Before costs can be allocated across these five business sectors, a more general cost allocation is necessary, specifically how much of the regulatory burden falls in the aggregate on businesses. This task requires a delineation of the regulatory burden that falls initially on business from the burden that falls initially on individuals and state and local governments. As discussed in Section II, the report does not attempt to map out the subsequent shifting of this burden from businessas to individuals (*e.g.*, in the form of higher retail prices) or from one business sector to another (*e.g.*, in the form of higher energy prices or health insurance premiums). It is worth emphasizing that all regulatory costs are — and can only be — borne by individuals, as consumers, as workers, as stockholders, as owners, or as taxpayers. In other words, the distinction between "business" and "individual" is one that focuses on the compliance responsibility, fully recognizing that ultimately all costs must fall on individuals. Moreover, the degree to which businesses are able to shift compliance costs forward onto consumers can only be determined with highly specific information about the market elasticities. For example, without the price elasticity of demand, we cannot determine with any level of certainty

what percentage of the regulatory cost will be shifted forward beyond the statutory incidence.

A second rationale for attempting to apportion costs between businesses and individuals is that the incidence of costs across different sectors of the economy is potentially quite important from a policy perspective, and the consumer costs cannot be allocated to the different classes of businesses. As a final introductory comment, some of the costs of federal regulations fall on state and local governments. Homeland security regulations are a good example of such costs. These costs borne by state and local governments are bundled with those borne by individuals to keep a relatively tractable division in business versus non business costs.

The cost allocations for each type of regulation are shown in Table 9.

Table 9. Allocation of Compliance Cost Incidence to Business

Type of Regulation	Business Incidence (% of Category Costs)	Other Incidence (% of Category Costs)
Economic	50	50
Environmental	65	35
Tax Compliance	60	40
Occupational Safety and Health, and Homeland Security	97	3

The allocations shown in Table 9 generally employ the same methodology used in Hopkins (1995), and Crain and Hopkins (2001), and Crain (2005). The allocation of environmental regulations is based on the compliance data reported by the

Environmental Protection Agency.[33] In the absence of allocation data for economic regulation, a default judgment of 50-50 is applied. The allocation for federal tax compliance uses the apportionment data from the IRS as shown in Table 4. Occupational Safety and Health, and Homeland Security are allocated 97 percent to businesses and 3 percent to other. This assumption is consistent with the empirical evidence that the labor supply function is relatively inelastic, and therefore safety and health costs are not immediately shifted onto consumers.[34] The assumption is that a small share (3 percent) of estimated homeland security costs is borne by state and local governments and individuals.

Allocation of Regulatory Costs Across Business Sectors

The second task is to allocate the business portion of regulatory costs among the five major sectors. These five sectors generally follow those in Hopkins (1995), Crain and Hopkins (2001), and Crain (2005) to facilitate comparisons over time. The sectors are based on the Census Bureau's North American Industry Classification System (NAICS), in some cases aggregating categories.[35] For example, the NAICS separates wholesale trade and retail trade, and these are combined in this report. Table 10 lists these allocations by sector and the sources and methods used. A more complete description of the allocation basis for each type of regulation is described in turn.

---

[33] Environmental Protection Agency, "Environmental Investments: The Cost of a Clean Environment," EPA 230-11-90-083, November 1990, pp. 2-5.

[34] Moreover, this assumption is similar to that used by the Congressional Budget Office that payroll taxes are borne fully by workers (and therefore not shifted forward onto consumers through price increases). See the discussion in Jonathon Gruber, *Public Finance and Public Policy*. New York: Worth Publishers, 2004, pp. 539-540.

[35] The NAICS data are from the U.S. Census Bureau website: http://www.census.gov/epcd/naics02/naicod02.htm

Table 10. Allocation of Business Regulatory Costs to Sectors (Percentages)

Type of Regulation	Sectoral Allocations					Sources and Summary of Methods
	Manufacturing	Trade	Services	Health Care	Other	
Economic	12	18	46	13	11	BEA (Value added share of private GDP); SBA (Employment share of private workforce)
Environmental	54	0	0.3	1	45	Hazilla and Kopp, 1991 (Compliance Costs by Sector)
Tax Compliance	3	14	58	7	17	IRS, Statistics of Income (Sector share of total returns filed, weighted by cost of filings)
Occupational Safety and Health, and Homeland Security	14	18	49	12	8	SBA (Employment share of private workforce); BEA (Value added share of private GDP)

Economic Regulations. Regarding economic regulations, the cost allocations are based on a weighted average of two components: (i) the sector's value added to GDP divided by total private sector GDP, and (ii) the number of employees on the sector divided by total private sector employment. [36] The average for each sector is weighted by

[36] The source of the value added to GDP by sector and the private sector GDP data is the Industry Economics Division, Bureau of Economic Analysis (BEA), U.S. Department of Commerce. The data used were released on April 28, 2009. The source for the employment data is U.S. Small Business Administration, Office of Advocacy, "Statistics of U.S. Businesses: Firm Size Data," website: http://www.sba.gov/advo/stats/data.html.

the share of non-OSHA workplace regulations on the sector. That is, a sector's employment share gets a slightly higher weight where regulations such as "labor standards" or "labor management relations" are likely to have a larger impact.

Environmental Regulations. The sector allocations for environmental regulations are taken from Hazilla and Kopp.[37] Almost all of these costs fall on the manufacturing sector (54 percent) and the "other" sector (45 percent). The "other" sector includes such businesses as coal mining, ore mining, oil and gas extraction, coal gasification, and electric utilities, all of which are heavily affected by regulations promulgated under the Clean Air Act and the Clean Water Act. The remaining one percent of environmental costs falls on the health care and service sectors.

Federal Tax Compliance. The allocation of federal tax compliance costs is derived from IRS Statistics of Income data that indicate the number of returns and forms filed by each type of business by sector, sole proprietorships, partnerships, and corporations. These data are summarized in Table 11.

[37] Michael Hazilla and Raymond Kopp (1990), "The Social Cost of Environmental Quality Regulations: A General Equilibrium Analysis," *Journal of Political Economy*, Vol. 98 (4), p. 858.

Table 11. Cost Allocation for Federal Tax Compliance

	Sole Proprietorships	Partnerships	Corporations	All Businesses	
Total Number of Returns / Forms Filed	39,503,733	3,445,433	6,922,433	49,871,600	
Share of Forms:					
Manufacturing	2%	2%	5%		
Trade	12%	8%	18%		
Services	56%	80%	52%		
Health Care	9%	2%	8%		
Other	22%	9%	18%		
Compliance Costs (in Millions of 2009 $):					**Cost Share**
Manufacturing	475	289	2,417	3,181	3%
Trade	3,642	1,335	8,451	13,429	14%
Services	16,943	13,991	24,871	55,805	58%
Health Care	2,645	409	3,819	6,874	7%
Other	6,626	1,520	8,549	16,695	17%

Occupational Safety and Health, and Homeland Security Regulations. The costs of homeland security regulations are allocated based on each sector's share of value added to private sector GDP. The costs of occupational safety and health regulations are allocated based on each sector's share of private sector employment. The sum of these two sector costs then determines the overall sector share.

Allocation of Regulatory Costs by Firm Size

The third task of this study involves allocating the costs of regulations by firm size. As noted above, this study adopts a three-division scheme: firms with fewer than 20 employees ("small"), firms with 20 to 499 employees ("medium," or "mid-sized"), and firms with 500 or more employees ("large"). The specific allocation procedure differs for each type of regulation, and the procedures are described below.

Starting with economic regulations, the cost allocation among the three firm size groups uses a two-step procedure. Step one seeks to separate the total regulatory costs for the sector into two components, those that apply to all firms and those that explicitly exempt small firms (those with fewer than 20 employees). In step two, for the nonexempt regulations, the procedure follows Crain and Hopkins (2001) and Crain (2005) and allocates these costs based on the share of payroll expenditure within each firm size category (shown in Table 8 above). For example, in the manufacturing sector, small firms generate 7 percent of payroll within the sector, medium-sized firms generate 31 percent, and large firms generate 62 percent. This procedure is used because payroll expenditures are the best available proxy for the economic activity by firm size. The portion of economic regulations from which small firms are exempt is approximated using the share of costs that were exempt in the Johnson 2005 study. This historical share is then multiplied by the currently estimated cost of economic regulations to estimate exempted costs. These exempted costs are then reallocated to the medium-sized and large firms based on their respective employment shares. In other words, the aggregate costs of economic regulations include some regulations that exempt small firms and these exempted costs are reapportioned to mid-sized and large firms. The costs reapportioned to mid-sized and large firms are sector-specific, and based on the relative employment shares by firm size in each sector.

The methodology used to allocate the cost of environmental regulations by firm size is described in detail in Appendix 5 and is relatively easy to summarize. The procedure uses multiple regression analysis to estimate the relationship between pollution abatement costs (PAC) per employee and firm size, measured by the number of employees per firm. The model regresses firm compliance costs per employee against the number of employees, controlling for other factors. The regression results indicate that a 1 percent increase in firm size (measured in terms of the number of employees) corresponds to a 0.43 percent decrease in pollution abatement costs per employee. In essence, this parameter estimates the degree of economies of scale in compliance costs.

This "economies of scale" parameter value is used to solve for the median cost per employee within each firm size category for each business sector. To state the problem differently, given the economies of scale parameter and the share of employees within each size class, what per-employee cost for the three firm size classes would yield the overall sector average cost? Other studies are consistent with this finding of economies of scale in environmental regulatory compliance, although Becker (2005) finds that economies of scale differ depending on the type of pollutant.[38]

---

[38] See, for examples, Thomas J. Dean, Pollution Regulations as a Barrier to the Formation of Small Manufacturing Establishments: A Longitudinal Analysis, Office of Advocacy, U.S. Small Business Administration: Washington, D.C., 1994; and Thomas J. Dean, *et al.*, "Environmental Regulation as a Barrier to the Formation of Small Manufacturing Establishments: A Longitudinal Analysis," *Journal of Environmental Economics and Management* 40, 2000, pp. 56-75. These two studies suggest that regulatory costs lower the startup rate for new firms, especially in the manufacturing sector, because of its higher capital requirements from environmental and other types of regulations. They also indicate that environmental regulations increase the minimum efficient scale of production. See also the related study by Samuel Staley, *et al.*, *Giving A Leg Up to Bootstrap Entrepreneurship: Expanding Economic Opportunity in America's Urban Centers*, Los Angeles: Reason Public Policy Institute, 2001. As noted in the text, a recent student finds that relative costs of pollution abatement by firm size vary depending on the type of regulated pollutant. See Randy A. Becker, "Air Pollution Abatement Costs under the Clean Air Act: Evidence from the PACE Survey," *Journal of Environmental Economics and Management*, (5) 2005, pp. 144-169.

The allocation of tax compliance costs across the firm sizes starts with the information reported in Table 11, the compliance costs by sector and by type on business (sole proprietorships, partnerships, and corporations). Within each sector, the following apportionment strategy is used. All of the costs for sole proprietorships are allocated to small businesses. The costs for partnerships are distributed between small and mid-sized businesses based on their shares of payroll expenditures. For example, consider the manufacturing sector. Of total payroll spending by small firms and mid-sized firms, small firms account for 17 percent and mid-sized firms account for 83 percent. Thus, 17 percent of the compliance costs for manufacturing partnerships are allocated to small businesses and 83 percent to mid-sized businesses. Similarly, the compliance costs for corporations are distributed between mid-sized and large businesses based on their shares of payroll expenditures. Again using the example of the manufacturing sector, of total payroll spending by mid-sized firms and large firms, mid-sized firms account for 31 percent and large firms account for 69 percent. Thus, 31 percent of the compliance costs for manufacturing corporations are allocated to mid-sized businesses and 69 percent to large businesses.

The costs of occupational safety and health, and homeland security regulations are distributed among the three firm size categories such that the cost per employee in small firms is 20 percent higher than in medium-sized firms, and the cost per employee in large firms is 20 percent lower than in medium-sized firms. For the regulations that exempt small firms, the costs are allocated solely between the medium-sized and large firms using the same ratio as above (20 percent lower per employee in large firms than in medium-sized firms). The final allocation then sums the nonexempt and exempt cost components for each firm size category.[39]

[39] The category of workplace regulations is the one area that applies this judgmental cost allocation used in Hopkins (1995), Crain and Hopkins (2001), and Crain (2005). That is, the 20

IV. Principal Findings

This section presents the report's principal findings regarding the total cost of federal regulations and the distribution of this cost across major sectors of the economy, and across firms of different sizes.

A Preliminary Benchmark: Total Federal Regulatory Costs per Household

One way to illustrate the magnitude of the total cost of federal regulations is in relation to the number of U.S. households. Table 12 presents this cost per household data as a benchmark for comparing how the regulatory burden has changed over time based on the previous studies for Advocacy. However, it is important to caution the reader that this particular benchmark includes the total cost of regulations and makes no effort to distinguish between how much of this cost falls on individuals compared with businesses. It simply assumes that households (as consumers, workers, small business owners, shareholders, and so on) ultimately bear the entire burden of regulations. Further, as noted throughout this report, the estimation methodologies have evolved since the initial study in 1995, and, obviously, this accounts for some of the differences in costs. Table 12 also shows the total federal government burden, encompassing federal tax receipts, and how this total burden per household changed during this time period. The data in Table 12 are adjusted for inflation and expressed in 2009 dollars.

---

percent assumption is applied solely to a relatively small segment of all regulations, and therefore the overall results are not very sensitive to this assumption.

Table 12. Federal Regulatory Costs and Federal Receipts per Household (HH), Compared to Prior Studies for the Office of Advocacy [a]

Year	Households (Millions)	Total Regulatory Costs per HH	Federal Receipts per HH [b]	Combined Federal Burden per HH
2008	112	$ 15,586	$ 22,375	$ 37,962
2004	109	$ 11,550 [c]	$ 19,516	$ 27,359
2000	106	$ 10,362 [d]	$ 23,903	$ 30,176
1995	98	$ 9,580 [e]	$ 19,309	$ 25,441
Avg. Annual Growth Rate: 1995 to 2008	1.1%	4.8%	1.2%	2.4%

Notes to Table 12:

[a] All dollar amounts are adjusted for inflation and denominated in 2009 dollars.

[b] Federal receipts by fiscal years, including Social Security. Source: CBO Web Site: http://www.cbo.gov/showdoc.cfm?index=1821&sequence=0

[c] Source: Crain (2005).

[d] Source: Crain and Hopkins (2001). As described in Crain (2005) this estimate for 2000 adjusts the cost originally reported in Crain and Hopkins (2001) upward by $37 billion to be consistent and comparable with the calculation methods and sources introduced in the Crain (2005) report.

[e] Source: Hopkins (1995)

As shown in Table 12, the total cost of federal regulations per household reached $15,586 in 2008, an increase of more than $4,000 per household since 2004 after adjusting for inflation. (A substantial portion of the 2004-2008 increase shown in Table 12 is the result of the change in methodology in the calculation of the costs estimate for economic regulation). The combined federal burden — federal receipts plus regulatory costs — reached $37,962 per household in 2008, an increase since 2004 of nearly $6,900 per household. The combined federal burden is growing at a real annual rate of 5.5 percent. An interesting observation in Table 12 is the sharp increase in growth rates

in comparison to the 2000 to 2004 period. In that four-year period, the combined federal burden per household fell at annual rate of 2.3 percent.

Distribution of Federal Regulatory Costs: Businesses and Others

Table 13 shows the estimated costs of all federal regulations, broken down by type, and the distribution of the burden between businesses and others (*i.e.*, individuals and state and local governments).

Table 13. Total Cost of Federal Regulations in 2008 by Type and Business Share (Billions of 2009 Dollars)

		Business Portion		Others	
	Total Costs (Billions of $)	Share (Percent)	Amount (Billions of $)	Share (Percent)	Amount (Billions of $)
All Federal Regulations	1,752	55%	970	45%	782
Economic	1,236	50%	618	50%	618
Environmental	281	65%	183	35%	98
Tax Compliance	160	60%	96	40%	64
Occupational Safety and Health, and Homeland Security	75	97%	73	3%	2

These estimates in Table 13 indicate that the annual total cost of all federal regulations in 2008 was $1.752 trillion. Of this amount, the annual direct burden on business is $970 billion. Economic regulations represent the most costly category, with a total cost of $1.236 trillion, and with $618 billion falling initially on business. Environmental regulations represent the second most costly category in terms of total cost ($281 billion), and the cost apportioned to business is $183 billion. Compliance with the federal tax code is the third most costly category ($160 billion), and the cost of occupational safety and health, and homeland security regulations ranks last ($75 billion).

Distribution of the Regulatory Burden across Business Sectors: Three Metrics

Table 14 further deconstructs the business portion of regulatory costs by sector and by the four categories of regulations. Three measures of the regulatory burden are

employed to assess the cost distribution among business sectors: cost per firm, cost per employee, and cost as a share of payroll expenses.

Table 14. Average Sectoral Regulatory Costs, 2008 (In 2009 Dollars)

	Total Costs (Billions of Dollars)	Cost per Firm (Dollars)	Cost per Employee (Dollars)	Cost as a Share of Payroll (Percent)
		Manufacturing

Environmental	183	30,329	1,523	4
Tax Compliance	96	15,939	800	2
OSHHS *	73	12,141	610	1

Note to Table 14:

* OSHHS stands for Occupational Safety and Health, and Homeland Security Regulations

As shown in Table 14, considering all U.S. businesses and all federal regulations, the cost burden on the typical U.S. firm is about $161,000. The cost per employee for the typical U.S. firm tops $8,000. This cost of federal regulation in the typical U.S. firm equals 19 percent of payroll expenditures. To place this amount in perspective, it exceeds the employer contribution to the payroll tax for Social Security (OASDHI) and Medicare, which is 7.65 percent of wages. Indeed, 19 percent of payroll expenditures exceeds the combined payroll taxes for OASHDI and Medicare paid by employers and employees, or self-employed individuals, which equals 15.3 percent.

The three cost metrics described and shown in Table 14 reveal several noteworthy patterns in how the cost burden of regulations is distributed among the business sectors. Table 15 shows these patterns a bit more clearly by ranking the five sectors in terms of the relative cost burden.

Table 15. Sector Rankings Based on Three Metrics of the Regulatory Burden (In 2009 Dollars. 1=highest burden; 5=lowest burden)

Business Sector	Cost Per Firm (Dollars)	Cost Per Firm (Rank)	Cost Per Employee (Dollars)	Cost Per Employee (Rank)	Cost / Payroll (Percent)	Cost / Payroll (Rank)
Manufacturing	688,944	1	14,070	2	29	2
Other	188,704	2	14,992	1	31	1
Services	129,912	3	7,235	3	15	4
Health Care	116,326	4	4,221	5	10	5
Trade	109,970	5	5,289	4	16	3

As illustrated by the rankings in Table 15, the manufacturing sector and the "other" sector bear the largest regulatory burden by all three metrics. For example, using the "cost per firm" metric as a gauge, the distribution of the regulatory burden is heavily skewed toward these two sectors. The manufacturing sector in particular bears the

highest total regulatory burden in terms of the average cost per firm. The burden on the manufacturing sector ($688,944 per manufacturing firm) exceeds the burden on the second most costly sector (the "other" category at $188,704 per firm) by a factor of 3.6. However, by the other two metrics — cost per employee and cost as a percent of payroll — the "other" category bears the highest burden. The cost per employee for firms in the "other" category is $14,992 as compared with the second highest sector (manufacturing), where the cost per employee is $14,070.

The difference between the rankings based on "cost per firm" versus "cost per employee" is likely explained by the fact that enterprises within these two sectors operate with different mixes of capital and labor. For example, predominant among the "other" category are utilities, mining (including coal and oil and gas extraction), and transportation and warehousing concerns, all of which require huge capital investments relative to the number of employees. This means that the regulatory cost per worker rises in this sector relative to manufacturing establishments that typically have more employees per unit of capital investment than establishments such as public utilities, airlines, and railroads. It is worth emphasis, however, that costs per employee in both of these sectors are double the cost per employee in the next highest-cost sector, services, where costs equal $7,235 per employee.

The second conclusion from the metrics in Table 15 is that regulatory costs are distributed much more evenly among the three remaining sectors: health care, services, and trade. For example, in terms of the cost per firm, the burden on the services sector is 12 percent higher than the health care sector and 18 percent higher than the trade sector. As a final observation, when the regulatory burden is gauged by "cost as a percent of payroll," the health care sector fares far better than any of the other sectors (equal to 10 percent). For example, the difference is large even compared to the second

lowest cost industry, services, which equals 15 percent of payroll expenditures. Health care compliance costs as a share of payroll is one-third the level in the "other" sector.

In summary, some conclusions about the distribution of the regulatory burden among sectors depend on which metric one favors. However, the metrics uniformly indicate that the manufacturing sector and the "other" sector bear substantially higher regulatory costs compared with the services, health care, and trade sectors of the economy.

The Distribution of Regulatory Costs by Firm Size

The distribution of regulatory costs among different firm size categories is presented in Table 16.

Table 16. Regulatory Costs in Small, Medium-sized and Large Firms, 2008 (Cost per Employee in 2009 Dollars)

Type of Regulation	All Firms	Firm Size <20	20-499	500+
Manufacturing

OSHHS *	610	781	650	520

Notes for Table 16:

* OSHHS stands for Occupational Safety and Health, and Homeland Security Regulations

** The costs per employee for all U.S. Businesses are computed using the employment shares to weight the costs in each of the five respective sectors.

Considering first the aggregate costs for all federal regulations and all business sectors (displayed as the last category in Table 16), regulations cost small firms an estimated $10,585 per employee.[40] Regulations cost medium-sized firms $7,454 per employee, and large firms $7,755 per employee. Overall, the cost per employee is 42 percent higher in small compared with mid-sized firms, and 36 percent higher in small firms than in large firms. It is noteworthy that the distribution of costs across the three categories of firms in 2008 is similar to the findings in the prior study for Advocacy (Crain, 2005). In 2004 the cost differential between small and mid-sized firms was 41 percent; thus, the cost disadvantage to small businesses has remained nearly constant. In 2004 the cost differential between small and large firms was 45 percent, which is even greater than the gap estimated in 2008. This suggests that since 2004, costs per employee have increased for large businesses relative to small and mid-sized businesses.[41] Indeed, considering the costs of all regulations and all business sectors, mid-sized firms appear to have a slight advantage over large firms, and a wide advantage over small firm.

This pattern, however, is not uniform across sectors or types of regulations. As the results in Table 16 reveal, the distribution of compliance costs with respect to firm size classes differs across the five major business sectors. Indeed, even within sectors, the distribution of the burden varies with the type of regulation. Table 17 reports the percentage difference in the cost per employee in small firms versus larger firms by

[40] The U.S. total figures are based on a weighted average of the costs in the five business categories. The weights for each average use the share for the respective category. For example, for the "cost per firm" value, the cost per firm in each sector is weighted by the share of all U.S. firms in that sector. For the "cost as a percent of payroll" value, the sector values are weighted by the share of all U.S. payroll expenditures in that sector, and so on.

[41] The caution about comparing the 2008 estimates with prior years again should be noted because of the newly introduced methodology for estimating economic regulations.

sector. That is, Table 17 restates the numbers in Table 16 in terms of the cost burden on small firms relative to mid-sized and large firms.

Table 17. Regulatory Costs in Small Firms Relative to Medium-sized and Large Firms in 2008 *

Business Sector	Small Firms Relative to Medium-Sized Firms	Small Firms Relative to Large Firms
Manufacturing	110	125
Trade	-13	15
Services	13	-9
Health Care	45	28
Other	70	83
All Sectors	42	36

*** Note to Table 17:**

The numbers reflect the percentage difference between regulatory costs per employee in a small firm versus a medium-sized firm or large firm using the data reported in Table 16.

The disproportionate cost burden on small firms is dramatic for the manufacturing sector. In that sector the estimated cost per employee for small firms is 110 percent higher than in medium-sized firms ($28,316 versus $13,504), and 125 percent higher than in large firms ($28,316 versus $12,586). To drive home the importance of this result, in the U.S. manufacturing sector, small firms face a regulation burden that is more than double the burden faced by their larger rivals. This cost disadvantage faced by small manufacturing firms appears in three of the four types of regulations (see the detailed breakdown by type of regulation in Table 16). The burden falls disproportionately on large manufacturing firms only in the case of economic

regulations.[42] However, while some types of regulations disadvantage large firms relative to small, the combined impact of all regulations in the manufacturing sector puts small firms at a substantial competitive disadvantage.

The distribution of the regulatory burden among firms of different sizes in the "other" category is similar to that in the manufacturing sector, although the overall cost differentials are less extreme than in the manufacturing sector. The cost per employee is 70 percent higher in small firms than in medium-sized firms, and 83 percent higher in small firms than in large firms. The health care sector exhibits a similar disproportionate distribution. In that sector, the cost per employee is 45 percent higher in small firms than in medium-sized firms, and 28 percent higher in small firms than in large firms.

The regulatory burden is distributed most evenly with respect to firm size in the services sector, as summarized in Table 17 and displayed in detail in Table 16. In the services sector the total cost per employee for small firms is only 13 percent larger than the cost in medium-sized firms, and 9 percent less than the cost in large firms. In the trade sector, small firms face a 15 percent heavier cost burden than large firms, but have a 13 percent cost advantage over medium-sized firms. In other words, within the trade sector, the heaviest cost burden falls on mid-sized firms.

Summary Comments

Overall and on almost every regulatory frontier, compliance costs place small businesses at a competitive disadvantage. The cost disadvantage confronting small business is driven by environmental regulations, tax compliance, and occupational safety and health and homeland security regulations. The particular cost drivers differ

[42] The relatively large impact of economic regulations on large firms has been noted by a number of scholars. See the literature review in Steven C. Bradford, "Does Size Matter? An Economic Analysis of Small Business Exemptions from Regulation," *The Journal of Small and Emerging Business Law*, 8 (1), 2004, pp. 1-37.

somewhat across the five business sectors, as the details of this report point out. Moreover, not all regulations fall more heavily on small firms than on their larger counterparts. For example, the cost of economic regulations falls most heavily on large firms in every sector except health care. The most disadvantaged of all by federal regulations are small manufacturing firms.

This study provides a broad sense of the costs of federal government regulations in the United States and how they affect the balance in public versus private sector responsibilities. In 2008 federal regulatory compliance absorbed about 14 percent of U.S. national income, a clear indication of what citizens give up in exchange for this government function.

Appendix 1. Elements Included in the World Bank Index of Regulatory Quality and Data Summary for Estimating the Costs of Domestic Economic Regulations

Table A-1: List of Concepts Included in the Regulatory Quality Index

Export and Import Regulations
Restrictions on ownership of business by non-residents
Restrictions on ownership of equity by non-residents
Unfair competitive practices
Price controls
Discriminatory tariffs
Excessive protections
Stock Exchange / Capital Markets
Foreign investment restrictions
Administrative regulations
Tax system is distortionary
Competition in local market is limited
Anti-monopoly policy is lax and ineffective
Complexity of tax system
Easy to start a company
Banking / finance restrictions
Wage and prices controls
Administrative business start-up formalities
Ease of market entry for new firms
Tax Effectiveness (How efficient the country's tax collection system is.)
An assessment of whether the necessary business laws are in place.
Labor Market Policies
Enabling Environment for Private Sector Development
How problematic are labor regulations for the growth of your business?
How problematic are tax regulations for the growth of your business?
How problematic are custom and trade regulations for the growth of your business?
Trade & foreign exchange system
Enabling conditions for rural financial services development
Investment climate for rural businesses
Access to agricultural input and produce markets
Banking regulation does not hinder competitiveness
Competition legislation in your country does not prevent unfair competition
Customs' authorities do not facilitate the efficient transit of goods
Financial institutions' transparency is not widely developed in your country
Labor regulations hinder business activities
Subsidies impair economic development

Table A-2. Summary Statistics for OECD Cross-Country Data Set

	mean	median	sd
GDP per Capita (in 2009 US $)	22,654	24,306	12,201
World Bank Index of Regulatory Quality	1.317	1.441	0.441
Population (in 1000s)	38,900	10,800	57,900
Fixed Broadband Subscribers per 100 people	14.2	13.3	10.1
Primary Education as a Share of the Eligible Population (times 100)	98	99	5
Foreign Trade as a Share of GDP (times 100)	98	81	57

Appendix 2. Methodology Used to Correct Overcount of Firms in the SBA Data

When the Census Bureau compiles its Statistics of U.S. Businesses, it relies on survey questionnaires filled out by firms. Occasionally the firms classify themselves under more than one industry. Because some firms are redundantly classified, the sum of the firms within each category is actually greater than the entire number of firms.

To correct for this over count, the number of redundantly counted firms is calculated by summing the number of firms by industry and subtracting the total number of firms from this across-industry sum.

The next task is to assign a certain fraction of over counted firms to each industry to be used as a reduction factor. This is accomplished using the fact that the number of employees within each industry is accurately measured. Each industry's share of the total work force is calculated; these shares are then used to allocate the over counted firms to each industry. From there, it is a simple matter of subtracting the over count within each industry from the reported count in each industry. This ensures that the total number of firms is equal to the number of firms summed across the five industry categories.

Appendix 3. Methodology for Estimating Economies of Scale in Environmental Compliance Costs

Introduction

In 2008, environmental regulations cost an estimated $281 billion (16 percent of total federal regulatory costs), and the cost falling on businesses was an estimated $183 billion (19 percent of total business regulatory costs). This appendix describes the methodology used to estimate the relationship between firm size and compliance costs for environmental regulations. This methodology is adopted from Crain and Hopkins (2001) and Crain (2005), and the objective is to provide a basis for allocating the cost of environmental regulations among the three firm size categories.

The relationship between compliance costs and firm size is estimated using pollution abatement expenditures by manufacturing firms. For reasons described below the data used in the analysis are for 1992. Among environmental regulations, pollution abatement expenditures account for about one-fourth of the costs. Thus, a reliable estimate of scale economies in pollution abatement provides a reasonable approximation for the general distribution of all environmental regulatory costs.

Estimation Procedure and Results

The general approach is to estimate the relationship between pollution abatement cost (PAC) per employee and firm size, here measured by the number of employees per firm. Equation (2) specifies the estimation equation, which is estimated in log form:

$$\text{(Eq. 2)}\quad \ln(\text{PAC / employee})_{i,s} = \beta \ln(\text{Firm Size}_{i,s}) + \phi \ln(\text{Value of Sales}_{i,s}) + \gamma_i + \varepsilon_{i,s},$$

where subscript *i* stands for a specific industry type and subscript *s* stands for a specific American state. Industry types are defined by two-digit SIC codes covering all industries in the manufacturing sector; see Table A-8 below for a description of the 20 industries included. Each continuous variable is entered into Equation (2) as a natural logarithmic transformation (ln).

In Equation (2) the dependent variable, (PAC / employee) $_{i,s}$, measures the average pollution abatement expenditure per employee in industry *i* in state *s* in 1994 (source: Bureau of the Census, 1996). These are the most recently available data, as Census no longer collects this series. These expenditure data include capital expenses and operating expenditures. The main independent variable of interest, firm size $_{i,s}$, measures the average number of employees per firm in industry *i* in state *s* (source: Bureau of the Census, *1992 Economic Census*). The estimated coefficient on firm size, β, thus provides the measure of economies of scale. Specifically, how does pollution abatement expenditure per employee respond to changes in firm size? Equation (2) also includes a control variable for the average value of sales, and a fixed-effects variable, γ_i, which seeks to control for other factors that cause pollution abatement costs to differ among the 20 industries. For example, the chemical industry may simply be subject to different environmental standards than, say, the leather products industry. Including the fixed-effects dummy variables in the model allows the cost function to shift for each specific industry. $\varepsilon_{i,s}$ is the regression error term, which is assumed to be normally distributed.

Equation (2) is estimated across states using data for 1992. While the Census Bureau continued to survey pollution abatement expenditures through 1994, 1992 is used because the Census of Manufacturing (the source of the state-level data on firm

sizes, employment, and sales) also occurred in that year (the Census of Manufacturing is conducted only every five years).

Results

Table A-3 presents the regression results. Overall, the regression model demonstrates considerable explanatory power. The F-statistic is significant at the one-percent confidence level, and the model explains 83 percent of the variation in pollution abatement expenditures per employee. The estimate of β, –0.431, is significant at the 0.07 confidence level. This parameter value indicates that a 1 percent increase in firm size (the number of employees) corresponds to a 0.431 percent decrease in abatement costs per employee. (Recall that the variables are entered as log transformations, so the estimated coefficient indicates the elasticity.) The control variable for the value of sales is significant at the 0.01 level. Finally, the F-statistic allows us to reject the hypothesis that the coefficients on the industry-specific dummy variables are jointly equal to zero. In other words, not surprisingly, the fixed-effects variables pick up significant differences in costs among the various industries.

Table A-3. Regression Results: Economies of Scale in Compliance Costs: Environmental Regulations

Dependent variable: Pollution Abatement Expenditure per Employee

Independent Variable	Coefficient	Std. Err.	t-stat	P>|t|
ln (Number of Employees)	-0.431	0.243	-1.78	0.07
ln (Value of Shipments)	0.698	0.186	3.75	0.00
Constant	-2.494	2.28	-1.10	0.28

Notes to Table A-3:

Number of observations = 208
Adjusted R-squared = 0.83
Regression F-stat (2, 188) = 10.84
Fixed Industry Effects, F-stat (17, 188) = 18.43

Following the firm classification scheme used throughout this study, the predicted costs per employee are computed for three broad categories of firm sizes: firms with fewer than 20 employees ("small firms"), firms with 20 to 499 employees ("medium-sized firms"), and firms with 500 or more employees ("large firms"). These costs are also shown in Table A-4, converted into 2009 dollars. The relative costs across these three firm size categories for the earlier time period establish the basis for allocating the cost of environmental regulations in 2008.

Table A-4. Results on Environmental Compliance Costs by Firm Size
(2009 Dollars)

	Cost per Employee, Manufacturing Sector Firms with:		
	<20 Employees	20 to 499 Employees	500+ Employees
Values Using Eq. 2	22,594	7,131	4,865

Concluding Comments

The earliest studies for Advocacy (Hopkins, 1995) provided the most comprehensive assessment to date on the incidence of regulatory costs by sector and firm size. However, Hopkins pointed out, he was forced to rely on a judgmental approach to the cost allocations across firm sizes in the absence of specific empirical estimates. This appendix provides the basis used in this report (and two prior reports for Advocacy) to allocate the costs of environmental regulations among the different firm size classes.

Table A-5. Sectors Included in the Regression Analysis of Environmental Compliance Costs

SIC Code	Industry Description
20	Food and kindred products
21	Tobacco products
22	Textile mill products
23	Apparel and other textile products
24	Lumber and wood Products
25	Furniture and fixtures
26	Paper and allied products
27	Printing and publishing
28	Chemicals and allied products
29	Petroleum and coal products
30	Rubber and miscellaneous plastic products
31	Leather and leather products
32	Stone, clay and glass products
33	Primary metal industries
34	Fabricated metal products
35	Industrial machinery and equipment
36	Electronic and other electric equipment
37	Transportation equipment
38	Instruments and related products
39	Miscellaneous manufacturing industries

Appendix 4. Spending and Staffing by Federal Regulatory Agencies

Table A-6. Total Spending by Federal Regulatory Agencies on Regulatory Activity, Fiscal Years (Millions of 2009 Dollars)

Fiscal Year	Social Regulations	Economic Regulations	Total
1990	17,020	3,883	20,903
1991	18,588	3,736	22,323
1992	20,320	4,098	24,418
1993	20,442	4,687	25,130
1994	20,745	4,366	25,111
1995	21,243	5,076	26,319
1996	21,041	4,685	25,726
1997	22,103	5,057	27,160
1998	24,123	4,948	29,071
1999	25,034	5,197	30,231
2000	26,247	5,460	31,707

UNITED STATES
CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

August 15, 2011

The Honorable Cliff Stearns
Chairman
House Committee on Energy and Commerce
Subcommittee on Oversight and Investigations
2125 Rayburn House Office Building
Washington, DC 20515

Dear Chairman Stearns:

Attached please find responses to the written questions for the record submitted by you in connection with the Thursday, July 7, 2011, hearing entitled: "The Views of the Independent Agencies on Regulatory Reform."

Thank you again for the opportunity to testify before the Subcommittee. Should you have any questions or require additional information, please do not hesitate to contact me or Christopher Day, Director, Office of Legislative Affairs, at (301) 504-7660 or by e-mail at cday@cpsc.gov.

Sincerely,

Robert Adler

Robert S. Adler

cc: The Honorable Diana DeGette, Ranking Member
Subcommittee on Oversight and Investigations

Attachment

The Honorable Cliff Stearns

1. In Chairman Leibowitz's testimony he said the FTC is "seeking to identify acts of Congress that appear to be of little value but that impose burdens on businesses, particularly small businesses and the Commission." It would be useful to this Committee if all of the agencies in our jurisdiction performed such an analysis. Can you please provide us with a list of any such statutes you have identified to date at CPSC, the reasons they are burdensome, why they do not provide much value, and how you would recommend changing them.

Response: The U.S. Consumer Product Safety Commission (CPSC) enforces seven laws: (1) Consumer Product Safety Act, as amended (15 U.S.C. §§ 2051-2089); (2) Federal Hazardous Substances Act (15 U.S.C. §§ 1261-1278); (3) Flammable Fabrics Act (15 U.S.C. §§ 1191-1204); (4) Poison Prevention Packaging Act (15 U.S.C. §§ 1471-1477); (5) Children's Gasoline Burn Prevention Act (P.L. 110- 278); (6) Virginia Graeme Baker Pool and Spa Safety Act (P.L. 110-140); and (7) Refrigerator Safety Act (15 U.S.C. §§ 1211-1214). Over time, various provisions of these laws have been amended. The most recent example of this is the passage of H.R. 2715 (now P.L. 112-28), which, among other things, clarifies application of the lead limits in section 101 of the Consumer Product Safety Improvement Act of 2008 (CPSIA) to certain products, and provides additional flexibility and relief to small manufacturers from the third party testing and certification requirements in section 102 of the CPSIA.

In the wake of H.R. 2715's enactment, which cleared the House 421-2 and unanimously in the Senate, I believe there is now broad, bipartisan agreement that our laws are well balanced. Taken collectively, the CPSC's enabling statutes do not, in my opinion, impose burdensome requirements because they generally give the agency the authority to act against dangerous products through multiple avenues including standards setting, bans, recalls and education campaigns. The CPSC is required to determine whether products are sufficiently dangerous to warrant agency action, so it is within the agency's discretion to decide when action is appropriate. I believe these laws have allowed the agency to do so in a measured and reasonable manner.

Speaking as one Commissioner, I believe the most burdensome features of our laws are the elaborate cost-benefit analyses required when promulgating mandatory safety standards or regulations. The cost-benefit analysis provisions in section 9 of the CPSA, (15 U.S.C. 2058(f)(2)), section 3 in the Federal Hazardous Substances Act (15 U.S.C. 1262(h) and (i)(1)), and section 4 in the Flammable Fabrics Act (15 U.S.C. 1193(i) and (j)(1)) are prescribed in such a way that unreasonable delay is inevitable. As I mentioned in my testimony before the Committee, because of this burdensome requirement, by my count, the agency has only promulgated nine rules in thirty years – or about one rule every three and a third years.

I believe that such rigidity in the law is what led Congress to enact the CPSIA, which allowed the agency to use more streamlined procedures. These procedures were untouched by H.R. 2715, which I believe represents a clear indication that they are working – and ensures that the Commission is able to effectively carry out its mandate in the areas touched by the CPSIA.

Accordingly, I would recommend removing the cost-benefit requirements from section 9 of the CPSA, section 3 in the Federal Hazardous Substances Act, and section 4 in the Flammable Fabrics Act and replacing them with language consistent with the CPSIA and the President's executive orders regarding cost-benefit analyses.

2. Please also list any regulations or other Commission requirements you have identified to date as being unnecessarily burdensome or duplicative.

Response: Speaking as one Commissioner, I have not conducted a review of CPSC regulations to identify those which are unnecessarily burdensome or duplicative. Before I could give a meaningful response, I would feel it necessary to consult with my fellow Commissioners, CPSC staff, the industries we regulate and consumers who benefit from our regulations. As stated in my testimony before the Committee, it is my understanding that the agency is in the process of undertaking such a review, and I look forward to reviewing the results of this process in the near future.

Commissioner Anne M. Northup
Consumer Product Safety Commission

Questions for the Record
House Energy and Commerce – Subcommittee on Oversight and Investigations
"The Views of the Independent Agencies on Regulatory Reform"

The Honorable Cliff Stearns

1) **In Chairman Leibowitz's testimony he said the FTC is "seeking to identify acts of Congress that appear to be of little value but that impose burdens on businesses, particularly small businesses and the Commission." It would be useful to this Committee if all the agencies in our jurisdiction performed such an analysis. Can you please provide us with a list of any such statutes you have identified to date at CPSC, the reasons they are burdensome, why they do not provide much value, and how you would recommend changing them.**

Since 2009, the Consumer Product Safety Commission has focused its time and resources principally on implementing the Consumer Product Safety Improvement Act of 2008 (CPSIA). Of our governing statutes, the CPSIA is by far the most burdensome on Commission resources and on thousands of consumer product manufacturers (both large and small)—and its requirements are largely not based on risk. Traditionally, the CPSC had been a risk-based agency, as seen through our other governing statutes – the Federal Hazardous Substances Act, Consumer Product Safety Act (prior to being amended by CPSIA), Flammable Fabrics Act, and Poison Prevention Packaging Act. However, with the passage of the CPSIA, the agency's expertise and resources have been diverted to implementing and enforcing mandates on all manufacturers that do not make products safer and burden American manufacturers disproportionately.

On August 1st, both the House and Senate passed HR 2715, a bill to amend the CPSIA. I am pleased that bipartisan agreement could be reached to ameliorate at least some of the unnecessary harm the CPSIA has and will continue to inflict on businesses, consumers, the economy, and individuals employed in the children's product industry. For instance, I support exempting ATVs and most used products from the lead limits of CPSIA § 101(a); capping the lead limit for the metal parts of bicycles at 300 ppm; and exempting from third-party testing most children's books and printed materials, and the metal components of bicycles. I am also pleased that the CPSIA's .01% lead limit, due to go into effect August 14, 2011, will no longer be applied retrospectively. While the lead limit of newly manufactured products will still be reduced below the level supported by scientific evidence, at least retailers will avoid the needless economic waste of throwing out noncompliant products already in inventory. Other provisions of HR 2715 appear to fall short of providing adequate relief, and will require the expenditure of significant private and public resources for businesses to obtain the modest relief it provides. I have proposed more straightforward and effective alternatives. Below, I discuss my

recommendations to further amend the CPSIA in order to permit the lawful and economically viable manufacture and sale of **all** safe children's products.

Additionally, in response to Ranking Member DeGette's request at the July 7 hearing, I will offer general recommendations for regulatory reform, including suggested amendments to statutes that govern the regulatory activities of both Executive and Independent Federal Agencies. I hope that these solutions will address the common obstacles all federal agencies face to achieving balanced, economically sound, risk-based regulation.

Recommended Changes to the CPSIA:

Adopt a Solubility Based Standard for Lead

The CPSIA contained a provision that permitted the Commission to exclude from the lead limits any specific product or material whose lead content did not "result in the absorption of any lead into the human body, taking into account normal and reasonably foreseeable use and abuse of such product by a child, including swallowing, mouthing, breaking, or other children's activities, and the aging of the product." CPSIA § 101(b)(1)(A). The Commission did not except a single material or product under this exclusion, and HR 2715 removes it and replaces it with a "Functional Purpose Exception."

The sticking point for the Commission was the inclusion of the phrase "the absorption of *any* lead." The Commission was unable to conclude that there was any product for which the absorption of *no* lead could be deemed a certainty. My view that Congress must have intended for this exception to apply to something, and that, therefore, a *de minimis* standard rather than an absolute standard should have been adopted, was overruled by the Majority.

Clearly, Congress attempted through both the CPSIA and HR 2715 to provide an exclusion that incorporates the concept that a product containing lead is only harmful if the lead it contains can be absorbed by a child in harmful amounts. The Functional Purpose Exception of HR 2715 includes this idea in part. It grants an exception to products that cannot practicably be manufactured at the lead limit, but only upon the condition that the exception will result in no measurable increase in blood lead levels or otherwise have a measurable adverse impact on health.

However, this provision of the Functional Purpose Exception is a classic case of the tail wagging the dog. A product that will result in no measurable adverse impact on health should not be subject to expensive reengineering, third part testing and certification costs, irrespective of whether the lead it contains *could* practicably be removed. Therefore, I support a lead standard based on the quantity of absorbable lead, rather than on an absolute measure of the total quantity of lead. Alternatively, there should at least be an exception for **any** product whose lead content does not have a

measurable adverse impact on health, and such an exception should be included as a standalone provision.

Focusing on whether a product can result in a measurable increase in blood lead levels is one proxy for measuring adverse health impacts generally. But it may lead to unnecessarily over-inclusive regulation, if this Commission chooses to interpret the term "measurable" to mean that a one part per billion increase in blood lead level is sufficient. The science of measuring lead in blood can detect lead at a level below amounts that are considered harmful. A better methodology would take into account the solubility and bioavailability of lead contained in a product. Other jurisdictions follow this approach. For instance, the European Union bases its laws limiting the lead content of certain toys on the amount of *soluble* lead (lead migration/leachable lead) a product contains.

Drawing the line at the level of soluble lead that is harmful to a child's health is consistent with the findings of our leading scientific agencies, the National Institutes of Health, the CDC and the EPA. Only lead that is "absorbable" at greater than *minimal levels* is dangerous, especially to children ages five and under. Thus, the experts at the CDC and NIH have found that lead paint in old houses and lead in dirt near old gas stations are the main source of environmental lead presenting a danger to small children (http://www.cdc.gov/nceh/lead/). In other words, the *risk of absorbability* from lead in dirt that is tracked into a home or lead paint in an old home that becomes chipped and may be inhaled or ingested is quite high. Notably, the EPA standard for lead in soil is 400 ppm (http://www.epa.gov/lead/). This standard for safety is less strict even than the former 300ppm lead content standard (which was reduced to 100 ppm as of August 14, 2011) provided in the CPSIA for children's products, including furniture or bicycle handlebars where lead is embedded in the metal substrate and cannot be absorbed.

Regulations promulgated under the CPSIA, as interpreted by the Majority, have led to the banning or substantial reengineering of many products that pose no risk of harm from lead. For example, everyday products such as school lockers, child-sized brass musical instruments, the hinges on a child's dresser, or jackets with zippers and buttons are outlawed if they contain tiny levels of lead in the substrate. Even ball point pens are outlawed, due to the brass found on the tip, if they have a toy or game attached to them and are marketed to children. Because there are still *negligible amounts of lead detectable by scientific equipment* that may be wiped off by touching a ball point pen or a child's dresser, the CPSIA treats these items in exactly the same way it treats products that truly could hurt a child by increasing her blood lead level.

HR 2715 will exempt a few products from the CPSIA's overreach. Most used children's products and children's ATV's are excluded from the statutory lead limits. The metal components of children's bicycles are permitted to contain 300 ppm, rather than the 100 ppm standard applicable to other children's products. These changes signal Congress's recognition that the lead in most children's products does not present an absorbability risk, but the bill fails to provide this relief to all products that are just as harmless. A standard or exclusion based on the bioavailability of harmful amounts of lead, such as the

EU solubility standard, would go a long way toward rationalizing the country's approach to protecting children from lead, while not unnecessarily destroying businesses and jobs.

Define "Children's Product" as Intended for Children Age Six or Younger

Under the CPSIA, a "children's product" is any product designed or intended primarily for children twelve years old or younger. The CPSIA thus treats the same all products intended primarily for use by children under thirteen, regardless of whether they are intended for one-year olds or twelve-year olds. Recognizing the substantial difference in risk presented to different age groups by the same products, CPSC staff have suggested to the Commissioners that lowering the age range of products impacted by the CPSIA would be one of the most efficient ways to amend the law in order to exclude those products that many believe should not be impacted.

The 12-and-under age range affects many products that are also used by teenagers, thus creating enforcement difficulties over marginal products. Producers argue that certain products are primarily intended for children age thirteen and older, and the Commission examines marketing and other factors to assess the claim. Some blurring of the age lines will happen regardless of the age cut-off, but there are many more products subject to this uncertainty for "tweens" (*e.g.*, certain sporting goods, apparel, etc.)

In addition to enforcement difficulties, the benefits of the law are vastly reduced when applied to products for older children, who no longer mouth objects or constantly put their hands in their mouths. Thus, Congress could amend the statute to apply only to products primarily intended for children age six and under, while giving the agency discretion to raise that age limit for particular materials or categories of products that it determines pose a risk to older children. In any event, the CPSC always retains the authority to issue a stop-sale order or to recall any product determined to pose "substantial product hazard" under the Federal Hazardous Substances Act.

Eliminate Third-Party Testing and Certification Requirements

Given the tools available to manufacturers to determine compliance, and our own improved enforcement methods, the complex, third-party testing and certification requirements of the CPSIA are unnecessary and/or unhelpful in ensuring compliance with the law's new requirements. In fact, relief from the law's testing requirements is the number one request of small businesses, many of whom are able to comply with the law's lead, phthalates and toy standards but still cannot afford the mandatory third-party testing and the subsequent certification and tracking label requirements of the law that are a paperwork nightmare.

By requiring all children's products to be tested at a third-party lab, regardless of risk, the law disproportionately hurts companies with robust in-house testing programs, those with more creative and effective ways of ensuring compliance internally, as well as domestic American companies who have never had a violation, but who nonetheless must pay the most for third-party testing. The CPSIA's micromanagement of a company's testing,

certification and tracking of each and every component of a product is entirely unnecessary – and in fact, will be less helpful than the sophisticated internal controls manufacturers are currently using and continue to develop and perfect. Furthermore, a "bad actor" with a casual attitude toward safety standards compliance will be just as casual about maintaining accurate records to support CPSIA-mandated certifications.

There are entire industries that have had very few, if any, safety violations; yet, they are required to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety. For example, the American Apparel and Footwear Association wrote in its public comments on the Commission's Notice of Proposed Rulemaking on Component Parts:

> As the CPSC continues to issue specific compliance requirements, manufacturers become increasingly wrapped up in ensuring compliance over ensuring product safety. All AAFA members have had long-standing quality control programs in place that have developed based on the product, production of the product and the manufacturer's unique circumstances. These programs are effective and do not need to be changed. To demonstrate, only .0084% of all apparel and footwear sold in the U.S. in 2008 were involved in a recall. Moreover, most apparel and footwear recalls have been drawstring violations – a compliance issue that results from lack of information not lack of testing.[1]

Today, the Commission also has enforcement tools vastly improved over those available even a few years ago. I believe these are a more effective use of taxpayer dollars to ensure compliance with safety standards than is policing all children's product manufacturers for certifications to mandatory third-party tests. Since the advent of our agency's Import Surveillance Division in 2008, we have continued to increase the number of full-time CPSC investigators posted at key U.S. ports. We have also expanded cooperation with Customs and Border Patrol to maximize the number of products screened at all U.S. ports. Today, the Commission intercepts non-compliant toys through more extensive border control efforts, application of x-ray technology (currently used to identify heavy metals) and computer databases that flag previous offenders for greater scrutiny. The CPSIA also increased the incentive for compliance by authorizing the CPSC to confiscate and destroy at the border products that violate federal safety standards, to impose higher penalties of up to fifteen million dollars, and to more easily seek criminal penalties.

Testing and certification to the law's widest reaching mandates -- lead and phthalates limits and the toy standard -- are stayed until December 31, 2011. Thereafter, the full weight of these costly requirements will fall on children's product manufacturers. Congress could eliminate these third-party testing and certification requirements before next year, allowing manufacturers to ensure compliance through less costly in-house tests and other manufacturing programs and processes. The Commission would retain the

---

[1] American Apparel and Footwear Association, Request for Comments, Docket No. CPSC-2010-0037 & CPSC-2010-0038, August 3, 2010.

discretion to impose third-party testing requirements on products whose risk justifies the cost.

HR 2715 opens the door to potential third-party testing reforms, by calling for public comment and possible rulemaking to reduce the costs of third-party testing. I am hopeful the Commission's Majority will embrace this opportunity in the spirit in which Congress provided it. That is, with the intent of meaningfully reducing the number and scope of third-party tests mandated by the CPSIA, in order to permit businesses to focus their limited resources on growth and job creation. And I will work with my colleagues on the Commission to encourage the broadest possible relief consistent with the statutory language. But it is also clear that the provision falls far short of eliminating all third-party testing for any product or material, and in that regard, further Congressional action is necessary. And to be frank, I am fearful that any possible rulemaking to implement cost saving measures will be too little, too late, because the Majority is likely to push ahead to finalize the Commission's proposed rule on third-party testing in the near future, rather than reproposing to permit public comment consistent with the Congressional intent underlying HR 2715.

HR 2715 also provides a mechanism for excluding from the third party testing requirement very low production products (7,500 units), provided they are manufactured by a business meeting a very narrow definition of "small" ($1,000,000 annual revenue). Relatively few businesses are likely to obtain relief under this provision, perhaps including only those who fashion by hand unique or very small batches of products. It also appears that no businesses will be excluded under the provision until the Commission has promulgated guidelines under which businesses may register their status. I hope that the Commission's Majority recognizes the importance of prioritizing the drafting of guidelines, so that small businesses can register before the crushing costs of third-party testing drive them out of business, when the stays are lifted on January 1, 2012. In this respect, to paraphrase our Chairman, relief delayed is relief denied.

Require Reforms to the Database Rule to Ensure That Incident Reports are Verifiable and Useful

The Commission's Database Rule should be revised to ensure that incident reports posted to the public database are verifiable. Potentially inaccurate and unverifiable information is of no value to the Commission in its enforcement efforts, and useless to consumers seeking actionable product safety information. The revisions contained in HR 2715 do not come close to addressing this problem.

Several features of the database and the Commission's policies governing the posting of reports make it likely that inaccurate information will be published on the database.

First Hand Information Is Not Required

The database requires that submitters of reports include their own contact information, but does not require that a report submitter have any firsthand knowledge of the product,

harm or risk of harm. Nor does it require submitters to provide the contact information of an individual with firsthand knowledge, such as the product owner or the person who used the product. As a result, requiring the contact information of only the submitter is not much different from permitting the submission of an anonymous report. In fact, the Commission is receiving incidents from people who are merely repeating information they find while surfing the internet. In these cases, the Commission has no means to verify the alleged circumstances of the incident or to obtain supplemental information relevant to determining the existence and scope of an alleged product hazard. Without access to a direct witness to an alleged incident, the Commission may also be unable to determine whether a report contains a material inaccuracy. Where a lack of information and inability to contact the product owner or a witness prevents the Commission from determining the existence of a material inaccuracy, a dubious report will remain on the database.

Moreover, these concerns are not diminished by the requirement that submitters of reports verify "to the best of their knowledge" the accuracy of the report submitted. The honest, best knowledge of someone with no personal connection to an incident or product is of little value.

This problem is not addressed by HR 2715. It could be solved by requiring that reports to the database include the identity and contact information of someone with firsthand knowledge of the product or incident.

The Rules Governing Material Inaccuracy Claims Do Not Prevent the Posting of Inaccurate Information

The rules governing the posting of reports that are subject to a manufacturer's claim of material inaccuracy also make it likely that inaccurate reports will be posted. Under the CPSIA as amended by HR 2715, manufacturers have ten business days after a report of harm is sent to them to claim that the report contains a material inaccuracy. If they fail to do so, the report is posted on the 11th day. If a material inaccuracy claim is made within the ten day period, the posting of the report is stayed for *no more than* an additional five days. The initial ten-day window to make a claim of material inaccuracy was not changed by HR 2715, and it remains insufficient time in many cases for a manufacturer to determine whether a report identifying its product contains a material inaccuracy.

This is partly because the rule passed by the majority did not require reports to contain sufficient detail about the product and incident to guide a manufacturer's investigation. Information essential to this purpose that is not required to be contained in the report, includes: the model number of the product; the date it was purchased; the UPC code; and/or, any other unique identifying information that would distinguish one product of a particular type from the potentially dozens of others that are of the same general type but are materially different. For example, a recent search of Amazon.com for high chairs manufactured by one particular company produced a list of 137 different high chairs ranging in price from $54 - $148. Given the broad range of identically named, yet distinctive products available from the same company at a single snap shot in time, a

report of harm relating to a particular manufacturer's high chair, with no reference to the model, date of purchase or other more specific identifying information, would not permit the manufacturer even to identify the specific product, let alone to gauge the accuracy of a report about the product.

HR 2715 requires that the Commission *seek to obtain* the model, serial number or a photograph of a product when the information is not included with a report. But there is no consequence to the Commission's failure to obtain any of them, or even to a submitter's refusal to cooperate. The limited available information without the model, serial number, photograph or other essential identifying information is still transmitted to the manufacture, the manufacture is subject to the same time limits, and the report is posted to the public database.

Our Chairman and Ranking Member Henry Waxman are fond of citing the statistic that 80% of submitted reports contain "model or serial number information." But this is misleading. Here are the facts: about 80% of reports contain *some text in the model or serial number field*. That includes characters such as "?", "I don't know", "unknown" and "unsure." The more relevant statistic is the percentages that actually contain a model or serial *number*. For the model number field, that figure is closer to 60%. For the serial number field it is less than half.

Even a manufacturer provided with sufficient information to identify a specific product may not receive enough detail about an incident to understand the role its product played in causing an alleged injury. Moreover, there may be no way to ascertain the truth in those cases where the manufacturer is certain that its product could not have caused an injury in the manner alleged. This is because a third-person reporter is not required to identify the victim or product owner, and access to a firsthand observer of the incident is necessary to resolve issues of fact.

A manufacturer forwarded a vague report has few options. Even where a firsthand observer is identified in the report, the manufacturer is not entitled to the individual's contact information. Without the ability to follow-up with a witness, the manufacturer must base its assertion of material inaccuracy upon the content of the report. In many cases, the report may not contain sufficient information for the manufacturer to ascertain whether it contains a material inaccuracy.

Even with adequate information, 10-days will often be too little time. Obvious cases of manufacturer misidentification may be discernable within the available window of time. But many products of a more generic nature will be very difficult to distinguish without a much more extensive investigation. I have spoken with manufacturers who have needed over 30-days after receiving a consumer complaint to conclude that the subject product was not their own. And those were cases where the company had access to the product. Ten days will clearly be insufficient in many cases, and as a result, materially inaccurate information will remain on the public database well beyond that point.

Even where a manufacturer meets the 10-day deadline to submit an adequately supported claim that a report is materially inaccurate, under the CPSIA as amended by HR 2715, the Commission only has 15 days from when the report was transmitted to the alleged manufacturer to complete its investigation of the claim. If the Commission fails to complete its investigation within the 15 day time period, the report is published on the 16th day. This policy continues to guarantee that inaccurate reports will sometimes be posted. Moreover, the materially inaccurate information will remain on the site until the Commission completes its investigation and makes a determination. And because there is no fixed period within which the Commission must complete its investigation, inaccurate information can remain on the site indefinitely. Meanwhile, the Commission's efforts to investigate claims of material inaccuracy are hamstrung by its failure to require the identification of victims of harm or firsthand witnesses of incidents raising a risk of harm. There are therefore likely to be many cases where a manufacturer will have good reason to believe a reported incident is either completely false or materially misrepresented (and companies routinely receive these types of mistaken or fraudulent claims), but neither the manufacturer nor the Commission will be able to obtain the information necessary to resolve the claim. Under those circumstances, the manufacture will be unable to meet its burden and the challenged, but unverified and unverifiable report, will remain on the database forever.

Further, the manufacturer has no right to inspect the product. In those cases where contact information for the product owner is neither provided nor obtainable from the third-party submitter, it would be impossible even for the Commission to inspect the product. Similarly, there would be no opportunity for the Commission to follow up with the consumer under those circumstances. The manufacturer is not entitled to the contact information of a product owner who chooses to remain anonymous.

All of these factors make it inevitable that inaccurate reports will be posted on the database, and that many will remain searchable by the public forever.

A recent example demonstrates that these are not idle concerns. A report was published on the public database in which a parent identified a particular company as the manufacturer of a toy kaleidoscope that injured her child. The report had been forwarded to the named manufacturer as required by the rule, but the report contained insufficient information for the named manufacturer to determine whether it had actually manufactured the product. The company therefore made no claim of material inaccuracy, but posted a comment explaining that it was uncertain whether it had manufactured the product. Subsequently, a CPSC compliance officer obtained the kaleidoscope from the parent as part of its investigation of the product's safety, and discovered that the parent had misidentified the manufacturer. The incident report was then removed from the database, the correct manufacturer was notified, and the report was reposted with the correct information. However, this outcome resulted from happenstance and not any protections built into the database. If the incident had not been one of the approximately 10% that lead to a follow-up investigation, the error would never have been discovered. In addition, the investigation would not have uncovered the mistake if, as the database rule permits, contact information for an individual with firsthand knowledge of the

product and who retained it, was not provided. The fact that an error of this kind has already been discovered, given the short period that the database has been "live" and the small percentage of incidents that are investigated, suggests that this situation is probably not unique. Rather, it indicates that there are likely already a significant number of published incident reports that misidentify a manufacturer and that will never be corrected or removed.

Regulatory Reform: Other Statutory Changes

Two fundamental changes in the law governing federal agency regulatory action would go a long way toward avoiding the sort of economically burdensome unintended consequences that resulted from the CPSIA. First, there must be a mechanism for increasing accountability for the potential adverse impacts of regulatory actions. Second, economically significant regulatory action should not be taken until a thorough cost-benefit analysis demonstrates that the burdens imposed are outweighed by the societal benefits obtained.

Regulatory Reform Must Address All Significant Regulatory Actions, Not Just Formal "Legislative Rules"

Since becoming a Commissioner at the CPSC in 2009, I have seen that immense power is delegated to regulatory agencies-- often with little accountability. An agency's interpretation of one word of a statute can make the difference between the statute's being implemented reasonably, or with massive economic consequences.[2] Even more challenging, much of the Commission's regulatory activity under the CPSIA has not been through "legislative rules". As a result, neither full cost-benefit analyses nor other forms of economic review have been required. In fact, some of the most costly (and unnecessary) decisions made by the agency have come through party-line votes on interpretive rules, Notices of Requirements[3], and petition decisions. None of these are "legislative rules," but they each had wide ranging impact. Thus, when considering proposals for regulatory reform, I would strongly recommend that Congress take into account the full scope of regulatory decisions that an agency makes –not simply the most obvious regulatory vehicle, legislative rules.

---

[2] By a vote of 4-1, the Commission voted to interpret the word "any" in CPSIA § 101(b)(1)(A) to mean "zero," rendering the absorbability exclusion of the original statute meaningless, and resulting in the rejection of a petition from a manufacturer to exclude the brass axle of a toy car that had *less absorbable lead* than the FDA permits in a piece of candy.

[3] Notices of Requirements (NOR) are ostensibly procedural regulations that provide notice to testing laboratories on how to become CPSC-recognized labs for the purposes of third-party testing under the CPSIA. However, their issuance triggers the underlying statutory requirement that all children's products be third-party tested to the particular standard listed in the NOR – a huge, new, non-risk-based requirement of the statute with sweeping economic impacts. The Majority has used them to require manufacturers to third-party test to many general consumer product safety standards that I believe should not have been construed as "children's products safety rules" subject to third-party testing under the CPSIA.

Passage of the "Regulations from the Executive In Need of Scrutiny Act" (REINS) Would Ensure Accountability

The discipline of accountability could be brought to regulatory action by amending the Congressional Review Act to require Congressional pre-approval of all "economically significant" rules or regulatory decisions. This idea is embodied in the bill titled the "Regulations from the Executive In Need of Scrutiny Act" (REINS), which provides for expedited review and approval of final rules by the full House and Senate. Under the REINS proposal, Congress would be required to approve any final rules that are "economically significant" or have at least $100 million per year impact. This added step would alert Members of Congress to the most burdensome regulations put forth by federal agencies. It would also prevent unelected agency staff and leadership from continuing to regulate without considering the economic impact of their actions. Moreover, agencies often take years to implement laws passed by earlier Congresses, as illustrated by the CPSIA. Requiring the current Congress to consider significant implementing regulations would help to avoid the unintended adverse consequences of a law and permit changed circumstances to be taken into account.[4]

REINS as currently offered only applies to legislative rules. But given the many other regulatory actions an agency may take to implement a statute, I recommend expanding the scope of this type of proposal to include any rule *or other type of regulatory action* with at least a $100 million impact. The objective would be to include not just high impact legislative rules, but also such interpretive rules, petition decisions, guidance documents, Notices of Requirements, or other types of Commission decisions. I recognize that this may expand the amount of legislative work for Congress and the number of cost-benefit analyses required. However, the scope and impact of these agency decisions more than justifies the added oversight.

REINS could also be expanded by asking Congress to exercise oversight of regulatory actions that result in *less than* a $100 million per year impact. In that case, the process could be streamlined by requiring such regulatory actions to be approved solely by the relevant authorizing Committee(s), and not by the full House and Senate.

Greater Accountability Could Also Be Achieved Through A Mandate for Formal Rulemaking

Greater accountability could also be achieved by imposing more widely on economically significant rules the procedures currently applicable only to formal "on the record" rulemaking. This idea is well articulated by Susan Dudley, Director of George Washington University's Regulatory Studies Center.[5] Agencies normally go through

---

[4] Since the CPSIA's passage in 2008, the Commission has received letters from Members of Congress requesting that the Commission provide relief for small businesses and certain industries, numerous bills have been introduced to reform the statute, petitions for relief have been denied, and a CPSIA reform bill was recently signed into law. But more could have been accomplished along the way, and quicker, had there been a "REINS"-like process of congressional approval for all major rules and other regulatory actions.

[5] http://www.regulatorystudies.gwu.edu/images/pdf/regreform_dudley_workingpaper_20110405.pdf

informal rulemaking processes, including notice and comment, when promulgating rules. More formal rulemaking under 5 U.S.C. §§ 556 and 557 require a full trial like hearing, where pre-hearing discovery is permitted, the rules of evidence apply and parties may both subpoena and cross examine witnesses. The agency decision must be made exclusively based on the oral and written hearing record and must be supported by "substantial evidence." These procedures are often used by agencies responsible for economic regulation of industries, and some variation on them may therefore be particularly appropriate for CPSC regulatory action. In those cases where the full scope of formal rulemaking procedures seemed excessive, imposition of the "substantial evidence" requirement would still be particularly effective. It would ensure more judicial oversight then can be obtained under the current "arbitrary and capricious" standard of review that governs agency informal rulemaking.

Cost-Benefit Analyses of Regulatory Actions are Essential and Should Be Performed by an Independent Entity

Economically significant regulatory actions should not be taken until a cost-benefit analysis has been performed that demonstrates a reasonable relationship between the action's costs and benefits. This should apply to all economically significant regulatory actions, not only legislative rules.[6]

In the absence of a statutory mandate, regulatory agencies are unlikely to perform cost-benefit analyses. For instance, the CPSIA did not require cost-benefit analyses to be performed in connection with the legislative rulemaking that it mandated, and the CPSC Majority therefore objected to doing so. In addition, the vast majority of the Commission's actions implementing the law were taken through procedural rules and other vehicles that never require full, quantitative economic analyses. The Commission's Majority refused to exercise its discretion to undertake cost-benefit analyses even of the CPSIA's most costly and controversial regulations, notwithstanding that Members of Congress[7] as well as the President (EO 13579) have called for such analyses.

A federal agency that is required or willing to undertake a cost-benefit analysis of a significant regulatory action is not always equipped to do so. The CPSC, for instance, lacks the expertise and resources to perform thorough economic analyses of all of its rules. Indeed, to my knowledge, the CPSC has only performed one full cost-benefit analysis in its history.[8] If the CPSC had been required to perform a cost-benefit analysis

---

[6] For certain rules, such as "Notices of Requirements" under the CPSIA, where the "Notice" itself may not have costs associated with it, but the act of issuing the "Notice" triggers an underlying statutory requirement to test and certify (imposing huge costs), I would recommend requiring that the agency perform a cost-benefit analysis of ***both*** the rule itself and the underlying statutory requirement that is associated with it/triggered by it.

[7] In June 2010, then Ranking Member Jo Ann Emerson (R-MO) of the House Financial Services Appropriations Subcommittee wrote a letter to Chairman Tenenbaum urging the Commission to use available extra funding to begin immediately a cost-benefit analysis of the Commission's testing and certification rule, including all other underlying costs of Section 102 of the CPSIA.

[8] The Commission's 2006 final mattress rule on flammability (16 CFR Part 1633) contained a cost-benefit analysis.

of CPSIA's main testing and certification rule, it would have had to outsource the study, given the sheer scope of the rule and number of different industries impacted.

Even if Commission staff had the knowledge, experience and resources to perform cost-benefit analyses of all the CPSC's major regulatory actions, our Economics department is constrained by its lack of independence. The Economics staff must report to the Chairman of the Commission, who may in some cases favor expedition over the performance of a thorough analysis. Fundamentally, regulatory agencies do not view their primary job to be assessing the economics of decisions. Rather, regulatory agencies focus on ***regulating***—with the natural tendency ***to regulate more***. In other words, the more "tweaks" or requirements that can be added in the name of safety, the better—and the costs of such decisions, even when considered, are always ***secondary***.

An effective way to address agencies' lack of expertise, resources and independence, is to create an independent federal office charged with reviewing or performing cost-benefit analyses of all economically significant rules *or other types of regulatory actions* taken by any federal regulatory agency. Offsetting the cost of such an independent office is the fact that "regulatory flexibility analyses" performed under the Regulatory Flexibility Act (RFA) would no longer be needed. RFA analyses are extremely limited compared to a full cost-benefit analysis that qualifies and quantifies in detail the effects of a regulation. The RFA requires an analysis to be performed only if there is a "significant impact" on a "substantial number of small entities." RFA analyses do not necessarily consider a regulation's impact on consumer choice, prices, or more indirect costs to the broader economy, such as job losses. Most importantly, since I have been a Commissioner, few if any analyses under the RFA have lead to changes in rulemakings the agency has promulgated—and there is no mechanism under which agencies are forced to change what they are doing based on an economic analysis under the RFA.

The Independent Body Charged With Analyzing Agency Action Could Also Analyze Congressional Actions Not Otherwise Subject to Review

The independent office charged with performing cost-benefit analyses of agency action could also be tasked with analyzing those federal statutes that are not subject to a full private sector impact analysis by the Congressional Budget Office. CPSIA was such a statute, and its unintended economic consequences attest to the need for a more thorough examination of economic impact before passage. In addition, analyzing statutes would ensure that statutory provisions that are self-implementing without agency action would also be subject to a cost-benefit analysis. Using the CPSC as an example, such provisions might include those making a voluntary industry standard mandatory,[9] or banning a product or substance. Such information would be beneficial both to the Commission implementing the statute and to Congress, which must normally depend entirely on the regulatory agency (and whatever industry comments the agency receives) for information on the law's total costs and economic impact after its enactment.

---

[9] For example the Toy Standard was made law by the statute, not by implementing regulation. CPSIA § 106.

President Obama's Executive Orders No. 13563 and 13579 Should be Made Law

Congress could also ensure that adequate analysis is undertaken before burdensome regulatory action is taken, by passing as law President Obama's Executive Orders No. 13563 and 13579. This would require all agencies, including independent agencies, to "take into account benefits and costs, both quantitative and qualitative" of the rules it promulgates. If the CPSC is any indication, independent regulatory agencies are unlikely to take action beyond the law's minimum requirements, and will ignore or construe very narrowly the nonbinding exhortations of executive orders. Codifying such orders would require agencies to take these necessary steps. Additionally, codifying these requirements for cost-benefit analyses, public participation and other regulatory reform objectives, would subject them to judicial review.

Congress Should Not Except Regulations from Existing Cost-Benefit Analysis Requirements

Congress can sometimes be an obstacle to the performance of economic impact analyses by regulatory agencies. For instance, the CPSIA expressly excepted the CPSC from its existing statutory mandate to perform cost-benefit analyses of its legislative rulemaking under the statute. As a result, no cost-benefit analysis was performed of the CPSC's Testing and Certification rule, or the law's new mandatory standards requirements. Admittedly, the CPSIA did not prohibit the agency from undertaking the analyses, but removing the requirement allowed a Majority of Commissioners disinclined to confront the law's costs to argue that Congress did not wish them to be considered. This situation could be avoided through a new law requiring a separate vote to specifically exempt authorized agency action from cost-benefit or other economic analysis requirements. ***For example, Congress could prohibit the consideration of any bill exempting cost-benefit analysis, public participation, or other necessary regulatory accountability procedures without a separate, stand-alone vote requiring a 2/3 majority to pass the exemption.*** This requirement would permit Congress to ensure expeditious regulatory action where absolutely necessary, but to do so only with added visibility and accountability.

2) Please also list any regulations or other Commission requirements you have identified to date as being unnecessarily burdensome or duplicative.

Chairman Tenenbaum recently announced that the Commission may conduct a retrospective review of its regulations. She indicated that it would be similar to a review that was undertaken annually for several years prior to the passage of the CPSIA. Such a review could reduce unnecessary regulatory burdens on manufacturers, but only if the Majority prioritizes the review of CPSIA regulations and other agency action taken pursuant to the CPSIA. If not, it is doubtful that such a review will yield many significant changes. After all, the CPSIA's impact across the greatest scope of industries dwarfs that of all other CPSC statutes and regulations since the agency's inception. I

hope the Chairman will be open to my views on how the Commission can most effectively use this opportunity to meaningfully reduce the unnecessary burdens the Commission's implementation of the CPSIA has imposed on American businesses. But I fear that the Majority will proceed with a regulatory review that avoids addressing the major CPSIA regulatory actions that have had the most significant impact.

In particular, the following are Commission actions that should be revisited so that the Commission's safety goals can continue to be met without unnecessary collateral damage to the economy:

- ***Civil Penalties Factors*** – In the Commission's interpretive rule on Civil Penalties Factors, I proposed a number of changes to provide more certainty for the regulated community and to ensure that, while the overall civil penalty ceiling was raised, "technical" violations, such as incorrect paperwork, would not be treated the same way as more serious violations, such as failures to meet safety standards. This is one area of the statute that was not too prescriptive, and a middle-ground could have been reached.[10]

- ***Definition of Children's Product*** – The CPSIA applies to all "children's products", statutorily defined as products "designed or intended primarily for children 12 years of age or younger." To assist manufacturers to identify which of their products are subject to CPSIA requirements, the Commission published a Notice of Proposed Rulemaking defining "children's products." The comments the Commission received in response made clear that the parameters we had tried to set in the proposed definition were not helpful to most manufacturers that produce children's products intended either for ages 10-12 or for an age range falling both inside and outside the upper age limit of 12. They therefore asked for clarification and more specific direction. After receiving these comments, the Commission had a chance to put a much narrower "fence" around the scope of covered products—or to at least define clearer boundaries. Instead, the Majority voted for a Final Rule that left in place a vague definition that has led to confusion among the regulated community[11] and provided insufficient guidance to CPSC staff[12] in their efforts to enforce children's product safety standards.

- ***"Children's product safety rules"*** – The CPSIA requires third-party testing for compliance with all "*children's* product safety rules." Prior to the CPSIA, the Commission promulgated numerous "*consumer* product safety rules", such as those governing carpets and rugs, vinyl, clothing textiles and mattresses. Over my objection, the Commission's Majority has required any such products intended for use in a children's room to be third party tested to those general consumer product safety rules. For instance, a rug with the image of a Disney character and intended

[10] http://www.cpsc.gov/pr/northup03102010.pdf
[11] http://www.cpsc.gov/pr/northup09292010.pdf
[12] Justin Pritchard, "Feds dismiss need to recall lead drinking glasses," *Associated Press*, December 11, 2010, http://news.yahoo.com/s/ap/20101211/ap_on_be_me/us_cadmium_lead_glassware

for a child's room that the CPSIA clearly required to be third-party tested to lead and phthalates limits must, because of this interpretation, now also be third party tested to the rug flammability standard; but a blue rug in the living room does not. I believe a clear distinction can and should be made between "children's product safety rules" and more general "consumer product safety rules." Fundamentally, no safety improvement is attained by requiring the third-party testing of a lamp or rug based on its design, when there is a greater risk that a rug will encounter a fire hazard in a kitchen or adjacent to the living room fireplace than in a child's room. And children play throughout the house. The CPSIA defined children's products as those primarily designed or intended for children under 13. "Children's product safety rules" should be consistently construed to mean safety rules that relate exclusively to children's products, and not to products intended for general use and governed by a longstanding consumer product safety rule. The Commission did not have to adopt a contrary view—and there is no risk associated with these products that necessitates *new* third-party testing requirements.[13]

- ***Public Database***: I proposed an alternative database rule that addresses the concerns I raised above and would have made the database a more accurate source of information for consumers. The Commission's Majority instead passed a rule that went well beyond the statute's requirements, allowing "anyone" to submit reports of harm—even advocacy groups, attorneys, random bystanders, and, as has actually occurred, people perusing the internet that may not have firsthand knowledge of the incident. In total, the Commission Majority's database rule ensures that the database will be filled with inaccurate reports of harm that will be useful only to advocacy groups and trial attorneys, and will be time consuming and costly to manufacturers--particularly small businesses.

- ***Reduction to 100 ppm of Lead***: The CPSIA banned as a hazardous substance children's products containing over 300 ppm of lead. It also provides that children's products containing over 100 ppm of lead shall be treated as a banned hazardous substance beginning on August 14, 2011, "unless the Commission determines that a limit of 100 parts per million is not technologically feasible for a product or product category." On July 13, 2011, the Commission voted 3-2 that there is no product or product category for which 100 ppm is not technologically feasible. The Majority reached this decision despite substantial evidence to the contrary. Commission staff advised that the economic impact of reducing the limit to 100 ppm is a factor in determining the technological feasibility of doing so. In addition, staff identified significant "economic impacts that are likely to occur", including: the need to use more expensive low-lead materials rather than the nonconforming materials used today; the costs associated with reengineering products to make use of new materials; the costs of making leaded components inaccessible; increased testing costs; increased consumer prices; reductions in the types and quantity of children's products available to consumers; businesses exiting the children's product market; manufacturers going out of business; reduction in the utility of products due to the

[13] http://www.cpsc.gov/pr/northup07122010.pdf

substitution of materials; reduction in the durability of products due to the substitution of materials; and, the loss of the value of all inventory not satisfying the new standard. With respect to any potential counterweight to this economic harm, Commission staff concluded that the "overall contribution of" products with lead content between 100 ppm and 300 ppm "to lead exposure in children is minimal." Notwithstanding staff's acknowledgment that reducing the lead limit to 100 ppm will cause substantial economic harm with no offsetting improvement in product safety, the Commission's majority voted to reduce the standard.

In addition to these past regulatory actions with which I disagreed, I also believe the Commission's ongoing approach to regulating is fundamentally flawed. The President's Executive Order No. 13579 encourages independent agencies to perform cost-benefit analyses before imposing new regulatory burdens that could undermine the nation's economic recovery without sufficient justification. This Commission had steadfastly refused to do so, yet some of my colleagues routinely rely on the absence of "data" to justify their refusal to consider the adverse economic consequences of the Commission's regulatory actions. Requiring the Commission to obtain the necessary data and to limit its rulemaking to decisions whose benefits justify their costs would go a long way toward avoiding future regulatory overreach.

Questions for the Record

Subcommittee on Oversight and Investigations
Committee on Energy & Commerce
United States House of Representatives
"The Views of the Independent Agencies on Regulatory Reform"
July 7, 2011

Answers from
The Honorable Robert M. McDowell
Commissioner
Federal Communications Commission
August 15, 2011

1. In Chairman Leibowitz's testimony he said that the FTC is "seeking to identify acts of Congress that appear to be of little value but that impose burdens on businesses, particularly small businesses and the Commission." It would be useful to this Committee if all of the agencies in our jurisdiction performed such an analysis. Can you please provide us with a list of any such statutes you have identified to date at the FCC, the reasons they are burdensome, why they do not provide much value, and how you would recommend changing them?

I operate under the philosophy that Congress should tell us what to do, and not the other way around. Given your solicitation of suggestions, however, I will start by raising several possible statutory changes to improve the FCC before moving on to possible procedural reforms.

