to manufacturers' having the opportunity to add comments to database reports, that supposed benefit is also of questionable value. As many manufacturers and their legal representatives have suggested, engaging in an open, on-line dispute with a customer over the contents of a report of alleged harm is not in a manufacturer's interest, and could cause a manufacturer to unwittingly increase its exposure to a products liability lawsuit. Nor is a forum for a "he-said, she-said" exchange of opinion about unverifiable allegations likely to assist viewers of the site in their search for useful product safety information.

6. *Is it correct that the Commission as practicable will attempt to expedite review of material inaccuracies where the manufacturer has limited the length of its submission?*

Yes, the Commission has committed to ***trying*** to expedite its review of material inaccuracies where a manufacturer can make a strong case through evidence and argument. However, as previously explained, this is small solace to a manufacturer provided with insufficient information even to assess the report's accuracy, let alone to support a claim of material inaccuracy.

7. *Is it correct that the Commission will review all inaccuracy claims and will correct or remove any inaccurate information published in the database?*

In those cases where a report contains sufficient information for a manufacturer to support a claim of material inaccuracy, and the Commission has sufficient information to conduct an adequate investigation of the claim, the Commission will correct or remove any information it determines to be inaccurate. Pending the Commission's investigation – for which there is not even an aspirational deadline – the potentially inaccurate report remains on the database. Once the change is made, consumers who have already relied upon the materially inaccurate information to select products to purchase will derive no benefit from the change.

8. *Is it correct that the database will contain only reports of harm from a product and not general complaints or reviews about a product?*

The goal of the database is to include only reports of harm, but it is difficult in practice to distinguish between reports of actual incidents or risks of harm and other categories of consumer complaint.

9. *Is it correct that the Commission will seek criminal prosecution through the Department of Justice where it identifies repeated instances of false submissions?*

The Commission has made that statement. However, between fiscal years 2004 and 2010, the Commission referred for criminal prosecution to the Department of Justice only one case that did not involve illegal fireworks. Moreover, the difficulty of proving that a report is not "true to the best of [the submitter's] knowledge" makes it unlikely any action would be taken. Even a consumer advocacy group in the habit of submitting reports based on third and fourth hand information heard "though the grapevine" is still submitting a report to the best of its knowledge. Finally, assuming the Commission even concluded that a report failed to meet this lax standard, the choice to prosecute would be made by the Department of Justice. I would be shocked if the Department of Justice, overwhelmed by significant cases effecting the national interest, would exercise its discretion to dedicate its resources to litigation over whether someone really didn't believe something they heard about a consumer product.

10. The final rule states: "The Commission will as a matter of policy, redact the allegedly confidential information from a report of harm before publication in the database until it makes a determination regarding confidential treatment." Does that really mean what it says? Is it correct that no information claimed by a manufacturer to be confidential will be made public until this is resolved?

It is true that information claimed to be confidential by a manufacturer will not be published until the Commission makes its own determination as to the confidentiality of the information. However, once the Commission has done so, regardless of the manufacturer's position, the information will be published. It will then remain on the database unless and until the manufacturer prevails in court.

4. You explained during your testimony that CPSC's rules for the public database do not require that submitters identify the exact product involved in the incident. In your example, you explained that one manufacturer of children's highchairs makes over 100 different models, and that reports to CPSC can be included in the public database without specifying which of the 100-plus models was involved in an incident. However, Chairman Tenenbaum also stated later that she is hopeful that people will give the model name and that the Commission staff certainly will investigate. Does that resolve your concern?

No it does not resolve my concern. "Hope" that people will provide the minimum information necessary to ensure the accuracy of reports of harm is not a substitute for requiring such essential information. Moreover, the promise of an investigation is illusory when the Commission does not require the identification and contact information of a party with firsthand knowledge of the product and incident. Requiring precise product information *or* the identity of a party with firsthand knowledge would have given the Commission at least a chance of ensuring the veracity and accuracy of reports. Requiring neither has produced a system that is more harmful than helpful.

Because the Majority's database rule all but guarantees that the database will be flooded with inaccurate reports of harm, it will be less useful for Commission staff in determining hazard patterns than are the current, internal databases we have today. It will also harm consumers by driving their purchasing decisions with unreliable information – potentially steering them from safe products to unsafe ones based on the false and unverifiable information populating the database.

5. You explained during your testimony that a Component Testing rule will help small businesses to be able to comply with the law's testing requirements. If the Component Testing rule will be helpful, why are small businesses still asking for relief from this law?

If the rule on component testing (75 FR 28208) is finalized as it is written today, it will allow for compliance with the CPSIA by some manufacturers that otherwise may have

had no chance to survive under the law's costly, complicated testing and certification requirements. This is because component testing has the potential to allow considerable flexibility under the CPSIA's testing regime for both small and large manufacturers. But it will not offset all of the unintended costs nor eliminate all of the negative consequences of the CPSIA.

To begin with, promulgation of the final component parts rule will not instantly create a market for component parts available to all small manufacturers. While the rule will make such a market possible, it will still be up to component parts manufacturers to determine whether they can profit from voluntarily incurring the expense of testing and certifying the component parts that they sell. It is questionable whether certified component parts will ever be available for sale at the craft and hobby retail outlets such as Michaels Stores or Joanne's, where many very small manufacturers purchase the materials they use to fabricate their products. Assuming such a market develops, it may not be available soon enough to benefit some small manufacturers, who will already have been driven out of business by the cost of third-party testing. And even with the benefit of pre-certified component parts, small businesses will still have to shoulder the enormous recordkeeping burden created by the Commission's rule.

In addition, even a robust market for component parts will not relieve small children's product manufacturers of the other costly requirements of the CPSIA. I urge the Committee to review the Commission's proposed rule governing testing and certification (75 FR 28366) to gain a better understanding of the tremendous burdens imposed by the CPSIA. Small manufacturers will still be required to do an initial third-party test of every component of their product and a third-party test following any material change to the product or component, regardless of whatever flexibility the Commission determines is possible within our testing rules. Some Commission safety standards require destructive testing of the finished product. The cost burden associated both with testing and the destruction of salable product will remain substantial for low volume producers. The extensive record keeping requirements and the disruption to production caused by the obligation to test products or components periodically after initial certification will also continue to burden small manufacturers. Moreover, some retailers have reported that there is unlikely to be sufficient third-party laboratory capacity to meet the increased demand that implementation of the third-party testing requirements will produce, particularly given that turnaround times at labs have already increased. As a result, small manufacturers can look forward to long delays waiting for labs to finish testing the products of the larger and more valued players who will likely be given priority, as well as increased testing prices as supply and demand market forces bid up the cost. Meanwhile, the sunk costs of product development and production capacity will remain economically unproductive while the small manufacturers await testing.

6. Can you clarify your $29 million estimate for the cost of the database as compared to the $3 million estimate provided by the Chairman? Are you familiar with the basis for the $3 million estimate?

I first heard the $3 million dollar estimate during the hearing. After checking with my staff, it was clear that no one in my office had ever seen or heard that number previously, and that there was no written, public or confidential paper available to me where that number appeared. Prior to then, I understood from the Commission's FY 2012 Budget Request that the Commission had estimated the cost of both the public database and IT modernization to be $29 million, and that it was impossible to distinguish the funding for the two initiatives because they are inseparable.[2]

Following the hearing, I learned that a variety of cost estimates for the database (or database plus IT modernization) have been provided by various sources, including:

- A statistic cited in Commissioner Bob Adler's January 14, 2011, Supplemental Statement on the Public Database: "In fact, according to CPSC staff, the cost of the database is only a small part of the $9 million spent on the first phase of the IT modernization."[3]

- An estimate communicated orally by CPSC staff that the database might cost between eight and ten million dollars.

- An estimate reported by the Associated Press on February 25, 2011: "The database was ordered by Congress as part of a 2008 product safety law aimed at removing lead and other dangers from toys, and last April the commission estimated it would cost about $20 million. That estimate included a major technology upgrade of antiquated computer systems that the agency said at the time was essential to providing a foundation for the searchable database."[4]

In order to resolve the confusion surrounding this issue, I recently requested from the CPSC Budgeting Office figures reflecting the exact cost of the database. In response, our budget office was unable to separate funds allocated to "IT modernization" from those associated with the creation of the database.

I was then referred to our IT staff, who provided me for the first time with written documentation supporting the $3 million figure. Notably, the document is a memorandum dated March 8, 2011, over two weeks *after* Chairman Tenenbaum

---

[2] Commissioners began their review of the 2012 Budget Request in fall 2010. The document states at Page 5: "By the end of 2011, the Commission will have spent $29 million in contracted work for the public database and IT modernization." http://www.cpsc.gov/cpscpub/pubs/reports/2012plan.pdf

[3] http://www.cpsc.gov/pr/adler01142011.pdf

[4] Jennifer Kerr, "New Unsafe Products database Under Fire on Hill," *Associated Press* (February 25, 2011). http://hosted2.ap.org/APDEFAULT/89ae8247abe8493fae24405546e9a1aa/Article_2011-02-25-Dangerous%20Products-id-c20609a71a1d4f74af36b0430f1d233c

announced the $3 million figure at the Committee hearing. A copy is attached for your reference.[5]

The March 8 memorandum speaks for itself, but I find it to be an extremely confusing and loosely drafted post hoc justification for the $3 million figure. Its effort to separate the costs associated with creating the public database from expenses associated with other technology improvements is difficult to follow and unpersuasive. Indeed, before launching into its rationale for the precise delineation, the memorandum's author concedes that "[b]ecause modernizing the Commission's business processes and supporting IT systems is required in conjunction with deploying the public database, it is challenging to draw a bright line between these efforts." But the thrust of the argument appears to be that all of the funds used to create the database should not be included in its cost, because the accompanying IT modernization improvements and certain features of the database have uses beyond facilitating the public's submission and search of consumer product safety reports.

For example, the memorandum states at page 2 that "regardless of whether a report is a candidate for publication" the agency wants to: (1) drive the public from reporting incidents via the hot line or U.S. mail to an online form on the database; (2) change its standard communication method with businesses from paper forms to online forms via the business portal of the database; and (3) otherwise share with the public through the database valuable information in addition to the reports posted to the database by the public. Through this logic, the creation or upgrade of a public portal to facilitate consumer incident reporting and searching online is *not entirely* a cost of the public database, because the CPSC would have wanted *some* of this upgrade, regardless of the statute's requirements.