Twenty-first century consumers want to have the freedom to enjoy their favorite applications and content when and where they choose. Whether such material arrives over coaxial cable, copper wires, fiber or radio waves is of little consequence to most consumers so long as the market's supply of products and services satisfies demand. Legacy statutory constructs, however, have created market distorting legal stovepipes based on the regulatory history of particular delivery platforms. While consumers demand that functionalities and technologies converge, regulators and business people alike are forced to make decisions based on whether a business model fits into Titles I, II, III, VI, or none of the above. As Congress contemplates FCC reform, it may want to take the current marketplace into account and consider adopting an approach that is more focused on preventing concentrations and abuses of market power that result in consumer harm.

Other statutory changes could include modernizing the Sunshine in Government Act to increase our efficiency and spirit of collaboration while preserving openness and transparency.

Additional suggestions for statutory amendments are listed below:

Reform of the Regulatory Flexibility Act (RFA) (5 U.S.C. § 601 et seq.)

- The RFA requires an agency to perform an analysis of the effect of proposed and final rules on small entities, including what steps have been taken to minimize the burden on small businesses.

- The RFA has been ineffective in reducing the implementation of burdensome or overly-regulatory rules.

- Without a cost-benefit standard or mandate to prevent rules that are burdensome, compliance entails creating a report that merely reiterates the boilerplate analysis in the notice of proposed rulemaking or order.

- The RFA should be either eliminated or modified to prevent costly and unnecessary rules.

Forbearance Authority (47 U.S.C. § 160) (Section 10)

- Section 10 of the Telecommunications Act of 1996 mandates that the Commission "shall forbear" from applying any regulation or statutory provision to "a telecommunications carrier or telecommunications service, or class of telecommunications carriers or telecommunications services" if the agency determines enforcement of such requirement "is not necessary" to ensure that charges and practices are reasonable and "not necessary for the protection of consumers," and that forbearance is consistent with the public interest.

- Given the convergence in the communications industry, it makes more sense for the FCC to review regulations applying to all providers under its jurisdiction, not just carriers and providers of telecommunications services. Congress could consider amending the Act to require a broader and more comprehensive approach.

Section 11 Biennial Review (47 U.S.C. § 161)

- Section 11 of the Telecommunications Act requires the FCC to review every two years those regulations that apply to providers of telecommunications services to determine "whether any such regulation is no longer necessary in the public interest as the result of meaningful economic competition,"[1] and to "repeal or modify any regulation it determines to be no longer necessary in the public interest."[2]

- Unfortunately, these reviews have not resulted in much action to actually eliminate rules. As such, the reviews are burdensome and unnecessary. I recommend that Congress amend this section so that following each biennial review, the FCC is compelled to move forward within a specific timeline to repeal various rules or to justify why repeal is not necessary.

- Furthermore, the section only requires the FCC to review regulations that apply to providers of telecommunications services. Given the convergence in the communications industry, it makes more sense for the FCC to review regulations

[1] 47 U.S.C. §161(a)(2).

[2] 47 U.S.C. §161(b).

applying to all providers under its jurisdiction. Congress could consider amending the Act to require a broader and more comprehensive approach.

- Additionally, Congress could amend the statute to require the FCC to conduct the review under the presumption that a rule is not necessary unless the FCC finds compelling evidence to the contrary.

Set-Top Boxes (47 U.S.C. § 629)

- Section 629 requires the Commission, in consultation with standards-setting organizations, to adopt regulations designed to assure the competitive availability of video navigation devices, such as set top boxes.

- Section 629 should be modified to promote competitiveness and innovation, and to ensure our rules do not hinder the marketplace.

- The government does not have a great track record in fashioning detailed technical mandates. For instance, in the case of CableCARD technology, the industry continues to innovate; however, the industry's work on many enhancements, such as downloadable security, has largely stalled as a result of the FCC's regulations.

Statutory Requirements for Various Reports

- Various statutory provisions require the FCC to file annual reports on various topics; such as, the Wireless Competition Report,[3] Satellite Competition Report,[4] Section 706 Report,[5] and Video Competition Report.[6] Preparation of each is a monumental and costly undertaking.

- Rather than requiring that the Commission submit these reports annually, Congress might consider amending the Act to require biennial submissions. For

[3] *See* The Omnibus Budget Reconciliation Act of 1993, Pub. L. No. 103-66, Title VI, § 6002(b), amending the Communications Act of 1934 and codified at 47 U.S.C. § 332(c).

[4] *See* Pub. L. No. 109-34, 119 Stat. 377 (2005), which amended the Communications Satellite Act of 1962 and is codified at 47 U.S.C. § 703.

[5] *See* 47 U.S.C. § 1302(b) (2010). Section 706 of the Telecommunications Act of 1996, Pub. L. No. 104-104, § 706, 110 Stat. 56, 153 (the Act), as amended in relevant part by the Broadband Data Improvement Act, Pub. L. No. 110-385, 122 Stat. 4096 (2008), codified in Title 47, Chapter 12 of the United States Code. *See* 47 U.S.C. § 1301 *et seq.*

[6] *See* Pub. L. No. 102-385, 106 Stat 1460 (1992). Congress imposed an annual reporting requirement on the Commission in the Cable Television Consumer Protection and Competition Act of 1992 ("1992 Cable Act") as a means of obtaining information on "the status of competition in the market for the delivery of video programming." *See also* 47 U.S.C. § 548(g).

example, filing each sometime within the first quarter of odd-numbered years would allow each incoming Congress to have fresh data at hand for any possible legislative considerations. Moreover, this amendment would remove the Commission from what sometimes seems like perpetual reporting mode.

The 70/70 Benchmark (47 USC § 612(g))

- Provides the Commission with the authority to promulgate additional cable rules to provide diversity of information sources when cable systems are available to 70 percent of U.S. households and are subscribed to by 70 percent of the households to which such systems are available.

- Should be reconsidered in light of the modern competitive marketplace.

- Concerns of a cable monopoly hindering the delivery of diverse programming has been eliminated as a result of deregulatory policies that have encouraged investment and new entry by wireline and satellite providers, in addition to Internet-supplied content.

2. Please also list any regulations or other Commission requirements you have identified to date as being unnecessarily burdensome or duplicative.

"Net Neutrality" Rules

- For the first time ever, the FCC imposed network management rules on the Internet.

- The rules are unnecessary at best, and will deter investment in badly needed next-generation infrastructure at worst. There has been no evidence of systemic market failure that justifies these overly burdensome regulations.

- Language in the "net neutrality" order itself concedes that the Commission did not conduct a market power analysis or make a market power finding.[7]

- Even though the FCC adopted the "net neutrality" rules last December, they have yet to become effective. In the interim, America's Internet remains open and freedom-enhancing, as it *always* has been.

[7] *Preserving the Open Internet, Broadband Industry Practices*, Report and Order, 25 FCC Rcd 17905, n. 49 (2010) ("Open Internet Order").

Equal Access Scripting Requirement

- A number of phone companies are still required to inform a customer seeking a new local exchange service provider that the customer can receive long distance phone service from another carrier and, upon request, must read aloud to the customer a list of available independent long-distance companies.

- This requirement is an old vestige from the break-up of the AT&T long-distance monopoly. Ma Bell's long-distance arm was declared "non-dominant" way back in 1995, and the long distance market has been competitive for almost 16 years, yet some of our antiquated rules live on.

- While the larger Bell companies and their successors were granted relief from this requirement years ago, it is *smaller* phone companies that must continue to bear the burden of living under them.

Cost Allocation Requirements and Automatic Reporting Management Information System Mandates

- Only the smaller non-Bell companies are still required to follow the cost allocation requirements and ARMIS (Automatic Reporting Management Information System) reporting mandates.

- For carriers living under flexible price cap rules, rates are not dependent on costs and therefore such rules do not make sense. Also, considering that these carriers operate in an environment that is more competitive than a few years ago, these rules are not necessary.

Affiliate Transaction Rules (47 CFR § 32.27)

- These rules require only the smaller non-Bell companies to track the valuation of assets that are transferred between regulated and nonregulated affiliates. The larger Bells are no longer required to follow these requirements.

- For carriers living under flexible price cap rules, rates are not dependent on costs and therefore such rules do not make sense. Also, considering that these carriers operate in an environment that is more competitive than a few years ago, these rules are not necessary.

Continuing Property Record Requirements (47 CFR §§ 32.2000(e),(f))

- Requires incumbent LECs to maintain detailed recordkeeping of their plant accounts such as descriptions of property, and location of property and original cost data.

- These rules have primarily served for states in state ratemaking proceedings, not for FCC purposes. Furthermore, each incumbent LEC has a vested interest in maintaining accurate property inventory, absent these detailed requirements.

- Additionally, over a decade ago, the Commission tentatively concluded that these requirements should be eliminated.[6]

CMRS Spectrum Aggregation Limit (47 CFR § 20.6)

- When in effect, limits the amount of spectrum a given carrier was able to hold in a given market area.

- Rule sunset as of 2003, yet still remains in the CFR.

Rules Applicable to the Provision of CMRS Service by ILECs (47 CFR § 20.20)

- Unique regulatory requirements established for ILECs providing wireless services.

- Rule sunset as of 2002, yet still remains in the CFR.

Mutually Exclusive Applications (47 CFR § 22.131)

- Procedures for resolving mutually exclusive license applications.

- Provisions are moot because the FCC uses auctions to assign licenses based on the submission of mutually exclusive applications.

Competitive Bidding Procedures (47 CFR §§ 22.201, 22.213, 22.225, 22.227, 22.228)

- Procedures for auctioning private mobile services spectrum.

- Duplicates competitive bidding procedures set forth in Part 1 of the Commission's rules.

Antenna Structures (47 CFR § 22.365)

- Requirements for installing and maintaining antenna structures.

---

[6] *See 2000 Biennial Regulatory Review – Comprehensive Review of the Accounting Requirements and ARMIS Reporting Requirements for Incumbent Local Exchange Carriers: Phase 2, et al.*, Report and Order and Further Notice of Proposed Rulemaking, 16 FCC Rcd 19911, ¶212 (2001) ("[W]e tentatively conclude that we should eliminate our detailed [continuing property records] rules in three years.").

- Duplicates antenna structure requirements set forth in Part 17 of the Commission's rules.

Mutually Exclusive Applications in the Paging and Radiotelephone Service (47 CFR § 22.509)

- Procedures for resolving mutually exclusive license applications.
- Provisions are moot because the FCC uses auctions to assign licenses based on the submission of mutually exclusive applications.

Responsibility for Mobile Stations (47 CFR § 22.571):

- Requires base station licensees to maintain responsibility for mobile stations.
- Duplicates a general provision in Section 1.903(c) of the Commission's rules.

Comparative Renewal Proceedings (47 CFR § 24.16)

- Provides preference in comparative renewal proceedings for licensees who have demonstrated substantial service.
- Licensees are no longer subject to the comparative renewal process. FCC assigns licenses by auction.

Cost Sharing Requirements for Broadband PCS (47 CFR §§ 24.239-253)

- Rules applicable to cost apportionment associated with post-auction clearing of incumbents from PCS band.
- The cost-sharing plan sunset for all PCS entities in 2005, yet these rules remain in the CFR.

Oppositions to Narrowband PCS Applications (47 CFR § 24.430)

- Procedures for submitting oppositions to applications submitted as part of the competitive bidding process.
- Duplicates Section 1.2108 of the Commission's rules.

Mutually Exclusive Narrowband PCS Applications (47 CFR § 24.431)

- Procedures for resolving mutually exclusive applications.
- Provisions are moot because the FCC assigns licenses by auction.

Responsibility for SMR Mobile Stations (47 CFR § Section 90.656)

- Requires base station licensees to maintain responsibility for mobile stations.
- Duplicates a general provision in Section 1.903(c) of the Commission's rules.

Media Ownership Rules (47 CFR § 73.3555)

- These rules – including the newspaper/broadcast cross-ownership rule, the radio/television cross-ownership rule, the local television ownership rule, the local radio ownership rule, and the dual network rule – prohibit the ownership of multiple broadcast/newspaper entities.
- Should be modernized to reflect the current competitive marketplace and economic and technological realities.
- Should consider eliminating the newspaper-broadcast cross-ownership rule.

Leased Commercial Access (47 CFR § 76.970)

- Requires cable operators to lease channels to programmers not otherwise carried on a cable system. In January 2008, the Commission released an order, to which I dissented, that changed the rate structure. These rules are not yet effective due to a stay issued by the Sixth Circuit Court of Appeals and Paperwork Reduction Act delays.
- Should re-evaluate the rate structure, which causes cable operators to subsidize commercial leased access users and determines rates based on the content delivered.
- The rates adopted will result in a loss in the diversity of programming as cable operators are forced to drop lesser-rated channels in favor of leased access requests seeking distribution distorted below cost and market rates.
- The majority also adopted customer service standards, complaint procedures, and reporting requirements, which are all aimed at propping up a regime that is past its prime.

Fairness Doctrine

- Despite the fact that the FCC stopped enforcing the Fairness Doctrine in the late 1980's because the doctrine regulated political speech and is therefore patently unconstitutional, the Fairness Doctrine is literally still codified in the CFR.[9]

- Fortunately, Chairman Genachowski recently informed your committee that he supports removing references to the Fairness Doctrine (and its corollaries) from the CFR and intends to move forward on this effort in August. I look forward to helping him achieve that goal.

Form Requirements

- The FCC has too many forms. For example, there is Form 603; Form 611-T; Form 175; Form 601; Form 492; Form 477; Form 323; and Forms 396, 396-C, 397 and 398, among others.

- To the Chairman's credit, he has launched an initiative which seeks to reform the FCC's data collection processes. I support these efforts and hope that this exercise results in comprehensive reform of the FCC's burdensome data collection procedures as opposed to simply shaving them around the edges.

- While a few forms may be necessary, many could be eliminated or simplified. Several forms require companies to submit data that is no longer needed or is supplied elsewhere.

Enhanced Disclosure Form (Form 355)

- The Enhanced Disclosure Form is a specific example of a form that should be eliminated entirely. The form was previously adopted by the Commission for the purpose of obtaining detailed information from broadcasters about community-focused programming on a quarterly basis.

- Has not become effective due to Paperwork Reduction Act delays.

- Should be eliminated as suggested in the Information Needs of Communities Report. Risk remains that a replacement might simply resurrect the Enhanced Disclosure form's pointless and burdensome mandates.

---

[9] 47 CFR § 73.1910 ("broadcasting"); 47 CFR § 76.209 ("origination cablecasting"). *See also* 47 CFR §§ 76.1612-13 (Fairness Doctrine corollaries applied to origination cablecasting).

- Costly, burdensome, and unnecessary in today's highly competitive video market, which motivates broadcasters to respond to the interests of their local communities.

Pending Regulations

Finally, Chairman Genachowski has initiated some proceedings that will help clear away some of the regulatory underbrush, and he should be commended for those efforts. I look forward to continuing to work with him and all of my colleagues on these matters. In the meantime, however, Chairman Genachowski has also initiated many proceedings, through notices of inquiry, notices of rulemaking, or staff-prepared public notices, which seek comment on proposed new regulations.

Although I have supported opening these dockets, I have likewise expressed concern about the seeming rush to regulate. I have urged that the FCC develop a solid record, including a thorough cost-benefit analysis, and allow meaningful public comment prior to forming conclusions and implementing any regulations. While it may be tempting to shrug off regulatory costs, the reality is that businesses pass on their costs to consumers. We all pay for the cost of government mandates. As such, it is important to proceed carefully.

Some examples of pending proceedings are:

Subject	Docket No.
Broadband Speed Survey and "Need for Speed" Information. FCC seeks comment on speed survey results and measurement of broadband speed, and also seeks comment on what kinds of "need for speed" information will be most helpful to consumers in choosing their broadband service.	CG 09-158 CC 98-170 WC 04-36
Network Survivability. FCC seeks comment on current efforts in the industry to ensure continuity during major disasters, existing reliability standards, and the FCC's role and legal authority as to these issues.	PS 11-60; 10-92 EB 06-119
Uniform License Renewal, Discontinuance of Operations, and Partitioning/Disaggregation. FCC seeks comment on creating new requirements for license renewals, to establish uniform consequences for service discontinuance, and to clarify construction obligations for spectrum licensees.	WT 10-112

Subject	Docket No.
Broadband Data Collection. In the April 2010 order, the FCC adopted rules addressing the provision of aggregate data collected from broadband service providers on Form 477. Current rulemaking proceedings propose possibly expanding data collection requirements.	WC 07-38; 09-190; 10-132; 11-10; 11-3 GN 09-51; 09-47
Deploying Aerial Communications Architecture to Disaster Areas. FCC seeks comment on deploying aerial communication architecture to disaster areas.	PS 11-15
Advanced Broadband for First Responders. FCC seeks comment on proposed rules for deployment and operation of a nationwide interoperable public safety broadband network.	WP 07-100 WT 06-150 PS 06-229
Framework for Next Generation 911 Deployment. FCC seeks comment on how Next Generation 911 ("NG911") would enable the public to obtain emergency assistance by means of advanced communications technologies' beyond traditional voice-centric devices.	PS 10-255
E911 Location Accuracy Requirements. FCC requires wireless licenses to satisfy E911 Phase II location accuracy and reliability standards on a county or PSAP-based geographic level basis. FCC also seeks comment on further improvements to the location capability of 911 and E911 services (including indoors and vertically) for existing and new voice communications technologies and new broadband technologies associated with deployment of NG911 networks.	PS 07-114 WC 05-196
"*Bill Shock*." FCC proposes to require mobile service providers to provide new usage notifications and additional disclosures so that consumers would not receive unexpected charges on their bill; *i.e.*, "bill shock."	CG 10-207; 09-158
International Broadband Comparison. FCC seeks comment on improving the International Comparison required by Broadband Data Improvement Act.	IB 10-171
Roadmap for Cybersecurity. FCC seeks comment on creation of cybersecurity roadmap to identify vulnerabilities to communications networks in preparation for potential cyberthreats.	PS 10-146 GN 09-51
Robocalls/TCPA. FCC proposes restricting automated telephone calls ("robocalls") by requiring sellers and telemarketers to obtain written consent from recipient – even where the consumer has established a business relationship – before making these calls.	CG 02-278
Special Access. FCC seeks comment on pricing for access to high-capacity facilities.	CC 05-25
Cramming. FCC seeks comment on proposed rules that could alert consumers to unauthorized charges being "crammed" on their bills; could potentially lead to regulation of billing services.	CG 11-116
Outage Reporting for Interconnected VoIP and Broadband ISPs. FCC seeks comment on new requirements for these providers in the event of a service outage.	PS 11-82

Subject	Docket No.
Lifeline and LinkUp Reform and Modernization. FCC seeks comment on ways to reform the Lifeline and Linkup programs to reduce waste, fraud and abuse; including a proposal for a federal standard as a minimum threshold for verifying continued eligibility in the program and proposals to extend the subsidy to support broadband.	WC 11-42
Video Device Competition/AllVid. FCC seeks comment on rules to provide competition in the retail market for set-top video devices that are compatible with all multichannel video programming distributor ("MVPD") services.	MB 10-91 CS 97-80 PP 00-67
Program Carriage. FCC seeks comment on various revisions and clarifications to the program carriage rules, which prohibit, amongst other things, MVPDs from discriminating against unaffiliated programming vendors when determining carriage or negotiating program carriage agreements.	MB 11-131
Media Ownership. As part of the 2010 quadrennial review, the FCC seeks comment on the state of the media industry and the multiple ownership and cross ownership rules affecting radio, TV and newspapers.	MB 09-182
Broadcast Localism. FCC seeks comment on various proposals – including permanent community advisory boards, renewal guidelines, and a requirement to have a 24 hour physical presence in a station – to ensure that broadcasters are addressing the needs of their local communities.	MB 04-233
Retransmission Consent. FCC seeks comment on modifications to the rules governing good faith negotiations when broadcast television stations elect retransmission consent negotiations as opposed to exercising their must-carry rights.	MB 10-71
Program Access and Tying Arrangements. FCC seeks comment on revisions to the program access rules, which pertain to the ability of an MVPD to access video programming, and retransmission consent rules in light of program tying arrangements.	MB 07-198
Digital Audio Broadcasting Systems. FCC seeks comment on the appropriate treatment of subscription-based radio services and whether digital radio stations should be subject to additional public interest obligations beyond those that apply to analog stations.	MM 99-325
Sponsorship Identification. FCC seeks comment on its sponsorship identification rules and the incorporation of commercial messages into programming; *i.e.*, "embedded advertising."	MB 08-90

FEDERAL ENERGY REGULATORY COMMISSION
WASHINGTON, DC 20426

OFFICE OF THE CHAIRMAN

August 17, 2011

The Honorable Cliff Stearns
Chairman
Subcommittee on Oversight and Investigations
Committee on Energy and Commerce
U.S. House of Representatives
2125 Rayburn House Office Building
Washington, D.C. 20515

Dear Chairman Stearns:

Thank you for the opportunity to testify before the House Subcommittee on Oversight and Investigations of the Committee on Energy and Commerce on July 7, 2011 on the views of the independent agencies on regulatory reform. Enclosed are the responses to the post-hearing questions that Representatives Stearns, Barton, Myrick and Gardner have submitted. Commissioner Moeller has informed me that he concurs in my responses to the questions that were posed by the Honorable Cliff Stearns and the Honorable Joe Barton, as those questions were also directed to Commissioner Moeller.

Should you need additional information, please do not hesitate to contact me.

Sincerely,

Jon Wellinghoff
Chairman

Cc: Diana DeGette, Ranking Member

The Honorable Cliff Stearns

1. **In Chairman Leibowitz's testimony he said the FTC is "seeking to identify acts of Congress that appear to be of little value but that impose burdens on businesses, particularly small businesses and the Commission." It would be useful to this Committee if all of the agencies in our jurisdiction performed such an analysis. Can you please provide us with a list of any such statutes you have identified to date at FERC, the reasons they are burdensome, why they do not provide much value, and how you would recommend changing them.**

Answer: Below are several parts of the Federal Power Act (FPA) that I believe could be eliminated or modified to reduce burden.

FPA section 305(c)

- Section 305 of the FPA concerns officials dealing in securities and interlocking directorates. FPA 305(c) has two reporting requirements. The first is to report a broad range of interlocking officer positions and directorships. The only apparent use for this provision is to serve as a check to ensure that those required to file interlock applications under the much more narrow section 305(b) did so. The second is a related requirement to report each public utility's 20 largest purchasers of its power. I also do not see that this provision of the Federal Power Act serves much purpose. I believe that these provisions could be eliminated, as they are not typically used by this Commission to carry out its functions, and they do not appear to be useful to the general public.
- In addition, Part 46 of our regulations is devoted to the implementation of these two statutory reporting requirements. If FPA section 305(c) is repealed, then the Commission could eliminate Part 46 in its entirety.

Modification to the Commission's hydropower certification statutes

Congress could modify the Commission's authority for licensing hydropower projects in the following ways:

- Exempt all conduit projects from Commission jurisdiction (modeled after H.R. 5922, which intended to exempt 1.5 MW or less).
- Remove projects currently holding a conduit exemption from Commission jurisdiction. In the alternative, allow projects on federal lands, if they would otherwise qualify, to be eligible for a conduit exemption.
- Clarify that 5-MW exemptions may be located at government dams.
- Extend the term of preliminary permits for 2 years if activities under the original permit were conducted with due diligence.

2. Please also list any regulations or other Commission requirements you have identified to date as being unnecessarily burdensome or duplicative.

Answer: As I stated in my testimony, the Commission's practice is to engage in constant self-review to avoid red tape or unnecessary regulation that would impose undue burdens on the energy industry. Below are several actions the Commission has taken to reduce unnecessarily burdensome or duplicative regulations. In addition, I welcome the President's new executive order asking independent agencies to engage in a public effort to reassess and streamline their federal regulations and have announced that the Commission will implement the President's executive order. When that review is completed, I would be happy to share our results with you.

Revisions to Form 552

- Under the Commission's Form No. 552, natural gas market participants must annually report information regarding physical natural gas transactions that use an index or that contribute to or may contribute to the formation of a gas index. Order No. 704 required market participants to file these reports in order to provide greater transparency concerning the use of indices to price natural gas and how well index prices reflect market forces. In Order No. 704-C the Commission reduced burden on the industry by revising Form No. 552 so as to (1) exempt from reporting any unexercised options to take gas under a take-or-release contract; (2) exempt from reporting cash-out imbalance and percentage of proceeds transactions, since they were burdensome to report and provided little market information; and, (3) strike the form's references to the blanket sales certificates issued under § 284.402 or § 284.284, since they were burdensome to report and provided little market information, so as to also exempt small entities who were obligated to report solely by virtue of possessing a blanket sales certificate.

Elimination of Form 11

- Form 11 was a quarterly filing made by natural gas companies whose gas transported or stored for a fee exceeded 50 million Dth in each of the three previous years. In 2008, in revising the Commission's financial forms to carry out its responsibilities under the NGA to ensure that rates are just and reasonable, the Commission eliminated a separate filing, Form 11, to streamline the filing process, mitigating the filing burden.

Electric Quarterly Report (EQR) requirements

- All public utilities are required to electronically file EQRs summarizing the contractual terms and conditions in their agreements for all jurisdictional services (including market-based power sales, cost-based power sales, and transmission service) and transaction information for short-term and long-term market-based power sales and cost-based power sales during the most recent calendar quarter. As indicated in a notice issued June 24, 2011, the Commission will be switching the filing mechanics from an outdated, difficult-to-support software platform to a more flexibly implemented process using the current business standard of XML. In this way, the Commission will allow EQR filers to develop their own methods for

submitting this vital part of its market based rate program rather than forcing them to use a system developed almost 10 years ago.

- In order to reduce the burden on companies making corrections to previously filed EQRs, the Commission has adopted a policy of limiting those corrections to the most recent 12 reports (three years) rather than requiring corrections back to the original filed EQRs which could be as early as 2001.

Semi-Annual Natural Gas Reporting Requirements

- Sections 284.13(e) and 284.126(c) of the Commission's regulations require certain pipelines to file semi-annual storage reports at the end of each complete storage injection and withdrawal season. On December 16, 2010, the Commission in Docket No. RM11-4-000 issued a Notice of Inquiry (NOI) regarding whether and how the semi-annual storage reports required of both interstate and intrastate pipelines should be modified in light of (1) changes in the natural gas market since the Commission originally adopted the semi-annual storage reporting requirements and (2) recent improvements in the Commission's other reporting requirements. As part of this NOI, the Commission sought comment on whether to retain a revenue reporting requirement and whether certain semi-annual storage reports should be folded into another form No. 549D. The Commission is still considering comments submitted in this proceeding.

The Honorable Joe Barton

1. **I am aware of a planned hydro project at an existing dam on Lake Livingston in Texas and the license application has been pending with FERC staff for over two years. Can you check on the Livingston application and let us know when the license might be issued?**

Answer: I cannot give you an exact date for when the Commission will act on the application, because the matter is still under consideration. However, I can tell you that Commission staff issued an environmental analysis of the proposed project on February 2, 2011. Staff has all of the information necessary to complete its analysis of the proposal and is working diligently on the matter.

The Honorable Sue Myrick

1. **Due to the significant delay by the National Marine Fisheries Service in issuing a Biological Opinion for the Catawba-Wateree Hydro Relicensing process, what is stopping FERC from issuing the license for the project that reserves the right to reopen the license if/when short nose sturgeon are detected in the river basin?**

Answer: A reopener would not protect the Commission against allegations that it had violated the Endangered Species Act (ESA) by issuing a license without completing consultation as required by section 7 of that Act. Also, in the absence of an incidental take permit – which is issued in conjunction with a biological opinion -- if project

operations resulted in the taking of listed species, the Commission as well as the licensee (and possibly certain individuals) could be subject civil and criminal peoalties for violating section 10 of the ESA. In addition the license cannot be issued without action on the water quality certification from South Carolina.

The Honorable Cory Gardner

1. FERC is mandated, under the Federal Power Act, to provide rates that are "just and reasonable and not unduly discriminatory," but has instead allowed these rates in RTO markets to rise virtually unchecked.

What is FERC's view of its mandate under the Federal Power Act to ensure that wholesale electric rates are "just and reasonable and not unduly discriminatory?"

Answer: The premise of your question suggests several conclusions which are erroneous. It is suggested that FERC "...allowed...rates in RTO markets to rise..." and that FERC did so such that that rise was "...virtually unchecked." First, where competition is adequate, FERC generally does not control the rise or fall of electric rates in RTO markets. Rates in those wholesale markets are controlled by competitive market forces that are directly responsible for the level of those rates.

Next as to the "checks" on the RTO markets by FERC, the FERC oversees those markets and establishes the market rules and tariff conditions that all market participants must comply with or be subject to enforcement action and penalties. The FERC Office of Enforcement monitors the RTO markets on a daily basis and reviews market activity for signs of fraud and manipulation. Enforcement actions are brought if a market participant is not complying with the established market rules. In addition each RTO has an independent market monitor who also oversees market operations, reviews activity for instances of fraud and abuse, determines if the markets are operating competitively, and reports to the FERC Office of Enforcement. These market monitors in their annual reports to FERC for the past four years have reported that each of the RTO energy markets is competitive. So there are substantial "checks" on the RTO markets. But the purpose of those checks is to ensure that they are competitive and to prevent fraud and manipulation. There is no command and control of rates as you suggest in the wholesale energy markets. And historical data has demonstrated that such an uncompetitive system fails to provide optimum benefits for consumers.

Finally, your question seems to assume that rates have risen in the RTO markets. This is in fact not the case. Wholesale energy rates have fallen significantly across all RTOs since 2009. In particular, the chart below contrasts RTO prices for the past three years.

RTO	2008	2009	2010
ISO-NE	$97/MWh	$59/MWh	$66/MWh
PJM	$85/MWh	$56/MWh	$67/MWh
MISO	$53/MWh	$31/MWh	$35/MWh
SPP	$53/MWh	$27/MWh	$31/MWh
CAISO	$53/MWh	$38/MWh	$40/MWh
NYISO:			
Western Zone	$67/MWh	$44/MWh	$50/MWh
N.Y. City	$120/MWh	$66/MWh	$83/MWh

This reduction in rates is due to competitive forces and market fundamentals dictating rate levels. Wholesale prices dropped in recent years due in large part to a reduction in demand for electricity reflecting the economic recession. Electricity markets quickly adjusted to the fundamental reduction in demand by clearing at lower prices for consumers who were in the market, rather than requiring the time and expense of multi-month rate proceedings to adjust wholesale rates through a traditional rate case.

So in summary rates in RTO markets are controlled by competitive market forces that will cause wholesale rates to rise and in the case of the last two years fall depending on market fundamentals. Such market fundamentals work efficiently in properly designed and monitored markets. That market design and monitoring requires effective regulation such as that provided by FERC. By FERC establishing the regulatory framework enabling a fair, open and efficient competitive energy markets in the RTOs consumers will be provided the opportunity to take advantage of wholesale electric rates that are truly "just and reasonable and not unduly discriminatory." This is how competition works for the benefit of consumers.

2. A provision in the 2005 Energy Policy Act allowed for voluntary participation in RTOs by federal utilities (TVA, BPA, WAPA). However, RTO participation seems hardly voluntary when it comes to wholesale market customers. If a distribution utility or an industrial customer, for example, is in an RTO region and the transmission and generation owners in its region have decided to participate, it has no other choice but to take part in the market.

Are small utilities and industrial customers able to "opt-out" of RTO markets if they are located within the RTO's geographic footprint?

Answer: There is no requirement that any entity join (or "opt-into") an RTO or ISO. Membership in any RTO or ISO is voluntary. An entity must apply to become a member, agree to comply with the terms of the appropriate agreements, and pay any applicable

membership fee. For example, the voluntary nature of RTO and ISO membership is reflected in the Operating Agreement of PJM Interconnection, L.L.C. (PJM), which specifies that nothing in the PJM membership provisions "is intended to remove, in any respect, the choice of participation by other utility companies or organizations in the operation of the PJM Region through inclusion in the System of a Member." An entity may join an RTO or ISO and later decide to leave that RTO or ISO under terms specified in the provisions of the RTO's or ISO's tariff. For example, the NEPOOL Agreement in ISO-New England (ISO-NE) allows entities to withdraw from the RTO upon 60 days' notice.

A small utility or industrial customer that is a participant in an RTO or ISO is not obligated to purchase its electricity from the RTO- or ISO-administered markets. All participants may (and many do) purchase their power under bilateral contracts and schedule delivery of their bilateral purchases through the RTO or ISO. Bilateral contracts are fully supported within the market and a market participant does not need to opt out of an RTO or ISO to take advantage of such transactions.

In some RTOs and ISOs with capacity markets, a market participant may secure future capacity outside of the RTO or ISO market. For example, PJM administers a forward capacity market that secures a variable resource capacity requirement for the regional participants for a three-year forward delivery year. Entities may opt out of the variable resource capacity requirement in favor of a fixed-resource capacity requirement and remain participants in the RTO/ISO energy and operating reserves markets.

3. Since their creation by FERC, the RTOs themselves have become regional authorities subject to federal approval that tend to favor transmission owners and remote generators, putentially at the expense of ratepayers. Further, the stakeholder process that is supposed to guide decisions at the RTO is dominated by those entities that own the assets – namely, the power generators.

What recourse does a retail customer in an RTO region have if wholesale power and transmission rates increase without sufficient justification? What recourse does a state public service commission have?

Answer: RTOs and their decision-making processes, by FERC requirement, must be independent of control by any market participant or class of market participants. Commission policy, as detailed in Order No. 719, also requires RTOs and ISOs to be responsive to customers and other stakeholders, and to ensure that customers and other stakeholders have access to the RTO board of directors. The Commission has assessed the responsiveness of each RTO using four criteria: inclusiveness; fairness in balancing interests; representation of minority positions; and ongoing responsiveness.

Each RTO is responsible for developing its own stakeholder process, and those processes vary from region to region. The Commission encourages interested parties to act through the RTO stakeholder process to ensure that their concerns are heard and addressed. By participating in the stakeholder process, interested parties are able to assist

in shaping RTO policy on the ground floor. Many state commissions (and in four regions, associations of state commissions) participate in RTO stakeholder processes.

Any party, including retail customers and state public service commissions, may file comments on RTO rate and tariff proposals pending before the Commission, or file a complaint if they believe that wholesale power and transmission rates are unjust and unreasonable.

4. Over the past four years there have been several cases where the behaviors of certain market participants caused prices to skyrocket. Such cases included the circuitous scheduling of power flows to the NY ISO around Lake Erie that resulted in at least $100 million in excess transmission costs, non-competitive bids of three New York state generators costing an additional $2.7 million, and the Edison Mission Corporation use of a "high-offer" pricing strategy to withhold generation from the market and drive up prices.

Why has FERC chosen not to use its authority under the Federal Power Act to order disgorgement of such dollars or refunds to electric customers who were harmed by such behaviors of market participants?

Answer: The Commission uses its statutory authority to order disgorgement when it determines that: (1) the conduct of a market participant violates the Federal Power Act or other governing statute, or a rule, regulation, or order issued pursuant thereto; and (2) the violation resulted in unjust profits. Since the Commission received its enhanced civil penalty authority in the Energy Policy Act of 2005, it has ordered the payment of over $150 million in civil penalties and the disgorgement of another $35 million in unjust profits. However, in cases where the Commission determines that no violation occurred, or where the facts are insufficient to prove such a violation at trial, the Commission does not have the authority to order disgorgement. The Commission also requires the payment of refunds to electric customers when it is appropriate to do so.

With regard to the three matters mentioned above, the Commission determined either that the conduct of the market participants did not constitute a violation of the Federal Power Act, or a rule, regulation, or order issued pursuant thereto, or that the facts were insufficient to prove such a violation; and therefore, the Commission did not have the authority to order disgorgement. However, the Commission approved a settlement requiring Edison Mission to pay a civil penalty of $7 million and to spend at least $2 million on a compliance plan.

5. How does FERC expect to deter such future behaviors without ordering restitution to electric customers for the excess costs they have paid?

Answer: The Commission will aggressively seek disgorgement in any case for which it is appropriate. In those cases where a market participant's conduct does not constitute a violation and disgorgement is therefore inappropriate, the Commission will seek

alternative, prospective remedies, such as market rule changes to prohibit conduct that caused electric customers to incur excessive costs.

6. If electric customers do not receive refunds or restitution for transactions undertaken without a legitimate commercial purpose that raises prices for customers, how can the rates still meet the just and reasonable standard under the Federal Power Act?

Answer: The Commission is required to ensure that the rates under its jurisdiction meet the just and reasonable standard under the Federal Power Act through ratemaking proceedings, tariff filings, and careful review procedures. When the Commission becomes aware that a filed rate is unjust or unreasonable, the Federal Power Act only authorizes the Commission to order refunds from the point at which the relevant proceeding was initiated by a complaint or Commission order. 16 U.S.C. § 824e (2006). Likewise, when the Commission becomes aware that an existing market rule results in unjust or unreasonable rates, the Commission is authorized to amend that market rule, but it is not authorized to order market participants that have not committed violations to disgorge profits earned through legitimate business activities.

7. In recent hearings held by the Maryland Public Service Commission in October 2010, several independent builders of new generation stated that capacity markets do not provide needed long-term price stability to attract investors in new power plants.

Given that this market pays almost all revenues to owners of existing facilities and discourages new market entrants, how does FERC demonstrate that this market is encouraging competition, improving the reliability of supply, and that the rates produced meet the just and reasonable standard set out in the Federal Power Act?

Answer: PJM, which is the RTO serving Maryland, meets its reliability needs at least cost by securing capacity resources in a three-year forward auction. The PJM auction is designed to encourage competition among all capacity resources on a non-discriminatory basis, and to ensure that PJM acquires adequate capacity resources in a competitive, non-discriminatory auction, so that rates produced meet the just and reasonable standard set out in the Federal Power Act. In the annual auctions, existing and new generation resources, upgrades to existing resources, transmission enhancements, demand response, and energy efficiency compete to provide reliability of supply to consumers. To date, PJM has secured more than enough capacity to meet its needs in each delivery year at a market-clearing price that is lower than the projected cost of new entry. Capacity clearing prices have varied among different regions for some delivery years, but the actual market-clearing prices generally have been less than the projected cost of new entry in even the highest cost regions.

PJM's Reliability Pricing Model (RPM) is designed to provide the appropriate price signals when new resources are needed to meet PJM's reliability requirements. PJM is discussing with its stakeholders additional capacity auction mechanisms and changes to its open access transmission tariff that governs new entry pricing alternatives. Such changes, if adopted, would expand the role of longer-term commitments that might facilitate the building of new generation by providing more long-term price certainty for new generation to enter the capacity market.

8. **The changes to the capacity market rules in both PJM and ISO-NE that FERC has ordered will undo language in the tariffs that was negotiated through a multi-party settlement process. This will be done without a hearing or the opportunity to negotiate replacement protections.**

What is the potential impact of this action on participation by market participants, especially customer and load (demand) representatives, in future settlement processes?

Answer: On April 12 and 13, 2011, the Commission issued orders on proposed alterations to the capacity markets in these regions to address concerns over the exercise of market power in capacity auctions. Parties have filed requests for rehearing of these orders, which the Commission is currently considering. Because both of these proceedings are still pending, I cannot comment further on the specifics of these matters at this time.

Generally, the Commission encourages interested parties to participate in settlement processes starting at the beginning of the process, as this can often be the best way of ensuring that their interests are fully considered. The Commission gives a great deal of consideration to the results of settlement processes as representative of the collective views of the parties involved; however, it is ultimately the Commission's responsibility to ensure that rates are just and reasonable and not unduly discriminatory. When making our rulings, the Commission solicits and review comments from interested parties, including from customer and load representatives.

9. **EIA data shows greater levels of construction of generation capacity in non-RTO markets. A number of studies also project high levels of coal plant closures following implementation of pending EPA regulations – with greater levels of closures in RTO regions.**

Has FERC investigated this disparity, and if so, what steps is it taking to promote the construction of new baseload generation capacity in RTO markets?

Answer: No, the Commission has not conducted such an investigation. As noted in the response to question 7, RTO capacity markets are designed to secure a competition-based combination of capacity resources to meet reliability needs on a non-discriminatory basis. The various competitive market approaches to obtaining capacity are not designed to promote any particular capacity type, such as new baseload generating capacity, over any

other type of new or existing generating capacity resource, demand response, energy efficiency, or transmission capacity resource.

10. If not, is FERC concerned about the low levels of new generation construction in RTO regions given pending coal plant closures?

Answer: The Commission expects that competitive markets will provide appropriate incentives for construction of new generation. It is important to note that available data indicates that the electric utility industry has added significant amounts of generating facilities when circumstances warranted.

Federal Trade Commission

House of Representatives Committee on Energy and Commerce
"The Views of the Independent Agencies on Regulatory Reform"

July 7, 2011

Responses to Questions for the Record to Chairman Jon D. Leibowitz
From Chairman Cliff Stearns

1. **In your testimony you said the FTC is "seeking to identify acts of Congress that appear to be of little value but that impose burdens on businesses, particularly small businesses and the Commission." Can you please give us a list of such statutes you have identified so far, the reasons they are burdensome, why they do not provide much value, and how you would recommend changing them.**

Commission staff are continuing to try to identify statutes that appear to be of limited value, but that divert business or Commission resources from more pressing work. Thus far, staff have identified two statutorily mandated reports, the benefits of which do not appear to be justified by the cost required to research and produce them.

The first is a statutory requirement to issue reports on concentration in the ethanol market. Section 1501(a)(2) of the Energy Policy Act of 2005 imposes an annual requirement on the Commission to "perform a market concentration analysis of the ethanol production industry… to determine whether there is sufficient competition among industry participants to avoid price-setting and other anticompetitive behavior."[1] The Commission has found each year that the market is extremely unconcentrated, and that entry is easy and ongoing.[2] Therefore, these reports seems to provide little useful information.

The second is a statutory requirement for reports on college scholarship scams. The College Scholarship Fraud Prevention Act of 2000[3] requires that the Attorney General, the Secretary of Education, and the FTC jointly submit to Congress each year a report on that year's incidence of fraud by businesses or individuals marketing financial aid assistance services to consumers. Though stopping scholarship scams is an important priority, the report simply describes actions taken to address scholarship scams. Thus, the report appears to provide little valuable information.

---

[1] Energy Policy Act of 2005 § 1501(a)(2), 42 U.S.C. § 7545(o)(10) (2009).

[2] Under the FTC and DOJ Horizontal Merger Guidelines, market concentration is calculated using the Herfindahl-Hirschman Index ("HHI"). The HHI measures concentration by summing the squares of each participant in a market. An HHI can be no higher than 10,000, which is reached when a market is a monopoly. The Merger Guidelines regard an HHI below 1500 as unconcentrated. Mergers resulting in an HHI of up to 1500 are unlikely to have anticompetitive effects and generally require no additional analysis. *See* U.S. Department of Justice and the Federal Trade Commission, *Horizontal Merger Guidelines*, August 19, 2010, at 24-26, *available at* http://www.ftc.gov/os/2010/08/100819hmg.pdf. The HHI in the ethanol industry is less than 700, which represents a highly unconcentrated market.

[3] Pub. L. No. 106-420, 114 Stat. 1867

The ethanol report requirement imposes some burden on business, as Commission staff must interview market participants to verify company-specific information gleaned from public sources and reformulated fuels association publications. The scholarship report requirement does not impose any burden on business. However, both reports use FTC staff resources that could be used to address other problems, and neither appears to produce much of value for Congress, businesses, or the Commission.

We would recommend Congress strike the requirements that the Commissions produce these reports.

2. **Please also list any regulations or other Commission requirements you have identified to date as being unnecessarily burdensome or duplicative.**

To ensure that the Commission's regulations and compliance advice remain cost-effective, the FTC has engaged in a voluntary, systematic review program for the last two decades, scheduling all rules and industry guides for review on a ten-year cycle. Pursuant to that program, the Commission has rescinded 37 rules and guides, and made significant updates and improvements to dozens of others, since the early 1990s. Please see Attachment A the enclosed document for a complete list of rescinded and revised guides and rules.

Questions for the Record to Chairman Jon D. Leibowitz from the Honorable Brian Bilbray

1. **In a May 2011 interview, Chairman Leibowitz stated that "one of the commission's priorities is to find a pure section five case under unfair methods of competition. Everyone acknowledges that Congress gave us much more jurisdiction than just antitrust." In contrast, in 2009, the U.S. Chamber of Commerce published a 2009 article (attached) that casts doubt on the FTC's authority to expand its jurisdiction under Section 5. The Chamber stated, "The character of many of these proposals, as well as their scope and diversity, highlights key disadvantages of extending Section 5 beyond the range of the existing antitrust laws." Please comment on the Chamber's views that we should look with skepticism at the expansion of Section 5?**

Reasonable people can disagree about when the Commission should use Section 5, but no one debates that Congress intended to give the FTC broader jurisdiction than the antitrust laws. One of the advantages of using Section 5 is that since, by its nature, it is not an antitrust statute, it is much harder (if at all possible) to bring a follow-on private treble damage suit. For that reason, I strongly believe that, once it thinks these issues through, the Chamber will be more supportive of the Commission's judicious use of its Section 5 authority.

Congress established the Commission as a bi-partisan independent agency with a mandate to protect the public from unfair methods of competition. Congress intended that the Commission play a unique role in the economic life of the nation. As the Supreme Court explained in FTC v. Sperry & Hutchinson Co., 405 U.S. 233, 239 (1972), in which it thoroughly

examined the legislative history of the FTC Act, Congress intended for the Commission to proscribe unfair business practices that are not condemned under the letter of the antitrust laws. Senator Cummins, one of the bill's main proponents, squarely stated on the Senate floor: "[t]hat is the only purpose of Section 5 – to make some things punishable, to prevent some things, that can not [sic] be punished or prevented under the antitrust law." 51 Cong. Rec. 12,454 (1914). While the vast majority of our antitrust enforcement actions involve conduct that falls within the prohibitions of the Sherman or Clayton Acts, the Commission has a broader mandate, which it discharges by challenging under Section 5 conduct that is likely to result in demonstrated harm to consumers or to the competitive process.

Indeed, Section 5 may be the only practicable means to stop some conduct that harms consumers but that cannot be reached under the antitrust laws. The Commission's recent use of Section 5 demonstrates that the Commission is committed to using that authority in predictable ways that enhance consumer welfare. For instance, the Commission has used Section 5 to prevent "invitations to collude" by fixing prices. A competitor's invitation to its nominal rival to fix prices does not violate the Sherman Act, but it serves no lawful purpose and creates an intolerable risk that price fixing will result. And even if an invitation to collude is rejected by rivals, it can undermine the process by which prices are set by independent competitors and lead to tacit coordination. The Chamber of Commerce already agrees with this as they note in their article that "there are certain, limited forms of anticompetitive conduct that may not be covered by the antitrust laws," including invitations to collude.[4]

Congress chose to give the Commission its broad mandate rather than handing the Commission a list of specific acts to be condemned as unfair because it knew that no such list could be, or long remain, sufficiently complete to protect competition and consumers. To address concerns about the fairness of not doing so, Congress limited the remedies available for violations of Section 5, and Section 5 does not provide for a private right of action. Because of the limited consequences of Section 5 enforcement, the Commission uses its Section 5 authority not to punish the wrongdoer, but to fairly eliminate the conduct that is likely to injure competition and consumers, allowing honest and competitive markets to further consumer welfare.

2. **The Association for Competitive Technology (ACT) represents a number of tech companies including Microsoft, Oracle, and VeriSign. ACT has blogged about Chairman Leibowitz's desire to expand the FTC's Section 5 authority. It wrote that Chairman Leibowitz "is arguing that requiring actual economic analysis of alleged 'harms to competition' is too high a bar for his agency. They need to be able to prevent business practices they believe are harmful to competition and consumers, even if the economic analysis suggests otherwise. And in this new regime, companies will have little guidance as to what the FTC will consider legal vs. illegal." This doesn't seem to be the right policy for the agency to be pursuing. Why is the FTC doing so?**

---

[4] U.S. Chamber of Commerce, *Unfair Methods of Competition Under Section 5 of the FTC Act: Does the U.S. Need Rules "Above and Beyond Antitrust"?* Competition Pol'y Int'l, Sept. 2009, at 2.

The Commission will not bring a case where the evidence shows no actual or likely harm to competition or consumers. As I explained in testimony[5] before the Senate Judiciary Committee last summer, "Of course, in using our Section 5 authority the Commission will focus on bringing cases where there is clear harm to the competitive process and to consumers." That means that any case the Commission brings under Section 5 will be based on demonstrable harm to consumers or competition. For instance, in the Intel case,[6] a unanimous and bipartisan Commission alleged that Intel's behavior harmed consumers and the competitive process in a number of ways, such as raising the price of computers; limiting consumer choice; inhibiting competition from non-Intel chip makers; reducing innovation by computer makers; and reducing the quality of industry benchmarking. Commission staff was prepared to offer proof of these harmful effects to establish that Intel violated Section 5, as well as Section 2 of the Sherman Act. As you know, Intel offered to settle the case, resulting in a Commission order eliminating the harmful conduct.

I realize that Intel is one of ACT's largest members, but for the reasons stated in Question 1, I am confident that it, like the Chamber, and even Intel in time, will be more supportive of our Section 5 enforcement mission.

3. **Following Sherman Act jurisprudence, traditionally the FTC has interpreted Section Five of the Federal Trade Commission Act to require demonstrable consumer harm to apply. But more recently the commission has been pursuing an interpretation of Section Five of the FTC Act that would give the agency unprecedented and largely-unchecked authority. In particular, the definition of "unfair" competition wouldn't be confined to the traditional measures – reduction in output or increase in price – but could expand to, as one commentator put it "just about whatever the agency deems improper." Why is the FTC pursuing what this commentator called "largely-unchecked" authority?**

Congress created the FTC and gave it authority under Section 5 to combat unfair methods of competition. The Supreme Court has on more than one occasion upheld the FTC's authority to use Section 5 to protect competition and consumers.[7] We use this authority to challenge anticompetitive conduct that harms or is likely to harm the competitive process, thereby harming consumers through higher prices, reduced quality and service, and fewer choices. The Commission will not bring a case where the evidence shows no actual or likely harm to competition or consumers. Its authority is not "unchecked," as federal courts review appeals of FTC cases and ultimately decide the reach of Section 5.

[6] *In the Matter of Intel Corporation*, Docket No. 9341, Administrative Complaint dated December 16, 2009 *available at* www.ftc.gov/os/adjpro/d9341/091216intelcmpt.pdf.

[7] FTC v. Sperry & Hutchinson, 405 U.S. 233, 240 (1972). Also, the Supreme Court observed in Indiana Federation of Dentists that the "standard of 'unfairness' under the FTC Act is, by necessity, an elusive one, encompassing not only practices that violate the Sherman Act and the other antitrust laws but also practices that the Commission determines are against public policy for other reasons." FTC v. Indiana Federation of Dentists, 476 U.S. 447, 454 (1986).

The Commission uses this authority when conduct and consumer harm cannot be addressed through the antitrust laws. We have an obligation to use this authority judiciously - and I think we have. On this point, our actions speak for us. For example, recently in N-Data, we used Section 5 to stop a "patent troll" from holding the computer industry hostage after that firm reneged on a commitment to a standard setting body. Because the industry relied on the commitment made by a previous owner of the patent and used the patented technology in the standard, the misconduct did not cause the firm's monopoly power and could not have been subject to the Sherman Act. The Commission stopped the conduct using section 5 because the conduct threatened to harm consumers by impeding the standard-setting process and the adoption of the standard in question. As industry participants Cisco, Oracle, IBM and Sun noted in their comment to the Commission in response to the N-Data order: "We welcome the Commission's use of its broad authority under Section 5 of the FTC Act against abusive conduct with regard to patents implicated in standards development processes. The circumstances alleged in the N-Data complaint and accompanying documents exemplify how there may well be abuse of this kind that threatens serious injury to [standards development organizations] participants and to the consuming public but that may be difficult to reach under established Sherman Act standards."[8]

We also used our Section 5 authority in the Intel case,[9] specifically to deal with alleged deception on Intel's part that skewed competition in its favor. In my opinion, this is a great example of how Section 5 allows the Commission to address both deceptive and unfair methods of competition. We also used our Section 5 authority in our recent case against U-Haul.[10] U-Haul is an important case because it shows precisely why Section 5 authority is necessary. We alleged that U-Haul's parent company had attempted to collude with its competitor, Budget, to raise prices in the truck rental market. This is clearly conduct that ought to be prohibited - but the Sherman Act addresses actual collusion, and not mere "invitations to collude." Section 5 provided the right means to stop U-Haul's unilateral anticompetitive conduct before it resulted in a completed Section 1 violation. Commission votes on Intel and U-Haul were unanimous and bipartisan.

4. **Gary Shapiro, the CEO of the Consumer Electronics Association (CEA), recently made the following statement regarding a high profile announcement from the FTC: "The fact that any given company is big or successful does not inherently make it bad. Unfortunately, in America it seems that our most successful and innovative firms attract the most intrusive regulatory scrutiny. These expensive, drawn-out investigations deter innovation, siphon money from productive uses, and place additional burdens on those trying to grow our economy. We urge the FTC to conduct its investigation narrowly and swiftly, and let Google get back to the critical business of innovation and job creation." Please respond to that quote? Whether in Google's case or any other, are successful**

[8] Comment of Cisco Systems, Inc., International Business Machines Corporation, Oracle Corporation and Sun Microsystems, Inc., In the Matter of Negotiated Data Solutions, File No. 051 0094, *available at* http://www.ftc.gov/os/comments/negotiateddatasol/534241-00012.pdf at 3.

[9] In the Matter of Intel Corporation, Docket No. 9341, *available at* http://www.ftc.gov/os/adjpro/d9341/index.shtm.

[10] In the Matter of U-Haul International, Inc., File No. 081 0157, *available at* http://www.ftc.gov/os/caselist/0810157/index.shtm.

companies attracting "the most intrusive regulatory scrutiny" and is that a good thing for the U.S. – especially given current economic conditions? What message does that send to foreign antitrust authorities about how they should conduct investigations?

I cannot comment directly on any particular matter, but I can say that we take our responsibilities to enforce the antitrust laws without placing undue burdens on businesses very seriously. Moreover, Mr. Shapiro is of course right: the fact that a company is big or successful or acquisitive does not inherently make it "bad" – nor should it.

But an investigation is a dynamic process. Our staff works closely with parties subject to investigation to gather information quickly and efficiently. Staff negotiates the scope of information required, and modifies and limits information requests as it learns facts that enable it to refine the focus of our investigations. And we have an internal appeals process so that parties may appeal to the Commission any compulsory process requests that they feel are overbroad. Our staff makes itself readily available to meet with parties subject to investigation. To provide transparency to our investigations, staff explains its theories of competitive harm. This gives the parties opportunities to make presentations and provide evidence to explain why they think staff may be wrong.

At the same time, we must investigate credible complaints of anticompetitive conduct and gather evidence needed to enforce the antitrust laws to their full extent to protect competition and consumers from undue harm. We protect competitive markets so that companies of all sizes have the opportunity to be successful and innovative. But antitrust law is concerned with the wrongful acquisition or maintenance of substantial market power, and so it is not surprising that large and successful enterprises may be subject to scrutiny at times. We incorporate sound economic theories into our analyses and assessments of business practices, and we strive not to interfere unduly in the competitive process and to carefully consider economic justifications for business conduct. Even when a business practice may on its face appear to be anticompetitive, the business may have a sound economic justification for the practice which may create efficiencies and allow it to compete more aggressively to provide value to consumers. If we do not have evidence that conduct is likely to create harm to competition or consumers, we will not bring an enforcement action.

We promote these same principles in our international relations. We work with our foreign counterparts to promote convergence and cooperation through organizations such as the ICN and OECD. These programs have promoted more efficient and economically sound antitrust enforcement worldwide.

5. **Prior to Google's announcement of an FTC investigation into its competitive practices there were a lot of news stories about the battle between the FTC and the DoJ over which agency would get to investigate the company. In fact, Assistant Attorney General for Antitrust Christine Varney questioned whether two agencies should have antitrust review powers. She stated "I would leave to Congress how they would like to resolve the overlapping and sometimes inconsistent jurisdiction between the agencies... I think what business does need is clarity, certainty and understanding of the legal**

framework within which their deals will be evaluated." Do you think that the overlapping jurisdictions of the FTC and Department of Justice – and the fights that they produce – are a good thing for American businesses and consumers? If not, how would you propose to fix it?

I believe the FTC and the Department of Justice generally work well together to promote and protect competition and the interests of American consumers and businesses. Both agencies have areas of expertise, and the differences in their organizational structures are deliberate decisions by Congress and provide certain benefits. For example, the FTC was created by Congress as an independent agency with expertise in both consumer protection and antitrust. One of the principal benefits of the FTC is that it is bi-partisan and our decisions require consultation and consensus. That means that our enforcement efforts do not change much as we go from administration to administration. Further, because Congress wisely charged the Commission with competition and consumer protection enforcement, we have a broad perspective that enhances our work. The FTC also was chartered by Congress to use non-litigation activities, such as issuing reports, performing empirical studies, and advocating for pro-competition reforms with other government agencies, to support and strengthen the agency's competition and consumer protection missions.

This year, the agencies worked closely together on several joint policy projects to provide transparency and predictability for businesses subject to the antitrust laws. Last August, FTC and DOJ issued revised Horizontal Merger Guidelines, a core document that provides businesses with a clear view into how the agencies conduct antitrust merger reviews. This year, the agencies also jointly developed a Proposed Antitrust Enforcement Policy relating to cooperation among health care providers organizing Accountable Care Organizations under the Affordable Care Act. These joint statements reflect a high level of consensus and cooperation, and serve as models for competition agencies throughout the world.

To be certain, there are occasional clearance disputes over which agency is in the better position to investigate a matter. In most instances, one or the other agency has greater expertise in the industry of potential concern due to a previous investigation, and clearance is given to that agency right away. But in grey areas, such as where neither agency has conducted an investigation in the past or where both have, both agencies can make a claim that a related investigation gives them a head start on the facts and issues that are likely to arise. The FTC and DOJ have a process in place to resolve clearance disputes, which helps resolve the issue quickly, so that one agency can get started on the investigation and minimize any burden on the parties. Recently, as most all observers of the antitrust agencies have acknowledged, clearance disputes have been rare and are handled quickly.

6. **Some people have criticized the FTC's administrative adjudication process as unfair. In fact, the Commission has told Congress that the last time the Commissioners ruled against their own lawyers was in 1995. 1995 – Clinton's first term and the year Yahoo! Was incorporated. Does the fact that neither the ALJ nor the Commission has ruled against its own attorneys in over 16 years cause you any concern about the process being fair and open?**

I believe the Commission's administrative process is open and fair, mainly because Congress built in several fail-safe features when it created the agency. As an independent, bi-partisan agency with law enforcement authority, the Commission, through its career staff, investigates potential law violations and issues a complaint only if a majority of the Commission itself finds that there is reason to believe that a law within its authority has been violated. Depending on the violation, the Commission then initiates a case in federal court or in its own administrative process where the Commission's allegations are tested by an independent administrative law judge and the defendants have the opportunity to present contrary evidence and cross-examine witnesses. Final Commission decisions can be appealed to the federal courts.

Of course, we are always working to improve our adjudicative process. For instance last year, in response to objections that the administrative process took too long, the Commission revised its rules to streamline and improve the agency's "Part 3" adjudicative proceedings. The new rules expedite the prehearing, hearing, and appeal phases; streamline discovery and motion practice; and ensure that the Commission can apply its substantive expertise, as appropriate, earlier in the process.[11]

Questions for the Record to Commissioner William E. Kovacic from Chairman Cliff Stearns

1. **In Chairman Leibowitz's testimony he said the FTC is "seeking to identify acts of Congress that appear to be of little value but that impose burdens on businesses, particularly small businesses and the Commission." Please provide us with a list of such statutes you have identified so far, the reasons they are burdensome, why they do not provide much value, and how you would recommend changing them.**

I endorse the answer provided by Chairman Leibowitz to this question.

2. **Please also list any regulations or other Commission requirements you have identified to date as being unnecessarily burdensome or duplicative.**

I endorse the answer provided by Chairman Leibowitz to this question.

Questions for the Record to Commissioner William E. Kovacic from the Honorable Brian Bilbray

1. **In a May 2011 interview, Chairman Leibowitz stated that "one of the commission's priorities is to find a pure section five case under unfair methods of competition. Everyone acknowledges that Congress gave us much more jurisdiction than just antitrust." In contrast, the U.S. Chamber of Commerce published a 2009 article (attached) that casts**

---

[11] *FTC Issues Final Rules Amending Parts 3 and 4 of the Agency's Rules of Practice*, news release dated April 27, 2009, *available at* http://www.ftc.gov/opa/2009/04/part3.shtm.

doubt on the FTC's authority to expand its jurisdiction under Section 5. The Chamber stated, "The character of many of these proposals, as well as their scope and diversity, highlights key disadvantages of extending Section 5 beyond the range of the existing antitrust laws." Please comment on the Chamber's views that we should look with skepticism at the expansion of Section 5?

In adopting Section 5 of the Federal Trade Commission Act in 1914, Congress intended the FTC to use Section 5's mandate to play a central role in creating norms of business behavior. This role contemplated that the Commission in some instances would prohibit behavior not previously banned by judicial interpretations of the other antitrust laws. Congress expected that Section 5's elastic mandate would provide valuable flexibility to adapt federal competition policy to respond to new commercial phenomena and to incorporate new learning in economics and law. This intuition remains sound today. For a fuller treatment of this point, I refer the members of the Subcommittee to William E. Kovacic & Marc Winerman, *Competition Policy and the Application of Section 5 of the Federal Trade Commission Act*, 76 Antitrust Law Journal 929 (2010) (hereinafter "*Competition Policy*").

2. **The Association for Competitive Technology (ACT) represents a number of tech companies including Microsoft, Oracle, and VeriSign. ACT has blogged about Chairman Leibowitz's desire to expand the FTC's Section 5 authority. It wrote that Chairman Leibowitz "is arguing that requiring actual economic analysis of alleged 'harms to competition' is too high a bar for his agency. They need to be able to prevent business practices they believe are harmful to competition and consumers, even if the economic analysis suggests otherwise. And in this new regime, companies will have little guidance as to what the FTC will consider legal vs. illegal." This doesn't seem to be the right policy for the agency to be pursuing. Why is the FTC doing so?**

The Commission should and does rely upon economic analysis when it uses its norms creation function under Section 5 to prohibit conduct. Modern judicial decisions have indicated that the courts will sustain the FTC's use of Section 5 only upon a showing that the behavior at issue poses actual or likely harm to competition. This is fundamentally an economic inquiry.

At the same time, I believe it is appropriate for the Commission to issue a policy statement that describes when the agency will apply Section 5 and states the limiting principles that will inform the exercise of this authority. *See* Kovacic & Winerman, *Competition Policy*, at 944.

3. **Following Sherman Act jurisprudence, traditionally the FTC has interpreted Section Five of the Federal Trade Commission Act to require demonstrable consumer harm to apply. But more recently the commission has been pursuing an interpretation of Section Five of the FTC Act that would give the agency unprecedented and largely-unchecked authority. In particular, the definition of "unfair" competition wouldn't be confined to the traditional measures–reduction in output or increase in price–but could**

expand to, as one commentator put it, "just about whatever the agency deems improper." Why is the FTC pursuing what this commentator called "largely-unchecked" authority?

FTC decisions applying Section 5 are subject to review in the courts of appeals. I am unaware of any trend in the history of Section 5 jurisprudence for courts to endorse the view that Section 5 permits the Commission to condemn "just about whatever the agency deems improper." Not since the 1960s has the FTC prevailed in the courts on a competition claim premised solely upon Section 5. Instead, it has suffered a number of defeats in such endeavors, including a famous trilogy of setbacks in the courts of appeals between 1979 and 1984. See Kovacic & Winerman, *Competition Policy*, at 942. This experience does not suggest that the FTC's Section 5 authority is "largely unchecked."

4. **Gary Shapiro, the CEO of the Consumer Electronics Association (CEA), recently made the following statement regarding a high profile announcement from the FTC: "The fact that any given company is big or successful does not inherently make it bad. Unfortunately, in America it seems that our most successful and innovative firms attract the most intrusive regulatory scrutiny. These expensive, drawn-out investigations deter innovation, siphon money from productive uses, and place additional burdens on those trying to grow our economy. We urge the FTC to conduct its investigation narrowly and swiftly, and let Google get back to the critical business of innovation and job creation." Please respond to that quote? Whether in Google's case or any other, are successful companies attracting "the most intrusive regulatory scrutiny" and is that a good thing for the U.S. -- especially given current economic conditions? What message does that send to foreign antitrust authorities about how they should conduct investigations?**

I have nothing to say about the Google matter or any other law enforcement investigation pending before the FTC.

I am aware of no evidence that supports the statement that the "most successful and innovative firms attract the most intrusive regulatory scrutiny."

5. **Prior to Google's announcement of an FTC investigation into its competitive practices there were a lot of news stories about the battle between the FTC and the DoJ over which agency would get to investigate the company. In fact, Assistant Attorney General for Antitrust Christine Varney questioned whether two agencies should have antitrust review powers. She stated, "I would leave to Congress how they would like to resolve the overlapping and sometimes inconsistent jurisdiction between the agencies... I think what business does need is clarity, certainty and understanding of the legal framework within which their deals will be evaluated." Do you think that the overlapping jurisdictions of the FTC and Department of Justice - and the fights that they produce - are a good thing for American businesses and consumers? If not, how would you propose to fix it?**

Dual, concurrent jurisdiction has created tension between the two federal antitrust agencies since the adoption of the Clayton Act and the FTC Act in 1914. This is an inevitable result of placing two public institutions within the same policy domain. One way to reduce this tension and improve the performance of the U.S. antitrust system is to permit the two agencies to make an agreement that clarifies and rationalizes the allocation of responsibilities between the two bodies. The two agencies reached such an agreement early in 2002, but the threat of congressional retribution caused these reforms to collapse. Reconsideration of such an initiative, with congressional support, would be a useful first step to place the U.S. system on a better institutional footing.

6. **Some people have criticized the FTC's administrative adjudication process as unfair. In fact, the Commission has told Congress that the last time the Commissioners ruled against their own lawyers was in 1995. 1995 -- Clinton's first term and the year Yahoo! was incorporated. Does the fact that neither the ALJ nor the Commission has ruled against its own attorneys in over 16 years cause you any concern about the process being fair and open?**

I see no unwillingness on the part of the courts of appeals to review Commission decisions carefully and reverse decisions that they believe to be improvident in substance or process. The certainty of this scrutiny has provided abundant incentives for the agency to decide its cases in a fair and open manner.

CONTAMINATED DRYWALL: EXAMINING THE CURRENT HEALTH, HOUSING AND PRODUCT SAFETY ISSUES FACING HOMEOWNERS

TUESDAY, DECEMBER 6, 2011

U.S. SENATE,
SUBCOMMITTEE ON CONSUMER PROTECTION, PRODUCT SAFETY, AND INSURANCE,
COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION,
Washingtan, DC.

The Subcommittee met, pursuant to notice, at 10:03 a.m. in room SR–253, Russell Senate Office Building, Hon. Mark Pryor, Chairman of the Subcommittee, presiding.

OPENING STATEMENT OF HON. MARK PRYOR, U.S. SENATOR FROM ARKANSAS

Senator PRYOR. I'll go ahead and open this, call this meeting to order. And I want to thank all of you all for being here, I want to thank our witnesses and thank our fellow senators, to talk about this very important issue.

I want to give a special thanks to Senator Warner, because he has been the primary driver in getting this hearing scheduled today. So, Senator Warner, thank you for your leadership on this and many other things.

The purpose of the hearing today is to provide an update on the health and product safety issues associated with problem drywall installed in thousands of homes over the last decade. It's a story that we all know well. Drywall was imported from China in large volumes during the height of the housing market when domestic supplies were low. It was used extensively in Florida and Louisiana following the devastating hurricanes of 2005.

In early 2008, homeowners in Florida and Louisiana began complaining of a peculiar odor that was permeating their homes. They also reported health concerns and serious corrosion of metal in the homes. Investigators were able to trace these problems back to drywall laced with sulphur and sulphide gases.

We last examined this issue in May of 2009. At that time, we heard from the CPSC and the CDC and the EPA about the scope, and the problem of their efforts to address it. Progress has been made, but unfortunately, too many consumers, too many Americans, are left with costly repairs, uninhabitable homes, or health problems thought to be caused by the problem drywall.

In addition to Florida and Louisiana, numerous cases of problem drywall have been reported in Virginia and Mississippi, as well as

Alabama. All told, the CPSC has logged claims of health problems or metal corrosion as a result of contaminated drywall in 42 states and territories.

We hope to establish for the record how multiple Federal, state, local, and even international, governments are working together; make clear the pathways available to provide relief to affected homeowners; and identify steps we must take to ensure this problem does not repeat itself.

Today we'll hear from Mr. Neal Cohen, Small Business Ombudsman at the Consumer Product Safety Commission; Dr. Christopher Portier, Director of the National Center for Environmental Health at the Centers for Disease Control and Prevention; Mr. Bill Shelton, Director of the Virginia Department of Housing and Community Development; and Mrs. Brenda Brincku, a Florida homeowner.

I want to thank all the witnesses for being here today and thank you for your testimony.

I'm surrounded here by senators from afflicted states.

So, Senator Wicker, would you like to have an opening statement, please?

STATEMENT OF HON. ROGER F. WICKER, U.S. SENATOR FROM MISSISSIPPI

Senator WICKER. Thank you, Mr. Chairman. And, indeed, I appreciate the scheduling of this hearing today, and I appreciate your interest, and that of Senator Warner.

Tainted drywall has affected thousands of homes throughout the United States. It is most prevalent, as the Chair says, in coastal states. Florida, Louisiana, Alabama, Virginia, and my home state of Mississippi have been hardest hit.

To handle the increased demand during post-Hurricane Katrina rebuilding along the Gulf Coast, as well as during the Nation's housing boom, domestic producers expanded their facilities to increase capacity. However, despite this increased production, unusually high demand required importing drywall from sources outside North America, including China.

Dealing with this problem drywall has been a disaster for homeowners. It causes corrosion to many of their electrical components, and can potentially cause adverse health effects, including difficulty in breathing.

There have been multiple agencies working together: CPSC, CDC, EPA and HUD have been collaborating for the past 2 years to determine the flaws of the drywall—particularly how it is affecting homes and the families that live in them.

Interestingly, no causal connection has been found by the Government between the health effects experienced and the drywall. This perplexes me, and it concerns me, and I hope to learn more about the reasoning for this.

I also look forward to hearing about the CPSC's communication with Chinese officials, and whether there has been any progress on finding remediation options for homeowners.

Again, thank you, Mr. Chairman, for holding this hearing. I look forward to listening to today's witnesses, and getting a full update

on their respective progress and current views on this important issue. Thank you.

Senator PRYOR. Senator Wicker, thank you. And thank you for your interest in this, because I know we've talked about this before, and it's very important to your state and your people back home to make sure we get this right.

Senator Warner.

STATEMENT OF HON. MARK R. WARNER,
U.S. SENATOR FROM VIRGINIA

Senator WARNER. Well, thank you, Mr. Chairman, and let me thank you for holding this hearing.

I've been involved in politics, government for 20 years. I can't think of a more frustrating issue that I've been involved with than this issue of drywall, and, an issue where the affected families—and I know the CPSC's logjam, about 4,000 at this point, that have gone through some level of certification and toward a remediation process—but the numbers are much, much larger.

But, these families' lives have been basically devastated for multiple years, calling in our state, going down and visiting an affected home with Chairman Tenenbaum a couple years back. And it took less than 45 minutes for me to be in the home to come out with a burning nose, headache for the rest of the day. And yet, the families had to go through a year, two-year-plus multiple CDC studies, and then trying to get the Consumer Product Safety Commission to come up with appropriate remediation standards. And many of these families have no place else to turn. And then, if they do move, if they at some point say, you know—to see children with family—with small children living outside, having to then move out of their home, move into rental facilities. And then, on top of that, they have the enormous financial crush that comes from banks that are still expecting those mortgage payments.

We've worked with the banks to get remediation, and we've worked with the IRS to try to get some safe harbor. We're going to hear from Bill Shelton, who is, has been as concerned as any official at the state level that I have been, from Virginia and some of the activities we're trying to do in Virginia.

But, these families continue to get ping-ponged from one entity to another. I've talked to a couple of my constituents here, one who just lost their home this week, and another who has been one of the leaders in this effort. She told me she'll be losing her home on Friday.

One of the things that I think—echoing what Senator Wicker said—you know, the Chinese government, which owns some of these companies, wants to proceed in international commerce; yet they seem to be unwilling to step up and be financially responsible for faulty product that was sold into our country.

There's a German company that sold some faulty product as well, but there was a major settlement. There were, I think we're going to hear from Ms. Brincku on even some American product. But, there has to be a path here for these affected families—and I'm anxious to hear from the testimony—and also, even for families that if, at the end of the day, lose their homes, find a way to get

their, at least, their credit restored, because they got into these circumstances through no malfeasance on their own.

We did work to make sure that, I found in our area in Hampton Roads, a number of folks work for the military. They were potentially going to have not only the health care loss, the housing loss; but if they worked for the military, because they then might have, in effect, a financial blot on their record, they could lose their security clearance and then lose their jobs. So, we finally work with Defense security services to make sure that there would be, again, recognition of this so that when folks were doing their background checks, this wasn't held against them.

So, I again want to thank the Chairman and thank Senator Wicker for his interest, as well. But, this is about as frustrating an issue, again, in, when I started 20 years plus of politics, that I've ever seen. And we need to try to find some way to get these folks some answers.

Thank you, Mr. Chairman.

[The prepared statement of Senator Warner follows:]

PREPARED STATEMENT OF HON. MARK WARNER, U.S. SENATOR FROM VIRGINIA

Toxic drywall has dramatically affected over 4,000 homeowners nationwide including many Virginians. In order to capture a portion of the hardships and difficnlties encountered by Virginians, I wonld like to include some their stories in the record for today's hearing.

Ms. Albania Tyler—Hampton, VA

In August 2010, it was discovered that 75 percent of my new home, built 2006, was contaminated with toxic Chinese drywall. The drywall has caused several major appliances to fail. We've have over ten services and repairs to our central air and heating units since 2007, electrical wiring problems throughout our home, and corrosion of our bathroom fixtures. Currently, I have no air conditioning or heat because units are not properly working. We've also have had two minor electrical fires in our refrigerator and doorbell transmitter as a result of corroded wiring. Because the odor has become so unbearable, I have been forced to move my family to rental property. I have attempted to short sale my home to a cash investor but my mortgage lender has denied the sale due to low offer. I am currently facing foreclosure.

Mrs. Karen Tompkins—Williamsburg, VA

In Jannary 2010, our family discovered our home in Braemar Creek, Williamsburg, VA, was constructed with toxic Chinese Drywall. We had three children five years and younger, and because of unknown health risks, immediately abandoned the home. We lived with relatives for several months, while awaiting resolution from our builder and worked with our mortgage company to avoid foreclosure. In order to afford a rental home, we stopped making payments in March 2010. By September our home was bank-owned due to a Deed in Lieu of Foreclosure. Our credit scores suffered greatly. We are still awaiting results of ongoing court hearings and have not given up hope for compensation from the drywall manufacturers, suppliers, and Chinese Government. Thank you for continuing to work on behalf of thousands or residents like us who have lost their homes due to Chiuese Drywall.

Mr. Robert Orlando—Williamsburg, VA

I took a new job and relocated my family to Virginia in 2009. The home we bought was built with toxic drywall manufactured in China. We were forced to move out and lived in a rental home for two years on the brink of bankruptcy. Our mortgage servicer and investor worked with us on a short payoff of our mortgage and our local bank lent us enough money to rebuild. However, this would not have been possible without financial help from our family. We have lost over $200 thousand due to this "drywall disaster" and we need someone to help us recover our losses.

Ms. Michelle Germano—Norfolk, VA

My life was destroyed by contaminated drywall imported from China. The toxins from the drywall destroyed my health, home, personal belongings, and finances. I am liviug iu a rental home with porch furniture. I was forced to leave everything

behind because I was so sick. That was nearly three years ago. At 61, I am forced to re-start my life, broke and sick.

Mr. and Mrs. Jerry Baldwin—Williamsburg, VA

After three years of living in our home we are on our third set of air conditioner coils, our third home computer, and have had to replace a failed air handler motor, a failed microwave, a failed refrigerator and a failed thermostat. We continue to live in the house and pay our mortgage despite the fact that our home is worthless in the open market. We are throwing money away with no hope of intervention or remediation.

Mrs. Zenaida Perez—Newport News, VA

I am a school teacher and a single mother, who built a house at Hollymeade, Village in 2007. Due to the Chinese Drywall situation that we are experiencing, I had to move out of my home and my finances have been terribly affected to the point of declaring Bankruptcy. I don't know how long this situation is going to last, but I feel it's not taking us anywhere and I am facing a terrible situation with the Mortgage Company as well. They don't want to approve a loan modification due to the loss of value of my property that went down from $257,000 to less than $100,000.The worst part is that I invested everything I had on that home, and now it is lost.

Mr. Richard Ilich—Suffolk, VA

Chinese Drywall has ruined me and my family's life. My 6 year old son developed Asthma and suffered violent attacks when in the house. We don't know if there are other long term affects at this point. I've lost my credit, my home which was part of my retirement investment, spent thousands of dollars on appliances, HVAC, and furniture which needed replacement, and to date there is no tangible method/way/or outlook to get out from under this sheetrock. Just about everyone is empathetic to our situation, but empathy does not pay for two homes, it does not pay two heating bills, it does not pay homeowners fees, it does not extend or protect your credit to buy a new car when you need it, it does not prevent the games and hassles the mortgage companies put us through, it does not stop the depression, and it does not pay the medical bills. While I understand the need to let the legal system play out, we are 2–4 years away from that type of resolution. It appears insurance will play no part in the resolution and if the courts come through for the Victims of CDW it would take several years for the remediation to be completed, and that is if we can even collect any money that would be awarded. If we must wait for the courts, only government can create tangible short term solutions to help the victims who are left isolated and devastated from this situatiou. We need to have our credit protected so we can live in the meantime, we need help preventing the games and pressure that the mortgage companies are playing, as well as some short term relief.

Elizabeth Berry—Yorktown, VA

The CPSC states that there are close to 4,000 reports of homes with toxic Chinese Drywall but the number of people actually affected by toxic drywall is so much greater. Yes, we are spread out over 37 different states, and no, Chinese Drywall is not a natural disaster. But how many lives have to be damaged in order for victims to receive recognition and assistance? This is a disaster and we are in need of assistance.

Our homes are corroding, our financial future is in ruins as the biggest investment of our lives is worth nothing, our credit scores are damaged, security clearances necessary to maintain careers are in jeopardy, and we can't afford to move out and pay for two homes. Many of us are liviug in these houses with sulfuric gases—when mixed with moisture—basically acid rain! When I kiss my kids goodnight and watch them the toxic air in our home I become enraged. For the rest of my life I will worry about what toxic Chinese drywall has doue to the health of my two sons.

We must create laws that will require Chinese products to meet the highest safety standards in order to protect our citizens from harın! Men, women and children are suffering. Tax paying, hardworking citizens are being told, "We are working on it, but it is a difficult issue!" How long are we going to continue to suffer in this disaster with no relief? My husband and I have scraped together and borrowed $100,000 into gutting and rebuilding our home. We will never recover financially or emotionally.

Christopher Levy—Virginia Reach, VA

I love serving my country and am writing to you from Kandahar, Afghanistau. I am a military officer, aud as such am vuluerable to be moved at a momeut's uo-

tice. My house is worth $100 as per the City of Virginia Beach because of the toxic drywall. Thus, if I get orders, I won't be able to sell or rent my honse. I will have to leave the service and stay in Virginia Beach, default on my loan, or soak-up the cost of maintaining two households (the latter two options would result in our financial ruin). Please work to retnrn my home to a livable condition. Thank you!

Joseph Anello—Virginia Beach, VA

My wife, mother and I built home together in 2006. Within 6 months our AC unit failed and we replaced the coils twice. My wife and I went to the Philippines in early 2008 to work for Verizon. My mother remained in the home and her Chronic Obstructive Pulmonary Disease got progressively worse. When our A/C unit failed again we first learned of toxic drywall. When my mother's condition rapidly declined we returned to the U.S. and moved her out of the contaminated home. Although she initially improved, she passed away on July 4, 2011 due to respiratory issues. I could not sell the home and needed to move due to employment in West Virginia. We attempted the short sale process but Wells Fargo foreclosed on our home. The City of Virginia Beach had assessed my home at one dollar. Thus we have since lost our mother and our credit is in shambles. We are just awaiting results of the various legal proceedings. Thank you for your support in this manner it is much appreciated.

Mr. Mike Shen—Virginia Beach, VA

In 2011 we spent $250,000 on repairs to our house that was built in 2006. Toxic Chinese drywall destroyed everything in our house that has metal component made from copper including AC copper coils, gas copper pipes, electrical wires, TVs, computers, refrigerator, Wii player, piano strings, etc. The drywall has also deeply affected our family's health. We have suffered from nose bleeding, headaches, foot pain, arm pain, kidney pain, and muscle pain.

Liz, Steve, and Allison Heischober—Virginia Beach, VA

We were so happy to move into our new home on November 10, 2006. This was to be the home where we would spend our retirement years. We are now living a nightmare. We discovered in July 2009 that the home we purchased was built with Chinese drywall. The Chinese drywall was causing physical damage to the home and health problems for our family. All three of us have had physical ailments as a result of the Chinese drywall. Seven months after living in the home, our golden retriever, Kramer, died of kidney failure. Our second dog, Bailey, died in Decenber 2008 of respiratory issues. As of August 2009, we have replaced six to seven coils in two AC units. We have had problems with our flat screen TV, computer hard drives and monitors that crashed, small appliances that failed, a dryer that stopped working due to circuit board failure, and electrical outlets that had to be replaced. Physically, we have experienced unexplained rashes, respiratory problems, headaches, fatigue, insomnia, chronic coughs, and muscle pain. The smell in the house is in our clothes, furniture, mattresses and linens. Our silver jewelry and flatware have turned black and are unable to be cleaned. When we opened our windows, our neighbor complained of the smell that came from our home. We have documentation to prove all of these issues.

Upon learning of the problem, the stress has become unbearable. We moved out of our home immediately in August 2009, leaving our belongings behind, and filed a lawsuit because we had no other recourse since the builder and insurance companies were of no help. We are currently living in a rental. Our home was sold in a short sale in November 2010. We lost $400,000 in equity. This was a major investment for us and through no fault of our own, we've lost everything. Selling the home was in our best interest and that of the mortgage company. Hanging on to a home you can't live in with forbearance on your mortgage, only keeps increasing your debt to the mortgage company. The increasing debt has caused many families to file bankruptcy. We are glad that we were able to sell. Had we foreclosed, the mortgage company would have been stuck with a home in poor, uninhabitable condition. The short sale has caused our credit to be hit and it will be affected for many years. New rules for the underwriting of mortgages and loans need to be updated to make provisions for homeowners that were victims of Chinese drywall.

Senator PRYOR. Thank you, Senator Warner.

In the interest of time, I'll dispense with the longer introductions. And I mentioned our four witnesses already. So, why don't we just dive into this?

Mr. Cohen.

STATEMENT OF NEAL S. COHEN, OFFICE OF EDUCATION, GLOBAL OUTREACH, AND SMALL BUSINESS OMBUDSMAN, U.S. CONSUMER PRODUCT SAFETY COMMISSION

Mr. COHEN. Thank you. Good morning, Chairman Pryor, Senator Wicker, Senator Warner, and members of the Subcommittee on Consumer Protection, Product Safety, and Insurance.

My name is Neal Cohen, and I currently serve as the Small Business Ombudsman at the United States Consumer Product Safety Commission in our new Office of Education, and Global Outreach, and Small Business Ombudsman. Prior to that, I served in the Office of General Consul as the lead trial attorney on matters of problem drywall, and I continue to advise the drywall team on those matters.

I'm pleased to be here today to discuss the CPSC's investigation into problem drywall, as well as to lay out the steps that the Commission has taken to try to assist these homeowners that have been impacted by problem drywall.

Before I begin, I have two important notes: First, the testimony that I give today is my own. It has not been reviewed or approved by the Commission; it may not reflect their views. Second, on a more personal note and in line with the opening statements, the members of the staff and the Commission want to recognize Ms. Brincku and Ms. Stevens and Mr. Bailey, and other homeowners who are here and have been affected by this. We share the sense of frustration, and we recognize the incredible hardship this has taken on your families.

As a government regulatory enforcement agency, however, we must be, and we have been throughout this investigation, guided by the science and by our statute in trying to determine whether the problem drywall represents a health or safety hazard. That's exactly how we conducted our investigation.

In January 2009, we began to look into these reports of noxious odors, corrosion of metal items, and complaints of upper airway irritation in these homeowners.

The principles in our plan, which have been in place from the earliest parts of this investigation—I'd like to set out the paradigm of how we've conducted this.

First what we did was, we analyzed the suspected source of the emissions, the drywall, in a controlled chamber setting so that we could see exactly what chemicals were being emitted from that drywall in a controlled setting.

Second, we conducted indoor air testing on homes that were built or remediated with problem drywall to see what emissions were happening on the actual level of a homeowner's home that they were experiencing in their personal lives.

Third, we took corroded household components that had been exposed to the same conditions over those years of installation, and analyzed to see whether or not there were potential safety hazards that had developed over that time.

And fourth, we looked toward the future and we took new household components, and we placed them in an accelerated aging corrosive environment in order to simulate long-term corrosion, and to also analyze whether there would be potential health or safety hazards over a longer term of up to 40 years.

To do so, we engaged our Nation's top laboratories and scientists, and we relied upon a rigorous process that was methodical; it was scientifically and legally defensible, and informed each of the subsequent studies.

Where necessary, we did additional studies, such as the one on domestic drywall, as well.

Unfortunately, the results of our studies have not permitted us to make a health or safety finding that would enable us to compel a manufacturer to recall this product.

In terms of the safety, we observed no significant declines in performance, and certainly, no safety hazards were observed in any of the experiments that we conducted.

In terms of health, we used advanced techniques to measure the concentrations of chemicals that were found in these homeowners' homes. These concentrations were below the levels where health effects have been reported in the peer-reviewed scientific literature.

Now, although those concentration levels did not permit us to make a health finding, it is possible that the health effects may occur when consumers are exposed to multiple chemicals in this complex setting. The study of that is incredibly complex, and we look forward to the CDC's review of their health consultation to help inform us on those effects.

Throughout the case, we have continually examined our legal options under the Consumer Product Safety Act. Unfortunately, based on the evidence, we have not been able to undertake a case. We have monitored and observed the private litigants in State and Federal court, and note that primarily economic case—those cases of economic losses—are proceeding, and will likely provide a substantial amount of relief for a set of the homeowners, though certainly not for all the homeowners.

We've worked with the Gypsum Association and the ASTM International to make sure that voluntary standards are in place so that this would never repeat itself, and that if such an occurrence were, we would be able to track and monitor the situation better this time.

And throughout all of this, we have applied continual pressure on the Chinese manufacturers to come to the negotiation table to stand behind their product, and to make American consumers whole. Unfortunately, those efforts at all levels of government have not yielded results yet.

That concludes my oral statement, and I would be pleased to take any questions the subcommittee may have. Thank you.

[The prepared statement of Mr. Cohen follows:]

PREPARED STATEMENT OF NEAL S. COHEN, OFFICE OF EDUCATION, GLOBAL OUTREACH, AND SMALL BUSINESS OMBUDSMAN, U.S. CONSUMER PRODUCT SAFETY COMMISSION

Good morning, Chairman Pryor, Senator Wicker, and members of the Committee. My name is Neal Cohen, and I currently serve as the Small Business Ombudsman iu the Office of Educatiou, Global Outreach, and Small Business Ombudsman at the U.S. Consumer Product Safety Commission (CPSC). Prior to assuming the Small Business Ombudsman position, I worked in the Office of General Connsel where I served as the lead attorney on the CPSC's Drywall Team. In my current position, I continue to work with the Drywall Team on legal issues.

I am pleased to be here today to discuss the CPSC's investigation into problem drywall. Before I begin, I would note that the testimony that I will give this morn-

ing is mine, has not been reviewed or approved by the Commission, and may not necessarily represent the views of the Commission.

I. Background

CPSC began looking into reports of noxious odors, and corrosion of metal items inside of homes, especially air conditioner coils, and complaints of short term upper respiratory irritation in late January 2009. To date, the CPSC has received approximately 3,921 reports from residents of 43 states, the District of Columbia, American Samoa, and Puerto Rico who believe corrosion of certain metal components in their homes or health effects are related to problem drywall. After analysis of these reports and other data regarding imports of potentially problematic drywall from the People's Repnblic of China, CPSC staff believe there may be as many as 8,200 U.S. homes containing at least some problem drywall.

In onr first report to Congress, in July 2009, we outlined what we then described as "a mnlti-pronged, concnrrent approach . . . to inclnde import investigations, field measnrements in the affected homes, chamber studies to assess the possible health risks and corrosion to electrical, gas, and fire safety systems." In this testimony, I hope to outline the science-based investigation undertaken by CPSC and our agency partners, as well as onr efforts to provide assistance to homeowners impacted by problem drywall.

II. CPSC's Scientific Investigation of Problem Drywall

The principles in our strategic investigation plan, in place by Jnne 2009, have been followed by CPSC staff throughout this investigation. Where scientific findings and the compliance investigation indicated a need for additional information, staff added multiple distinct, standalone stndies to address those needs.

For more than two years, CPSC has worked with our interagency partners, including the U.S. Department of Housing and Urban Development (HUD), the Centers for Disease Control and Prevention (CDC), and the U.S. Environmental Protection Agency (EPA) (collectively the "Federal Interagency Task Force on Problem Drywall" or "Task Force") and has spent more than $6 million dollars from its general operating fund to conduct this investigation.

Briefly, I would like explain the paradigm we employed; it is one that is reliably used in scientific investigations:

1. Analyze the suspected source of the emissions, the drywall, in isolation to see what chemicals the source is emitting in a controlled environment;

2. Conduct indoor air testing in homes built or renovated with the suspected sonrce of the emissions;

3. Test corroded household components that have been exposed to the emissions; and

4. Expose new metal household components in an accelerated aging corrosive environment to simulate long-term corrosion and analyze for potential safety hazards.

CPSC and our partners also engaged our Nation's top laboratories—Lawrence Berkeley National Laboratories (LBNL), Sandia National Laboratories (Sandia), the National Institute of Standards and Technology (NIST), and the U.S. Geological Snrvey (USGS)—in addition to a well-regarded private company, Environmental Health & Engineering (EH&E).

This scientific paradigm—executed by these top laboratories and scientists—was methodical and iterative, with each step informing the next in the investigation. This rigorous process ensured that the Commission's investigation was based upon the hest, quality-controlled and quality-assured results, each result informing the design and conduct of snbsequent studies.

CPSC also shared the nrgency felt by the homeowners, and we had to balance that sense of nrgency with the exercise of cantion to make certain that all scientific studies concerning the effects of the problem drywall were credible and defensible. To that end, in a somewhat unprecedented move iu a CPSC-compliance investigation, we were transparent and posted all scientific investigations publicly on *www.drywallresponse.gov*, including the underlying raw data. We did so because we recognized the homeowners' need to understand what was going on in their home environments, because we were confident that our science was of the highest caliber and should be held up to public scrutiny, and because we felt that the public was entitled to make use of the information. Wherever feasible, and without jeopardizing the scientific process, investigations were conducted in parallel to increase our ability to deliver sound scientific results to the public iu the timeliest manuer.

A. Efforts to Diagnose and Pinpoint Critical Characteristics of Problem Drywall

In July 2009, CPSC staff contracted with EH&E to study gases present and corrosion effects within homes where problem drywall was installed. This was consistent with onr investigatory paradigm to condnct indoor air testing in homes with the suspected sonrce of the emissions. The 51-home indoor-air study conducted by EH&E was released in November 2009, and allowed the development of certain corroborating factors forming the core of the Identification Guidance, building npon earlier work condncted by the EPA at the CPSC's reqnest to identify chemicals present in certain drywall samples. The 51-home study also informed CPSC staff about low levels of certain sulfur gases and other compounds present in the homes.

While the 51-home study was being conducted, CPSC also worked closely with LBNL, part of the U.S. Department of Energy, to conduct advanced chamber emission stndies to determine the types and amounts of gases emitted by certain drywall in controlled laboratory conditions. The chamber emission studies represented another important cornerstone of onr investigatory paradigm. Those studies analyzed the drywall samples in question in isolation in order to capture which chemicals the samples were emitting in a controlled environment, apart from possible confounding sources in the home.

We relcased LBNL's initial results in November 2009 and March 2010, with the final report on the first round of testing issued in January 2011. Importantly, the findings from the chamber studies enabled CPSC to definitively identify those chemicals being emitted directly from the drywall, apart from the other confounding factors in the home. This work demonstrated the conclusive link between certain drywall and the corrosive emissions of hydrogen sulfide and other reactive sulfur gases. It also demonstrated that some, but not all, Chinese drywall emits hydrogen sulfide and other reactive sulfur gases at much more elevated rates compared to other Chinese and North American drywall.

CPSC staff knew that hydrogen sulfide corrodes copper and silver to produce the type of corrosion seen on those metals in affected homes. However, it was not until this work was completed that we could positively identify the problem drywall itself as the source of that hydrogen sulfide. The levels of reactive sulfur gases, specifically hydrogen sulfide, emitted from the drywall also informed our investigation into potential fire or electrical safety risks. This determination that certain drywall does iu fact emit elevated levels of hydrogen sulfide and other reactive gasses also enabled CPSC and HUD to develop Identification Guidance and Remediation Guidance based on the common sense approach of removing the source of these emissions.

In Jauuary 2010, the CPSC and HUD issued Identification Guidance for homes affected by problem drywall. This Identification Guidance, which was updated in August 2010, was very important for potentially affected homeowners as it provided some common, scientific characteristics for homeowners to use in determiuing whether a specific dwelling contained problem drywall.

Remediation Guidance was first issued in April 2010 by the CPSC and HUD. In its first iteratiou, the Remediation Guidance was extra cautious iu its approach to consumer's health and safety until the results of our scientific investigatory plan became available, including precautionary removal of certain building materials. As the results of the scientific investigation became available, we updated the Remediation Guidance in March 2011 and again in September 2011 to provide consumers with a safe and more cost-effective approach to remediation.

In February 2010, we held a closed meeting with our staff, staff from our Federal Task Force Partner agencies, including the CDC, our private contractor, and scientists from the leading national laboratories that conducted many of our studies. CPSC staff reviewed the strategic plan that we had set in motiou and the preliminary results received to date. There was broad agreement amongst the attendees that CPSC staff had set forth a clearly defined, scientifically defensible plan and one which could also provide the basis for a solid legal case in the event one was warranted.

In the spring and summer of 2010, the CPSC worked with Sandia to design and execute experiments, detailed further below, that would accelerate the aging processes on electrical and fire safety components to simulate the effects of decades of exposure to the types of corrosion exhibited in problem drywall houses.

While we worked with Sandia, we also conducted additional studies to refine how we characterized the problem drywall and to address other concerns that had arisen inclnding the concern regarding the possibility that sulfur reducing microbiological elemeuts may have been a potential root cause of the emissions. In March 2010, the CPSC, in conjunction with EH&E, released a report on a microbiological assessment of a limited number of drywall samples. No difference was found in the presence or absence of sulfur-reduciug bacteria between imported Chinese drywall and U.S.

domestic drywall tested, including those Chinese samples found by LBNL to have some of the highest reactive sulfur gas emissions in the chamber tests.

In May 2011, the CPSC, in conjunction with EH&E, released a longitudinal study of the temporal effects of seasonality and elapsed time on the gaseous emissions and rate of corrosion formation in problem drywall and control homes. This limited study of six homes found that emissions increased during periods of elevated heat and humidity and were markedly reduced in cooler and drier periods.

In June 2010, the CPSC, contracting with EH&E, released a study titled *Identification of Problem Drywall: Source Markers and Detection Methods.* This study confirmed the association between elemental sulfur and the characteristic corrosion associated with problem drywall, and it also provided new information indicating that strontium (when used alone as a marker) possibly could lead to misidentification of problem drywall.

In September 2011, LBNL completed a second round of emissions studies focusing on the effects of heat, humidity, and surface treatments like paint, upon the emissions rates of the problem drywall. The additional testing found that emissions increase with elevated temperature and humidity. Importantly, however, the testing also found that the emissions actually *decreased* significantly over time for the samples, compared to when they had been tested during the first round of testing in 2009–2010. Importantly, all of our modeling and accelerated aging had been based on a worst-case assumption that these levels do not decrease over time.

Also, in September 2011, the CPSC, through an interagency agreement with USGS, conducted additional microbiological assessments of drywall samples and gypsum rocks from relevant mines. Throughout the investigation, there had been many claims of sulfur reducing bacteria actively converting the gypsum in drywall into corrosive sulfur gases. Like the prior EH&E study, the USGS study found no evidence indicating the presence of active bacteria of these types.

In sum, the analysis of chemical content and chemical emissions from problem drywall determined that certain brands of drywall produced around the year 2005–2006 contain elevated levels of elemental sulfur (octahedral sulfur, S_8) and have elevated emission factors for hydrogen sulfide (H_2S) and other reactive sulfur gases known to corrode copper and silver. It also was fonnd that over time, the emission rates for these reactive sulfur gases decreased and that increases and decreases in emission rates corresponded to increases and decreases in temperature and humidity.

B. Potential Health Impacts of Problem Drywall

The report on the 51-home stndy included discussion of health impacts for the compounds found in the home environment. In analyzing the results in that study, CPSC staff relied on the actual measnrements of reactive gases taken in the 51-home stndy as the best approximation of the levels of gases to which homeowners may have been exposed. However, the concentrations of individual chemicals found in the homes were below levels where health effects have been reported in the toxicology literature and did not provide the CPSC with enough evidence to determine that a substantial or imminent product hazard or significant injury or illness occurs due to problem drywall.

Although those concentration levels did not permit the CPSC to make a health or safety finding, it is possible that health effects might occur when consumers are exposed to combinations of chemicals, as found in all indoor environments. The study of health effects related to exposures to chemical mixtures is scientifically complex due to the interactions between and amongst chemicals, as well as the fact that responses to chemical exposures can vary tremendonsly from person to person. Much more study and analysis—beyond the current staff and monetary resources of the CPSC—would be necessary to develop the evidence necessary to conclusively establish the health case.

CPSC staff also used mathematical modeling to predict possible exposures that might result from the reactive sulfur compound emissions measured in the LBNL chamber testing. As with most modeling exercises, this undertaking was complicated by the many assumptions that had to be made about some of the environmental conditions and interactions between chemicals that were occurring in the homes.

In light of staff and resource constraints, the CPSC formally requested that the CDC consider conducting a long-term health study on the effects of problem drywall. In making the request, CPSC staff felt that such a study or series of stndies by the CDC could seek to address some of the deficiencies in the data outlined above. In January 2011, the CDC indicated that it had "carefully considered" a long-term health effects study and concluded that "the best scientific evidence available to [CDC] today does not support" such a study. While CPSC staff hoped the available

scientific evidence would allow the CDC to conduct a long-term health effects study, CPSC staff was encouraged to learn that CDC staff took the time to carefully consider the merits of such a stndy before deciding not to proceed.

In Febrnary 2011, CDC staff reqnested that the CPSC staff provide all information on the addresses and reported health effects associated with problem drywall homes so that the CDC could map the scope and consider the potential health effects. In response to that request, CPSC staff provided the requested information to the CDC to assist in their evaluation of the potential health effects of problem drywall. It is the understanding of CPSC staff that CDC work continues on this health consultation project, and CPSC staff looks forward to reviewing the results when that project is complete.

C. Examination of Any Potential Fire or Electrical Safety Implications of Problem Drywall

In an effort to determine whether prohlem drywall presented any fire or electrical safety risks that could be quantified as presenting a serions safety hazard, the CPSC also hired Sandia and NIST to conduct engineering stndies of the effects of corrosion on electrical and fire safety systems.

Sandia subjected samples to accelerated aging processes to simulate the effects of decades of exposure to the types of corrosion exhibited in problem drywall houses on components, including electrical wiring, receptacles, switches, plus smoke alarms, fire suppression sprinkler systems, and gas service piping. Sandia also conducted engineering analyses of the electrical systems that were aged in these conditions, as well as other electrical components harvested from affected homes. Sandia provided the exposed fire safety system samples to NIST to complete similar engineering analyses of those systems.

The CPSC's study, conducted with Sandia, on the impact of accelerated corrosion on electrical components, which simulated 40 years of corrosion, was completed in March 2011. The results of the Sandia study led the Task Force to modify the Remediation Guidance and to remove the earlier recommendation that all electrical wiring be removed. This study fonnd visnal evidence of corrosion but found that the corrosion did not significantly rednce the overall cross section of copper nor did it decrease the wire's ability to carry its rated cnrrent. No acnte or long-term safety events such as smoking or fire were observed during the course of the experiment.

In September 2011, the CPSC, working with NIST, released a series of staff reports on the effects of problem drywall and related corrosion on fire safety systems and natural gas service piping.

The first report was a study on the effects of simulated 10 years of corrosion of the type exhibited in problem drywall homes on a variety of smoke alarms. NIST also studied smoke alarms collected from homes where they had been exposed to the emissions from problem drywall. There were small but significant changes to performance in some cases, although each set of the smoke alarms continued to meet applicable safety standards. Iu auy case, the CPSC recommends replacemeut of smoke alarms every 10 years aud carbon monoxide alarms after their limited lifespan, typically every five to seven years. Therefore, as part of remediation, it is recommended that all smoke alarms and carbon monoxide alarms be replaced because they have a limited life span and cost little to replace.

The second report was a study on the effects of simulated 20 years of corrosion of the type exhibited in problem drywall homes on a variety of fire sprinkler heads. In additiou, NIST studied fire sprinkler heads collected from homes where they had been exposed to the emissions from problem drywall. Fire sprinkler heads showed small effects due to accelerated corrosion, but were generally within accepted industry standards.[1] Fire suppression sprinkler systems are present only in a very small fraction of problem-drywall homes.

The third report was a study ou the effects of problem drywall emissious on gas service piping. The CPSC collected gas service pipes from homes where they had been exposed to the emissions from problem drywall. NIST also studied copper alloys commouly employed iu the mauufacturiug of gas service pipiug after exposure to the simulated corrosion chamber to achieve 40 years of simulated exposure. The results showed that corrosion of gas service piping was uniform and minimal compared to the thickuess of pipes. No acute or long-term safety eveuts were observed

[1] A single fusible-type fire sprinkler head that had been exposed to accelerated corrosion did not activate when tested. Out of an abundance of caution, CPSC staff recommend the replacement of fusible-type fire sprinkler heads as part of remediation. However, we note that this type of sprinkler head is generally found in commercial, rather than residential, applications and that the sole failure could not be causally linked to the problem drywall at this time.

during the course of the experiment. Gas service pipes are present only in a very small fraction of problem-drywall homes.

D. Additional Targeted Scientific Studies

Additional studies were conducted for targeted investigations on an as-needed basis as new issues emerged during the overall investigation, including (A) investigating the limited claims of problems due to domestic drywall in homes, (B) investigating the indoor environments in two homes at Fort Bragg where mnltiple infant deaths had been reported and (C) investigating deaths reportedly related to problem drywall.

1. Domestic Drywall Study

While the majority of the complaints to the CPSC have been for imported drywall, approximately one to two percent of the total reported incidents came from homeowners who have alleged that corrosion and other problems have resnlted from the installation of domestic, problem drywall. In response, CPSC staff conducted in-depth investigations (IDIs) on a number of these homes and found that some appeared to have Chinese drywall and others did not appear to have the characteristic problems associated with problem drywall.

In addition, the CPSC undertook a limited stndy on 11 homes believed to best represent the types of reports we had received. In April 2011, the CPSC released a stndy on these 11 homes for which the presence of problem domestic drywall could not be ruled out, and the results were inconclusive. Some of the homes in the study were found to have characteristics of problem drywall, but the actual conntry of origin could not be determined conclusively for all of the drywall in those homes. Other homes in the study exhibited corrosive characteristics that were different than those that the CPSC had observed in homes with imported, problem drywall. However, none of the findings resulted in the need to change the Task Force's recommendations in the identification or remediation guidance documents.

2. Investigation Into Deaths at Ft. Bragg, North Carolina

The CPSC provided substantial support to the U.S. Army in the Army's investigation into deaths at Ft. Bragg. CPSC conducted a comprehensive and independent investigation into the indoor environments in two homes at Fort Bragg where multiple infant deaths had been reported. The results of onr study, released on February 10, 2011, concluded that problem drywall was not present in the homes. For the benefit of the Army, our contractor conducted additional environmental testing while in the homes and did not find an environmental cause of these tragedies. Somewhat elevated levels of two pesticides, permethrin and cypermethrin, were found in one of the homes, and the Army is continuing to investigate these pesticide issues on its own. Both of these pesticides are approved by the EPA under the Federal Insecticide, Fnngicide, and Rodenticide Act (FIFRA) for use inside of homes. The Army paid to have EH&E continue to investigate the slightly elevated pesticide levels.

3. Investigation of Deaths Reportedly Related to Prohlem Drywall

On Jannary 31, 2011, the CPSC released the CDC's review of state medical examiners' investigations into reports of deaths in homes alleged to contain problem drywall. The report fouud no connection between the 11 deaths and the drywall; instead it fonnd several other contribnting factors that specifically inclnded pre-existing health conditions. CPSC staff also found no connection between the snbject homes and problem drywall iu our investigation.

III. CPSC and Private Efforts to Assist Impacted Homeowners

A. Problem Drywall Identification and Remediation Guidance

As discussed earlier, Identification Guidance for homes affected by problem drywall was first issued in Jannary 2010, and npdated in Angust 2010. Remediation Guidauce was issued in April 2010 and updated in March 2011 and again in Septemher 2011.

The updated documents clarify that the Remediation Gnidance represents an effective protocol on which a homeowner may rely to make appropriate decisions about remediating their home comprehensively. The current guidance documents are comprehensive and integrate the results of all scientific studies completed as part of this investigation.

B. Development of Standards for Drywall Labeling and Content

During the course of the investigation, one substantial impediment encountered by CPSC staff was the lack of uniform labeling on both domestic and foreign drywall. The bnlk of problem drywall examined by staff contained no marking de-

tailing manufacturer, brand, or country of origin. This substantially hindered CPSC staff efforts to determine the exact source of problem drywall, as well as the scope of the problem.

In an effort to prevent similar problems in the future, CPSC staff worked with ASTM International on a new gypsum board voluntary labeling standard that would require manufacturer name and country of original on the product. We are pleased to note that, as a result of these efforts, ASTM recently approved a revision to the C1264 gypsum board standard.

The revised C1264 standard, which was effective as of last month, requires that manufacturers place either names or unique codes identifying the name of the manufacturing company, facility and production line, date and time of manufacture, and country of origin on each sheet of finished gypsum products. The revised standard also specifies that this identifying information be reproduced at regular intervals on each sheet of finished gypsum products. CPSC staff believe that this voluntary labeling standard should help builders and consumers better understand the origin and source of gypsum products in the future.

CPSC staff also continue to work with ASTM and other industry associations on standards regarding gypsum board content. That work is currently ongoing, and we hope for further progress on that voluntary standard in the near future.

C. The Multi-District Drywall Litigation

Some private parties impacted by problem drywall are engaged in extensive Federal and state litigation, which has largely been consolidated in the Federal Chinese-Manufactured Drywall Products Liability Multi-District Litigation (MDL) in the Eastern District of Louisiana.[2] The CPSC has never been a party to this litigation, although Commission staff has tracked the progress of the case through discussions with parties and stakeholders. Despite the lack of CPSC's formal involvement in the case, the agency's scientific findings have been relied upon universally by the various parties as representing a credible and serious effort to understand and explain the issues associated with problem drywall.

Unlike a potential CPSC recall, which would require the CPSC to demonstrate health or safety hazards satisfying the high burdens set forth in CPSC's controlling statutes (*e.g.*, that the drywall presents an imminent hazard or substantial risk of serious injury or death), the private civil cases are primarily economic in nature and need only prove, for example, that the drywall was not fit for its originally intended purpose. As part of this process, one of the potentially responsible producers of problem Chinese drywall, Knauf Plasterboard (Tianjin), announced a pilot settlement on October 14, 2010. In that pilot settlement, Knauf and certain American companies in the distribution chain of commerce, agreed to voluntarily remediate 300 homes in Alabama, Florida, Louisiana, and Mississippi containing its drywall. Knauf's remediation protocols for this pilot program conform to the CPSC's interim remediation guidance.

During the week of February 14, 2011, Knauf's contractor broke ground on the first such remediation project. The Court and all parties have also sought to broaden the number of homes covered in this pilot settlement beyond the original 300 homes. Some private estimates indicate that Knauf manufactured drywall may be present in 40 to 45 percent of all homes impacted by problem drywall. In addition, almost all impacted homes in Alabama, Louisiana and Mississippi contain drywall manufactured by Knauf.

The MDL Court has also directed the parties in the case to proceed with discovery and depositions, which are presently underway, concerning certain other Chinese manufacturers and certain American companies in the supply chain. The MDL Court represents a credible process addressing claims of economic loss from the plaintiffs, and it will proceed and likely provide a substantial level of relief to a number of homeowners with problem drywall manufactured by Knauf (and possibly a few other companies). It is, however, unlikely to cover all homeowners impacted by problem drywall.

D. CPSC Efforts to Seek Compensation from Potentially Responsible Chinese Manufacturers Outside of the MDL Case

Throughout the problem drywall investigation, the CPSC has continually engaged with our counterpart agency in China, the General Administration for Quality Supervision, Inspection, and Quarantine (AQSIQ), to share information and arrange a meeting between the CPSC and Chinese manufacturers. Specifically, CPSC personnel have engaged in the following face-to-face meetings (in addition to numerous

[2] MDL 2047, Chinese Manufactured Drywall Products Liability Litigation, *http://www.laed.uscourts.gov/drywall/drywall.htm*.

videoconferences and conference calls) with high-level AQSIQ personnel to seek resolution to the problem drywall issue:

- August 2009. CPSC staff traveled to China to investigate the possible origin of problem drywall and to meet with AQSIQ staff regarding the issne.
- Second Trilateral U.S.-EU–China Consumer Product Safety Summit, October 25–26, 2010, Shanghai, China. CPSC Chairman Inez M. Tenenbaum personally discussed the issue with AQSIQ Minister Zhi Shuping and urged the Chinese Government to facilitate a "fair and just" resolution to the issne.
- The Third Bilateral United States—China Consumer Prodnct Safety Summit, held in Washington, DC on October 13–14, 2011. At this meeting, the Chairman again publically called on the Chinese Government to come to the table, resolve this issne and provide relief to impacted homeowners.

To date, the CPSC has used all of the resources available to it, including high-level international contacts by the Chairman and other international diplomatic efforts with the U.S. Departments of State and Commerce to push this item to the front of the agenda with the Chinese government. Throughout many months of diplomatic efforts, the Chinese manufacturers have continued to signal their reluctance to meet with us. The principal Chinese trade associations have stated that their members are being singled out, and refuse to accept CPSC assurances that all responsible parties would be included in a possible settlement.

* * * * *

Mr. Chairman, thank you again for the opportunity to testify regarding the CPSC's scientific investigation of problem drywall, as well as efforts to assist impacted homeowners. I would be happy to answer any questions at this time.

Senator PRYOR. Thank you. And thank you for staying in the allotted time.

Dr. Portier.

STATEMENT OF CHRISTOPHER J. PORTIER, PH.D., DIRECTOR, NATIONAL CENTER FOR ENVIRONMENTAL HEALTH, CENTERS FOR DISEASE CONTROL AND PREVENTION AND AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY, U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES

Dr. PORTIER. Thank you, and good morning, Senator Pryor, Senator Wicker and Senator Warner. Thank you for the opportunity to be here today.

I am Chris Portier, the Director of the National Center for Environmental Health at the Centers for Disease Control and Prevention, and the Director of the Agency for Toxic Substances and Disease Registry.

The CDC and ATSDR are concerned for the health and safety of people who have been living with, or exposed to, sulphur compounds emitted from contaminated drywall.

My testimony today will focus on three aspects of CDC/ATSDR support of the CPSC response on this issue: Number one, CDC/ATSDR's current knowledge and recommendation on human health effects from exposure to sulphur compounds emitted from contaminated drywall; number two, our role and the efforts to date in the coordinated Federal response on contaminated drywall; number three, our public health consultation underway to learn more about potential health effects from exposure to sulphur compounds emitted from contaminated drywall.

Indoor air tests of homes with contaminated drywall conducted on behalf of the CPSC, the lead Federal agency in the investigation of contaminated drywall, found low levels of reactive sulphur gasses, including hydrogen sulphide and carbonyl sulphate. This is a

concern, because at some concentrations, exposure to sulphur gasses may result in eye, nose and throat irritation, and exacerbation of respiratory problems such as asthma or chronic obstructive pulmonary disease. These same symptoms are consistent with what has been reported. However, the levels measured inside of homes with contaminated drywall were below levels linked to human health effects as demonstrated in the scientific literature. Still, it is possible some people are more sensitive than others to sulphur gasses.

CDC/ATSDR believes that preventing continued exposure is the best method to address contaminated drywall. We support the CPSC and the U.S. Department of Housing and Urban Development's recommendations for remediation.

In support of CPSC's leadership of the Federal response to concerns on the contaminated drywall, CDC/ATSDR has put significant effort into helping residents understand the potential health implications through the following activities: We worked with poison control centers and state health departments to develop and share guidance to the public and healthcare providers. We supported Federal response efforts with our extensive network of state health and environmental agencies. This has helped us to understand the types of health complaints being reported, to ensure that up to date and accurate information was rapidly shared, and to ensure that coordination among the involved Federal and state agencies and other partners is effective.

We assisted the EPA and the Florida Department of Health in developing a sampling plan for homes with and without contaminated drywall, and in interpreting results. We engaged our partners to develop precautionary health guidance documents for families and their physicians. And we coordinated with states to review 11 deaths reported to the CPSC.

We are currently modeling indoor air levels of sulphur gas compounds to estimate potential exposure. These estimates will then be used to calculate the risks of human health effects in homes with contaminated drywall. Results should be available in spring of 2012.

This consultation activity involves three main phases: First, we've engaged experts at Georgia Institute of Technology to model indoor air concentrations. They will be using data that measured sulphur gasses emitted by contaminated drywall in a controlled laboratory setting. These data were collected by Lawrence Berkeley National Laboratory on behalf of CPSC.

In the second phase, NCEH/ATSDR scientists will use these estimates to simulate a range of plausible human exposures to several drywall-related sulphur compounds. Finally, our scientists will determine if the levels of exposure could result in possible short term and long term health effects, and what these outcomes might be. This will be based upon health information summarized in existing ATSDR toxicological profiles, EPA guidance values, and then evaluations of scientific literature. This is one of the tox profiles. This is for hydrogen sulfide gas.

In conclusion, CDC/ATSDR recognizes the serious concerns of people living in homes and exposed to contaminated drywall. We are committed to providing appropriate and necessary information

to help answer questions related to health effects from contaminated drywall.

Thank you for the opportunity to present this testimony to you today, and I would be happy to answer any of your questions.

[The prepared statement of Mr. Cohen follows:]

PREPARED STATEMENT OF CHRISTOPHER J. PORTIER, PH.D., DIRECTOR, NATIONAL CENTER FOR ENVIRONMENTAL HEALTH, CENTERS FOR DISEASE CONTROL AND PREVENTION AND AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY, U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES

"Health Issues Associated with Contaminated Drywall"

Good morning Chairman Pryor, Ranking Member Toomey, and other distinguished members of the Subcommittee. Thank you for the opportunity to be here today. I am Dr. Christopher Portier, Director of the National Center for Environmental Health (NCEH) at the Centers for Disease Control and Prevention (CDC) and Director of the Agency for Toxic Substances and Disease Registry (ATSDR).

The CDC aud ATSDR are concerned for the health and safety of people who have been living with or exposed to sulfur compounds emitted from contaminated drywall used in the construction or renovation of their homes. My testimony today will focus on three aspects of CDC/ATSDR's support of the Consumer Product Safety Commission (CPSC) response to this issue:

- CDC/ATSDR's current knowledge and recommendation on human health effects from exposure to sulfur compounds emitted from contaminated drywall;
- CDC/ATSDR's role and efforts to date in the coordinated Federal response to contaminated drywall; and
- CDC/ATSDR's public health consnltation underway to learn more about potential health effects from exposure to sulfur compounds emitted from contaminated drywall.

CDC/ATSDR's Current Knowledge and Recommendation on Human Health Effects from Exposure to Sulfur Compounds Emitted from Contaminated Drywall

Indoor air tests of homes with contaminated drywall conducted by Environmental Health & Engineering Inc. (EH&E) on behalf of the CPSC, the lead Federal agency in the investigation of contaminated drywall, found low levels of reactive sulfur gases, including hydrogen sulfide and carbonyl sulfide.

This is a concern because at some concentrations, exposure to sulfur gases may resnlt in eye, nose, and throat irritation and exacerbation of respiratory problems such as asthma or chronic obstructive pulmonary disease (COPD). These same symptoms are consistent with what has been reported. However, the levels measured inside of homes with contaminated drywall were below levels linked to human health effects as demonstrated in the scientific literature. Some people are more sensitive than others to chemical exposures; an exposure that causes no problems for one person can make a different person nncomfortable or sick. There are currently no tests available that would identify people in the general public who are more susceptible to exposnre to the sulfnr compounds emitted from contaminated drywall.

With respect to public health, CDC/ATSDR helieves that preventing continued exposure to reactive sulfur gases is the best method to address problem drywall. We support the CPSC and U.S. Department of Housing and Urban Development (HUD) recommendations for remediation that "consumers replace all problem drywall; smoke and carbon monoxide (CO) alarms; electrical distribution components, including receptacles, switches and circuit breakers, but not necessarily wiring; and fusible-type fire sprinkler heads."

Recommendations from the Pediatric Environmental Health Specialty Units (PEHSU), a CDC/ATSDR partner, include eliminating, if possible, or reducing exposure through remediation and ventilation; minimizing aggravating environmental factors such as secondhand tobacco smoke and harsh cleaners; monitoring mental health; seeking medical specialty care; and seeking guidance on medical monitoring from a health care provider.

CDC/ATSDR's Role and Efforts to Date in the Coordinated Federal Response to Contaminated Drywall

Since 2009, CDC/ATSDR has provided public health expertise in support of the CPSC's leadership of the Federal response to concerns with contaminated drywall. As part of this response, CDC/ATSDR collaborated with the CPSC, the U.S. Environmental Protection Agency (EPA), HUD, the Florida Department of Health (FLDOH), the Louisiana Department of Health and Hospitals, the Virginia Department of Health, the Association of Occupational and Environmental Health Clinics (AOEC), and other state and local health and environmental agencies to assess possible health implications from living in a home with contaminated drywall.

CDC/ATSDR has put significant effort into helping residents understand the potential health implications associated with exposure to sulfur compounds emitted from contaminated drywall.

To date, we have conducted the following activities:

- CDC/ATSDR worked with poison control centers and state health departments to develop and share health guidance. This guidance came in the form of easy-to-read fact sheets to help the public understand health and safety issnes and recommendations on how to protect themselves. We provided guidance to health care providers who may be evaluating patients living in homes with contaminated drywall;
- CDC/ATSDR supported Federal response efforts with our extensive network of state health and environmental agencies to understand the types of health complaints being reported, to ensure that up-to-date and accurate information and approaches were rapidly shared, and to ensure that coordination among the involved Federal and state agencies and other partners is effective;
- CDC/ATSDR assisted the EPA and the FLDOH in developing the sampling plan for homes with and without contaminated drywall and in interpreting the results;
- CDC/ATSDR engaged our partners AOEC and PEHSUs with specialties in pediatrics, medical toxicology, industrial hygiene, and occnpational environmental medicine. This resulted in precautionary health guidance document for families and their physicians;
- CDC/ATSDR coordinated with states to review 11 deaths reported to the CPSC. In the judgments of the state medical authorities who reviewed these cases, exposure to contaminated drywall was not believed to be a contributing factor to these deaths.

CDC/ATSDR's Public Health Consultation Underway to Learn More about Potential Human Health Effects from Exposure to Contaminated Drywall

CDC/ATSDR's current public health effort is modeling indoor air levels of sulfur gas compounds to estimate potential exposures. These estimates will then be used to calculate risks of health effects in homes with contaminated drywall. Results should be available in spring 2012, and we expect that this work will provide important and appropriate information to help answer questions related to potential health effects from contaminated drywall.

The consultation involves three main phases. First, we have engaged experts at Georgia Institute of Technology to model indoor air concentrations. They will be using data that measure sulfur gases coming off of contaminated drywall in a controlled laboratory setting. These data were collected by Lawrence Berkeley National Laboratory on behalf of CPSC. In the second phase, CDC/ATSDR scientists will nse these estimates to simulate a range of plausible human exposures to several drywall-related sulfur compounds. This will include a range of home types and patterns of air movement in and out of the homes. Finally, CDC/ATSDR scientists will determine if the levels of exposure could result in possible adverse health outcomes and, what those outcomes might be. This will be based upon health information summarized in existing ATSDR Toxicological Profiles, EPA guidance values, and in evaluations of recent scientific literature.

Conclusion

In conclusion, CDC/ATSDR recognizes the serious concerns of people living in homes and exposed to contaminants from problem drywall. We are committed to providing appropriate and necessary information to better understand residents' concerns related to health effects.

Thank you for the opportunity to present this testimony to yon today. I wonld be happy to answer any questions.

Senator PRYOR. Thank you.
Mr. Shelton.

STATEMENT OF WILLIAM C. SHELTON, DIRECTOR, VIRGINIA DEPARTMENT OF HOUSING AND COMMUNITY DEVELOPMENT

Mr. SHELTON. Senator Pryor, Senator Warner, it's a pleasure to be with you today. Shelton. I'm the Director of the Virginia Department of Housing and Community Development. We handle a number of community development and housing issues, but today my expertise is more in the area of building codes.

What I would like to focus on today is how Virginia has responded; the things we think we can do at the state level; and then, perhaps, some of the things that remain undone.

There was a perfect storm—you've already heard the stories—but the one nuance of difference in Virginia, as Senator Warner mentioned, all the product that, we believe, that came into Virginia came through one supplier in southeastern Virginia in the Hampton Roads area through one manufacturer in China. Unfortunately, that manufacturer, we believe, is owned by a Chinese concern, as opposed to the German company. And this has ramifications longer-term that become clear when you get to litigation.

The story was unfolding, you know, we were hearing reports, and we certainly were monitoring this issue. Our first response in Virginia came in early 2009 as we began to hear more and more anecdotal evidence of problems. And basically, the first item was to notify local building officials to be aware of this, especially in the Hampton Roads region. We believe the building officials are the front line defense related to responding to this problem, and notified them to notify all builders and others that this could be an emerging problem. Even if we didn't have authority to ban the product, we were certainly raising awareness.

Governor McDonnell assumed office, and then in early 2010 established a drywall task force made up of homeowners, of, state agencies, and other affected parties to look at this issue. And we looked at a number of different items, trying to outline priorities of how Virginia could response.

There was some state legislation—both proposed and unsuccessful. Perhaps the most substantive piece that passed was an issue looking at the issue of disclosure, making sure that property owners who were owners of these properties and were transferring them, that there was actual disclosure so that the problem was not passed on to other property owners down the road; and there were penalties imposed if that disclosure did not happen. And that was both for ownership, as well as rental. And we think that was the best practice.

Perhaps the most important aspect of what we focused on, though, was this issue of, how would you remediate this problem? How would you begin to do the building part of it? And I know that CPSC and others were doing quality research, and we were very anxious to get the answer, because everyone was stuck in neutral, if you will, and could not move either direction without that remediation standard.

We are fortunate in Virginia to have a uniform statewide building code, and so we used that mechanism working through the

issues with our Board of Housing and Community Development, and other affected parties, and using the recommendations, the interim guidance from CPSC, the National Homebuilders Association, and others who have come forward with a potential remediation. And then, effective this summer, effective in August, we did adopt a remediation standard for Virginia that's built into our building code. So, we have established the standards by which all properties need to be remediated; we have required that a building permit be pulled on the property; that inspections be done; that a testing be done after the initial demolition to ensure that you got all the product out; and then, post- construction, that you test again to make sure that there's no evidence of the gases that are causing the problem in the homes.

We feel this is the appropriate and responsible way to move forward. And once concluded, a letter can be given, then, to the property owner that basically says the property has been remediated, so that you remove the stigma on the property. This does not address how to pay for it, but at least gives a pathway to move forward.

One of the issues is the cost of remediation. If you look at the various standards, the court case in Louisiana established a fairly rigorous amount of work, deconstruction and reconstruction, that have to take place. That worked out to almost $90 a square foot. The remediation standard that we have adopted in Virginia, we believe, will be closer to about somewhere in the $35 to $45, maybe $50 a square foot, depending on the type of construction, which makes it more affordable, but yet, would, in fact, then, remediate the property. So, the difference in pricing, that $86 level would be roughly a $200,000 expense, as opposed to maybe a $60,000 or $70,000 expense with that $35 to $40 a square foot, which we think is more realistic.

We have looked at funding mechanisms. The bottom line is that we have looked at all kinds of debt-oriented kinds of activities. We don't believe the properties support debt. The homeowners are upside-down; we've got a housing crisis; those properties are under water anyway; and the market—and with the remediation, it's certainly not feasible.

And so, we think that it has to be more of a response similar to a disaster response. And we would love to work with the Federal Government on trying to figure out some way to get the responsible parties to come to the table and help provide that financing.

[The prepared statement of Mr. Shelton follows:]

PREPARED STATEMENT OF WILLIAM C. SHELTON, DIRECTOR,
VIRGINIA DEPARTMENT OF HOUSING AND COMMUNITY DEVELOPMENT

Good morning, my name is Bill Shelton. I am the Director of the Virginia Department of Housing and Community Development (DHCD). The agency administers a comprehensive set of housing and community development programs that help create safe, affordable, and prosperons communities where Virginians can live, work and do business. The agency is also responsible for the administration of the state's major building safety regulations, most notably the Uniform Statewide Building Code (USBC). This latter role led to our involvement in understanding and responding to some of the serious problems that resulted from the use of defective drywall in residential construction during the last decade. I am here today at the invitation of Chairman Rockefeller to speak about Virginia's experience with defective drywall products.

Background

Drywall, sometimes referred to as plasterboard or gypsum board, is one of the most common building materials. Builders use it for walls and ceilings in home and commercial construction. It consists of a saudwich panel made of gypsum (hydrated calcium sulfate [$CaSO_4{\cdot}2H_2O$]) pressed between two thick sheets of paper. For decades, builders have used drywall as a safe and economical alternative to traditional lath and plaster. However, during the latter half of the last decade, owners and occupants of single-family and condominium units constructed at mid-decade in Virginia and elsewhere began to report problems with significant and unexpected levels of corrosion in HVAC, electrical and plumbing systems, and appliances. Over time, the apparent cause of these and other problems such as the presence of strong odors ("burning matches" or "rotten eggs") were traced to excessive levels of gaseous sulfur compounds such as hydrogen sulfide (H_2S) emitted by specific brands of drywall. While the offending products were ultimately identified with reasonable certainty, uumerous questions remained. These included:

- Determiuing where aud how many residential units were affected,
- Preventing the continued use of defective drywall products,
- Developing and applying appropriate remediation standards to eliminate current and future problems,
- Providing assurance that homes can be remediated and reoccupied safely,
- Estimating the total and unit costs for remediation activities, and
- Determining who would pay for property remediation and other losses incurred by homeowners, contractors, developers and others.

That the problems of defective drywall appeared when and where they did was the result of a kind of perfect storm of circumstances, if you will. These included the need for massive rebuilding in the Gulf Coast following two very real storms–Katrina and Rita–and the red-hot (some wonld say in retrospect "overheated") honsing market found in many parts of the country (including Virginia) during the middle of the last decade. Demand for drywall simply outpaced domestic sources of supply. American distributers of building materials seeking new sources found them in half a dozen or more manufacturers based in China. Their products appeared to be functional equivalents of the familiar domestic materials. In southeast Virginia, one building materials supplier received 150,000 sheets from a single Chinese source. Builders used them to complete projects throughout the region and elsewhere in the state. This set the stage for the problems that have brought us here today.

The Problem Emerges

By late 2008, the federal Consumer Products Safety Commission (CPSC), as well as state and local officials in Virginia and other southeastern and Gulf States, began receiving complaints about drywall-related problems. By January 2009, CPSC had received some 1,500 incident reports from 24 states, with the largest numbers attributable to, in descending order, Florida, Louisiana and Virginia. By the summer of 2010, data received by Virginia's Department of Health, the Office of the Attorney General, and DHCD *confirmed* that at least 250 Virginia homes were affected; it appeared very likely that the total might exceed 400.

While the number of affected homes was small relative to the state's 2010 inventory of more than three million occupied housing units, the consequences for homeowners were anything but small. For some households, the presence of defective drywall has rendered the homes uninhabitable. The threat of fire hazards associated with damaged electrical system components, damaged plumbing and gas piping, dysfunctional or damaged HVAC systems, damaged appliances and consumer electronics, nonworking smoke and carbon monoxide detectors, actual or perceived threats to the health of individual family members, persistent and overwhelming foul odors and other factors all contributed to individual decisions to vacate properties.

Relocation might relieve the family of the immediate threats to health and safety, but it could not relieve them of the financial obligations associated with a house that conld no longer be called home. Although lien holders could offer temporary moratoria, in most cases to avoid foreclosure and long-term damage to the family's credit, mortgages still needed to be paid—even as the stigma associated with defective drywall erased the owner's equity and the property's marketability. Many of the Virginia homes were large, with values above regional averages. In some cases, they represented the owner's primary asset, often the product of years of saving toward the goal of securing the home of their dreams. In still other cases, owners may have had no recourse except bankruptcy to stave off even worse financial consequences for the family.

Owners soon encountered other problems. The underwriting for most homeowner policies requires that the insured occupy the home. While limited abseuces might be permitted and waivers secured in some cases to deal with unforeseen circumstances, in the end homeowners may face the loss of insurance coverage. Because mortgages are predicated on the homeowner maintaining insurance coverage to indemnify the mortgagee in case of destruction or damage to the property, the loss of insurance may ultimately lead to termination of the loan even if payments are being made.

Bad as these circumstances were, the affected homeowners were also caught up in the overall housing market collapse that occurred almost simultaneously with the discovery of widespread drywall problems. Even without defective drywall, homeowners in areas experiencing double-digit declines in property values might have faced the prospect of going "underwater" on their mortgages. With defective drywall present in the home, that prospect became a virtual certainty. This, of course, would preclude seeking conventional refinancing or the leveraging of homeowner equity.

Thus, homeowners generally had limited recourse to the financial resources needed to remedy the problem even if there was an agreed-upon remediation protocol. Some homeowners sought relief from the insurer covering their properties. Except where a specific policy provision covered the risk for faulty materials, insurers generally denied snch claims, asserting that the damage to the homeowner was the result of the use of faulty materials by builders and thus specifically *excluded* from coverage. Litigation to overcome this assertion has generally failed in Virginia state courts and in the Federal court system, once again leaving the homeowner without the resources needed to address the problem.

Homeowners also brought suit in the Federal courts against the manufacturers and distributors of the defective materials. This approach met with limited success. In a noteworthy case brought against a Chinese manufacturer (Tai-Shan Gypsum Co., Ltd.) in the U.S. District Court for the Eastern District of Louisiana, seven Virginia homeowners prevailed. In a default judgment, the trial court awarded damages ranging from $90,000 to more than $441,000. The average award was almost $373,000. However, the plaintiff families are yet to receive the proceeds of this case. Litigation, including appeals from this decision and additional class actions, continues. Within the past week, a Virginia couple also secnred a defanlt judgment against Tai-shan; however, as in the Louisiana trial, actually collecting the award will likely be a prolonged and uncertain process.

Litigation in other states has been somewhat more successful. In Muscogee County (Columbus), Georgia, Lowe's Home Centers, without admitting wrongdoing, liability or fault, agreed to a settlement of a state class action suit that resulted in a total of $5.5 million being available to qualified claimants. In addition, the same Federal court in Louisiana that heard the seven Virginia plaintiffs has agreed to settlements with one of the multinational corporations (Knauf Plasterboard Tianjin Co.) producing drywall in China. It provides funding for the repair of hundreds of homes in four states (Florida, Louisiana, Mississippi and Texas). This case does not affect Virginia claimants directly. It involved products made by a different manufacturer and one that is not a solely Chinese enterprise as was the apparent case in Virginia.

The State Response in Virginia

The legal and factual circumstances surrounding defective drywall claims differ from state to state. Once the nature and the potential scope of the problem in Virginia became apparent, the legislature and Executive Branch agencies became actively involved in responding to defective drywall issues.

Notice to Local Building Officials

As early as 2009, the Division of Building and Fire Regulation at DHCD, responding to initial reports from the CPSC and other sources, sent an advisory memorandnm to all local building officials, the parties charged with enforcement of the USBC. This alerted the officials to the emerging problems associated with certaiu Chinese-manufactured drywall products. The memorandum noted the potential for the corrosion of metals by sulfur compounds and the hazards that such corrosion presented to occupants from a host of causes including malfunctioning smoke and carbon monoxide detectors. The advisory noted that while the CPSC and other agencies were just beginning their research into the problem, the use of the suspect materials should be discontinued and that segments of the construction industry be so advised.

Defective Drywall Task Force

In early 2010, as the scope of the problem continned to grow, Governor Bob McDonnell assembled a drywall task force to learn more about the problem, hear

from homeowners and other affected parties, determine the numbers of affected properties and consider possible areas for action at the state level. Task Force meetings and subsequent town hall events brought together local officials, homeowners, other affected parties and state agencies with potential roles to play in responding to the issue. These sessions revealed more fully and poignantly the extent to which defective drywall had disrupted the lives of hundreds of Virginians. They also began to outline priority areas for state action. These included the urgent need to provide homeowners and contractors with authoritative guidance on appropriate remediation steps as soon as possible. Participants registered their concerns about whether potential homebuyers and renters were receiving proper notice from sellers or landlords when properties contained defective drywall products were offered for sale or lease. Finally, homeowners—frustrated by the response of insurers, manufacturers and the courts–looked to the state to identify funding to support remediation activities once guidance was in place. This proved to be the thorniest issue in a time of overall financial stringency.

State Legislation

During its most recent two legislative sessions, Virginia enacted measures that responded directly to aspects of the defective drywall problem. Earlier this year, the Governor signed HB 1610 and SB 942 into law. These bills, which the Virginia Housing Commission recommended, responded to concerns about the possible lack of disclosure of the presence of defective drywall in properties offered for sale or lease. Real estate professionals engaged by sellers and buyers, individual sellers and landlords with actual knowledge of defective drywall in a dwelling unit must disclose that fact to prospective bnyers or tenants. Failnre to disclose can have real financial and regulatory consequences. These identical bills went further to establish a reassessment process and other provisions that localities could use to grant property tax relief to homes with defective drywall.

Also in 2011, SB 1294 brought defective drywall under the aegis of the Virginia Consumer Protection Act. The law prohibits suppliers, after March 25, 2011, from selling, offering for sale, or using defective drywall in the construction, remodeling, or repair of any residential dwelling in Virginia. This prohibition does not apply to the sale or offering for sale of buildings or structures in which the drywall was already in place.

The first legislative attempt to address funding for remediation took place during the 2010 session. HB 46 created the Virginia Defective Drywall Correction and Restoration Assistance Fund for residential property. Loans and grants from the Fnnd could be used to pay reasonable and necessary costs for: (i) the remediation of a contaminated property to remove hazardous substances, hazardous wastes, or solid wastes, (ii) the stabilization or restoration of such structures or (iii) the demolition and removal of the existing structures or other work necessary to remediate or reuse the property. However, without an actual source of money, and with few prospects for a direct infnsion of state funds given the current fiscal environment, the Fund remains empty. A key provisiou of the bill established a statutory definition of "defective drywall" that drew upon the extant research and findings published by the CPSC.

Other initiatives that the legislature chose, for a variety of reasons, not to enact during the past two years would have:

- Compelled insurers to provide coverage for the damaged property,
- Barred the cancellation of insurance coverage for property that became vacant due to the presence of defective drywall,
- Barred the nonrenewal of insurance coverage or changes in rate structures based on the presence of defective drywall, and
- Required the State Corporation Commission to levy an assessment against state-regulated property and casualty insurers to provide financial support for the Defective Drywall Correction and Restoration Assistance Fund.

Regulatory Initiatives

During much of 2010, affected parties continued to await authoritative guidance on the remediation of defective drywall properties from a variety of sources, including the CPSC. Based on information developed at CPSC and elsewhere, DHCD, following consultation with the state's Office of the Attorney General, concluded that it—or, more accurately, its Board—could act under existing statutory authority to bar the use of defective drywall products and provide remediation standards through an amendment to the Uniform Statewide Building Code.

Following statutory procedures specifically intended to address defective or deficieut building materials, DHCD and its Board conducted a process to defiue defec-

tive drywall, bar its use within the Commonwealth, and provide remediation standards that wonld allow the safe removal of the offending prodnct and the restoration of property to a safe condition. With the participation of representatives of the building industry, the bnilding materials industry, affected homeowners and other interested parties, the Department developed a proposal that was nltimately considered and approved for final publication in the *Virginia Register of Regulations* on August 29, 2011. The new regulation:

- Prohibits the use of defective drywall in new construction,
- Establishes a remediation standard for the removal of defective drywall and the rebnilding of bnildings affected by the installation of defective drywall,
- Defines defective drywall for the purposes of applying the interim performance and remediation standards,
- Reqnires a building permit for the remediation of defective drywall,
- Reqnires use of the remediation standards when defective drywall is replaced and clarifies that the local bnilding official has anthority to consider modifications to the standards,
- Reqnires the removal of defective drywall when remediation is undertaken while permitting non-defective drywall to remain in place under certain conditions,
- Addresses the conditions for the removal and replacement of insulation and flooring materials,
- Addresses the conditions for the removal and replacement of electrical wiring and plumbing and mechanical system components and equipment,
- Establishes cleaning, airing out, and clearance testing criteria post remediation and prior to re-occnpancy,
- Establishes standards for agencies conducting pre-rebnilding or post-rebnilding clearance testing,
- Establishes standards for post-rebnilding clearance testing,
- Addresses final approval by the local bnilding official, and
- Addresses the approval of remediation work undertaken prior to the approval of remediation standards.

As far as we are aware, these were the first general remediation standards for defective drywall to use the medium of nniform building regnlations to give effective guidance for contractors and homeowners restoring residential properties to a safe condition. They are comprehensive in scope. Perhaps most importantly, they provide standards for post-remediation testing. Current and snbsequent occupants of remediated residential property mnst have assurance that the problems associated with defective drywall have been eliminated so that these houses can once again become homes.

Other Sources of Remediation Guidance

While DHCD was considering the provisions for a remediation standard, the CPSC continued to work on its recommended guidance. The National Association of Homebuilders (NAHB) and the Knauf Company (a global supplier of building prodncts) also proposed varying responses. The U.S. District Conrt for the Eastern District of Louisiana inclnded its own scope of remediation in conjunction with the *Taishan Gypsum Co., Ltd.* case. While there was considerable overlap among these proposals, there were also some significant differences. The most notable of these concerned the appropriate handling of electrical wiring in affected properties. The District Court generally required the most extensive remediation steps, going beyond not only the NAHB but also the most recent CPSC recommendations. The Court included the removal and replacement of all electrical wiring as well as removal and replacement of various hard-surfaced components of homes, such as cabinetry and tile floors.

The most siguificant difference between the standard incorporated in the Virginia building code and those of the Louisiana court probably occurs in connection with electrical wiring and hard-surfaced components. Virginia does not *require* the complete removal of electrical wiring components or of woodwork, cabinets, tile or wood floors. Instead, wiring may be left in place so long as exposed ends are removed or cleaned to reveal clean or nncorroded surfaces. Hard-snrfaced-materials *may* be left in place or reused. On the other hand, the CPSC guidance does not go as far as the Virginia regulations in addressing the removal and replacement of items such as HVAC components and water service plumbing. These variations in applicable guidance do have implications for the cost of remediation.

Costs of Remediation

It is perhaps no surprise that the Louisiana Court's remediation protocol, which required the most sweeping actions, appears to carry the highest cost—pegged at $86 per square foot. That would amount to more than $200,000 for a 2,400 square foot home—exclusive of temporary relocation costs and other ancillary charges. The National Association of Homebuilders suggested guidelines would fall well below that range (perhaps closer to $35–$50 per square foot) as would Virginia's new regulations.

Several factors influence any estimate of the aggregate cost of remediating defective drywall in Virginia. These iuclude the actual number of affected properties, the size of the housing unit, the extent to which the offending material is actually present, the number of sheets of new material needed to replace the defective product and the remediation standard. Homes where relatively little of the material was actually present or where it was limited to a specific area may not require as extensive a response. However, where the material is mixed with other drywall or scattered throughout the dwelling unit, the safest and most expeditious response is to remove and replace all drywall.

Assuming that there are at least 400 affected housing units in Virginia, the estimated cost of remediation could reach or exceed $32 million depending on whether only limited amounts of material were present in affected homes nr if all drywall and other affected materials and systems had to be removed and replaced. Given what we know ahout the extent of the problem, it is likely that the costs would reach the estimate. Following the Louisiana Court's protocol would likely double this sum. Note that this only addresses the work done to the property itself and not costs associated with reimbursing residents for the time they would be relocated during the remediation process and other potential costs.

Funding Remediation

Regardless of the specific dollar amount associated with varying remediation standards, the most salient fact is that, for a variety of reasons, most of the parties affected by defective drywall lack the resources tn pursue remediation without assistance. Further, at least in the case of Virginia, few viable sources of funding appear to be available. Unless the manufacturer associated with the materials implicated in the affected Virginia homes agrees to a broad settlement, litigation is likely to be long and frustrating with no certainty that claimants will be ever be made whole. While the state and its local governments have offered tax relief to affected owners, such relief cannot provide the front end funding needed to begin the remediation process.

The straitened financial circumstances of state and local governments make them less able to offer financial assistance to homeowners than might have been the case in earlier times. Annual funding available to states and affected entitlement jurisdictions from formula-driven Federal program sources, such as those administered by HUD, fall well short of the scope of the problem in Virginia and include features that may limit their direct use in the response to the drywall issue.

Virginia has explored other options, including the possibility of setting up a low/no-interest loan fund to give affected homeowners access to the front-end money needed to pursue remediation. Unfortunately, the wider decline in housing market values as well as the even more catastrophic losses associated with property identified as containing defective drywall, means that there is almost no equity in these homes to provide security for loans under current circumstances.

Virginia has used low/no-interest loan programs successfully for many years to finance low-income home purchases, the remediation of indoor plumbing deficiencies and more general home rehabilitation initiatives. In each of these cases, however, the expectation built into the projects was that at some point in the future—whether by a subsequent sale of the property, a market rate refinancing, or even in the case of delinquency and ultimate foreclosure—some equity would be available to return to the underlying program. That assurance does not appear to present in the case of defective drywall homes. As a result, any financial aid might effectively amount to a grant in aid at a time when the state, like other governmental entities is working hard to meet its existing obligations for a wide array of vital public services.

As an alternative, Virginia is also exploring the possible use of HUD Section 108 Loan Guarantees authorized under the Community Development Block Grant Program to provide loans to affected homeowners. It is unclear whether such a mechanism is feasible. Program reqnirements may limit the availability of this option to some affected parties or communities. The ability of homeowners to repay even loans at this relatively favorable rate is a practical constraint. Despite their nominal incomes, many households could find it difficult to repay loans while continuing to

remain current with mortgages—especially when those homes have little or no remaining equity in their current state. Snccess might depend on the willingness or ability of the original mortgagee to agree to a modification based upon the potential benefits of a successful remediation effort, including more stable home valnes, the restoration of equity, and an increased likelihood of future mortgage payments. Nonetheless, even this approach faces long odds and is unlikely to offer a broad remedy for the bulk of affected homeowners.

Closing Thoughts

The circumstances surrounding defective drywall are nearly unprecedented. Previous instances of the failure of construction materials have generally involved domestic manufacturers and snppliers of new prodncts. Defective drywall involves international trade in what was seemingly one of the most mundane commodities used in construction. The fact that some of the manufacturers have virtually no legal or business presence within the United States severely constrains the ability of individuals, or their home states for that matter, to attain redress. The scale of the aggregate costs of the product and the fact that its effects and substantial costs extend across several states strongly snggests that there is a need for the Federal Government to become even more active in responding to this issne. The CPSC and other agencies have provided valuable information that helped identify the source and nature of the problem and lay out a technical path for the safe remediation of affected homes. Now the Federal government needs to consider putting its shoulder to the wheel in addressing the next step of the process–marshalling the financial resources that enable homeowners to undertake remediation.

Virginia, like its sister states, will continne to pursue workable methods for getting the product out of homes and people back into them. In the end, of course, the best solution would be for those who produced a product that has disrupted the lives of our citizens to take financial responsibility for those consequences.

Senator PRYOR. Thank you. Mr. Shelton: That concludes my remarks. Senator Pryor: Thank you. Ms. Brincku.

STATEMENT OF BRENDA BRINCKU—ALVA, FLORIDA

Ms. BRINCKU. Thank you for the opportunity to appear, Chairman Pryor.

I especially want to thank Senator Nelson for personally inviting me here, and for meeting with us in the office in November 2009.

My name is Brenda Brincku, and my test—my drywall home is in Alva, Florida, where I lived for four and a half years with my husband George, my son Harrison, and my two daughters, Christine and Ashley.

Three years ago, a few days before Christmas, we found out that our home was what was making us sick and corroding our electric wires and our A/C unit.

We were both owner-builder of our home in Alva, which was built in 2004 using American-made drywall. I bring this to your attention because so much of the problem has been focused on defective Chinese drywall.

Despite the manufacturer, if your drywall is defective, your nightmare becomes your reality. We suffered the very same consequences as the Chinese drywall homeowners. We got sick; our homes smell; our electrical wiring corroded; and we had seven air conditioning units fail. Our financial well-being has been decimated. My dream home is now valued at zero. My taxes used to be $4,000 a year, are now just $254.

The expense of this disaster has destroyed our credit, and we no longer have credit cards. The simply act of getting a hotel to testify today was now impossible.

Our small family-owned landscape was diminished, and when our clients realized that they had Chinese drywall, and then they,

and their neighbors, due to the loss of the value of the whole neighborhood, canceled their contracts. We had to leave behind bedding due to the fact that our coils inside our beds were corroded.

As grown adults, we are now forced to turn to our parents for financial support, when, in turn, hurt them financially. Never did we, or my parents, imagine that this would be allowed to go on for so long.

I appear before you today representing the tens and thousands of homeowners across the United States that have any type of defective drywall in their homes. Please read the homeowners' testimonies that have been submitted to the Committee so that you can understand what a devastating impact this has been on American families.

Despite what you may have heard in the news, homeowners with defective drywall are still suffering tremendously financially, emotionally, physically. Senior citizens who purchased their home outright are now forced to pay rent to live in a safe environment or are forced to stay in a toxic home. Three of the homeowners sitting here today in the hearing room have lost or are losing their homes.

A Florida homeowner moved into a tent on her property this past weekend. A Virginia homeowner was forced into bankruptcy from toxic drywall, but a mortgage company is holding up the bankruptcy hoping for money from the legal settlement, which could take years. Military families, if they are forced into bankruptcy or foreclosure and or not being able to sell their homes when they get—change orders to their new duty area. This is upsetting for the children, because they have to leave their friends, their neighbors, their schools, and in many instances, their toys, personal items, because odor from their contamination is horrendous.

Families have been told to leave their homes by their pediatricians and physicians due to extreme illnesses, autoimmune, kidney disease, kidney cancer, extreme breathing problems, unimaginary fatigue, death of pets and cats and dogs, death of family members.

Where are families and their physicians to turn to? Where are the families and physicians to turn to for assistance? Many of these families had to seek out professional help, another expense, to help them deal with this surreal experience. The CPSC is too small of a Federal agency to deal with such a large issue. The financial remediation guidance says corroded electrical wiring can remain in a contaminated home; leave the wiring is a miniscule expense in the whole remediation process, and never should be left considering the hazard. Requires electrical wiring check every 40 years. The CPSC says there is no health hazards and no safety issues but yet the drywall must be removed.

What are we to do with this type of information? When would this findings be peer reviewed? What can the Committee and the Congress do to help? The House of Representatives has a caucus dedicated to contaminated drywall. The Congressional caucus and the Committees can. Most important is our health. Require the CDC to start gathering health information, and appoint a specialist to be available to answer ongoing health concerns from toxic drywall homeowners and their physicians. Hold another hearing, and call in the manufacturers to let them know that they will be held liable by our Government for the destruction of these homes,

just like it was done with Toyota, Haliburton, BP and Transocean. Help homeowners restore their credit, via extenuating circumstances ruling to pre-toxic drywall status. Help prevent foreclosures for the few homeowners that wish to try to save their homes in hopes of legal settlement. Meet regularly to craft legislations and produce minutes to be made available to the public.

Call in the insurance industry to the next hearing to discuss lack of coverage. To date, all the insurance from homeowners, installers, suppliers, builders deny coverage, citing the pollution exclusion. Provide legislation that authorizes no-interest loans to help homeowners remediate. Establish drywall standards to help prevent this from happening in the future.

We request the Attorney General look into the fact that some American businesses knew about the problem caused by this toxic problem and chose to cover it up, not inform homeowners or the Consumer Product Safety Commission. If this is not illegal, then laws need to be changed.

The toxic drywall homes that are now owned by the banks need full disclosure upon sale, so that the second generation families will not become victims of this toxic product.

Federal regulators have dropped the ball, and we hope this committee can help turu that around and send Federal assistance to these devastated American families. The victims of toxic drywall have sat and watched our Government rush off to help citizens in other countries for the last 3 years, while we have been completely ignored. We watched as our Government sends $20 million to Pakistan to create Sesame Street. In these dire times in our own country, our money should not be going overseas—taxpayer money should not be going overseas, but staying here and helping to put our country back together.

Once again, I thank you for the opportunity to testify before you on behalf of the homeowners suffering with defective drywall, be it Chinese or American made. If time permits, I will be attempting to answer any questions the Committee may have for me.

[The prepared statement of Ms. Brincku follows:]

PREPARED STATEMENT OF BRENDA BRINCKU—ALVA, FLORIDA

Thank you, Chairman Pryor and members of the Committee for this opportunity to provide testimony to the Senate Snbcommittee on Consumer Protection, Product Safety and Insurance. I would also like to express my personal appreciation to Senator Bill Nelson for his commitment to helping affected homeowners whose houses are contaminated by sulphur compounds emitted from defective drywall. I am convinced that these compounds are causing health and safety problems for my family and countless Americans.

My hnsband George and I are jnst one of tens of thousands of homeowners who, through no fault of our own, have beeu devastated by having defective drywall in our home. Unlike the commou complaint about Chinese Drywall, we had National Gypsum American made drywall in our home. We had no Chinese drywall in our home yet our American drywall was causing the same effects as those experienced with Chinese drywall.

American drywall has destroyed our home. Both American and Chinese drywall have destroyed our landscape busiuess. Many of George's laudscape clients had Chinese toxic drywall in their million dollar homes. Some of our clients that lived in the neighborhoods with Chinese Drywall homes but did not have the defective drywall in their homes felt the toxic drywall homes where briuging dowu the value of their homes. Both sets of clients decided to stop investing money in their homes and landscaping due to the contaminated Chinese drywall homes. A lot of my husband's clients have walked away from their milliou dollar homes siuce their builder

wouldn't step up to the plate and the legal cases are being dragged out in the court system.

We had to move out of our defective American drywall home on March 14, 2009 and we moved into a rental home about 25 minutes away. We have been trying to run our landscape business traveling back and forth between our toxic and our rental home. Our landscaping business was run from our acre and a quarter property where the toxic home sat. Now that we are no longer able to live there we cannot keep our inventory on hand for fear of it being stolen from the property of the abandoned toxic home. Our rental home is in a community which won't allow us to run a landscape business out of our home. George has had to obtain a new position at a nursery and we continue to service our last few clients from the landscaping business.

In 2003, George and I invested our savings and our hearts into the purchase of a property in Alva, Florida. We acted as owuer/contractor in building our home. We made a full effort to employ local subcontractors to help with construction. I remember the many days and nights both George and I fell exhausted from the days work only to strive for the next days tasks to build our dream together.

Shortly after completion of the home in October 2004, we experienced failures of 3 coils in one AC unit and 4 coils in our other air conditioning unit, blackening of electrical wiring and failure of household appliances. After we found out we had the defective drywall our homeowners insurer asked us to turn the electric off to our home when we were not there because they feared there would be a fire. I realize that much of the attention has been paid to those with defective Chinese drywall, yet there is a universe of homeowners like us, with American made drywall, who have yet to be acknowledged as having a problem.

The impact that this has had on my family is unimaginable. My three children lived in this toxic environment and then had their lives turned upside down when we were forced to abandon our home and leave many of our personal items behind for fear of contamination of our new residence. My son lived in this house for half of his life and now, for the rest of our lives, we have to wonder what impact this will have on his future health, the health of all of our family members. If this toxic product has corroded the silver and copper items in our home what has it done to our lungs, our health, our bodies. We know we were horrendously sick living in that toxic home and we must ponder the long term effects forever.

For today, however, I represent everyone across the United States and abroad who continue to suffer the ill effects—physical, emotional and financial—resulting from having defective drywall in their homes.

George and I are among a few outspoken homeowners who have been advocates for these victims. We have been involved from the very start of this problem, yet little help has been provided to us to date.

I would like to summarize what has occurred at the Federal level. However, I preface my comments by stating that, short of some homeowners receiving local property tax relief, the *federal agencies working on this problem for over four years have failed us.*

The U.S. Consumer Product Safety Commission Failed Us

The CPSC is the lead Federal agency responsible for addressing the safety issues surrounding the defective drywall problem in the United States and its Territories. This Agency is ill equipped to deal with such a large scale defective product issue. The CPSC has invested millions of dollars in testing homes with the defective drywall and has made a valiant effort to find a solution. We have been provided with stndy after study, many which are not peer reviewed. The findings of the studies have often been published late on a Friday afternoon to avoid media attention.

The Final report released by the CPSC provided its recommended remediation protocol which told homeowners that it is acceptahle to leave the electrical wiring in a home. To me this protocol is useless and I would never put my family in a situation where we may be killed in a fire cause by an electrical malfunction from defective drywall. I invite the CPSC to talk to some of the contractors who have remediated these homes. In every case they have found that the corrosiou caused by the defective drywall has spread far beneath the casing of the electrical wires. CPSC did offer some advice to homeowners. They suggested that we have the wiring checked every forty (40) years. Imagine that, how would one do that when the average home is sold once every 7–10 years.

I realize that the CPSC has just over 400 employees nationwide and that they spent a major portion of their budget on the drywall problem. Much of the cost could have been avoided if they had in-house expertise. Early on there was a Multi-Agency Task Force Formed to address this, but I found that coordination and commu-

nication among the agencies involved was inconsistent at best and should be considered a failure.

The U.S. Internal Revenue Service Failed Us

I would like to personally thank Senator Nelson for his involvement in directing the IRS to provide homeowners with defective drywall the ability to claim a casualty loss on their income taxes if they had remediated their drywall homes themselves. This provision only helped homeowners who were wealthy enough to have remediated their homes and did nothing for the tens of thousands of other homeowners. While in principal, this tax relief is welcomed, under the provisions issued by the IRS, homeowners who may receive compensation in the courts would then be required to declare that compensation as income making the casualty loss useless once/if court cases were settled and compensation was distributed.

The Federal Emergency Management Administration Failed Us

As homeowners searched for every opportunity for resources, we quickly turned to FEMA to declare the defective drywall problem as a national emergency, thus releasing emergency funding for temporary housing, and for low or no interest loans. The damages from the defective drywall are likened to damages suffered in a hurricane or other disaster. In fact, both Senators Warner (Va.) and Nelson (Fl.) referred to the defective drywall problem as a "Silent Hurricane." We were told by FEMA that they could only act if the Governor of our State requested a Federal declaration.

Homeowners in Florida began petitioning then Governor Charlie Crist to request the necessary declaration; however, the Governor had his Director of Emergency Management request FEMA assistance, which was quickly declined because the request was not from the Governor. Further attempts to have the Governor directly request FEMA help failed.

The U.S. Department of Housing and Urban Development Failed Us

Once again Senator Bill Nelson petitioned another Federal agency for assistance for homeowners. Senator Nelson thought there may be an opportunity to utilize Community Development Block Grant Funding for remediating homes with defective drywall, the premise being that these funds could he used if the homes with defective drywall were considered blight. This idea gave us hope, yet in practice, we found that the funds were administered by the local government and were already allocated; and we quickly found that we would be competing for the funding with Victims of Domestic Violence, the homeless, and Victims with AIDS. In reality, the CDBG funding was so small it would only help 1–2 homeowners if the entire budget was used solely for the defective drywall home.

The Center for Disease Control Failed Us

There are many health symptoms that homeowners and especially children have, as a result of being exposed to defective drywall. Nosebleeds, skin rashes, respiratory issues, sore throats, dizziness, and burning eyes and autoimmune disease are just some of the health problems homeowners are experiencing. Others have reported greater problems including central nervous system effects, restless leg syndrome, hair falling out and some even claim that deaths have occurred from the off-gassing. With all of these complaints, the State Health Department in Florida did uot have the resources for individual testing of homeowners and once again Senator Bill Nelson asked CDC to look into the health aspects.

The CDC reviewed available data and drew a conclusion that the symptoms that homeowners were experiencing were similar to common ailments like having a cold or allergies. The CDC response in their online drywall document was that homeowners should "Go outside to get fresh air" if they could not breath in their own home!

The CDC recently issued a final decision that there will not be a long tern health study associated with the effects of having defective drywall in a home.

The U.S. House of Representatives Drywall Caucus on Defective Drywall has Failed Us

We appreciate those Members of the House of Representatives who have come to our assistance by becoming members of this Caucus. Having said that, it should be uoted that until recently, the group rarely met and attendance was dismal.

Statistics reveal that millions of board-feet of defective drywall enter the United States and its Territories—enough to build 100,000 homes nationwide. Defective drywall has been discovered in at least 41 of the 50 United States. There are 435 Members of the U.S. House of Representatives.

These statistics are telling because the problem of defective drywall is so widespread yet there are only a handful of Members of the House of Representatives who actively participate on the Drywall Caucus. How can that be? I realize that each Member has a lot to do bnt there seems to be a lack of attention to the defective drywall problem on a national scale.

I ask that the Committee consider the following ideas:

- Require the Consumer Product Safety Commission to arrange for a peer review of its final remediation guidance, particularly because leaving electric wiring in a contaminated home is clearly an unsafe condition. Peer reviews are a normal part of any technical decision that affects the public and in this case the CPSC issued its final guidance without a formal peer review process or public hearing and/or public input as required by the Federal Code of Regulations.
- Direct the CPSC to declare this product a hazard
- Direct the CPSC to create standards for drywall content
- Direct the Center for Disease Control, in conjunction with State Health Departments across the United States, to conduct a long term health assessment of the effects of defective drywall on humans.
- This Committee should be the catalyst for Members of Congress to be made aware of and actively participate in the Congressional Drywall Caucus.
- This committee should undertake the responsibility to pursue the availability of low or no interest loans to homeowners who wish to remediate their homes. Perhaps the Small Business Administration would be one avenue to pursue.
- This committee should work to restore the credit of families who, through no fault of their own, have lost their homes due to this toxic product be it via short sale, bankruptcy or foreclosure.
- Lastly, the Committee should consider the possibility of homeowners receiving Federal grauts under a declaration similar to that of a hurricane or flood, aud administered by FEMA. At a minimum the grants should be available to those wishing to relocate to temporary housing.

In couclusiou, I would like to again express my appreciatiou to the Committee and to Senator Nelson for this opportunity to provide testimony on this important issue. I stand ready to answer any questions the Committee may have. Thank you.