While nicely supporting the Chair's goal of minimizing the apparent cost of the database, I believe this carve out is unwarranted. It amounts to writing off a portion of the database's cost simply because certain of its features can also be used to accomplish other agency goals. To illustrate this point, imagine a vacuum purchased for $500 with the intent to clean a floor. The vacuum is then used for cleaning blinds, removing cob webs, and even blowing leaves from the driveway. Does this mean that the vacuum actually cost $300 because $200 was saved that could have been spent to perform the additional work? The same faulty logic – formulated in hindsight to reduce the apparent cost of the database – underlies the reduction of the database's cost from $29 million to $3 million. The features of the database that serve functions beyond facilitating public reporting and searching, including much of the IT modernization work that was an essential prerequisite to the creation and functioning of the database, have been deducted from its cost. But the fact remains that none of the database's features and their uses, nor much of the underlying IT modernization, could have been achieved had the Commission not received and spent funding to design and program the database.

---

[5] CPSC Staff Memorandum, March 8, 2011, Subject line: "Estimated Costs of Public database Development."

Notably, the agency has always *promoted* its IT modernization and database plans as inseparable on the grounds that the former is essential to having a more efficient database. This argument was intended to reduce the risk that the Office of Management and Budget (OMB) or Congress would seek to cut the budget by eliminating funding for either IT modernization or the database. Since 2009, OMB has requested not only our Exhibits 300 and 53 on the database costs, but also a Spend Plan for the Consumer Product Safety Risk Management System ("Database Spend Plan") laying out in more detail the annual costs of the database. In none of these documents does the agency attempt to separate the funds allocated to IT modernization from those dedicated to the public database. On the contrary, a single combined figure has always been presented. The contracts the Commission has let to execute its IT modernization plan and to create the public database also do not distinguish between the two.

The fact that the agency's broader IT modernization efforts have only just begun also indicates that much of the money spent to date directly supported the database. The database became public on March 11, but the work necessary to achieve the IT modernization goals the Chairman discussed at the hearing will not be completed for several years. This includes integrating our different information silos, so that our staff can search across incident reports, field investigations and standards work, and perform more complex statistical searches. So far, we have standardized the way we intake data --a laudable accomplishment considering the agency's multiple internal databases. We have also begun a website redesign, and a plan to begin standardizing incoming data. However, the "IT modernization" piece, even if it could be broken out completely from the public database, is nowhere near complete---even after incurring over $29 million in contract and other costs.

While your question implicitly assumes that either the $3 million or $29 million figure is accurate, I believe that even the $29 million estimate understates the real cost of the database. The $29 million figure represents only the estimated contracting costs through FY 2011. It does not include the hours CPSC staff dedicated to developing the database and preparing for its launch, including managing contracts. Agency projections for the future cost of the database are also misleadingly low. The FTE cost estimates in the CPSC's Database Spend Plan only account for IT employees, ignoring the additional staff needed for data intake, investigations, and legal work associated with the new public database. It also appears to discount the expected increase in incident reports, material inaccuracy and confidentiality claims, and other work likely to be generated by the existence of a searchable public portal for the reporting of product safety incidents and issues.

The Commission's 2012 Performance Budget Request also discounts these expenses. According to that document, the "New and Reallocated Resources" dedicated to "Data Intake, Incident Review, and Investigation" is derived from an extrapolation of the growth trend line for reported incidents and investigations dating back to 2003. If, as is likely, this projection is proved to be too low, the assigned staff will be unable to timely manage all of the information reported through the database. As a result, Commission staff will be even less likely to resolve claims of material inaccuracy within the ten-day

period prior to the posting of unverified information. The Commission will then either request and be provided additional funding in subsequent years, or preside over an increasingly misleading database.

7. On February 16, 2011 the Commission held a public hearing on the technological feasibility of lowering the lead content limit for children's products to 100 ppm this August. Unfortunately, we did not have time on February 17 to discuss the results of this hearing. Overall, did manufacturers and other witnesses provide evidence that they will be able to make the transition to 100 ppm this coming August?

Evidence was presented at the hearing on two issues: the reliability of testing products for lead content as low as 100ppm, and the economic feasibility of actually manufacturing products to that level. With respect to testing, the reliability of lead content testing, as measured by the repeatability and reproducibility of test results, diminishes as the lead levels measured are decreased. However, representatives from several labs testified that they were able to measure lead levels down to 100ppm, albeit with an approximately 10% margin of variability. This means that the lead in a product might need to be 91ppm in order to be consistently measured no higher than 100ppm. In addition, a single portion of a material may have different lead levels at different locations. Thus, a 15 foot steel rod might produce five different lead level readings if measured at five different locations on the rod. This fact also reduces the reliability of testing for lower lead levels, because there is a greater likelihood that lead levels along a single object could rise above or fall below a low threshold.

Manufacturers testified that it was *possible* to obtain source materials with 100ppm of lead or less, but that such materials could *not* be obtained without increasing a product's cost to the point that it is priced completely out of the market for products of its type. For instance, most bicycles on the market today are manufactured from steel comprised at least in part from recycled materials. Such steel could not satisfy a 100ppm standard. But alternatives to recycled steel are available for the manufacturer of bicycles, including virgin steel and carbon based alloys. The problem with these alternatives is that they increase the cost of the product substantially. Virgin steel was estimated to increase the cost of a bicycle's manufacture by approximately 25%. Bicycles constructed of carbon sell for thousands of dollars.

Under the CPSIA, the 100ppm lead limit is technologically feasible if "a product that complies with the limit is commercially available in the product category." A common sense interpretation of the "product category" must take into account the market price of the product. Thus, the fact that a bicycle that costs $100 when made using recycled steel with 300ppm lead can also be manufactured and sold for $2000 if made from carbon containing 50ppm lead does not mean that the latter bicycle is a commercially available substitute for the former. They are different product catergories. Congress' mandate that the CPSC consider technological feasibility should therefore prevent the CPSC from destroying the market accessible to Americans of modest means for bicycles or any other

products, where reduction to 100ppm of lead would meaningfully increase the product's price.

Another relevant issue presented at the hearing is the absence of safer alternatives to lead for obtaining the essential characteristics lead contributes to a metal alloy. Lead increases the tensile strength of steel, permitting it to bend and bear greater pressure without breaking. Lead also adds to the machinability of metal alloy, allowing the punching of small holes while otherwise maintaining the integrity of the material. Lead is also an effective lubricant to reduce the friction of two metals rubbing together, and has therefore traditionally been used in the manufacture of ball bearings. Other substances can also contribute these characteristics to metal alloys, but they are either untested or known to be as dangerous as lead, including antimony.

Questions for the Record: The Honorable Mike Pompeo
March 24, 2011

Commissioner Anne M. Northup
U.S. Consumer Product Safety Commission

1. Do you think paper clips pose a significant threat to children? Do you think it makes sense for the Commission to require testing a paper clip in a science kit but not when attached to a child's worksheets? Do you think it makes sense for the Commission to require testing brass in a child's bedside lamp but not in a child's musical instrument? What can Congress do to return the agency to one that regulates based on risk?

While the CPSIA has forced the Commission to regulate children's products without regard to risk, I believe the Commission's rulemaking has unnecessarily compounded the problem.

As your question suggests, the Commission's final interpretive rule on the definition of children's product is a good example. It imposed the full scope of the burdensome CPSIA regime applicable to children's products – including the requirements that products be reengineered to remove levels of lead that pose no risk of harm, third party tested, certified and accompanied by tracking labels – on many more products than required by the statute, and many that pose no risk to children.

Under the Commission's final interpretive rule on the definition of a children's product, a paper clip contained in a child's science kit is a children's product and therefore must be third party tested to CPSIA lead limits. The same ubiquitous paper clip that secures the papers in every elementary school class room in America is deemed by the Commission to be a "general use product" because it is an office supply that is not primarily intended for use by children. It therefore need not be third party tested and is not required to meet the law's arbitrary lead limits. Obviously, the paper clip is no more likely to present a danger to a child in the one setting than the other. Indeed, younger children, who tend to mouth objects, are much less likely to encounter a paper clip in a science kit designed for older children.

But most importantly, the paper clip presents a danger in neither setting. This is because any lead contained in the item is locked in its substrate and does not present the absorbability potential that defines the real risk of lead to children.

The CPSC's differing treatment of lamps decorated for children and brass musical instruments further highlights this disconnect between actual risk and CPSIA regulation. The CPSIA as construed by the majority requires the reengineering and testing of children's lamps for lead content, while standard-size, brass musical instruments are considered general use products not subject to reengineering and third-party testing. But

standard-size brass musical instruments are often used by children, and brass typically contains lead well exceeding the statutory limits. And both are, in fact, equally harmless because any lead is locked in the product's metal substrate and cannot be absorbed in unsafe levels. Moreover, musical instruments are designed to be handled extensively, whereas a child might touch the brass in a bedside lamp only rarely if ever. There is therefore no logical reason for treating them differently, and both should be excluded from the law's requirements under the absorbability exclusion.

These two examples merely scrape the surface of the absurd distinctions the children's product definition has made. Children, especially after the age of six, do not live in an isolated world populated only by children's products. They turn on lamps all over the house, open drawers in the kitchen and elsewhere, handle keys for the door, and help plant flowers using garden tools. Each of these everyday objects is loaded with lead but pose no risk to a child because the lead is not absorbable. There is no logical reason to impose arbitrarily all of the burdensome CPSIA requirements on one of set of products and not the other, when none pose a risk of harm.

Congress can prevent these absurd outcomes and permit the CPSC to once again regulate based on risk, rather than arbitrary limits, by amending the law's absorbability exclusion so that it is meaningful. This exclusion can be amended so that products that do not contain lead that is absorbable, or bioavailable, to a child in any amount that could be harmful would be exempt from the law's requirements—and such an exclusion could be drafted in a way that the agency would not need to review or approve such products before they are sold. Lamps, school desks, children's sizes of brass musical instruments, books, ATVs, bicycles, toys and all other products that do not contain lead that is absorbable would be able to be produced and sold. Of course, such a change still would not allow lead in paint, solid-lead children's jewelry, or other harmful products to be sold that do contain dangerous amounts of absorbable lead.

Additionally, Congress could simply eliminate all third-party testing requirements from the law. The Commission has other new and more effective enforcement mechanisms that are more reliable than requiring manufacturers to certify to having performed third-party tests. Today, the Commission intercepts non-compliant toys through improved and expanded border control efforts, application of x-ray technology to identify violative lead content, computer databases that flag previous offenders for greater scrutiny, the imposition of higher penalties of up to fifteen million dollars, and the threat of lawsuits and loss of reputation in the market.

Notably, even prior to these improvements, the Chinese manufactured toys containing lead paint that were the impetus for the CPSIA were themselves identified and intercepted using the Commission's traditional methods. The company responsible faced a class action lawsuit and a massive fine.

Following the elimination of mandatory third-party testing, the CPSC will retain its new and longstanding enforcement tools, as well as the authority to impose third-party testing

and other requirements where necessary to address a risk with a specific product or material.