Senator PRYOR. Thank you.

Ms. Brincku, let me start with you. And again, I'm sorry that you've had to go through all this. It's just been a terrible hardship. But, let me ask just a few questions. And I think you touched on all these, but I want to make sure I understand the answers.

I want to go back to legal recourse under the circumstances you, in your case, maybe rarer than the other ones, you have an American company who manufactured this. What, do you have any legal recourse against that company?

Ms. BRINCKU. We are going to trial in May, the first 2 weeks in May, at Fort Myers. And, you know, for us, it's the, this issue, the same things that happened to us, just like any other homeowner with Chinese. And we've lost our business; we've lost, you know, our home is, we're going through moratoriums. Every 3 months we get reviewed. And then, you know, fighting for the victims, and watching what has happened to them, it's the same things as what is happening to American——

Senator PRYOR. And your homeowners insurance doesn't cover this?

Ms. BRINCKU. No. Our homeowners, or builders insurance. And our homeowners——

Senator PRYOR. But, there's some sort of exclusion in the policy?

Ms. BRINCKU. Yes. Pollution exclusion. And also, our homeowners insurance told us to flip off the electricity. They were worried and concerned about a fire.

Senator PRYOR. OK. So, you've also tried to work through your contractor, but no——

Ms. BRINCKU. We are the owner-builder.

Senator PRYOR. OK.

Ms. BRINCKU. We are the contractor.

Senator PRYOR. OK. And, you've told us what you think the Congress should do and what the agency should do. So, I appreciate you coming in today, and I appreciate your testimony today. And, we will continue to try to do this. The two senators here, as well as some others who aren't here today have been working on this for a while. But, we've run into some brick walls ourselves.

Mr. Shelton, let me ask you a question about Virginia. You mentioned that you, the state has a drywall task force, and that you've done some requirements now about disclosure upon the sale of the homes, I guess is how that works. And, you have this new remediation standard. And you mentioned that it's hard to figure out how to pay for the remediation. That's a difficult thing. Is it your experience that generally homeowners policies don't cover this?

Mr. SHELTON. That's correct. I think the experience in Virginia was very similar as Ms. Brincku described. There's usually a hazard or a pollution exclusion in those that has been tested through the courts. In fact, there was proposed legislation to try to unwind that in Virginia that was unsuccessful. Generally, the conclusion has been that was a preexisting contract that was defined in the terms, and that's been upheld on the insurance companies. And so, homeowners have not been able to get any relief.

Senator PRYOR. OK. And, you mentioned the costs of remediation in your state, and I wasn't quite sure I followed that exactly, but there may be a national figure, and you guys think you can do remediation cheaper in your state?

Mr. SHELTON. Well, this is an evolving field, so the first standard, I believe, that anyone put forward was in the courts. And there was professional testimony in Louisiana, and that involved removing all of the drywall, all the electrical, all of the soft surfaces, as well as many of the hard surfaces. So, trim; cabinetry; and lots of tile floors all would have to be removed. That's almost——

Senator PRYOR. What about the plumbing? You——

Mr. SHELTON. Not so much the plumbing, unless it was copper. If it's copper line pipes, yes, because—but the plastic pipe didn't seem to be affected. But, it was more the copper elements, or, that would corrode.

That was estimated at about $86 a square foot, which gets up pretty high in many of these homes, which are not, you know, there are different experiences. But in Virginia, they're larger homes.

What we believe is that if you don't require the removal of those hard surfaces, which, we think the testing from CPSC and others shows that you really don't have to do; and then, the big issue was removal of electrical wiring. Initially we were looking at having to remove all wiring. The decision came down after CPSC issued its updated guidance, was that you would not have to remove all wiring. All devices, yes. And you would have to strip the wiring back to show that there was no corrosion. But, if you did that, we be-

lieve that you can leave wiring in place, and that's a major cost factor in this remediation.

So, by doing those things and not removing the hard surfaces, it gets you down, the estimate is somewhere between 35 and 50, depending on the kinds of materials used in the home; but it makes it more affordable.

Senator PRYOR. OK. But that's still a lot of money for people.

Mr. SHELTON. It would definitely be a lot of money, and could not be done within the means of most of these homeowners. That's correct.

Senator PRYOR. And the inconvenience of having to probably move out of the home while that's being done, and——

Mr. SHELTON. Absolutely. But, I think the experience is that most homeowners are not in their homes right now.

Senator PRYOR. All right.

Senator Wicker.

Senator WICKER. Well, it is just heartbreaking.

Let me follow up on that line. Mr. Shelton, at $35 a square foot, which would be the lower end of your estimate, a 2,000-square-foot home, am I right that that's $70,000?

Mr. SHELTON. That's correct, Senator.

Senator WICKER. And some homes are smaller than that, and some homes are larger than that. But, try to do with math with 8,000 homes nationwide, that's over half a billion dollars.

Mr. SHELTON. It's a big number. In Virginia alone, our estimate was on the low side in the 30 million range; and it might be upwards of the 50 million range. That was an estimate of some 300 to 400 homes.

Senator WICKER. Well, you know, the home is the castle. And, Ms. Brincku, I just, I hope there's something that the brightest minds in Washington, D.C. can come up with to give you some sort of solution. And, at least, you have a redress through the courts.

Have any other homeowners from this particular American manufacturer company had complaints?

Ms. BRINCKU. Yes. Yes. There is, there are homeowners. And some have lost their homes in waiting for the process. Their, the banks have taken their homes. The banks refuse to work with homeowners.

Senator WICKER. Approximately how many?

Ms. BRINCKU. Excuse me?

Senator WICKER. Approximately how many homes are——

Ms. BRINCKU. We have about 100 cases of——

Senator WICKER. Of that particular——

Ms. BRINCKU. For National Gypsum that are waiting. There's others that have also had, other American drywall companies have also had problems.

Senator WICKER. Do you think that National Gypsum adopted different standards in the years shortly before you purchased the drywall? What is it that happened all of a sudden with their product?

Ms. BRINCKU. We are not exactly sure. We've done a lot of research. There was a lot of different things going on at that time. And there is shortages. They were running their factories 24/7. So,

there's a lot of different things, theories that we have, that then could have gone wrong at that time.

Senator WICKER. Mr. Cohen, Ms. Brincku suggests that your studies were not peer reviewed. Would you respond to that? You know, I have been someone who for a decade and a half in the House and Senate has always called for sound science: Let's listen to the scientists, and don't jump to conclusions. But, she suggests that a peer review of these various studies might have revealed something more helpful to the cause of these 8,000 families.

Mr. COHEN. Yes, Senator Wicker. The studies that we conducted were conducted with our top national laboratories and using some of the top scientists. And we've conducted those in consultation with our partner agencies and with private scientists as well, to make sure that there was nothing but the highest level of science going on. And we stand behind those results completely. And we feel so confident that the science was of the highest caliber that we posted all of those materials publicly on our website as soon as they were reviewed for quality control and quality assurance.

We've also put all of the raw data underlying those studies publicly available so that anyone in the country can take issue and study, and review our studies if they feel that they're not done adequately.

To date, though, we have received no scientific contradiction to our studies from others who have really questioned the adequacy of our studies. We, our goal was to get that information done right the first time, and to get it out to the homeowners and to the public so that they could use it as quickly as possible, and that's what we did.

Senator WICKER. You're not suggesting that the health symptoms are not there, are you?

Mr. COHEN. I'm not suggesting that at all, Senator. I've been in a home myself. I have experienced them, as have other members of the staff. We've experienced them differently, and different homeowners experience them differently. Approximately half of homeowners report no health effects, and approximately half do. And the half that do report differing levels of sensitivity, from slight sensitivity to a great sensitivity.

We're not suggesting that they don't exist. We're suggesting that we don't—we have not been able to explain them with the low levels of emissions that we're able to measure in the home.

Senator WICKER. OK. Well, so, you haven't ruled it out, then. You simply have not been able yet to establish a causal connection. Would that be a fair statement?

Mr. COHEN. I think that's a fair statement. And we'll be looking to our colleagues at CDC. If they're able to provide us with additional information in their health consultation. We would, of course, consider that in our investigation.

Senator WICKER. Do any of you—maybe Dr. Portier, or maybe Mr. Shelton—can the drywall be tested before delivery at this point? Do we have the scientific capacity now to test drywall for this sulphuric and adulterated presence before it is brought to a home? Can anyone answer that question? Mr. Cohen, it seems——

Mr. COHEN. I'll take the question. Yes.

Senator WICKER. OK.

Mr. COHEN. We are working, as I mentioned in my opening statement, with the Gypsum Association and ASTM International, which is a voluntary standard-setting organization, to do two voluntary standards. One of which, we're pleased to announce, went into effect last month. That standard focused on the labeling of the drywall, because one of the major problems we encountered in our investigation was—it's very hard to track when you go inside a home that's been painted and to get behind the board. Oftentimes the drywall is not marked by point of origin. That will now be changing. It'll be marked by a code. It'll be marked on a regular basis, so that we'll be able to trace the drywall.

The second standard that we're working on, and we continue to work with the Gypsum Association and with ASTM International, is on a performance emission based standard, which is what you're alluding to, which is to be able to measure the levels of gasses, and what acceptable level would be permitted, if any, coming off the——

Senator WICKER. When it is still at the warehouse.

Mr. COHEN. I'm sorry?

Senator WICKER. When it's still at the warehouse, or, the manufacturing plant.

Mr. COHEN. Absolutely. And trying to—there are, there is the technology available to test that. I think that was your first question. And what the industry, and what we're trying to work with industry to figure out is, what are the acceptable levels, if any, of—you know, because some of these materials are naturally occurring, and so you can't completely get them out. But, at a very low level, I think, we're going to agree on a number that will assure, provide some assurance.

Senator WICKER. You know, if Senator Warner will withhold for one final question, maybe I won't take a second round, then.

Tell me, are we aware of any problems that have occurred in other countries that have received this Chinese drywall? It, is it strictly an American phenomenon? Or, should we perhaps have known from other instances before we started actually importing it?

Mr. COHEN. It appears to be a strictly American phenomenon located in your region—the Gulf Coast region, and Hampton Roads area.

Senator WICKER. I just suggest there's a lot we still don't know about the science.

Thank you, Mr. Chairman, for your indulgence.

Senator PRYOR. Thank you.

Senator Warner.

Senator WARNER. Thank you, Mr. Chairman.

And, a lot of questions. One, following up on why, in an inquiry, you asked about, with the insurance companies. As a matter of fact, what even happens, it's so absurd, is if, when you have, we had in Hampton Roads a responsible homeowner, or home builder go into a series of homes and start to remediate off her own nickel, and she got sued by her own insurance company. A major homeowner-developer.

And again, I, Mr. Cohen and Dr. Portier, we've gone around and around on this a number of times. But, you know, this health cau-

sation, it just seems strange to me that we've not been able to determine this health causation issue; yet, we all acknowledge that for many people there are health effects. Anybody that's been in one of the homes can see the corroded wire. There's no doubt about the corroded wire. And even the potential, then, is, as Ms. Brincku said, the potential health hazard from a fire potential on the—and you go ahead and acknowledge that people should go through remediation. It, there seems to be just a disconnect there.

And, I know, Dr. Portier, you said in spring of 2012 now, 3 years after the fact, we're going to get the final CDC back about causation?

Dr. PORTIER. Causation is an interesting term you're using here, so I'm going to take a minute and back away from it a little bit. These particular gasses are toxic to human beings. There is no doubt about that. It's a question about the level of exposure, and whether you would manifest that toxicity for those levels of exposure that you are seeing in these homes.

Senator WARNER. Would you allow your family to live in one of these homes?

Dr. PORTIER. Probably——

Senator WARNER. As a doctor.

Dr. PORTIER. Probably not. That's part of the reason why we are looking at it the way we are looking at it now.

The amount of time it would take to do a formal health study would not do anyone any good in this particular case. What a health consultation will allow us to do in this case is to calculate what we think the peak exposures were in the homes early on, or during warm days, or during days with high moisture in the air—things that would affect what those concentrations were. And, using that, we can look to see if we missed the boat in measuring in the homes—the 51 home study. Because the way you measure is over a longer period of time, and so, it's an average exposure.

So we want to look very carefully at what those exposures might have been in those homes, and think in terms of whether it has crossed a threshold of human health effect.

Senator WARNER. I think the most telling part of your comments was that you wouldn't let your own family live in one of these homes.

You know, one of the things that's also important, Senator Wicker, with, that, we talk about causation, and the lack of a full standard. Yet there are companies out there settling suits on, legal suits on this issue. So, companies don't settle unless they feel like at the end of the day they're going to be found guilty.

And, one of the questions I have, Mr. Cohen, is that, you know, I know that Chairman Tenenbaum has had now, I think, three bilaterals with China on this, trying to force the Chinese companies, and particularly some of the ones that, Taishan, who came into Virginia, to bear some responsibility.

I want you to, I'd like to know what the status of those conversations are; and, as well, again, to Senator Wicker's point about—do, are we aware of how much additional Chinese drywall may be sitting in warehouses around the country? And, God forbid, let's make sure that there's some warning put on that. And is there any possi-

bility that there could be some of that stored drywall still being sold into the marketplace?

So, if you can address both the question of the status of the negotiation with the Chinese, and then, if we have any record of where this drywall, that may not have been sold, is in any storehouses around the United States, and making sure that that's not sold into the marketplace.

Mr. COHEN. Yes. As you correctly noted, we have had some very high level discussions—that Chairman Tenenbaum has had very high level discussions with our Chinese counterpart, AQSIQ, the regulator there.

When this investigation began in June nf 2009, we coordinated with that group, and we had two of their officials visit homes in Florida and visit CPSC headquarters. We then secured an invitation to go to China and send an investigatory team there to look at some of the factories and tn try to get into some of the mines. Since that time, the item has remained on our monthly agenda with them.

But on a much higher level, we've really pushed to raise it, as you noted, to the bilateral China summits, and even the recent trilateral summit involving the EU. We pushed it on very high levels of the Department of State, the Department of Commerce. We've provided briefing papers to former Ambassador Huntsman on this.

As a small agency, we have pushed and pushed. And we know that members of the subcommittee have also done so, and we appreciate that.

To date, there have been no response from the Chinese manufacturers. They are basically telling us, "return to sender," and they don't see a problem with their drywall. And their response has been pretty similar in the private litigation as well. Unlike the one German conglomerate that's made an appearance, these other Chinese companies have not come to make an appearance, and to get involved in the settlement discussions that you alluded to.

In terms of your second question regarding the other Chinese drywall, I'll note that the import of Chinese drywall, which was basically, the vast majority was in 2006, was in a response to the overheated housing market and the post-Katrina and Rita situation. It was a very unique historical and economic moment. So, we don't see the economics supporting any new drywall coming in. And, in fact, we have verified every——

Senator WARNER. What about any of the drywall that may have been imported in 2006——

Mr. COHEN. Right.

Senator WARNER.—sitting in warehouses in the——

Mr. COHEN. We are aware, we have tracked some of that drywall—it is a limited quantity—to a couple of warehouses. And we have, and we do maintain contact with those, the owners of that, and we've advised them that they should not be distributing that in the marketplace, and if they intend to, that they should notify us before doing it, because we may want to take some action.

Senator WARNER. But, is there any basis that they may be still ignoring those recommendations and still selling that old Chinese drywall into the marketplace?

Mr. COHEN. I don't have any information that would suggest there's a basis that they're doing that based on the high——

Senator WARNER. Can you get me some—I'd like to get some documentation on that.

Mr. COHEN. I'd be happy to follow up after.

[The CPSC submitted the following letter and exhibits in response.]

Chairman,
Subcommittee on Consumer Protection, Product Safety, and Insurance,
Committee on Commerce, Science, and Transportation,
United States Senate,
Washington, DC.

Dear Chairman Pryor:

Thank you again for inviting Mr. Neal Cohen, Small Business Ombudsman, U.S. Consumer Product Safety Commission (CPSC), to provide testimony at the Subcommittee's December 6, 2011, hearing titled, "Contaminated Drywall: Examining the Current Health, Housing and Product Safety Issues facing Homeowners."

At the hearing, Senator Mark Warner requested that Mr. Cohen provide additional information regarding any remaining "stockpiles" of problem drywall that the CPSC has identified in the United States, as well as information on the current status of those stockpiles. Through this letter, we respectfully respond to his request.

In late January 2009, the CPSC began to look into reports of noxious odors, corrosion of metal items in homes, and reports of short-term upper respiratory irritation in new and recently renovated homes. After identifying problem drywall imported from the People's Republic of China as a potential catalyst for these problems, the Commission set forth a multi-pronged, science-based plan to examine the issue. Key elements of the plan included establishing the amount of potentially problematic drywall that was imported, where that drywall was installed, and whether any problem drywall remained in the distribution chain.

By October 2009, the Commission had mapped out many of the contours of the distribution chain. As part of this investigation, the Commission also identified a limited number of stockpiles of remaining inventory potentially linked to the drywall used in houses where metal corrosion and other problems were reported. The ownership, locations, and amounts of the principal stockpiles known to Commission staff are as follows:

(1) Davis Constrnction Snpply, LLC, Newberry, Florida (hereinafter "Davis Construction"). Approximately 394,000 pieces of "Dragon brand" drywall produced by Beijing New Building Materials.

(2) Knanf Plasterboard (Tianjin) Co., LTD (hereinafter "KPT") and Banner Supply Company (hereinafter "Banner"), Fort Lauderdale, Florida. Approximately 50,000 pieces of drywall manufactured by KPT.

(3) Palmetto Manatee Forestry Terminal (hereinafter "PMFT"), Palmetto, Florida. Approximately 39,000 sheets of "C&K" brand drywall.

(4) Habitat for Humanity, New Orleans, Louisiana. Approximately 35,000 sheets of KPT drywall.

In late October 2009, CPSC staff sent each of the entities managing or controlling these stockpiles a letter, by certified mail, requesting that they "notify ns immediately regarding any possible sale, disposal, or transfer, of any sort, of any portion of your stock or inventory of Chinese drywall." A copy of this letter is attached as Exhibit 1. To date, Commission staff has not received any responses from these parties that the stockpiles have been sold, transferred, or otherwise moved out of storage facilities and into commerce.

However, in an effort to continually monitor any remaining potentially problematic drywall inventories, Commission staff recently reached out again to the entities

managing or controlling known stockpiles. Attached as Exhibit 2 are copies of recent letters from Davis Construction, KPT, Banner, and Arrow Terminals, Inc. (USA) (manager of PMFT) stating that the drywall inventories they manage or control have not been released into commerce. It is our understanding from speaking with Habitat for Humanity staff in New Orleans that the stockpile under its control was destroyed according to local waste disposal laws. Commission staff obtained and retained samples of the stockpile prior to its destruction. In addition, it is the understanding of Commission staff that there are several entities that continue to retain possession of small amounts (500 pieces or less) of potentially problematic drywall. To date, Commission staff has no reason to believe that any inventory has been removed from these small stockpiles for use in new residential construction or renovations.

Finally, we note that this letter and associated attachments may contain confidential business information protected by section 6 of the Consnmer Product Safety Act (CPSA), as amended (15 U.S.C. 2055). The Commission could not provide this information to the general public until staff followed all of the disclosure steps required by the statute. Pursuant to your reqnest, however, we are respectfully providing the information pursuant to the Congressional Committee exception in section 6(a)(7) of the CPSA (15 U.S.C. 2055(a)(7).

I hope this information is helpful to you. Should you or your staff have any questions or need additional information, please do not hesitate to contact me at (301) 504–7660, or by e-mail at cday@cpsc.gov.

Sincerely,

CHRISTOPHER DAY,
Director,
Office of Legislative Affairs.

RE: CPSC FILE NO. PI090017—DRYWALL IMPORTS FROM THE PEOPLE'S REPUBLIC OF CHINA

Dear [Sir/Madam]:

Per our prior communications, the U.S. Consumer Product Safety Commission ("Commission" or "CPSC") is an independent Federal regulatory agency charged with the responsibility of protecting the public against unreasonable risks of injury and illness associated with consumer products. As you kuow, the Commission is investigating reports that drywall imported from the People's Republic of China and installed in homes in the United States has caused corrosion of metal components in those homes and various health problems to the occupants of the homes.

We understand your firm currently maintaius a stock or iuventory of such Chinese-made drywall. Given our concerns with this product and the related reported health aud safety issues, pursuant to Section 27 of the Cousumer Product Safety Act (CPSA), 15 U.S.C. § 2076, we ask that you uotify us immediately regarding auy possihle sale, disposal, or transfer, of any sort, of any portion of your stock nr inventory of Chinese drywall.

Contact Information

Please direct any such notice to me directly by phone at 301–504–7651 or e-mail at *DWoodard@cpsc.gov*. If I am not available, you may also direct any snch notice to Mary Kroh, Compliance Officer, at 301–504–7886 or *mkroh@cpsc.gov*. Please address your correspondence to Mary Kroh's attention at the following address: Office of Compliance and Field Operations, U.S. Consumer Product Safety Commission, Room 613–15, 4330 East West Highway, Bethesda, MD 20814–4408. The Office of Compliance and Field Operations telefax nnmber is (301) 504–0359.

Thank you for your cooperation.

Sincerely,

DEAN W. WOODARD,
Director, Defect Investigations Division,
Office of Compliance and Field Operations.

RE: INVENTORY OF CHINESE DRYWALL

Dear Mr. Woodard:

Thank yon for your call earlier this week regarding our inventory of Chinese Drywall. We have discovered that our initial figures which were provided to your office in June of 2009, were inadvertently understated. As a result of litigation, we have re-inventoried our warehoused drywall since June 2009 and actually have more drywall stored than previonsly reported. Onr revised figures are:

305,628 boards of 5/8″ Type X

89,148 boards of 1/2″ Type X

We continue to maintain that onr Dragon Brand drywall, which has successfully been determined to be non-defective and non-corrosive through independent testing and testing done by the CPSC, should be released for commercial nse. Should you have any questions or if we may be of assistance in any way, please feel free to call or e-mail. We look forward to hearing from you soon and also hearing that the CPSC has released our drywall for commercial use.

Sincerely,

STEFAN M. DAVIS,
President.

RE: KNAUF PLASTERBOARD (TIANJIN) CO., LTD. DRYWALL

Dear Neal:

This letter is submitted on behalf of Knauf Plasterboard (Tianjin) Co., Ltd. ("KPT") in response to your inquiry regardiug KPT drywall in the United States that is still in KPT's possession and control. As we discussed, KPT has stored ap-

proximately 50,000 pieces of drywall in a warehouse in Ft. Lauderdale, Florida. The drywall is stored for evidence preservation purposes pnrsuant to an order of the Court in the *In Re Chinese Manufactured Drywall Products Liability Litigation,* MDL 2047, pending in the U.S. District Court for the Eastern District of Louisiana. The drywall is not being stored for distribution purposes. It is K.PT's intention to dispose of the drywall in conformity with applicable waste disposal regulations when permitted to do so by the MDL Court. K.PT has no intention of distributing the drywall for installation purposes.

In addition to the warehoused drywall, KPT's contractor, Moss & Associates, comes into possession of removed KPT drywall in the course of remediating homes pursuant to a settlement program entered into with the Plaintiffs Steering Committee in MDL 2047. Moss has represented that it disposes of the removed KPT drywall in conformity with applicable waste disposal regulations. The removed drywall is not distributed for re-installation.

In addition, some of KPT's litigation experts may have some KPT drywall, but these also will not be distributed for installation purposes.

I would point out that Banner has brought an action to rescind the agreement whereby K.PT took title to the drywall in the Ft. Lauderdale warehouse. Although K.PT disputes Banner's right to rescind, if they were successful, Banner would regain title to the drywall, and KPT would no longer control its disposition.

This response is without waiver of KPT's jurisdictional defenses to CPSC.

Sincerely,

STEVEN GLICKSTEIN,
Kaye Scholer LLP.

RE: CHINESE MANUFACTURED DRYWALL

Dear Mr. Cohen:

This firm represents Banner Supply Company and a number of its affiliates (collectively "Banner") in the Chinese drywall litigation. As you know, during the relevant time period Knauf Plasterboard Tianjin Co. Ltd and its affiliates (collectively "Knauf) manufactured and sold Chinese manufactured drywall ("Chinese Drywall") to my clients. Banner, a small family owned Florida Corporation, has devoted countless resonrces in pnrsning Knauf for its conduct that has devastated Banner's business and shattered the lives of many Florida homeowners.

I am responding to your request for written confirmation concerning my clients' intentions related to the Chinese Drywall that is currently stored in a warehouse located at 5260 N.W. 10th Terrace, Fort Lauderdale, Florida. This Chiuese Drywall has been stored in that warehouse for years; it is within Knauf's possession and control. Judge Fallon, in charge of the *In Re: Chinese Drywall* Multi District Litigation pending iu United States District Court, Eastern District of Louisiaua, as well as the attorneys for the Plaintiff homeowners that have sued Knauf in Judge Fallon's Court, are all aware of the location of this warehouse and its contents. Again, Knauf has title and possession of the Chinese Drywall in this warehouse; while Knauf and Banner disagree about many issues, Banner does not claim any right or ownership over this Chinese Drywall.

Nevertheless, Banner agrees that it will uot sell or otherwise distribute to the public any Chinese Drywall over which it currently holds title or over which it subsequently obtains title and; further agrees, that if it disposes of such Chinese Drywall it will do so iu conformity with all applicable laws.

My client wishes to continue to cooperate with your office, as it has done in the last several years since the Chinese Drywall inquiry began. Please let me know if you have any additional questions or coucerus.

Yours truly,

NICK P. PANAYOTOPOULOS,
Weiuberg, Wheeler, Hudgins, Guuu & Dial, LLC.

Subject: Chinese Drywall at Manatee Terminal

Tony,
We are surprised to hear of the Capt. Okland's retirement and wish him well. Confirming our conversation, the problematic imported drywall is still located in the Manatee terminal and has not been sold or disposed in any manner. Is this correct?

It would be our recommendation that you follow through with your local jurisdiction regarding scrapping this material. You should check with your EPA office as well. You will likely find that the best method is a Hazardous Waste Disposal Site.

Dean W. Woodard
Director

Senator WARNER. I don't know—Senator Rubio and his state has been very effective on this. One last question, if I could also get this one in.

Mr. Shelton, I know we've worked with you on a number of ways to try to look at low cost refinancings. Do you have any final comments on that? I know we've looked at a host of different entities, and we're still, now, engaged with Fannie and Freddie. But, if you'd comment on the cost of remediation financing?

Mr. SHELTON. Senator Warner, the most likely looking one was using a HUD product, which is a loan guarantee product which would allow for a fairly low-interest loan to be used to finance the program. It currently operates at LIBOR plus two, so—I meant,

LIBOR, I think, is 2 percent. I'm sorry. I misspoke. So, you're going to be above 2 percent.

The problem is, to pass any kind of reasonable underwriting standard, you would have to have some equity in the home, or some ability to pay. And so, as we've tried to unwind this, we've come to the conclusion that's going to be very problematic. There are other issues with that program and the ability to use it, not the least of which is, it's a difficult delivery system because there are HUD contracts with the larger cities, and there are contracts with the state, and trying to work across that span has been particularly difficult.

But, I think, if it's a loan-influenced product, our belief is, this is not going to work. Someone mentioned zero percent interest loans. If you have to secure with any kind of guarantee on the loan and underwrite it, I don't believe it would pass right now, because most of these were homes purchased in the last six, seven, 8 years, and the equity is just not there.

Senator PRYOR. Thank you.

Senator Rubio, thank you for being here. And welcome today.

And also, I notice that Florida has 56 percent of all the reported cases in all the country, 56 percent.

STATEMENT OF HON. MARCO RUBIO,
U.S. SENATOR FROM FLORIDA

Senator RUBIO. That's correct. Thank you for having this hearing. And this is an issue that predates my service here. I've been here less than a year now. But during my time in the State legislature, we saw a lot about it.

And, Ms. Brincku, thank you for being here and for all your activism on behalf of Floridians who have been affected by this all over the state. We've been hearing about this for years now, particularly after 2004 and 2005, with the building and rebuilding boom.

I wanted to ask you something. I know it's in your statement because I read it, and it talks about credit and the impact that this has on people's personal credit ratings. And you may have discussed this already, and if you have, I apologize. I was a little late. But, the changes you've had to make, and also other people had to make in their lives. They've had to leave their homes behind; they've had to find secondary places to live; sometimes have fallen behind on their payments. I don't know if that's the case with you. But, talk a little bit, if you could, with us about the impact that this has had on the credit rating of victims who have suffered from this and are now trying to recuperate some of that.

Ms. BRINCKU. It's had an enormous impact on the victims. For 27 years, my husband and I had never missed a payment in our lives. We'd always be on time. We had impeccable credit. And our 800, over-800 credit score went down to 500. It, just the simple thing of credit cards, having a credit card, we no longer have credit cards; we no longer are able to obtain credit. By the end of, by the time we get to court we will owe $80,000 in back payments and interest and penalties from our, Wells Fargo.

So, it's, for all the victims, it's had an enormous impact. People that had their houses paid off, it's devastated them because a lot

of them live on fixed incomes. People that have, like, Colleen, behind me, she, you know, over a million-dollar home; had $800,000 credit—I mean, equity in her home, and now she's, you know, short- saling this Friday. So, what is this still going to do her, you know, for her credit rating? On top of, you know, when you go to apply for a job; if you claim bankruptcy; all these things having a huge impact on, you know, our job, our finances, I mean, everything.

And we, my, I had a grandfather that always told me, put your money in your house, because it's always a safe investment. So, I took my entire IRA and put it in my home. So not only have I lost my home—I've lost my IRA, I've lost all my savings. I'd stuck $150,000 into my home so I, you know, I had equity, didn't have—and now, you know, it's gone.

Senator RUBIO. And, I asked that question because you're a victim of domestic drywall——

Ms. BRINCKU. Yes.

Senator RUBIO.—but, the one we hear a lot about is the Chinese drywall, and so we have limits into what we can do to reach these manufacturers—the folks overseas.

One of the things we can do something is about is what you're talking about, and that is the credit rating of individuals that have been directly——

Ms. BRINCKU. Right.

Senator RUBIO.—impacted. Because you can leave the home; you can move away from the drywall; but the credit rating issue will follow for——

Ms. BRINCKU. For the rest of our lives.

Senator RUBIO. Well, at least, for 7 years, or whatever the——

Ms. BRINCKU. Yes. Seven years.

Senator RUBIO.—timeframe is. But it just takes forever to rebuild it. And quite frankly, there's things we can do about that. And we, and I know you've been talking about that with Senator Nelson before I got to the Senate, and that's something we want to work together on with everybody on this panel, because I think it's one of the things we can do something about immediately.

You touched upon something else, which is short sales and transactions. I'm talking to you now because I see you've become an advocate on behalf of other people in the state that have suffered this. One of the things I'm concerned about, and maybe you can touch upon it, is that some homes are being sold, or people are now buying homes without full disclosure as to what they're getting. And, have you heard how many of your victims actually bought homes from either a contractor, or a builder, or another homeowner who basically dumped it on them without disclosing? How much of a problem has that been in terms of the non-disclosure issue?

Ms. BRINCKU. There's just so many victims that have told me and share their stories. I've had cases where I've, I had somebody go over and watch a house be remediated, and they took ketchup and cleaned the wires. I've had, I mean, right here, this wire, it's gone all the way through. And if I cannot remove the wiring from my home, I will not move back in. You can guarantee that. I will not—you cannot have alarms go off in the middle of the night, with your children wondering, is there a fire? Is there not?

I mean, all, like, all my things have turned yellow. It's affected all the appliances in my home, you know. And so, we're worried about the health and safety issue of this. It's a very big concern.

And the thing that, it's not being disclosed. And people are remediating, and there's no set guidelines of how the remediation is going to take place. You have people that are remediating for as little as $6,000, just flipping the drywall, or even patching up. I've heard, you know, them patching up the drywall. Not even tearing the drywall out. One homeowner in California, they did that to her home. They patched it up and put it back on the market, and put some new carpet in it. A lot of times they're, you know, taking the air conditioning out. And so, they're, the banks are taking the air conditioning out; it's bad, and then leaving everything else alone, so, when a homeowner, the first thing they're going to check is what, the A/C coils. When they see the A/C coils is not a problem, then they say, "OK, there's not a problem in the home" and they may not pay for an inspection, or the inspector doesn't, you know, catch it or not, more, you know, educated in the area.

So, these are all things that we see constantly, every day, that the homeowners, this has happened to.

Senator RUBIO. That's my last point, and I'm glad you brought that up. And one of your complaints—and I think rightfully so; I read it in your statement—was that many of these studies that are coming out on the safety and effectiveness have not been peer reviewed, or, not been looked at and compared.

But the opinion of some is that it's okay to move back into some of these homes after certain things are done, but you're saying this is not enough; that in fact—and you just highlighted—you're not moving back into a home as long as this faulty wiring is there, no matter how many reports come out that say otherwise.

How prevalent of a concern is that among folks?

Ms. BRINCKU. It's very concerning. I mean, I've heard it over and over. If these homes are not properly remediated, they will not move back in. And the homes are so upside-down. You know, before all this happened, our home wasn't an upside-down. We had equity in it. And so, that's an enormous concern.

And for the amount that—it's, like, 5 percent to fix the wiring and take it out—why not—well, why, in 40 years, who is going to be here to check this wiring for the next families that are coming in? The average homeowner lives in the house for seven, you know, 7 years. So, who's going to keep passing that information that needs to be changed?

Senator RUBIO. Thank you, again, for the work you're doing on this issue, and hopefully, we can be helpful, as well. Thank you.

Senator PRYOR. Let me say we'll do a second round here, so if anyone has more questions, be glad to entertain those.

Let me start with a little editorial comment, and it follows on something Senator Warner said. And that is, China should take responsibility for the products that they allow to be sold in this country and other countries. And one of the very basic starting points from my standpoint on this is that Chinese corporations should have to register in this country, just like domestic corporations, just like European corporations, for service of process. If there's a

problem, they should have an agent in this country for service of process.

Senator Whitehouse has a bill on that, and I support that. And I think he's going to re-file it soon. I'm not quite sure when. But this is a textbook case of why it's critical that we be able to reach these Chinese corporations if they do anything wrong. They should be held liable, and they should take responsibility just like other companies all over the world. It gives them a huge economic advantage to be able to put all this stuff in all these countries all over the world, and not have any recourse to them.

So, that's my editorial comment for the hearing.

But, let me ask, if I can, Dr. Portier, you mentioned that you, about the health studies, even though your studies are not exactly as conclusive as I'd want them to be, you still support remediation. Did you say you have another health study coming out this spring?

Dr. PORTIER. It's called a health consultation. So, the difference between a health study and a health consultation—in a health study, take a compound like lead in children, you have a clear disease that you can follow; you see neurological, developmental deficits; you can measure the compound in the blood, so you have a good exposure measurement; and that allows you to have a definitive study that you can clearly understand.

Here we have none of those things. So, a health study in this case would not give us a good, definitive answer. We think we would spend a lot of time and effort, a lot of resources, and in the end, we couldn't answer your question.

In a health consultation, on the other hand, what we do there is, we go to well-done studies in the literature, things that have been peer reviewed and have been published—occupational studies, and studies like that where we've seen health effects. From that we extrapolate down into a lower exposure region until we find a place where we think it's going to be safe for exposure. So, you estimate where you think it's safe for exposure. Then, hased upon the exposure reconstruction, the simulation modeling that we're going to do of homes, we bring those things together and make a decision as to whether we believe there are health outcomes that should—that would have been seen in this particular case.

Senator PRYOR. OK. Well, that's helpful.

Mr. Cohen, you heard Ms. Brincku talk about her dire financial consequences with this drywall. In the CPSC's experience of looking across the country at all the states that have been impacted, are you finding those similar stories in all the states, and in—not with every single homeowner, but generally, do you find that same type of story?

Mr. COHEN. Absolutely. And on the majorly affected states that we've discussed, notably, Florida, Louisiana, Virginia, Alabama and Mississippi, we hear these heartbreaking stories, much like Ms. Brincku's, every day. And it, you know, we are homeowners, too. We feel that and we have put our professional lives toward trying to come up with the causation, trying to be able to put forth a case. And we share the frustration, I think, of everyone in this room that we haven't, that the science hasn't provided that yet. And, we, you know, our hearts go out. And we're just going to keep on this thing. And hopefully we, well, might be able to develop with Dr. Portier's

expertise, the modeling that he just described might be able to inform a future legal case that we can undertake under our authorities. But presently, we don't have the evidence to support those.

Senator PRYOR. And, you also mentioned that the CPSC is working with the Gypsum Association. And do you think that the steps that the Association, the voluntary steps they're taking, are satisfactory?

Mr. COHEN. We've been very pleased with the steps that they've taken. Most drywall, just because of the nature of it—it's a heavy commodity product—is generally made and delivered in the area in which it's going to be used. So, traditionally, this whole occurrence is just so out of the ordinary. So, most of, almost all the drywall that's used in this country is produced in North America, mostly the United States, a little bit from Canada, and a little bit from Mexico.

All of the members of the Gypsum Association, including those major producers in Canada and Mexico, have voluntarily agreed to use this new labeling system which just went into place next month, which will have a standardized code and a standardized way that you can recognize the drywall that's been installed in any home across the country. So, we are pleased. We think they've been very cooperative in that regard.

And we have experienced the same cooperation in working toward this performance-based emission standard. Just because of some of the things that Dr. Portier described, it is a more complex standard, and so we'll just continue working. And that's something that CPSC does on a lot of products. We work and try to improve these voluntary standards over many years.

Senator PRYOR. And I think the Subcommittee, as well as the full Committee, would be interested to know what the Chinese government and Chinese companies response is when the CPSC reaches out to them and asks them to provide information, and also, step up on their responsibility to this. What do the Chinese say about that?

Mr. COHEN. As I noted previnusly, they don't believe that the—there's a problem with their product, and they've steadfastly said that. They've said that in open court in the multi-district litigation, when the German company stated that they were going to do remediation. The major Chinese importer, that has not made an appearance, stated to the judge: Judge, we are not standing behind this company, and we're not getting in line to do the same thing. We don't see a product—we don't see a problem with our product. And to the Government, to us, and to others who've raised the issue, they've said the same thing, and they said: Show us the science. Show us where the problem is. We don't see it anywhere. And that's been their response.

Senator PRYOR. Senator Wicker?

Senator WICKER. Well, I won't take a full second round.

Let me echo what the Chair has said. China benefits immensely from trade with the United States. It's time for Chinese manufacturers to step forward and make themselves available for service of process, much as other international trading parties have done.

So, thank you for that, and thank you for mentioning the Whitehouse legislation, which is something that we could use a starting point for a small solution to this.

Mr. Cohen, you said that usually because of the weight of drywall, it's usually not shipped internationally.

Mr. COHEN. Correct.

Senator WICKER. It's only this type of unusual circumstance. You're not suggesting at all that maybe something might have happened in the transportation, you know, oversea transportation of this product?

Mr. COHEN. I'll just, sort of, note, on your first comment—we, the Chairman has also come out in support of this concept of having a registered agent here for these Chinese manufacturers, especially in regards to the large number of consumer products that are imported from China. This has been a real problem for the Consumer Product Safety Commission. So, CPSC staff provided testimony in support of a prior proposal to that effect. And, as I said, the Chairman herself has come out in favor of it.

In answer to your second question regarding——

Senator WICKER. Whether the actual physical transportation might have——

Mr. COHEN. Right.

Senator WICKER.—had something to do with——

Mr. COHEN. We, in our compliance investigation—which we haven't spent a lot of time discussing, but we conducted a large compliance investigation as well—we did look toward, to see if there were any similarities in the way things were shipped, the ships they came on, the sorts of pallets they were shipped on, all the different confounding factors that might contribute to something you're suggesting. We didn't find any evidence of that.

Senator WICKER. OK. Now, with the exception of American Gypsum, we have not had any complaints about domestic drywall, complaints made toward domestic drywall manufacturers, is that correct?

Mr. COHEN. There have been reports—obviously, Ms. Brincku's among them, and others like her—to the Consumer Product Safety Commission of homes reportedly constructed exclusively by domestic drywall exhibiting the same sorts of characteristics of the problem imported drywall.

Senator WICKER. And these are from other manufacturers than Ms. Brincku mentioned?

Mr. COHEN. Due to our statute, I'm not permitted to actually speak about the specific manufacturers here on the record, but I can talk in general terms about the domestic claims.

We did, in June 2010, undertake a study particularly focused on domestic drywall. At that time, we had received over 3,400 complaints of imported drywall problems. At that time, 67 of those were of domestic drywall. Since that time, we've received 10 more.

Based on that, we still felt it was important, because we wanted to be on top to make sure there was not going to be another emerging hazard of domestic drywall in addition to the imported drywall. So, in order to make sure that was the case, we instituted the study. We used the exact same methodologies that we had done on the imported problem drywall studies. We went into 11 homes of

domestic—that were self-reported to be exclusively domestic drywall, and our findings were inconclusive. We did not find another distinct pattern of emerging hazard like the imported problem drywall.

Of the 11 homes, five seemed to match the imported drywall, and very well may be imported drywall, because it's really impossible for us to know what's in that home without completely ripping out every piece of drywall in that home. And that's been the most major challenge of our compliance investigation.

Senator WICKER. But now, at least, with the labeling, that one distinct issue will be better handled.

Let me ask you this——

Mr. COHEN. Yes.

Senator WICKER. The ingredients of the drywall, the components, how different is that in these Chinese manufacturing plants, as opposed to domestic ingredients?

Mr. COHEN. The ingredients of drywall are fairly simple and straightforward, and they don't really change based on the place of manufacture. I mean, they're based on gypsum mined, usually either gypsum mined rock, or reconstituted ash, fly ash. But, all of those are basically reconstituted into gypsum. They are put into a sort of mush, and pushed between two pieces of paper, and basically baked and cut. It's a very simple process.

Some of the issues that are known in the industry are that the rock that you're mining may have contaminants in it, of course, and so there needs to be some level of quality control or quality assurance on the input side of your factory. We're not sure, because we just don't have complete access to know what happened on that side of the Chinese manufacturing process—how they were able to assure that there were no impurities in that gypsum rock that formed the basis of the drywall.

Senator WICKER. Thank ynu.

Mr. COHEN. Thank you.

Senator PRYOR. Thank you.

Senator Warner.

Senator WARNER. Thank you, Mr. Chairman. Again, I'll be, try to be brief here.

But, some of, one of the things that there—there was the German company, though, who settled, correct? So, there was——

Mr. COHEN. They have engaged, and they have done some pilot settlements, and they are engaged in major settlement talks. That's correct.

Senator WARNER. And, how do we make sure that, you know, even if there's not—we went down the road of what might be sitting in warehouses and trying to make sure those folks are notified. And I want to see that documentation.

And then we also, you know, God willing, we may have another housing boom at some point. And if we start importing again, how do we make sure that we never repeat this? Even if we're not at the final stage of causation—to make sure that going, on a going forward basis, there's some ability to check whether imported drywall, whether it's from China or anywhere else in the world, isn't being mined in a, with faulty materials?

Mr. COHEN. Again, I would, sort of, harken back to my earlier comments about our voluntary standards development. That technology does exist to test the rock, the raw rock, and also the gypsum itself. You can test the elemental components that make up, make it up. And so, I think in the near future here—I don't want to give an exact date—but, in the matter of months we should have a gypsum standard that we can be able to have a baseline measurement, to be able to answer that question, Senator Warner.

Senator WARNER. Well, it seems to me we've got a couple of different paths we need to continue to pursue. One—and I'm going to echo what my colleagues have said in terms of holding the Chinese responsible and making sure that if they're going to do business in this country, they meet minimum fair business practices, and trying to work with your agency and other agencies of the Federal Government to force the Chinese to accept this responsibility, since some of these companies were, in effect, state-owned enterprises in China, so this directly bears back on a responsibility of the Chinese government.

Number two, there's a question of both for this, these circumstances on a going forward basis, what do we do in terms of these pollution exemptions on insurance contracts? I mean, it seems to me, if I was a homeowner and I bought a house that, through no mistake of my own, ended up with a faulty product in the wall—when I first heard there was an exemption and that insurance companies somehow weren't covered on, through that basis, why do you buy homeowners insurance in the first place? And I'd like to get a comment from someone on the panel on this.

And then, the third is, it appears that many of these families are going to be engaged in some form of litigation for some time to come. And it appears that, while we have, at the state level, working with Mr. Shelton, and these offices, and I know Senator Nelson has been working with us as well, we've tried to work with the financing organizations on how we can, ease the pain a bit, forbearance. The IRS has gone ahead and given safe harbor in terms of being able to write off; we've made some progress there. We've been able to work with the Defense security services to make sure people don't bear that blemish that might hurt their secret clearance or clearances with the Government.

But, as one of the Virginia families mentioned to me, you know, "Just tell me how I can get my credit back." I know this is not either of your particular expertise, Mr. Cohen or Mr. Shelton, but, you know, I would be interested in comments on that. If someone is forced into a short sale, forced into losing their home, how do they not let this disaster be something that blots their next 20 years of their financial future? Question—comments?

Mr. SHELTON. Senator, that is not my area of expertise. You know, in the mortgage crisis that we've just had, there's been a lot of work done on that. Clearly, that would take, I believe, some intervention, perhaps at the Federal level, since most of the, what we've experienced in foreclosure is that no action at the state level will address this, because most of the servicers are beyond the reach of the individual state. They exist outside the state. So, that's, it needs a national solution.

I don't know that solution yet, although I think that some standards for making sure that—similar to what, exemptions for military families, or some ability to at least get some response from the ratings agencies directing, or, as, the situation, if this is a one-time occurrence, it's a catastrophic loss, but, at the same time, it was beyond the control of the individual, so therefore it's not the individual's personal credit. It was beyond their control.

I think the ultimate answer is that either through settlement with the manufacturer, or through some other intervention, as someone mentioned earlier, that if there is not an ability to bring a product in to essentially remediate these homes without putting additional burden and debt. I mean, you bring the homeowner back current, then I think it gives more standing to go back and say that the problem has been cured both in terms of physical structure and the financial piece of this.

My worry is that most homeowners will not last through this crisis. Many, as we've already heard today, are going under.

Senator WARNER. Mr. Cohen?

Mr. COHEN. I'd agree with Mr. Shelton. It's certainly not my area of expertise; but I would certainly associate myself with those comments. I think that it is a tragedy, what's happening, that through no fault of their own, these homeowners' credit is being eviscerated, in addition to the loss of their homes. Some of the issues are state law issues. The insurance issues are state law issues.

But perhaps there is some sort of Federal policy distinction that can be made as well, akin to the military situation.

Senator WARNER. Well, Mr. Chairman, I want to again thank you for holding this hearing.

I agree with both of you that we need to make sure that if Chinese companies are going to do business in our country, they play by fair rules, and are subject to our processes.

The insurance issues maybe have to be dealt with on a state level, but I'd look forward to working with both your offices, and other members of this committee, to at least also try to—as Mr. Shelton said, it may require legislation. It may also simply require us going at the credit rating agencies a bit, that there should be some exemption so that these families don't have a blot on their financial records which, candidly, is not due to any inappropriate actions on their part.

I know we've worked with the banks and the IRS, and since the IRS has been willing to note this and put safe harbor, perhaps we can at least go down that route, as well as some of the legislative route.

But, I want to again thank you Senator Wicker and Senator Rubio, for your interest in this.

I'll close with where I started—in 20 years being in government and public service, I can't think of a more frustrating example of families through no fault of their own being kind of ping-ponged from one governmental entity to another, all being sympathetic and empathetic, but not getting them the relief that, quite honestly, I think they deserve.

Thank you, Mr. Chairman.

Senator PRYOR. Thank you.

I would like to say, I want to thank all the witnesses for being here, but, Ms. Brincku, you especially. And I'm curious about how many other victims are in the audience. Let's see. There's three of four back there.

Well, we want to thank you all for coming. And we know this has been a terrible hardship on every level. And so, thank you all for being here.

What I want to do is, we're going to leave the record open for 2 weeks. We're also going to encourage any Senator who has any more questions to go ahead and get those in in the next 7 days, so that we can get these to our witnesses for them to answer.

And we think that we may have one Senator on the way, but let me check.

Well, we had one senator on the way, who we think may be caught up in the Intelligence Committee, we think. And we prnbably just shouldn't wait any longer, because he's a little bit out of communication right now.

But, anyway, thank you all for being here. Thank all the witnesses for being here. And I know the Government witnesses are trying to resolve this and sort this out. But, like Senator Warner said, this has been a real conundrum, or, a very difficult problem to solve, and it's a real problem, and it's just been hard.

So, thank you all.

Did you have anything?

Thank you all, and we'll conclude the hearing, but we'll leave the record open for 14 days. Thank you.

[Whereupon, at 11:25 a.m., the hearing was adjourned.]

APPENDIX

LETTERS FROM THE GENERAL PUBLIC

Dear Natasha,

Please enter my story with all of those received as evidence to the hardships, non-restored health and financial welfare most of us face.

Important Points: My home was remediated, but after some months of living there, I left again because symptoms came back; my Homeowner's Insnrance, St. John's, dropped me, lying on paper that I was an "unknown homeowner—1 yr." and while in forbearance Bank of America made me take ont Lender's Insurance at over $900/day while my builder was remediating and I was out of my home. Bank of America had me pay a small escrow each month, even though I kept asking about paying more, especially when they forced me to carry Lender's Insurance. I was told repeatedly not to worry. Bank of America understood, would keep my forbearance until my home was completed, then would send me a Loan Modification, and would lower my interest, maybe stretch out years, and do what was needed so I could live in my remediated home again. This turned out to be false. As soon as they got the call from me that my home was completed, and I requested the loan modification, they stopped communicating. Instead I received a letter to tell me that I had 1 month to pay about $17,000. When Sen. Nelson's office contacted them in my behalf, I did receive the BOA Loan Modification packet in recognizable fed ex. What was never conveyed was any amount I could be paying them, so I sent in my basic principle and interest payment for 2 months while I was waiting for the loan modification packet. Meanwhile, without any communication to me, foreclosure proceedings were begun by them on June 6, 2011. After that, I had received a call from someone who was from the CEO's office who let me know about Sen. Nelson's office sending a complaint. She was the person to assure me that I would get the loan packet. *However, she told me that it did not mean I would get it. This was the first time I was told that this would not be automatic because of my contamination loss.* When I received the packet, I sent it back, and again, never heard from Bank of America. I never heard that I was already a defendant in a foreclosure proceeding. Plus, I never received any communication for more than 2 months. One day, I went looking for a used car to replace mine, and I was told by the manager that he could not help me—BOA stated on my report that I was 6 months in arrears and in foreclosure. I was in shock and shaking when I left. Again, I went to Sen. Nelson's office, and received a copy of a letter sent back from BOA saying my loan modification packet was not complete. *No information about what was incomplete was given.* After leaving messages, I finally reached [redacted]. She told me at first, that my modification loan was thrown out now, because it went 90 days past, and that my loan application was scanned and sent to another dept. Her dept. only worked on forbearances. When I questioned where it went, who was then responsible for it, and on what date was it sent, she conld not answer my questions. She had me on hold for a while. As soon as I told her that she was not truthful to me during my forbearance as to what the steps would be, and I was angry. Also, I complained that it was not fair to have no one communicate a foreclosure proceeding, tell me what could be missing from my loan application packet, nothing! I told her that all of this seemed so wrong, and I would probably go to an attorney. Suddenly, she changed, and told me that I could speak to someone right away to begin another loan modification application. She just happened to have someone! I was in disbelief!

I told her that I still wanted answers to my questions, and called back and left a message that I wanted to know where and to whom my loan modification went, and to whom, and the date, and I am requesting this in writing. *I have requested this again, but to this date, I have not received this.* [Redacted] did call me back to tell me that she now got special permission to handle solely a new loan modification request, and wanted to send it to me to complete. She said that she would be the only one handling it (which was not reassnrance really, given her "track record" with me so far). She told me that this would not stop the foreclosure from moving

forward, even though I told her this was not fair. She said that, if a sale date is set while the loan modification was proceeding, BOA would notify the court that they were considering the loan modification. For the first time, Isabel said that this application was not a gnarantee. She had been the one during the forbearance who led me to believe it was! I did complete and mail this on Nov. 25, 2011. I have heard nothing. However, I did receive a "Notice of Action" telling me Bank of America has filed against me, and I am required to serve a copy of written defenses to the plaintiff's attorney, Paul M. Messina, Jr. of Kass Shuler, Tampa, FL on or before January 9, 2012. It is dated December 1, 2011. *Why am I going through all this when I have had a disaster destroy my home and most of its contents?* I have had the FL. Health Dept. Radioactive Testing Div. test my home for remnants of strontium becanse I am trying to figure out why the same smell that was in my home has once again, permeated through all of my clothing in my closets, and why I started with headaches, cramping in my stomach, incredible pressure in my head, bnrning chest, and cough again. When I looked at my certificate of testing during and after remediation by tbe builder's appointed investigator, this document just said all the sulfides were no longer present. I told my builder, KB, that strontium was also found in my home. But the letter did not even mention that testing. Upon moving out a second time to see if my symptoms subsided, I contacted the FL Health Dept. to investigate. They did and said their meter was not making repeated, fast beeps so there was not strontium left in it. What do I do now? I am back and forth to my house, but feeling insecure. Do I now have to pay more money to have my home tested again? A home that Bank of America is foreclosing on anyway? These are my most recent concerns aud situations. I am a teacher, but have been planning to retire soon. My pay checks are losing 3 percent this year, due to a Florida law, and we have been told that another 2 percent may begin to be added to this come January. I am single and a mother of 2 grown children, hut I do belp one as I can. In fact, last week, she asked if I would be a co-signer for her on a student loan so she can start school again, and I sadly had to tell her what is going on, and that Bank of America has totally ruined my credit statns. I instead will be able to do nothing as far as helping myself or my children for a very loug time. In fact, I am 64 now. I try so hard to deal with the emotional pain and stress. Knowing now that my HOA can also foreclose on me and have a judgment against me, even thongh I am paying my HOA, causes more stress and embarrassment. The development I am in, KB Sunset Pointe Townhomes have most remediated homeowners not returning, and renting. Also, I saw last week that still another home is vacated and is beginning to be gutted out.

More information and how this began:

*In July, 2007, I pnrchased my townhome in KB Homes" Sunset Pointe Townhomes, Lot 3, Block 27, as a 30 yr. fixed mortgage with Conntrywide as being the noted lender. It was a Freddie Mac. Purchase: 135,000.

*Started with strange health problems: rashes on my face; feeling my chest ache; sudden weight loss for no apparent reason; congh; terrible jaw and head pain, dry, burny eyes; mouth always feeling like it is burned inside. I also had cramps in legs and stomach at times. I complained of hlacking out twice.

*Nov. 2009: Service on home A/C reveals mnltiple holes, leaks and copper tubing is black. Kross Inspection confirms contaminated drywall in December, 2009.

*Neighbor told me to call Bank of America for a forbearance, which I did and was told to continne paying about $276/mo. escrow.

*Signed to have KB remediate my home, with agreement giving me per diem to move out and back in, pay for rental, and other living expenses. Told I wonld be provided testing and a certification that my home would be safe upon completion. I was told that I would also get 3 reports dnring the process and wonld have access to the information abont the drywall as they pnlled it from my home. (I was never given this.) I was told that I could still sue KB or any entity for health but not for other reasons about the damage.

During this time, I also gave the Consnmer Product & Safety Commission my information on this disaster. I also notified the Florida Health Dept. In addition, I went to my physician, Dr. Weiss, and told her that I had been exposed to 2 toxic gases, and wanted to have her check my health. But she told me that she didn't know what to do, and did nothing.

*Upon leaving my home in Nov., 2009, I noticed the terrible pitting and corrosion on metal bathroom hooks. Jewelry was rnined. When I make calls to inquire what would be safe to remove in my home and what I would need to discard, I was told by beth the FL Health Dept. and the Consumer Product and Safety Commission that they did not know the answer to that. What I found was just from my own research on the gases.

*My living elsewhere, transportation, faxing, calls etc. were solely paid by me from November, 2009–April 10, 2010. I took little out of my home, washed clothing according to Internet directions, aired out things I took for days, but most, I was afraid to touch anything, and afraid to go to my home to take out. *If the metal hooks were so pitted and corroded, and holes were made by these gases, what possibly was it doing to me?*

**2010—contacted my Homeowner's insurance. *Told they were protected from claims by a 31-year-old air pollution law. When I pointed out this was not air pollution, he said still protected. Insisted that I still let them do a second inspection on my home, saying it would help me have more information for down the road.* This was done by Burton Investigation.

*Finally, April 10, 2010, KB Homes is ready to have me move out so they can begin remediation. Upon moving out, there was *still no information on what could be safely removed and reused.* I therefore, removed and discarded most of my contents. What I was told by Mr. Wallace at the FL Health Dept. was that he would not save any thick porous items, like mattresses, metal things, appliances, sofas, chairs, etc. I even threw out a year-old TV! *Whatever I replaced had to be my expense!* Everything I kept left me great concern but I aired it out for a long while.

*May, 2010, receive notice from homeowner's insurance, St. John's that they are not renewing my contract. Even though I had been calling my insurance agent to give an update almost monthly, they say "Homeowner unknown 1 yr." Actual cancellation July 2010. Previously, my building manager and I had sent a letter, giving approximate date when remediation wonld be done, and details, but to no avail.

*June 2010, BOA continues forbearance, and even with telling me in July that they need to force Lender's Insurance on me, [Redacted] kept telling me not to worry—all would he worked out upon completion of my home, getting the letter of certification my home was safe, and getting new homeowner's insurance. A loan modification would then begin to be in place. Not to worry.

*Feb. 2011—My home is completed, right after I was given Lender's Insurance, I was notified by Tina Calderon, Bank of America, that Isabel would no longer handle my case—Tina would!

*Although health improved while out of my home for remediation, I had been admitted to Lakeland Regional Hospital on Dec. 25, 2009 because my throat and breathing felt like it was closing off. At this time I was told the lung X-rays showed signs of COPD. This has not changed thus far.

*When two members of the Consumer Product and Safety Commission came to meet with "victims" in Sarasota, FL, even though over a year had gone by, or longer, they still lowered their heads toward the floor when asked our questions, and kept repeating, "We don't have any answers yet on that", or "we didn't see any reason to investigate that further". That is a disgrace! So many sick, and perhaps some have died (even 12 infants in Ft. Bragg), and they feel no investigation is needed? An injustice and a disgrace!

*Health questions and concerns have remained unaddressed by 3 of my doctors over the past 2 plus years. They have stared at me and said "I don't know what to do for you." I even had one leave the room, come back 10 minutes later to inform me that she looked up "hydrogen sulfide on her computer but the only thing she found were lawyer advertisements." Again, a disgrace.

*I am 64, a teacher for about 30 years intermittently, hold a Master's degree, with a small retirement savings. I have raised my children, helped them in every way I could, and love them dearly. I plan on leaving my teaching career, hut now I have my life in great jeopardy, with health fears, a closely timed foreclosure, and probably an impending bankruptcy. I have to still wonder, because of recent health, if my home is safe. *Did I purchase this home with any knowledge of this disaster? Did I do something to cause all of the following hardship and disaster? Will I end up with more losses? This is unjust, and I will not stop speaking out for myself and for all the other victims until there are answers to our questions and justice is served by giving us aid to move forward, with or without our homes.*

Builder: KB Homes Lender: Countrywide/Bank of America/Freddie Mac Home: Lot 3, Block 27 Sunset Pointe Townhomes

---

It's difficult to express the devastating impact living in a toxic home has had on our lives, home, health and retirement. We all have been affected and need our government to step up look past the lobbyists and help the families that have been devastated by Toxic Drywall; both American and Chinese.

We purchased our *Lennar home* new and moved-in Oct. 2004.

Within weeks of us moving in we smelled rotten eggs and called the gas company twice who came out and checked for gas leaks but found nothing.

But we have tests that show toxic drywall directly linking to our health problems.

We had experts test the drywall twice and the test were positive for sulfur and strontium both times. The experts pointed out signs of copper corrosion on the water heater, AC unit and electrical in the walls; noting it is less than the higher humidity climates but that we definitely had copper that was blackening. Additionally we've had electrical components, appliances and computer equipment, smoke detectors, and alarm system repeatedly fail or sound randomly with no explanation.

Our home has no Chinese markings but *Blanks* and confirmed *American Gypsum* aud *Georgia Pacific* with the following markings:

- Georgia Pacific—Tough Rock
- American Gypsum—Albuquerque NM "350 Crew 1 7/13/2004",
- Unidentified markings "250 7/11/04 H. Smith 12:12".
- Unidentified markings that have Spanish words "1 Pieza" "2 Por Paquett"
- Unidentified markings that are stamped "CAN" possibly for Canada

The fact that we found 5 different brands/markings in our home is an indication the builder was gettiug multiple shipmeuts of drywall from different sources. It is clear it was not all shipped at once from the same place.

The problem we face is we have no idea what manufacturers *Lennar Homes* used aud *Lennar Homes* is refusing to remediate. *Lennar Homes* came to iuspect our home and they did air quality tests and then refused to release the results or address our concerns. They have been provided our positive test results and they continue to deny us remediation and discriminate against us (as they are doing remediation elsewhere) because in Nevada they claim there is not a problem.

Georgia Pacific also came to our home, and they took a sample and said they would test it but wheu we asked for results they ultimately told us they were instructed by their attorney's not to speak to us.

The health of our family has seriously deteriorated while living in the *Lennar* home.

Health Issues

We were seen by an environmental toxicologist Dr. Robert Harrison (UCSF). He confirmed we had *Sulfur poisoning at levels of 5000 mg daily compared to the average American exposure of just 2 mg daily.* We have long term exposure to Sulfur Dioxide and Hydrogen Sulfate, which has caused long term health problems.

We also confirmed we hoth have the hlood tests results showing Strontium (Jason at 38.2 ng/ml and Olivia's at 26.7 ng/ml) due to long term exposure to Strontium.

Our water heater and PEX plastic water lines were so discolored and had absorbed so much of the toxic gases our water turned orange and we are *not* on well water. The city water right up to our drive way tested at perfect levels, yet in our *home, our water tested Sulfur at 200,000 ppm and Strontium at 4500 ppm which is 5000x higher than the average American.*

Additioually, we've met with the CPSC and have had our test results reviewed by both the CPSC and the CDC. The CPSC has a formal report from their investigation on our home. The CDC provided us a guideline and based on the test results in our home, we exceeded acceptable levels of these toxins by 1000 times or more. They referred us to DR. Robert Harrison, the toxicologist at UCSF.

Our bodies were husy fighting unexplained rashes, bloody noses, constant sinus infections, migraine headaches, sore throats, vomiting, burniug eyes, blurred vision, memory loss, fatigue, slurred speak, loss of coordination, loss of vision, unexplained nerve damage in Jason's face, and ultimately unexplained lesions found on Jason's brain.

We spent countless hours and thousands of dollars in medical expenses for doctor's appointments, emergency room visits, tests and prescriptions trying to diaguose and treat unexplaiued symptoms.

Health Issues include:

- *Chronic migraines* and light sensitivity
- Chronic sinus infections and daily
- Bloody noses
- Laryngitis (for over 6 months
- *Lesions throughout brain*
- Paralysis on his face (uerve damage)

- Loss of vision
- Slurred speech
- Loss of taste
- Jumbled of words
- Loss of motor function
- Red burning eyes
- Difficult to keep eyes open
- Burning sore throat (Choking)
- Shortness of breath/Chest pain
- Nausea/Vomiting and choking
- Digestive and upper and lower GI health problems (constant antibiotics)
- Fatigue
- Insomnia
- Olfactory sensitivity
- Headaches
- Constant tearing eye
- *Growths on Vocal Cords (requiring surgery)*

The neurologist knows of the toxic drywall test and the Strontium heavy metal poisoning and he advised we vacate the home immediately. We received the same advice from the ER doctor while my wife was treated for a migraine.

Our health issues have devastated our health so severely we've shut down our businesses as we cannot function at the same level we used to. We have no way of knowing what the long term medical damages are, but we are very scared as we see the deterioration aud know the damage this has done to our bodies. We fear for our future.

In Nevada new homes were built at a rapid pace of 35,000—45,000 new home per year during the period from 2001 to 2006 with the pace slowing iu 2006–2007 but the builders have a lot of clout here as they have contributed to the economy greatly over the past decade.

Additionally we have information and photos on our website *http://toxicdrywalllasvegas.blogspot.com/*

We ask that our government take action to protect us (it's citizens) and make us whole again by holding the builders, suppliers, and manufacturers liable for the damage they have caused so many Americans.

Thank in advance for your time and consideration.

My husband served 20 years in the AF, then had another career after that. I retired from DoD in Feb 2007 after 27+ years. We lived in many places and were looking forward to settling down in our forever house in warm, sunny, Florida living on a canal where we could have a boat. Our builder went out of business after 30 years of buildiug homes in the SW FL area a few days after we moved into our "dream" home. We started receiving dunning phone calls from sub-contractors who said they hadn't been paid, followed by certified letters. Every time the mailperson pulled up and got out of her car, I was about ready to bawl. After a year and a half, we had those legal situations taken care of and figured we could finally start enjoying life. About a year later, our air conditioner wouldn't turn on.

We had a home maintenance agreement and they came out and replaced the coils. They told us they'd fix them once, but we had defective drywall and they wouldn't do it again. Our entire house is filled with ProWall drywall—all Made in China. We're the lucky ones, if anyone with CDW cau be called lucky. Our house doesn't smell, and we haven't had anywhere near as many things go kaput as a lot of people have. Our son's house which is 40+ years old has bright copper wire, our house has black copper wire. Both my husband aud I have rashes that appeared after we moved in and won't go totally away—mine so bad I regularly see the dermatologist. She keeps trying different ointments/creams. Not sure if the drywall is the culprit or uot. The value of our home for tax purposes is $0.0. Our home equity loan has been frozen. We can't sell without remediating (or we'd have to practically give it away and still be stuck with a $200K mortgage). Our lawyer has told us that since our builder is out of business and we dou't have Knauf drywall, we're going to have trouble getting anything from the class action lawsuit, and we definitely should not count on getting enough to remediate completely. Oh the Golden Years. How they suck!!

PREPARED STATEMENT OF ROBERT D. GARY OF GARY NAEGELE & THEADO, LLC

I want to thank the Committee for focusing its attention on the devastating problem that has been caused by the off-gassing of drywall which has forced people to abandon their homes, often with catastrophic financial and personal consequences.

My uame is Robert D. Gary and my law firm, Gary Naegele & Theado, LLC, together with the undersigned attorneys, represent [redacted] and others whose homes are uninhabitable because they contain not Chinese drywall but drywall domestically produced by Americau companies. I have represented the [recacted] since early 2009.

My coucern is that innocent homeowners who have domestically produced defective drywall in their homes have been poorly served by the very Federal agency whose sole purpose is to protect consumers from defective products. To some degree, and at the urging of [redacted], the Consnmer Prodnct Safety Commission undertook a much delayed study of "non-Chinese manufactured drywall". That study referred to domestically produced drywall with the cnrious ambiguons description of "often referred to as domestic drywall by consumers."

The critically important issue before the Consumer Products Safety Commission shonld be "is American-made drywall exhibiting corrosion problems?" It is beyond dispnte that the now notorious Chinese drywall is destroying homes. Our American homeowners deserve a full study into whether domestically manufactured drywall has also experienced corrosion caused by the drywall in their homes. Rather than address this issue, the CPSC chose instead to side-step the question in its report issued on April 15, 2011.

For pnrposes of its report, the CPSC tested eleven homes which "the homeowners self-reported were constructed with domestically produced drywall." See Exhibit A, attached hereto, at page 2. The results of this study were anxiously awaited by those homeowners who clearly had corrosion bnt no evidence of Chinese drywall in their homes. Nine of these eleven homes were confirmed to have "evidence of blackening of copper wiring or cooling coils. Water was eliminated as a possible source of the indoor corrosion.

Prior to the issuance of this report, I, along with my colleagues and Pamela Gilbert, a former Executive Director of the Consumer Product Safety Commission, met on April 5, 2011 with the Commission. We urged at that meeting that the Commission test for sulfur-reducing bacteria which conld have established that the drywall, and not another source, was causing interior corrosion in the tested homes. The Commission declined to do this testing or to do the well-established chamber testing of the drywall. Presumably the issue was the cost of the testing.

The issue of whether American-manufactured drywall was causing interior corrosion was and remains a vitally important qnestion to the American homeowner. Yet the CPSC failed to make the most basic determination in its testing of the eleven homes. The CPSC made no effort to confirm whether the drywall they were testing was in fact American-mannfactnred. Instead the CPSC relied on self-reporting from the occupants of the homes that the drywall was constructed solely with domestically-manufactured product. It would have been a simple procedure to confirm the identity of the mannfacturer of the drywall the CPSC was testing. All domestic drywall has run codes printed on the back which would have identified the time, place and manufacturer. The failure to take this simple step rendered an expensive study all bnt nseless because it never segregated out the origin of the drywall it was testing. As counsel for the Brinckus, I can state categorically that their home has no Chinese drywall, yet because of interior corrosion, it is uninhabitable.

Rather than providing protection for the consumer, the net resnlt of the CPSC stndy instead provided cover to the drywall mannfactnrers who cite the stndies of the CPSC in its press releases to confirm the safety of its drywall products. I have attached two such examples as Exhibits B and C. National Gypsum has repeatedly nsed the flawed study of the Consnmer Product Commission to discredit any claims about their drywall and even specific victims including George and Brenda Brincku. For example, note the following from a National Gypsum press release:

> *CPSC Report Determines National Gypsum Drywall in Brincku Home is Not Defective:* In April 2011, the Consumer Product Safety Commission (CPSC) released a report on testing of domestic drywall as part of a broader investigation into problems associated with defective Chinese drywall. The report determined that the National Gypsnm drywall in the [redacted] home was not defective.

A critically flawed stndy by an agency whose mandate is to protect the consumer is being used to discredit the very consumers the CPSC is supposed to protect. The most casnal visit to the Brinckn home will qnickly reveal that the home has been destroyed by something that is corroding copper in the home. The Brincku's attor-

neys have confirmed the presence of sulfur-reducing bacteria while the manufacturer of the drywall suggests the problem arises from the well water.

The CPSC has eliminated well water as a possible source of corrosion. If, in fact, as the domestic drywall manufacturers allege, the well water in Florida is so corrosive that it can destroy copper through air born transmission the problem for Florida and its real estate market extends far beyond the confined problem of defective drywall. It would mean not only has there been a catastrophic failure by those agencies that regulate Florida water quality but the real estate industry with equally devastating consequences would have to alert home owners to this menace emanating from the well water. Neither of these concerns will be realized because the attack on Florida's well water is a red herring.

In conclusion, a separate study of the potential problems with American drywall remains regrettably an open question despite the considerable costs of investigating drywall-related problems. The CPSC's explanation that it did not want to do extensive removal of drywall begs the question and could have been eliminated by testing for sulfur-reducing bacteria. This simple test would have established that hydrogen sulfide is being produced by drywall as a waste product of sulfur-reducing bacteria.

We, the undersigned, urge that the agencies of the Federal Government not close the door on problems created by domestically manufactured drywall before even the most basic questions have been answered. At the very least, we ask that the Consumer Product Safety Commission confirm the origin of the drywall from the eleven homes already tested.

Thank you for your consideration and please submit this testimony for inclusion in the Congressional Record.

U.S. CONSUMER PRODUCT SAFETY COMMISSION STAFF SUMMARY OF CONTRACTOR'S EVALUATION OF HOMES REPORTED TO BE CONSTRUCTED WITH DOMESTIC DRYWALL[1]

Background

The U.S. Consumer Product Safety Commission (CPSC) contracted with Environmental Health & Engineering, Inc. (EH&E) to conduct an investigation of a few homes where consumers have reported health and corrosion problems and where they also reported that the homes were built with what they identified as non-Chinese manufactured drywall (often referred to as "domestic drywall" by consumers). Although these reports alleging problems due to non-Chinese drywall represent a very small fraction of the total reported incidents, the CPSC investigated them as part of its overall investigation to gain a comprehensive understanding of the reported problems.

Earlier investigations conducted by EH&E under contract with the CPSC identified a link between problem drywall in a home and increased levels of hydrogen sulfide in indoor air and increased rates of copper and silver corrosion. They also found that orthorhombic sulfur (S_8)[2] was a useful marker for identifying problematic drywall (EH&E, 2010a and 2010b). These findings, in part, formed the basis of the Federal Interagency Task Force on Drywall's Interim Guidance for Identification of Homes with Corrosion from Problem Drywall (CPSC/HUD,2010).[3]

This guidance includes two steps: (1) a threshold inspection of the home to identify blackening of copper electrical wiring and/or air conditioning evaporator coils and the installation of drywall in the time period of concern; and (2) the verification of corroborating evidence. In accordance with the Identification Guidance, either two or four pieces of corroborating evidence are required to identify a home as one with corrosion from problem drywall. Homes built or renovated between 2001 and 2004

[1] This document was prepared by CPSC staff and has not been reviewed or approved by, and may not necessarily reflect the views of, the Commission.

[2] Also referred to as "elemental sulfur."

[3] Recent investigations indicate that the years should be expanded to include 2009. This has been reflected in an update of the Identification Guidance, March 18, 2011.

require at least four pieces of corroborating evidence, and homes built or renovated between 2005 and 2009 require at least two pieces of corroborating evidence.

Corroborating evidence can be: the detection of elevated S8 levels in samples of drywall taken from the home; corrosive conditions; the formation of copper sulfide on copper coupons placed in the homes for 14 to 30 days; visual observation of markings, indicating the origin of the drywall; elevated levels of specific sulfide compounds from chamber testing of drywall samples; or corrosion of copper metal coupons to form copper sulfide when exposed in a chamber with drywall samples.

Study Design

CPSC staff contracted with EH&E to perform this study to assess whether the objective criteria reportedly associated with problem imported drywall and outlined in the field-based component of the Identification Guidance were present in complaint homes allegedly constructed of domestic drywall. CPSC staff also wanted to compare the data collected from these homes with results obtained in the initial, large-scale investigation of homes with problem drywall (referred to as the "51-Home Study"). This comparison is important because the 51-Home Study was the largest study, to date, conducted on problem drywall homes using consistent and rigorous testing parameters. Testing performed as a part of the present study was conducted with methods identical to the 51-Home Study to ensure comparability. In this way, the results of the present study on 11 homes could be placed in context with the results of the larger study. CPSC staff asked that EH&E:

- characterize the indoor environment in consumer complaint homes that were reported to the CPSC to be constructed with domestic drywall, and
- compare the drywall composition, indoor air quality, and corrosion conditions in these homes to corresponding parameters observed and measured in residences in the 51-Home Study.

This study, like the earlier 51-Home Study (EH&E, 2010a) was intentionally designed to identify source characteristics of drywall and characterize the indoor environment in the home where the complaint was reported. Thus, the study was conducted as a field study at the home, and chamber emissions testing and chamber-based corrosion testing were not performed as part of the suite of tests.

CPSC staff selected 11 homes for the study. Homeowners self-reported that their homes were constructed with domestically produced drywall; and before undertaking this study, CPSC staff performed in-depth investigations to remove homes from the study where Chinese markings were clearly present. CPSC staff selected the homes, located in Florida (n=9), North Carolina (n=1), and Pennsylvania (n=1), from drywall-related consumer incident reports that the CPSC received between December 2008 and April 2010. Staff developed a ranking system to guide the current study, which like the 51-Home Study, considered location, date of construction or restoration, severity and extent of reported health effects, and corrosion. Staff also considered consumer-reported manufacturer of drywall as a factor in the home selection, as well as consumer willingness to participate in the study.

Between September 20, 2010 and September 29, 2010, EH&E field teams visited the humes and scanned multiple locations on the walls in each home with an x-ray fluorescence (XRF) analyzer as a screening tool to aid in detecting possible markers of problem drywall; collected drywall samples to analyze for orthorhombic sulfur; inspected ground wires and air handling units for corrosion; conducted air exchange, temperature, and humidity measurements; deployed passive air samplers for measuring indoor air concentrations of hydrogen sulfide and formaldehyde; placed strips of copper and silver metal called corrosion classification coupons in the homes to measure the rates and types of metal corrosion; and analyzed water samples to rule out alternate sources of sulfides in the homes. The full report can be found on www.drywallresponse.gov. Key results are detailed below and presented in Table 6.2 of the full report, which is attached to this summary.

Key Results

- Nine of the 11 homes (Homes A–E and H–K) had evidence of blackening of copper wiring or cooling coils and were constructed/renovated in the relevant date range (2001–2009). However, homes investigated to date, impacted by problem drywall, meet a common set of parameters, not all of which were observed in each of the nine homes.
- Five of the 11 homes (Homes A–E) met the criteria for identification of homes with problem drywall in accordance with the Identification Guidance, including elevated rates of corrosion and elevated concentrations of S8 in drywall samples. Hydrogen sulfide was detected in the air in only three of the five homes

(Homes A, B, and D) at levels that were similar to those levels found in problem drywall homes in the 51-Home Study.

- In five homes (Homes A–E), indoor corrosion rates exceeded ontdoor corrosion rates by as much as nine times. These results are consistent with the results found in the 51-Home Stndy.
- The presence and percentage of drywall samples with sonrce markers (S8 and strontinm/carbonate) in Homes A–E varied by room.
- Two of the 11 homes (Homes F and G) do not have the characteristics of homes with problem drywall consistent with the characteristics found in the 51-Home Stndy or in accordance with the guidance for identifying problem drywall homes.
- Four of the homes (Homes H–K) had a corrosive environment based on elevated rates of corrosion, as determined by the visual observation rating system and mixed findings of corrosion on the copper and silver coupons between and within each home. The S8 marker was not found in the drywall samples from any of these fonr homes.
- In four homes (Homes H–K), ontdoor corrosion rates were sometimes similar to the indoor rates.
- All of the homes in this study had air exchange rates that are typical of North American residences.
- Formaldehyde levels in the 11 homes were consistent with levels fonnd in recently constructed homes and results of the 51-Home Study and were not associated with the drywall.
- Sulfides were not detected in any water samples from any of the 11 homes and, therefore, were not likely a potential contributing factor to measured indoor corrosion rates.
- Average humidity and temperature conditions in the 11 homes were typically within the ranges recommended for summer months by the American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE). The temperature and humidity levels were generally higher in homes in Florida in comparison to the two homes (Homes F and G) located in North Carolina and Pennsylvania.

Other Issues and Study Limitations

- Informatiou that these homes were constructed solely with domestically manufactured drywall as opposed to Chinese drywall was obtained by self-report from the occupants. CPSC staff and EH&E were not able to confirm independently that all of the drywall in the homes was produced domestically. This would have required extensive removal of the drywall and destructive testing of the residences.
- An elevated rate of corrosion in homes is not sufficient, by itself, to conclude that the corrosion is associated with problem drywall in the home. Outdoor corrosion rates may be the source of indoor corrosion in some of these homes (Homes H–K). Or, the corrosion source might originate from something other than the drywall.
- In its report, EH&E suggested that additional chamber emissions and chamber-based corrosion studies may help identify whether the drywall is the source of corrosion versus some other factor or source inside or outside of five of the subject homes (Homes H–K). While CPSC staff understands the reasoning for the recommendation of additional study, the CPSC has determined that due to the relatively limited number of homes affected, the uncertainty concerning the drywall's origins, agency resource constraints, and that any findings of problem drywall would not change the current Task Force recommendations, it cannot authorize further expenditure or study on this issue at this time.
- While a sufficient number of drywall samples from each home were analyzed for elemental sulfur (S8), and the selection of samples to analyze was based on the presence of a secondary marker (strontium) to increase the likelihood of selecting a sample with elevated elemental sulfur, it is possible that, even with the robust study design, problem drywall with elemental sulfur exists on a small number of boards in Homes H–K; however, it was not detected.
- There is a possibility that some problem drywall, including domestic drywall, may have different characteristics from the originally defined problem drywall. For example, there may be differing mechanisms of chemical off-gassing or compositions of source materials; or S8 might be a good marker for a particular type

of problem drywall (for example, problematic Chinese drywall) but not all problem drywall. If that is the case, this study would not have been able to identify this drywall as problematic because it had materially different characteristics from the problem drywall studied to date.

Conclusions

Based on the characterization of the drywall and indoor environments of the 11 homes tested, comparison of the results with existiug data from homes classified as problem drywall homes (51-Home Study), evaluation of the test results in relation to the Identification Guidance, and EH&E's extensive experience in conducting investigatious of problem drywall homes, EH&E reported that five of the homes in the study (Homes A–E) have drywall that is consistent with problem drywall. However, because EH&E was unable to confirm independently that all of the drywall in the homes was produced domestically, and without detailed documentation of the drywall's origin, or without damaging the homes through extensive removal of the homes' drywall, it is not possible to conclude that only domestic drywall is present throughout the homes.

Four of the homes (Homes H–K) had a corrosive indoor environment, but the test results were not consistent with previous findings related to the identification of problem drywall. It appears that the indoor corrosive environment might be influenced by outdoor corrosive conditions. Based on this study, other indoor sources, or the presence of a limited amount of problem drywall, cannot be ruled out as a source of the indoor corrosive environment. Conclusions regarding the potential of domestic drywall to be problematic cannot be confirmed at this time without further extensive investigation and detailed documentation of the origin of the drywall in these homes.

From "Evaluation of Homes Reported to be Constructed with Domestic Drywall," April 12, 2011, Environmental Health & Engineering.

I am writing to tell you about the nightmare my wife and I have been living since discovering in 2009 our home contains contaminated Defective Chinese Drywall. We are unable to attend Tuesday's hearing but hope that our story can be shared.

After 23 years of marriage and living in the same home for more than 19 years my wife and I felt we were in a secure financial position to build the home of our dreams on 11 acres in the County. I am a contractor by trade and at the time owned

a successful construction company. We purchase the land in 2005 and began to design the home. In late 2006 we broke gronnd on what we had planned to be our final home which would later be a great financial investment to us in our retirement years. In July 2007 we closed on the $402,000.00 mortgage and began to enjoy our new County lifestyle. This home was our dream over 4,500.00 sq ft appraising at closing for over 550K and we couldn't believe we did this and seemed to have done it all right. In early to mid 2009, we began to start having issues with first our security system panel, which effected our inter-come system and security cameras. Then 2 televisions went out. Small appliances such as 2–3 coffee makers, toasters, and other strange electrical things. The small mini central A/C unit that fed our oldest sons room went out. We began to see increased electric bills and realized our other 2 central units were working very hard and running constantly. There was a strong smell in the house when we got home in the evenings, and my wife's jewelry began to discolor. Being a contractor I had begun to hear rumor of the Chinese drywall. I did some checking with the wires in our home and found that they were corroded. I did some further research on the Internet and began to realize what was going on. It was probably 2 months before I got the courage to tell my wife. She was just 19 and I was 21 when we married. Like all couples we had dreamed for years of building a home like this. Finally iu our 40s we felt we were in a position to do just that. Our home had been featured in a local magazine for it's design, style and features. Now I had to tell her our home was basically worthless. I learned in my research that the drywall affects metals; our home is built entirely out of metal studs including the trusses. All I could envision was that the home would have to be demolished! I finally told her. I can actually say it was probably oue of the lowest points in my life. I was a builder, how could I have missed this? How will I be able to afford to move my family, aud do we let the house go back to the bank? I had never had to foreclose on mortgage what would that do to our finances? How am I going to take care of this for my family? I felt as if I had disappoiuted my wife and let my entire family down. On top of all this, as the economy was failing so was my construction busiuess.

Once my wife's initial shock wore off, she began to do her own research. Her biggest fear was/is what are the health effects on the kids. Our oldest son who is 22 constantly suffered from sinus infections. He has now moved out and the infections have stopped. Our 13 year old son was diagnosed with allergies about 8 months after we moved in the home. He spends most months congested. And now takes monthly injections. We constantly wonder is it related to the drywall? We have a 12 year old daughter, is she being effected in a way we have yet to see? Center for Disease Control says "no health effects" . . . this stuff turns metal black, kills appliances and electronics, and we are supposed to believe that? In October of 2009 we learned of a law-firm handling the defective drywall in our area. We contacted them, and after a consultation, they scheduled us for the Environmental testing. In November 2009 it was confirmed, we had the defective drywall. The markings on our boards were not clear enough to immediately determine our manufacturer. We were told there are suspected 5–6 Chinese manufacturers. My wife and I were pretty much in a fog the rest of the year and into early 2010. Not only were we trying to fignre out what to do about the house as we watched things unfold in the news and on the Internet about drywall, my business was not getting any better. I had worked in construction for 25+ years owning my own business since 2003 and now I couldn't land any jobs for my company. I had to cut my salary back to try and keep my business a float. Eventually by late March, I had to lay off all of my employees. I laid myself off and went on unemployment in May of 2010. I tried to find work in my industry all the time bidding jobs for my company in hopes of landing just one job. In April of 2010 the BP Oil Spill impacted the Gulf Coast bringing further damage to our towns failing economy. My wife works full time but her salary really did nothing more than cover health benefits for the family. It was time we notified our mortgage company and asked them for a modification. By this time, the appointed court in New Orleans to oversee the drywall cases had come up with a remediation plan. I obtained estimates in accordance with the remediation protocol to provide to the bank to show them what it would cost to renovate the house. The estimates were close to the mortgage amount of 400K. We notified our property appraiser of our County, our home that once appraised on the tax rolls for 445K was reduced down to 218K. All of this documentation was provided to the mortgage company along with the testing results, letter from our attorney financial statements from our business and personal accounts. We pleaded with them to do something to help us, statiug that we were willing to try and keep the house iu hopes that the economy would turn around and our government would step in and make the Chinese do the right thing and fix our home. With the assistance of our attorney we tried to convenience the bank that they didn't want this house that it would beu-

efit them to modify and keep some type of payment coming in rather than have another honse on their books that they more than likely could not sell. The response we got was we conld run 30 days late hut that was it. Even the government loans that were being offered to individuals in crisis with their mortgage were not an option to ns. So we made a decision to stop making the mortgage payment pnt that money back and let them kick us out. By not making the mortgage payment we would stop depleting our savings and hopefully be in a position to rent somewhere when we were eventnally forced out of the house. In a last ditch effort, we hired an attorney to try and fight the foreclosure, you know try and prove the note etc. in hopes to buy 6 months or so. Our first mediation rolled around in early October of 2010. Our attorney re-submitted the documents we had previously provided to the bank in early 2010 adding his legal verbiage which we paid for of course. We decided not to have the attorney attend mediation. He basically told us the mortgage company didn't care that the house was of no value we were just another number they would write off. So we decided to attend withont him and go through the emotions . . . after all we would have had to pay him to be there and he was not enconraging. Well needless to say the mediation was a joke. Onr mortgage service company is PHH Mortgage ont of New Jersey. A local credit nnion Pen Air holds the note. There was a mediator, an attorney for the bank and my wife and I. My wife was crying nncontrollably the entire time. A bank representative was snpposed to call in for a conference call at a certain time and they were late. Their attorney finally had to call them some 45 minntes later only to get a person who said they had to fill in, that the original person who was listed on our documents to attend, was called into a meeting. Needless to say this person was not prepared. Their own attorney who was in the room with us was clearly frustrated. When we were asked why we were not making our payments we told them a combination of the problem with the drywall and a reduction of incomc. The representative on the phone said what is Chinese Drywall? As I tried to explain it to her she said she jnst Google'd it and couldn't believe what she was reading! "What a devastating position to find yonrselves in" she stated. She further said she did not see where we had submitted any of the docnmentation to them regarding the drywall and then their attorney spoke up and said "you have to have it, I have it in my packet that yon all sent to me"! Finally she said she was in no position to make a decision, that she felt that Pen Air Credit Union had to make a decision on the modification. By this time the mediator was totally frustrated and called the meeting adjourned citing that no decisions could be made because the appropriate parties were not present. He ordered the attorney to reschedule and have a representative from Pen Air attend the next mediation. That next mediation did not take place till mid November 2010. In attendance, a representative for Pen Air, the same attorney, my wife and I. The Pen Air representative started the meeting hy saying very kindly, "we had no idea about the drywall"! "We are a home town lending institution and are in the business of keeping people in their home." We are not a construction company in the business of renovating homes ". . . the Board has reviewed your file and we are going to do what ever we can to keep you in your home." Basically what she was saying is we don't want to be stuck with that toxic home! If you people are stupid enough to stay in it and pay us to do it we will take your money! The meeting was adjourned and we were told they would work up the figures and re-schedule the meeting. The next mediation was the end of November 2010. By this time I had found work in my industry with another company. It was not the salary I had once had, but it was not in the poverty level of unemployment either. It put us in a position to really be able to give a firm figure to the bank on what we could try and modify to. The modification terms proposed by the bank were to take onr interest rate down from 6 percent to 2 percent for the next 5 years stating they hoped by that time the drywall litigation would be settled. That reduced our payment by about $1,100.00 per month. And they would do that by adding only $47,000.00 to our loan . . . great deal hnh?! Reluctant, my wife and I signed the note believing that certainly this issue would resolve, the economy would get back to normal and our dream life would go on.

Here we are 1 year after modification and not one step closer to getting the house repaired. Our drywall case is a bit uuique. I have uo builder to sue, I was the builder. The courts have ruled I cannot file this as a claim on my insurance company. I purchased my drywall from our local Port, Pate Stevedore. Just this month, we received a letter from our attorney telling us they have decided uot to sue Pate Stevedore for a number of reasons the most important being "they do not have the insurance or assets to pay a judgment in our favor." It was determined that our drywall manufacturer is Taishau Gypsum Co., Ltd. The letter we just received from our attorney stated, "we are continuing to pursue every avenue possible to bring that company (Taishan) to justice in the American court system but we face a number of obstacles, not the least of which is their challenge to jurisdictiou because they

do not have minimum contacts with our Nation. They further state this is a battle we will wage for some time in the court system and through political and other channels. *Wage for some time!* Nothing I have heard is encouraging to my wife and I. We don't have years to invest in this political battle. We cannot nnderstand our own government not stepping np to help us. My wife and I are doing everything possible to try and keep this house and not become another number in the mortgage crisis. *We are trying to keep up our end of the deal despite every obstacle we have faced.* Please we urge the government to step in and help us! When you look at the scheme of this drywall crisis the government gives away billions of dollars. There are just an estimated 10,000.00 homes effected by this drywall, just a drop in the bucket don't yon think? We should not have to suffer because our own government allowed China to import to us this defective product and as we all are aware of many, many more defective products. I thank yon for yonr time and enconrage yon all to help make this right for us.

Chinese Drywall and Cancer

I am an Engineer, Shipbuilder, Hnsband, and Father of 2. In 2006, my wife and I upgraded from a starter home to a beautiful, four-bedroom home in a family-oriented neighborhood. The home was sold by a repntable developer (East-West Partners) and built by a reputahle huilder (Orleans Homebuilders, based in Philadelphia).

In July of 2009, we initially suspected that we had Chinese Drywall after our 9th air-conditioner evaporator failure, and in September, our builder cut into our walls and confirmed it. In October 2009, an X-ray fluorescence evaluation confirmed all walls and ceilings on the second floor were Chinese Drywall, all ceilings on the first floor were Chinese Drywall, and about 25 percent of the walls on the first floor were Chinese Drywall. Our builder promised to stand by his work, and would commence remediation "after the holidays". After some stalling tactics in January and February of 2010, Orleans Homebuilders declared bankruptcy on March 1, 2010. We were on our own.

A contractor provided an estimate to repair the home, which, coupled with moving expenses approached $150,000. Both my wife and I rely on security clearances in our careers, so a foreclosure or bankruptcy was out of the question. Due to the nnknown health concerns at the time, we decided to self-remediate. In May, 2010, my wife and children moved in with local family, and I turned the children's attic playroom into a dormitory, and worked 42 hours per week on average over 5 months to remediate the home. Along with family and friends, we logged 2,930 hours and spent $59,000 to remove all drywall, clean thoroughly, and then replace all wiring, copper plnmbing, HVAC, insnlation, drywall, and trim. On October 22, Isle of Wight County conducted the final inspection, and the home remediation was complete.

Our first child was born in July 2006—one month after moving into the home. Between 2006 and 2010, there were respiratory issues in the children that did not raise mnch concern at the time, but in hindsight we now know the children's bonts with illnesses lasted much longer than normal. In addition, my wife was diagnosed with hypothyroidism while in the toxic home. The real health concerned appeared in 2011—almost a year after the remediation was completed.

In July of 2011, I was diagnosed with a 6cm mass on my right kidney. It was found by nltrasound, confirmed by CT Scan and MRI. No biopsy was condncted because even if the mass were not cancer, it could become so in the future, so given my age, my doctor recommended an open, partial nephrectomy (partial kidney removal). The surgery was conducted in August. While recovering in the Intensive Care Unit, my doctor informed me that the mass was Papillary Renal Cell Carcinoma—kidney cancer. My surgeon informed me that at 3cm, the cancer typically starts to spread. At 6cm, my cancer showed no signs of spread, and was classified as a Stage 1, Grade 2 cancer, and the surgery was declared "curative". I was lucky. I have monitoring and scans for the rest of my life, but the prognosis is good.

I have since learned that Papillary Renal Cell Carcinoma is a relatively rare form of kidney cancer, and 95 percent of those that are diagnosed with it have a family history. They are also at least in their 5th decade of life. I have no family history. I am not in my 5th decade of life. I am personally convinced that my cancer was the resnlt of exposure to toxic drywall. I cannot say whether it was the chronic exposure from 2006–2010, or the acute exposure during the self-remediation. I tend to think a 6cm mass wonld not have grown that quickly in the single year since the acute exposure, but there is little data available on the rate of growth of these cancers since these cancers are typically removed soon after detection.

Are there other people diagnosed with kidney disease with Chinese Drywall? Yes. Are there others with cancer—that remains to be seen. In the years to come, it will

take dedicated studies to identify the health connections and risks. I need to know for the sake and safety of my 3-and 5-year old children, what risks they have been exposed to, what scans they may need, and what health tests should be scheduled and when. The Victims need the U.S. Government to sponsor these studies.

OSHA and EPA have the best publicly available data on the health risks of Hydrogen Sulfide gas exposure, however dne to the nature of the responsibilities of those organizations, the data is focnsed on short term, high concentration exposure. There is little to no data, at least publicly available, on long-term, low concentration exposure. The CDC is performing a study relying on modeling a toxic home for personal exposure levels, and correlating available data to assess health impacts. Since there are no data on long term exposure, what conclusions can that study possibly draw?

From a consumer protection and public safety perspective, and as a victim of Chinese Drywall and Cancer Survivor, I call on the U.S. Senate to:

- Fund a University or Government Lab to conduct studies to assess the impacts of long-term, low coucentration exposure to Hydrogen Sulfide gas, and other Chinese Drywall off-gas products, on appropriate laboratory animals. These studies should supplement the studies CDC is already conducting.
- Fund a Health Organization to conduct a comprehensive epidemiologic study on not only respiratory issues, but potential long term issues on cognitive function, endocrine systems, renal (kidney) functiou, muscular-skeletal systems, liver fuuction, aud publish the results.
- Identify a Federal Government POC, by name, for collectiug health information on CDW—be it CDC, HHS, CSPS, or other; and publicize it ou government websites. Make CDW Health Impacts and studies the responsibility of au ageucy, and fund it.

Thank you very much for allowing me to present my family's testimony today. We are a family of three: myself, my husband, and our 12 year old son. We own a home in a master planned community in Hillsborough County Florida.

Do you know how my family discovered our toxic drywall? I became sick after living in our new home for just 2 years. I visited internists, a pulmonologist, and an infectious disease doctor. No one conld tell me what was making me so sick. My patient files said amongst other things, "fever of unknown origin." I had multiple x-rays taken, ultrasounds (tbey feared it was my heart), CT scans, and I even allowed them to inject me with radioactive material to do gallium scans because they feared it might be cancer. I have never had asthma. Now I spend most days thankful if I can run 2 miles without stopping to gasp for air. Singulair doesn't work. Advair doesn't work. I have few days without chronic sinnsitis. I have had dizzy spells, hallucinations, nausea, diarrhea and vomiting for days because I have been in the house too long. I have lost quite a bit of hair. I am the worst off because I spend the most time home . . . until now. Our son has become sick. He now has the same symptoms: diarrhea, chronic sinusitis, dizziness, nosebleeds, and breathing trouble. I asked him what he would like to say to you. He sadly replied, "Tell them that now I know how you feel." Far more troubling, his doctor just tested him for celiac disease and hypothyroidism to determine why he is vitamin D deficient. Celiac disease and hypothyroidism do not run in our family. He is also having vision trouble while in the house—it is a red/green color distortion.

We have been fighting our builder for years now. We have been through multiple home testings and had multiple lawyers. We are furious that homeowners like ourselves are being left to bear the burden of this financial disaster while big business is let off the hook. *We* are the *victims*. We did not purchase our homes knowing they were full of toxic materials which destroy our health and render our properties worthless. Our insurance companies have left us high and dry. The builders are escaping culpability. Their insurance companies are being absolved of responsibility. We receive no assistance from our government and to add insult to injury, all onr health complaints have been ignored to date. This will be another asbestos disaster. We are all guinea pigs who will be forced to bear years of health problems and more litigation down the road when we have cancer and mesothelioma. I am disgusted and feel we have been sacrificed so that every corporation making profits from these toxic materials can continue to rake in billions. These products are dangerous and the truth must come out. Their use must be discontinued and there must be a cooperative assistance from builders, suppliers, and insurers to fix our homes and give us safe places to live. This is America. Why aren't we looking out for our own?

We own this home. We invested every cent we had into it. We face financial ruin if we walk away. We face risking our lives if we stay. Are either of these choices fair when we bought this home before the words, "toxic drywall" hit the airwaves?

Thank you.

November 29, 2011

Hon. MARK WARNER,
United States Senator,
Washington DC.

Dear Senator Warner:

We live in Williamsburg, VA, and are a family that has been devastated with owning two homes that are contaminated with Chinese Drywall (CDW). Chinese Drywall has not only destroyed copper & silver in our homes; it has also devastated our families' health and financial well being! My parents moved into one home and my father-in-law into the other home (both in their 80s). In the first year there were many mechanical issues with the thermostats and air conditioning coils in both of their homes.

My father-in-law died unexpectedly (7/2008) only two years after moving unknowingly into a CDW contaminated home (Respiratory Failure). *Our family will never be convinced that the CDW did not potentiate his death?* Imagine our guilt for not knowing what was causing his extreme weakness. My father-in-law experienced weakness of his legs and was falling which, was not normal for him. He was an active healthy man until unknowingly moving into a tainted CDW home. My father-in-law left the home to go into in-patient rehabilitation and improved tremendously only to revert back to his CDW health related issues upon returning to his toxic CDW home. If we had only known he was living in a toxic environment we would have moved him out and saved his life. My mother also experienced some of the symptoms. As soon as we became aware of the CDW we moved my parents out of their tainted home!

According to news articles, the primary reports of deaths to the Consumer Product Safety Commission (CPSC) were of the elderly or youths with medical problems. This should not be a surprise to the CPSC! If an adverse reaction would be experienced the above mentioned populations are the ones you would expect to see the most severe reactions. You can *not* convince me that the toxic drywall's hydrogen sulfide off gas, which is both an irritant and a chemical asphyxiant, does not affect the body's ability to use oxygen; especially in the elderly. This part of the population spends more time in their homes and therefore has more exposure to the toxins than people who leave their home for work everyday. This does not mean we should *accept* that their lives were cut short by this toxic product.

How can this situation not be considered a disaster? How can Venture Snpply and *their* insurance company not be responsible for not following the "International Safety Standards"? Why do companies pay thousands of dollars for insurance protection and yet have no coverage when needed? We homeowners did not cause this problem and should not be the one's left holding the bag!

When will the U.S. Government hold China responsible for the atrocities it has bestowed upon tens of thousands of innocent American families!?

House built 2001—Florida

My husband and I built our "dream retirement home" in Delray Beach, Florida in December 2001. We replaced the air conditioner coils in 2002 and 2003. In September 2004 we purchased a new air conditioner rather than replace the coils again. We replaced the coils again in 2007 and 2008 as well as replacing the heating element and fan. We replaced the light fixtures in our bathroom because of pitting, replaced mirrors due to black spots, have black "copper" pipes under the sink as well as black wires in back of the refrigerator and inside the electrical outlets. In April 2009 we hired an attorney and had the house tested. They found drywall that said "Made in China" and the air in the house was found to be unhealthy. My husband and I suffer from burning eyes, runny noses, insomnia, fatigue, coughs, headaches, memory loss, etc. We pray the house will be remediated. We are senior citizens living on a fixed income and cannot afford to move out of this toxic environment. We hope to see a positive outcome from this toxic disaster that will make us "whole" again in our lifetime.

We have just purchased a third air conditioner in 2011.

Please help us.

Forgot to tell you we don't have a mortgage on our home. Being seniors we cannot afford to move out. We need money to gut the house and rebuild.

Thanks.

Date: December 1, 2011

In August 2010, it was discovered that 75 percent of my new home (built 2006) was contaminated with toxic Chinese drywall. The drywall has caused several major appliance failures including new refrigerator, central air and heat units (over 10 services/repairs since 2007), fireplace, electrical wiring problems throughout home, and corrosion of bathroom fixtures. Currently, I have no air conditioning or heat because units are not properly working and I have had two minor electrical fires (refrigerator and door bell transmitter). The odor has become so unbearable to the point that I have been forced to move my family to rental property. The Hampton City Assessor has deemed my home uninhabitable and has decreased the building value from $227,000 to $100. I have attempted a short sale to a cash investor but my mortgage lender has denied due to low offer. Because I cannot afford to pay mortgage and rent, I am currently facing foreclosure.

Ms. Mbabazi,

For the record, I want to express my appreciation for the work done by this committee thus far on this growing issue of contaminated drywall. My family, here in Alahama, has been affected by this complicated disaster. I will not take np your time with our recent history of hardship and surveillance, only inform the committee that my family is stronger for it. Our value is here and available for any assistance we may provide the committee as it examines solutions. Please feel free to contact me anytime.

My family, here in Alabama, has been affected by this complicated disaster. I will not take up your time with our recent history of hardship and snrveillance, only inform the committee that any family is stronger for it.

Our value is here and available for any assistance we may provide the committee as it examines solutions.

December 2011

Dear U.S. Senate Committee of Commerce, Science, and Transportation Members:

Our American dream has become an American nightmare. My wife and I are writing to express our imperative plea for legislative assistance regarding families effected by Chinese drywall. The CPSC and CDC continue to ignore long term health effects of people living in this toxic environment. No long term health studies have been released. *Please read this letter with vigilance and understand there are several people experiencing long term health effects of Chinese drywall.* In September 2006 we built a new home in the beautiful Ross Bridge community where our children would have access to wooded paths, commnnity gatherings, parks, and a wonderful school system. We entered a lawsuit against the builder within 18—20 months after moving in due to numerous electrical problems including breakers tripping on a weekly/daily basis, Christmas lights catching fire, new bnlbs blowing out frequently, failing A/C units requiring multiple repairs, appliance replacements (refrigerator, washing machine, three coffee makers, waffle irons, hairdryers and roller sets, etc.), and foundation issues. Soon after entering the lawsuit we discovered many of these problems were associated with Knauf Chinese drywall that was installed in our home. Within six months of living in the home health issues developed within all family members, but we were not aware these issnes were related to the toxic air we were breathing.

In August 2010, eight months after learning we were living in Chinese drywall, we made a decision to move into an apartment to avoid continued exposure to the toxicity of hydrogen sulfide that was taking a toll on our children's health. Despite the enormous financial strain this created, the health of our children was paramount under current circumstances. Other families in our lawsuit have also moved out prior to litigation resolution to protect the health of their children. You may have read initial reports regarding the health effects associated with people living in Chinese drywall, such as nose bleeds, respiratory and siuns infections, skin rashes, itchy eyes, but the CDC is releasing new information regularly that is revealing other abstract health concerns that may not be diagnosed and treated immediately. *Neurological, circulatory, and decreased bone growth are surfacing that we have per-*

sonally experienced. No one can confirm the long-term health effects that may transpire from this tragic event. We feel compelled to share our health concerns that have developed since living in our home. It may contribute to your knowledge of the concern many families in Alabama are facing.

Health Concerns of [redacted] (age 44)

Chronic Fatigue Syndrome (aching joints; no energy; depression; loss of concentration; memory loss)

Mycoplasma (320+ considered clinically significant—two lab reports reveal David's count at 1427 and

1913—well beyond clinically significant—doctors cannot determine cause for extremely high numbers)

Irritated Eyes

MRSA/staph infections

Skin rashes

Respiratory infections

Paranoia

Severe Insomnia

Depression

Significant Stontium/Lead levels present in blood tests 1.5 years after moving out of house!

Health Concerns of Spouse, [redacted] (age 43)

Osteoarthritis and Rheumatoid Arthritis

Joint pain

Fatigue and loss of concentration

Insomnia and depression

Vitamin D deficiency

Meneire's disease

Significant Stontium/Lead levels present in blood tests 1.5 years after moving out of house!

Health Concerns of Son, [redacted] (age 12)

Multiple antibiotic prescriptions for respiratory infections

Inhaler for asthma

Sleep problems

Anxiety

Major concern: 55 percentile drop in height and weight in TWO YEARS—Previously averaged 80–100 percentile

Significant Stontium/Lead levels present in blood tests 1.5 years after moving out of house!

Appetite loss

Health Concerns of Daughter, [redacted] (age 13)

Auto-immune diseases—celiac

Development of seizures

Concentration problems

Vitamin D Deficiency

Swollen lymph nodes

Multiple antibiotic prescriptions for respiratory infections (three rounds of antibiotics from April–June 2010)

35 percentile drop in height in TWO YEARS—Previously averaged between 90–100 percentile

There are other health issues, but we wanted to highlight those of greatest concern. *Some* of the above concerns have improved since moving out in August 2010, but our daughter continues to struggle with clinically significant auto-immune and Vitamin D deficiencies despite substantial changes in our regular diet. The physical development and decreased bone growth implications are unknown. Our son continues to be well below his projected height despite the fact we have been out of the home a year and half. Some research states strontium in the drywall replaces calcium. Bone and lung cancer are serious concerns based on preliminary research

released from toxicology experts conducting more in-depth research. Other Chinese drywall neighbors of onrs have children who have also experienced many of the above concerns. It is too ironic for this to be occurring with several children in the same neighborhood with normal pediatric history prior to living in CDW. One week prior to moving out of our home, our son had a friend to spend the night who had a history of asthma. The child had not had an asthmatic attack in fonr years, but went to the Emergency Room the next day after experiencing the worst attack in his life. Chronic fatigue is still an issne with David who even recently continues to exhibit clinically significant mycoplasma lab resnlts. *The CDC and CPSC are NOT taking this issue seriously as they have not looked into the particulate matter or heavy metals that have a greater impact on long term health.* Please read the toxicology report we will attach for further scientific research being conducted in one of the hardest hit areas, post Hurricane Katrina.

We share this information so you may have a personal acconnt of the mnltiple financial and health matters that are effecting victims of Chinese drywall. Your leadership in assisting families in the same situation is greatly appreciated. We were debating the possibility of filing for mortgage modification through a forbearance, but have concerns of how this will effect our credit that has been snperior to this point. Currently, our mortgage holder will only allow three months forbearance bnt will make us pay postponed payments at the end of three months, with additional fees attached. This is disheartening when we spent three years paying hundreds of additional dollars toward the principal of our mortgage, only to pay the loan off faster and save for our children's college edncation. We are forced to continue payment of a mortgage, rent, and utilities at both locations since onr homeowner's insurance requires power and utilities to be turned on for coverage. We have spent close to $50,000 of onr children's college savings and personal savings to avoid exposing our children to the chronic health issues experienced! God blessed us with the financial means to move out sooner than later, but this is not the case for many other families in our sitnation.

We need all politicians to demand additional involvement and corrective action from The Department of Homeland Security, FEMA, mortgage industry, and other Federal agencies to provide assistance to families devastated by the import of Chinese drywall and other toxic imports. Many doctors are "scratching their heads" as to how to treat families who are experiencing many of the long term exposure symptoms that are now surfacing. China has continned to import a multitude of toxic products that are not only killing our citizens, but effecting our economy by forcing Americans to buy their cheap products. *We need updates on health studies immediately. Time is running out!* A neighbor in his 50s recently died of lung disease. . .CDW?

Please help us!!!! Demand more information from other governmental agencies. We voted for you to represent the people. People are dying from this and everyone wants to turn their head! If you would like additional information, please e-mail us. Our community is arranging town hall meetings, and we encourage you to attend.

To Whom It May Concern:

I purchased my brand new home on December 15, 2006. I took one month to make the home my own. Shortly after moving in I began to have nnmerous electrical problems in my home. I have spent close to $70,000 in to this home.

The first things I began to notice in my home were numerous cable television problems. Cox Cable had been to my home around 15–20 times with in a 12 month period. I lost many DVR boxes and had television reception problems. Dnring the first 12 months I was in the home, I lost an ice maker in my refrigerator, dish washer, and many other small appliances. In the meantime, I also lost three 50" Plasma Televisions.

I thought my house was haunted and actually became the joke of my friends. They would routinely say that my home was built on someone's grave. In the summer of 2007 I lost my air conditioner coils. I paid $750.00 to have this repaired because the company refused to stand behind the installation. In the summer of 2008 I lost the same air conditioning coils again. At this point, I am really wondering what I have done to deserve all of this stress. Then in August of 2009, I was getting off work around 4pm. My neighbor comes over and asks if I was having problems with my home. I had never met the gentleman and he was very npset. After a long chat he and I had shared many similar stories. He and I decided that we needed to figure out what was wrong with our homes.

That night, I was determined to get to the bottom of this issue. I posted on facebook that my home was cursed. A friend read my post and said I might have

something that a friend of his has called Chinese Drywall. He gave me the number to his friend, and I called him. After a long chat with him on the phone I thought I finally might be on to something. I attended a meeting in Norfolk, Virginia about Chinese Drywall. This was when reality set in.

I thought to myself, this should be easy go to court and get this house fixed. Well after two years I am no closer to having resolution to this matter. I have not lived in the home for a long time now, as I am afraid to be in the house.

Our government has not done anything to stand up for it's tax paying residents against China, the bnilders, or the insurance indnstry to help us. I cannot even begin to describe the mental anguish this has caused in my life. I have always paid my bills, taken care of myself, and paid my taxes. I am almost 40 years old and wonder if I will ever be able to recover from such a devastating man made catastrophe. I have been denied homeowners insurance, a claim against my builders insurance. Why should I be left holding the bag for something I had no part of? I cannot understand why our government is not here to help us. After all, they are the ones that negotiate trade deals with foreign countries. Not me!! Everyone involved in the construction of my home should be forced to step up to the plate, and right the wrongs they have caused. I am afraid by the time our government does something, I will have already lost this home!!

UPDATE: I lost my home yesterday on November 29, 2011

Regards

Natasha,

Hi I was told to write you about health concerns with the Chinese Drywall. We did an addition to our home in 2006 and come to find out it was Chinese Drywall. In May of this year our then eight year old son suddenly developed a severe headache. I gave him tylenol and he laid down then I went to check on him and he couldn't pick his head up or turn his head. I took him to Dr. [redacted], when we got out of car he was having trouble walking on his own. The Dr. sent us to E.R. to check for meningitis. He had a spinal tap and did not have it, so they gave him strong anitbotics and sent home. His white blood level was elevated high. He slept most of the next day (Thnrs.) then on Fri. I went to wake him up and he could not get np. I helped him sit up on the bed and he cried when I moved him. He conld not stand up and said his legs felt weird and would not work. I took him back to Dr. as he cried all the way there. We had to put him in a wheel chair to take him in and his legs would not work. He also was having a severe headache. The Dr. could not get a reflex on his legs. He finally calmed down after about 4 or 5 hours and was finally able to walk. The Dr. wanted us to go have lunch and come back for some of blood results. We went back and he was able to walk in and the Dr. and nurses were all relieved. The blood tests did not show anything so he wauted us to follow up in a few days with a Neurologist.

We left and as we got close to our car he said "mom my legs feel weird again" and they gave out. I caught him and we put him in the car where he started screaming with his head again. Took him back into the Dr. and he sent ns to USA Women's and Childrens Hospital where he spent 3 days. Doctors could not pin point anything and we did say something about the drywall and the Dr. said we were the second family that week to ask about drywall problems. They sent us to another Neurologist and Rheumatologist and he had MRI's, nerve test, and EEG done and found nothing. The doctors have all been baffled.

Long story short, he had about 2 or 3 episodes a week for 4 months and after everyone asking if we thought the drywall could have anything to do with it we paid someone to tear out the drywall out of the addition and have been airing the room ont and blocked off from rest of the home. His episodes after 4 months have basically stopped now.

Also another thing I really wonder about is, my four year was born with a birth defect of the eye. It did not develop in the back and she had Cataract, Detached Retina, a mass behind the eye and a distorted optic nerve. She was a full term baby and the Doctors were baffled that she was not a premie with all those troubles. I was pregnant with her when we did the addition and always in that room. She almost lost her eye and get a prosthetic. She is now blind in that eye. This is just 2 things that concern me about being linked to the Drywall. Anyway I have a journal of the stuff with my sons' problems. I am curious if anyone else has had any of these health problems associated with this drywall.

Thank you for your time and hard work.

December 5, 2011

Ladies and Gentlemen,

I just watched footage from a hearing you had on this very topic on May 21, 2009. How completely sad that it is over 2 years later and you are having another hearing on December 6, 2011 "Coutamiuated Drywall: Examining the Current Health, Housing and Product Safety Issues Facing Homeowners". Nothing seems to have changed in my mind for the Homeowners. Have you been able to sleep comfortably in your homes since 2009? My family has not. Have you been hounded by your bank, ignored and dismissed by your insurance agency? My family has. Through no fault of your own have you been pushed to the brink or over it financially? My family has. Have any of you lost a beloved pet, because the air in his home was toxic? My family has. The current "issues" are the same "issues" we had 2 years ago or 5 years ago. The victims of this disaster need you to examine how to help us now, right now.

My testimony is: my home has toxic Taishan Chinese Drywall. All the metal in my home is/was corroded, pitted and black. My family and I had nose bleeds, respiratory problems, lethargy, headaches, skin rashes and situatioual asthma. We fled our home to a rental, rather than risk our health any longer. Our homeowners insurance denied our claim and then non-renewed us. I reported to every local, state and Federal agency. The only help came from Lee County Property Appraiser; they valued our home at $0. We joined the lawsuit in Louisiana. My bank, Chase, who owns stakes in Taishan drywall and who has been bailed out by our government quickly, after much harassment of us, finally gave us a special forbearance. But we can only have 2 choices, special forbearance or short sale for 6 months. They are waiting to see how this all shakes out in terms of money for them. I cannot take the Federal tax exemption because I have not remediated. There is stress involved in every aspect of this disaster, even down to little things like getting out of a cable contract prematurely because your house is rotting their equipment, because no one cares if you have toxic drywall or not. This is only a brief synopsis of the living hell we victims endure on a daily basis.

Our country gives billions of dollars in aid to other countries, we are building houses in Haiti and meanwhile there are over 10,000 families in the U.S. suffering because our government allowed this toxic product into this country and our government is ignoring this crisis. Please end this madness, now.

Toxic Home: Cape Coral, FL built 2006

Addendum:

Please do not think that yesterday's settlement news from KPT has been the magic answer for the Victims of Toxic Drywall. Thousands of us still have Taishan drywall or American drywall. Judge Fallon is going to Hong Kong next month for Chinese depositions and the American drywall victims do not go to trial until May!

As for the science part of this drywall fiasco, I would like to add my thoughts. My home has been vacant since approximately October 2009, with no air conditioning on, in SW Florida. There is no mold growing and there are no bugs alive in it. I have seen pictnres from other victims of dead rats. Nothing can live in these toxic conditions.

I personally think some of the science must have to do with drywall eating bacteria, bnt I am not a scientist.

I am a homeowner, who has paid her taxes her whole life. I have been blindsided by Chinese Drywall that was allowed into this country. I have been abandoned by almost all government entities. Do you know what it felt like to watch the President of the United States wine and dine the President of China? Why has he not uttered the words "Chinese Drywall" yet? Why hasn't he surveyed the damage this disaster has caused, like he does with other disasters? Ask him for me please.

I would also like to address the Federal tax break again. It is real simple. I have documented toxic drywall, I can have a catastrophic loss deduction. Done. Not the convoluted law we have now, that only if it is remediated silliness. That is what I would like to see.

I implore you to help the Victims of this disaster now and do not allow toxic imports in again, for my children's sake.

Do not drop the ball. We Victims need help!

Thank you.

We were so happy to move to our final home on November 10, 2006. This was to be our home that would take us through our retirement years. We are now living a nightmare. We discovered in July 2009 that the home we purchased was built with Chinese drywall. The Chinese drywall was causing many physical problems in

the home and for our family personally. All three of us have had physical ailments as a result of having Chinese drywall in the home. Seven months after living in the home, our golden retriever, Kramer, died of kidney failure. Our second dog, Bailey, died in December 2008 of respiratory issues.

Now we know why all of these things happened. Chinese drywall!

We purchased and moved into our home in November 2006. After living in the house for seven months, we began to experience problems with the air conditioning. As of August 2009, we have replaced six to seven coils in two AC units. We have had major repairs to our flat screen TV, computer hard drives and monitors that crashed, small appliances that failed, a dryer that stopped working due to circuit board failure, and electrical outlets that had to be replaced. Physically, we have experienced unexplained rashes, respiratory problems, headaches, fatigue, insomnia, chronic coughs, and muscle pain. The smell in the house is in our clothes, furuiture, mattresses, linens, and silver jewelry and flatware have turned black and are unable to be cleaned. When we opened our windows, our neighbor complained of the smell that came from our home. We have documentation to prove all of these issues.

Upou learning of the problem, the stress has become unbearable. We moved out of our home immediately in August 2009, leaving our belongings behind, and filed a lawsuit becanse we had no other recourse since the builder and insurance companies were of no help. We are thankful that our AC repairman was the one that discovered the cause of our problems. We are depressed and saddened at the current statns of onr life. We worry about our two other dogs that lived in the house all day long. The outcome of their health and our own is yet to be known. If the drywall is corroding copper and other metals within the home, what is it doing to our bodies?

We are cnrrently living in a rental. Onr home was sold in a short sale in November 2010. We lost $400,000 in equity. This was a major investment for ns and throngh no fanlt of onr own, we lost it all inclnding the home we loved. Selling the home was in our best interest and that of the mortgage company. Hanging on to a home yon can't live in with a forbearance on your mortgage, only keeps increasing yonr debt to the mortgage company. The increasing debt has caused many families to file bankrnptcy. We are glad that we were able to sell. Had we foreclosed, the mortgage company would have been stuck with a home in poor, nninhabitable condition. The short sale has caused our credit to be hit and it will be affected for seven years. Families that are dealing this will be held prisoners by their credit. They will not be able to purchase new homes or buy cars at a decent interest rate, if at all. We have always maintained excellent credit, and now because of Chinese drywall that has also been damaged. We are not deadbeats that have not managed onr finances. We attempted to get a new loan and were told by a bank aud mortgage company to come back in three years. They did not even want to deal with ns. Our local commnnity bank is giving ns an adjnstable rate mortgage at 5.5 percent that they are holding on their beoks since it cannot be sold. This is not a bad rate, but rates for conventional loans are mnch lower. We will have to refinance later to get a conventional loan when our credit rates improve. Another financial burden! New rnles for the underwriting of mortgages and loans need to be updated to make provisions for homeowners that were victims of Chinese drywall. Chinese drywall is an "extennating circumstance", yet there is nothing written about that so loans can be given. This is something that the government can do.

We are victims of Chinese drywall. This product was allowed in our country. Please work on safety regulations for imports and make foreign countries abide by our regulations.

We will continue to move ahead and work with local, state, and national officials to rectify our situation and the situation that countless other hard working, tax paying citizens are facing. As of today, very little if anything has been done to help American citizens in this situation. We received two forbearances on our mortgage prior to selling the home in a short sale . . . this is only a band aid on a much larger problem. We did not cause this situation and we need help from our government to assist and ensure safety standards for all Americans. We have contacted the White House on uumerous occasious and have uot heard one thiug back regarding our situation. We run to foreign soil at the drop of a hat. Why can't our own country do something to help its own citizens? You have done nothing! We are ashamed to be citizens of a couutry that does not come to the aid of those that do deserve it. We will tell you that each and every family that we have met that has Chinese drywall are hardworking American citizens that pay their taxes and contribute to society. We deserve some help as well. Our government is a travesty! Actions speak louder than words and we are tired of the lip service we have received. Wake up and take action! Help the hard working American citizens and their families that have beeu victims of Chiuese drywall.

December 8, 2011

ADDENDUM TO TESTIMONY

I attended the U.S. Senate Committee on Commerce, Science, and Transportation on December 6, 2011 in the Russell Senate Building. I would like to add my comments regarding the health aspects and credit issnes in the form of an addendum to my testimony turned in prior to the hearing.

It was noted by the CPSC and the CDC that there is no specific canse for concern regarding health issues and toxic contaminated drywall as a result of their stndies. How do we know what significant levels are for exposnre to these gases from the drywall? It is very possible that jnst an average nnmber was nsed based on the studies. In their studies, did they use a significant number of homes where physical complaints to this exposure were reported or was it just a random sampling? Every home may have been different based on the geographic location of the home.

Our family had two very healthy dogs nntil we moved into the honse with Chinese drywall. The dogs are in the home 24 hours a day for the most part and stayed by the front door on the lower level jnst waiting for us to come home. The gases are heavier ou the lower levels as we now know. Our home had three levels. Seven months after moving in, our golden retriever developed issues with his kidneys and could not recover from them. For a week to 10 days, he was at the vet for treatment. My husband, [redacted] also had some issues with his kidneys that required treatment. Our standard poodle had a skin reaction that caused her nose to become crusty, peel and then crust up again. This was ongoing the whole time we lived in the house. She died two years after living in this house due to respiratory issues. My husband had a severe rash that could not be explained by the doctor. He called it "contact dermatitis" and the doctor told him something was irritating his skin. No changes were made to detergent or anything else that could irritate his skin. It looked like he had chemical burns all over the trunk of his body, up his neck, and onto the scalp. Nothing made it go away. Our daughter, who was away at school, would break out in a rash on her lower torso, and strangely enough when she went back to school, it would disappear. This only happened to her in this house. We lived in both houses when she was in college. I had a chronic cough, headaches, and fatigue (and I am a high energy person that used every minnte of every day—not in this house). About three months after moving out of the toxic home, our physical symptoms went away. We wonder; if the gases corrode metal pipes, what do these gases do to the inside of our bodies? Only time will tell. What families have reported is enough to know that you can't live in these houses. I felt the need to explain in more detail the physical problems that we experienced.

Congress also needs to address the financial situation that has been created by the Chinese drywall situation. Forbearances were only a Band-Aid solution for a much larger and longer lasting problem. Forbearances allowed us to move out of onr homes and rent something. Forbearances were short-lived. Banks are not going to continue to give them to you and your debt keeps rising for a house that is uninhabitable through no fault of your own. I addressed this in more detail in my original testimony submitted prior to the hearing. It has come to my attention that if the credit is able to be restored for some families, that it may not be retroactive. Please do not do something for "some of us" and not all of us. We had our short sale a year ago. We have no idea at this time how long this will affect our credit. According to the info I received from the bank, it will be seven years unless it is an extenuating circumstance. I have yet to really get a clear answer on "who" makes that call. Who is going to tell us that we did have an extenuating circumstance? When will we be able to get a conventional loan? Don't penalize good, hardworking Americans that were victims of Chinese drywall because they could see that nothing was going to be happening anytime soon. We had to act responsibly regarding our finances, as we always have our entire lives.

When you think about it in our situation, we dealt with the problems caused by the house with Chinese drywall for two and a half years. We had the physical problems both with the honse and personally. These resulted in numerous expenses for items that were not covered by warranties—appliances, electronics, AC coils, vet bills, and personal medical bills. Insurance did not cover any of this. And now, we have been out of our house for two and a half years. All in all, we have been dealing with this nightmare for *five years*. We need help now and not years later. We should not be penalized. We are well aware that not every individual that had Chinese drywall had the same credit ratings. You can make some decisions that would restore our credit back to what it was prior to having had to have a foreclosure, a short sale, or a bankruptcy. Make decisions that will help all of us—not some of

us. Please do not form another committee to investigate. Take action now and please do it as soon as you can.

Think about it this way. It is your house and your family. What would you want done to help you recover?

To Whom It May Concern:

On November 1, 2010, we bought our dream home at [redacted]. We bought this home thru a Foreclosure. We hired a Chinese Drywall "expert" to examine our home to determine whether or not it had defected drywall. The report came back negative so we proceeded to purchase the home. Within days, we experienced unusual health problems. My 8 yr old (7 then) developed Hives from his groin area to his knees. He had never had Hives before. My 5 yr old (then 4) developed upper respiratory problems for which he was put on an inhaler. He had never been put on an inhaler before. My wife developed daily Migraines. Now, she gets Migraines on average 1 migraine every month. Always around her menstrual cycle or if a large weather front comes thru. I have known my wife for 18 years and never has she had more than 2 migraines in a month and this was DAILY migraines. My 2 yr old (1 then) developed an upper respiratory infection and her first ear infection. She has not had a respiratory or ear infection since we moved out over a year ago. Personally, I developed heavy hreathing. It was like someone was standing on my lungs is the only way I know how to explain it. Even with all these health problems, I first attributed them to the "stress of the move". However, after about 3 weeks of living at [redacted, we received a letter from Doyle law firm stating they had evidence that over 450 sheets of Knauf Drywall had been invoiced to our house back when it was originally built in 2007. After almost throwing the letter away (remember the part we had a Chinese drywall Inspection done) I decided to call Jimmy Doyle. He came out to our house the following day and within 10 minutes had located an entire area with Knauf "Made In China" drywall. I contacted our pediatrician and informed her of this discovery. She advised us to vacate the premises immediately. So, after living in our new home for about 3½ weeks, we moved out of the house that night into my Mother-In-Law. To put it lightly, it has been HELL for our entire family since the discovery of the Knauf drywall. On a good note, all of onr symptoms went away after a few days of being moved out of [redacted]. However, I do not need to wait for tests to determine if this will cause very serious health problems over long exposure. I know first hand what it does to your body in about 3 weeks, so common sense tells you it will only get worse with long tern exposure.

We are in the class action lawsuit against Knauf. It has been VERY slow moving. However, at least until now, onr bank, Regions, (who sold our mortgage to Freddie Mac after I told them of the drywall problem) has issued a forbearance on the loan. We cannot afford paying a mortgage payment and rent payment, nor should it be expected of us. We also have a lawsuit against Griffith Home Analysis (the supposed "Chinese Drywall Expert). I hope this e-mail helps, I really can't stress enough the emotional strain we have been under. Please feel free to e-mail me back with any questions you may have.

Thank you for any help you can provide.

Chinese/American Defective Drywall

I am a Disabled Veteran who purchased a new home in 2007. My home was built in 2006, and contains United Gypsum. After living in our home for 39 months, and 6 hospital visits, with two additional visits post-moving, we are still waiting for help from someone!

I listened to the Commerce, Science, and Transportation Subcommittee Hearing on Drywall recently by videocast. I am quite dismayed by some of the answers that were given, especially by Mr. Cowen in his testimony before your committee. I believe that I may answer some of the questions that you were looking for.

Drywall Differences

What most people don't seem to comprehend is that there are similarities between the true Chinese Drywall, and the American Drywall, hut there are vast differences also. The true Chinese drywall that is marked (ex: Taishaun, Knauf, China, or others) turns everything black quickly, you normally lose you're A/C coil qnickly, and most of the time there will be a smell such as rotten eggs. At least with these signs people can get out of their homes much quicker.

But with the American Drywall such as mine, as I only have United States Gypsum, we had A/C issues right from the start. We started feeling sick about 6 months

in, and other things happened that were unexplainable. The lights would flicker, we started losing small appliances, and at times we thought we smelled something.

Then we lost our electric kitchen stove, and then the water heater went, and my wife started having kidney issues. Being a Disabled Veteran with an already compromised immune system, I started having additional breathing issues. This was followed by kidney problems also just like my wife had. Then I had blood pressure problems for the first time, followed by heart problems.

Now over 4 years later we have discovered that it took our home with American Drywall about 2–2½–3 years to become fully evolved. It seemed to evolve and cook more and more throughout this time period. You could notice the progression, if you inspected the house about every 3–4 months. You could see the changes in the copper wiring, and the odor increased significantly. In the American Drywall homes it comes across as a sweet-sickly, chemical smell, and you can taste it on your lips and tongue. I and my wife, (but more myself) have become so sensitive after living in this for so long that when we cross the threshold of a door we can tell if that home or building has bad drywall in it. In some cases you do not even have to make entrance, as you can smell it coming from the soffit under the eves of the house.

Commercial Exposure and Food Products

I am very concerned as in this past year we have discovered many commercial businesses that have bad drywall. I have tried talking to the Managers, but most of them usually think that I am crazy, or have came back later and stated that they checked and do not have any problems. I am in the process of sending a letter to the Health Department of Florida listing the businesses I have observed bad drywall in.

My biggest concern is the food stores with the meats and open exposed goods. Also the gases that permeate the cardboard boxes. We have discovered stores from Estero to Sarasota, Florida. In Estero alone there are in a 5 mile radius 4 Publixs', 2 Super targets, 1 Sweetbay grocery stores that are infected. Then there are 2 extremely large shopping malls that were built during this timeframe,and we have discovered some of these businesses have bad drywall.

Residential and Real Estate Dealings

We moved out of our home in the middle of October 2010, and moved about an hour South to Estero, Florida in a home that I knew was free from any bad drywall. Prior to our first year expiring we started looking for a place to rent, back in the area where our home is located.

We were shocked as we searched for a place to live, finding mainly homes that were exposed to bad drywall just like our own home. The smells were identical to our own. What was even more frightening was the fact that some of the homeowners and Realtors, knew that the homes contained bad drywall, or that at least there was a problem. Others were in denial, and even after I talked to them trying to educate them, I also told them some websites to assist them in learning more about the problems, many of them didn't care and still rented or sold the homes to unsuspecting people. In a 3 month period we encountered over 50 homes, as well as some Real Estate offices that were contaminated.

Foreign Drywall

One of your committee members inquired at the hearing if anyone knew of any foreign entities that had bad drywall. I wanted to shout through the webcast at that time because my wife was back home visiting her mother in Yalta, Ukraine. My mother-in-law's apartment is on the 1st floor, and constructed of all concrete inside. About 1 year ago she had some new windows and interior doors replaced. In the bedroom my wife grew up in they installed a new wooden door, and they had to add some drywall around the door after framing. This was the only drywall in the entire apartment and it was Knauf brand. When my wife first arrived at her mothers, as she entered the front door she smelled the drywall, as stated before she also had become quite sensitive to the odor.

Drywall Time Frames

In our search for a place to live we encountered mostly homes that were built in the years of 2004—2006. But we did find homes that were constructed in different areas, by different builders, in 2008 and also in 2010. We also found many older home when we changed our search requirements, that had been remodeled and contained contaminated drywall.

Builders, Suppliers and Installers Knowledge

As a homeowner and also a Victim of this Disaster, I am enraged that many of the builders, suppliers, and installers were aware of the drywall problems back in

the year "2006". When the judge opened the Settlement Agreement in the Miami trial, that was made between Knauf and Banner Supply, after reading the documents it made me sick.

If these facts had been revealed to the public, I don't think that many of us homeowners who are sick and suffering, would be in the position right now that we are in!

Conclusion

My wife and I are still sick, with an unknown future as to our medical health. We are out Thousands of Dollars, and our Credit has taken a hit because we could not afford to pay our Freddie Mac loan and rent at the same time.

I would like the opportunity to speak before your panel because I am tired of listening to experts who know nothing, and sugar coat all the facts and details. I have lived it, I have breathed it, I have studied it, I like the other tens of thousands have had the same medical symptoms—I have suffered it, so why not ask a real professional—I do have many answers and also some snggestions for a solution.

Re: The Toll Chinese Drywall Has Taken On Our Family and Commuinity

We want to share the absolute tragedy our family has faced as a result of a toxic foreign product which was allowed into the United States. We are 100 percent innocent victims who will pay the price for this oversight the rest of our lives, and we are pleading for help from our political leaders.

In 2006 we wanted to move our growing family into a larger home in a promising development. We moved in August of '06. Immediately after moving in we began experiencing problems with the home and unexplained health symptoms. The builder had a long "punch-list" of items which were never completely resolved and resulted in us and several of our neighbors taking legal against the builder after 18 months. Upon lawsuit inspections, we discovered many additional issues with our homes which were in direct code violation and never should have passed inspections. Then, in September of '09 we also discovered our home was built with Knauf Chinese Drywall—as were 35 percent of the homes on our street.

Problems with our home:

— Water flooding and year-round standing water in the yard due to improper drainage and grading. Water ran underneath the home soaking support structures and elevating moisture levels. Later we would find that this elevated moisture further exacerbated the off-gassing of our Chinese Drywall.

The following are all issues resulting from Chinese Drywall:

— Failing HVAC system: frost on interior walls from Freon leaks, five failed AC coils, and the furnace setting off smoke alarms etc. There were 9 HVAC repair visits in the first year.

— Wiring problems: lights which turn themselves off and on, light switches which "pop" when used, and rooms full of lights which would "dim" when an appliance was turned on etc.

— Failing electrical and appliances (big screen TV, smoke alarms, security system, constant replacement of light bulbs, washing machine, stereo receiver, DVD players, speakers, computers, printers, and multiple small appliances which stopped working after 3–4 months etc.).

— Batteries which quickly died, including car batteries from the vehicle which we parked in the garage. Our family van had 2 batteries die in the first year of use.

— Smoke alarms and the security system would sound for short intervals and then silence. In one 2008 instance the fire department was called. When the firefighters arrived at 3:00 a.m. they said the home smelled like burnt matches (sulfur) but could not locate a fire. Later we would learn that many other victims were experiencing similar alarm problems due to CDW dust on alarm sensors.

— The drywall itself is "weak" and crumbles around nails and hanging brackets in the wall. A large 4' x 7' mirror pulled away from the wall and fell toward our 3yr old while he was at the sink. The nails and brackets holding the mirror up were black and corroded and the sheetrock itself had crumbled and given way. Several wall hangings and curtain rods fell off the walls in similar fashion. On another occasion our 7 yr old accidentally slid into the wall while running and punched a hole in the drywall with his knee. The drywall gave way under relatively low-impact.

But all of these issues pale in comparison to the severe health problems my husband, I, and our three young children have faced in the last four years. *Health symptoms started with the tell-tale nose bleeds, respiratory and sinus infections, skin rashes, itchy eyes, chronic coughing, but grew to include broader neurological, circulatory and bone growth delays.* These are all outlined as the effects of hydrogen sulfide, strontium, carbon disulfide and carbonyl disulfide poisoning. This information is available via the National Library of Medicine.

We discovered the vast majority of our home was constructed with Knauf drywall in September of '09 and since have learned that the following health issues follow similar patterns across the nation:

— In the first few months in our new home, my husband developed severe sleep-apnea to the point where he was having an apnea every 60 seconds while sleeping. Sleep deprivation and pulmonary strain followed.

— Our youngest child immediately developed chronic chest congestion and was diagnosed with asthma which required he receive nebulizer treatments 2–3 times a day.

— All three children (ages 18 months, 3 and 6 at the time) quickly developed skin rashes, eczema, bladder infections, yeast infections, loss of appetite, ear infections, and repeated respiratory complications. The children wonld constantly cough after waking—a symptom which would go away when they left the home or were in school.

— Adults suffered chronic fatigue, loss of sense of smell, memory loss, inahility to concentrate, insomnia, nausea/vomiting and depression.

— Visiting family members became ill—65 year old father was hospitalized with pneumonia and 61 year old mother developed a severe sinus infection after staying with us for just a few days.

— Every member of our family was diagnosed with ADD/ADHD within 18 months. This was accompanied by high-anxiety and irritability requiring medication for all, ages 4 through 45.

— Onr youngest child spent the majority of his life developing in this toxic home has experienced the most severe symptoms. After four years of symptoms, he was tested by the Hoover school system in the spring of '10 and diagnosed with high ADD and had boarder-line Autism scores. He was issued an IEP and placed in Early Intervention Pre-school. *Additionally his growth rate dropped from 97 percent percentile at age two, to 30 percent percentile at age 5.* Tests were condncted for endocrine fnnction, growth hormones, celiac disease, liver function etc. and all cam e back normal indicating something else was the cause. In June '10 we believe we discovered the cause; our Knauf drywall contains very high levels of strontium. Our drywall was inspected with an XRF detector revealing boards with strontium counts as high as 3300 ppm when the allowable level is below 200. Strontium is absorbed into the bone and replaces calcium, stunting bone growth.

— *By July of 2010 we had spent thousands on doctor visits and had over $700 in monthly prescriptions to treat all of our health symptoms.*

We then made the difficult decision to evacuate our home to alleviate our children's current health problems and for fear of future health complications. Since moving ont of onr toxic Chinese Drywall home:

— The children's appetites have increased and all have gained weight. The youngest grew a 3 inches in the first year we were out of our toxic home.

— Skin rashes have minimized and there have not been any bladder or yeast infections.

— All have been able to reduce medication.

— And most importantly, our youngest was re-tested by the Hoover school system in October and scored completely "normal" for his age and no longer needs ADD medication.

— Unfortunately, many health symptoms remain and doctor visits are frequent.

We are thankful our health problems are improving, but we are now faced with the financial burden of paying our mortgage, rent and utilities on two households which is unsustainable. *We filed suit against the manufacturer in '09, and while the legal process is moving quickly, homeowners like us are running out of time.* Settlements are only covering repairs and 3 months of relocation and are still many months away. Like many homeowners, we will be faced with months of relocation

costs which will never be reimbursed and forbearance costs for which we'll never be compensated.

We are sharing this personal information so you can understand the toll Chinese Drywall is having on many families in Alabama. Current AL statistics are significantly understated and true impact could be as high as 3500 homes based on the gap between reported vs. confirmed cases in Ross Bridge. *Your leadership and focus on this issue is imperative.*

We purchased our "retirement" home in Sun City Center, Florida in February of 2007. Built in September of 2006, it had never been lived in. It was a home we could be proud of and fit our lifestyle perfectly, as we love to entertain. We also enjoy having family and friends visit us when it's cold up north and they need a break from snow-shoveling.

We noticed a "different" smell to the home. It didn't smell like most new homes. But we thought that was due to it's being closed up for a few months. After we moved in, we noticed some discoloration of many of the metal items in our home over time, hut didn't think much of it. We found that we both suffered a few more headaches than we usually did and onr eyes bothered us, as they often itched or burned. We treated both with over the counter medications.

In 2009 we learned that we had Chinese Drywall. From that point on we have learned, through experience, what living with Chinese Drywall really means. We have had to replace our air-conditioning coils and one very expensive refrigerator. Our lamps are not working well, many of our switches for our overhead lights have quit working and onr smoke alarm has failed. Additionally, our mirrors are getting little black specks or drips in them. Our fixtures are getting pitted in our bathrooms. The replacement refrigerator had to be fixed (fortunately not replaced, this time). Some of our jewelry and decorative items have turned black with corrosion. Anything silver is tarnished beyond normal tarnishing.

As the economy has affected the value of homes, our home has taken an even worse hit. It isn't worth anything. The house is totally unsellable at any price. We have received a little help from Hillsborough County, in the form of real estate tax relief. Our house has no value as far as they are concerned. And there are no instructions as to how we might be able to claim this loss on our taxes.

This house is a sick house. We don't know the full ramifications of the long-term effects on our health as a result of living in this house. But we do know that it has already been costly to live in this house, compared to living in a similar home of the same design and age.

We victims of Chinese Drywall deserve for our government to back us. This is too big a problem for ordinary citizens to solve without the help of those who should be overseeing the products that come into our country. For most people, one's home is their largest single expense. Most of us don't have the necessary resources to fix our homes. Through no fanlt of ours, we are having to pay for the problem financially, physically and emotionally. Please help.

I finally after 47 years had the money to build my dream home on my little 8 acres of paradise in the country. After working and saving and paying on mortgages and children and I could finally say I had accomplished something. Every penny I had would go into this little home, so that I could afford to live there in my old age and leave something to my danghter. Two years after moving in the nightmare was realized. My A/C stopped cooling it was still under warranty so I called my A/C man, it was then that he told me I had Chinese drywall and what it had done to my A/C coils. I began my research, and then nnderstood that strange smell the sinus problems and beadaches that I had had. I could not afford to keep fixing my A/C I now have an ahandoned home, no money to fix it its been a disaster to me just like if it had been a tornado or hurricane without insurance! My daughter had given me a house warming plaque to hand over my front door, it reads, "God is the head of this home and the unseen guest in every room". I still have it hanging there, because it seems that he is my only hope, no lawyer, and no government cares about the injustice that has happened to all of the CDW victims.

Dear Senate:

I have written numerons letters to agencies aronnd the connty all-the way to the president of the United States of America I hope this will have different outcome.

There a few words to describe Chinese drywall a living hell a nightmare you can't wake up from. Financial disaster

---

December 08, 2011

RE: TESTIMONY CONCERNING IMPACT OF CHINESE DRYWALL FOR THE SENATE COMMITTEE ON CONSUMER PROTECTION, PRODUCT SAFETY, AND INSURANCE

Dear Senate Committee:

This letter is to document the negative life impact created by owning a home that was constructed with Chinese Dry Wall (CDW). I am one of the many homeowner's, whom through no fault of their own, discovered their homes contained "toxic" Chinese dry wall.

I pnrchased my condominium at [redacted], Williamsburg, VA, in October of 2007 after retiring from 27 years of service in the U.S. Navy. It was a lovely home that suited our every need. After the first year of living there however, we began to notice that something was not right; as my wife and I were often ill and suffered enduring headaches, skin rashes, burning eyes, and respiratory distress. As a hardcore runner, the respiratory issues began to take their toll on my running performance. With the summer heat of 2009, the toxic fume level inside the home had become extremely noticeable and very unbearable. Then that August, the builder informed me that he had received word from his drywall supplier that shipping records indicated that the home had been built with a significant amount of Chinese dry wall installed. I immediately had the builder test the home. If our health issues were not evidence enough, his actual tests without doubt, confirmed the presence of Chiuese Dry Wall.

We were forced to evacuate the home on 31 AUG, 2009 due to the extremely unhealthy environment that was actually worsening each day. My wife and I had uo other choice but to remove all our household possessions from the home for further risk of them being cross-contaminated (the toxic hydrogen sulfide fumes emitted by the Chinese dry wall actually penetrate and are absorbed by anything that is porous or permeahle; clothing, pictures, books, paintings, upholstery, bedding, mattresses, etc.). We temporarily relocated to a hotel for three months while we attempted to negotiate resolution with the builder. After numerous unsuccessful attempts at eugaging the builder to remedy the situation, I was forced to take legal action and I joined a forming class action law suit, as well as a case filed at the State level. These suits are agaiust the entire supply chain involved with the manufacture, procurement, distribution, and installation of the Chinese dry wall in our home.

The Federal District Court in New Orleans heard the original six cases for homeowners involved from Virginia. The presiding judge, [redacted], ruled in their favor, however since the ruling was against a Chinese company, appropriate restitution has not been forthcoming. Additionally, the other part of his ruling determined the "official protocol" for remediation, which to date had been in question (remove just the Chinese drywall, or gut the entire home?). His determination at that time was the only acceptable remediation method is the complete gutting of the home dowu to the framing studs. This includes removal of all insulation, ducting, appliances, wiring, plumbing, etc. to prevent any further cross-contamination. He estimated the cost at between $80–90/sq ft, meaning a 2000 sq ft home such as ours would cost as much as $180,000 to remediate fully, to restore it to a safe and livable condition. His remediation protocol has since been refined slightly by the CPSC.

After three months of hotel living and no reasonable solution within sight, I purchased another property at my current address in December 2009 to help restore some "normalcy" and sense of balance to our lives. This was an important step in trying to place behind us the absolute nightmare and absurdity of the previous three months in losing our home for no visible or apparent reason. As a side note, while moving in to our new home we had to discard over $30,000 of our personnel possessions due to their being cross-contaminated by the fumes (they stank of the noxious gas). This was a considerable financial burden in itself to replace these possessions, and having to essentially "start over" to equip our new home (this was NOT covered by homeowners insurance).

We were then in a situation where we are paying over $5000/month in mortgage cost alone for two homes; one of which is completely vacant and useless; *a true financial "black hole"*. Through no fault of our owu, we were left with a property that *we could not sell, we could not rent, nor could we "live" in it.* The property was completely worthless until proper remediation could be performed to remove the toxic Chinese drywall restoring the property to a "clean and livable state". It was during

this time that I requested a forbearance from Wells Fargo. I was asking for some "relief", or time, while the legal process was taking its course and future corrective action could be directed. *I was doing everything in my power to do the right thing, fulfill my obligations, and to prevent a foreclosure on the loan.* Wells Fargo did uot grant a forbearance, but they did allow for a loan modification that lowered my monthly mortgage by about $200/month.

Thankfully, in October of 2009, I received an offer from the builder to buy the property back, however at a significant loss to me of my down payment and equity, as well as having to cover the remaining balance of my loan. I originally purchased the condominium in October of 2007, at a selling price of $427,000. Faced with the situatiou of paying two mortgages, on two homes at close to $5000/month, and *one of which is completely vacant and useless,* I made the decision to accept the builders offer of $220,000. As part of this agreement, I also had to agree to drop any further claims against the builder in any future CDW legal actions. We settled on this sales transaction on 21 December, 2010.

I had requested from Wells Fargo a "short-sale" of the home, since my loan balance was $325,000; however, I was disapproved because of for all reasons, I was *not* delinquent on any of my payments. You had to be delinquent on your payments to be considered for a short sale; which is an absolutely absurd policy that penalizes those homeowners who are doing everything possible to NOT be delinquent in their payments (less it affects their credit score). Since I was not approved for a short-sale, I then had to pay the $105,000 difference from my savings to cover the remaining balance of my loan and protect my credit score. This completely wiped-out my savings; however, the builders offer to re-purchase the home was an opportunity to put this nightmare behind me, even though *it was a catastrophic loss and at great cost.*

Besides the obvious financial impact, and potential health complications that are still being evaluated, there is the "human and moral" impact side to this story. To be sitting in your lovely home one day, and then to have it completely useless to you the next, for no reason of your own, is truly incomprehensible. It's just not right. The feeling that you have been "violated" is overwhelming, and it continues to be with me each and every day. I lost my home; then I lost my savings to get out of it, and into a new one; and then I lost my wife, as the duress and strain dealing with this unbelievable nightmare for two years was a stress our relationship could note endure. This nightmare of Chinese drywall was at great cost to me, and not for anything that I did wrong. Please help the victims of Chinese drywall who are completely innocent Americans who did absolutely nothing wrong to bring this catastrophe upon themselves.

Thank you very much for your time, consideration, and assistance in helping those of us homeowners who have been significantly impacted by the effects of Chinese drywall.

TESTIMONY, (KNAUF—TINJUIN DRYWALL)

My family, [redacted], had Chinese drywall in our home. We remediated last year from January 2010—August 2010. We Could not afford an apartment so we moved in with our in-laws. I did a lot of the work myself since I work for a contractor. During the demolition process my brothers and dad helped me remove the gypboard, insulation, cabinets, wood trim, doors, we salvaged cabinets and doors, basically had to trash the remainder. We would do this work at nights after work and weekends. Most of the time working to midnight. We had to use our savings and take out a home equity loan to pay for the efforts, also plenty of credit card debt, which is mostly outstanding. I was able to subcontract out the remediation and testing. I did have to clean every square inch of insulation from the studs and plywood. This alone took about a week of scrubbing the wood and using a shop vacuum to remove the insulation in the corners of the wood framing. I also subcontracted out the paint, insulation, electrical, and HVAC. I was able to rework the plumbing on my own. Meanwhile my wife got sick, she has crones disease, found ont we had it about the time we moved into our new home in 2006. With the stress of money issues and no home, it activated the crones disease into a state where she required surgery (flare up). In may during our remediation efforts [redacted] had to have 18" of her intestines removed. It was a three week hospital visit, not to mention the bills that came later. My yard is destroyed from the vehicles, dumpsters, and material unloading dnring the efforts, though I do not have enough money to fix to date. It was 8-months of hell, late nights working every day during my normal work hours ordering materials and making sure the subcontractors were showing up, performing and making trips for lnnch to check quality, etc.. That's it in a nutshell. Thanks for lis-

tening. Only God got us through it. By the way, we still are using our same appliances and we have to get them worked on about once a month. We spent about $50,000 total.

Dear Sir/Madam,

Here is my story. . .

A Human Disaster—Toxic Chinese Drywall

Thank yon for taking the time to ask for comments from American citizens! I hope that you will research the situation my family and thousands of other families have been dealing with for over 2 years! Please see these sites/articles for more information.

http://victimschinesedrywall.com/default.aspx

http://www.facebook.com/DefectiveDrywall

http://abclocal.go.com/wtvd/story?section=news percent2Flocal&id=7767973

China needs to be held accountable for the toxic imports being sold to the USA and other countries!

It seems unbelievable to me that the leaders of our country refuse to publicly acknowledge this as the *Disaster* it is for American families! This story has been kept out of the national media spotlight to "Preserve our relations with China", I assume. What if it was made public? What if our children's lives were more important than China? What if China had to face a national audience to offer some explanation concerning their *toxic* product? Our government has kept things quiet while we have been dealing with this tragedy for *years*!!!

The CPSC states that there are close to 4,000 reports of homes with toxic Chinese Drywall. That number does not come close to showing how many *people* live in those homes and are affected. The fact is that the true number of *human lives* being damaged by this product that was allowed iuto the U.S.A. is not being reported. The uumber of *people* being affected by Chiuese Drywall is *so much greater!* Yes, we are spread out over 37 different states, aud no Chinese Drywall is not a natural disaster. *But, how many lives have to be damaged to get the officials of this country to recognize this disaster and give these victims some help?* The fact that we do not show as one huge group suffering in one location from some act of nature should not sway anyone from seeing that this disaster has occurred and we are in need of assistance!

Our homes are corroding, our financial future is in ruins as the biggest investment of our lives is worth nothing, our credit scores are damaged, security clearances necessary to maintain careers are in jeopardy, and we can't afford to move out and pay for 2 homes. Many of us are liviug iu these houses with sulfuric gases—when mixed with moisture—basically acid rain! *When I kiss my kids goodnight and watch them sleeping and breathing the air in our home, I become enraged!!*

I don't care if our country owes China. *We* still hold the power over them because we can stop purchasing products from their country! Or at *least*, we must create laws that will require their products to meet the highest safety standards and protect our citizens from harm!

If we could gather up all of the people affected in this *disaster* from all 37 states and plop them in front of the White House to protest the *complete lack of concern for human life* we would. However, most of the Victims of Chinese Drywall *cannot* take time off from jobs they can't stand to lose to go into D.C. to be a show of force!

We are barely holding on as officials seem to *do nothing to hold china accountable* for *all* of the *toxic products imported into the U.S.A!* Bring China to the table. Hold them accouutable!!!

Men, women and childreu are suffering. Tax payiug, hardworking citizens are being told, "We are working on it, but it is a difficult issue!" How loug are we going to continue to suffer in this disaster with *no relief*?

NOTE I created this letter about 1½ years ago. At this point, my husband and I are having to put $100,000 (scraped and borrowed that we will be repaying forever) into gutting and rehuilding our home. We will never recover financially or emotionally. We will worry for the *rest of our lives* about what Chinese Drywall has done to the health of our 2 sons!

Respectfully,

WORRIED MOTHER/DISGUSTED CITIZEN/CHINESE DRYWALL VICTIM

Don't understand why elected officials will not help us.
My bank, B of A has created all sorts of felonious charges.
Help!

My name is [redacted] I live in Port St. Lucie, Florida with my husband, daughter, son in law and grandson. We have endured severe health conditions with the drywall being in our home. The worse is having to see my small grandson get up in the middle of the night due to bloody nose, he has also been diagnosed with Asthma due to the toxic drywall. We adults are exhibiting severe headaches, watery eyes along with other issues. My credit score as been damaged due to this issue also.

At this point we have seen no one in the government or these companies that imported this toxic drywall be it from China or the States as suppliers, builders etc. who have compensated us and helped us out in a remediation issue with our homes. We bought these homes in good faith aud therefore this situation has beeu devastating to us. I only hope that in me e-mailing this letter along with the other with the other homeowners who are suffering due to this will bring a prompt conclusion to our paiu and sulferiug.

After the recent Seuate Hearing on Chinese Drywall (CDW), I was told I ueeded to send correspondence to this e-mail address to tell about our CDW experience.

When Hurricanes Jeanne and Frances hit the area around Vero Beach, FL around September 2004, we were out of our Condo until it was repaired and finished the middle of August 2006. We had installed a new Air Conditioning Unit at that time. By February 2010 we had to replace the A/C coil 2 times so that is when we discovered we had CDW iustalled in our unit. The Sulphur Dioxide emissions had eateu up 3 A/C coil and turned all other copper pipes and exposed copper wiring black, plus any silver and some other metals also turned black from the emissions of that gas. We coughed a lot and finally had our lungs check, but the Doctor discovered no damage to our lungs. However, when we returned to our home in Haymarket, VA in early May 2010 our coughing stopped within a week. Even though, the Presideut of our Condo Association at first said early in February 2010 the Condo Association would take care of the CDW, she later said in April 2010 that they were not responsible for tainted products, even thongh the Condo Association had put in the drywall after the hurricanes. My insurance company would not pay for the repair as the Condo Association is responsible for the drywall and everything behind it.

Finally, in May 2011, with new Board Members on the Condo Association Board and a new President of the Board, they began to take action. They had all 246 condo units inspected and found around 60 units with CDW and 16 as bad as onrs. The new President and Board did replace all tainted drywall at Association expense. However, the unit owners were responsible for removing their furniture and belongings out of their nnit. Before the drywall could be removed and replaced, all trim had to be removed as well as all bathroom and kitchen cabinets. All light fixtnres and fans also had to be removed. All that had to be put in storage. Once work was started, progress was fairly swift. We hired a Contractor to do all the work, except the drywall, and to put the unit back together as it was before. We began moving our stuff back into our unit by late August 2011, completing the move by September 5, 2011. Our remediation cost to ns for our unit was approximately $40,000, plus another $4,000 for moving and storage expenses.

We live in Haymarket, VA and spend 4–6 months each year during the winter in onr condo in FL. We feel that tainted products, snch as Chinese Drywall, should have been inspected by the U.S. Government before allowing these tainted products to be used in the USA for construction purposes.

To Whom It may Concern:

The enclosed will recount my families nightmare reference the Chinese Drywall Disaster. My wife and I purchased our dream home in November 2006 from WCI (the builder) at the Parkland Golf and Conntry Club in Parkland, Florida. Little did we know that this dream home would turn into such a nightmare ultimately affecting onr health and destroying our credit along with taking much of our life savings with it. Soon after purchasing the home we began to smell something in the home that did not seem right. When we contacted the builder we received no help. As the months went on our handlers needed repair and replacement as well as our microwave and dishwasher. Still nothing from the builder explaining the root causes of

such issues. Then rumors began to spread around the neighborhood (which was a new community) that WCI suspected that faulty drywall had beeu used in the coustruction of the homes. Later we found out during the WCI bankruptcy that WCI kuew the drywall was defective but still elected to build our homes with it and knowingly closed on our homes with this defective material. Several months after living in the home my wife, son and I all began to experience different health effects that we were unclear where they were coming from. My son began to experience asthma like symptoms with deep bouts of extreme respiratory congestion. My wife began to develop extreme swelling in her joints and found it difficult to sleep through the night. I experienced similar issues of breathing difficulty and had problems sleeping through the night as well. Then in 2009 our little dog fell ill and we had her examined by our vet and he found a cancerous tumor had developed in her body. Several months later she died. Additionally throughout the neighborhood we heard of similar health issues and in fact to homeowners in the community who had CDW were diagnosed with cancer and both have since passed. Late in 2008 WCI (in their bankruptcy documents) finally admitted that the CDW (Knauf) was present in our homes and we hired an attorney to represent our interests. First we started with our homeowners insurance policy as well as our builder's insurance policy we received as part of our closing. The builder's insurance was denied immediately since they considered the CDW a pollutant. Our homeowner's Insurance claim was a longer process (Lexington Insurance—an AIG Company) where we paid for expensive testing and they performed testing as well only to find that our home was indeed infected with the Knauf CDW. Ultimately Lexington denied our claim as well citing non-coverage due to the CDW being a pollutant. The funny thing is that during the CDW testing large sections of drywall sections were removed from our walls. Because of this the air became worse as it was almost as if the walls were free to bleed more toxicants. Additionally, we tried to get some relief from our bank reference our mortgage but this was a futile effort as well. Ultimately, we decided for health reasons that we needed to move out and find a healthy place to live. I can tell you that almost immediately our individual health issnes went away. There is no doubt in my mind that breathing in sulfur in an enclosed box has and will have serious health consequences. It may vary in degree as we are all made up differently but unfortunately people will die from this much like asbestos poisoning. Once we moved out with no relief in near sight we did not have the financial ability to continue to pay our mortgage and pay for a rental property as well and ultimately after being refused a short sale by our bank the Bank purchased the property back thru a foreclosure and REO process. The funny thing is that our bank was Bank United and because they were a hank that had failed during the 2008 financial crisis we believe their losses were covered by the U.S. Government. So onr story is simple. Many parties have been involved in our situation and the only people who have lost and are without hope are ns the former homeowners. We did nothing wrong and our laws and our government has failed us. Our government has not done one thing to help us or others like us. The key parties in this transaction were:

WCI—Builder who knowingly sold us a defective home but was then protected by the hankruptcy laws.

WCI Independent Insurance Companies—We were sold a builders assurance policy which was later deemed worthless for this loss.

Lexington Insurance (AIG Company)—Our insurance company who made us go thru a sham of a claim process later to deny our claims. Funny how we bailed out AIG and once again they do not have to make good on an insurance policy.

Bank United – Bailed out by the U.S. government.

Mike Ryan—our lawyer—Mike has tried his best to move the various cases along and now seems as frustrated as we are with our failed legal system. We ueeded immediate relief not a 4 to 6 year process that may never provide us relief.

Our government—All the various agencies and senate and congress members who have been involved with this issue who when you cut to the bottom line have done nothing concrete to help those who have been wronged by faulty, defective and toxic product imported from China. As my mom always told me proof is in the pudding and quite frankly this pudding is now rancid from the broken dreams of tax paying U.S. citizens.

In conclusion I was always taught that this is why (these situations) we have a set of laws and a government. And for all of the agencies who have said there is no health issue with the CDW shame on them. They would not have wanted to live in onc of these houses. Our government has failed my family. I want you to know that tears are streaming down my face as I write this knowing that what I was

taught to be true as a child was not the case and nobody was there to help us during this tragedy. Our government has failed us and they were not there to help us out from this disaster. We would have been better off if a hurricane had destroyed our house. At least FEMA would have stepped in.

Lastly, I am pretty sure my letter will change nothing but I was asked to send it in and that is what I have done. Please help us.

Re: Chinese Drywall Victims
Dear Natasha,

My husband and I are victims of Chinese Drywall. We saved up and bought our new home in Florida in 2002. The home was built in 2001 and we were its' first occupants. From the day we moved in, I had trouble breathing. We had leaky evaporator coils, blackening of the wires and metal in our home and knew something was seriously wrong.

My health has deteriorated. I now have asthma and am taking many expensive medications. My husband has early COPD and we can only breathe comfortably when we are outside our home. We cannot afford to move and are therefore, trapped in this miserable situation. I am starting to lose my hair and am tired all of the time. My energy level is low and after mnch testing the doctor attributes it to the toxic drywall. This is so depressing. We have tried to get help from the builder, installer, supplier, insurance company and manufacturer to no avail.

We need help and we need it now. We have lived in these conditions for 9 years and feel that our health has definitely heen compromised.

Why doesn't our government realize that so many of its' citizens are suffering from this terrible devastation? We haven't done anything wrong and yet we are the ones' suffering.

Thank you for your attention in this matter. I hope and pray that someone will be able to help us.