2. Do you think Congress should delay implementation of the Consumer Product Safety Database Rule in order to allow this subcommittee time to revisit the statute and clarify whatever language led the agency to adopt a rule that puts materially inaccurate data into the database?

3. If Congress allows the database rule to be implemented 'as is,' do you think the rule will increase costs for consumers? Drive some safe products from the market? Increase companies legal costs? Distract the agency from genuine long-term risks with the 'headline of the day'?

This answer responds to your questions number 2 and 3.

I believe the Commission should be prohibited from expending any funds for the purpose of launching the Public Database until Congress amends the law to ensure that (1) reports of harm submitted to the Database contain sufficient information to clearly identify the product in question and permit verification; and (2) there is an effective procedure for resolving claims of material inaccuracy before a report of harm is published on the Database.

Section 212 of the CPSIA requires the Commission, subject to the availability of appropriations, to establish and maintain a public, web portal accessible Database on the safety of consumer products. The statute identifies five sources from which the Commission shall receive reports of harm. These are (1) consumers; (2) local, state, or Federal government agencies; (3) child care professionals; (4) child service providers; and (5) public safety entities. CPSIA § 212(b)(1)(A).

Each of these categories of submitters is likely to have first-hand knowledge of the harm reported. They can therefore be expected to provide accurate and reliable information that may be useful to consumers seeking product safety information.

Notwithstanding the statute's clear language, the Commission's Majority adopted a rule that greatly expanded the list of allowable submitters to the Database. For example, the Commission's regulation defines "consumers" to include "attorneys", and "public safety entities" to include "consumer advocates or individuals who work for nongovernmental organizations, consumer advocacy organizations, and trade associations." 16 C.F.R. § 1102.10(a). This expansion goes against the statutory purpose that the Database be "useful" for consumers and not disseminate erroneous information.[1] Indeed, the Majority has expanded the list of submitters to such an extent that ***anyone*** can submit reports of harm—thereby rendering meaningless the statutory language listing permitted submitters.

[1] On the Senate floor, during consideration of the CPSIA on March 5, 2008, Senator Pryor stated: "We have tried to find something that is balanced, that provides information, but also has some filtering so we make sure erroneous information is not disseminated. But the goal of this provision is that the public has the right to know when products are dangerous."

It is important that individuals with first-hand knowledge of incidents of harm involving consumer products be permitted to submit reports to the Public Database. However, groups or individuals with no direct knowledge of the incident, who did not see it happen or do not even know the person that was harmed, should not be permitted or encouraged to submit incident reports to the Database. There are several reasons why first-hand knowledge is essential, but the primary reason is ***accuracy***. A Database full of inaccurate reports from individuals who have second or third-hand information is not remotely helpful to consumers using the Database to determine which consumer product they should purchase.

Soliciting information from sources seeking to promote an agenda unrelated to simply sharing first hand information invites dishonest, agenda-driven use of the Database—diluting its usefulness for consumers. Trial lawyers, unscrupulous competitors, advocacy groups and other nongovernmental organizations and trade associations serve their own agendas and lack an incentive to prioritize accuracy in their reports of harm. Trial lawyers or other groups with self-serving motives will use the Commission's Database to look for potential trends and patterns of hazards. Under the Majority's Database rule, these same groups could also submit to the Database false and unverifiable reports to fuel a lawsuit. It is no coincidence that these groups are strongly in favor of this public Database and of the Majority's interpretation of the statute, which expressly allows them to submit reports of harm.

There are many advocacy groups and associations that serve a role in public policy, but may not have the incentive or ability to provide specific and accurate product identification information to the Commission's Database. For example, the National Fire Protection Association (NFPA) supports government-mandated sprinklers in new homes. One cause of house fires is the use of cigarette lighters, which are consumer products. Thus, the NFPA has a strong incentive to add all reports of house fires caused by lighters to the Commission's public Database. The more incidents in our Database, the better case they can make that new fire prevention technology – which some of their members sell—should be mandated in homes.

But it is not important to the NFPA whether it correctly identifies a brand of lighter in an incident report. A lighter may appear to be the branded product of a particular manufacturer, but instead be a cheap counterfeit. The NFPA is interested solely in reporting house fire incidents; the particular brand of lighter is not relevant to its goal of promoting sprinklers. Meanwhile, the company identified in the report as the manufacturer of the cigarette lighter must defend countless unverifiable and potentially inaccurate claims about its product. Such inaccurate and unverifiable information is of no value to a consumer seeking information on the safest type of lighter.

By inviting trial lawyers, consumer advocacy organizations and trade groups to input reports of harm, the Commission has all but guaranteed that the Database will be a tool for lawsuits, policy agendas and anti-competitive activity. Under those circumstances, it cannot also serve its intended function of providing a reliable resource for parents

seeking useful information about product safety. A Database populated with such information will be no more useful than "Amazon.com", "Yelp.com", or any of the other hundreds of websites where anyone can submit comments on a product, and does not warrant tax payer funding.

The problems caused by over expanding the list of submitters to the Database could have been reduced if reports of harm had to be verified, or at least verifiable, before being published. But the information solicited on the Database is inadequate to this purpose. With respect to the submitter, the Database requires that a "self-verification" box attesting to the report's accuracy be checked. But this will do little to discourage or prevent inaccurate reports of harm. Self-verification in the context of the Database rule means only that the report is accurate "to the best of the submitter's knowledge". The "best" knowledge of someone with no first-hand knowledge is of little value. An individual or group without first-hand knowledge will likely not have the full story of what happened -- including the exact type of product, the recent history of the product, or even the precise cause of the incident.

The scope of product information solicited on the Database under the Majority's rule is also inadequate. The only product information required is the identity of the manufacturer, the name of the product (such as, "highchair") and the approximate date of the incident. This information is insufficient to permit reliable verification that the manufacturer and *specific* product are correctly identified. For example, a recent search of Amazon.com for high chairs manufactured by one particular company produced a list of 137 different high chairs ranging in price from $54 - $148. Given the broad range of identically named, yet distinctive products available from the same company at a single snap shot in time, a report of harm relating to a particular manufacturer's high chair, with no reference to the model, date of purchase or other more specific identifying information, would be of no value.

Carrying this example one step further, consider a scenario: Company A sells five million high chairs and Company B sells 5,000 high chairs. Company A has six incident reports on the Database and Company B has one incident report (all of which are unverifiable). Thus, a consumer could falsely conclude that Company A's high chair is less safe, even though simply due to the number of units it sold, it is more likely that people own that high chair—and more likely that reports on that high chair would make it into our Database. Or, it is also possible that some of the reports about Company A's high chair actually pertained to older models of the high chair that are no longer for sale, which means the information may be entirely irrelevant to people using the Database to look for safety information about current products on the market.

The Majority rejected proposals contained in an alternative Database rule I offered that would have minimized such confusion and would have aided in the verification of reports of harm that are challenged by manufacturers as materially inaccurate. I proposed requiring that (1) reporters of harm include the consumer and/or the victim's identity and contact information with a report (to be held confidential, as is current practice), so that the Commission could obtain additional information to evaluate a manufacturer's claim

of material inaccuracy; and (2) the Database include fields requiring submitters to provide exact product information, such as model number, the approximate date of purchase of the product, and whether the product was purchased "new" or "used", thereby allowing consumers to gauge the age and better identify the specific model.

The Majority also rejected my proposal that the Commission withhold reports of harm from publication pending the evaluation of a substantiated claim of material inaccuracy. Instead, reports about which there is an adequately supported claim of material inaccuracy are posted on the 10th day after they are submitted, unless the Commission can somehow resolve the claim in the brief intervening period. Notably, the Commission's Notice of Proposed Rulemaking on the Database originally included an interpretation similar to the one I recommended. For example, § 1102.26 of the NPR states: "If a request for determination of materially inaccurate information is submitted prior to publication in the Database, the Commission may withhold a report of harm from publication in the Database until it makes a determination."[2] 75 FR 29180. That language could not have been included in the NPR without a legal opinion supporting the permissibility of the policy choice. That the agency apparently believed at one time that this approach is legally permissible, reflects, at a minimum, statutory ambiguity regarding the point.

Not surprisingly given the NPR, most of the commenters assumed that incidents would not be published to the Database pending the determination of a material inaccuracy claim. Although at least one commenter expressed the policy view that reports of harm should go up on the 10th day even when such claims are unresolved, no one—not even consumer groups argued that the statute legally prohibits the agency from withholding reports from publication for the duration of its investigation. To the contrary, several commenters proposed a detailed protocol for addressing claims of material inaccuracy, based on their understanding that reports would be withheld from publication while under review for accuracy. And yet the Majority's final rule forbids delaying publication in those circumstances. Moreover, our agency's fiscal year 2011 appropriations request did not include even a single new FTE to resolve pending claims of material inaccuracy, and our fiscal year 2012 request does not provide sufficient resources to account for an anticipated increase in reports. These facts alone make clear to the business community how low the CPSC prioritizes its responsibility to resolve claims that reports of harm contain false or misleading information about products.

Because the Majority's Database rule all but guarantees that the Database will be flooded with inaccurate reports of harm, it will be less useful for Commission staff in determining hazard patterns than are the current, internal Databases we have today. Frankly, this is one of my greatest fears—that Commission staff will be overwhelmed by inaccurate

---

[2] The preamble of the NPR contains analogous language: "If a request for determination of materially inaccurate information is submitted prior to publication in the Database, the Commission may withhold a report of harm from publication in the Database until it makes a determination." 75 FR 29161. And this: "We propose that in cases where a claim of materially inaccurate or confidential information is under review, the Commission, in its discretion, may withhold a report of harm *in part or in full* until such a determination is made." 75 FR 29170 (Response to summary 26)(emphasis added).

reports (or the reports that get picked up by the media) and unable to use their expertise to search objectively for genuine hazards. As the Database is swamped with reports that inadequately identify the product, and are misleading or inaccurate, such reports will drown out the accurate ones. The flood of reports with potentially inaccurate or incomplete product information, which will be difficult, and often impossible, to verify, will also impose a tremendous burden on manufacturers. Substantial private sector man hours will now be dedicated to understanding and responding to incident reports containing incomplete and often mistaken information. Manufacturers, who might otherwise view the Database as a means to stay ahead of the curve in their ongoing efforts to improve the safety of their products, will have nothing but vague reports and guesswork on which to rely. The resources spent by a company chasing down unverifiable information to avoid reputational damage, would be better dedicated to reviewing incidents known to relate to the company's products or otherwise promoting safety innovations.

Congress could prevent the irreversible damage that unverifiable and materially inaccurate information will cause American businesses, and ensure the creation of a Public Database that is a useful tool for consumers, by prohibiting the Commission from expending any funds for the purpose of launching the Database until (1) the Commission's regulations ensure that reports of harm submitted to the Database contain sufficient information to identify the specific product and to permit verification when there is a pending claim of material inaccuracy; and (2) the Commission has established an effective procedure for resolving a claim of material inaccuracy before a report of harm is published on the Database.