My uame is [redacted] and I live in Venice FL. We had Chiuese drywall in our home and we found out about it in March of 2009. We are just one of the 50 to 60 home owuers in our community that were affected by the tainted drywall. For 3 years, we could never figure out why we had so many electronics failures, discolored metal items, and repeated health issues. Some of the health issues were respiratory illnesses, sore throat, nose bleeds, headache, nausea, eye irritation, and a persistent cough. Other people have had much more serious problems.

From May until November we could no longer sleep in our own home. We cannot iuvite family and friends to visit us for fear of their health. Those families with children also have the stress of what to do about their children's health. We still had to make our ruortgage payments, insurauce payments and pay our association fees on a home that was worthless. We cannot live in them and we cannot sell them. This has beeu described as a "silent hurricane" where the damage is as bad as a hurricane, but we do not have photos from the air that shows the devastation. In some regards this is worse because our insurance companies are not covering the damage. As a result, throughout our cities people are making choices between their health and their financial futures on whether to stay. As people leave, the blight of abandonment will take over and further negatively impact our local economies for years. There is also a financial burden to the local economy, the people who are only here for the winter are not returning, so they are not here spending any money in the local areas. The loss in the value of our homes is in the millions of dollars and the decreased assessed values will affect property taxes. This may also bring about another round of home foreclosures for the area.

We were fortunate enough to be able to remediate our home at a cost near $150,000.00. The IRS changed the disaster tax laws, but it did not really help. Many of the young working families do not have the cash to make the repairs and the people who are retired who may have the savings to make repairs do not have the income to use the deduction from the remediation.

We are the victim's here we did nothing wrong. We have been given the run around by every level of government and agency involved. No one will take responsibility or hold the manufacturers accountable. Our elected officials should be ashamed of themselves.

Ms. Mbabazi:

I would like to add out voice to the many Americans who have a house that was built with Chinese Drywall. Three years ago when we found out about this our house originally purchased new for $395,000 is now basically worthless. You can imagine the concern an d pressures that has put on a working family finding their largest asset is worthless. I am so hopeful and faith in our government's ability to work with us and find a solution to this horrific problem.

Thank you for you compassion and concern.

My name is [redacted]. I have a Masters in Nursing, so I am well awure of the physical changes that occurred to my body while living in the home. I was a healthy strong fit woman when I moved into that house. I have been diagnosed with neuropathy and fibrocystic lungs.

When I heard the "experts" at the Senate hearing say there are no health effects, I sat here and cried as I watched it live on the internet. I will stand up in any Senate hearing or conrt of law and tell you the hell that I have gone through because I bought a Chinese Gas Chamber.

On June 1, 2006, I purchased a home built with Chinese Drywall (CDW). It is a toxic drywall that emits the following "nerve gases", hydrogen sulfide, carbonyl sulfide, and carbon disulfide, as well as the metal, strontium. The CDW first began eating my house, and destroying anything with a silver or copper finished. It corroded the electrical wiring, copper fixtures, electronics, appliances, mirrors, and all the silver fixtures throughout the home. It emitted a noxious smell that permeated my furniture, clothes, and anything else porous in the home. The fibers in my clothes and shoes were breaking down. My knit suits were losing their form. My hose would disintegrate as I tried to put them on, and the dyes would get on my hands and the skin on my legs. My shoes were leaking dyes onto my feet. There were also physical changes happening to my body. My skin was absorbing hair color, and my skin would peel off when I had my eyebrows waxed. My nails began peeling. I was having neuromuscular pain in my legs, back and neck. I would have trouble walking because of the pain. My balance perception was off, I would fall or lose a stairstep. I started having daily headaches, and I could no longer wear my contacts. My eyes felt like I had glass in them. I started having trouble breathing, and developed a noticeable raspy voice. We now call it the "CDW voice". It was eating me alive and attacking my lungs, eyes, nose, throat, muscles, nerves, genital and anal mucus membranes. I was dying in that house, I just knew that something was drastically wrong. I had rationalized all I could! I was in so much pain I was crying everyday. When I finally found out what it was, I left that house and have not gone back. That house frightened me.

I have over 30 documented Doctor visits during the 3 years that I lived in that home. It has taken me nearly 2.5 years to feel some normalcy in my health. I can no longer run, and I have pain every day.

It has cost me thousands of dollars. I had $50,000 in savings which I burned through paying rent, condo fees on a Chinese Gas Chamber, mortgage, thousands in medical expenses, medications, replacing necessary items for daily living, lost work, not to mention the thonsands spent while in the house replacing almost every electrical item I owned.

I lived, worked, and worked out in a 3 story townhome that had 153 sheets of CDW.

My dog nearly died in the house. She would not come in, I would have to pick her up to get her in, and when she was in, she was hiding under something to filter the air. She developed kidney disease. I spent thousands on her medical care, too.

I spent over 40 years of my life working to have the American dream of owning a beautiful home. It is all gone now, and I start my life over at 61 years of age.

The builder, developer, supplier, insnrance companies have left me with the "empty bag". My credit has been destroyed, and I have a mortgage and interest accumulating, and condo association suing me.

Make the Chinese accountable because if you don't, they will continue to export every toxic waste in their country with "goods" to America.

Good morning,

I was given this e-mail address as a point of contact to provide 'testimony' to Senate Consumer Protection, Product Safety, and Insurance. I am curious why the Consumer Product Safety Commission isn't providing records of the homeowners who have registered with them? It would seem the CPSC could easily provide all rel-

evant data that includes the number of residents stricken with Chinese Drywall as well as other demographics that were included in the CPSC registration process. This included information like nnmber of family members living in the home effected with Chinese Drywall, health issues, property damages, and so on. As a government employee I find it painfully ironic that as a busy, working, tax-paying American citizen I have to take yet more time out of the day to write 'testimony' to the Senate about how this Chinese Drywall is effecting me and my family. Why don't you all also subpoena and examine the insurance claims filed and denied by homeowners stricken with Chinese Drywall? Why is the burden of informing my elected representatives on me? My congressional representative is Bobby Scott and his office has plenty of information on my particular case as I routinely shared information with them last year as I worked through the self-remediation process. I stopped contacting his office as it was apparent my government could care a less about fixing this problem.

In a nutshell, here is my testimony. In order to fix the Chinese Drywall problem in my home I self-remediated the drywall from my home as no one was providing stricken homeowners with any assistance! The cost of this self-remediation was well over $65,000. My personal savings is depleted; I am in deeper debt as I used credit to purchase materials when my savings ran out. I did receive forbearance from the bank but now my credit is ruined and in much need of repair. The downside of any forbearance is you're listed as 'seriously delinquent' for not making your monthly mortgage payments something the bank assured me would not happen as I was trying to fix my house—a shared toxic asset that both the bank and I would lose money on should I have chosen to abandon the property vice fix it!

Where has my government been during all this? They were and remain Missing-In-Action and silent as could be . . . the Chinese have yet to be held accountable for the destruction they've caused to so many Americans. Yet, I continue to go to work, pay my taxes, and serve my conntry fulfilling my end of the social contract between the citizens and this government. Pathetic is the only word that can best describe the lack of action and performance of our current government. There is little wonder why the United States government has the lowest approval ratings in its history. Trust me, I know first-hand the frustration and disappointment many Americans feel toward their government. My message is simple—do your damn job and represent the citizens of the United States! Protect us from these types of unnecessary damages! You failed to regulate the import of this toxic Chinese Drywall, and now you stand silent as the Chinese stonewall us from getting answers to why and how this happened!

A beautiful home it was when we moved into it 2006, the answer to our golden year dreams. And how soon this dream was destroyed!

Chinese Drywall reduced our lives to that of Nomads. For nearly five years we have spent 40 percent of our time away from the odors and gases in order to minimize exposure to same.

It has been and still is a nightmare. Expensive replacements of AC components, electronic equipment, electrical motors of washing machines and wiring.

My question to our government is: How long do we have to wait for action?

I would like to wish every Senator and Member Of The House a happier Christmas than what ours is going to be. When you see the smiles and happy faces in your homes, please think of us.

Merry Christmas

Greetings—

My home in FL is in Sun City Center and we built it in 2006 . . . evidently not a great year for building in FL since many of us have found ourselves with Chinese Drywall in our homes. We discovered this in 2009. Since then, our builder, WCI has gone bankrupt and all other responsible parties have been running for cover. I see from recent articles that members of the Senate are feeling frustrated by the lack of progress in resolving this issue. Needless to say, we homeowners are feeling frustrated along with a feeling that this might never be fairly resolved.

My home is in Sun City Center and is a 55+ community. We don't have $100,000 in our bank account to remediate our home on our own. Our home is toxic. You only have to step into our front door to smell the disintegrating Chinese Drywall. All products, whether they're produced in the U.S. or imported from abroad should be held at consistent standards and if those standards aren't met, then they need to

be recalled and fixed. This is done with many products. . .cars being one example . . . this should apply to Chinese Dry Wall as well.

I hope you can help . . . maybe it takes a woman to lead the charge to resolve this issue.

Please let me know if there's any further information that would be helpful.

Best regards.

To Whom It May Concern,

The home we purchased in March of 2008 has Chinese Drywall.

We are part of the class action lawsuit which to date has provided zero relief. Additionally, our Federal government and it's governing bodies (house, senate, president, etc.) has provided zero relief. The consumer protection agency has provided zero relief. The only thing the Federal government has done successfully is spend tax payer money discussing and discussing the problem while American's that have found themselves in this same situation have been victimized. We have been victimized by builders, realtors, lenders and everyone else that was part of the transaction to sell us our home. While they all retained the proceeds from the sale/purchase of our home we have lost everything related to the purchase of our home including many possessions we had prior to owning the Chinese Drywall home because of the corrosive effects of this product on possessions like TVs, computers, small and large appliances and family air looms like silver trays and other precious metals that corroded.

We ended up short selling our home and losing everything we put into it because we could not afford to fix it and we have not received any relief or assistance to complete the repair. The Federal government can't even agree on how to fix the problem. We couldn't live in the house and we couldn't rent it so we ended up letting it go.

We had been believers iu the Americau dream of home ownership but because of the financial hardship associated with the Chinese Drywall home we may uever owu another home.

While we suffered through this tragedy we watched as our government bailed out huge financial institutions that should have been stopped from their aggressive irresponsible behavior. Additionally, the cost of operating the multi-district litigation has reached millions of dollars between court costs, legal fees, communication costs, on and on and none of that expense has yielded any relief to victims. The best course of action in this scenario would have been to give the home owners their down payment back plus verified improvement costs and let them pursue another home. This would have addressed not just the personal crisis that each victim was dealing with but it would have helped with the larger housiug market issue of unsold homes. The Federal government could levy a tax on iustitution from the builders to the lenders to cover this cost. They all contributed to the sale of these homes and only the home owner was impacted. They should feel the bruut as well. They would get some of it back if these home owners turued around aud purchased another home. To be sure the federal, state and local governments aren't dealing with secondary issues related to these homes years from now these homes should be bulldozed and disposed of like the toxic waste they are.

The Federal government needs to make these home owners whole again and provide ongoing medical monitoring to ensure major health side effects are identified, communicated and addressed quickly. Many of us have communicated the health effects such as sinus infections, migraines and nose bleeds and yet the Federal governmeut wauts to continue debatiug if there are real impacts. The government should assume there are and monitor auyone that lived in these home nutil such time as it can be definitively proveu there are no effects.

As much trouble as the Federal goverument has had dealing with this issue I hold little hope that it can preveut other foreign countries from selliug the United States similar products that present hazards to health, environment and the economy. Something needs to be done to stop similar products from entering our country.

The Federal government has failed it's citizens completely. This was not a hard issue to understand and the impact was easily identifiable and the number of people impacted was not as large as other national disasters. If our government can't solve these kinds of problems how can we ever expect bigger things from what is supposed to be the most powerful country in the world. It is no wonder why the American people have lost faith in our leaders.

Please do something and soon!!!

Good Morning,

My name is [redacted] and I live in Va. Beach, Va. I am 54 years of age—a college graduate, former teacher/coach and a law abiding citizen. In 2005 I went through a divorce aud my former wife and I reached au mutual agreement of what would be best for our two sons. One is currently a sophomore at Ole Miss and one is in the Math and Science program at Linkhorn Park Elementary School. I share this with you because what I am about to share with you has pretty much ruined my financial freedom that I had worked my entire life—thus affecting my dear family.

Upon buying my ex wife out of our million dollar home, I came to the conclusion in 2006 to downsize for the sake of my boys and I. This was my attempt to prepare for retirement. I sold my home that I had been in for 23 years and with proceeds bought a new condo a short walk to the ocean for my boys and I. I furnished this new home with state of the art appliances, new furniture iu every room of the home and upgrades throughout. Within a few months of living there I had to call and express concern about my air conditioning not working, my 50 inch television not working and uoting that something was goiug on with my health. With joint custody of my boys and a rotation of every other week my ex wife and I became concerned because of nose bleeds, rough coughs, congestion, and fatigue being exhibited by onr boys. We determined that it only occurred when they were with me. I also went to the Doctor and it was determined that my thyroid was not functioning and I am now on medicine for that. In addition, I am fatigued, out of breath with short walks, and ultimately respiratory problems that do not seem to be getting any better.

Imagine my surprise when my neighbor said that he thought we had Chinese Drywall. I immediately put the pieces together and after a little research knew that what had been happening was due to CDW. I moved my boys out right away. I have been leasing a place for the past 2 and half years. I sold my condo at the urging of Chase for land value—my total loss was 500k (*five hundred thousand dollars*) *Yes*—that is the cash I had put into this final retirement home. Absolutely—no one in our government has done anything to help those of us that have this problem which is tied directly to the *Chinese government.*

My once sterling credit rating of 54 years of paying taxes and contribnting to society in a positive way is no longer. I could not even get an apartment with one landlord because of my credit and having to jump through hoops for Chase and my second lien Gateway Bank. And, I offered to pay 6 months in advance. I continue to pay my fair share to my ex for our boys, college for my son, taxes that come my way—but yet am told that this is several year away from being settled in litigation and payback for those of us whose lives were ruined. You might understand that I am a little bitter and I look at our leaders in Washington feeling ashamed that no one has made this a top priority.

I have been to Washington 3 times over the past few years. Most recently at the feel good about one another Chinese—US Summit this fall. What a joke!

Well—there it is—a brief story of my journey with Chinese Drywall. I have told this story so many times to our leaders that honestly—I have *no* faith that anyone will finally step up and make us whole again.

Without prejudice,

My husband and I had to downsize to a smaller home he had suffered a stroke in 2001 at the age of 55. He is currently on disability and at home 24/7. We build this home and moved in March of 2006. We put all our money from the sale of our previous home into this home. We wanted to make this our perfect home and our last as I reach retirement. We did many upgrades inside and ont. At this point in our lives we do not have the resources to start over again if you know what I mean. We have both worked hard all our lives for what we have. I have great concerns about health issues with my husband's health issues, and I am a cancer survivor since 2003. There are 7 homes in our subdivision that have Knauf drywall mine is just 1 of the many stories out there. We are praying for a reasonable settlement so we can rebuild our lives.

Thank You.

It is with reluctance that I write, because I don't like the doubt and questioning that the current administration is putting on those of us who have this problem. However, I feel this issne is so important that I must do something.

When my wife and I built our dream vacation house near Cape Coral, FL in 2006, we were ecstatic. But within a few years we had two air conditioning units go bad; all our faucets, chrome trimmed lights and some mirrors had to be replaced and the

microwave stopped working. The refrigerator required several service calls and still does not work right. Every time we went to stay there for a while I would get terribly congested and had a hard time breathing. This condition cleared up within a week or two after we left.

Finally in 2010 we had our house inspected for Chinese drywall and they found that we have about 50 percent CDW. Not being able to stand it any longer, in 2011 we contracted to have the CDW removed according to the court ordered specs and to be cleaned, sprayed and rebuilt.

We had to make special financial arrangements to do all this work which cost approx. $88,000.00.

So far we are satisfied with the contractor, but the expense, hassle and inconvenience is unbelievable! I can understand why some people just walk away from their home.

Something needs to be done to help the people with CDW. Why doesn't the government set up a fund like they did with BP in the Gulf disaster?

I find it incredible that in this country, such an obvious problem can be swept under the proverbial rug.

Thank you for all you are doing to help us.

To Whom it May Concern,

My wife and I own an apartment in West Palm Beach FL that is tainted with Chinese Dry Wall. The unit at The Whitney Condominium was purchased for $303,000. While home values have dropped nationwide, we have been hardest hit because no one would buy an apartment that you can't live in. Conservatively, the unit value is barely $115,000. We owe double that to the mortgage company. Fixing the problem will cost tens of thousands, and no entity is stepping up to resolve the matter. We are stuck with a $220,000 mortgage.

Dec 06, 2011

PREPARED STATEMENT OF HUSBAND, PARENT AND OWNER OF HOME BUILT BY LENNAR WITH TOXIC KNAUF DRYWALL FROM CHINA

I appreciate the opportunity to come before you to discuss the problems with this defective home building product, and also discuss measures that will assist current owners of properties where this defective material was used, and remedies to help prevent further financial and health damages to everyone affected that result from the use of this dangerous product.

My name is [redacted], and my wife [redacted], and 11 year old son [redacted], moved into a home at [redacted], on November 30, 2006 that was purchased from Lennar.

The purchase price of the home was $420,000. We added another approximately $25,000 in home improvements. We have very good credit, put approximately 30 percent down on the purchase, and can afford the mortgage. We invested a majority of our savings, believing, we would be living there for many years. All of our hopes were shattered, and a nightmare began for us after less than a year in the home.

Soon after moving in during December 2006, problems both medically and with the house HVAC system began.

In January 2007 we required a service call on the HVAC system as it would not work in the heating mode.

In March 2007 a second service call on our HVAC system resulted in the copper coils being replaced on the larger system due to Freon leaks.

We have a 2 zone independent of each other, HVAC system. One cools and heats the main portion of the home, 2BR's, FR, LR,DR, Kitchen, 2 Bth Rms and Den and the other system supports the MBR and bath area.

In July 2007 the smaller HVAC system had their coils replaced. Thru out 2007 my son [redacted] and I would develop random nose bleeds. I began to get severe headaches as well. My doctor could not locate a specific problem even though I complained of unexplained illness and respiratory problems. I started to get Angina attacks that I never experienced since before my heart bypass surgery in 1997. Since living in this house I was given nitro stat patches to wear and began to carry nitroglycerin pills that I used almost daily.

In 2008 three set of coils were replaced in our HVAC systems with the last one happening in November 2008. The house began to have a strange odor in it when we needed to use the heating part of the system. The A/C people in November said I should speak to Lennar because I may have a home infected with "*Chinese Dry*

Wall". I placed a call to Lennar and was told by them that their records indicate I have a home constructed with *"Chinese Dry Wall"* !

I did a *"Google"* search on *"Chinese Dry Wall"* and it scared the heck out of me based on what I read. I immediately contacted Lennar and told them I wanted out of this house ASAP. They promised to get back to me right away. Two weeks went by with no word from Lennar so I hired an attorney to go after Lennar on our behalf. My attorney informed Lennnar in writing we were making a claim per Florida Statute 550.

Lennar assured my attorney that they would move the "MEDICO HOME" up to the top of their priority list as they were dealing with other homeowners in the Heritage Harbor sub division with the same problem we were faced with.

In mid December 2008, I was contacted by Lennar who said they wanted an Air Quality inspection firm to test my home for air contamination. I agreed to accommodate them ASAP. I was told by Lennar to set my A/C temperatnre at 68° the night before the test so the honse would be cool when their testing company came. I did this and "ENVIRON" of Tampa, FL performed the air qnality test the next day.

I did a "GOOGLE" search on testing homes for Chinese dry wall emissions and all indications were that the home should be warm not ice cold as I was told to do so.

I received a letter from ENVIRON that no toxic gasses of any type were found in my home. I called the President of ENVIRON regarding the test results and indicated that I felt the test was set up to benefit them. I said my honse smells awfnl and his results were in error. Several days later ENVIRON issued to me a second report that indicated Toxic sulfur emissions were detected in my home bnt the levels of toxicity were not harmful to our health. I questioned ENVIRON on making this statement and came to the conclnsion that they had no medical qnalification to make such a claim.

The home became so fonl smelling that I purchased a highly rated Air Purifier that I kept running constantly in the MBR area where I stayed with my wife and son. We avoided being in the rest of the home as much as possible and ate our meals out at restaurants constantly until we moved.

From December 2007 thrn March 2008 when we vacated the home we noticed a very fine black soot was appearing thrn out the house on onr fnrnishings, rugs, works of art, jewelry and especially on anything made of or containing silver .

Our furnishing, oriental rugs, beddings, linens', etc all smelled of sulfur and our jewelry and works of art all became heavily tarnished and pitted beyond anything I've ever seen before.

Our personal property losses from CDW are well over $250,000 and we are making a claim reqnest against Lennar for this loss.

We thonght that overall, we were lucky to have Lennar for our builder, but this may not be the case if repairs are not done properly. It wasn't until after we moved into a rental home, that we discovered just how badly all of our personal belongings and furnishings had been cross contaminated to the core. They were so badly contaminated, some of the gnys doing the move, which had allergy sensitivities, were having a terrible time handling it. The rental home smelled like a Chinese drywall home with our belongings in it.

We informed Lennar. They said they would send someone out to HEPA vacuum the belongings (they did this), and to then air it out and it would all be fine soon after. Well, it is 10 weeks later, and we are still getting exposure symptoms from the off gassing of our belongings, such as continued headaches, sore throats, stuffy noses, raspy voices and breathing difficulties.

We are convinced that the exposure to the sulfur gases are in fact, the cause of all of our health problems, while living in that house.

There is no decontamination solution for the personal property that Lennar must replace. We now have approximately $250,000 in belongings and furnishings that are contaminated and useless to us.

We have also had to bear the expense, of buying some new furniture, as well as dry cleaning bills to remove the contamination from bedding, and clothing.

No oue is waruing people who move out, that their furuiture has also been contaminated, and that it may, still cause them trouble with exposure symptoms to the gases.

In additiou, after the home was gutted to wooden studs, trusses, plywood and block, after 5 weeks of airing out, it still reeks of sulfur gases, and can quickly in this hot and humid environment cause exposure symptoms within ten minutes or so upon enteriug the home.

Lennar is ignoring this continued contamination of our home and was continuing with repairs. I had the home inspected by a professional construction firm that has iuspected over 100 Leuuar homes for Chiuese Dry Wall coutamiuation. They con-

firmed the presence of very strong odor within the home. I forwarded this report to Lennar as a courtesy.

I believe Lennar intends to leave these cross contaminated materials in the residence, as well as reinstall cross contaminated wood cabinetry and window treatments. Unless Lennar can find a safe and proven decontamination solution, or agrees to replace all contaminated materials, I cannot feel it is safe to move my family back into this house.

We will then have to bare the expense of paying rent elsewhere when Lennar declares themselves finished, and we will not be able to continue paying the mortgage and additional rent as well.

We will face financial ruin, thru no fanlt of onrs, over this toxic construction material that was allowed to come into the conntry.

Lennar assnred us in writing that we would virtually have a brand new home interior. This is turning out not to be true, as they are intending to re-install, numerous cross contaminated materials that still reek of sulfur. We had uo way of knowing about the block and wood cross contamination at the time either. We truly were assured that the home, when completed would be 100 percent fully free of the toxic sulfurous compounds coutamination and odor. However, it appears to me and others as well, that Lennar is not now doing this because of the unexpected climbing costs to do this.

I implore you to aide in the removal of this dangerous blight, further weakening au already distressed housing market. These homes may be going into foreclosure, if the banks will eveu take them, will most likely become left abandoned, and further hurt neighboring home values, or further hurt new and unsuspecting owners. They should all be identified, torn down and taken to the toxic waste dump. Then they should be rebuilt, or the owners reimbnrsed, all at the expense of everyone who profited from this toxic drywall along the way.

The housing market aware of this problem is scared right now with this toxic wild card out there. Far too mauy families, suffering deteriorating health, have yet to even learn that it may be the drywall iu their homes causing their families chronic illness. We are still finding them in our neighborhood. This problem ueeds more regular press, without the added minimization of health and safety risks.

In my experience, these structures are toxic gas chambers, not safe homes for families to even live in again.

I am now personally aware of 7 year old boy from our sub-division, diagnosed with an auto immune disorder, and numerous children being diagnosed with asthma.

Is the Health Department going to wait for children to end up with permaneut braiu, heart, lung, liver, kidney, or central nervous system damage or dead, until they get serions and consisteut with their alerts for parents to find their children, safe havens away from these homes?

Is FEMA ever going to step in to provide a temporary safe haven, for families that cannot afford a mortgage and rent, nntil a permanent solntion is found? I think it is more then called for.

Further, I would strongly advise any health or product safety authorities to not further minimize the health risks of chronic domestic exposure to these chemicals. Yon will ouly loose more consnmer trust, and pnt more families at a greater health risk, for more serious chronic exposure effects. They have been waiting on direction from you, and yon are failing them right now.

In my experience, these structures are toxic gas chambers, not safe homes for families.

I would like to thank Senator Nelson and his staff for answering onr pleas for help and everyone who has taken the time to come visit these homes and families, to get firsthand knowledge of the gravity of this problem, and take action to help resolve it. And I thank you for the opportunity to share my first hand experience and suggestions for much needed, emergency assistance.

I implore you, to find some way, to help people save their good credit, who could have maintained making mortgage payments, or tried to sell, and then couldn't because of a CDW disclosure, and had to flee for health reasons.

They did not engage in an irresponsible financial act by moving out and foregoing mortgage payments if they had too. They are acting on behalf of secnring the health and safety of their families. They are the ones being truly responsible parents, looking out for the well being of their children first, and should not be punished on their credit reports for that.

What have we come to as a society, if we cannot snpport parents who do the right thing, but rather seek to punish them, just for caring for their families well being.

I am asking Legislatures for assistance in many areas on behalf of all those impacted by the use of this defective and dangerous construction material.

Please provide adequate funding to the proper departments so they can do the job that tax payers pay them to do. That involves, banning and recalling defective and harmful products from the USA market place again.

The CPSC claims it has not had the funding or resources to put a ban and recall on this product by now. Though I think they can at least do that, until more can be learned.

I think it is shameful, that the health department has had to claim, they do not have the funding or resources, to better inform the public.

I also recommend that you get the best of the best on this. I find it appalling, that so many so called professional toxicologists seem to have not a clue, about the cumulative effects of low level exposure to these chemicals, or knowledge, easily obtainable from NIOSH, that the immune system can lose tolerance to hydrogen sulfide at chronic low level exposure, and that higher level exposure.

If we can so easily bail out Wall Street with billions, surely we can help the American people thru this mess that is not of their making.

This is my testimony of my experience as a parent, husband, and owner of a Toxic Chinese drywall house, as I know it to be the truth. I also believe that I speak for many others who have not yet come out of shock and denial, and into anger and found their voice, experiencing the same nightmare my family has been living through, facing the same tough choices between their families health, or financial ruin.

Thank you for your time.

Thank you for your thoughtful consideration of our desperate crisis. As I write this letter to you on the 5th of October, 2009, I cannot begin to imagine the challenges of representing a populace so expansive. Which cases does one pursue and which ones are left to themselves? My prayer for you is that God will empower you with such strength and virtue that every person's needs in your constituency will be fully met. Nothing is impossible with Him.

On November first of 2007 my wife and I left a closing attorney's office excited and filled with vision for this new season of life to which God had called us. With our three children, we were relocating from Richmond to Newport News for our first lead role in a burgeoning church. We knew the work would be difficult and demanding but deeply fulfilling. We also knew that having just the right home for our family was paramount to successfully transitioning from where I had called home my entire life. Walking into our brand new town home in Hollymeade, we knew we had chosen well.

I just celebrated my 42nd birthday in March of 2009, now having suffered from chronic pain since the spring of 2008 that is symptomatic of lupus, medically documented signs of a degenerative spine condition, as well as everyone in our family struggling with fatigue, and our middle child having serious bouts with eczema and needing steroid breathing treatments. Our family was a picture of perfect health the day we moved into our home, with proper diet, exercise, and a weekly regime of rest being core values for us. Now, thousands of dollars in medical bills in hand, we remain sick. We have moved out of our home fearing the health of our family, desperately needing your attentive, aggressive, and unrelenting help, action that will be timely and substantive.

There had always been an odd smell in our home, what I would describe as an aged wood smell and sometimes gunpowdery. We had constant hvac problems in addition to intermittent issues with our smoke detection system. There were leaky plumbing problems in the kitchen, a failed ceiling fan and other small electronic devices. In August of 2009, we learned we had all the symptoms of Chinese Drywall and upon further inspection, we found corrosive ground wiring, tarnished door hinges and jewelry and upon removing a core sample of drywall, found a smell in our walls that was frightening.

We know that God is working to help rescue ns and our neighbors from this tragedy, but we know that throughout history, He has demonstrated a fondness for rescuing citizenry through those in authority. Help us; be the saving grace of His hand.

To the Senate Subcommittee for Consumer Protection, Prodnct Safety, and Insurance,

My wife and I worked long and hard all our lives and finally were able to retire in 2006. We purchased our dream honse in Sun City Center, a 55+ commnnity south of Tampa. It is a gorgeous home . . . Everything we had hoped for when we retired.

However, it wasn't long after we moved in that our horrible nightmare began . . . We learned that contaminated Chinese drywall was used in the construction of our home. We have replaced two air conditioning units, the microwave and just recently, the refrigerator. The gases given off by the Chinese drywall corrode copper, silver and chrome . . . It is only a matter of time before the rest of our electronics and appliances succumb to the same fate. And only the Lord knows what these corrosive gases are doing to our respiratory systems!

Sun City Center is a beautiful little town where many, many homes have fallen victim to this terrible problem. Here we have solid citizens who have worked hard all their lives, done what was asked of them to help make this country great, and uow are faced with a major crisis through uo fault of their owu.

Because drywall made in China was used to build their homes, their property values have gone down by 75–80 percent and in many cases they have been forced to move out of their homes because of resulting health problems.

Also, because most retirees live on a fixed income, they cannot afford the cost ($100,000–$150,000) to remediate their homes. Many will be forced to abandon their homes while others will be forced to deplete the remainder of their life's savings to fix this problem that they did not create.

There are thousands of homeowners around the country that have been devastated by this crisis. My wife aud I have been in limbo for several years waiting for direction and help from our government. Unfortunately, none has come. How can this government, the richest country in the world, sit back and ignore the thousands of homeowners (tax payers) that are suffering from this crisis. How cau this country continue to send billions of dollars to countries all over the world and not help the citizens in this country that are ultimately paying the tab?

We uuderstaud that alliances are importaut but there is nothiug as importaut as keeping our own house strong and in sync with the values that this country was founded on.

My wife aud I extend an open invitation to all members of the Seuate Subcommittee to visit our lovely community and home to see (and smell) firsthand this China-made disaster. We need your help. Don't turn your back on us. We need you to get behiud your own people and help those that have helped make this country great.

Respectfully

I have a home in Parkland, Florida that is effected by CDW. I have had all sorts of electrical and minor health issues. We have to completely gut our home to fix it. It is a terrible situation that my family aud I have had to endure. We are victims that have not been helped. Please help all of us out of this mess.

To Whom It May Concern:

I am writing this to give you a brief history of what my wife and I have had to go through regarding this problem. We built our dream home in Cape Coral, Florida in 2001. Since my wife's firm had split and my company had been sold we decided to move 10 years before we had planned to retire and find jobs in Florida. In October 2001 we moved in to our home. Immediately we started to have problems. A sulphur smell in the home was blamed on the water, so we put in a whole house reverse osmosis system. Our cast iron sink started to rust on the edges, fixtures in the home were corrodiug, our antique silver spoon collection in glass cases were tarnishing within days of cleaning. Our treadmill electronics went out, after 10 months our A/C coils failed. My wife had repeated sinus infections and headaches. I was treated for severe dry eyes aud had my tear ducts plugged. Both of our cars that were garaged started to have electrical problems, the smoke alarms would go off at 2:00 am, two TVs failed within months. We had to replace the system board on our uew computer and the printer stopped priutiug in the middle of a print job. Our floor tile started popping up, especially close to walls.

Of course we attributed all of this to just bad luck. In the following eight years we replaced our A/C five times, replaced all of our appliances, even though they were Maytag's top of the line. Oh, and five TVs. My wife had a tumor on her thyroid develop, which a specialist said was caused by an environmental problem. I developed prostate cancer at age 54 aud had it removed. I also developed Type II Diabetes and had a heart-stent put in two years ago. (We were both in excellent health prior to moving to Florida, I had a complete heart scan in 2000, they found zero plaque and no family history.)

In July of 2009 I read an article about Chinese Drywall. It mentioned that most of the homes had been built in 2004 thru 2006. But a few were built in 2001. After doing further research, I concluded we had all the classic symptoms. I then got up in to our attic, the first piece of insulation I pulled away from the ceiling drywall had printed in big blue letters, "Made in China". Of course both our homeowner's and my builder's insurance denied our claims due to their "pollution exclusion"! You have got to be kidding me!

Earlier this year, with no recourse in sight we decided to get a new mortgage and pay for remediation. After $110,000 in expense we moved back in our home in April. Yes we could have walked away and let the bank have it, but I have never walked away from any obligation and I wasn't going to here either. Due to the economy, my job was eliminated effective May 1st. Finding a job has been a real task, who wants to hire a 63 year old with health issues? I was forced to take out social security. One major concern I have is that when all the wiring was removed from our home it was placed into a large pile on our driveway. The smell was awful, the biggest problem I saw was the scorch marks on the wiring insulation. Obviously, at different times our wiring got overheated! It is amazing to me that we did not have a fire. It is my understanding that the Electrical Contractors Assoc. and the CPSC has stated that the wiring does not need to be replaced. Maybe for those homes bnilt recently, but who has studied the homes built in 2000 & 2001???

Our home is wonderful now, but my wife will have to work until 65, I am still looking for employment. We are very concerned about the long term effects on our health.

Some say that heat and humidity aggravates the problem. Could there be many more homes in the U.S. with the problem and it hasn't been discovered yet? I believe this could be bigger that asbestos, but we have only seen the tip of the iceberg.

I purchased my brand new home just off of [redacted] in the Buckingham/Lehigh Acres Fl area back in January 2008. This was my first home I purchased on my own and I was so proud of myself . . . "my own little home". I purchased the home that was brand new and never lived in from M.W. Johnson Homes. It had a one year warranty and I thought this is the way to go . . . new house and no worries about things breaking or needed replaced.

I lived in the house about a 1 year and 3 months when I started to get sick.

I had sore throat, glands were popping out of my neck, my Dr. put me on a breath in-hailer-like I had asthma, I started to itch, I had a rash on my legs and rash on my chest that were so bad that it would bleed, I had 16 hour headaches and fatigued. I went to my doctor and countless others that could not find anything wrong with me and they said it was all in my head.

So finally in May 2009 my A/c went out on me and I called my girlfriend and started crying and said "I just can't take this . . . My a/c broke not working and I'm so sick". I was at my wits end . . . I called a friend that did a/c work and he came over to look at my a/c system. He said that I had Chinese Drywall that's why my a/c was broke. My heart sank . . . I knew a little abont this stuff but not bad it really was.

I lost everything. I lost my past, my pictures of my life and the different countries I lived in and all the stuff that I had inherited from my parents that both are gone. I lost my perfect credit score of 790 that I worked my ass off to get everything that I wanted. These item you cannot attach money to.

The truth I learned. I lost all my money that I put down on the house. My belongings were all ruined and they were all contaminated by the gas. I tried to clean them but they still had that crap on it. I tried to professional clean it . . . but it still did not work. I tried to clean it and bring it to my sister's house where I stayed for, for a few weeks while I looked at an apartment. But my belongings off gassed at my sister's house and then contaminated to her house and I had to move out.

How do I know it was still contaminated . . . . . any time I get near anything that has the Chinese drywall gas on it ..it makes me itch. Not just a little itch but the worst itch you ever had in your life time's 4.

So I lost everything like those people on TV that were hit by earthquakes, tsunamis, flood, hurricanes and or tornadoes. They can qualify for help threw a numbers of different types of help.

We get *no* help what so ever. Our government helps everyone else in this world but not us.

There is more to my story that it's hard to tell the whole thing.

Hello,

My hushand is in the military and had a permanent change of duty which moved us to Florida.

We purchased the home new from the Bank. Shortly after had air conditioning issues which have been ongoing for 3.5 years.

We have no markings on the back of our drywall after two inspections that Morgan and Morgan arranged. No one to pursue legally.

Our builder is out of business and it's a hopeless situation. We expect there will be no remediation for us. My Husband, daughter and I have frequent dizzy spells and consulted with our doctor who advised with the unknown effects to move out of the home.

We are moving next month. My husband has to have good credit for his security clearance through the DOD. We can't afford to rent and pay the payment, but our health prevails.

A new home, this is the American dream we worked for. No one to protect us from this?

Thnak you

To Whom It May Concern:

We built a new home in Tampa, FL in 2007 to ensure we had the latest hurricane standards. We huilt a Custom Built home with concrete block. We moved in the home November 2007. In February 2009 we had an issue with the evaporator coil in the downstairs air conditioning unit and due to the media around Chinese Drywall, were instructed to investigate Chinese Drywall. The evaporator coil was replaced.

We spent time researching and contacted our builder who confirmed that the Drywall supplier did stock Taihe (Taishan) drywall at the time our home was built. In June we had non-destructive testing done that confirmed the presence of Chinese Drywall. We were instructed to file a home owner's insurance claim and we did. The claim was denied. Our insurer was Olympus Insurance. Further sampling confirmed Chinese Drywall made by Taishan. The builder made a claim with his insurer who denied the claim. We started litigation, hut to date have had no luck and see no future of a settlement as the builder is bankrupt, the drywall supplier is bankrupt, the insurers are all denying coverage and Taishan is owned by the Chinese Government who is denying the claims are even valid.

We had 4 evaporator coil failures, constant electronic issues, some appliance failures and many fixtures tarnished and pitted. On top of the problems with the home, our Homeowners Insurance decided to non-renew our home and we were denied coverage by every insurer, secondary insurer including Citizens. After countless hours (50+) of phone calls, research, and the help of the Insurance Advocate Citizens decided to insure us. This would have never been accomplished without the Insurance Advocate.

Seeing no help in sight and determining that walking away from the home was not a financial option, we began the remediation process. We moved out in June and four years to the date finally moved back in. The remediation was entirely self funded.

We find there are many misconceptions about our situation. 90 percent of people believe it is covered by insurance. Another large percentage possibly as high believe we will receive a settlement. When we moved back into the home our window coverings no longer fit the windows in trying to determine how to retrofit them or how to obtain a discount, we were told, 'Oh you will definitely get reimbursed for this kind of thing. You should be looking into that.' I would like to know where this settlement is coming from since everyone is either denying responsibility or bankrupt. This is the majority of people in our situation. Very few were lucky enough to have a large builder who paid the bill. Even fewer had their case taken to court and won. The fact remains no one is taking responsibility for this tragedy. Yet we continue to import other toxic Chinese materials into our country.

I am often asked why aren't the people who allowed the toxic drywall into the country being held accountable. I have no idea. I tried to contact these agencies, but had no response. I have no idea why there seems to be no restrictions on China importing more products based upon this problem and the other toxic products they have had over the years. I have no idea why no one in our government believes any of these issues are their problem to help correct. I have no idea why there isn't a fund setup to help people in this situation. I have no idea why this problem has largely been ignored and it seems like everyone just thinks it will fix itself and go away. You bet I will take this information with me to the polls and so will every

other individual in this situation. We know who was responsive and at least tried to help and care and we know who largely ignored our calls and e-mails. We have legislatures spending time and money on demanding that schools change the name Winter Break to Christmas Break, yet they don't want to spend any time debating helping victims of Chinese Drywall.

To those who are soliciting feedback and debating this issue we thank you. We appreciate your efforts to try and help us. This is an important issue and again we thank you for your time and effort.

I am currently one of the thousands of homeowners who unknowingly purchased a home contaminated with Chinese drywall. In July 2007 I was transferred from my Federal law enforcement position in NY to beautifnl Miami. It was the opportunity I had been waiting for, I finally made it down to Miami and now would be able to purchase my first home. Living in NY on a Federal salary made it difficnlt to pnrchase a home therefore I felt very prond that I was finally able to have a piece of the American Dream. I purchased my 2 bedroom condo in Doral, FL for $270,000.00 and was expecting to someday have a family where I can already have an established home.

Towards the end of 2008 I began hearing reports of some homes in the Doral area that had been bnilt with toxic drywall and that people were having problems with their air conditioning, home appliances, and began having health problems. I began investigating a little further because the symptoms that were being discussed sonnded very familiar to me. My home always had a certain smell to it that I always believed was like fresh paint and I assnmed it was because it was a newer home. I also recalled having burning eyes and sore throats often especially when I wonld wake np in the morning. I remember seeing pictnres of corroded wiring and decided to look at my air conditioner and this is when I discovered that my AC hose appeared to be tarnished. I immediately reached out to my developer and advised them of my finding. They sent someone to look at my AC and my electrical panel and they confirmed it was corroding. I spoke to the attorney for the developer and he advised me not to worry about it that they would see what they could do. I never heard from them again, my developer disappeared, the attorney never returned a phone call again. 1 contacted the City of Doral and they sent an Inspector who confirmed that my property contained toxic drywall, the minute the Inspector walked in he knew because of the distinct odor. At this point was when I realized that all my years of hard work had all gone down the drain. My home was toxic and dangerous to my health.

Over the next several months and years my AC failed 4 times, I purchased a new coil and within a few months that began leaking as well and was completely corroded. The AC tech actually thought their had been a fire inside my AC because the copper coils were completely black. My stove's electricla panel stopped working as well therefore I needed to pay several hundred dollars to get it fixed. I continued getting sore throats and burning eyes but I had nowhere to go so I continued living there hoping for a quick solution.

I contacted an attorney in January 2009 and filed a lawsuit. I continued making my mortgage payments because I did not want to ruin my excellent credit history bnt I finally gave up in July 2011. I got married in November 2010 and realized that the health of my wife and mine was more important then maintaining my credit history. We wanted to begin a family and we knew that we did not want our baby anywhere near this home. I decided to move into a rental home that at least I know is not detrimental to my health.

It deeply angers and saddens me to see how our government has done nothing to help homeowners with this problem. These homes were built with faulty and dangerous materials and everyone has walked away from us. The government, the bank, the association can care less. They still want their taxes, their interest, and their monthly dues and could care less that these homes are unliveable. In the U.S. we have the lemon law to protect car buyers but I find it unbelieveable that when someone buys a new home there are absolutely no protections. Buy at your own risk. . . . I didn't know I had to inspect the drywall when purchasing a new home and neither did the bank because they appraised it. . . .

I don't expect this lawsuit to go anywhere and decided to cut my losses now knowing that the banks will probably come after me to pay up in the future for a home that recently was appraised at $75,000.00 due to the toxic drywall.

My home is currently in foreclosure, my credit has been ruined, I will probably owe taxes, or the bank will try to sue me for the default amount on the mortgage. This is a "lose lose" situation for all the homeowuers involved.

As a Federal law enforcement officer that investigates fraud, I feel like I have had the biggest frand in U.S. history committed against me and my government (and employer) has done nothing to help.

I wish everyone luck with their homes and hope that someday we can come ont of this nightmare and maybe help make changes so that no other American falls victim to anything like this again.

I would like to tell you our story, of two disabled person's struggling to survive this Toxic Chemical Drywall Disaster. [Redacted] was deemed totally and permanently disabled as determined by the two years of the required Government evaluations, Government Doctor's exams, Laboratory, and other extensive testing as required by the SSD process with a personal appearance and found conclusive by the Federal Court, I do not reveal all of this health information lightly but it is in the best interest of all parties/victims who have suffered and continue to suffer with disabilities and also Toxic Drywall. All information is based on sound Science. He was severely injured and has some genetic problems that contribute and now he is poisoned.

His Parents came to America, fleeing the War torn Hungary in 1956 during the Revolution to find their American Dream. His Parents became Citizens, built their own home, started their own Machinery Facility and contributed to this United States of America. [Redacted]'s Father was a manufacturer for the United States Military, building parts which were considered to be of high security clearance, he even designed a part that is now on the moon, part of the Lunar Lem.

[Redacted] learned this trade from his Father and has great knowledge and expertise in the manufacturing field, all fields. He is a former Certified OSHA General Industry Outreach Trainer, this before his disability. He is highly qualified with several Certificates in various fields including being a Former Licensed Insurance Agent for the State of Florida. I am a former bookkeeper and Office Manager before being stricken with Lupus at an early age. In 2005 [redacted] and I decided after my Disability continued and all of the issues along with that and now his Disability that we would build, using his 401k money, a home specifically designed for our Disabilities. We could no longer climb stairs, no longer bend at certain degrees, we had and still have severe limitations. Our home was very well thought out. Every aspect, the counters are a perfect height, the Refrigerator is elevated, we have a Physical Therapy Whirlpool, Our shower is built with five shower heads as with Lupus, hot or cold changes affect me tremendously. I will go as far as to tell you that we even have a restroom built for Disabled Persons. Our home for our disabilities was perfect. I cannot tell you how much we have missed it over the past almost two years now. It is only 900 sq. ft. but built on a bigger slab of concrete under roof and above code for possible hurricanes,(irouically), so that I do uot have to be in the sun, you see with Lupus, the sun is a trigger as well as stress, actually, stress is the number one trigger for a Lupus Patient resulting in a Flare and with this Drywall Tragedy, I have had aud coutiuue to have pleuty of unwauted and uudeserving stress.

We were the Owner/Builder, as this is allowed in Hillsborough County Florida as long as we adhere to all contracting guidelines. *i.e.*, hiring licensed, Bonded and Insured Sub-Contractors. So in doing this we find it very dishearteuing that we adhere to the guidelines but the sub-contractors do not, or I should say they should share responsibility in the materials installed in our home. There should be product accountability wheu they purchase the drywall and briug iuto the home. We Sub-Contracted out the drywall, etc. to Companies that we thought we could trust. We moved in in January of 2007, so happy, we finally could live out our limited days or I should say difficult days in a perfect place for us. We were thrilled. My Lupus was in remission, [Redacted] had his disability but he was o.k.. Shortly after moving in, we began to have issues with the smoke detectors, air conditioner, I started noticing corrosion in the bathroom but although I saved and waited for my bathroom fixtures to go on sale and bought the best, I thought maybe I would take them back to the store. Then . . . I began to cough up blood, trips to the hospital and emergeucy room left [redacted] and I with a visit, per the hospital, to a visit to the local health department for possible TB testing. We were both coughing up blood and horrendous phlegm, not to be gross on a public document but factual. The testing was done, we did uot aud do not have TB.

We continued to feel ill. I had continuous nosebleeds and a severe rash which was thought to be shingles but was treated and left unexplained. [redacted], under routine labs begau to have pancreatic issues that he never had before and had previously before moving into the home had routine blood work every 3 months. He also had a return of his childhood asthma which in almost thirty years of marriage he never used a rescue iuhaler. He was put ou one. I awoke to being numb ou the

left side and paramedics were called when [redacted] could get no response from me one morning, I went into now I know what was a hypoglycemic stroke/coma with an unexplained flare of Lupus and was hospitalized on Mega IV doses of medications, and remain with neurological damage. I suffered from breathing issues/ hyperinflated lungs and severe fatigue. [Redacted], after many, many trips to the physicians, and emergency rooms was put on mega doses of antibiotics for what the Physicians believed was a lung issue . One morning after his now normal pattern of having to sleep sitting up, I noticed he was extremely cold, I took his temperature over a few hour period and it was extremely low. I phoned the doctor where he stated that [redacted] was hypothermic. I rushed him to the ER once again, he was hypothermic, and had bi-lateral pneumonia.

The Physicians were puzzled because his immune system was basically non-existent. Knowing that he had routine labs they, asked me what was different. At this point I had heard of Chinese Drywall and saw the signs in our home but never in a million years did I think we could have it. I trusted the Sub-Contractor/Supplier . . . no longer. While [redacted] was still hospitalized after 17 days, I contacted the Florida Department of Health, they instructed me on what to do. Our Air Conditioner Contractor came out, (the owner) and actually looked at the coils, he had seen this many times and stated that we had bad drywall. He did look at the rest of the home after that. I immediately told the Physicians. We could not go home. They were going to put [redacted] in a nursing home. This would be the first time in 28 years that we would be separated, luckily we had a little money left so I rented an apartment and took my Husband home to hopefully recover after having to purchase new beds, furuiture due to the gases and contaminants. He was now so weak. The first couple of months he did get somewhat better but never the same.He now has COPD, not before. He continues with left-sided kidney pain, His pancreatitis did immediately go away as did my problem with my blood sugar. He has lung damage aud now marrow issnes. We will never be the same. We were not this way, even with our Disabilities. There has been a drastic change since moving and living in that home for two yrs. We have been "Poisoned" just as it is written on the CPSC document done by Mr. Glen Dunlap, as well as other homeowner's documents.

While living in the first apartment, we have since had to move to another, I contacted the CPSC for the second time, the first while [redacted] was hospitalized. I got a reply e-mail from Christopher Day and then a follow-up phone call from Mr.Dean Woodard, at the time he was the Defect Investigator. He told me that Mr. Glen Dunlap would be in touch. Mr. Glen Dunlap did phone me and wanted to talk about our health first and then go to the home. We did. Mr.Dunlap left the house with his eyes burning. He saw tbe Domestic Drywall Barcode, the same piece that the Insnrance Company had tested the month prior via an Engineering Firm, and finding Defective/Reactive/Contaminated drywall with Impurities.. Not Chinese. I asked Mr.Dunlap if he wanted to test the piece also and he stated that he did not need to. I gave Mr.Dunlap all of or most of our medical records, including the photos of the inside of [redacted]'s windpipe. Approximately one month later we received an e-mail from Mr. Dean Woodard for us to contact him. We did, he told us specifically that he wanted to contact the Domestic Wallboard Manufacturer and get them to settle. I found this to be the best news that we had heard in a very long time. The Domestic Manufacturer did come into our home, along with onr Attorney at the time, Robert (Bob) Gary, and it is videotaped. The Company, tore our house apart finding nothing but their labels, taking pieces for testing and has and continues to refuse to release our testing. Our Attorney at the time did testing by a Doctor that found problems. I have recently contacted Dean Woodard who stated that he cannot get our results from the Domestic company now and that he bowed out due to us hiring an Attorney,(we had to because the Domestic Drywall Company could not tell me on the phone that we would have access to the results and even with an Attorney and a signed agreement, they fulfilled that statement, breaching the agreement)

This makes no sense that Mr. Woodard would state this, given the fact that Mr. Cohen stated yesterday that they have "no legal recourse at this time to make the manufacturers do a recall" and they are the Government Agency that is suppose to handle this type of problem.and was willing to handle ours . . . why? To the Senators: how can an official from the Consumer Product Safety Commission offer to get a Domestic Drywall Company to settle with us based on the facts he has in his/ their investigation(s) and now refuse to help? In the hearing, Senator Warner stated that "some companies have settled and they usually do not do that unless they know they are going to be found guilty". How and why did the Consumer Product Safety Commission try to get the Domestic Drywall Company to settle . . . I firmly believe that what Senator Warner stated rings true, and apparently the Consumer Product Safety Commission thought so as well. But what about the other Families with this product ? They have been reported and some have not because they hear

that the Consumer Product Safety Commission will do nothing, so why bother? I have written to them so many times.

I also contacted Senator Bill Nelson's office over the past year and a half for help, as well as Senator Rhonda Storms for food assistance, for FEMA for something. They have tried and helped as much as possible. It is greatly appreciated.. I wrote and copied all of them that [redacted] and I after selling everything that we own can no longer afford rent and will be moving into a tent on onr property as soon as the order is fixed, we cannot afford for the County to condemn our home.They do not strive to Condemn homes but it cannot sit there, empty, being a blight to the Community although we have bartered with a kind Family to keep up the yard. Hillsborough County is trying to expand and improve our Community. We cannot get help, we live on a severely fixed income and are paying half on rent. Budgets are constrained in this County. They have done all that they can. We did get a permit via help from a friend and luckily it was half price . . . to remediate, inch by inch, extremely slowly, when and if we can, this is keeping the home from being Condemned. The Building Official for Hillsborough County, Mr. Wayne Francis knows of our plight and is very supportive.

We need help from FEMA. I have so many details and so much more to share about how the CPSC and the other Federal Agencies, including others . . . have failed us. We have got to hold the Manufacturers accountable, the voluntary system/ labeling is a smokescreen, if they will not even fix our home what makes the Government think that they will be voluntarily labeling anything and in actuality what chemicals will they be labeling, as Mr. Cohen stated about the process of making drywall to Senator Wicker. "They use fly ash, and bake it". If not scrubbed properly, the fly ash will end up making everyone ill, it contains over 22 contaminates and this will continue. Fly ash is a general term, used by Mr. Neal Cohen, of the combination of ingredients given off after burning coal and these ingredients are mercury, lead, strontium, etc. There needs to be oversight. Some fly ash is imported. This should be looked into. The Installers need to be held accountable, the Suppliers, the Insurance Companies, all the way down the chain. This will happen again or worse yet, continue to happen if something is not done.

The bottom line for us is, how does a Federal Agency step in, say they will help and then step out. How do they get to in my opinion, not be entirely truthful with the Senate as to all of the facts and get by with it. As an American Citizen who has to wear a respirator to go into her own home and does live by the laws of this Country, I, we would like to know when if anything will be done to fix the damage from this Toxic Chemical Hurricane so that [redacted] and I can live in our home, our American Dream, our Safe Haven and live out the rest of our days, now even lessened.

We would just like to thank Chairman Pryor, Senator Warner, Senator Wicker and Senator Marc Rubio for the questions asked of the witness panel yesterday. The Witness Panel including Mr. Neal Cohen of the Consumer Product Safety Commission, Dr. Portier of the CDC, Mr. Shelton of V.A. and Ms. Brenda Brincku of Alva Fl. Now that I have told you our story of our life and experience with Toxic Domestic Drywall, (which is a different Domestic Company from Ms.Brincku)I would like to address the answers given by some of the witness panel. I am doing this as a Victim and I speak for my Husband [redacted] as well. As to Mr. Neal Cohen's testimony, in my opinion he did not answer the questions completely. There were direct questions posed to him about causation, there were many theories that the C.P.S.C worked on including the Sulphur Reducing Bacteria issue and if looked at closely (Peer Reviewed, not just put on the Internet for anyone to contradict, which is not a peer review study) then it would be mentioned in the hearing that they did not find zero Sulphur Reducing Bacteria. This is one causation, they, the CPSC also found other bacterium. I would just like to say that I, as an American Citizen did contact the "CPSC'S expert scientist". I have sent my serious concerns as to a possible health aspect of just this issue in numerous e-mails to the CPSC, the CDC and anyone and everyone that would listen. The only person that responded was the Scientist and Mr. Christopher Day who said he forwarded.

As to other homeowners filing reports about other Domestic Drywall Companies. I cannot say with certainty that Mr. Cohen is accurate but I have read all of the In-Depth-Investigative reports on line. Our Report has not been released on line. I do not know the Statute that Mr. Neal Cohen quoted as it pertains to releasing the Domestic Manufacturer's names but I would like it quoted and made a part of record. From my experience there are quite a few Domestic Manufacturer's that have been reported about/on. There is/was a Domestic Drywall Problem. Mr. Cohen's quoting of the 11 home study in 2010, was not complete either. They did find problems. Please ask for all documentation.

Mr. Portier's statement about these gases including Carbonyl being Toxic is accurate. So given that statement, why then should the American Citizen's have to wait another moment before our Government declares this a National Disaster (it is a Toxic Hurricane) within our own homes. We have been "Poisoned" and it is written on not only ours but other In Depth Investigative Reports under . . . Injury Diagnosis.. If this were a Hurricane, we would have a FEMA Response. We have, all, the victims have, begged for FEMA'S help. So many of us have been or are still homeless. We are the ones that Ms.Brincku so diligently pointed out when asked, that will be living in a tent on our property, we have ordered it and had to reorder, as mentioned in our story. We implore and have implored the CDC through Christopher Day of the CPSC including sending photos of my Husbands windpipe while hospitalized from the gases that Mr.Portier referred to, to help us and all of the other victims that are suffering from tremendous health problems from, immune issues, insulin, bone marrow, blood, kidney, seizures nasal sores and cysts, etc. even cancer. Creating a "safe level" of these gases is unacceptable, it is too late for us, we have all had long-term exposure even at low levels. There should not ever be a standard level for these gases and impurities. My County even refers to it as "Septic Drywall". That along with Dr. Portier's statement about not allowing his family to live in this environment speaks, as Senator Warner stated "Volumes". We need to be followed for this just as the CDC lists asbestos on their registry, so should these gases be. Lead, Asbestos, it makes no sense to not include this Drywall as a health hazard although basically if listened to very closely, the words spoken at the hearing by a couple of the witnesses, do just that.

To Whom wants to listen,

My name is [redacted] and my family and I own a Chinese Drywall home. August 2009 is when our nightmare began!

We moved to Florida from Kansas, we had never even heard of "Toxic Chinese Drywall"! WE did all the right things when you buy a home, we had it inspected (Little did we know, Chinese Drywall was not an item covered by the inspection), we bought a home that we could afford and did research on the ueighborhood and schools. Within 90 days of moving in, we had to move out! Our home was never lived in so it took only 90 days for the AC aud man made humidity to start the effects of producing a "firecracker factory" odor in our home. My 6 year old son's room was the worst. He is my most precious gift and I was not about to risk his health!

We all started getting sore throats, upper respiratory congestion, muscle fatigue, I was the worst because I was in the home all day and night. Needless to say that once we tore out two closets in the house, we left never to return shortly after words. I'm predicting that Chiuese Dry wall is the "next asbestos" health concern. Is our country really going to just wait and see how many of our children develop serious illnesses as Adults due to Chinese Drywall? Just the fact that so many people are complaining of illness should cause the CDC to ban and recall the stuff! If it isn't dangerous to one's health why are so many of our government agency's going in to homes wearing full protective garb?

We have been faced with having to move several times(the first home rented was foreclosed/short sold-the owner was taking our money and running, never paying the mortgage). Three moves within a year and a half. Financially, we will never be able to recover what we have lost, not to mention having worked hard all my life to have perfect credit and having to face that being destroyed. Emotionally, hours of therapy and meds just to control my since of dispare that we had no where to turn to fix the problem. You see my home being poisonous was not something that I did yet I am paying the price.

We live in a wonderful country full of opportunity and justice. I'm proud to be an American. I'm glad that my tax dollars help the needy and that we are a nation under God. My question is this, why is it so hard for me (a born and raised U.S. citizen) to get help when I need it? A portion of the millions of dollars we send to other countries in need would help put the lives of us "victims" back on track. Not to mention how many jobs this could create and how the housing market may get a helpful hand in rising home values. When are we going to make China accountable for all the dangerous products that they are making and sending over here?

I just hope that some of you have the heart and passion to take serious action and help those who have been effected by Chinese Drywall. The homeowners are the "real victims" whose day to day lives and health are affected the most.

May you do the right thing,

My families story is complicated and has been a horrendous experience for all of us but the thiug to keep in mind as you read this is that I cousider my family to be one of the lucky (if that is even a word you could us in describing anything related to this disaster) ones in this Chinese Drywall (CDW) disaster. We were able to remove our family from this toxic environment over 2.5 years ago. I have spent more hours than imaginable for the last two and a half years listening to the stories of American families facing sure financial ruin and unknown health conseqnences due to the toxic import of Chinese Drywall. We lose our house this week to the bank and this toxic import!

In March of 2009 there was a story written about Chinese Drywall being installed in onr area in homes that had been built in 2006. While I had not experienced many of the problems with my home that were listed in the article I decided that I should give a call to my drywall installer and obtain a letter saying they did not use CDW in my home. This way, in the future, when I was ready to sell my home, I would have a letter in hand stating that it was not a toxic drywall home. This is when the nightmare began. A few days later the owner of the drywall company called to tell me that they DID install Chinese drywall in my home aud that there were 40 sheets (we found out later after obtaining the delivery records that it was not 40 but 77). 1 was on a field trip with my 9 year old daughter and her classmates in Jamestown when I received this phone call. Needless to say I, realized the enormity of this news and that our lives would be forever changed.

What hit me the most that day was the realization that this was why my family and I had been so sick for the last 2 years. My oldest daughter, then 11, was extremely ill and had missed so much school that her doctor was running all kinds of blood tests, including mono, to try and figure out why, what was once this health, extremely active, dancer, honor student, could barely get out of bed. The next day I called my oldest daughters doctor and tried to explain what little I knew about Chinese Drywall. She told us to come in immediately. Upon arrival she told us to get out of our the house for a week and see how we all felt. Friends were going out of towu for Spring Break so we weut and lived at their home. My youngest daughter at the time was 7 and begged us to have Easter at home. We spent Easter morniug at home and moved out that afternoou. Never again have my daughters been back into their home, seen their rooms or played with their toys.

After the week in our friends house another friend loaned us their 37 foot travel trailer and our family of 5 lived next to our million dollar waterfront home in this trailer for 3 months. Remember, I told you that we were the lucky ones. We did have friends that were able to assist us and we did finally have the means to move our family into a tiny new home, all he it a safe home, to raise our girls. That was over 2.5 years ago! Just as a point of refereuce to explain more about my husbaud and myself. My husband came to this country when he was 5 from Vietnam. My husband being the oldest and the rest of his family of 6 escaped the day the country fell and arrived here with the clothes on their back. My father was a hard working New York City fire captain who worked numerous jobs to support his family and get all of his children through college while my mother worked in the school systems because she understood the importance of having somebody home to raise the children. My point in all of this is that my husband and I came from very hard working middle class families, worked our way through college and graduate school and worked very hard to obtain what we had. We had built our dream home on the water to raise our three girls, kayak, fish and enjoy the outdoors on our beautiful 2 acre property.

Two and a half years into this legal and political battle we realize that by the time, if ever, any of this is settled our children will most likely be grown and hopefully able to afford to attend college. I have dedicated my life for the last 2 years to working to bring attention to this issue. We have worked with our government officials, starting locally going to our Congressman and Senators and then coming back to the state level. Nothing over the last 2 years has been done that would actually assist these Victims of Chinese Drywall (VCDW). There may be other things happening in the world but to these American families this is the most tumultuous part of our lives. What we don't understand is our government's lack of acknowledgement of this issue that is destroying tens of thousands of families. Please stop worrying about offending China and realize that American homeowners and families are being offended.

The Victims of Chinese Drywall are hurt and destroyed every time we hear a story about our tax payer money going overseas to help foreign families while we are all devastated by this toxic import. This is not a simple choice of recalling yet another toxic product Made in China, the estimate we received to restore our home was $380,000. While we did have equity of $800,000 in that CDW home we cannot justify pouring any more money into a home that made ns so sick and that we may

never be able to sell after it is "restored" because there is no real "protocol" that is accepted by all in the field or the government agency, CPSC, that are dealing with this situation. This toxic product does not discriminate. Young families and singles who are just starting out have lost everything. Seniors who put all of their money into purchasing their retirement home are forced to remain in these toxic homes dne to lack of fnnds to move out and pay rent someplace else.

I mnst point out that we are over two and a half years into this disaster and over two and a half years into not being able to live in onr homes and yet we still have no answers. We don't know how to fix these homes, we don't know how this happened to the drywall, we don't know how the drywall manufactnrers can ensure that it will not happen again and we still don't have a content sheet for what drywall is allowed to contain. To top it all off, during the last two and a half years it has never been made illegal to sell or import this product into the United States. What are we doing to protect American families from this toxic product?

Toxic products have been entering our country from China for more than 12 years now. China started sending us small toxic products that could be recalled and now we have let this grow into a product that has destroyed American homes and made American families extremely ill. If nothing is done to counteract these toxic imports the question is—What will be next?! By ignoring the Chinese Drywall disaster we have given the Chinese manufacturers carte blanche to do as they please and send us whatever toxins they want to send our way!

While my daughters are very strong and have lived with what life has handed them I feel this has taught them extreme disappointment in their own country that never would I have expected for them to learn EVER no less at such a young age. Sure they have met with Senator Warner, Congressman Nye and nnmerons other officials but then only to realize that after we leave onr elected officials NOTHING happens to right this wrong that has been done to their family and thousands of other families across, what we used to think of as, this great country of ours.

The Congressional caucus and this Committee can:

(Most important is our health) Require that CDC start gathering health data and appoint a specialist to be available to answer ongoing health concerns from toxic drywall homeowners and their physicians.

Hold another hearing and call in the manufacturers to let them know they will be held liable by our government for the destruction of these homes, just like was done with Toyota, Halliburton, BP and Transocean

Help homeowners restore their credit via extenuating circumstance ruling to pre toxic drywall status

Help prevent foreclosure for the few homeowners that wish to try to save their homes in the hopes of a legal settlement

Meet regularly to craft legislation and produce minutes to be made availahle to the public

Call in the insurance industry to the next hearing to discuss lack of coverage. To date all insurance from homeowners, installers, suppliers and builders deny coverage citing the pollutiou exclusiou

Provide legislation that authorizes no-interest loans to homeowners to remediate

Establish drywall standards to help prevent this in the future

Require that a governmeut orgauization coutiuue studies to fignre out how this happened to the drywall, was it bad mined gypsum, coal flue gas desulfurized gypsum drywall, recycled drywall or improperly cured drywall, to help ensure that this problem never happens again?

We request that the AG look into the fact that some American bnsiuesses kuew about the problems caused by this toxic product and chose to cover it up, not inform homeowners or the consumer product safety commission. If this is not illegal then laws need to be changed.

The toxic drywall homes that are now owned by the banks need full disclosure upon sale so that 2nd generation families will not become victims of this toxic product

CPSC has stated that they informed U.S. Customs that CDW should not be allowed into our country. Where is this letter?

CPSC has stated that the owners of the stock piles of CDW that are stored around the United States have been told not to sell the drywall. Where is this letter?

Federal regulators have dropped the ball and we hope this committee can help turn that around and send Federal assistance to these devastated American families.

MY CHINESE DRYWALL PROBLEM

This is my story about a condo I purchased in the summer of 2009 from Fannie Mae. Fannie Mae sold the unit to me with no disclosure that the unit had Chinese drywall. After some investigating I found out the unit and approximately 80 other units have Taishan drywall and were unlivable. To date I have not slept one day in the unit and it is financially running my life. This is the general timeline of the events that happen to me and my family. The condo is part of a planned community located in Port Saint Lucie Florida.

- May 2nd we mailed Bayshore management an application to be approved for the full time residence. My wife and three year old child and I purchased the unit to relocate from New York to Florida.
- June 25 we were scheduled to close but the approval letter from the board, permitting me to move in, was not returned because the lawyer for Bayshore management Association was still negotiating back fees. To date $11500 was owed to Bayshore for previous maintenance fees. The president of the Board of Directors had to sign off on our background check allowing me and my family to move in.
- July 1st, 2009 was a second closing date and we did not close again, because Bayshore management's lawyer agreed on amount to be paid back but did not sign the documents allowing the closing to proceed. My wife went to [redacted], the manager of Bayshore Management, asking him for pool key. He refused to give key, questioned her about the payment of past association fees that were owed.
- July 3rd, 2009 Liberty title closed property through mail and computer with Fannie Mae. They wired the money to Fannie Mae and closed for me. I wired money to Liberty title about two weeks prior.
- July 4th and 5th three families moved out from our street. Out of 22 units next to mine only 5 units had people in them.
- July 6th at 9:30 am I was outside with furniture deliveries and lady across a street and another neighbor told me I can't move small child into the unit because it was toxic. I said "It can not be, the inspector check it". I refused to believe it. The neighbor and I went into my unit where he start taking out the electrical outlets. The ground wires were black along with AC coil. Along the same wall two appliances were missing. The corrosion would rust the electrical components that would render the appliance non-working. The neighbor told me that over the last two weeks about twelve neighbors have moved out because of corrosion and health problems linked to Chinese drywall.
- July 6th about 10:30–11:30 I went to the satellite office of Bayshore Management to speak to [redacted], the association manager. I asked him if my unit has Chinese drywall. The receptionist had a colored chart on her desk that he looked at and said" Yes, your unit has a "mild case" of Chinese drywall. I would not bring my child in there." He also recommended not taking the furniture out from there, suggesting cross contamination.

When I asked why he did not tell us prior to closing he replied" I can be sued for blowing a sale. And you should have been told by the seller."

In my case Fannie Mae had deed to the condo and the original owner was not on any of the closing contracts only Fannie Mae. I purchase a toxic condo from Fannie Mae.

The chart that [redacted] was referring to was created by the president of the Board, [redacted]. [Redacted] was paid to determine all of the condo units with Chinese drywall; this was months prior to my contract to purchase. Approximately eighty of the one hundred and ten units had Chinese drywall.

[Redacted] did the unit evaluation back in March and with the Board of Directors did the mailing to the residents informing them of the toxic drywall in there unit. This letter went out in April certified mail.

The letter for my unit went out and was singed by the previous owner that was foreclosed over a year previously by Association and the bank.

- July 10th at 11:30am I called the PSL Property Appraisers office. Their # is 772 337 5760. I told them about my problem and they said to contact [redacted]. He is the president of the Board of my condo association. They informed me that Howard was at the Property Appraisers office month ago giving them a list of all the toxic properties in my neighborhood.

  The list would let the Property Appraisers office deduct the amount of money to fix unit called "Right to Fix" from the Appraised value which in turn lowers your taxes.

- July 10th at 12:30 pm I called Fannie Mae at 972 773 4663. I told them that the unit they sold ns is toxic, and I and my family are homeless. They said they will do a "Page send" and someone will call me in two days.
- Jnly 13th or 14th a rep called from Fannie Mae saying that it was my job to do Due Diligence to find out history of the unit. I told them that they did not disclose the findings of the unit knowing that last owner foreclosed because of Toxic drywall. The inspection service for the bank is First American Field Service, there phone number is 1800 873 4532. I called them and they said to call the bank if I have a problem.

  First American Field Service left a large sticker across the condo's front door with their name and phone number that said they inspected the unit.

Additional information found on my closing contract:

- Fannie Mae File #SL–09–0171. Alfred L. Gonzales of, as partner of Adolno & Yoss LLP, Attorney in fact of Fannie Mae A/IC/A/Federal National Mortgage Association.

Additional information:

- Fannie Mae 972 773 4663 in Texas.
- Liberty Title Company of America inc. 10060South Federal Hwy., Port saint Lucie, FL, 34952 (772 335 7474). Sharon Evans was handling the closing.
- Property Appraisers office PSL (772) 337 5760. "Cost to cure" adjust value paperwork was given to them by association president. This outlined all of the infected units.
- Business Tax Office. A&A Inspections is inspector we hired to check the apartment for Chinese Drywall. I called them if inspector is licensed and insured. He is licensed in PSL. However, inspector is not a "trade" in Florida, therefore NO insurance is required. The owners name is Steve Frank at 514 SE Guava Terrace, Port Saint Lucie, FL, 34983. The office number is (772) 336 0936, cell (772) 240 6219. He is in the phone book as Licensed and Insured, but does not have insurance. I called him to put in claim. He said "NO insurance, sorry"?
- First American Field Services for Fannie Mae 1800 873 4532, inspected the place for the bank prior to me buying it.
- Burt is a property manager his onsite number is (772) 345 0596. He told me that I do not own outside walls, walls touching another condo, ceiling and floors of my condo. However they did not disclose to us that "their" part of the condo I purchases is toxic. He is on the Board of Directors. Their position is that the sell is required to disclose not the Board.

In July of 2009 I purchased a two bedroom two bathroom one car garage condo in a plauned commuuity, located in Port Saint Lucie Florida. I purchased the unit in good faith from Fannie Mae not knowing or ever hearing of Chinese drywall. I am from New York and this is a problem typically found in the south. The unit was inspected by prior to my purchase by First American Field Services I suspect this was for Fannie Mae when they tool ownership, the finding were not disclosed to me. I am presently strapped with a unit I can't live in, sell, or rent because people are getting sick from the drywall. The Chinese drywall problem has created a lot of foreclosures and in my case the person required to disclose doesn't and the new homeowner is stuck with a toxic asset.

Thank you

RE: Defective Drywall

We recently watched our dear frieud, Brenda Brincku, testify before your commission regarding the plight of thousands of homeowners that have been plagued with defective drywall, without any assistance from our insurance carriers or Federal goverumeut. The recognized affects of defective drywall has been acknowledge for

nearly four years now. There have been countless studies that seem to prove inconclusive as to whether there are any health or safety hazards. Yet every victim of a defective drywall home can testify of numerous safety hazards in their homes along with varied health conditions caused by the defective drywall.

My family has also been a victim of defective drywall at our Cape Coral, Florida home. And, like the Brincku family, we were the owner/builder that hired all of the sub contractors to build our dream home. Therefore, we had no builder to go back to for any form of restitution for this uightmare. We turued to our builder's risk insurance, only to be denied, due to tbe pollution exclusion, which is in virtually every insurance policy.

Before discovering that our home was built with defective drywall, we encountered numerous malfunctions of various electrical components throughout our home. Our alarm system would go off for no reason; some of the plastic components of the alarm system completely disintegrated; the control panel on our wall oven (that may have been used a total often times) completely malfunctioned and had to be replaced, our pool control panel had to be replaced, brand new computers stopped workiug, ceiling fans burnt up; and a sprinkler clock had *to* be replace. A majority of our plumbing fixtures were pitted, mirrors were blackened along the edges, two year old paint cans were completely rusted through, screws completely rusted and pitted, and various tools rusted.

If the defective drywall can cause such damage to hard metals, imagine the affects it can cause to the delicate tissues of the human body.

I have been an electrician for 32 years and have never seen copper wiring turn black as I did in my own home. I initially did not feel that the electric needed to be completely removed until I stripped several feet of romex wire in various locations throughout my home. To my surprise, the blackened copper had traveled intermittently throughout all of the wiring in the house. The exterior of the romex had also turned brown in various locations on all of the romex. I do not how the CPSC can conclude that the wiring is *not* a safety hazard.

As far as the health affects, everyone in our family was affected differently. I would get sore throats, headaches and cough, my children were always lethargic and slept most of the time, and my wife would get rashes, nose bleeds and headaches. These symptoms would always subside after a few days back home in New Jersey. These are the varied symptoms that are synonymous for every victim of defective drywall. Fortunately for my family, this was not our primary residence, and we had somewhere else to go to breathe clean air and not be sick on a daily basis.

Financially, the defective drywall has devastated our family. We invested over $500,000.00 to build our dream home. We used our lifelong savings along with taking a mortgage out on our primary residence in New Jersey. When we discovered our home had the defective drywall, we could not just walk away like so many families did, because we would risk loosing our New Jersey home, in which the loau had been secured with. We opted to fix our home immediately, instead of waiting years in hopes of any type of lawsuit settlement or help from our government. This was not an easy task, my wife and I were both employed full-time iu New Jersey, with two children, then ages 13 and 19. We flew back and forth to Florida over 18 times in one year, along with driving to Florida for one month to completely demo the house and rebuild it. We rented au RV to sleep in ou our property and worked 16–18 hours every day for a month to get our home back to a livable condition. We had no cooking facilities, because the Township would not permit us to hook the RV up to any of the utilities, for fear of ground contamination. We kept one toilet bowl iu place along with a shower in the house. We showered at night with flash lights for weeks while the electrical was ripped out, with no walls for privacy. We had an outdoor sink for cleaning and brushing our teeth. We also slept on our outside lanai a few nights before we received permission to have the RV on our property.

I understand that you have not received many letters from the thousands of victims of defective drywall. Please realize that we have all been asking for help for several years now, only to have our pleas fall upon deaf ears or have "so called experts" say that there are no health or safety hazards. I invite each and every expert to spend one week iu a house with defective drywall, then tell us agaiu that there are no health or safety hazards. During your defective drywall hearing, Senator Warner questioned Dr. Portier of the Center of Disease Control if he would allow his family to live in a house with defective drywall and his respouse was "probably not". Those words speak volumes as to how he can then say that there are no health issues with the defective drywall. Unfortunately, many victims have simply given up the fight aud have walked away from their homes and are now liviug iu finaucial ruin. I applaud the Brincku family for not giving up and renewing my faith that someday someone will listen and help the thousands of American people that have been affected by this disaster.

Thank you for the opportunity to share our story.

To Whom It May Concern:

We had built our home in Vero Beach, Florida in 2006. We paid top dollar for it as it was the height of the market. We filled our home with beautiful furnishings and things that we love. We were all prepared, in September 2009, to sell our place in NY, retire and move to Vero Beach. As luck, or should I say, as life happens our move never happened. When we went down to our home in June of 2009 we realized our A/C unit had yet again failed. Upon consultation with our AC repairman, we for the first time heard the term Chinese drywall. Needless to say, after months of painstaking agony we realized that our beautiful home was being eroded from the inside by sulfuric acid.

We contacted the builder, who we learned was in the process of filing for Chapter XI protection. We were devastated to learn that our 10-year structural guarantee was not worth the paper it was written on. We proceeded next to our insurance company. They informed us that they would not be getting iuvolved with CDW because our insurance policy precluded such coverage. No matter who we contacted, no one was interested in our problems.

We next realized the only way to proceed was to hire an attorney which we did. However, we were told that we were required to pay all of the expenses of the home, mortgage, taxes, insurance, etc., on the house. We could try to get our mortgage company to give us a forbearance or we could sell the house. How could be sell a house with toxic drywall to anyone else? So we were doomed to deal with this nightmare alone.

Thereafter, we spent five hours a day for two years trying to contact our Florida and NY representatives, hut to no avail. We begged and wrote letters to anyone that we could think of. This too was of no use. There was no one out there who gave us any hope. It was either paying all of our bills in a timely fashion or losing the credit it had taken us a lifetime to build. Not to mention the house was uninhabitable and corroding.

My husband, in the meantime, had sold his husiness in anticipation of retiring to Florida. He was left unemployed, which has gone on for the past 2.5 years. He has been forced to take menial jobs just to make minimum wage. I was forced to put my retirement off and am working double duty to try to make ends meet. This is the "gold years" for us. A time in of our lives when we were hoping to be able to rest and slow down, we have been forced to work harder than we ever imagined.

Our home in NY in June of 2009 was worth $200,000 more than it is worth today. My husband and I are unable to sell our NY home, unable to sell our Florida home (it is currently underwater financially)and we are living a meager and depressed existence awaiting a settlement or resolution of this horror. What should be the best years of our life have turned into the worst.

During the course of the past two-and-a-half years I have been shocked to learn that our government has refused to acknowledge the desperate straits that working, responsible, middle class families have been put in due to the corrosive product that was allowed into this country. How can it be that here, in the land of opportunity, when you pay your bills and abide by the laws of the land, that such a devastation can occur? How can there be no criminal repercussions? How can tens of thousands of families he hung out to dry after spending their life savings on what they believed to be their dream homes? How can children not be protected from illness and death due to toxic products being allowed into our country?

Perhaps we are naïve, but these American families, who are responsible, hard working people, were taught to believe their country and the values of right and wrong. These are the same values we teach our children. Many of our victims served in the armed forces to protect our country and the lives of its citizens. Yet the government has chosen to remain silent and let us lose everything we have spent our entire life working for. It just doesn't make any sense.

If we can provide you with any further information, do not hesitate to contact us.

December 8, 2011

To Whom It May Concern:

My family and I are Toxic Chinese Drywall Victims. We built a house with Knauf Drywall and our lives have been turned upside down ever since. The roller coaster of emotions almost tore our marriage apart. We lived there without knowing that we had it, and we all kept getting upper respiratory infections. It got to the point where we were all on antibiotics for something or the other all year. At one point,

they thought my son had Mono. They drew blood and took X-rays. That's the image I have in my mind the most through all this. My son with his arm begrudgingly out having blood taken out. Now, all I worry about are the long term health effects that our exposure will have on onr kids. My daughter is having stomach aches for no reason at all. My mind wanders down paths of their children being born with defects or maybe they're sterile. Nobody knows yet what will happen to them. As far as my wife and I are concerned, we have tingling in our hands and definite neurological issues.

As for the house, it is getting remediated. We were one of the lucky ones who hung in there and paid our mortgage and were fortunate to have Knauf and Banner Supply make things right. The stress has been immense. There are days when I feel like I could snap for the least little thing. Not only did the drywall take away our sanity, but it took away thousands of dollars in antiques, car alternators, air handlers, TV's, microwaves, hard drives, air purifiers, jewelry, and God knows what else. But, what about the people who did not have Knauf or any other help? What about the people who rented this houses and were exposed to the gases? What about the workers who installed the original product?