4. How could we salvage this database that the agency has already spent $29M in taxpayers' money on in order to make it useful?

The Database could be an effective tool for consumers if it were redesigned to ensure that reports are submitted only by identified individuals with direct knowledge of the reported incident, such submitters are required to provide contact information and clear, specific product identification, such as the model number, and, in the case of a claim of material inaccuracy, a report may not be published until after the completion of an investigation concluding that the report is not materially inaccurate.

5. Should new federal product safety requirements for cribs, portable cribs, and play yards mean that families who own products that compiled with previous standards not be allowed to sell them on the secondary market even though the products were never found to be defective nor shown to be unsafe?

Regardless of the steps that were taken to bring us to a place where traditional drop-side cribs will no longer be made (a place reached largely aside from the CPSIA's mandates), the CPSIA required the Commission to issue a mandatory retroactive standard for cribs—not just for new cribs, but for used cribs as well. Such a provision is unlike the mandatory standard requirements for other durable nursery goods, such as toddler beds, play yards, or cradles. For cribs alone, the Commission's mandatory standard that goes

into effect this summer ***will make every crib in this country obsolete overnight and unable to be sold***—regardless of whether that crib was ever subject to a recall or ever considered unsafe.

What are the consequences of this provision of the law? First, any young family who has bought a new crib over the past year (not a small investment) will not be able to sell it or donate it to a thrift store after it has been used—even if the crib has fixed sides and is safe. Working families often depend on second-hand due to the high cost of new cribs. While the Commission advises consumers not to use any crib that is over ten years old, the fact remains that the safest place for a baby to sleep is in a crib, and the second-hand market for cribs remains a lifesaver for many families.

Unfortunately, once this provision of the law becomes effective, retail stores and thrift stores will no longer be able to sell fixed-side, safe cribs—a waste not only for those stores but for families in need of affordable cribs later this year or next.

Furthermore, the law goes beyond just a prohibition on the purchase of new cribs. It expressly forbids cribs that do not meet the new mandatory standard (and the CPSC has yet to confirm that a single crib on the market today meets that standard) from being offered ***for use*** by places of public accommodation. Once the new standard becomes effective two years after issuance of the Commission's final rule, day care centers and hotels across the country will have to begin using brand-new cribs that meet the Commission-approved mandatory standard— even if they bought a crib earlier this year that meets the previous ASTM standard (less than a year old), has fixed sides and is completely safe. This is not an insignificant number because of the large number of crib recalls in the past year. Many daycare centers have just recently replaced those cribs with new, safe cribs that will have to be discarded in the next two years. This represents a tremendous waste of money for families, day care centers, and taxpayer dollars that help fund many day care centers.

6. When database defenders say anonymous database complaints are not allowed, does the name and contact information for the actual person who was harmed have to be provided to the Commission? Even if the person harmed is the one reporting, doesn't that person have the option of remaining anonymous to the manufacturer? Must the person who is reporting have first-hand knowledge?

The report submitter must include contact information. But the report submitter need not have any firsthand knowledge of the product, harm or risk of harm. As a result, requiring the contact information of only the submitter is not much different from permitting the submission of an anonymous report. In both cases, the Commission has no means to verify the accuracy of the report or to obtain supplemental information relevant to determining the existence and scope of an alleged product hazard. Without access to a direct witness to an alleged incident, the Commission may also be unable to determine whether a report contains a material inaccuracy. Where a lack of information and inability to contact the product owner or a witness prevents the Commission from determining the existence of a material inaccuracy, a dubious report will remain on the

database.

All reporters of harm, including those who report harm to themselves or their child, are permitted to remain anonymous to the manufacturer.

7. Companies only get 10 business days after a report of harm is sent to them before it is posted to the database under the agency's rule. Is that enough time for them to investigate? Do they get enough information about the incident to be able to tell whether the report is true or not? Are they allowed to follow up with the victim to see what really happened? Are manufacturers able to identify reports that do not contain enough information to assess whether or not they are materially inaccurate? Can they require more information from a reporter of harm?

In many cases, ten days is unlikely to be sufficient time for a manufacturer to determine whether a report identifying its product contains a material inaccuracy.

This is partly because many reports will not contain sufficient detail about the product and incident to guide a manufacturer's investigation. Information essential to this purpose that is not required to be contained in the report, includes: the model number of the product; the date it was purchased; the UPC code; or, any other unique identifying information that would distinguish one product of a particular type from the potentially dozens of others that are of the same general type but are materially different. For example, a recent search of Amazon.com for high chairs manufactured by one particular company produced a list of 137 different high chairs ranging in price from $54 - $148. Given the broad range of identically named, yet distinctive products available from the same company at a single snap shot in time, a report of harm relating to a particular manufacturer's high chair, with no reference to the model, date of purchase or other more specific identifying information, would not permit the manufacturer even to identify the specific product, let alone to gauge the accuracy of a report about the product.

Even a manufacturer provided sufficient information to identify a specific product may not receive enough detail about an incident to understand the role its product played in causing an alleged injury. Moreover, there may be no way to ascertain the truth in those cases where the manufacturer is certain that its product could not have caused an injury in the manner alleged. This is because a third-person reporter is not required to identify the victim or product owner, and access to a firsthand observer of the incident is necessary to resolve issues of fact.

A manufacturer forwarded a vague report has few options. Even where a firsthand observer is identified in the report, the manufacturer is not entitled to such individual's contact information. Without the ability to follow-up with a witness, the manufacturer must base its assertion of material inaccuracy upon the content of the report. In many cases, the report may not contain sufficient information for the manufacturer to ascertain whether it contains a material inaccuracy.

Even with adequate information, 10-days will often be too little time. Obvious cases of

manufacturer misidentification may be discernable within the available window of time. But many products of a more generic nature will be very difficult to distinguish without a much more extensive investigation. I have spoken with manufacturers who have needed over 30-days after receiving a consumer complaint to conclude that the subject product was not their own. And those were cases where the company had access to the product. 10-days will clearly be insufficient in many cases, and as a result, materially inaccurate information will remain on the public database well beyond that point.

8. Under the agency's rule, reports of harm go up after 10 business days whether the inaccurate information in them has been corrected or not. There is no requirement for the agency to act on every report within a certain time frame, is there? If a company believes that a report is not about their product, are they allowed to inspect the product? Or even necessarily follow up with the consumer? What does a company do to respond within 10 days if a ton of information is dumped into the database all at once?

The Commission will not publish a report until the 10th business day after sending notification to the named manufacturer. But the report will be published at that time even if the manufacturer has made an adequately supported claim that the report is materially inaccurate and the Commission has not completed its investigation of the claim. As a result, materially inaccurate information can remain on the site until the Commission completes its investigation and makes a determination. And because there is no fixed period within which the Commission must complete its investigation, inaccurate information can remain on the site indefinitely. Meanwhile, the Commission's efforts to investigate claims of material inaccuracy are hamstrung by its failure to require the identification of victims of harm or firsthand witnesses of incidents raising a risk of harm. There are therefore likely to be many cases where a manufacturer will have good reason to believe a reported incident is either completely false or materially misrepresented (and companies routinely receive these types of mistaken or fraudulent claims) , but neither the manufacturer nor the Commission will be able to obtain the information necessary to resolve the claim. Under those circumstances, the manufacture will be unable to meet its burden and the challenged, but unverified and unverifiable report, will remain on the database forever.

The manufacturer has no right to inspect the product. In those cases where contact information for the product owner is neither provided nor obtainable from the third-party submitter, it would be impossible even for the Commission to inspect the product. Similarly, there would be no opportunity for the Commission to follow up with the consumer under those circumstances. The manufacturer is not entitled to the contact information of a product owner who chooses to remain anonymous.

A company required to respond in a short period of time to a large number of reports about its products would presumably either divert resources to the task or risk the long term publication on the database of inaccurate information about its products.

9. How would something like last year's Pampers investigation be affected by the database? You could have children's medical records and photographs in there forever couldn't you? Even once the agency has exonerated a product like Pampers DryMax diapers, the medical records and pictures would stay because the agency's rule does not require their removal, does it?

It is my understanding that inflammatory or inappropriate photographs will not be included with published web postings. However, there is no mechanism for the redaction of photographs or medical information published on the database, except where the entire posting is removed following a determination of material inaccuracy. The Commission's evaluation of a report's accuracy does not entail consideration of whether the product actually *caused* the harm that a submitter has associated with the product. There is therefore no plan or procedure for removing postings linking particular products with harm, regardless of any conclusions the Commission may reach regarding causation.

Your Pampers example is therefore an apt one. Were the Database an available conduit for consumer complaints at the time of the DryMax scare, it would presumably have been inundated with reports of diaper rashes attributed to the product. Notwithstanding the Commission's failure to find any link between the diapers and the rashes experienced by some children, those reports would have remained on the Database. Notably, it took the Commission months after it initiated an investigation to state publically that it found no link between the new DryMax product and an increase in diaper rash cases, and that public statement also inconclusively reported that the CPSC was still studying the question. The Commission's DryMax experience is not anomalous. Indeed, if history is any indication of the future, it would be rare for the Commission to conduct any investigation and resolve it in ten or fewer days.

10. Will the agency adjudicate accuracy based on claims of causation? If not, won't there be lots of false causation information on the database to mislead consumers?

As noted in response to Question 9, the Commission will not consider implied or direct attribution of causation in its evaluation of claims of material inaccuracy. As a result, it is reasonable to expect that there will be a substantial number of reports that expressly or implicitly attribute an injury or illness to a product defect where no imputation of causation is warranted under the facts. This is one more reason that I believe the database being built by the majority will mislead consumers and mistakenly hurt the reputation of quality products and safety-conscious manufacturers.

11. Does the soft launch show that the database will be successful? If not, why not? Does the fact that only 4 reports of harm out of 1000 were claimed to be materially inaccurate necessarily mean that the other reports were accurate? Or did many of those reports fail to contain enough information for the companies to even assess whether the report was accurate or not?

12. Did the agency learn about any unsafe products during the soft launch that it would not have learned about anyway? Will it recall anything faster than it would have anyway?

It is premature to read much into the numbers, content and outcomes of the reports submitted during the soft launch. Generally, it is my understanding that the numbers of reports coming in have not exceeded the totals traditionally received during a similar time period through other available portals, such as the 1-800 hotline. There is therefore no reason to believe that the agency has learned through the Database of any unsafe products about which it would not otherwise have learned. Similarly, I can think of no obvious reason why the source of a report would impact the speed with which the Commission investigates and, where appropriate, recalls a product. In fact, when the database is launched, the Commission intends an aggressive public campaign to increase its use. If the campaign succeeds in soliciting a greater number of incident reports, the Commission will likely be unable to investigate them at the current rate.