In a few months the "Drywall Family" will be moving back into our neighborhood. Maybe now people will let their kids come over to play with my kids. Maybe now they will come inside instead of standing out in the rain. Maybe now we can move on. Maybe . . . if the health issues go away. I know for a fact that there are going to be long term health issues with myself, and that my exposure to the gasses will shorten my life. That's no problem. But, what's really unsettling is that my grandkids who aren't even born yet, might be dealing with a birth defect because a builder didn't notify me, or that my kids will deal with the harsh realities of a government who did very little in the wake of their countries number one consumer product safety issue to hit dnring their watch.

December 8, 2011

On behalf of my family I am personally asking for your help. I am an Army Special Forces Lieutenant Colonel with over 20 years of service, and found out a year ago that our house has Chinese Drywall. As you are probably aware, tainted Chinese Drywall emits toxic fumes that erode metals in the home (copper wire) and has been linked to numerous health problems. Since we moved in the house in 2008 my family has had two hospitalizations for respiratory related issues that we attribute to these toxins. Since determining that our house was infected, my family has lived in a single room of the drywall house (most ventilated space), in a camper in the garage, and finally in a small house. To say that two mortgages (with related costs) is a huge financial drain is an understatement—I honestly don't know how long I can maintain this.

The emotional toll that accompanies this issue has dominated my family for the last year. Although we are signed up with the ongoing class action law suit in Lonisiana, and have contacted all of our State and local governmental officials, very little progress is being made overall. Local officials look at the problem as a Federal issue, and those in D.C. see it as a litigation and/or Chinese diplomatic issue. Therefore, almost nothing is being done to help those like my family who are having significant challenges. This issue has affected my career, in that I cannot realistically deploy without serious negative repercussions to my family's ability to maintain two houses, one of which requires constant maintenance dne to the toxins' effects on the appliances and internal wiring. I'm hoping that you are able to influence our Nation's leaders to introduce legislation, or influence our press corps to report on this issue to force our governmental to acknowledge that more should be done. You have always been supportive of our military, and have made a career of providing a "voice" to those like me who don't have one—thank you.

As a military member I've been conditioned to offer recommendations whenever I have a problem or complaint. Therefore, short-term our government should establish an immediate financial remedy, allowing us to fix and move back into our home. Mid-term, legislation should be established that includes the Chinese Drywall issue as part of a more encompassing package. Because thousands of homes are affected, and it will take 20–30 workers to fix each, the overall "throughput" back into our Nation's economy will be counted in the millions—both in dollars and jobs. By establishing a funding line now, immediate impacts will be felt at the local level, regionally and eventually throughout the Nation as a whole. Finally, long-term solutions must center on addressing China directly, by taking responsibility for the problem and for the forgiveness of a portion of U.S. debt to reimburse the "up front" costs to our government.

I sincerely thank you for taking the time to address this issue.

To Whom It May Concern:

Our drywall story begins back in February 2007. We built our home on land which was given to ns by [redacted] father. Within a little over a year of living in the new honse, onr A/C coils quit working. Within the 2.5 years we lived there we lost 3 sets of A/C coils and other things broke as well: computer, microwave, our doorbell, and an electric dog fence controller that was in a window sill. We had more items malfnnction, bnt those are the main ones that come to mind. As far as the A/C unit we assumed we had gotten a defective one, and even spoke with Penny-Worth Homes (onr bnilder) abont this issne. They said there was nothing they could do becanse onr warranty had expired. We had a lot of corrosion to the light fixtnres, and the mirrors began to bevel.

Immediately npon moving in, [redacted] began to develop migraine headaches daily. She had headaches in the past but never as frequently as in this home. We both had nose bleeds, and general fatigue. In August of 2007, we welcomed into the world our son, [redacted]. He was born with respiratory issnes and was in the NICU for 8 days. When he came home, [redacted] began a battle with chronic ear infections and rashes. Over and over we were at the pediatrician for the same thing. Later, when they began testing of the home and cut into the walls, he developed a nose bleed and from there he had CHRONIC bronchitis. It seems for the past couple of years he has been constantly battling some kind of respiratory issue. We've seen numerous doctors and the best explanation we can get is: "Healthy children can fight off these bacteria they normally are exposed to bnt since he lived in a toxic drywall home, it can be more difficult to recover quickly." Nebulizers and inhalers have become routine in onr home, even thongh we no longer live in the toxic house. I am convinced this all happened when they opened the walls and exposed us to the drywall dust.

[Redacted]'s mother had heard abont Chinese Drywall on the news and said, "Maybe you all have this issue." We laughed it off since things like that do not happen in Interlachen, Fl! Then in August of 2009, a friend posted online that she had not been around because they had to move due to Chinese Drywall. She posted a link to the state of Florida site that tells the signs and symptoms. Honestly, some of the pictures were so similar to our home! We were in shock. Immediately we hired an investigator who said that we had all the signs of the problem. . . . *Except* he couldn't find Chinese Drywall . . . only National Gypsum. Over the next several days we spend hours researching defective American drywall and learned of Brenda and George Brincku who had the same problem as us.

We have since had other experts including one of the leading environmental researchers from the University of Florida out to test the house. This particular expert said that our drywall was off gassing sulphur almost as much the Chinese cases. Iu fact, he said it was the worst American Drywall off gassing he had seen.

Through our attorney's investigation, it has been concluded that our National Gypsum wallboard has come from their Apollo Beach, FL plant. After the chemical testiug was completed it was determined that the most problematic board was National Gypsum's greenboard which was removed from the market in 2007.

Our lender is OneWest Bank and they are not working with us. We recently had to hire a foreclosure attoruey to help us deal with this issue. This whole ordeal has taken a big financial impact on us as well. Hiring the lawyers, and paying rent for the apartment, which is more expensive than our mortgage payment and smaller, is costly. Jim's credit has already taken a huge hit due to the missed payments, even though it was perfect before the drywall incident.

We now are in a lawsuit with the Brincku's and the Garcia's against National Gypsum. There is a big problem here, and we ueed answers. My child has suffered from this, and still talks about the drywall even though it's been almost two years since we left the house. He will be four in August, and he really misses his "blue house" and living uext door to his Minima (grandmother)! I am worried about future health risks. I need answers about my baby's health. I want to know this is not something that will haunt us for years to come. Please help with this issue!

August 16, 2011

President BARACK H. OBAMA,
Washington, DC.

RE: Chinese Drywall

Dear President Obama:

On August 3, 2010 we found out that we were among the thousands of victims with homes built using defective Chinese drywall. Construction on our 4,000 square foot home commenced in January 2006 and we moved in over the Labor Day weekend 2006. Between the day we moved in and August 3rd of last year we had to replace our HVAC coils three times and we had to replace two flat screen televisions. We thought we were just having an unusual run of bad luck. Little did we suspect that our bad luck wonld soon turn in to a nightmare. In July 2010 we received an unsolicited letter in the mail from a local attorney which included a copy of an invoice indicating that over 250 sheets of suspected Chinese drywall were delivered to our lot during construction. The letter advised us to have the home tested, which we did, confirming on August 3rd 2010 that we in fact did have defective Chinese drywall in the house.

We immediately joined the support group, Victims of Chinese Drywall.com, started meeting with our elected Representatives and Senators and quickly concluded that any help from our Government would be years, maybe decades down the road. We became part of a class action lawsuit against the Chinese manufacturer of the defective drywall and filed lawsuits against our bnilder and the snpplier of the drywall. We expect to win judgments against both U.S. companies but we also expect both to declare bankrnptcy in order to avoid compensating their victims. We have no idea how the litigation against the Chinese will turn out as they are seeking to avoid jnrisdiction in the United States. It also appears that the insurance industry has found the loopholes they need to avoid being part of the solution too. Another looming unanswered question was what kind of impact was this contaminated product having on our health? We could clearly see evidence of pitting and corrosion on our lamps and jewelry, what was happening to our lungs? We then decided that, like everything else in our lives, it would be up to us to remedy the unfortunate situation we fell victim to.

In January of this year we hired a contractor, packed up and moved out of the house, tore out everything inside, including drywall, electrical and plumbing fixtures leaving nothing but the studs. We let the gutted house air out for a month, had an environmental engineer certify that all defective drywall had been removed and the remains cleaned, and proceeded to rebuild. We moved back in at the end of May having depleted a significant portion of our life savings to cover all of the costs. The anxiety hanging over our heads was now behind us. We were one of the fortunate ones with the means to take care of ourselves and feel sorry for those victims who are still living with the nightmare. There is a saying that we are all two disasters away from financial ruin. Well we are now down to one. The one bright spot, and the only Government agency to offer any direct help to victims that we know of, was the City of Virginia Beach which reduced the real estate tax assessment on our home for a two year period.

Please give us an update as to where you are in addressing the following questions—Where are you and Secretary of State Clinton in pressuring the Chinese to compensate their victims in removing and replacing the defective Chinese drywall similar to the way the you made British Petroleum set up a "victim's trust fund" during last year's oil spill disaster?

How do we get this situation declared as a National Disaster so that Federal assistance dollars can be made available until the Chinese step up to meet their obligations?

Who is pressuring the Insurance industry to step up and share at least some of this burden?

When will CPSC Chairman Tenenbaum finish the CPSC analysis of this defective product and issue final remediation guidance?

When will Fannie Mae President Williams provide clear, uniform guidance to lenders and servicers for the victims of this defective product?

It is our understanding in talking with other victims that these questions have been pending since early 2009. We urgently seek your help in getting answers to the questions posed and look forward to your response as quickly as possible.

OUR CHINESE DRYWALL STORY

I worked part-time last year, after several years home with my son. My entire salary and more is being absorbed by a defective condo that I had to vacate but am still obligated to maintain. I worry *daily* about the financial future of my family and about the possibility of permanent health effects from having lived in a toxic condo for 4 years. I want to go back to school to train for a new career, but I can't afford to, and resent that unforeseen outside forces have so much control over my life and thoughts.

I respond to every plea from a charity (or my child's school) with "No," though I believe in their mission, and I tell them why. When my country aids victims of natural disasters, instead of feeling proud, I am embarrassed at my reaction—what about the loss of *my* home and the thousands of other families whose homes and futures have been ruined by another unforeseen disaster, Chinese Drywall and the nearly complete *absence of responsibility* by involved parties? Recent tornados have me thinking, "Gee, I wish a tornado or hurricane or fire would erase my Florida home, because THEN someone would care, and insurance would pay, and maybe even charitable organizations would help!"

I check the "Made in" tag on *every* item I contemplate purchasing, and walk away from the "Made in China" items whenever possible (I'll pay more for a similar item from elsewhere, or I don't need it). I throw away my son's Halloween candy that is Made in China—at least he won't *eat* their tainted products (my brother who works at Borden says they mix Chinese-made chemicals into some dairy products, so maybe I can't prevent it . . .). I successfully filled the goody bags from his last birthday party with only home-made items, but he receives bags at parties full of potentially toxic Chinese junk.

I once had a different attitude. I contributed thousands of dollars over the years to charities. I used to enjoy shopping. Now, it is a game of Keep Away from China! What happened? My home, built in 2006, contains Chinese Drywall and the concomitant corroding metal and vanishing value. My builder? Gone. My homeowner's insurance? Not their problem. My attorneys? They'll get nearly half of any settlement, if there even is a settlement, *unless* a U.S. judge can get the involved *foreign* companies not only to remediate the homes, but to cover all attorney and court costs—unlikely. Now, I wonder not only if my son will go to college, but if my husband and I will ever retire. We have both volunteered time and energy to help build Habitat for Humanity homes—but no one will help us re-build our home? My husband and I gladly put together a care package to send to an unknown family after Hurricane Katrina. Ironically, that hurricane indirectly caused my problem, by helping cause a domestic drywall shortage because of post-hurricane re-building. We volunteered at a post-tornado clean-up a few years ago; where are the post-drywall volunteers? The Wizard of Oz has nothing in his bag for *us*.

We didn't go blindly into the abyss. Our home inspector detected nothing amiss. If only he had been in on the communications between Banner Drywall Supply and Knauf Plasterboard Tianjin! *They were aware* that something was smelly in the drywall business, soon enough that we, and many other families, could have backed out of the purchase and been spared all this agony. But *they conspired in silence*, so we had no way of knowing about the Chinese Drywall problem at that time. We excitedly closed the deal, and got take-out food to eat on our new kitchen floor that evening. Hey, as long as the fine folks at Banner and Knauf and Taishau are making money, well that's what's really important!

What led us to this home? In 2006 my husband accepted a career opportunity which moved us to Lee County in Florida; this was to be a stop of 3–4 years before moving on to the next opportunity (his career benefits from his working in different locations). We sold our home in Tennessee, and logically desired to put *all* that money into a new home. We were fortunate enough to get a mortgage and purchase price within our means. (Nevertheless, we have watched our home value decline as the market has declined, and so started singing the blues!) After 6 months of renting, we moved ourselves and our healthy two-year hold into a new condominium in Avalon Preserve in Ft. Myers.

In under two years, I noticed bathroom fixtures corroding—drain covers in the tubs are pitted and flecked with black, mirrors have black spots of de-silvering, and lavatory faucets we had upgraded are pitted/flecked. I called the customer help line at Peerless to get advice on these faucets, hoping that they were still under warranty (no such luck). I was advised to clean them with vinegar and to keep them waxed; some of the black did come off when cleaned, but built up again quickly, despite the waxing. The other items? The builder must have put in the cheapest possible stuff, we figured. Also in under two years, we had to replace a smoke detector

and a ceiling fan due to malfunction; both of these were still under warranty. We also replaced a vacuum cleaner, and threw out a VCR and two "boom boxes."

In Dec. 2008, I read the first article in the *NewsPress* about families having defective drywall that required replacement of the AC condenser coils as often as several times in a year. Because we had no trouble with our AC, I didn't connect the dots to discover the source of my bathroom fixture troubles. Suspicion began when I noticed AC service trucks frequently parked in driveways on my street, and recalled that there had been talk of defective AC parts in units on our street since the first were occupied in summer 2006. When the unit below mine was inspected and found to have defective drywall, I called for AC service and learned that we, too, have defective drywall and a deteriorating AC coil. Two drywall inspections and the video we took during construction confirm the drywall source as China.

Our neighborhood has 104 condominium units in 26 buildings, all completed in 2006 and 2007. It is unclear at this time how many units have bad drywall. Our neighborhood clubhouse also has defective drywall. Discovery of defective drywall has been a factor in several foreclosures and sales well below expected market value. This in turn has stressed *all other owners*, because the neighborhood association is not receiving quarterly dues from owners of many affected units, resulting in higher dues for the rest. And the reputation of the neighborhood is tainted in the realty market.

In our building, two families that were renting on a yearly lease moved out upon discovery of defective drywall. We were the only owner-residents, and became solo residents of the building in 2009. We also experienced our first AC coil failure that year. We didn't feel we could afford to move out, but my husband began looking for a new position in earnest, and in Nov. 2010 we vacated our condo and moved away from Florida. We may have to pay for not only our own remediation (or just walk away from lots of equity), but also be forced to help pay for the clubhouse remediation.

Now, we pay a mortgage, electricity, and association dues for a nearly new condo we do not live in, can not rent out, and are afraid to sell at the price that defective drywall homes command. In addition, we are paying monthly rent and utilities where we are now living. While we are grateful to have a place to live, this rental house does not meet our needs but we can't afford better rental property or a second mortgage. Could my husband have delayed his job search until this situation is resolved? I suppose, but why should a circumstance like this be allowed to *permanently alter* our life course? And how long will it take to resolve in the courts? And what are the long-term health consequences? After reading the suspicions that several infant deaths at Ft. Bragg may be associated with defective drywall, it was clear that we had to put the health of our child before our financial fears.

Time will tell if it has affected our health. While living with defective drywall, I was diagnosed with irritable bowel syndrome and had my gall bladder removed. Recently I was diagnosed with thyroiditis, which is known to be affected by pollutants.

Please, please, please Mr. Obama and others—*acknowledge* that this disaster is on par with "natural" ones, help all affected families, and stop doing business with irresponsible, unrepentant China!

To Whom It May Concern:

June 21, 2002: How excited and proud I was that day when I moved into my first home. Just four months later, on October 22nd, the air conditioner stopped cooling. There was a leak, and when I called the builder, his A/C contractor added Freon.

That day was the beginning of my story—a different one because over the past **nine** years I have had numerous air conditioning technicians look at the A/C coil failures with curiosity. They could only speculate on what was causing black soot to appear on the copper. Each time, they charged the A/C unit with Freon until, ultimately, the coil had to be replaced. I have had **eleven** coils installed at my expense, spent thousands, including a very expensive coil coated with a substance made to sustain salt corrosion in the islands. It started leaking 8 months after installation. I told myself that was it—I am not putting in another coil, however, with the cost of putting in Freon once a week . . . I even bought my own tank! It only made sense to purchase yet another on Sept 3, 2011, knowing in 6 months it will need to be replaced. Every 6 months I listen for the last bit of Freon to run out from a corroded coil .

Unfortunately I will be long gone by then, having finally exhausted myself mentally and physically—fearful of what 9 years of stress has done to my body, let alone

wondering what the toxicity that has blackened 11 coils could've done, tarnished jewelry, electrical wiring corrodes. I have had to replace five projection lamps in my Samsung DLP TV. My 2006 Jeep, which I keep in the garage with the A/C air handler, has had mysterious electrical issues. I have been afraid to turn the gas on in winters, in fear those wires have become corroded as well. Eventually I can repair my credit (the only way for me to escape completely was to file bankruptcy), however, no repairing my health. I absolutely can't do this anymore.

My home was inspected by a certified inspector. He sent core drywall samples and pictures showing "Made in China" to Atlanta, confirming the problem originated from **contaminated Chinese Drywall.** My entire house was built with tainted drywall.

I feel my situation is atypical because I am not in a neighborhood with others that have the Chinese Drywall. My lot sat empty for a couple years before Kimball Hill Homes built on it. My builder filed Chapter 11 bankruptcy in 2008. It seems to be a no-win situation, so much for the American dream.

THE CHINESE DRYWALL TOXIC ENTOMBMENT—LET OUR STORY BE HEARD

On January 10, 2007 we bought and moved into our home at [redacted] home in Founder's Pointe. We were so excited to have finally bought our dream home that we had saved for all our lives in a great neighborhood. We met many friendly neighbors and thought we could uot be happier.

We noticed (even before purchasing our home) from the start that this house had a peculiar odor that was hard to describe. It was not pleasant but was a sharp, caustic chemical uuusual smell that is hard to describe as we had never smelled anything like this before. We believed when we questioned the bad smell, the Founder's Pointe East West realtor, Amy Geaphart, told us, "It is a new home smell." I mentioned that none of the other new homes we were looking at had this smell but she insisted, "That different builders use different glues and products that make each house smell different". She was aware evidently as she didn't disagree that the house smelled of something odd. We innocently believed her. We continued for 3 years to notice the smell that we referred started to refer to as the "Chip Smell" (builder's first name) since he was the builder. We could not understand but hoped it would eveutually go away.

Then the nightmare began to unfold.

I developed a chronic "choking" cough immediately that sent me to the doctor. This was somethiug I had uever had in my life. Finally after changing doctors three times, in attempt to find out the cause and treatment I was being treated for asthma. I continuously coughed each morning and night as if I was choking to death. I woke in the night gasping for breath on more than one occasion. My husband started having nose bleeds that he had never had in all the years together. Our HVAC went out after turning it on the first summer. The builder ([redacted] with ABT Custom Builders, formally known as Area Builders of Tidewater) replaced the parts. Then the upstairs HVAC unit went out within the same time frame. This happened continuously throughout each of the three summers until they had been replaced/repaired a total of 9 times. The last time our builder, [redacted] informed us we had nothing but Chinese Drywall in our home. We were devastated beyond words. Over the 3 years living there, we have lost 2 flat screens TV's ($3800.00), computers, cameras, heirloom silver tea set, jewelry, all lamps wiring are black and corroded. Since leaving this toxic chamber or horror, three years living in a house of 100 percent CDW was too long. After moving, we realized how bad everything smells (furniture, sofas, mattresses, rngs, comforters, pillows, blankets, curtains, clothing, linens, sheet, etc.). We've had to dispose of all the big items such as sofas and mattresses). Also, our appliances and electrical items will most likely not last as they were already coded (refrigerator, stove, microwave, dryer, washer, lamps all have coded cords). The casualty losses have been devastating not even including the CDW honse loss.

The smell was in our furniture and everything to include our coats and clothing. Our losses are overwhelming not to even mention our health!! Plus financial devastation of onr huge down payment and house loss entirely. The house is now valued by Isle of Wight at $1,000.00 dollars.

The nightmare continues like a black cloud following us. Aside from the financial losses and major health problems there is no words to describe the mental torture we've had to endnre. We lived in this homes for 3 years before this toxin was realized and we watched and felt our health deteriorate, never imagining that it was from toxic drywall used in their home. Our health, home, and finances are destroyed.

There is no help for the victims. We just had to leave with 247 sheets of this toxic drywall (entire honse—worst in the neighborhood). On our moving day, I had to go to the Chesapeake General Hospital Emergency Room for chest pains, heart and respiratory issues. It just got too bad and we had to go. We hope someone will help ns.

We are approaching retirement age and have lost our home—couldn't take it anymore. The depression and health problems were too much to bear after realizing no one is helping. Not the bnilder, bnilder's insnrance, home owner's insurance, installer, snpplier, and we are left with the Chinese manufacturing company that will not even respond to the court hearings. The class action law suit is nothing but an empty jndgement. It is like looking np a giant mountain to move and we are holding two little shovels all on our own. It is bigger than ns—we've given up. We've recently discovered after moving that all our lamp wiring is totally corroded and black (clear, gold tint cords show this evidence). Also, couches, mattresses, pine furniture, chairs with cushions and worst of all, my lifetime work of original oil paintings all ruined with toxic sulfur smell. What will happen to them eventually? We are afraid of the fire hazard from the corroded lamps now in our new home and all onr electrical items—refrigerator, stereo, DVR, phones, 3 flatscreen tv's, cameras, microwave, computers, etc. etc. The nightmare continues. More importantly we are very worried about long term health effects since living in this toxic chamber of horror entombment for 3 years before our builder told us we have 100 percent nothing but CDW. He or anyone has done nothing to help us. We cannot remediate as it would be too expensive and the house would never be value it shonld have been for resale. We have moved out and are done with this. The health effects remind me of Agent Orange. At first the medical authorities said Agent Orange had no major health risks and it turned out to be just the opposite. Also, radon—2nd leading cause of lung cancer. This is such a shame and tragedy for our entire country.

We have suffered enough emotionally, financially and mentally through this toxic tragedy and onr lives have been turned upside down and inside out. We would have been much better if a tornado, hurricane, flood or fire destroyed our house. As it is now, the house is worthless and has in addition destroyed our lives. At least tornado, hurricane, flood and fire victims are covered by home owner's insurance. Nothing is helping or covering our loss. My husband [redacted] served in the United States Marine Corp for 26 years and is a retired officer. He feels as though he has been left on the battleground to die.

"The world is a dangerous place, not because of those who do evil, but because of those who look on and do nothing."—Albert Einstein

---

To: Whom it may concern 12/8/2011

We have Chinese drywall

We built our home in 2006/2007 with Monopoly Builders, who are now baukrupt, and the 2 principals have fled to Mexico to be outside of our legal system. [Redacted] the owner, placed all funds in a trust for his wife and together they fled to Mexico protected by the trust in her name

I am 60 years old, and have had my same job for 33 years. [Redacted], my life partner, owns the home with me and we live here full time

We bought a lot in the Cape for appx $ 175,000, planning to build our dream retirement home.

We built the home and have just over $500,000, in cash tied into the home plus the $175,000 for the lot.

The home today is valued at, $61,370 by the Lee County Tax appraiser. That's value is based on the pool and the land . The House is of Zero value due to the Chinese Drywall

We have Pro-wall which was made by *Taishan* a company that's owned by the Chinese Government. They claim that the U.S. courts have no jurisdiction over them. They said Judge [redacted] rulings do not apply to them.

Our 2 AC units have had the coils replaced twice. Home Tec, a local service provider in SW Fl will no longer repair any AC damages under our 5 year home a maintenance agreement.

State Farm has now taken our insurance rates up from just over $3,000 per year to over $7,000 for the same coverage. They of course denied any liability on the deffective drywall issues.

I believe that the rate increase is their way of forcing ns to fine new coverage which would then release them of any liability should a court find that the Insurers are accountable

We have had 2 inspections of the home and both have confirmed the drywall

Our attorney believes that it came from Stock Building supply.

[Redacted]'s danghter and son in law live here in the area as well they used to often stay the weekends with us. They will no longer stay and visit us mnch less often as they are concerned about their 3 year olds exposnre to the contaminated drywall.

I see the government spending billions of dollars to other countries.

I have been a productive, taxpaying, law abiding citizen my entire adnlt life.

What now? How do I stay here and continne to live in fear of the effects of the drywall. I do not have the funds to walk away and buy another home. As it is I will need to work way past my retirement age.

My neighbors have asked what you are doing to fix the problem. Our rednced value of the infected home is reducing the average market value in the neighborhood. I guess that's the world we live in today.

Please do nse all measure possible to force the Chinese Government to come to the table in Jan in Hong Kong and make resolution so we can remediate and live onr lives in that American Dream we have worked so long and hard to achieve

Please do contact me with any questions that you may have.

What joy filled my heart in 2006 as I moved into my 'golden years' dream home that I had built with a snpposedly fine bnilder, WCI. I had fonnd the perfect place to live and enjoy golfing, traveling, fun stnff, and lots of volnnteer activities, so many wonderful things available here in Sun City Center!

Why was some of my 14 karat jewelry tnrning dark? Why couldn't I keep my silver polished as I had been doing all my married life? Why was I snddenly getting headaches which I had never, ever had before? Why were my eyes burning all the time?

Why within the warrantee period did my kitchen TV go bad? Happily it was replaced without any cost to me. But within the next two years my microwave went bad (a microwave???? I've had several bnilt-ins in honses I have owned and never a problem!!!) costing $145 to repair, labor only. Then my 32" and 42" TVs went bad. The 32" was $480 to repair and the 42" $535, but of interest: when my repair man called the Toshiba repair desk about the 42" one to get some help, they informed him that in all their years of business they had never, ever had this problem before with one of their sets!

I've had to replace the a/c coils ($878), the disposal ($205), the ever-hot water at the sink ($365), the ice and water dispensers of my refrigerator replaced ($538) and when the microwave went out the second time, I opted for a countertop model which is now showing signs of not working (three and six don't work). And I have now had to replace the 42" TV ($695) and my compnter ($469). My telephone set-np consists of a base-station with a hands-free set and three chargers each with a hands-free set. Two of those chargers no longer charge. I'll have to replace the system ($200 approximately). We're talking about lots of $$$$$$s here that I cannot afford! And when will it end.

My home owners insnrance company took my claim quite serionsly and employed an engineering firm to study my situation at a cost of $3500. Their report shows my home riddled with bad dry wall, but did not identify what causes the problem. I have the pictnres showing the corrosion of receptacles, mirrors, jewelry, air conditioning coils, etc.

I feel like I am sitting on all kinds of 'time bombs,' not knowing when the next one is going to explode and cost me additional fnnds I do not have, were certainly not in my tight budget, should not ever have had to spend, keeping me from traveling or do other things I should be able to do in my 'golden years,' but can't because my house is worthless, just ask any real estate agent. You can't put it on the market. No one would buy it.

All this through no fault of my own . . . . . I did not cause this, am in no way responsible for this. I don't know which way to turn. I cannot afford to fix my home, canuot afford to take out a low iuterest rate loan to fix it, cau barely get by on my present income. I planned very well to live very comfortable here and even when the economy turned sour, I have been able to manage, but to have this Chinese drywall (CDW) dumped on me is just too much. The strain, the pressure is just wearing me down . . . . . the stress is getting to me, and that is totally wrong.

Testing of the CDW is going on, but it is taking too long. We need answers now. We ueed to know what can be doue and who is going to do it and pay for it. Those in our neighborhood who have been told they don't have the problem want to know how they can assure buyers of their homes that they are free of CDW, so they are just about as involved in this problem as we are.

We get some feedback off and on from our elected officials, but it isn't enough. We need action qnickly in the form of pushing CPSC, FEMA, the Chinese government, and others harder to fix onr problem quickly.

This horrible stress is like a knife cutting into every minute of our lives, causing ns to bleed onr 'golden years' out in pain, instead of enjoying those years.

To Whom It May Concern:

While living in a home at [redacted] St Estero Florida our family experienced many serious health related issnes, inclnding hospitalization for pnenmonia, bronchitis and later pnlmonary embolism. I was 48 years old at the time and in good health. Once we moved from the rented home our health issues resolved and have not been present since. This entire sitnation almost took my life, I spent 18 days in intensive care in Naples Florida. I feel most likely others have lost their lives in this fight to prove that Chinese Drywall is harmful to your health. My story is long and painful, I wonld be happy to elaborate with the health issues if anyone is interested in listening.

MY CHINESE DRYWALL PROBLEM

This is my story abont a condo I pnrchased in the summer of 2009 from Fannie Mae. Fannie Mae short sold the unit to me with no disclosure that the unit had Chinese drywall. After some investigating I found out the unit and approximately 80 other nnits have Taishan drywall and were unlivable. To date I have not slept one day in the unit and it is financially running my life. This is the general timeline of the events that happen to me and my family.

- July 1st my wife went to Bayshore management office and spoke to Burt Kelly about reqnirements for the door handle. She also asked: "Is there *anything* we need to know before we start to move to the apartment". *He said "No"*. Nataliya, my wife, as well asked for the key to the pool. Then Burt said that we can not be moving in yet becanse they don't know who we are and they don't have a deed.
- May 2nd we mailed Bayshore management an application to be approved for the fnll time residence.
- Jnne 25 we were going to close but the letter from the board allowing me to move in was not in the packet and the lawyer for Bayshore management was negotiating hack fees. To date $11500 was owed to Bayshore for previous maintenance fees. The president of the Board of Directors had to sing off allowing me and my family to move in as my new full time residence.
- July 1st, 2009 was a second closing date and we did not close again, because Bayshore management's lawyer agreed on amount to be paid back but did not sing documents of onr approval. My wife went to [redacted], the manager of Bayshore Management, asking him for pool key. He refused to give key, questioned her abont fees.
- Jnly 3rd, 2009 Liberty title closed property throngh mail and compnter with Fannie May. I wired money to Liberty title about two weeks prior.
- July 4th and 5th three families moved out from our street. Out of 22 units next to mine only 5 units have people in them.
- Jnly 6th at 9:30 am I was outside with furnitnre deliveries and lady across a street and another neighbor told me I can't move small child into the unit because it was toxic. I said "It can not be, the inspector check it". I refused to believe that. I went upstairs with the neighbor and start taking out electrical outlets. The ground wires were black along with AC coil. Two appliances were missing. The empty neighborhood, moving ont neighbors. Now it all made sense.
- July 6th abont 10:30–11:30 I went to the satellite office of Bayshore Management to speak to [redacted]. I asked him if my unit has Chinese drywall. The receptionist had a colored chart on her desk that he looked at and said" Yes, your unit has a "mild case" of Chinese drywall. I wonld not bring my child in there." He also recommended not taking the furniture out from there, suggesting cross contamination.

When I asked why he did not tell us prior to closing he replied" I can be sned for blowing a sale. And you should have been told by the seller."

The chart that [redacted] was referring to was created by the president of the Board, Howard. He owns the Chinese Drywall screening company. The Bayshore Management paid him $2300 to do the screening of all apartments. Howard did the screening back in March and with the Board of Directors did the mailing to the residents telling them of the intensity of toxic drywall in each unit. This letter went out in April certified mail.

The letter for my unit went out and was singed by the previous owner that was foreclosed on 1.5 years previous by Traditions and the bank.

- July 10th at 11:30am I called the PSL Property Appraisers office. I told them about my problem and they said to contact [redacted], The president of the Board of condo association for help. Howard was in here month ago giving them a list of all the toxic properties in the Promenade. Their # is 772 337 5760. The list would let the Property Appraisers office deduct the amount of money to fix unit called "Right to Fix" from the Appraised value which in turn lowers your taxes.
- July 10th at 12:30 pm I called Fannie may at 972 773 4663. I told them that unit they sold us is toxic, and I and my family are homeless. They said they will do a "Page send" and someone will call me in two days.
- July 13th or 14th a rep called from Fannie Mae saying that it was my job to do Due Diligence to find out history of the unit. I told them that they did not disclose the findings of the unit knowing that last owner foreclosed because of it. The inspection service for the bank is First American Field service 1 800 873 4532. I called them and they said to call the bank if I have a problem.
- Fannie Mae 972 773 4663 in Texas. File #[redacted]. [Redacted] of, as partner of Adolno & Yoss LLP, Attorney in fact of Fannie Mae A/IC/A/Federal National Mortgage Association.
- Liberty Title Company of America inc. 10060 South Federal Hwy., Port Saint Lucie, FL, 34952 (772 335 7474). [Redacted] was handling the closing.
- Property Appraisers office PSL (772) 337 5760. "Cost to cure" adjust value paperwork was given to them by [redacted. for the Promenade at Tradition.
- Business Tax Office. A&A Inspections is inspector we hired to check the apartment for Chinese Drywall. I called them if inspector is licensed and insured. He is licensed in PSL. However, inspector is not a "trade" in Florida, therefore NO insurance is required. The owners name is [redacted] at [redacted], Port Saint Lucie, FL, 34983. The office number is (772) 336 0936, cell (772) 240 6219. He is in the phone hook as Licensed and Insured, but does not have insurance. I called him to put in claim. Hi said "NO insurance, sorry"?
- First American Field Services for Fannie Mae 1 800 873 4532, inspected the place for the bank prior to me huying it.
- Chinese Drywall Screening LLC, [redacted]. Office (772) 224 8660, cell (772) 201 0006.
- [Redacted] is a property manager for the Promenade section at Tradition for Bayshore Management. On site number (772) 345 0596. He told me that I do not own outside walls, walls touching another condo, ceiling and floors of my condo. However they did not disclose to us that "their" part of the condo I purchases is toxic. He is on the Board of Directors.

I am 76 years old; my wife is 72. Our retirement dream home has been devastated and our health has been severely compromised by the "silent, invisible hurricane of toxic Chinese drywall."

We retired to Florida ten years ago, initially living in a condo along the beach in the Clearwater area. In mid-August, 2004 we had our first experience of hurricanes. Clearwater residents were warned to prepare for a direct hit. As Hurricane Charley gathered strength, heading for the Gulf Coast, we evacuated our 16th floor condo . Reaching winds of 145 miles per hour, Charley turned towards land further south at Charlotte Harbor and Punta Gorda, inflicting unbelievable devastation on the residents there. While we were enormously relieved, we realized that every serious hurricane threat would require evacuation.

Withiu a mouth, Hurricane Jeaune, made its way uorthward through the center of the state. While we were not in the direct path of destruction, we were amazed at the ferocity of 70 to 80 mile per hour winds. At one point we heard two loud crashes as the winds swept loose pieces of tile from the roof of a neighboring condo,

smashing into the glass sliders of the condo immediately above and immediately below us, exposing the condo iuteriors to the wind and rain, inflicting extensive damage, ruining drapes, rugs and fnrniture. We were grateful for heing spared again!

As we reflected on the widely circulated projection of 10 years of more intense storm activity, we decided to move to a more secure inland location. We began to search out 55+ communities within driving distance of Tampa We visited the impressive WCI Sales Center and heard the story of how Del Webb selected the Sun City Center location because of its elevation, distance from the water and history of no hurricanes. We were fascinated with the gracious, outgoing, welcoming way of being of almost everyone we met and the incredible number of activities available. We closed on our new home on December 1, 2006. Not having children, this was to be our retirement dream home until age or decreased mobility required a move to a Continuing Care Facility offering Independent Living, Assisted Living & Nursing Care. Equity in our home was foundational to our plauning for later years. Today, our primary asset, a mortgage free home, has little or no value; it is basically unsellable"

Since moving into our home in December 2006, we have experienced many health problems. Early on, we experienced nose bleeds, eye irritation, constant runny nose, chest congestion and uncharacteristic susceptibility to the flu before we knew anything about toxic drywall. Two years ago, I was diagnosed with "early Parkinson's disease. In April of this year, my wife, [redacted], was diagnosed with breast cancer, followed by a lumpectomy, 18 weeks of chemotherapy and is currently completing 35 sessions of radiation. In August, breathing difficulties resulted in my being hospitalized with an eventual diagnosis of severe bronchitis; it took weeks to regain my strength.

In our very senior years, after a lifetime of careful and conservative financial planning, we find ourselves financially devastated by the unforeseeable and catastrophic storm of Chinese drywall. Since moving in, our health has been seriously compromised.

We are beginning to lose hope for any positive results from the complex and extended legal procedures. Our bnilder, WCI, declared bankruptcy; onr toxic drywall was manufactured by Taishan, a Chinese company. The anxiety about our situation is incredibly stressful.

Along with many of our friends and neighbors, we need the assistance of government, at local, state and national levels to help us recover from the effects of this unforeseeable catastrophe.

We hired Aranda Homes to build our Florida dream house. We moved in October 2006. From the start we had an unspecific smell in our home. We assumed it was a "new" house smell. We chalked it up to everything being brand "new". About 6 months later, as I was walking across the floors with heels, I could hear "hollow" sonnds. I became a little concerned. I called [redacted] at Dom Izzo Tile. Through Aranda we were connected to Dom Izzo Tile. (Aranda and Dom Izzo are partners.) It was there that we picked out our carpet, cabinets, knobs, granite, tile, etc. . . . [redacted] said there was nothing wrong. A couple of months later I was hearing much more hollow sounds. Some of the tiles began to crack. Pete had someone come to our house to fix the cracked tiles. As the repairman tried to chisel out the broken tile(s) a domino effect would take place. The surrounding tiles would "pop" up. Sometimes they cracked and could not be reused and sometimes they didn't. After numerous repair jobs we were running out of spare tiles. [Redacted] had the repairman drill holes sporadically in the tiles and fill it with some kind of adhesive. This did not work. The tiles tented. Again the repairman came. Finally, one man came who said the tiles just could not be replaced anymore. The tenting was in too many spots. In July 2008 we had all our tile floors pulled up and replaced. We could not get the same tiles anymore as they were discontinued. We were very unhappy since this was a major factor to ns building this home. The inside tiles flowed to the ontside lanai. When the slider and pocket doors were open it all looked like one. However, this was another problem as we later learned. Dom Izzo Tile used indoor tiles on onr ontside lanai. When we first moved in, we'd get out of the pool and the floor became very slippery when it was wet. We called [redacted] and he came over with something that he brushed on the tiles. They became very dull but it did fix the slipping problem for a period of time.

Approximately April 2009 we hired a handyman to install a ceiling fan in the master bathroom because it was just too hot in there. About a week after the installation he called us. He said he was tronbled abont the wiring when he changed the fixture. He told us the wires were very black for a new house and that they should

have been a copper color. We had recently heard about Chinese Drywall and the problems it was causing. His concerns set off an alarm in our heads. We began investigating. We took the switch plate covers off all the outlets and sure enough the wires were black. Our mirrors, faucets, and toilet valves were pitted. We originally thought this was due to the fact that we live on the canal and the water and humidity had something to do with it. We also thought maybe they were just cheap fixtures. But now everything was beginning to make sense. In May 2009 our air conditioning broke. Tnrned out the coils were all black. Needless to say we were in denial for a while even though the facts were all there. Eventnally, reality sunk in and we knew we had to do something. We had a professional home inspection done. We had too much money invested in this house. We bought the land and built during the housing boom. With the Chinese Drywall it was worth uothing! In June 2010 we began remediation with Shannon Holland of Abisso Cleanse. He and his company did an outstanding job.

As I write this I am thinking about my next project. The outside lanai tiles tented just last week. Does it never end?

I find it very disheartening that our government is turning its back on us. There are so many people that have become ill because of this contamination in our homes. We were fortunate enough to be able to remediate. There are many families who just can not afford to leave their homes. I feel so sad for the families that lost innocent babies at Fort Bragg. Coincidence? I don't believe it! Will it take 10 years like it did with September 11 to realize these sulfurs and chemicals are harmful? We even have to pay taxes on a house that is worth $0. I think if this happened in another country or to a group of well knowns it would have been dealt with already. However, we are just a group of middle class people, barely audible. When is the United States government going to take a stand and do something to help—Go after the companies that knowingly brought this crap into the our country!

To Whom It May Concern,

I have a historical house in Ft Lauderdale Florida. In 2005/2006 I put an addition on my home using chinese drywall. I have had numerous electrical problems, but mostly I have had eye and throat irritation. I was getting nose bleeds for no reason. I tried to get my bank to lower my interest rate to the then current rate. This would free up money to repair my home slowly. I am a building contractor. I was told I do not qualify since my income had dropped. I only qualify for the higher rate. For health reasons I moved out of the house and stopped making payments. I am still trying to keep my house, but I need help in fixing my house. IndyMac just says they are a debt collector and no one can answer my questions and they have never answered any of my suggestions of how to work out a modification so I can keep the house. Now since I do not live in the house I am not eligible for any help. The bank would rather sell the house in foreclosure for 50 percent of the loan value then work with me. Because our government has guaranteed, the loan so why work with me. Chinese lead base paint in baby toys, tainted dog food, drywall, etc, etc, no one in government cares.

In case my previous e-mail didn't go thru here it is again. My name is [redacted]. I closed on my townhouse on December 21st 2007. I found about the chinese drywall in October 2009 from my neighbor. I filed my lawsuit with Richard Serpe on December 18th 2009. Unfortunately, I cannot afford to move out for financial reasons. There is a rotten egg smell that comes from the sulfur emitted from the walls. My girlfriend's silver jewelry turned black. I have replaced about 4 or 5 evaporator coils. I have lost a lot of weight due to the toxic drywall. Thanks for your concern.

My husband and I had our house built by Aranda homes in 2006. Two years later we found out the house was built with toxic drywall. We do not have Knauf so we do not qualify for the Knauf remediation project and our builder took $300,000 of our money, gave us a defective and worthless product and walked away with absolutely no responsibility or accountability. At the age of 55 we had to take out a loan for $75,000 to fix our home. We will have to work until we are 80 to pay it off. We were forced to move out in July of this year due to my sinus problems and my husband's daily headaches. We were told that the United States government has all but abandoned us. They have left the homeowner to fight the Chinese government to try and get restitution. The United States government allowed this toxic drywall into our country and into our homes and now they want me to fight a foreign gov-

ernment to fix this mess. There have been a lot of Americans hurt by this and financially ruined. Thanks to the Chinese Government aud the United States government. I will never be able to retire. I will have to work until my dying day to pay off a loau I never should have had. I paid cash for my home in 2006 aud three years later I am paying for it a second time. It is certainly not fair that some people will get their homes restored at no out of pocket to themselves and yet others are left holding the bag. Where is the United States government? I have paid my taxes my entire life. Why isn't the government taking care of its people?

To Whom It May Concern:

We bought our CDW home (the dream retirement home) in 2006 and we had health problems beginning in 2008. It began with running eyes, followed by throat irritation, cough, headaches, tooth aches, hair loss, breathing problems, insomnia etc. The smell was so bad it gave us sevear head aches, to a point that we had to wear charcoal filter masks to breath in my home. We pretty much lived out side of our house except to sleep and go to the bathroom. We could not turn the air condition on it the Florida heat, could not turn the heater on in the winter time. It was a horrible time for us. Our builder declared bankruptcy so we did not have any recourse, we took money out of our retirement fund and had to rebuild it.

Your help in this matter would be appreciated.

I am writing to you to voice my frustration with the very slow progress and inconclusive results of testing being conducted by the Consumer Product Safety Commission on the harmful effects that the presence of Chinese drywall may be having on homeowners throughout Florida and the rest of the country.

I can't stress enough how serious this catastrophe is and the negative affect it is having on the thousands of homeowners victimized?

I live in a retirement community. On my street alone, 75 percent of the homes have defective drywall present. These are people who have put most of their life savings into what was to be their dream home and now are being saddled, through no fault of their own, with a situation where their homes are in some cases unlivable and in all cases unsalable. These homes present potentially dangerous health and fire hazards, and the homeowners still have no answers from government officials on what to do to fix the problem. The cost once determined to fix the problem will, in fact, seriously impact their retirement income and in some cases hankrupt these individnals.

The longer the testing process takes, the longer homeowners are put at risk of contracting serious health conditions and potential electrical fire hazards. This protracted testing timeline is also putting tremendous financial strain on affected homeowners.

Many have had to move out of their homes and are now paying rent as well as their mortgage. All homeowners affected by this disaster are faced with homes that are unsalable and are seeing the value of their homes reduced to zero. Many homeowners are being notified by their homeowner's insurance companies that there is no coverage for Chinese drywall damage and additionally their insurance coverage will be dropped and HO policies will not be renewed until the problem is remediated. Because there is still no conclusive word forthcoming from state or Federal agencies on the proper process for remediation, many homeowners will be left with their homes totally unprotected by insurance.

This is an untenable situation and requires immediate action on the part of local, State and Federal elected officials. We need help now. Without immediate help the problem will continue to worsen. The longer people are left exposed to the health, fire hazard, and financial stresses created by this catastrophic situation the more long term lasting horrific effects will be realized by affected homeowners.

We need your help and we need it now.

To Whom It May Concern,

My husband and I have owned a Chinese drywall home for almost five years now. We have not been able to live in this home for practically three years now. We are having to rent a home which has put an enormous financial strain on us on a retirement income. Our home was built by WCI (which filed bankruptcy but now is building new homes across the street from our home) with Taishan drywall and it has caused us many health issues. While living in the home I had weekly nose bleeds, gastroenterologist problems, insomnia, eye irritations, and enormous fatigue. After

undergoing an MRI. I had developed vertigo, the doctors found that I have a vestibular disorder and I have also lost hearing iu oue ear. My husband developed a rash and a cough that has not left him to this day. He has undergone many tests and the only diagnosis from the Doctor is Chinese Drywall Syndrome. I cannot express to you the life we have been living in this nightmare. This travesty has drained us not only financially but physically and emotionally. Someone has got to help all the victims of Chinese drywall! I don't know how much longer my husband and I will be able to continue renting. We still have a mortgage on the Chinese drywall home, we rent and pay all the utilities and we have had all kinds of medical bills. When is the government going to step up and help all the victims in this country? *Please Help*!

My name is [redacted]. My wife and I purchased a home in Parkland Golf and CC in Parkland, FL in 2007 from the now bankrupt WCI. Who by the way is now building again after reorganization. They built many homes containing CDW and sold homes even after knowing the product was defective. We both have been living in the home not wishing to default in the hopes of remediating. We both have experienced health related respiratory issues as well as headaches, etc. After 3 years of legal battling we are pursuing remediation with Knauf, one of the companies who supplied the drywall. If the government was smart they would pursue financial remuneration to help all the homeowners to fix their homes. This would put the entire construction industry to work on over 100K homes and solve much of the unemployment issues which in turn stimulates the economy.

TRAPPED IN BIRMINGHAM!! SOMEONE HELP!!

Built our new dream home in December 2005 completed in June 2006, and from the first week we moved in my new wife said there's a smell in this house? Call the builder!!! (Eddelman Builders, Birmingham) and get them to find this smell? Our new home was under warranty so the builder sent his people out to try and resolve the smell issue, everyone smelled the smell, but no resolution! After 6–7 months of complaining to the Builder I contracted with a Home inspector to come in to find the problem 4 hrs later the home inspector said he could not find the smell? "Everything looks ok" That will be $400 please, I paid the man and my wife kept complaining & we kept calling the builder. Our first air conditioner went out in April 2007 the builder had it repaired 6 more service calls that summer, both HVAC units were replaced! the paint in the bathrooms started streaking? called a paint contractor no answer! the builders people said that "we were taking to hot showers" More calls to the builder more people came out with no resolution, called the gas co. they smelled something too, but it wasn't Gas? and all the while my wife was having one medical issue after the other! No answers doctors bills, prescriptions, it seemed like everything was caving in all around us, and then the letter came (certified mail) from the builder that onr home was suspected of having been built with Chinese Drywall? Two teams (4–6 guys) each time came to the house and both confirmed that we had the defective product!! Now it all made since!!!! By March of 2010 my wife's medical problems had become so acute that her Doctors recommended that the house could be causing the health problems? and she should get out!! So in April 2010 we have leased another home, and now I have a Mortgage on the defective home that no one can live in, and a lease for a home that costs me and additional $$$$$ every month and a house that I can't sell and that has lost more than Half it value!! This is a nightmare we are trapped and there is no end in sight. We have found out that after Katrina Jan 05 that there was a shortage of Drywall in the U.S. and the National Home Builders Association was pntting pressure on the Feds to strike down the Drywall standards that were in effect and let the product from China to be allowed in the U.S. The PAC's got their way, and the drywall was allowed in more that 15M tons of the stuff!! And the suppliers/builders bought it up (@ a lower price that U.S. drywall) And passed it along as U.S. drywall at the higher price mind you!! And here we are left to hang in the wind!! The Birmingham Homebuilders Assoc. has recently stated in the Birmingham News that they were unaware of any homes in the Birmingham market that had been built with the defective product!!! Something is wrong with that statement (my builder alone has a reported 40+ homes with the product! How many more of them are in this market let alone the U.S.

Dear Senator,

We bought our brand new house in Year 2006, from beginning, we noticed some strange smell in our house, and we thought it is new house smell. After we lived in the house for about four months, my son started to have nose bleeding, I started to have muscle pain and my wife started to have headache.

I went to doctor/specialist many times and had CT scan, X-ray. The doctors couldn't find the problems with my kidney, foot and arm where I had pain.

After one year, our A/C units, TVs, compnters started to fail again and again. The A/C coil copper pipes corroded and became complete black color. We didn't know what caused the problems nntil one of mechanic told us we mnst have Chinese Drywall installed in our house when he replaced our A/C coil, and he run to attic and pulled out insulation material away and found out the drywall labeled "Ventnre Supply, Made in Taihe, China". He also gave us the layer phone number and let us call lawyer to join the Class lawsuit.

Then I started to find the information related to Chinese Drywall and check more evidences in our house. I found out our copper wire in switch blacked ont. Copper strings of baby grand piano became black color.

For safety and health reason, we decided to hire builder to repair our house this year. Because of Chinese drywall, City lowered our honse strnctnre value to $100. Bank of America declined our refinancing due to the value of the house. We have to lie to other bank and say remodeling house to get home eqnity loan (Fortunately, it doesn't require house appraisal). After builder spent over four months and we spent about $240,000, our house got repaired. Now we have to pay back the money to bank from our own pocket.

This is most painful experience in our life.

Thank you.

After the recent Senate Hearing on Chinese Drywall (CDW), I was told I needed to send correspondence to this e-mail address to tell about our CDW experience.

I would like to tell onr experience for the last (4) years in trying to have responsible parties listen and help us resolve onr problem. We were totally destroyed by the hurricanes Jennie and Frances, in the fall of 2004. The condo association and our insurance replaced all the damage caused by these hurricanes. The condo association contracted to replacing all of the drywall to a licensed contractor who replaced all of the drywall in the *entire* condo in 2005. We moved back in January of 2006. We hegan noticing a corrosion of the pipes and eletrical wiring. We also noticed a strong odor, which later we were told was sulfur dioxide. It was not livable unless we aired the *entire* apartment, which we did by leaving all our windows open all day and night nnless it rained. We were later informed that all of the drywall which was replaced was defective and that the contractor nor the condo association were responsible for the defective material. My insurance also refused to pay saying that they would not cover defective material. After hiring an attorney and threatening the condo association with a law suit they agreed to remove and replace only the defective drywall which accrued in June 9f 2011. All of the additional cost related to being damaged by the CDW and expense incurred to achieve this task was a financial burden imposed on the homeowner. When the task of removing and replacing all of the items required a toaal cost out of pocket to us was $15,000.00 and I do not believe that the homeowner should have been responsible for this disaster. The tainted drywall which came from the Chinese Manufacturers should have been inspected and approved by the U.S. Government, prior to being allowed to installed in onr homes. I don't believe that the financial responsibility should be imposed on innocent homeowners

Thank you for your cooperation.

Sir/Madam

I am not poor yet. I have a home which I bought with all my savings (So I don't have a mortgage in my retirement) This house has Chinese drywall. It is so bad I cannot live in the house. I cannot sell or walk away from the house. If I don't get relief I don't know what to do. I pray to GOD that government look into this matter quickly and do the right thing. Save me from poverty.

Both of my parents are immigrants who came to America with nickels in their pockets and huge dreams. My father [redacted] has built some of the most incredible skyscrapers that exist in New York City and its surrounding boroughs today. My

mom [redacted], amazing singer and actress who even made the original cuts for the Original West Side Story production, successfully raised two beautiful children tending to home as a domestic homemaker. My parents, as hard as they worked never lived in a new home. The built at [redacted] was not only a dream of mine, but that of my parents. My father was onsite of the building of the home daily and in contact with everyone who worked on the site. All the bells and whistles were added to this home from custom granite throughout, custom moldings, polished nickel, upgraded tiles inside and outside, indoor Jacuzzi bathtub, outdoor Jacuzzi with waterfall pool, upgraded center island in the kitchen, a 4th bedroom for a playroom for the children, a golf cart plug, and the most gorgeous palms, hedges, fruit trees, and flowers you could imagine. Lastly, we had someone come in and custom paint each bedroom, bathrooms, ivy on the arches, vineyard settings in our niche's . . . You name it. It's here.

With Joy we all celebrated the home closing and enjoyed every holiday and weekend family event. This home wasn't my home—it was our home—for family, cousins, friends, etc.

In April of 2007, I went through a very difficult divorce with my ex-husband who had physically abused me. Because I was only a school teacher, I could not afford the home myself, and my parents couldn't let this home leave us. It took many, many months for us to come to a solution. In the meantime, I had met and fell in love with my husband. Together with his family—His father [redacted] a Yale Graduate and [redacted] a Harvard Business and Smith graduate, all came to the conclusion and agreed with my parents to allow my parents to take out a mortgage on their free and paid home—at [redacted] in order to pay this home off here at [redacted]. My husband and I never miss a payment. My in-laws graciously added to our already incredible home with priceless pieces of fine art that has been in the Hattemer and Maynard families for generations.

Then, to find out about our drywall. Currently, we are still here in the house. Financially we're a mess. So far beyond in bills, creditors keep calling us. My husband and I have four jobs between us. We are both public school teachers—educating tomorrow's leaders—giving back to our community daily. I suffer constantly from Vertigo and nausea. My baby boy wheezes constantly in his chest. His immune system cannot clear his cold that has lasted for months. We now have moved his crib into our room—sleep with the doors open. My older daughter and son both have sleep issues. My elder son has bloody noses. We are totally despondant. We cannot leave, for we would foreclose on my parents home. My in-laws cannot help because the stock markets have depleted their finances.

We have done nothing wrong. My parents have done nothing wrong. I cannot get help from the banks. There is no equity in this home. A home that was worth 425,000 when I closed is now worth literally 5,000 according to the Lee County Property Appraiser.

We can't even gut this house ourselves—because we cannot afford renting a home that will fit five people.

We desperately need your help to give back 325,000 to a mortgage company who has no sympathy for our predicament. When I call to explain what's going on and seek help—They sell my parents loan to another mortgage company. I still have home insurance, but that is because I cannot tell them I have drywall. If I do, I lose my insurance. We have nothing. Please,

Please, Please help ns!

Natasha,

You do not have our testimony bnt I would like you to inclnde.

We learned of CDW like all other Floridians in early 2009.

Our home was built in 2001. We always wondered why our AC coils would fail approx every 9 months since we moved in. No one had answers so we blamed it in the "crappy brand" the builder gave ns. After replacing coils 8 times in 7 years, we had enough and spent $5000 on a BRAND NEW Trane AC unit (Oct 2008), learn of CDW in 2009 and have the coils fail before the unit was 1 year old and again replaced 2 months ago in our new unit.

I thought and only knew that AC coils were black until learning about CDW.

We know understand why my cat of 10 years, suddenly died of a brain tumor, after being in this home 5 years. Why she had unexplained allergies, and respiratory problems in this home and not in homes we lived in before 2001. Why my husbands burning in his mouth, ear pain, nose bleeds and scabs in his nose could not be explained. Why both our stomachs make terrible noise at any time and we have intestinal problems. Why both of us have been embarrassed in front of people

(work included) when our stomachs make various sounds. Why my dry eyes, hoarseness and ear ringing cannot be explained. I know understand why my silver jewelry that I keep in "tarnish free" chests and some pieces in sip lock bags inside the tarnish free chest, still tarnish. My we had to keep replacing bathroom fixtnres when they rusted within a few months.

Why I have had to throw away decorative items and jewelry because they had blacken beyond repair.

Our builder is not longer in business, my mortgage company stopped calling me once they understood I have CDW.

Our home has been inspected by Spider Man Mulholland, a toxicologist, the builders inspector, dry wall distributor inspector and I've lost count of who else has walked through my home to conclude we have CDW. The Consumer Safety Protection Commission has used this home as part of their environmental air quality test; having multiple units in my home for months.

Our home has 218 pieces of CDW supplied by Seacoast Supply, owned by L&W, a subsidiary of U.S. Gypsum. Seacoast Supply was caught in a lie and has admitted ownership for installing the 218 pieces in my home.

The attorney for Seacoast, David Connor, says they will remediate but has not carried through on any promise—mediation, remediation, protocol and client testimony. In fact, he asked us to provide our initial remediation estimate to assist him in suing their importer, Shamrock. All parties cry that they are the victim, but the only victim is the actual homeowner. We did nothing to contribute or create this situation.

We are frustrated with our local attorney who has included us in class action lawsuits, which we never wanted, nor agreed to but were told we are in them. We are encouraged not to opt ont. We are promised a lower fee to the attorney but he does not commit to the percentage. The replies I have received form senators and representatives are outright insulting. The CDW homeowner is the only one getting the short end of this and again, we have done nothing to contribute or deserve this.

We can only say that back in 2001 and earlier since I've heard that CDW has been in the U.S. since 1999, the construction industry only wanted to cut corners and save on their cost while creating a false promise of quality.

Our home was built to be our "retirement" home but it is worth nothing except the land it sits on and even with that, the real estate market is still at a low point. It has prevented us form moving on with our lives and careers.

No one can put a price to the horrible arguments my husband and I have had about our CDW, the attorneys, mediation, remediation and our future. No one can put a price on our future health despite considering ourselves to be pretty healthy. We are stuck paying on a mortgage for a home that is worthless and we prefer not to walk away and ruin our credit. We are the only ones being taken advantage of by those who are out to make money on this horrible situation.

Information contained within this report was obtained from an on-site visit with the homeowners at their house. Dnring this visit, photographs were taken and are attached as Attachment 1.

The homeowners consist of a 67-year-old female and a 62-year-old male. No one else has lived with them in the home. The homeowners had this house bnilt as their dream home. They added many "top of the line" extras when the house was built.

The builder began construction of the house on February 14, 2006. The homeowners moved into the house on February 16, 2007. The house was built by Bender Construction and Development Company, Inc, 3775 7th Avenue N.W., Naples, FL 34120. The homeowners have lived in this house full time since then, except for an occasional short time vacation.

The honse is a two-story Florida honse. It has 4,900 square feet that includes a three to four car garage area on the back of the house. There is a screened-in porch on the back of the house that runs the length of the back of the honse. On the front of the house, there are two screened-in patios on the first floor and two screened-in porches on the second floor. The house has five bedrooms, four bathrooms, a kitchen, a dining room, a family room, a laundry room and a large foyer. The bedrooms and the stairs are carpeted. The family room has hardwood floors and the kitchen, the laundry room and the bathrooms have tile floors.

The house is constructed of concrete block stucco on the first floor and a combination of wood frame and stucco on the second floor. The house has a metal roof. The homeowner related that the house has wood studs. All of the appliances were new Kitchen Aid appliances when the homeowners moved into the house. The house is equipped with all electric appliances. There is no natural gas or propane gas con-

nected to this house. The homeowners had an osmosis water filtering system and a Hepa air filtering system installed when the house was built.

The walls in the house were painted before the homeowners moved into their home. Since they have moved into the home, they have put up window treatments and pictures but have not done any other major changes to the house.

The homeowner related that when the house was in the middle of construction, the builder told him that they were having a problem obtaining drywall because of a shortage of drywall at the time. The builder eventually found drywall for sale at a lumber store and purchased the drywall used in this house from this lumber store. The male homeowner reme mbered when the drywall was delivered to the property because the delivery people left the drywall outside and he carried the drywall inside the house so it would not get wet. At the time, he noticed that the drywall had "CHINA" printed on the back of the drywall. The builder hired a crew to install the drywall.

The female homeowner began having nose bleeds occasionally after they moved into this house. She had never had nose bleeds before they lived in this house. Also, she has had allergies in the past but they have gotten progressively worse since they have lived in this house. Also, the female homeowner had been in good health prior to living in this house but in December of 2008, she had to go to the local emergency room because of high blood pressure. She was diagnosed with a blockage in her interior arteries and had to have two stents inserted in her arteries. The male homeowner was concerned that his wife's medical problems may have been because of the Chinese drywall that was installed in their home.

The male homeowner has had respiratory congestion which has gotten progressively worse since living in this house. He added that when he and his wife are on vacation, there is a noticeable difference because he does not have the respiratory congestion problems and his wife's allergies disappear.

The male homeowner related that he never noticed an exact time when these symptoms started but stated that since they have lived in this house, the symptoms have gotten progressively worse.

The homeowners have five mixed breed dogs. All of their dogs are healthy and do not appear to have any medical problems. The male homeowner stated that the dogs rarely come inside the house. They stay in the yard or on the porches.

The homeowners noticed a slight odor when they first moved into the house. They attributed the odor to a "new house" odor. Also, they have lived in Florida for many years and are used to a slight sulfur odor, so they were not concerned about it.

This house has two air conditioning systems . One is a three ton Carrier unit that is for the upstairs part of the house and the other one is a two ton Carrier unit that is for the downstairs part of the house. In February 2008, the three-ton air conditioner stopped working. The air conditioning technician who came to determine the problem with the air conditioner said the evaporator coils had to be replaced because they had corroded. The homeowners had the evaporator coils replaced. In June 2009, the homeowners began to have problems with this same air conditioning unit. The technician came out again and said the coils had to be replaced again because they were corroded. The coils were replaced in July 2009 (Attachment 1, Photos 2–5).

The smaller air conditioning unit for the downstairs is not used as frequently as the larger unit that is for the upstairs part of the house. However, the coils in the smaller air conditioning unit had to be replaced in March 2008 because the coils had corroded and the air conditioning unit would not work (Attachment 1, Photo 6). Both of the air conditioning units are top of the line Carrier units.

In the summer of 2007, the new electric Kitchen Air range stopped working altogether. The technician who came out to repair it said that the computer chip in the range stopped working and had to be replaced. The new refrigerator that they purchased for the honse when they had the house built also stopped working. The technician who came out to repair the refrigerator said that the relay inside the refrigerator failed and it needed a new one. The female homeowner related that the motherboard inside her sewing machine stopped working and she had to have it replaced. Also, since they have lived in this home, she has two IPODS stop working. She has returned them each time to the store to receive a new one. The homeowners' stereo equipment has a scratching sound on it when they try to use it. They believe the drywall is emitting sulfur gases that affect the electronics in their appliances and air conditioning nnits.

The female homeowner had several antique pieces of silver that had been passed down to her from her grandmother. Since they have lived in this house, the silver has turned black. She stated she had these pieces for many years and they have never turned black until they moved into this house (Attachment 1, Photos 10–12).

The male homeowner pointed out the copper pipes behind the washing machine (Attachment 1, Photo 9). These pipes are copper and have turned black. Also, he pointed out the copper pipe that runs outside of the air conditioning units. The pipe has turned completely black. The homeowner took several of the outlets apart and each one showed black corrosion on the ground wires (Attachment 1, Photos 7–8).

The male homeowner is an experienced electrician and believes this is a major safety issue because of the wires within the house. He stated that the appliances and light fixtures and many other electrical units are always plugged into the outlets whether they are operating or not. When the wires are corroded, it may cause a fire.

The homeowner first learned of Chinese drywall problems when his air conditioning unit coils had to be replaced the second time . He had heard of problems with outside units that could be affected by a sprinkler system that would be hitting the unit everyday because the water may have some sulfur content. But he could not understand how the coils in the units that are located in a closet inside their home would corrode because they would never have been exposed to any type of sulfur. The homeowner researched this problem on the computer and heard about the Chinese drywall problems in the news. He remembered the shipment of drywall that was delivered to his home site when they were building the house and remembered that it was from China. The homeowner pointed out where the drywall in the attic had printing on it that reads "KNAUF CHINA TIANJAN" (Attachment 1, Photo 13). After he learned about the problems with the Chinese drywall on the news, he realized he and his wife were having the same problems with their drywall which came from China.

The homeowners contacted an attorney and registered with him to represent them in a class action suit for the people affected by the Chinese drywall. Their attorney contacted their builder, Bender Construction who sent out an inspector. Their inspector examined the entire house. He told the homeowners that he could detect a sulfur odor in the house. The builder's attorney contacted the supplier of the Chinese drywall, the lumber Company. The lumber Company also sent out an inspector to examine their house. He was also able to detect the sulfur odor in the house. He examined the entire house and saw the printing on the drywall in the attic. So far, the homeowners have not received any of the reports from the two inspectors.

The homeowners are concerned about the effects the Chinese drywall is having on their health. This is their dream home and do not want to move out. They hope there is some remediation from either the builder or the supplier so they can continue to live in their home.

The male homeowner added that his neighbors (his son-in-law and step-daughter) had their home built at the same time by the same builder. They also have the Chinese drywall in their home. Their home was built in 2006 and they moved into their new home in approximately November 2006. They have two young sons, a 9- year-old and a 5-year-old. Both of their sons have developed nose bleeds since they have lived in that house. They never had any nose bleeds before living in the house. Also, their allergies have intensified since living there. The homeowner was not sure if they have had any major problems with their air conditioning units but did recall that they had to have their dishwasher repaired since they have lived in the house.

Product Identification

The manufacturer of the drywall in the house was shown as KNAUF CHINA TIANJAN. According to the homeowner, the drywall was purchased from a store called 84 Lumber.

ARE CONSUMERS ADEQUATELY PROTECTED FROM FLAMMABILITY OF UPHOLSTERED FURNITURE? HEARING ON THE EFFECTIVENESS OF FURNITURE FLAMMABILITY STANDARDS AND FLAME-RETARDANT CHEMICALS

TUESDAY, JULY 17, 2012

U.S. SENATE,
SUBCOMMITTEE ON FINANCIAL SERVICES
AND GENERAL GOVERNMENT,
COMMITTEE ON APPROPRIATIONS,
Washington, DC.

The subcommittee met at 2:30 p.m., in room SD–138, Dirksen Senate Office Building, Hon. Richard J. Durbin (chairman) presiding.

Present: Senators Durbin, Lautenberg, and Moran.

OPENING STATEMENT OF SENATOR RICHARD J. DURBIN

Senator DURBIN. Good afternoon. Today, I am pleased to convene this hearing of the Appropriations Subcommittee on Financial Services and General Government to discuss standards for the flammability of residential upholstered furniture and the use of flame-retardant chemicals, and whether efforts to date are adequately protecting American consumers.

I am going to be joined later by Senator Jerry Moran, my ranking member, and possibly Senator Frank R. Lautenberg, and other colleagues. I thank them all for their interest in this issue.

I welcome the Chairman of the Consumer Product Safety Commission (CPSC), Inez M. Tenenbaum, and the acting Assistant Administrator of the Environmental Protection Agency's (EPA) Office of Chemical Safety and Pollution Prevention, James J. Jones. I also welcome our second panel of witnesses we'll hear from a little later.

Why are we holding this hearing? According to national fire loss estimates for 2005 to 2009, upholstered furniture was the first household item to ignite in an average of 7,040 reported home structure fires every year. These fires caused an estimated annual average of 500 deaths, 890 injuries, and $442 million in direct property damage.

Once upholstered furniture is ignited, it burns extremely rapidly, because of the fuel in the upholstery filling materials. Lighted tobacco products or smoking materials remain the leading cause of

upholstered furniture fires and associated losses. One out of every six such fires started by smoking materials resulted in death.

In May, the Chicago Tribune published a four-part series on flame-retardant chemicals. It was an eye-opener. It explored the role of the major tobacco companies, which sought to shift focus away from cigarettes as the cause of fire deaths, and chemical companies, which wanted to preserve a market for their products.

Tobacco industry efforts with State fire marshals steered policymakers away from developing a fire-safe cigarette and instead toward rules requiring furniture flammability standards. That, in turn, led to the widespread use of flame-retardant chemicals.

The Chicago Tribune articles also highlighted research showing that flame-retardant chemicals escape from household products and settle in dust, causing infants and toddlers to have higher levels of these chemicals in their bodies than their parents. American newborns have the highest recorded concentration of flame-retardant chemicals than any infants in any other country.

This led Graco, one the Nation's largest children's product manufacturers, to ban the use of some toxic flame retardants in their products. Graco has recently announced that they will begin eliminating four of the most toxic flame-retardant chemicals from their products, including car seats and strollers.

The list of banned chemicals includes Firemaster 550, a chemical mixture that the current research and even the Tribune articles have shown to accumulate in humans and the environment.

The chemical industry points to research justifying the use of fire retardants. The Chicago Tribune exposes that research many times is distorted and based on manipulated data.

Finally, the series discusses the toxicity of flame retardants and the difficulties that EPA faces in restricting the use of flame-retardant chemicals in furniture.

What we will learn today is a little more about fires, furniture, fire-retardant chemicals, and, maybe as important, the role of the Government when it comes to these issues.

On our first panel, we are going to hear from CPSC, an obvious first stop in this conversation. They have been working, as you will find, for many years on a proposed standard for the flammability of upholstered furniture.

Upholstered furniture that catches fire is a leading cause of death in residential fires from consumer products. In recent years, CPSC has been working on a standard that would require upholstery to resist smoldering cigarettes, which are by far the leading cause of furniture fires.

To complete an upholstered furniture flammability standard, CPSC must comply with the Flammable Fabrics Act passed by the Congress, which sets the standards for testing. They are wide-ranging and lengthy, the standards.

As part of them, CPSC conducted testing to establish the effectiveness of different strategies on reducing furniture flammability.

I expect that CPSC will provide an update on this research, the status of the rulemaking, the remaining steps to finalize a rule, and any outstanding issues.

Also on the first panel, we will hear from EPA. They regulate the manufacture and use of flame-retardant chemicals under the Toxic

Substances Control Act (TSCA). Recent scientific research has demonstrated these chemicals accumulate in the environment and can cause cancer, neurological disorders, and impaired reproduction.

During this hearing, we hope to learn more about the public health and environmental effects of flame-retardant chemicals used in furniture. Additionally, we hope to hear what authority TSCA gives EPA to regulate these potentially dangerous chemicals and any recent actions taken by EPA with respect to them.

With the next panel we are going to hear from is an Illinois-based company well known to most, Underwriters Laboratories (UL). It's an independent, not-for-profit standards developer that tests products and certifies those that are consistent with public safety and those that are not.

Over time, the company has built a brand that reassures consumers the products they are purchasing are safe. In 2008, UL initiated testing on different methods of reducing upholstered furniture flammability and reducing the fire growth rate of upholstered furniture.

Some of their findings will likely have us taking a second look at the furniture we have in our homes. They are here today to discuss the results of their testing on furniture flammability.

We are going to also hear from the American Home Furnishings Alliance, representing the manufacturers and importers of residential furniture that include upholstered furniture. Much like CPSC, the manufacturers have been involved in developing upholstered furniture flammability standards. They will share their insights regarding current standards and ongoing work with CPSC to determine a new standard.

Finally, we are going to hear from a veteran firefighter and fire-safety expert to discuss the changes that have taken place in America affecting home fire safety and the factors leading to home fires. He will also tell us about the human cost associated with fires and very simple steps, including creating effective flammability standards, that we can take to help reduce this risk for consumers and firefighters alike.

After reading the Chicago Tribune articles, I was struck by several disturbing things. First, the intentional distortion and manipulation of research in order to deceive Americans into thinking that the use of flame-retardant chemicals in furniture provided additional protection in home fires even though the data do not support the claim; the extensive lobbying and significant funding spent by chemical companies and the tobacco industry to ensure that flame-retardant chemicals were used in furniture and to suppress opposition to their inclusion; and the growing awareness that flame-retardant chemicals in furniture may not add any benefit, and, in many cases, may cause harm to public health and the environment.

Generations of Americans have been asked to tolerate what may be an unsafe level of exposure to potentially toxic chemicals in their furniture in the name of fire safety. If the scientific evidence suggests this solution is not justified, we must move quickly to update our upholstered furniture flammability standards and limit our exposure to these dangerous chemicals.

Today, we'll attempt to gain a clear understanding of whether consumers are protected from flammability furniture, a leading

cause of house fires. We'll explore what's been happening with residential upholstered furniture flammability standards and the effectiveness of these chemicals.

We'll start by exploring CPSC's process for finalizing a standard, and then move to EPA for their statements on the actual chemicals involved.

PREPARED STATEMENT

I'd like to say, as a matter of record, we have a vote scheduled at 3 o'clock, which will probably go until about 3:15 or 3:20 p.m., so my ranking member, Senator Moran, and I will try to accommodate that vote and be sure that we make it and not interrupt this hearing indefinitely.

[The statement follows:]

PREPARED STATEMENT OF SENATOR RICHARD J. DURBIN

Good afternoon. Today, I am pleased to convene this hearing of the Appropriations Subcommittee on Financial Services and General Government to discuss standards for the flammability of residential upholstered furniture and the nse of flame-retardant chemicals, and whether efforts to date are adequately protecting consumers and the public.

I welcome Senator Jerry Moran, the ranking member, Senator Frank R. Lautenberg, and possibly other colleagues are joining me today. I welcome the Chairman of the Consumer Product Safety Commission (CPSC) Inez M. Tenenbaum, and the Acting Assistant Administrator of the Environmental Protection Agency's (EPA) Office of Chemical Safety and Pollution Prevention, James J. Jones. I also welcome our second panel of witnesses who we will hear from a bit later.

According to national fire loss estimates for 2005–2009, upholstered fnrniture was the first household item to ignite in an average of 7,040 reported home strnctnre fires per year. These fires caused an estimated annual average of 500 deaths, 890 injuries, and $442 million in direct property damage. Once upholstered furniture is ignited, it burns extremely rapid because of the fuel in the upholstery filling materials. Lighted tobacco products (or smoking materials) remain the leading cause of upholstered furniture fires and associated losses. One out of every six such fires started by smoking materials resulted in death.

In May, the Chicago Tribune published a four-part series on flame-retardant chemicals. It explored the role of Big Tobacco, which sought to shift focus away from cigarettes as the cause of fire deaths; and chemical companies, which wanted to preserve a lucrative market for their products. The tobacco industry's efforts with State fire marshals steered policymakers away from developing a fire-safe cigarette standard and instead toward rules requiring furniture flammability standards. That, in turn, led to the widespread use of flame-retardant chemicals.

In addition, the Chicago Tribune articles highlight research showing that flame-retardant chemicals escape from household products and settle in dust, causing infants and toddlers to have higher levels of these chemicals in their bodies than their parents. American newborns have the highest recorded concentrations of flame retardants than infants from any other country.

This has led Graco—one of the Nation's largest children's product manufacturers—to ban the use of some toxic flame retardants in their products. Graco has recently announced that they will begin eliminating four of the most toxic flame-retardant chemicals from their products, which include car seats and strollers. The list of banned chemicals includes Firemaster 550, a chemical mixture that the current research and Chicago Tribune articles have shown to accumulate in humans and the environment.

The chemical industry points to research justifying the use of fire retardants. The Tribune exposes that research as distorted and based on manipulated data. Finally, the series discusses the toxicity of flame retardants and the difficulties that EPA faces in restricting the use of flame-retardant chemicals in furniture.

ROLES OF WITNESSES

Today, on our first panel, we will hear from CPSC, which has been working on a proposed standard for the flammability of upholstered furniture.

Upholstered furniture that catches fire is a leading cause of death in residential fires from consumer products. In recent years, CPSC has been working on a standard that would require upholstery to resist smoldering cigarettes, which are by far the leading cause of furniture fires.

To complete an upholstered furniture flammability standard, CPSC must comply with Flammable Fabrics Act requirements, which are wide-ranging and lengthy. As part of the standards process, CPSC conducted testing to establish the effectiveness of different strategies on reducing flammability. I expect that CPSC will provide an update on their research, the status of the rulemaking, the remaining steps to finalizing the rule, and any outstanding issues yet to be resolved.

Also on the first panel, we will hear from EPA, which regulates the manufacture and use of flame-retardant chemicals under the Toxic Substances Control Act (TSCA). Recent scientific research has demonstrated that these chemicals accumulate in the environment and that they can cause cancer, neurological disorders, and impaired reproduction.

During this hearing, we hope to learn more about the public health and environmental effects of flame-retardant chemicals used in furniture filling. Additionally, we hope to hear what authority TSCA gives EPA to regulate these potentially dangerous chemicals and any recent actions EPA has taken with respect to flame-retardant chemicals.

On our second panel, we will hear from Illinois-based Underwriters Laboratories (UL), an independent, not-for-profit standards developer and product testing and certification organizer dedicated to public safety. Over time, the company has built a brand that reassures consumers that the products they are purchasing are safe. In 2008, UL initiated testing on different methods of reducing upholstered furniture flammability and reducing the fire growth rate of upholstered furniture. Some of their findings will likely have us all taking a second look at the furniture we have in our homes. They are here today to discuss the results of their testing on furniture flammability.

We will also hear from the American Home Furnishings Alliance, which represents manufacturers and importers of residential furnishings that include upholstered furniture. Much like CPSC, the manufacturers have been involved in developing upholstered furniture flammability standards. They will share their insights regarding current standards and their ongoing work with CPSC to develop a new nationwide furniture flammability standard.

Finally, we will hear from a veteran firefighter and fire-safety expert. He will discuss the changes that have taken place affecting home fire safety and factors leading to home fires. He will also tell us about the human cost associated with fires and the simple steps—including creating effective flammability standards—that we can take to help reduce this risk for consumers and the firefighters responding to these hazards.

SUMMARY OF THE ISSUES

After reading the Chicago Tribune articles, I was struck by several disturbing aspects such as:

—the intentional distortion and manipulation of research in order to deceive Americans into thinking that the use of flame-retardant chemicals in furniture provided additional protection in home fires even though the data do not support this claim;

—the extensive lobbying and significant funding spent by chemical companies and the tobacco industry to ensure that flame-retardant chemicals were used in furniture and to suppress any opposition to their inclusion in furniture;

—the growing awareness that flame-retardant chemicals in furniture filling may not add any benefit, and may, in fact, cause harm to public health and the environment.

Generations of Americans have been asked to tolerate what may be an unsafe level of exposure to potentially toxic chemicals in their furniture in the name of fire safety. If the scientific evidence suggests this solution is not justified, we must move quickly to update our upholstered furniture flammability standards and help limit exposure to these chemicals.

Today, we'll attempt to gain a clear understanding of whether consumers are adequately protected from flammability of upholstered furniture—a leading cause of house fires. We'll explore what's been happening with residential upholstered furniture flammability standards and the effectiveness of flame-retardant chemicals.

We'll begin by exploring the CPSC process for finalizing such a standard. And then, we'll examine whether EPA has the necessary authority to ensure the safety of flame-retardant chemicals prior to their entry into the marketplace.

Senator DURBIN. At this point, I'd like to turn over the floor to my ranking member, Senator Jerry Moran.

STATEMENT OF SENATOR JERRY MORAN

Senator MORAN. Mr. Chairman, thank you. I thank the witnesses for appearing before our subcommittee today. And I look forward to their testimony.

As you indicated, there have been a series of articles written in the Chicago Tribune, which have elevated interest in flame-retardant chemicals. These chemicals are found in products we encounter throughout daily life—cars, automobiles, plastics, electronics and other household goods, and upholstered furniture, which is the primary focus of your hearing today.