I agree that it is reasonable to assume that there may be few claims of materially inaccurate information because many reports contain insufficient information to permit an assessment. However, no data has been reported to me that either proves or disproves the assertion.

Another potential explanation for the small number of claims of material inaccuracy is that the reports received on the database during the soft launch will never be made public. Some manufacturers may have chosen not to expend their resources challenging as materially inaccurate reports that will never be made public.

13. How much of the agency's recent budgets have been devoted to wasteful spending like designing a new logo or hiring an editor? How much of a cut in the agency's budget would be justified in these economic times?

The Commission has spent $5,329 on a contract for the design of a new agency logo. Once the logo is finalized, it is likely that the Commission will incur additional costs to replace business cards, stationary, signs and other on-going items which typically bear this logo.

The agency hired an editor as a GS-14 at a salary of $105,211. Given the large amount of regulations, guidance and other public documents we issue on a regular basis, I would not consider this to be a waste of agency funds.

More importantly, I am concerned with the ability of our agency to utilize all of the funds it has been given, and believe that the funding we are unable to spend should be cut in the next Continuing Resolution or returned to the U.S. Treasury. The Commission already faced such a dilemma in fiscal year 2010. In June 2010, our agency determined it had $7.1 million in extra funds for the year (including approximately $5.7 million unspent for salaries). This amounted to six percent of our entire annual budget.[3]

[3] http://www.cpsc.gov/pr/northup06042010.pdf

I opposed the majority's decision to reprogram this funding for other purposes and instead requested that it be returned to the Treasury to help pay down the deficit. Our agency was on a steady clip to fulfill its hiring goals, but I did not believe that the Commission's inability to spend its *entire* annual budget (all $118 million) as originally planned required it to invent other ways to spend the money mid-year. Given our massive national debt and a clear desire by the American people to reduce federal spending, returning $7.1 million to the Treasury seemed like a straightforward request.

I have the same concerns with regard to fiscal year 2011 and thereafter— not only for the CPSC but for all federal agencies who do not complete all of their new hiring at the beginning of each fiscal year. Agencies generally are provided funding for new FTEs (full-time equivalents) for the *entire fiscal year*, but may not bring those new employees on board until mid-year or later. The resulting unused salary funds could be recouped in the following ways:

1) In the next Continuing Resolution, Congress could provide only 5.5 months worth of salary funding for any *new* FTEs that have not begun their employment with the agency – and only the exact portion of salaries necessary to fund all other FTEs hired during the middle of the fiscal year.

2) In the next Continuing Resolution, Congress could simply prohibit the Commission and all agencies from reprogramming any money, such as unspent salaries, for other uses—and ensure that this money is returned to the Treasury.

In the midst of a recession and our on-going fiscal crisis, it would be prudent to ensure that all agencies spend only the money they need—and only for the purposes originally appropriated.

14. I understand you voted against the agency's rules treating vinyl plastic film, carpets and rugs, small carpets and rugs, wearing apparel, and mattresses as children's products. Is that because you believe, as I do, that Congress did not intend every consumer product safety rule to be treated as a children's product safety rule?

The Commission, by a 3-2 vote along party lines, decided to ignore the distinction between children's product safety rules and consumer product safety rules, and to require third party testing of children's products to all the rules. Thus, general "consumer product safety rules," such as our flammability regulations for carpets and rugs, are now also "children's product safety rules" under the CPSIA. Manufacturers of carpets and rugs (as well as vinyl, wearing apparel and mattresses) already must adhere to a strict testing protocol for their products. This decision means that whenever they create a ***children's version*** of a product, they will have to do additional **third-party tests** to certify the agency's flammability standards. I opposed this decision, because these new third-party testing requirements were never part of the original standards promulgated by the Commission, and will not address a known risk. In fact, this was another area of the

statute where the Commission ignored the flexibility in the CPSIA to prevent unnecessary new testing requirements and costs in a struggling economy. The Commission easily could have distinguished between "children's product safety rules" and more general consumer product rules of the Commission, and thereby avoided additional third-party testing requirements, where they are neither required by the statute nor risk-based.

Of all of the votes we have taken at the Commission, I had hoped that this would be an easy one. After all, it is unlikely that Members of Congress were anticipating adding new third-party testing requirements to the 2007 mattress standard, the 1970 standard for carpets and rugs, and others when the CPSIA was passed. Unfortunately, due to the makeup of the Commission, I believe it will now take an act of Congress to reverse these requirements and to prevent future "consumer product safety rules" from being caught up in the CPSIA's third-party testing regime.

I would also note that due to the Commission's vague "children's product" definition, it is likely to be difficult for manufacturers to distinguish between a "children's rug" or "children's carpet" and a general-use carpet or rug. This difficult distinction also illustrates the absurdity of requiring carpets and rugs with children's decorations to be sent to a third-party, CPSC-accredited lab for testing (beyond the normal testing requirements of the standard), when the carpet and rugs in the hallway or in the living room of a home, where children also play, are no less safe without these added third-party testing requirements.

15. How do you answer the statement: "There is no safe level of lead"?

I believe it is important to clarify the risks associated with lead. Some advocates say that "there is no safe level of lead", implying that we can never spend enough time and money to reduce or eliminate lead everywhere. But there is, in fact, an *unsafe* level of lead that has been established by our leading scientific agencies, the National Institutes of Health, the Centers for Disease Control and the Environmental Protection Agency. Only lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under.

In order to determine risk, it is necessary to make a distinction between lead that is absorbable and lead that is not absorbable in meaningful amounts. In many other laws relating to absorbable lead levels, standards exist to allow for such minimal absorption. For example, the Food and Drug Administration allows for 0.1 microgram of lead in a one-gram piece of candy.[4] The Safe Drinking Water Act declares "zero lead" to be the objective for the amount of lead in water, but pipes carrying the water are permitted to be 80,000 parts per million (8 percent) lead allowing for negligible, trace amounts to exist

[4] "Supporting Document for Recommended Maximum Level for Lead in Candy Likely To Be Consumed Frequently by Small Children", Food and Drug Administration, November 2006 (http://www.fda.gov/Food/FoodSafety/FoodContaminantsAdulteration/Metals/Lead/ucm172050.htm).

in the water we drink.[5] California Proposition 65[6] as well as the European Union[7] allow for a negligible amount of absorbable (or soluble) lead in children's products. People often are surprised to learn that all children are born with a certain blood lead level, depending on the blood lead level of the mother. Some additional amount of lead (roughly one microgram per kilogram of body weight)[8] is then taken into the body every day through the food we eat and the air we breathe.

So what lead is actually risky? Lead is risky when it is absorbable into the bloodstream at greater than minimal levels. The experts at the CDC and NIH have found that lead paint in old houses and lead in dirt[9] near old gas stations are the main source of environmental lead presenting a danger to small children (http://www.cdc.gov/nceh/lead/). In other words, the *risk of absorbability* from lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high.

In the same vein, a heavily lead-laden metal charm or piece of jewelry that can be swallowed presents a danger, because such an item could get caught in the stomach and absorbed. However, none of these agencies, including the CPSC, has ever found that a child touching a brass musical instrument or a vinyl lunchbox, or riding a bicycle, could ever rub off enough lead, day after day, year after year, to affect his or her health.

Consider the CPSIA's lead requirements in comparison to these known lead hazards in the environment today. The CPSIA's arbitrary lead content limits (currently 300ppm, and moving this August to 100ppm or the lowest achievable level between 100ppm and 300ppm) remove the ability of the Commission to assess risk, or the *absorbability* that exists for a particular product. Thus, the law's lead content levels dictate that the metal handle bars of a bike that pose ***no health risk*** to a child be outlawed right alongside lead paint or a solid-lead charm on a piece of children's jewelry that actually is dangerous.

The CPSIA has led to a ban on children's books published before 1985, because the ink in them is likely to contain lead above the allowable level. Some at the Commission and many Members of Congress have expressed dismay that books have been affected, because children are not likely to eat the pages of old books or ingest more than miniscule amounts of lead after touching their pages. Likewise, youth ATVs and bicycles

[8] Centers for Disease Control, Agency for Toxic Substances and Disease Registry, Toxic Substances Portal: Lead; http://www.atsdr.cdc.gov/PHS/PHS.asp?id=92&tid=22

[9] Although lead in dirt is a proven hazard for small children nearby to old gas stations that used leaded gasoline or certain pesticides, it is notable that the Environmental Protection Agency standard for lead in soil is 400 ppm. See http://www.epa.gov/lead/. This safety standard is less strict than the current lead content standard provided in the CPSIA for children's products, which is 300ppm and scheduled to fall to 100ppm in August of 2011.

are outlawed or must be reengineered even though the lead that is in the hood, handlebars, or hubcaps will not become ingested and absorbed at any discernable level (from hand to mouth touching where miniscule amounts of lead may rub off—not from actually eating the hood, handlebars or hubcaps). Other everyday products such as school lockers, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens are outlawed if they have a toy or game attached to them and are marketed to children, due to the brass found on the tip.

Finally, children do not live cooped up inside of their rooms surrounded only by "children's products." Children live throughout the house, run around outside, and play with adult products such as pots, pans, furniture knobs, door handles, appliances and TV remotes. For example, the new costs associated with this law will affect a young child's lamp (usually turned off and on by the parent) but not the lamp in the den or the living room that a child is as likely to turn off and on. These products do not threaten a child's health due to their lead content, because the lead in them is not absorbable. This further illustrates the absurdity of the CPSIA's requiring the unnecessary reengineering of children's products with lead, while children are just as likely (if not, more likely) to play with everything else in the house.

16. If we amend the law to eliminate third party testing and certification, how will we be sure companies and other manufacturers comply with our laws?

Thanks in part to the CPSIA, the Commission today has enforcement tools vastly improved over those available even a few short years ago. Today, the Commission intercepts non-compliant toys through its extensive border control efforts, application of x-ray technology to identify violative lead content and computer databases that flag previous offenders for greater scrutiny. The CPSIA also increased the incentive for compliance through the threat of confiscated and destroyed violative products at the border, by authorizing the Commission to impose higher penalties of up to fifteen million dollars, and by streamlining its authority to seek criminal penalties. Notably, even prior to these improvements, the Chinese manufactured toys containing lead paint that were the impetus for the CPSIA were themselves identified and intercepted using the Commission's traditional methods. The company responsible faced a class action lawsuit and a massive fine. Today, retailers, private labelers, importers and manufacturers are collaborating to insure against violative products to protect themselves from lawsuits, damage to their reputations, the cost of recalls and loss of inventories.

It should also be noted that the requirement that all children's products be third party tested and certified irrespective of risk is an extremely wasteful way to promote compliance, and draws both industry and public resources away from more effective means. The CPSC is charged with "protecting the public from unreasonable risks of serious injury or death" from consumer products—but we cannot fulfill this mission if our time is spent primarily enforcing the CPSIA, including its complex, non-risk-based, testing and certification requirements.

Because the CPSIA's new requirements are not risk-based, manufacturers are spending time and money simply on "compliance", rather than on improving their products to the benefit of consumers. In fact, many of these requirements amount to massive new paperwork and tracking systems, rather than actual modifications to the products themselves. The American Home Furnishings Alliance writes in a letter to Commissioners:

> "...there has not been a corresponding benefit in the improved safety of children's furniture for children. All the representatives told you that their respective companies have not had to change a single material they use in the manufacturing of their children's product lines since they began testing to CPSIA in 2008....The testing is simply being done to attempt to prove a negative."[10]

Similarly, some industry associations have had very few, if any, safety violations and yet have to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety. The American Apparel and Footwear Association writes in their public comments on the Component Parts rule:

> "As the CPSC continues to issue specific compliance requirements, manufacturers become increasingly wrapped up in ensuring compliance over ensuring product safety. All AAFA members have had long-standing quality control programs in place that have developed based on the product's, production of the product's and the manufacturer's unique circumstances. These programs ***are effective and do not need to be changed.*** To demonstrate, only .0084% of all apparel and footwear sold in the U.S. in 2008 were involved in a recall. Moreover, most apparel and footwear recalls have been drawstring violations – a compliance issue that results from lack of information *not* lack of testing."[11]

17. Would you support the functional purpose exemption? If not, why not?

The functional purpose exemption proposed by Chairman Tenenbaum and Ranking Member Henry Waxman would grant to the Commission the authority to exempt from the CPSIA's lead limits products in which the lead content serves a "functional purpose" so that it is "not practicable or not technologically feasible" to remove the lead in each product or component, and provided that such lead "will have no measurable adverse effect on public health or safety." Notably, this formulation was designed to exempt certain products from lead limits that were arbitrarily set by Congress without regard to risk in the first place.

First, this exemption would be complicated and costly. To implement the exemption, the Commission would need to promulgate regulations defining "functional purpose" and "measureable adverse effect," and to establish standards to govern its review of

---

[10] November 8, 2010, Letter to Commissioners from the American Home Furnishings Alliance.

[11] American Apparel and Footwear Association, Request for Comments, Docket No. CPSC-2010-0037 & CPSC-2010-0038 (August 3, 2010).

manufacturer petitions seeking the exemption. Once in place, the exemption would require the Commission to make product-by-product determinations in response to petitions filed by manufacturers. Petitioning a government agency requires substantial resources, including legal and technical assistance to make the necessary showing. Thus, this petition process likely will be available to only the largest manufacturers that could afford it. Small businesses, again, would be at a real disadvantage.

Commission staff has expressed the view that such an exemption could generate a large number of complex petitions. As a result, substantial Commission resources would be directed toward the pre-approval of a potentially unlimited number of products whose lead content does not have a measurable adverse effect on public health or safety. This pre-approval regulatory role is neither one previously assumed by the CPSC, nor one for which it is currently funded. The Food and Drug Administration is charged with pre-approving products before they are marketed, and it is responsible for a much smaller universe of products than is the CPSC. Yet the FDA's annual budget is in the billions of dollars, whereas the CPSC's FY 2012 budget request is $122 million. It is safe to assume that adding an FDA-like pre-approval function to the CPSC through a functional purpose exemption would turn the agency's safety mission on its head and require unnecessary, expansive resources to pre-approve products that do not even pose a lead risk to children.

I am also concerned that this exemption will be applied subjectively and with prejudice. This concern is reinforced by statements other Commissioners have made that seemingly prejudge the application of the functional purpose exemption to particular products, such as bicycles, without any supporting analysis. Ironically, this would result in arbitrary, non-science based exemptions to a lead limit and a restrictively construed absorbability exclusion that are themselves without a scientific, risk-based foundation. For example, the lead in crystals on a child's jacket serves a "functional purpose" because it makes the crystals shine, but the crystals pose no risk because the lead is not soluble (that is, absorbable or bio-available). However, no matter how low the level of lead in such crystals, it is clear that the majority of Commissioners would not support a petition for a functional purpose exemption to permit crystals on children's jackets. Without even seeing a petition and/or having the benefit of a company's cost analysis, substitute materials evaluations, etc., those supporting the "functional purpose exemption" routinely assume that only specific industries would be helped.

There is something contradictory about the Majority Commissioners' casual attitude toward the need to award "functional purpose" exemptions while also interpreting the law's absorbability exclusion in the strictest manner possible, prohibiting any product with accessible lead from meeting this exclusion. It begs the question: "Are metals that contain small amounts of lead that are not bio-available dangerous to children?" If the answer is "yes," then clearly there should be no exemptions regardless of the functional purpose of the lead in the product—including no exemptions for ATVs or bicycles. If the answer is "no" because, in fact, such small amounts of lead do not pose a risk to children, then all metals where the lead is not soluble or bio-available should be permitted. This would allow manufacturers to continue to achieve the benefits that lead brings, such as strength, machinability, shine and other uses. This effort to construct a new exemption

that does not take into account the science behind the risks of lead reinforces my concern that science will be less of a guide in granting a petition than a preconceived notion of who should or should not be granted such an exemption.

For example, one of the criteria in the Waxman proposal for granting a functional purpose exemption is that it would not expose a child to risk, that is, the inclusion of the item in the product would not raise a child's blood lead level. If a component does not pose a risk to a child on one product, then why would that same component not be acceptable on any other item? The very argument at the basis of the functional purpose exemption is that there are many materials where the lead does not pose a risk to a child that are currently banned Why not acknowledge this and fix the law so that we only ban materials that are actually risky?

That is why I have argued in my testimony that the Absorbability Exclusion in the law be amended so that it is meaningful. This exclusion can be amended so that products that do not contain lead that is absorbable, or bio-available, to a child in any amount that could be harmful would be exempt from the law's requirements—and such an exclusion could be drafted in a way that the agency would not need to review or approve such products before they are sold. Lamps, school desks, children's sizes of brass musical instruments, books, ATVs, bicycles, toys and all other products that do not contain lead that is absorbable in harmful amounts would be able to be produced and sold. The same industries envisioned to be assisted by the functional purpose exemption will achieve relief under this provision, as will any other industries that produce safe products. Of course, such a change would still not allow the sale of products containing dangerous amounts of absorbable lead, such as those with lead based surface coatings and solid-lead children's jewelry.

18. Do you think that the agency's pre-existing rules governing vinyl plastic film, carpets and rugs, wearing apparel and mattresses were already doing an effective job of ensuring the safety of consumer products in these categories? Will treating them as children's product safety rules disrupt the pre-existing (effective) testing requirements?

These rules have been in place for decades and have done an effective job without third-party testing. For example, there have been no recalls of youth carpets and rugs in the last 36 years of the agency's existence. There is absolutely no reason to change a system that has worked. Carpets already have to meet the flammability standard, they already get tested in house, and they can obtain general conformity certificates on that basis. Third-party testing will not improve children's safety. Nor does it make sense to treat so-called youth carpets differently. No child stays entirely in his own room and crawls or plays exclusively on his own rug. Children's rugs do not need different flammability protection than adult rugs. Indeed, every other rug in the house is more likely to have a cigarette dropped or candle tipped onto it than the carpet in a child's room. If this testing made sense, why would we not also require third-party testing for all carpets being laid in elementary schools, day care centers or in babies' rooms? If a wall-to-wall carpet installer arrives at a job to find a crib set up in the room and a mother far along in pregnancy, why

should third-party testing turn on whether the carpet has a juvenile design or not?

There is no doubt that CPSIA regulations treating clothing textiles and mattresses as children's products disrupts a preexisting effective testing regime. The clothing textile rule involves a long-standing and successful guarantee program that is unlike any of the rules promulgated under the CPSA. That regime effectively splits responsibility for determining the compliance of certain fabrics in a way that is not readily amenable to third-party testing.

In particular, the agency recently revised the mattress rule in a painstaking process that carefully weighed the benefits and costs entailed in that regulation. As part of that process, the agency determined that the rule would have an impact of greater than $100 million on the economy, making it the rule with the single greatest economic impact in the history of the agency up to that time. Requiring third-party testing based on an overly literal interpretation of a part of the CPSIA—for which there is absolutely no evidence to suggest it applies to the mattress rule—upsets the careful balance that the mattress rule's design struck. The oddity of overlaying third-party testing and certification on this rule can be seen from the fact that the rule will now require the burning of a queen-sized prototype mattress in an accredited third-party lab to prove the inflammability of a crib mattress several times smaller.[12]

19. Do you think the agency's overreach in treating rules as children's product safety rules has caused job losses and other harm to the economy? What about other rules the agency has promulgated under CPSIA? Which other rules that the agency is still working on pose the greatest threat to jobs?

In March 2009, Commission staff reported that the economic cost associated with the CPSIA is "in the billions of dollars range."[13] Industry associations representing manufacturers of furniture, mattresses, sports equipment, children's clothing and handmade toys, just to name a few, have all told us that they will be saddled with enormous costs, first to reengineer their products to satisfy the new standards imposed by the law, and then to third-party test every component of every product they make to demonstrate compliance with all of the applicable standards, certify based on those tests, attach tracking labels that correspond to all the cohort data regarding testing, and maintain complicated data for years.

Small businesses without the market clout to demand that suppliers provide compliant materials have been hit the hardest. Many report that the new compliance and testing costs have caused them to cut jobs, reduce product lines, leave the children's market completely, or close. A sample list of businesses impacted by the CPSIA, as well as other economic data was attached to my testimony.

---

[12] Note that twin-sized mattresses would not require third-party testing, because they are not primarily designed or intended for children 12 years of age or younger. As clarified in the definition of a children's product, a twin-sized mattress is an example of a product typically purchased for a child under 12 but that would continue to be used all through the teenage years and even beyond.

[13] March 20, 2009, Letter from Acting CPSC Chairman Nancy Nord to Representative John Dingell.

This anecdotal data does not reflect the full breadth of the law's requirements, because the most onerous provisions of the law have yet to go into effect. The law's widest reaching mandate—third-party testing and certification of all children's products for lead content – is stayed until December 31, 2011. In addition, the Commission has yet to implement the law's mandate to third-party test to the phthalates or toy standards. When the CPSC is fully implemented, the entire process companies must go through to produce a toy or children's product will have drastically changed. Under the law, all toys must be tested at third-party labs for lead and phthalates, as well as to the toy standard, ASTM-F963, which the CPSIA made mandatory. As a result, a doll maker will be required to send to a third-party lab to be tested for lead, phthalates and any applicable rules under the toy standard, every component part, including each paint color used on the eyes, each button, the hair, and all of the accessories. After the components are fully assembled, the finished product will need to be sent back to a third party lab for additional testing and certifications related to the toy standard. Companies tell us that these requirements stifle innovation and product variety by erecting significant cost barriers to adding to toys new accessories, new colors, or other variations. For example, a large toy manufacturer told me that his company has had to "de-spec" certain toys in order to afford the law's new costs, which means removing accessories, moveable pieces or other parts – or, in the manufacturer's words, "taking the fun out of toys."

According to a brief small business analysis by our agency, the cost to test one toy could range from $3,712 to $7,348—not taking into account that the toy will likely change to stay competitive for the next Christmas season, or sooner, and every material change triggers a whole new set of tests.[14] And these costs do not include the cost to certify to these third-party tests, to add a tracking label, or to maintain the data and paperwork so that every component and material can be traced back to its specific test and lot number. All of these steps are required by the CPSIA without any regard for whether the product presents a safety risk.

In fact, while the costs to companies of reengineering products to meet the lead limits has been steep, many tell us that the ongoing costs to third party test, label and track every component have been and will continue to be much higher—all without any measurable benefit. A company making furniture for children's rooms would need to: 1) determine if its product is "primarily intended" for children 12 and under—an issue for which the Commission has provided ambiguous guidance; 2) submit for testing to a third-party lab every part of every piece of furniture that may be accessible on a children's product, including nuts, bolts, and varnishes (one piece of furniture may have fourteen different coats of finish); 3) certify each component based on each of these tests; 4) add to each piece of children's furniture a tracking label containing a lot number that can trace each component to its specific certification and test; 5) maintain records for all tests and certifications for all parts of each children's product; and 6) start this process all over again, if they decide to make a material change to the product, including a change of color or manufacturing process.

---

[14] Regulatory Flexibility Analysis: Testing and Labeling Pertaining to Product Certification, 16 CFR Part 1107, Notice of Proposed Rulemaking, CPSC Docket No. CPSC-2010-0038 (May 20, 2010).

One furniture manufacturing company reported that it spent approximately $13 million putting together a testing, tracking, and labeling system for its children's furniture, even though not one of its components exceeded the new lead limits or otherwise needed to be replaced. There was clearly no safety benefit, yet the company has faced enormous costs. Large and small companies alike must hire a lawyer or other outside expert simply to ensure they understand the extent to which their products are impacted by various provisions of the law.[15]

The CPSIA fails to make any distinction between large and small businesses, or foreign and domestic manufacturing, thus giving an obvious competitive advantage to large manufacturers who produce items overseas, where manufacturing and testing costs are cheaper. Meanwhile, the backbone of our economy, small businesses—from screen printers to manufacturers of chemistry sets for schools—are being forced to cut jobs or take other drastic measures due to the cost of compliance.

The CPSIA third-party testing requirements and lead content standards are far more stringent than the requirements governing products sold in the EU, Japan and other major markets. As a result, preexisting rules governing the export of domestically manufactured products that do not satisfy United States product safety standards erect a significant barrier to domestic manufacturing growth. A company wishing to sell in a foreign market a product that is in compliance with foreign standards but not CPSIA standards, can only manufacture it in the United States for export if the product has never been in commerce before, and if it undergoes a lengthy pre-approval process by both the CPSC and the receiving country. The CPSIA's new onerous requirements, combined with the difficult process for exporting products not meeting United States product safety standards, will encourage more businesses to move their manufacturing operations overseas. The CPSIA thereby undermines the economic imperatives of increasing both employment and exports, and is inconsistent with President Obama's exhortation that American companies relocate their manufacturing to the United States.

20. Should rules promulgated under the CPSIA be evaluated under a cost-benefit analysis? Is it too late to do that?

The Commission has received a considerable amount of anecdotal evidence from companies and trade associations regarding the costs to test at independent labs, as well as the cost of certification, tracking labels, continued testing, record keeping, testing to product standards, and the potential reputational and litigation costs that will result from the upcoming Public Database. Our staff has compiled some sample testing costs for toys and bikes, as part of a Regulatory Flexibility Analysis for our Testing and Labeling Rule. But the Commission has never conducted a full cost-benefit analysis of any regulation we have promulgated under the CPSIA. Moreover, the CPSC may lack the expertise to do so for complex regulations like our Testing and Labeling Rule, and such analyses should therefore be performed by qualified contractors.

---

[15] "Mattel Finds CPSIA to be a Challenge", *Product Safety Letter*, November 9, 2009.

I believe such analyses would reveal that much of our CPSIA mandated regulation cannot be justified. To begin with, there is no scientific evidence suggesting there is any benefit from many of the law's requirements. For instance, no government health agency, including the CPSC, has ever concluded that the components of children's products containing either 300ppm lead content or the interim-banned phthalates pose a safety risk to children. And until directed to do so by Congress in the CPSIA, the Commission did not make ASTM-F 963 a federal standard, nor require all toy manufacturers to third-party test to this standard, because the Commission did not believe such actions would reduce the risk to children. Regarding lead, the Environmental Protection Agency (EPA) and the Centers for Disease Control (CDC) report that in 1978, about 13.5 million children ages 1-5 had elevated blood lead levels. However, by 2007-2008, this number had declined to about 250,000 children.[16] Similarly, 2007 data indicates that nationwide, one percent of children selected for testing (and only high risk children were selected) showed an elevated blood lead level as established by the CDC. This number was down from nearly eight percent in 1997,[17] and is likely attributable to the elimination of lead in gasoline, as well as lead paint education and abatement. The CDC and the EPA have issued guidance for reducing children's exposure to lead, and neither has ever suggested that parents take away a child's bicycle because of the lead in the substrate of the metal comprising the spokes, pedals or handlebars. Nor has it ever been argued that the CPSIA, with all of its costs, will lower the number of children reaching the "tipping point" of having an elevated blood lead level.

Because the CPSIA's new requirements are not risk-based, manufacturers are spending enormous amounts of time and money satisfying arbitrary standards, rather than on improving the safety of their products to the benefit of consumers. In fact, many of these requirements amount to massive new paperwork and tracking systems, rather than actual modifications to the products themselves. The American Home Furnishings Alliance writes in a letter to Commissioners:

> [T]here has not been a corresponding benefit in the improved safety of children's furniture for children. All the representatives told you that their respective companies have not had to change a single material they use in the manufacturing of their children's product lines since they began testing to CPSIA in 2008....The testing is simply being done to attempt to prove a negative.[18]

Similarly, some industry associations have had very few, if any, safety violations; yet, they are required to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety. The American Apparel and Footwear Association writes in their public comments on the Component Parts rule:

> As the CPSC continues to issue specific compliance requirements, manufacturers

[16] http://www.epa.gov/opeedweb/children/body_burdens/b1-graph.html

[17] http://www.cdc.gov/nceh/lead/data/national.htm

[18] November 8, 2010, Letter to Commissioners from the American Home Furnishings Alliance.

> become increasingly wrapped up in ensuring compliance over ensuring product safety. All AAFA members have had long-standing quality control programs in place that have developed based on the product, production of the product and the manufacturer's unique circumstances. These programs are effective and do not need to be changed. To demonstrate, only .0084% of all apparel and footwear sold in the U.S. in 2008 were involved in a recall. Moreover, most apparel and footwear recalls have been drawstring violations – a compliance issue that results from lack of information not lack of testing.[19]

The law imposes on small businesses onerons requirements that are hurting the economy, without any evidence of a safety benefit. The CPSIA's lead content standard, interim-ban of phthalates, and all third-party testing requirements are not based on risk. The CPSC has the authority to impose these types of requirements on any product or industry, if it determines that a risk exists and these costs are necessary to reduce or eliminate the risk.

Finally, there is a cost to consumers—not only in the loss of jobs in a struggling economy, but the loss of choice. Many manufacturers can afford the costly mandates of the law only by reducing their prodnct lines, leaving the children's product market, or "de-specing" their toys – with no offsetting improvement in safety. The costs of complying with the CPSIA will discourage newcomers to the market and choice will be reduced, even as prices increase. Some international toy makers have even decided to leave the American market due to the costs imposed by the CPSIA, although they are still offering their products to European consumers.[20]

There is thus overwhelming anecdotal evidence suggesting that the costs, both economic and intangible, to the economy, businesses and consumers far outweigh any minimal improvement in safety that could be attributed to the CPSIA. Congress could prevent further harm by prohibiting the Commission from expending any funds for the purpose of undertaking any further regulatory action without first performing a full cost-benefit analysis and making a finding that the cost of the action is justified by its expected benefits.

UNITED STATES
CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

Memorandum

Date: March 8, 2011

TO : [redacted]

FROM : [redacted]

COPY : [redacted]

SUBJECT : Estimated Costs of Public Database Development

The purpose of this memorandum is to describe the major cost components of the Consumer Product Safety Risk Management System program (CPSRMS) in both functionality and cost including our estimate of the costs for the public database.

Background:

Section 212, Section 6A of the Consumer Safety Improvement Act consists of two major requirements: 1) the implementation of the public facing database, and 2) the modernization of the Commission's information technology systems.

Prior to the completion of the modernization, most of the CPSC's business processes use many, small, disconnected information systems. Commission staff are unable to efficiently and effectively pull together required, available data because of these "stove piped" systems. Staff must store and manually maintain too much critical information outside of the legacy systems; A situation that places an unwarranted dependency on a small number of key program area staff with expert knowledge in a particular field and supporting data.

IT Modernization Scope:

The modernization will improve our ability to make effective use of all of our available information. It will enable Commission staff to receive data from and communicate with consumers, businesses, retailers, and professionals (e.g., fire marshals, medical examiners) with unprecedented speed and effectiveness. It will improve data quality, reduce or eliminate manual and redundant processing, and make better use of the collective knowledge of the staff in a way that helps the Commission learn about emerging hazards quickly.

During the initial CPSRMS phase we have improved how we collect reports from consumers and professionals. The quality of those reports has improved because of a better incident report process and forms on SaferProducts.gov. Since soft launch, online consumer reports, hot line calls, press clippings, and death certificates go in via the same "front end" and are coded

consistently regardless of their ability to be published in the database. We have eliminated many of the redundant and inefficient steps required to code and share this information with businesses. And, we have begun to improve the way that that the information is analyzed by providing better tools to make more data available.

We have also improved how we interact with businesses. Prior to this modernization, too much staff interaction with consumers and businesses was transacted by U.S. mail. For example, incident reports requiring 6C comment are batched and mailed to businesses for comment once a month. The businesses correspond by U.S. mail in a slow process not conducive to time-sensitive safety related work. With our recent soft launch, businesses and Commission staff are able to securely exchange information electronically regarding potentially publishable reports. Businesses may provide general comments and make claims of material inaccuracy or confidentiality. In future releases, we plan to expand the business portal to cover Section 15, 6C, and other common correspondence.

We are bringing the Commission's home page, CPSC.gov, in line with the times to improve public outreach and education. A critical component of this project is cleaning up the thousands of published documents to help the consumers and businesses find what they are looking for much faster.

Finally, business and information technology changes have significant risk of failure. We have implemented IT governance improvements including improvements in contract management, IT budget management, Capital Planning and Investment Control, Enterprise Architecture, Information Assurance, Project Management Office, and Independent Verification and Validation. Most of these efforts are focused to improve the CPSRMS program.

Public Database Scope:

The major IT functionality unique to Section 6A includes 1.) replacing our pre-CPSIA online incident reporting form with 6A compliant form (e.g., requires mandatory questions), 2.) providing businesses with a portal where they can register, view reports, and comment, and 3.) providing public search that includes reports that meet the 6A criteria for publication. Because modernizing the Commission's business processes and supporting IT systems is required in conjunction with deploying the public database, it is challenging to draw a bright line between these efforts. Three examples illustrate this.

First, regardless of whether a report is a candidate for publication, we want to drive the public from reporting incidents via the hot line or U.S. mail to an online form that will, as far as possible, pre-code information to make it more accurate. Second, regardless of whether a report is a candidate for publication, we want to change our standard communication method with businesses from paper forms sent in via U.S. mail to cheaper, faster, and more accurate online forms via the business portal. Third, the CPSC has a lot of good information to share with businesses, consumers, and professionals. Our website, search engine, and currently published information should be cleaned up and redesigned to improve this information sharing regardless of 6A's requirement to make certain reports of harm publically searchable.

Cost Breakout:

The Office of Management and Budget released funding for the CPSRMS program in September 2009. CPSRMS has been executing for three fiscal years and is on schedule to shift largely to operations and maintenance in fiscal year 2013. The table below is from our most recent OMB Exhibit 300 and summarizes CPSRMS spending by fiscal year.

CPSRMS Costs

(Includes IT Modernization and Public Database)

Table 1: SUMMARY OF SPENDING FOR PROJECT PHASES
(REPORTED IN MILLIONS)
(Estimates for BY+1 and beyond are for planning purposes only and do not represent budget decisions)

	PY-1 and Earlier	PY 2010	CY 2011	BY 2012	BY+1 2013	BY+2 2014	BY+3 2015	BY+4 and Beyond	Total
Planning:	1.473	0.503	0.840	0.400	-	-	-	-	3.216
Acquisition:	7.167	8.818	2.717	5.234	0.846	-	-	-	29.672
Planning & Acquisition Gov. FTE Costs:				5.424	0.846	-			32.887
Subtotal Planning & Acquisition (DME):	8.640	9.321	3.557	5.424	0.846	-	-	-	32.887
Operations & Maintenance:	-	1.244	2.064	2.913	3.594	2.748	2.748	2.748	18.060
Disposition Costs (Disposal):	-	-	-						-
Disp. Disposition Government FTE Costs:									
Subtotal O&M and Disposition Costs (SS):	-	1.244	2.064	2.913	3.594	2.748	2.748	2.748	18.060
TOTAL FTE Costs:	0.314	0.813	1.360	1.910	3.000	3.036	3.097	3.097	16.695
TOTAL (not including FTE costs)	8.640	10.565	5.620	8.336	4.440	2.748	2.748	2.748	50.947
TOTAL (including FTE costs)	8.955	11.476	11.980	10.336	7.440	5.784	5.845	5.845	87.643
Number of FTE represented by Costs:	2	4	7	11	17	17	17	17	

The CPSRMS program described in the spending table above includes several components. Below are some common questions and answers.

Q: How much money have we spent on the CPSRMS program as of the public database launch in March 2011?

A: We have obligated approximately $23.2 million from the end of FY 2009 to now for the entire CPSRMS program.

Q: How much IT money has been spent on the public database and what are its future projected IT operations costs?

A: We do not breakout the costs of the public database from the other CPSRMS phase 1 project costs (much of which have to do with IT modernization). The estimate below of the work within CPSRMS to develop the public database has been done in hindsight according to the scope of the public database scope above.

CPSRMS Costs for Public Database

	FY 2009	FY 2010	FY 2011	FY 2012	FY 2013	Total
Development	$1.450	$1.000				**$ 2.450**
Operations and Maintenance		$0.400	$0.050	$0.050	$0.050	**$ 0.550**
Total	**$ 1.450**	**$ 1.400**	**$ 0.050**	**$ 0.050**	**$ 0.050**	**$ 3.000**

Please note that the costs (in millions) above include contracted goods and services by fiscal year. Costs in fiscal years 2009 and 2010 are based on actual obligations. Costs in fiscal year 2012 are for planning purposes. Costs in fiscal year 2011, while currently under continuing resolution, are a mix of the two.

Q: When are you finished with CPSRMS development and what will this development cost?

A: CPSRMS development ends in fiscal year 2013 at an estimated cost of $32.887 million. The program completes shifting to operations and maintenance with continued costs of approximately $3 million per year.

Q: What are you working on in the CPSRMS program after the public database is launched in March 2011?

A: When we comply with 6A in March 2011, we shift the remainder of our work to improving the operational processes and supporting IT systems described under "IT Modernization Scope" above.

Questions for the Record

Wayne Morris, Vice President

Association of Home Appliance Manufacturers

Questions on the U.S. Consumer Product Safety Commission

Public Incident Database

March 21, 2011

Questions from the Honorable Mary Bono Mack:

Question 1: **How could the database provisions be revised to make them more workable without giving manufacturers the ability to game the system and block all complaints?**

We believe that the database could be revised in several ways that would ensure greater accuracy and would not allow manufacturers to "game the system."

a. Manufacturers should be allowed more time to respond to the initial incident. It is extremely difficult to gather and analyze the necessary information from a variety of sources relating to a consumer's complaint in 10 days.
b. The initial reports should be restricted to those individuals that have direct information on the incident or a care-giver for that individual. CPSC should not have created the opportunity for non-involved parties such as trade associations, consumer activist groups, or trial lawyers to add information to the database.
c. We have already seen, during the soft launch, instances of consumers stating mere opinions about whether a product is safe, unrelated to an alleged incident, and CPSC doing nothing to restrict from the database highly inflammatory comments without merit or even any evidence.. CPSC should be required to limit database postings to actual reports of harm or of near-harm situations and not someone's mere opinion on a product.
d. Information and reports should not be released to the public database until claims of material inaccuracy are settled. At present, CPSC has said it will "try" to resolve these claims but feels bound to publish a report 10 days after the manufacturer has received it. The CPSC Chairman said in her testimony that out of over 700 reports in the soft launch only 4 have resulted in claims of material inaccuracy. This indicates that, as AHAM testified, there likely will be relatively few reports about which manufacturers will claim material inaccuracy but those are critical to resolve fairly and expeditiously. CPSC

should be required to finalize those determinations before publishing the reports.

e. CPSC should require the reporting of model numbers or other distinct identifiers where applicable and available. In this manner, reports can be linked together, information can be made specific to the item in question, manufacturers who may not be allowed to have customer identification may have some opportunity to evaluate the allegation ,and consumers ultimately will be better served with itemized information on the products. As it stands now, consumers could register an incident about a Brand X dishwasher, when the issue probably resides, if at all, with only one model or model type. Without this critical information, the database will serve no useful purpose to the consumer or to the manufacturer trying to search for like incidents and to discover what a root cause may be.

Question 2. **You indicated at the hearing that retailers may sell brands of the same product made by different manufacturers. Does this pose a problem for manufacturers under the CPSC's rules for the database?**

Yes, we believe that consumers will likely report on a Brand of a product, without the necessary information on the model or model type. As we mentioned above, without that specific information manufacturers may often not be able to ascertain if the alleged incident even applies to a product they manufacture and ultimately the database loses its original purpose of assisting consumers and manufacturers in tracking down and evaluating safety issues. Likewise, Brand owners may choose not to make the effort to timely send the reports to the actual manufacturer. We believe that both Brand owners and the manufacturers associated with that Brand by model or platform of models should be able to register with CPSC which should transmit that information to both parties. If multiple manufacturers are building two or more models under a particular product type, it is important to identify the specific model and manufacturer where feasible. Time is of the essence in this reporting sequence. It is important that manufacturers have the information about potential problems as quickly as possible so that they may search and evaluate, other similar reports, for example. Without the specific model information, the database truly becomes just a "complaint" forum, which we are already seeing in the soft launch.

Rick Woldenberg's Responses for the Record
February 17, 2011 Commerce, Manufacturing, and Trade Subcommittee:
"A Review of CPSIA and CPSC Resources"

Congressman Mike Pompeo

1. **Did your company have to buy a copy of the F-963 standard? Why? How much did that cost?**

   Our company has purchased several copies of ASTM F963 over the years. According to the ASTM International website (http://www.astm.org/Standards/F963.htm), the current cost of F963 is $62, or $74 (redline version). [This means that the ASTM literally charges companies EXTRA to figure out what changed in this legally-mandated standard.] To my knowledge, this standard is only available from the ASTM. Ironically, even the CPSC is unable to provide access to this document (as acknowledged in this CPSC Powerpoint presentation http://www.cpsc.gov/BUSINFO/intl/toyweb2_en.pdf) which casts doubt on its ability to guide companies attempting to comply with the law. The lack of access and cost of access to this standard certainly makes compliance burdensome for small businesses.

   The F963 standard has been updated regularly over the years, and we need to have access to the current version of the standard at all times. Until the CPSIA was enacted, the F963 standard was the tacit equivalent of a mandatory standard because the toy industry adopted it as a "voluntary" standard with the encouragement of the CPSC. At one time, voluntary standards were the preferred way the agency regulated many industries, including our industry. We have always used the F963 standard as a reference in product development and safety administration and frequently tested for compliance with the standard.

2. **You've been dealing with all of the agency's rules for the last few years. By my reckoning, an entrepreneur with, say, a good idea for a board game would have to pay to buy a copy of F-963 from ASTM (not a small price to pay for some small or start-up toymakers). Then, because the standard is literally dozens of pages long of densely spaced text, he'd have to hire a lawyer to tell which parts of the standard apply to his product. Then, he'd have to find a third-party test lab to test and certify a random sample of his actual production line for compliance with all of the F-963 requirements. And, if any product fails, you are basically back to the drawing board. And, of course, he'd have to do all this before ever selling a single toy. Do you think the next board game entrepreneur (e.g., Trivial Pursuit) might have a hard time getting off the ground under this regime? Has this agency effectively killed entrepreneurship in the toy market? Does a start-up company stand any chance of being able to navigate the CPSC's new rules and regulations on its own?**