Flame retardants are one of many safety tools that we have at our disposal, such as sprinklers and smoke detectors. And, collectively, these tools have made a difference in reducing fire injuries and death, even as fuel loads and potentially flammable materials have increased dramatically in households and office buildings.

This has been acknowledged by a variety of manufacturing sectors, which rely upon flame retardants to help meet Government-mandated or voluntary flammability standards for products and component parts.

This is a complex issue involving State standards, Federal standards, and industry standards, which, from electronics to construction to automotive and also home furnishing products, these technical standards are often developed through a consensus approach and there is often careful thought given to ensuring the standards do not favor one method of compliance over another, but focus on meeting a fire-safety test.

In some instances, manufacturers voluntarily decide to meet a particular product fire-safety standard, while in other cases product components must meet fire-safety tests as a regulatory prerequisite for sale in a market like California's standard 117 for furniture sales.

We must let the safety experts, like CPSC and EPA, work within their regulatory framework to address the safety of these products. Changes to the authorizing statutes at these agencies should be made by the Senate Commerce Committee, which has jurisdiction over the Consumer Product Safety Act and the Flammable Fabrics Act, and the Senate Environment and Public Works Committee, which has jurisdiction over TSCA. And that Committee will have a hearing on the reauthorization of that act with EPA on July 24, later this month.

PREPARED STATEMENT

I'd like to ask unanimous consent a report from Dr. Matt Blais, the director of Fire Technology Department at Southwest Research Institution, be included in the record.

And I look forward to the testimony of the witnesses.

Senator DURBIN. Without objection, that statement will be included.

[The statement follow:]

THE UTILITY OF CALIFORNIA TECHNICAL BULLETIN 117: DOES THE REGULATION ADD VALUE?

The implementation of California Technical Bulletiu 117 (CA TB 117) set miuimum performance standards for furnishings in incipient fire situations. The intent was to protect life and property from fires initiated by small sources such as matches, cigarettes, lighters, and candles. The standard was not intended to prevent ignition of a furnishing in a large fire where it would contribute to the fuel load of a room but not be the point of initiation.

Urethane foam-filled furnishings have the potential for contributing tremendous energy to a fire and when not protected with flame retardants can lead to rapid transition from incipient fire to a free-burning condition. The time to reach flashover (spread to the rest of the room) in a recent study performed at Southwest Research Institute (SwRI®) by Janssens et al. [1] was as short as 200 seconds from time of ignition. The addition of flame-retardant covering over the foam adds a layer of defense that delays transition to flashover to almost 800 seconds from initiation. The additional use of CA TB 117 rated urethane foams prevented sustained burning when a small ignition source was used. In cases where the CA TB–117 foams are used with flammable coverings, significant reductions in both peak Heat Release Rate (HRR) and total HRR were measured and a significant delay in reaching the free-burning condition was observed.

The impact of adding flame retardants to the covering material and urethane foams adds defense in depth to the furnishing that undoubtedly saves lives. The fact that nonflame-retardant furnishings contribute to flashover in a room in just a little more than 3 minutes severely limits the potential for escape for a family in a fire situation. It also would likely result in the total loss of the home before a fire department could respond. Extending the time to greater than 13 minutes increases the probability of escape for the family and allows for greater response time and likely reduces the total damage sustained by the structure.

The cigarette ignition source is less important today than in the past due to a reduction in the number of smokers and changes in cigarette technology. Cigarette wrappers are self-extinguishing when there is not airflow for extended periods. However, ignition from a small flame source is still a significant problem for homeowners with small children. The following facts were obtained from U.S. Fire Administration/National Fire Data Center:

—An estimated 20,200 residential structure fires in 2002, resulted in 276 deaths, 1,445 injuries, and $322 million loss. [2]

—The leading causes of residential structure fires are incendiary/suspicious, open flame, and children playing with lighters and matches fires. [2]

CA TB 117 uses ignition sources that mimic those found in the types of fires described. The testing performed in Janssens' is directly comparable to the CA TB 117 and CA TB 133 requirements. Three types of ignition sources were used:

—a small match-like flame;

—a large gas burner, similar to a fire in a pile of newspapers; and

—a small liquid pool fire simulating the use of an accelerant.

Three ignition sonrce locations were evaluated:

—exposing the seat from the top;

—exposing the furniture from the front bottom; and

—exposing the back.

Test Conditions

In most cases the small-flame ignition source was BS 5852 Source #1 simulating a match fire. In a few tests the item could not he ignited with this source and BS 5852 Source #2 was then tried simulating a lighter or candle. Both BS 5852 sources involve a diffusion burner consisting of a steel tube, with 8 mm outside diameter and 6.5 mm internal diameter and 200 mm in length, connected by a flexible tube via a rotameter, fine control valve, an optional on-off valve, and a regulator to a cylinder containing butane.

For Source #1, a flow rate of 45 ml/min at 25 °C was used, corresponding to a heat release rate of ca. 83 W and a flame height of 35 mm, measured from the top of the burner tube, when held vertically upwards. For Source #2, a flow rate of 160 ml/min at 25 °C was used, corresponding to a heat release rate of ca. 295 W and a flame height of 145 mm, measured from the top of the buruer tube, wheu held

[1] Reducing Uncertainty of Quantifyiug the Burning Rate of Upholstered Furniture, No. 2010–DN–BX–K221, awarded by the National Institute of Justice, Office of Justice Programs, U.S. Department of Justice. December 30, 2011.

[2] U.S. Fire Administration/National Fire Data Ceuter, Resideutial Structure Match- or Lighter-Ignited Fires, Topical Fire Research Series, Volume 4—Issue 2, October 2004.

vertically upwards. Butane gas was used as the fuel. The burner flame was applied for 20 s for Source #1, or 40 s for Source #2. Source #1 has been shown to have an intensity equivalent to a small match. The small-flame source is shown in Figure 1 being applied to a chair mock-up.

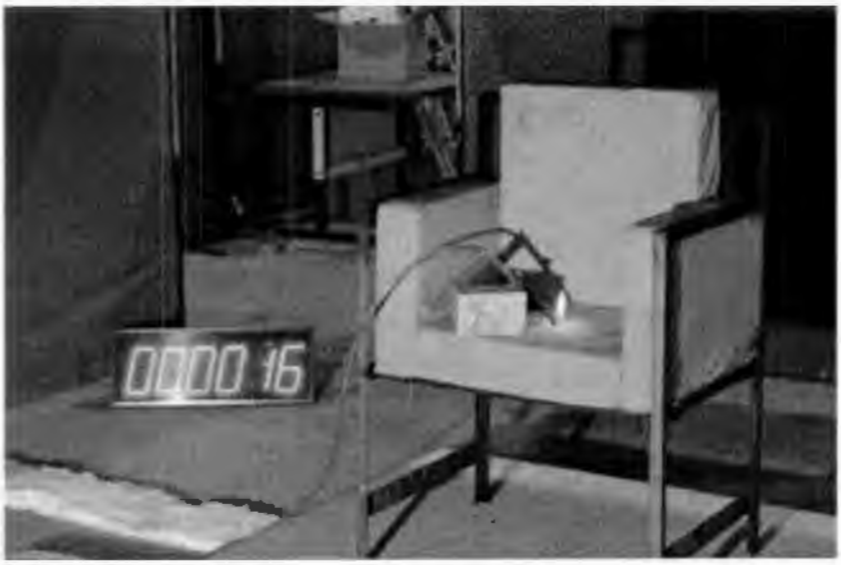

FIGURE 1.—*Small flame source*

The propane burner described in CA TB 133 and American Society for Testing and Materials (ASTM) E–1537 was chosen as the large flame ignition source exposing the seat from the top. This 250 × 250 mm square burner consisted of 13 mm outside diameter stainless steel tubing with holes pointing straight out, straight down, and inward at a 45 degree angle at various locations. Propane gas with a net heat of combustion of 46.5 0.5 MJ/kg was supplied at a rate of 13 l/min for a total of 80 s. The burner was an approximate intensity of 19 kW. Figure 2 shows the large-flame source burner applied to a three-cushion couch mock-up.

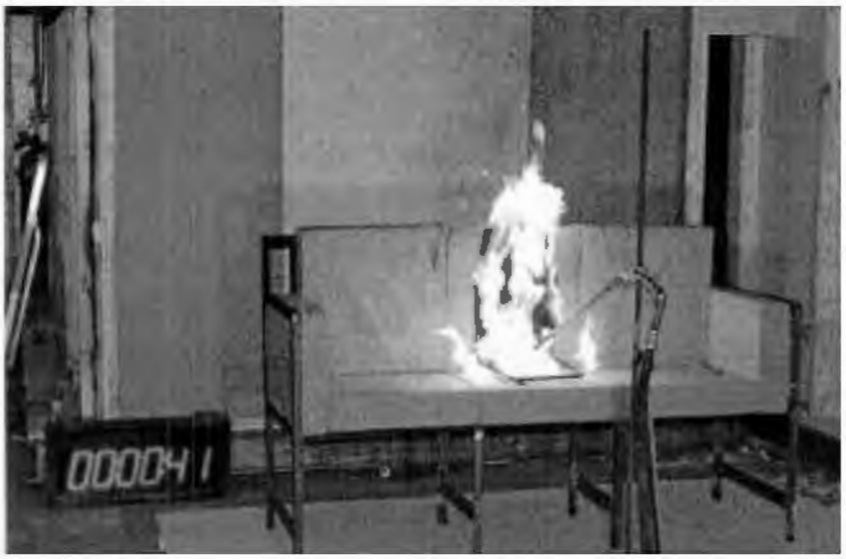

FIGURE 2.—*Large burner ignition source*

The 0.3 × 0.3 m sandbox burner described in National Fire Protection Association (NFPA) 286 was chosen as the large-flame ignition sonrce for front bottom and back exposure. The burner was supplied with propane at the same rate (19 kW) and for the same duration (80 s) as the CA TB 133 burner. Figure 3 shows the application of the large-flame sandbox burner to the bottom front of a three-cushion couch mock-up.

FIGURE 3.—*Large-flame ignition source burner box*

Finally, the liqnid pool fire ignition source consisted of 59 ml (2 oz) of gasoline distributed over a seat cushion (top exposure) or 118 ml (4 oz) of gasoline distributed more than 25 mm thick ceramic fiber blanket placed inside a 0.28 × 0.43 m

metal cookie sheet (front, bottom, and back exposure). Figure 4 shows the accelerant ignition sonrce for this series of tests applied to a center cnshion.

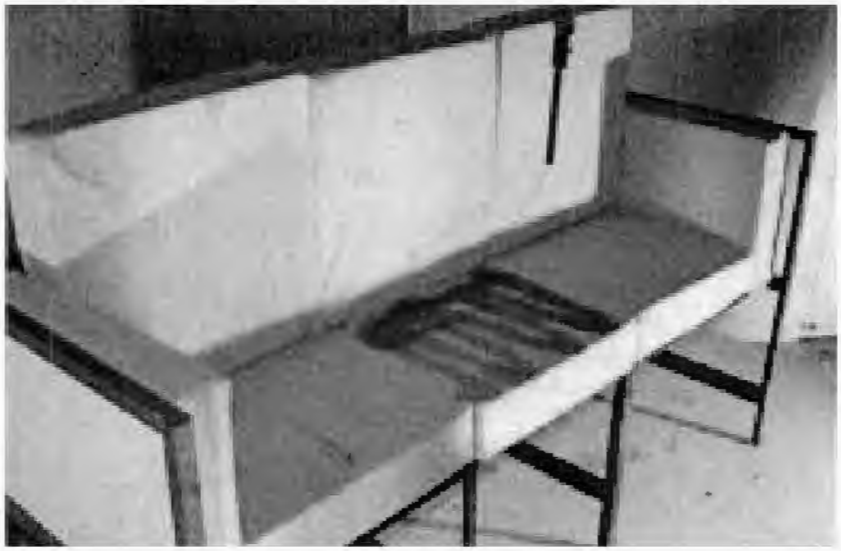

FIGURE 4.—*Accelerant ignition source*

Test Items

Because of the questionable pedigree for used furniture items, most of the tests were performed on furniture mock-ups with metal frames. The mockup cushions were constrncted with fabrics and padding materials that are common in fnrniture items that are currently on the market. Six different padding materials and two fabrics were selected. Chairs (without arınrests) and single-, double-, and triple-seat sofas were included in the test matrix. Table 1 shows the matrix of materials used to create the mock-ups for this series of tests.

TABLE 1.—MOCK-UP MATERIALS OF CONSTRUCTION

Fabric	ID	Color	Supplier	Weight (g/m2)
(Nonflame-retardant) cotton.	Eco Linen	Khaki	San Antonio Upholstery Fabrics	355
Flame-retardant cotton	Milano	Black	Dazian, North Hollywood, California	415
Padding	**ID**	**CA TB 117**	**Supplier**	**Density (kg/m3)**
LD polyurethane foam	1030		San Antonio Upholstery Supply	17
HD polyurethane foam	25110		San Antonio Upholstery Supply	45
CA TB 117 polyurethane foam.	FR1534	✓	San Antonio Upholstery Supply	23
Polychloroprene latex	CR SAFGUARD XL	✓	Chestnut Ridge, Latrobe, Pennsylvania.	103
Polyester wrap	Dacron	✓	San Antonio Upholstery Supply	16
Densified polyester	FlameChek (Core)	✓	Bob Barker, Fuquay-Varina, North Carolina.	23

The flame-retardant cotton fabric was verified to meet the requirements of NFPA 701. CA TB 117 tests were performed on specimens of the six padding materials to verify compliance (or noncompliance) with the standard. The test matrix used for this series of tests is summarized in Tables 2 and 3.

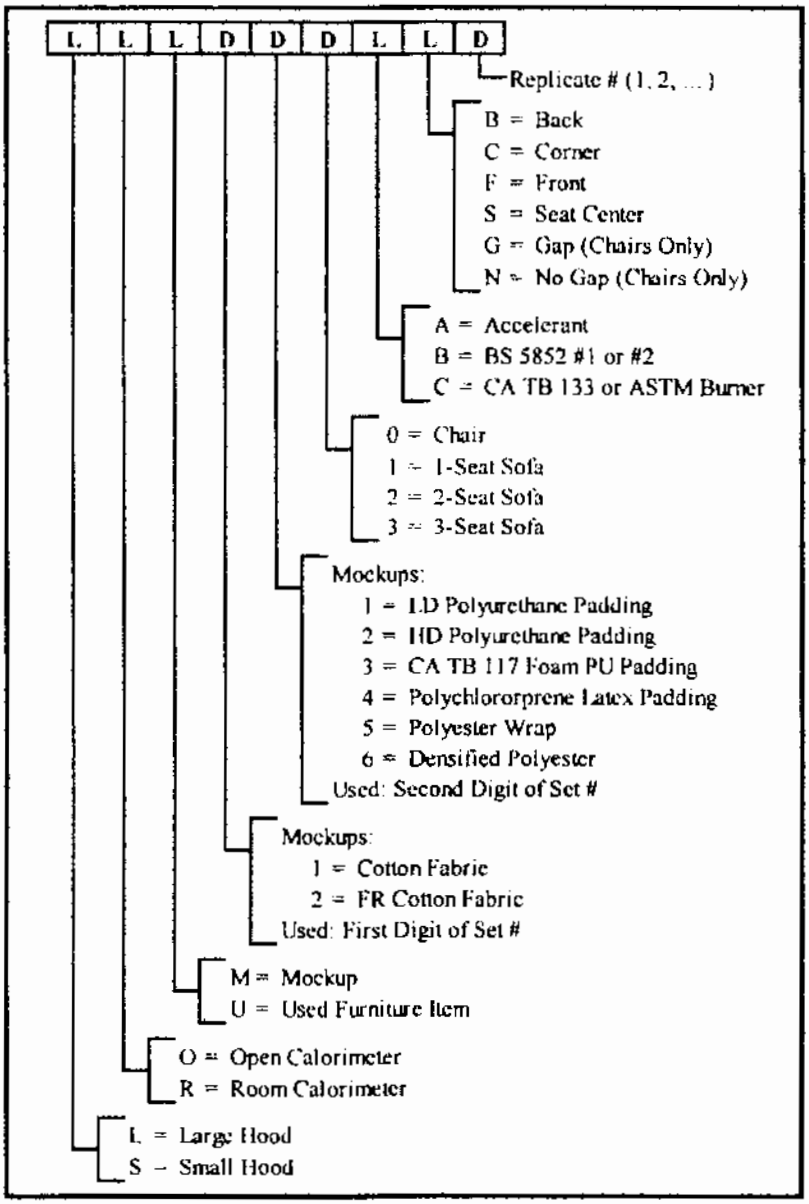
Results and Discussion

A direct comparison of four conditions shows the applicability of having an flame-retardant requirement for home furnishings. The heat release rates measured of the duration of the test are shown in the four pairs of graphs below. The conditions are:

—a flammable cover over urethane foam;
—a flame-retardant cover over urethane foam;
—a flammable cover over flame-retardant foam; and
—a flame-retardant cover over flame-retardant foam.

Table 4 provides the sample identification description dictionary that defines the test performed and material types. This can be used to show the materials of composition, test conditions, ignition source and ignition location.

TABLE 4.—*System for Composing and Deciphering the Test II) String*



A comparison of one cushion mocknps with low-density nonflame-retardant and flame-retardant urethane foams shows a reduction in the heat released. These two examples both have flammable covers. Comparing the time to fully involved fire environment, the peak HRR and the total heat released (area under the curve), show that the fire-resistant foam slows the onset of free-burning fire by more than doubling the time from ignition to peak HRR (pHHR). The blue plot in both Figures

5 and 6 is the experimental data for these two conditions. All of the other plots are fire-spread models attempting to predict the fire growth. The nonflame-retardant foam seat ignites and reaches free burning in approximately 400 s. The CA TB 117 foam requires 1,000 seconds to achieve pHHR. The pHRR and total heat released are also one-half for the CA TB 117 foam when compared to the nonflame-retardant foam. These tests nsed the small-flame ignition source. There are several examples of this exact relationship in Janssens work.

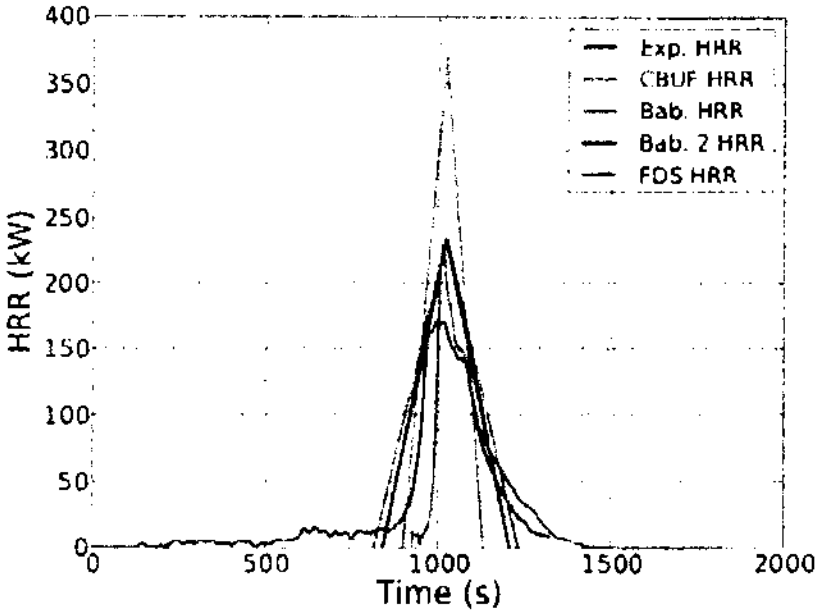


FIGURE 5.—*SRM131BB2—CA TB 117 Urethane Foam With Flammable Cover*

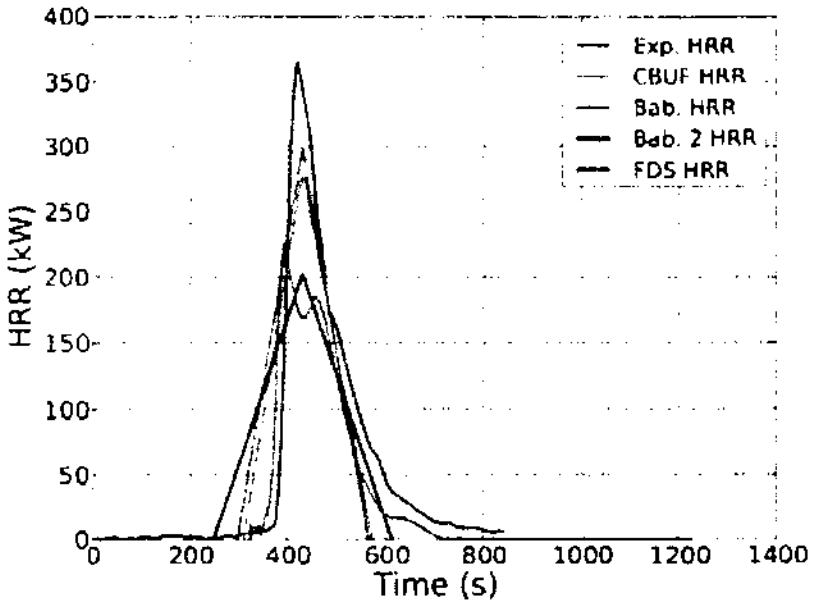

FIGURE 6.—*SR1V1111BS1—Low-Density Urethane Foam With Flammable Cover*

Comparing the material cover of furniture mockups illustrates the utility of using NFPA 701 rated fabrics as covers for foam-filled furnishings. The blue plots in Figures 7 and 8 illustrate the impact of using a flame-retardant fabric over high-density foam of the same manufacturing lot using the same ignition source and location. Again the time from ignition of the couch to the free-burning state is significantly delayed. The unprotected foam goes to a free-burning state upon ignition. The foam protected with the NFPA 701 fabric shows a delay of 10 minutes to reach the same condition. It is also important to note that the pHRR is half the intensity for the flame-retardant case with 220 kW for the FR fabric compared to 440 kW for nonflame-retardant fabric. The total energy released by both events is approximately the same. This series of test used the large burner igniter shown in Figure 2. Use of the small burner BS5852 failed to ignite the flame-retardant test item.

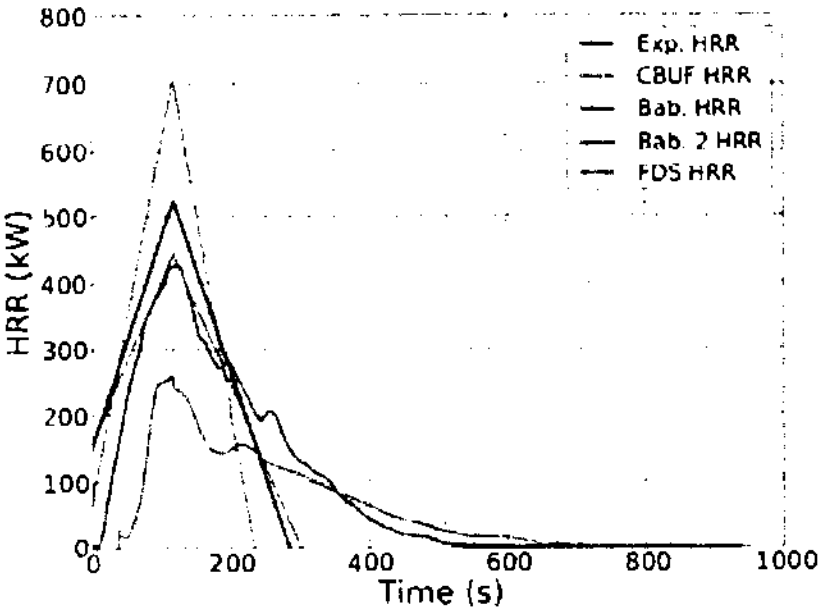

FIGURE 7.—*SOM121CS4*

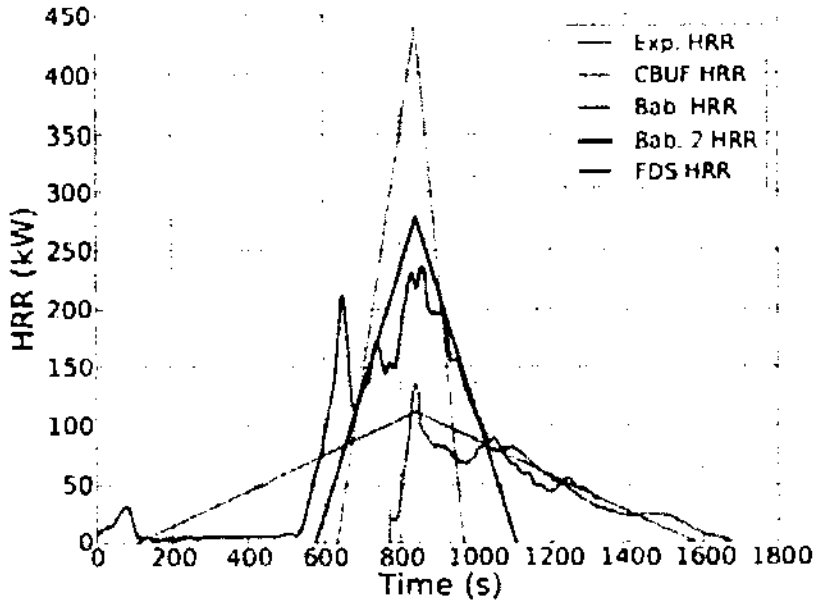

FIGURE 8.—*SOM221CS1*

The defense in depth approach of using both an flame-retardant fabric and CA TB 117 foam hugely impacts the fire event. Figures 9 and 10 compare the cases of

three cushion couch mockups with and without FR foams IAW CA TB 117 and NFPA 701 covers. These figures show that with the large burner the protected couch failed to ignite while the unprotected couch reaches free burning in 180 s. The unprotected couch would cause the room to reach flashover iu 4 minutes.

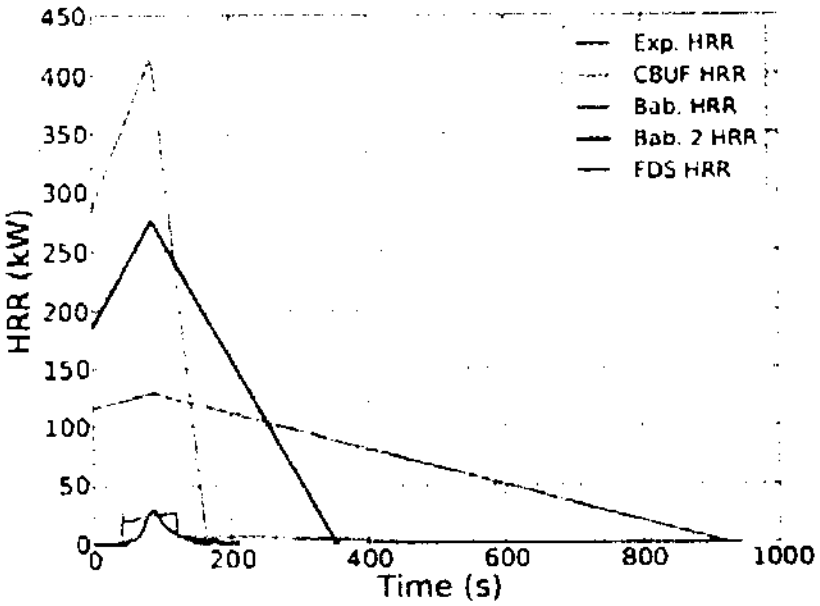

FIGURE 9.—*SRM233CS1*

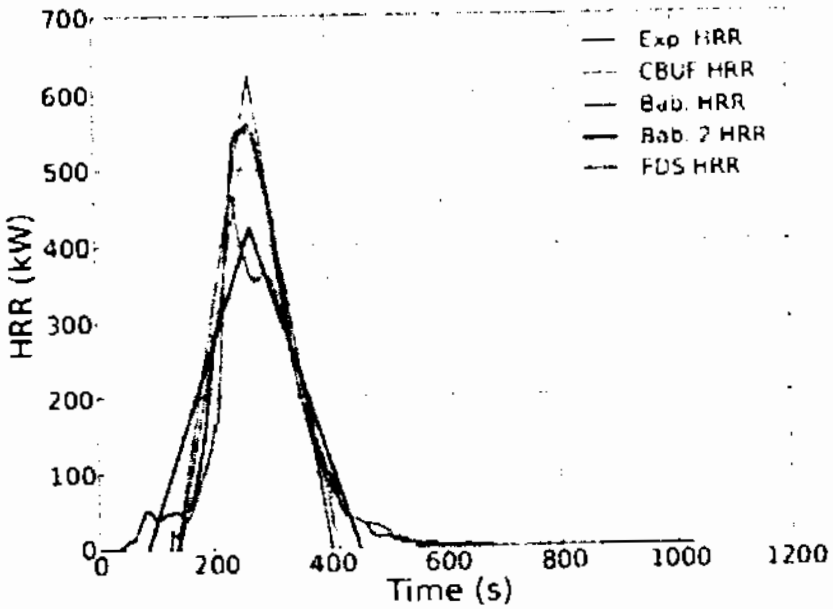

FIGURE 10.—*LRM113CF1*

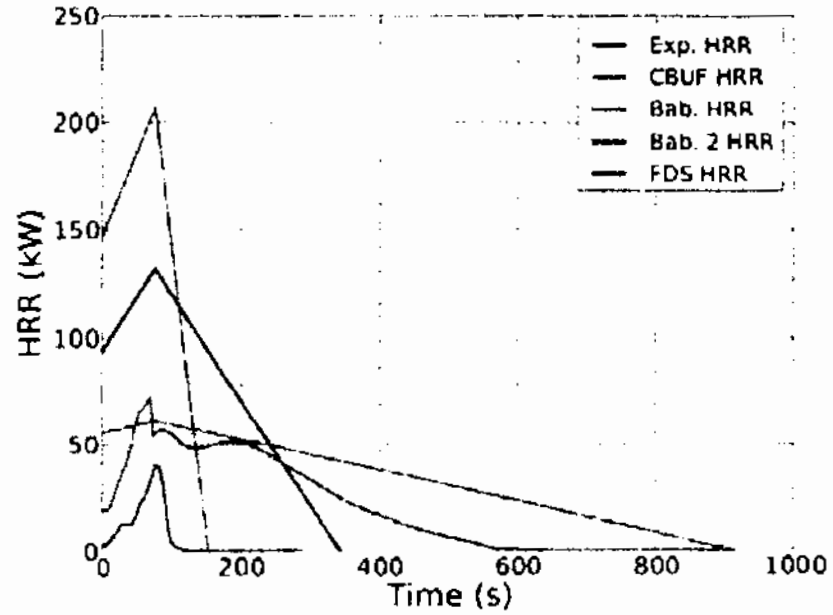

FIGURE 11.—*SOM231CS1*

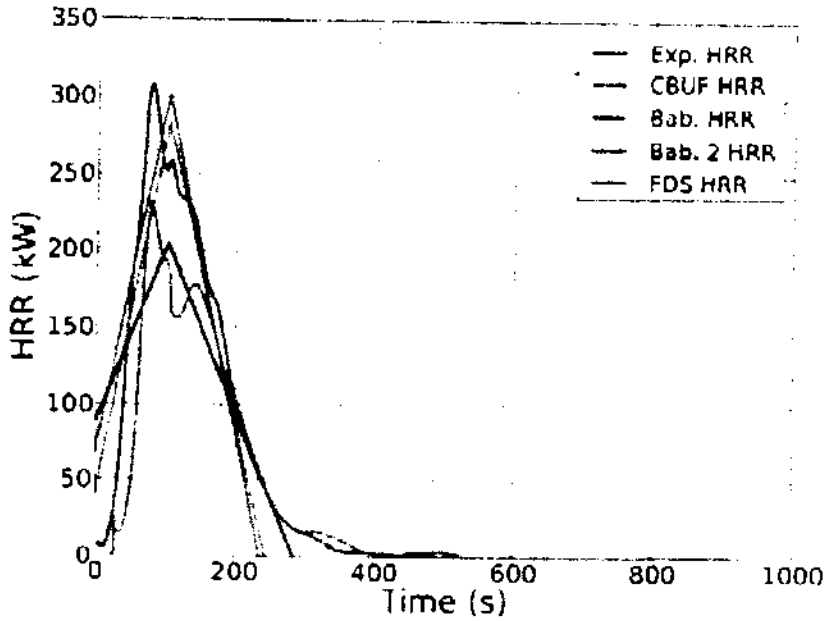

FIGURE 12.—*SOM111CS1*

Figures 11 and 13 show the same comparison for a single seat chair. The same no-ignition is seen for the CA TB 117 and NFPA 701 compliant cushion compared to rapid ignition of the unprotected cushion. The ignition time for the case was even more rapid for this unprotected furnishing due to the location of the ignition source.

Conclusion

The best conclnsion that can be drawn from the data presented here is that the use of CA TB 117 foam increases the fire safety of home furnishings by delaying the onset of free-burning conditions and reducing the total energy released by the event. Using a NFPA 701 compliant cover over the flame-retardant foam prevents the furnishing from becoming the point of initiation with numerons examples in Janssen's paper self-extinguishing on removal of the ignition source, videos of these comparisons are available on request. What CA TB 117 does not do is prevent the furnishing from burning where there is already a free-burning environment but that is not the intent of the regulation. The intent is to prevent the furnishing from becoming the initiation point of a large, free-burning fire caused by a small ignition source that could lead to trapping of occupants by preventing escape.

DR. MATTHEW S. BLAIS,
Director, Fire Technology Department, Southwest Research Institute.

Senator DURBIN. Senator Lautenberg.

STATEMENT OF SENATOR FRANK R. LAUTENBERG

Senator LAUTENBERG. Thanks, Mr. Chairman, for holding this hearing.

Parents in this country expect their child to be safe when sleeping on a baby mattress, feeding from a bottle, playing on the furniture.

When parents buy products that their kids will use, they assume that any chemicals in those products have been tested and proven safe and effective.

In many countries around the world, chemicals are required to be tested, but not in the United States. That's because a 35-year-old law that's supposed to assess and protect against chemical health risks is broken.

The Government Accountability Office has placed that law, TSCA, on its list of high-risk areas of the law. And the President's cancer panel, led by experts appointed under President Bush, said that TSCA, "may be the most egregious example of ineffective regulation of environmental contaminants."

Today, thank goodness, we're examining a prime example of why our system for regulating chemicals needs to be updated.

This spring, the Chicago Tribune exposed how the chemical industry has used dirty tricks and junk science to drive a public misinformation campaign that keeps chemical flame retardants in our homes.

The Chicago Tribune reported that many chemical flame retardants are highly toxic. And while industry has promised that flame retardants would stay put in our furniture, pose no threat to health, those chemicals have ended up everywhere, including in children's bodies. According to the Chicago Tribune, "a typical American baby is born with the highest recorded concentration of flame retardants among infants in the world."

The series shows how the industry repeatedly bullied and lied to the State legislatures to prevent common-sense reforms. They've been accused of bankrolling so-called experts to invent stories that spout the company line, all in the service of protecting their profits, and all at the expense of our safety and health.

But here are the facts: The average couch contains more than 2 pounds of flame-retardant chemicals—chemicals linked to cancer and other health risks.

And while we have filled our homes with toxic chemicals, these flame retardants don't even do what they're meant to do, and that's to prevent fires.

And that's why Senator Snowe and I recently sent a bipartisan letter to EPA, signed by 24 of our Senate colleagues, including Chairman Durbin, urging the agency to take action on a class of flame retardants. Our letter also called for real reforms to TSCA.

But I want to be clear: Flame retardants are just the tip of the iceberg. Studies by the Centers for Disease Control (CDC) scientists found 212 industrial chemicals, including 6 carcinogens, coursing through American bodies. In nearly 35 years, TSCA has allowed EPA to require testing of only 200 of more than 80,000 chemicals on EPA's inventory.

What's more, EPA has been able to ban only five toxic substances under the law. In essence, the American public has become a living, breathing repository for chemical substances.

Our TSCA reform bill, the Safe Chemicals Act, will simply require the chemical makers to establish product safety before they end up in children's bodies.

And most of the thousands of chemicals we use every day are safe, but this bill will separate those safe chemicals from the ones that are not. That's what we have to look out for.

It will ensure that chemicals are tested, that EPA can take unsafe uses of the chemicals off the market.

And I'm proud that Chairman Durbin and 20 other Senators have cosponsored the bill. And I hope that all of our colleagues will come together to finally fix this law to protect our families and our kids from toxic chemicals.

Senator DURBIN. Thanks, Senator Lautenberg.

First panel, Inez M. Tenenbaum, who is the Chairman of CPSC, please proceed.

STATEMENT OF INEZ M. TENENBAUM, CHAIRMAN, CONSUMER PRODUCT SAFETY COMMISSION

Ms. TENENBAUM. Chairman Durbin, Ranking Member Moran, and Senator Lautenberg, I'm pleased to be here today to discuss CPSC's current efforts to implement the performance requirement to reduce the fire risk of residential upholstered furniture.

Reducing deaths and injuries in residential fires is a key strategic goal of CPSC, and the flammability of upholstered furniture has been an area of significant concern by the commission staff.

On March 4, 2008, CPSC issued a notice of proposed rulemaking for a standard for flammability of residential upholstered furniture. The proposed standard would establish two possible pathways for upholstered furniture to meet the proposed standard: Manufacturers could either use an upholster cover material that complies with the prescribed smoldering resistance test, referred to as type one furniture, or use an interior fire barrier that complies with specific smoldering and open flame-resistance tests, known as type two furniture.

During the development of the notice of proposed rulemaking (NPR), CPSC staff was highly cognizant of the concerns expressed by many stakeholders over the use of flame-retardant chemicals as a part of any standard.

While EPA has primary jurisdiction over flame-retardant chemicals through TSCA, CPSC's proposed rule has a performance-based standard as noted above. It does not specify any particular materials or designs, and it does not require the use of any flame-retardant chemicals to achieve compliance with the proposed standard.

In this regard, the proposed rule's open-flame barrier requirement is consistent with certain preliminary findings in a CPSC staff report, conducted as part of the research on the upholstered furniture rule, which reviewed the effects of certain fire barriers on the flammability of upholstered chairs.

The foam used under the fire barriers in those tests represented both flame-retardant-treated foam and nonflame-retardant-treated foam. At the conclusion of these tests, staff noted that the addition of a fire barrier markedly increased the safety of the furniture. As a part of the testing, staff also noted that the fire-retardant foams did not offer a practically significant greater level of open-flame safety than the untreated foam.

Since issuance of the NPR in 2008, CPSC staff has worked diligently with stakeholders and other interested parties to finalize the rule and conduct associated testing. In doing so, we have faced several significant challenges.

One substantial challenge CPSC staff has faced is the development of reasonable and repeatable testing requirements to ensure

compliance with any new rule. Unlike other products, such as mattresses, furniture comes in a multitude of sizes and shapes, making representative and repeatable testing mechanisms a substantial undertaking.

As part of this proceeding, staff has also been working with other organizations to develop standard reference materials, such as standard test cigarettes and standard test foam, which can be part of a representative and repeatable testing mechanism detailed above.

As Chairman, I have recently allocated substantial additional resources to these efforts, and we're making progress toward these goals.

The second and most significant challenge is the statutory requirement that CPSC issue any flammability standards for fabrics, related materials, or products, including interior furnishing, pursuant to section 4 of the Flammable Fabrics Act (FFA).

Like section 9 of the Consumer Product Safety Act, section 4 of the FFA requires that CPSC make a series of very detailed and onerous findings before a final rule can be issued.

In addition, if there's a relevant voluntary standard that has been adopted and implemented, CPSC must determine that the voluntary standard is not likely to adequately reduce the risk of injury or that substantial compliance with it is not likely.

As part of the Consumer Product Safety Improvement Act of 2008 (CPSIA), the Congress recognized the burden that the CPSC section 9 requirements placed on the Commission's ability to issue mandatory rules protecting the public from a number of potential hazards, and moved to ease this burden in several areas.

One key example is section 104 of the CPSIA, where the Congress gave CPSC streamline authority to adopt new mandatory standards for durable infant and toddler products. Under section 104, CPSC must adopt standards for certain infant and toddler products that are substantially the same as relevant voluntary standards, or more stringent than such voluntary standards, if the Commission determines that more stringent standards would further reduce the risk of injury associated with those products.

This section has allowed CPSC to expeditiously adopt standards protecting infants and young children in durable nursery equipment.

Speaking personally in my capacity as Chairman, I believe that an amendment to the FFA permitting this type of flexibility for rules regarding flammability of upholstered furniture would be very helpful and may allow for expedited consideration of the proposed rule.

PREPARED STATEMENT

Chairman Durbin, thank you again for the opportunity to testify on CPSC's ongoing efforts to address the flammability of residential upholstered furniture.

I'm happy to answer any questions you or Senator Lautenberg might have.

Senator DURBIN. Thanks, Chairman Tenenbaum. I'm sure we will have some.

[The statement follows:]

PREPARED STATEMENT OF INEZ M. TENENBAUM

Good afternoon, Chairman Durbin, Ranking Member Moran, and members of the subcommittee on Financial Services and General Government. I am pleased to be here today to discuss the Consumer Product Safety Commission's (CPSC) current efforts to implement performance requirements to reduce the fire risk of residential upholstered furniture.

Reducing deaths and injuries in residential fires where consumer products play a contributory role is a key strategic goal of CPSC, and the flammability of upholstered furniture has been an area of significant concern by Commission staff. Upholstered furnitnre in a home is often a major sonrce of combustible fnel for a fire. Once this furniture is ignited, it contains enough fuel to spread a fire very quickly when the upholstery filling materials start to bnrn.

The most recent fire loss estimates for 2006 through 2008 indicate that upholstered fnrniture was the first item to ignite in an average of 6,500 residential fires attended by fire services during that period. These fires resulted in more than 500 deaths, 860 injuries, and $343 million in property loss each year.[1]

On March 4, 2008, CPSC issued a Notice of Proposed Rulemaking (NPR) for a "Standard for the Flammability of Residential Upholstered Furniture."[2] The proposed standard would establish two possible pathways for upholstered furniture to meet the proposed standard. Manufacturers could either use upholstery cover material that complies with a prescribed smoldering resistance test (referred to as Type I fnrniture) or use an interior fire barrier that complies with specified smoldering and open flame resistance tests (Type II furniture).

During the development of the NPR, CPSC staff was highly cognizant of the concerns expressed by many stakeholders over the use of flame-retardant chemicals as part of any standard. While the Environmental Protection Agency has primary jurisdiction over flame-retardant chemicals under the Toxic Substances Control Act, CPSC's proposed rule has a performance-based standard, as noted above. It does not specify any particular materials or designs, and does not require the use of any flame-retardant chemicals to achieve compliance with the proposed standard.

In this regard, the proposed rule's open-flame barrier requirement is consistent with certain preliminary findings in a CPSC staff report,[3] conducted as part of the research on the upholstered furniture rule, which reviewed the effect of certain fire barriers on the flammability of upholstered chairs. The foam used under the fire barriers in those tests represented both flame-retardant-treated and nonflame-retardant-treated foam. At the conclusion of those tests, staff noted that the addition of a "fire barrier markedly increased the fire safety of the furniture."[4] As part of the testing, staff also noted that "the fire-retardant foams did not offer a practically significantly greater level of open-flame safety than did the untreated foams."[5]

The proposal also aligns with previous CPSC rules regarding the flammability of consumer products, such as CPSC's 2006 final flammability rule for mattresses and mattress foundation sets, which also sets a performance-based standard that does not require the use of flame-retardant chemicals.[6]

Since issuance of the NPR in 2008, CPSC staff has worked diligently with stakeholders and other interested parties to finalize the rule and conduct associated testing. In doing so, they have faced several significant challenges.

One substantial challenge CPSC staff has faced is the development of reasonable and repeatable testing requirements to ensure compliance with any new rule. One component of this is developing appropriate scale tests that can account for the diversity of upholstered furniture products. Unlike other products, such as mattresses, furniture comes in a multitude of sizes and shapes, making representative and repeatable testing mechanisms a substantial undertaking.

As part of this proceeding staff has also been working with other organizations, such as the National Institute for Standards and Technology, to develop standard reference materials, such as standard test cigarettes and standard test foam, which

can be part of the representative and repeatable testing mechanisms detailed above. As Chairman, I have recently allocated suhstautial additional resources to these efforts and we are making progress towards these goals.

The second and most significant challenge is the statutory requirement that CPSC issue any flammability standards for fabrics, related materials, or products including interior furnishings pursuant to section 4 of the Flammable Fabrics Act (FFA).[7] Like section 9 of the Consumer Product Safety Act, section 4 of the FFA requires that CPSC make a series of very detailed and onerous findings before a final rule can be issued, including determinations that the standard is "needed to protect the public against unreasonable risk of the occurrence of fire leading to death or personal injury, or significant property damage"; that expected benefits from the regulation bear a reasonable relationship to its costs; and that the regulation is the least burdensome alternative that prevents or "adequately reduces" the risk of injury. In addition, if there is a relevant voluntary standard that has been adopted and implemented, CPSC must determine that the voluntary standard is not likely to adequately reduce the risk of injury or that substantial compliance with it is not likely.

As part of the Consumer Product Safety Improvement Act of 2008 (CPSIA), the Congress recognized the burden that CPSA section 9 requirements placed on CPSC's ability to issue mandatory rules protecting the public from a number of potential hazards, and moved to ease this bnrden in several areas. One key example is section 104 of the CPSIA, where the Congress gave CPSC streamlined authority to adopt new mandatory standards for durable infant and toddler products.

Under section 104, CPSC mnst adopt standards for certain infant and toddler products that are "substantially the same as" relevant voluntary standards or "are more stringent than such voluntary standards, if CPSC determines that more stringent standards would further reduce the risk of injury associated" with those products. This section has allowed CPSC to expeditiously adopt standards protecting infants and young children in cribs, play yards, bath seats, walkers, and toddler beds. Speaking personally in my capacity as Chairman, I believe an amendment to the FFA permitting this type of flexibility for rules regarding flammability of upholstered furniture would be very helpful and may allow for expedited consideration of the proposed rules.

Chairman Durbin, thank you again for the opportunity to testify on CPSC's ongoing efforts to address the flammability of residential upholstered furniture.

I am happy to answer any qnestions yon may have.

Senator DURBIN. And now let me introduce James J. Jones, Acting Assistant Administrator of the Office of Chemical Safety and Pollution Prevention at EPA.

Please proceed.

STATEMENT OF JAMES J. JONES, ACTING ASSISTANT ADMINISTRATOR, OFFICE OF CHEMICAL SAFETY AND POLLUTION PREVENTION, ENVIRONMENTAL PROTECTION AGENCY

Mr. JONES. Good afternoon, Chairman Durbin and Senator Lautenberg.

Thank you for the opportunity to address you on the reform of chemicals management, and our authority to assess the safety of flame-retardant chemicals.

Ensuring chemical safety, maintaining public confidence that EPA is protecting the American people, and promoting our global leadership in chemicals management remain top priorities for EPA and Administrator Jackson.

Chairman Durbin and Senator Lautenberg, I want to thank you both as well for your continued leadership on this important issue and the efforts you've brought about to help reform TSCA. I also want to thank Chairman Tenenbaum for her work on flame retardants.

With each passing year, the need for TSCA reform grows. Chemicals are found in most everything we use and consume, and they're

[7] 15 U.S.C. 1193.

also essential for our health, our well being, and our prosperity. It should be equally essential that chemicals are safe.

But I'd also like to discuss a prime example of the shortcomings of TSCA that stands as a clear illustration for the need for TSCA reform.

So what are the key problems with TSCA? When enacted, TSCA grandfathered in—without any evaluation—the 62,000 chemicals in commerce that existed in 1976. The TSCA inventory currently lists more than 84,000 chemicals, few of which have been studied for their risks, especially to children.

Unlike the laws applicable to drugs and pesticides, TSCA does not have any mandatory program where EPA must conduct a review to determine the safety of existing chemicals. Manufacturers do not need to demonstrate the safety of new chemicals before they are introduced into the marketplace. When EPA determines that a chemical poses a significant health concern, taking action under TSCA to limit or ban a chemical is challenging.

In September 2009, EPA Administrator Lisa Jackson announced a set of administration principles to update and strengthen TSCA. These principles include that manufacturers should provide EPA with the necessary information to conclude that new and existing chemicals are safe.

EPA should have the tools to quickly and efficiently obtain information from manufacturers that is relevant to determining the safety of chemicals. EPA should also have clear authority to assess chemicals against the safety standard and to take risk management actions when chemicals do not meet safety standards. These are three of the key principles and there are several others.

While the legislative reform process is underway, we are not just standing by. EPA is utilizing the current authority under TSCA to help protect human health and the environment.

Earlier this year, we developed a screening process to identify chemicals for review based on their hazard, exposure, persistence, and bioaccumulative characteristics. EPA identified 83 chemicals for risk assessment with an initial 7 for assessment in 2012.

In June of this year, we identified an additional 18 chemicals that the agency intends to review and then develop risk assessments in 2013 and 2014, including 3 flame-retardant chemicals.

EPA's experience with one flame retardant in particular highlights the limitations of TSCA. EPA first reviewed a new flame-retardant component, TBB, in several products in 1995 for use in foam and, at that time, was unable to identify that it was persistent and bioaccumulative. We only learned of these properties after the chemical was in commerce and was later found in humans and the environment.

TBB is one of the flame retardants EPA will evaluate in 2013, 18 years after it was introduced into the market.

This is an example that highlights the critical need for the agency to have greater evidence that new chemicals are safe prior to commercialization and stronger tools to take action after they are on the market to ensure safety.

The American public has the right to expect that chemicals manufactured, imported, and used in this country are safe. And the

EPA needs an effective law that gives us the tools necessary to provide the public with this assurance.

PREPARED STATEMENT

TSCA must be updated and strengthened, so that EPA has the tools to do the job of protecting public health and the environment. And the time to fix this badly outdated law is now.

And I would be pleased to answer any questions you have.

[The statement follows:]

PREPARED STATEMENT OF JAMES J. JONES

Good afternoon Chairman Durbin, Senator Lantenberg, and members of the subcommittee. Thank you for the opportunity to address the subcommittee today on the reform of chemicals management in the United States and the Environmental Protection Agency's (EPA) authority to assess the safety of flame-retardant chemicals under the Toxic Substances Control Act (TSCA). Ensuring chemical safety, maintaining public confidence that EPA is protecting the American people, and promoting our global leadership in chemicals management remain top priorities for EPA and Administrator Lisa P. Jackson.

Chairman Durbin and Senator Lautenberg, I want to thank you both, as well as members of this subcommittee for yonr continued leadership on this very important issue and your efforts to bring about reform of TSCA. With each passing year, the need for TSCA reform grows—the importance and prevalence of chemicals in our daily lives increases, and yet there remain significant gaps in our knowledge and understanding of many of these chemicals. The time to bring TSCA into the 21st century is long overdue. Today, we also want to discuss a prime example of the shortcomings of TSCA—the limited success and long history of the EPA's work on brominated flame retardants—that stands as a clear illustration of the need for TSCA reform.

Chemicals are found in most everything we use and consume, and can be essential for our health, our well being, and our prosperity. It should be equally essential that chemicals are safe. Compared to 30 years ago, we have a better understanding of the environmental impacts, exposure pathways, and distressing health effects some chemicals can have—especially on children. While our understanding of chemical safety is constantly evolving, significant gaps in our scientific knowledge regarding many chemicals remain. For these reasons, it is critical that we close those knowledge gaps. Recent press reports on flame retardants highlight the public health risks posed by certain chemicals such as flame retardants. Public understanding of these risks is growing, and that is why the public is increasingly demanding that the Government provide an assurance about chemicals, even chemicals like flame retardants that can also provide significant benefits. To date, hased on these concerns, EPA helped negotiate voluutary phase-outs of several of the more toxic retardants, and has also initiated regulatory actions; however, as explained in more detail below, TSCA reform would have given EPA additional tools to address this serious issue.

BACKGROUND ON THE TOXIC SUBSTANCES CONTROL ACT

EPA's chemical management authority is carried out under TSCA—a law that when enacted in 1976 was au iuportant step forward to protect humau health and the environment. But today, TSCA is the only major environmental statute that has not been reauthorized. Over the years, not only has TSCA fallen behind the rapidly advaucing industry it is intended to regulate, it has also proven an inadequate tool for providing the protection against chemical risks that the public rightfully expects and deserves.

When TSCA was enacted, it graudfathered iu, without any evaluation, the 62,000 chemicals in commerce that existed in 1976. The TSCA inventory currently lists more than 84,000 chemicals, few of which have heen studied for their risks, especially to childreu. Uulike the laws applicable to drugs aud pesticides, TSCA does not have a mandatory program where EPA must conduct a review to determine the safety of existing chemicals.

And the process of requiring testing through rulemakiug chemical-by-chemical has proven time consuming. As a result, in the 35 years since TSCA was passed, we have only been able to require testing on approximately 200 of the 84,000 chemicals listed on the TSCA iuventory. EPA has also relied on voluntary programs to collect

data, including through the High Production Volume (HPV) Challenge Program, which resulted in the submittal of screening level data for 1,366 HPV chemicals.

When EPA determines that a chemical poses a significant health concern, taking action under TSCA to limit or ban a chemical is challenging. For example, in 1989, after years of study and nearly unanimous scientific opinion, EPA issned a rule phasing ont most nses of the cancer cansing substance asbestos. Yet, a Federal court overturned most of this action because EPA failed to clear the hurdles imposed under TSCA before existing chemicals can be controlled.

Today, advances in toxicology and analytical chemistry are enhancing our understanding of the implications of multiple pathways of exposure, and a better understanding of the cumulative effects and interactions between the chemicals in the products we use every day. EPA is working to develop methodology to address potential health effects of multiple chemical exposures and evaluate cumulative risks. When TSCA was enacted, there was not the understanding of the subtle effects chemicals may have on hormone systems, human reproduction, and intellectual development and cognition, particularly in young children.

ESSENTIAL PRINCIPLES FOR REFORM OF CHEMICALS MANAGEMENT LEGISLATION

In September 2009, EPA Administrator Jackson announced a set of administration principles to update and strengthen TSCA. These include that EPA should have the tools to quickly and efficiently obtain information from manufacturers that is relevant to determining the safety of chemicals. EPA also should have clear authority to assess chemicals against a safety standard and to take risk management actions when chemicals do not meet the safety standard.

At the same time, Administrator Jackson also affirmed that, while the legislative reform process is underway, EPA is committed to utilizing the current anthority under TSCA to the fullest extent to protect human health and the environment.

WORK PLAN CHEMICALS

Earlier this year, EPA developed a screening process to identify chemicals for review based on their combined hazard, exposure, and persistence and bioaccumulation characteristics. This process included criteria specifically targeted at identifying chemical risks to children. Following this initial screen, EPA identified 83 work plan chemicals for risk assessment in the TSCA chemicals management program, with an initial seven for risk assessment in 2012.

On June 1, 2012, EPA identified an additional 18 chemicals that the Agency intends to review and then develop risk assessments in 2013 and 2014, including 3 flame-retardant chemicals—Bis(2- Ethyl hexyl)-3,4,5,6-tetrabromophthalate (TB PH), 2–Ethyl hexyl-2,3,4,5-tetrabromobenzoate (TBB), and Tris(2-chloroethyl)phosphate (TCEP). EPA is currently developing a strategy, scheduled for completion by the end of this year that will address these three and a broader set of flame-retardant chemicals. This effort will assist EPA in focusing risk assessments on those flame-retardant chemicals that pose the greatest potential concerns. EPA anticipates initiating the risk assessments on this category of chemicals in 2013.

POLYBROMINATED DIPHENYL ETHER FLAME-RETARDANT CHEMICALS

EPA is concerned that polybrominated diphenyl ethers (PBDEs) are persistent, bioaccumulative, and toxic to both humans and the environment. A critical endpoint of concern for human health is neurobehavioral effects dnring development, which makes them a concern for children's health. Various PBDEs have also been studied for ecotoxicity in mammals, birds, fish, and invertebrates. In some cases, current levels of exposure for wildlife may be at or near adverse effect levels.

PBDEs are not chemically bound to plastics, foam, fabrics, or other products in which they are used, making them more likely to leach out of these products. Despite the U.S. phasing out the manufacture and import of penta- and octaBDE in 2004, their component congeners PBDEs are still being detected in humans and the environment. Some reports indicate that levels are increasing.[1] One potential source is imported articles to which these compounds have been added. Another is the breakdown of decaBDE in the environment to more toxic and bioaccumulative PBDE congeners. In late 2009, the U.S. manufacturers of decaBDE announced that they intend to voluntarily phase out most uses of decaBDE by the end of 2013.

EFFORTS ON POLYBROMINATED DIPHENYL ETHER FLAME-RETARDANT CHEMICALS

In late 2009, EPA released an Action Plan for addressing concerns with PBDE flame-retardant chemicals and recently issued proposed rules that would require additional testing on these chemicals and require EPA review any new uses of these chemicals, including imported articles. EPA also helped facilitate an industry plan to phaseout decaBDE and launched a multi-stakeholder partnership to assess alternatives for this chemical to help move the market to safer chemicals. This follows EPA's earlier facilitation of an industry phaseout of two other widely used PBDE flame retardants, pentaBDE and octaBDE in 2004 and an associated partnership to help identify safer flame retardants for use in polyurethane foam.

In its 2009 Action Plan, EPA committed to support and encourage the voluntary phase out of the manufacture and import of decaBDE. Developed with public participation through EPA's Design for the Environment Program, EPA will shortly release the draft alternatives assessment on decaBDE for public comment. This assessment will profile the environmental and human health hazards on 30 alternatives to decaBDE. By providing a detailed comparison of the potential human health and environmental effects of chemical alternatives, EPA can help manufacturers identify and transition to safer alternative flame-retardant chemicals.

EPA first reviewed a new flame-retardant component of several products in 1995 for use in polyurethane foam and was unable to identify that a component of flame retardants was persistent, bioaccumulative and toxic. Later, after the chemicals were in commerce, information became available that showed the chemicals were being found in humans and the environment. This is an example that highlights the critical need for the agency to have greater evidence that new chemicals are safe prior to commercialization and to be able to take effective action after commercialization, when needed. Unfortunately, taking the necessary steps to ensure that chemicals already in commerce are safe can be a cumbersome, involved regulatory process that can take years.

While the latest steps taken by EPA are clearly a step forward, they must be viewed in the context of what has been a long history of actions on flame retardants, a history that has stretched over the course of two decades with a range of voluntary efforts and regulatory actions on flame-retardant chemicals in both EPA's new and existing chemicals programs. The long history of EPA's action on brominated flame retardants is tied in no small part to the shortcomings of TSCA.

SUMMARY

Simply put, EPA may have made a different determination in 1995 if TSCA required the snbmission of more robnst hazard, exposnre, and use data needed to adequately assess risk, and EPA may have been able to act more quickly and effectively on the risk information available if TSCA provided more robust tools to deal with chemicals already introduced into commerce. The American public has the right to expect that the chemicals manufactured, imported, and used in this country are safe and EPA needs an effective law that gives us the tools necessary to provide the public with this assurance. The time is now to fix this badly outdated law. TSCA must be updated and strengthened so that EPA has the tools to do our job of protecting public health and the environment.

I would be happy to answer any questions you may have.

Senator DURBIN. Thank you very much.

Chairman Tenenbaum.

Ms. TENENBAUM. Yes.

Senator DURBIN. You mentioned that the NPR was announced in March 2008, which was—what?—4 years ago. But, actually, didn't CPSC begin the rulemaking process under the Flammable Fabrics Act in 2003?

Ms. TENENBAUM. Yes, we have a long history of rulemaking in this regard. And, really, it began even before then when CPSC, at the time, asked the staff to develop an open-flame upholstered furniture rule.

And then in 1999, the Congress asked CPSC to study flame-retardant chemicals. We studied 16 chemicals. We worked with the National Academy of Sciences, and eight of those flame-retardant chemicals were found to be carcinogens.

So this has gone on for some time with the work on carcinogens. Now the new rule we're working on is a smoldering ignition rule and not an open flame.

Senator DURBIN. So let me just ask, the average person on the street, if you said to them, we have a Government agency, which is funded, with experts and laboratories, and we've asked them to figure out how to keep our furniture safe so it is less likely to catch fire, and less likely to kill us, they've been at it now for 9 years, make that 4 years.

Ms. TENENBAUM. We've been at it, yes, for at least that long.

Senator DURBIN. And the obvious question from the person on the street is, when does this end? At one point you said to me that the cigarette you were using, Pall Malls, were no longer made, so you had to start over or find a new standard cigarette.

I think here's the way I'm coming at it. I look at UL. I subscribe to "Consumer Reports". They're testing constantly. And they apparently come up with timely results.

Is the Congress the problem here? Have we created obstacles for you in this testing process, where you can't come to a timely finding that might be of value to consumers across America?

Ms. TENENBAUM. I think that the Flammable Fabrics Act places an onerous burden on CPSC with cost-benefit analysis. Not only do we have to look at and analyze what we're going to put in a rule, we have to analyze the alternatives and why they won't work.

So we did have a setback with Pall Mall, because they stopped manufacturing the filterless cigarette, when they were required by law to manufacture self-extinguishing cigarettes and stop making the filterless cigarette that we used as standard reference material.

So we worked with the National Institute of Standards and Technology (NIST) for 2 years, and now they have a standard cigarette. The next thing we had to do——

Senator DURBIN. Two years.

Ms. TENENBAUM. Two years.

During this time period, they were also working on standard foam. A rule requires a test that's repeatable. So NIST has been working on standard foam, and they have finished that work. And we're looking at whether we should use small-scale tests vs. full-scale tests. This model is small-scale testing. This is how we test. This is the foam. You put the cigarette right here. You cover it up.

You have to determine: Is this repeatable with this size or do you have to do full scale? You must test the number of furniture designs, the number of different fabrics, and you had to have a standard cigarette, and standard foam. So we have now completed all that work.

But let me say one thing——

Senator DURBIN. I want to make a point here, if I might.

Ms. TENENBAUM. Please.

Senator DURBIN. I guess the obvious question most people would ask is, how can we have reached the point where Europe has figured this out, or at least believes they have, and we are still testing away here?

Many European countries have taken steps to ensure flammability standards. The United Kingdom has banned the use of con-

ventional flexible polyurethane foam in the manufacture of upholstered furniture.

[The information follows:]

While it is trne that in the United Kingdom, there are fnrniture and bedding flammability standards, flexible polynrethane foam has not been banned in the United Kingdom or anywhere in the world. Complying with U.K. standards requires the addition of substantial amounts of flame-retardant chemicals to polyurethane foam, usually in the form of melamine with a chlorinated "carrier", such as Tris (1-chloro-2-propyl) phosphate. Nonflame-retardant foams do not work in testing standard applications such as British Standard 5852. Other European countries do not have similar flammability standards. Some of the Scandinavian countries, such as Norway, are pursuing development of a flammability standard; however, none has adopted one yet.

At the most recent EUROPUR meetings in Budapest, Hungary in Jnne 2012 (EUROPUR is the European equivalent of the Polyurethane Foam Association), flammability issues were discussed with representatives from many European countries and heard a presentation regarding the efforts in Scandinavian conutries to address the impact of adopting upholstered furniture flammability standards. It was in this presentation that the discussion took place regarding the efforts in Norway to establish a furniture flammability standard and the difficulties faced in deciding whether to adopt a standard. European countries are struggling with the same issues as we are in the United States regarding upholstered flammability furniture standards.

Senator DURBIN. In addition, many European countries have banned the use of PDBEs and greatly restricted other flame-retardant chemicals.

It appears that there is a body of study and investigation that is taking place in other countries, leading them to change the products that consumers have available, and the United States just keeps studying away.

Now I know from the congressional side of this that the industry will come in whenever there's an effort to regulate and have oversight, and create what they consider to be safeguards for their products.

But ultimately, at the end of the day, it seems to me that the losers are the American consumers. They don't know what's right, what's safe, and we're not doing our job for them.

Ms. TENENBAUM. CPSC does not require flame retardants for any of the textiles or furniture that we oversee.

We do not advocate for flame retardants. We don't require flame retardants to meet any of our standards. So comparing us to Europe or to California is really not a fair comparison, because we don't require flame retardants to meet any of our standards.

Senator DURBIN. But, Chairman Tenenbaum, what I did note was that there was a change in the type of furniture that is sold in Europe, too, beyond the flame-retardant chemicals.

I see my time is up, and I want to give Senator Lautenberg a chance to ask.

We're going to face a rollcall vote soon.

Go ahead.

Senator LAUTENBERG. Thanks.

Ms. Tenenbaum, nice to see you here and listen to what each of you have said.

And, Mr. Jones, Senator Snowe, and I recently, as I mentioned, sent a letter to EPA signed by 24 of our Senate colleagues, applauding EPA's current actions on polybrominated diphenyl ethers (PBDEs). The letter also expressed concern that EPA's authority to

address PBDEs is limited under our current chemical safety law, TSCA.

[The information follows:]

UNITED STATES SENATE,
Washington, DC, July 9, 2012.

Hon. LISA P. JACKSON, Administrator,
Environmental Protection Agency,
Washington, DC.

DEAR ADMINISTRATOR JACKSON: We are writing to express our support for the Environmental Protection Agency's (EPA) actions to address a class of flame retardant chemicals called polybrominated diphenyl ethers (PBDEs). These flame retardant chemicals are found in a number of everyday consumer products, including furniture, plastics, and even baby products. According to the EPA, these toxic chemicals are suspected to cause cancer and have been linked to serious neurological and reproductive diseases. We urge the agency to move forward as quickly as possible with its current efforts to protect American families from the toxic effects of PBDEs.

PBDEs are mixed into a number of household products in order to raise the temperature at which they burn, purportedly making the products more flame resistant. However, the Consumer Product Safety Commission found that these chemicals do not provide any significant protection against the risk of fires. Instead, it has become clear that PBDEs can increase human health risks and that the chemicals easily spread and accumulate in the environment and living organisms, including people.

We are deeply alarmed that peer-reviewed research has found that a typical American baby is born with the highest recorded concentrations of flame retardants among infants in the world. This is a serious threat to our children's health because PBDEs interfere with the body's hormone systems, and studies in animals suggest they can cause cancerous tumors, birth defects, and other developmental disorders. Researchers have found that children's exposure comes primarily through household dust, making babies and toddlers particularly vulnerable since they spend a significant amount of time playing on the floor.

Despite the danger to public health, a recent investigative report by the Chicago Tribune revealed that flame retardant manufacturers may have misled the public for decades regarding both the risks and efficacy of these chemicals. Due to industry opposition to common sense reforms at both the Federal and State level that would limit the use of these chemicals, PBDEs and other flame retardants continue to be used in a significant number of everyday products.

In response, EPA has adopted an action plan for PBDEs using its existing authority under the Toxic Substances Control Act (TSCA). This plan reflects the agency's assessment that PBDEs are persistent, bioaccumulative, and toxic to both humans and the environment. Currently, the agency is accepting public comment on two paired rulemakings related to PBDEs. The first action would amend the current Significant New Use Rule (SNUR) to require any manufacturer, importer, or processor of seven different PBDEs, or articles containing them, to submit a notification to EPA at least 90 days before beginning new activities involving these chemicals. The second rulemaking would require those insisting on continuing to use these chemicals to develop the data EPA would need to fully evaluate the health and safety effects of this class of toxic chemicals. We support these efforts and urge EPA to finalize and implement these rulemakings as quickly as possible following the public comment period.

While we commend the EPA for taking steps to address PBDEs, it is concerning that the agency must undertake lengthy rulemaking processes merely to secure additional health and safety data on a chemical of concern and to receive notifications regarding expansions of its uses. Further, EPA is not evaluating steps to actually restrict existing unsafe production and uses of these toxic flame retardants. This reinforces why there is broad agreement that TSCA must be reformed to protect American families from dangerous chemicals in a cost-effective way and we urge you to continue to work with Congress to enact consensus reforms.

Americans deserve to know that the chemicals used in everyday consumer products are safe. EPA's current action to address the health risks of PBDEs is an important first step towards protecting Americans from the risks posed by these pervasive chemicals and we look forward to working with you to enact these reforms.

Sincerely,

Frank R. Lautenberg; Olympia J. Snowe; Richard J. Durbin; Lisa Murkowski; Charles E. Schumer; Susan M. Collins; Ron Wyden; Bernard Sanders; Richard Blumenthal; Al Franken; Joeseph I. Lieberman; Patrick J. Leahy; Tom Harkin; Dianne Feinstein; Sheldon White-

house; Kirsten E. Gillibrand; Jeff Merkley; Jon Tester; Jack Reed; Tom Udall; John F. Kerry; Amy Klobuchar; Maria Cantwell; Michael F. Bennet; Daniel K. Akaka; Sherrod Brown.

Senator LAUTENBERG. What additional steps might EPA take to protect American families on PBDEs, if the Congress enacted TSCA reform?

Mr. JONES. Thank you, Senator Lautenberg.

We appreciate the letter of support for the actions that we're taking on the PBDEs. These are a group of flame retardants that are being phased out in the United States, and we're putting into place a backstop, we hope, known as the significant new use rule, that hopefully will keep new manufacturers of PBDEs from potentially other parts of the world from sending those chemicals into the United States.

One of the limitations under existing TSCA is that somebody from another country could bring a significant new use notice to EPA without any data supporting the safety of those compounds. And we, again, at EPA would be confronted with making judgments around these chemicals without any evidence of safety.

Closing that loophole under TSCA reform would be very helpful, which I think has been considered in your Safe Chemicals Act.

It also raises the question of all of the other flame retardants and the provisions that previous versions of the Safe Chemical Act have included, which involve manufacturers having data demonstrates safety of those compounds so that the agency can evaluate their safety, and the tools necessary to manage risks, if risks are unacceptable, would be very useful as well.

Senator LAUTENBERG. Yes, in your written testimony, you say EPA would like to do more to protect the public from the risks of flame retardants, but it is limited, again, by its current authority.

Would additional authority provided—you've looked at my Safe Chemicals Act—allow EPA to better address those risks?

Mr. JONES. Absolutely. The example that I described earlier of TBB, where the manufacturer is not required to provide any information to EPA demonstrating safety, which is a hallmark under the Safe Chemicals Act, would be very important to ensuring that new chemicals are safe.

Giving EPA the authority to get health and safety data for existing chemicals is critically important for our ability to demonstrate the chemicals are safe. And then the tools necessary to effectively manage risks from chemicals when risks are identified is also very important.

So I think all of those elements, which are in the Safe Chemicals Act, are critically important to EPA being able to demonstrate that we have safe chemicals in the United States.

Senator LAUTENBERG. A number of States have banned the use of some toxic flame retardants because of public health concerns. Other States are considering similar actions. Now, if EPA had greater authority under TSCA to address these chemicals, do you think that the States would continue pursuing efforts to ban flame retardants and other chemicals?

Mr. JONES. Thanks, Senator. When I speak with my counterparts in State agencies, those in particular who are active in regulating

chemicals, they are hopeful that EPA is more active in assessment and regulation of chemicals.

They are very constrained in their resources. They are responding to the people of their States. But they really wish EPA would, in my words, occupy the space more effectively.

And I think their sense is that, if we did that, that they would not have to be as active as they have been.

Senator LAUTENBERG. Mr. Chairman, I'll ask one more question.

Ms. Tenenbaum, CPSC has done extensive testing on the flammability of different products. Based on this analysis, do you think that the addition of flame retardants in furniture foam has provided Americans with any significant protection from household fires?

Ms. TENENBAUM. Our tests that we conducted on foam that was treated with flame-retardant chemicals and foam that was not, showed that there was no difference in terms of retarding the flame.

However, if you put a barrier behind the furniture, that has a much more significant result in stopping the fire and retarding the growth of the fire.

So the answer is no.

Senator LAUTENBERG. Yes, thank you.

Thanks, Mr. Chairman.

Senator DURBIN. Senator Lautenberg, you've hit the nail on the head, because if these chemicals don't make our homes safer—and that's what Chairman Tenenbaum has said; I think the UL testimony will back that up as well—the obvious question is, is exposure to these chemicals a danger?

And I think it goes back to a point you made in your opening, Senator Lautenberg: Most Americans incorrectly, falsely, assume that if a product is for sale in the United States, someone who cares for their interest—not an economic interest, but cares for the health interest of Americans—has taken a look at it and said it's safe to sell.

So let's get on the record, here, Mr. Jones. In terms of chemicals used throughout our economy—in this case, furniture in particular—there's no pre-clearance through EPA of these chemicals, is there?

Mr. JONES. Thanks, Senator Durbin.

The manufacturers for a new chemical—a new chemical, not one that was manufactured before 1976—must bring to EPA a notice prior to going to market. They are not required, however, to submit to EPA or to generate any health and safety data unless they already have.

And so EPA uses what knowledge we have to make judgments about whether or not we believe that chemical is going to be safe.

We are significantly limited by what is provided to us by the manufacturers.

Senator DURBIN. So let's do a sharp contrast with another role of our Federal Government.

When it comes to prescription drugs, in order for a company to legally sell prescription drugs in America, they must establish that that compound, that chemical compound, is both safe and effective, safe to the consumer and effective for the purpose sold. And until

they establish that, they cannot legally sell that pharmaceutical in America.

Now, in your world of chemicals, and let's deal with post-1976 after the 67,000, did you say?

Mr. JONES. Right.

Senator DURBIN. That were grandfathered in, when it comes to new chemicals, is there a legal burden on those who introduce them into commerce to establish that they are safe for exposure to human beings, and effective for the purpose stated?

Mr. JONES. There is no legal burden on the manufacturer to demonstrate to EPA or to anyone else that the products that they are going to be selling are safe. They need to submit the name of the chemical and a few other pieces of information to EPA, and the burden is on us to demonstrate that it is not safe.

Senator DURBIN. And you're dealing with 13,000 or 14,000 chemical compounds?

Mr. JONES. There have been more than 26,000 new chemicals since TSCA was originally passed.

Senator DURBIN. And according to Senator Lautenberg and things that I've read, you've been able to look at several hundred. Is that correct?

Mr. JONES. Of existing chemicals, we have required testing of several hundred. We have looked at the 26,000 new chemicals that came to us.

But again, they do not need to submit any health and safety data, unless they already generated it, to EPA. And so we are trying to use our judgment, often in the absence of data, to determine whether or not there's some reason to be concerned.

I think often we do a good job of that. I think TBB is an example of where we missed it. We missed an issue that ultimately——

Senator DURBIN. TBB being a flame retardant.

Mr. JONES. TBB being the flame retardant in Firemaster.

Senator DURBIN. So the premise is, from Chairman Tenenbaum and later from UL, these chemicals do not make us any safer. Number two, these chemicals in and of themselves could cause some health problems.

It's my understanding that scientific data says exposure to flame-retardant chemicals can lead to liver, thyroid problems, cancer, and other developmental defects. Is that not correct?

Mr. JONES. That's correct.

Senator DURBIN. There is no evidence, or there is no requirement, I should say, under the law that they be proven safe before they're introduced into commerce. And now we are finding concentrations in our babies and infants, unlike any other country in the world.

Now, if this isn't a call to arms across America from families, including families with grandparents like me, who have little toddlers now bouncing around on the floor when I'm sitting on these cushions and spraying these chemicals out, I don't know what is.

So at this point, the TSCA law that Senator Lautenberg has introduced, and I'm cosponsoring, would give you new authority in this area, if you could describe it.

Mr. JONES. Thank you, Senator.

The authorities that we would get under the Safe Chemicals Act are the manufacturers would need to have information to demonstrate the safety of the chemicals that they would submit to EPA, and EPA would make a judgment about the safety. So the burden would shift to the manufacturers to demonstrate safety.

For chemicals already on the market, the agency would be able to compel the generation of health and safety data in a way that isn't so burdensome. And then we would also have tools that would allow us to quickly and efficiently remove unsafe uses of compounds from the market.

Senator DURBIN. And just one point I'll make before we break—I think we have to vote, Frank.

One point I'll make is that Firemaster 550, one of these flame-retardant chemicals mentioned in the Chicago Tribune articles, originally developed as an environmentally friendly alternative to PBDEs, the fire-retardant chemicals.

However, new research on Great Lakes fish shows the chemical is accumulating and causing DNA damage to the fish in the Great Lakes.

When TBB, a component of Firemaster 550, was first submitted in 1995, EPA then identified possible negative health impacts of using this chemical. Is that not correct?

Mr. JONES. In 1995, the mistake that the agency made was that we hadn't figured out that that chemical was going to be persistent or bioaccumulative. Those are the properties that have ultimately led TBB to be in the environment in places we never thought it would have been. So it was missing those characteristics, because we had no basis to determine otherwise. That has led to the exposures that you've described.

Senator DURBIN. So it would seem to me interesting that when it comes to the regulation of furniture, products before CPSC, we have created this rigorous set of tests that need to be done by the Government, which make your job that much more difficult and takes that much longer.

And yet when it comes to the chemicals presented by industry to use in American commerce, our standards are very slight reporting of the chemicals themselves and any evidence they've collected. There's a sharp contrast here.

I'm going to ask this subcommittee to stand in recess for about 10 or 15 minutes. We're going to leave and vote and come back.

And Chairman Tenenbaum and Mr. Jones, thank you both for your testimony very much.

We'll have the second panel when we return.

Thank you.

NONDEPARTMENTAL WITNESSES

Senator DURBIN. On our second panel, we're going to hear from three witnesses involved in different parts of the flammability question.

Our first witness is August "Gus" Schaefer, Sr.—vice president and chief safety officer of Underwriters Laboratories (UL), in Northbrook, Illinois, responsible for maintaining and building UL's public safety mission, including planning, directing, and coordinating public safety activities within UL's operations all around the world.

Mr. Schaefer also acts as UL's public safety guardian, ambassador, and advocate inside and outside the company to ensure that public safety remains a key part of UL's relationship with clients and constituents. In this role, he leads the UL Corporate Social Responsibility Initiative.

He's been with them for more than 39 years, holds a bachelor's degree in industrial engineering from NYU School of Engineering and Science and a certificate in management from Long Island's Adelphi University.

Next we're going to welcome Andy S. Counts. He's the CEO of American Home Furnishings Alliance. The American Home Furnishing Alliance is the Nation's largest trade association for home furnishings manufacturers, importers, and suppliers. He's provided a voice on the development and implementation of consensus-based environmental regulations and product safety standards that impact their industry.

He has a degree in industrial engineering from the Georgia Institute of Technology, and he's served in a number of private sector posts, as well as with the Virginia Department of Environmental Quality.

And finally, our third witness is Peter Van Dorpe. He's the chief of the Chicago Fire Department's Training Division. Glad he's here. He is a 32-year veteran of the Chicago Fire Department with a bachelor degree in fire science management from Southern Illinois University.

In addition to his work as field instructor for Illinois Fire Service Institute, he's the lead instructor for the Chicago Fire Department's Fire Officer School, teaches building construction for the Fire Service at Harold Washington College in Chicago, and recently participated as a subject-matter expert for research conducted by both UL and the National Institute of Standards and Technology.

Mr. Schaefer, you have the floor, followed by Mr. Counts, and Mr. Van Dorpe.

Please proceed.

STATEMENT OF AUGUST "GUS" SCHAEFER, SR., VICE PRESIDENT AND CHIEF SAFETY OFFICER, UNDERWRITERS LABORATORIES, INC.

Mr. SCHAEFER. Thank you, Chairman Durbin and members of the subcommittee, for this opportunity to share UL's research and expertise on the subject of furniture flammability.

UL is a global, independent, voluntary standards developer, and product-testing and certification organization dedicated to public safety. We have been based in Illinois since our founding in 1894 and have about 1,600 employees at our Northbrook headquarters.

UL is driven by our safety mission, which promotes safe living and working environments by the application of safety science and hazard-based safety engineering.

UL recently concluded furniture flammability research, and we'll be showing video excerpts from our testing.

The first video shows a side-by-side comparison of a room filled with legacy furniture you would expect to find in a home in the 1960s and 1970s, and a room with modern day furniture.

During the past 30-plus years, petroleum-based materials such as polyurethane foam and synthetic fabric covers, have supplanted natural materials in furnishings. As you can see, modern furniture typically ignites faster, burns more intensely, releases energy faster, and produces greater amounts of smoke.

As a result, the amount of time available for a safe escape from a home fire is much shorter today than in the past and results in a disproportionately higher number of home fire deaths.

These results are confirmed through related studies by NIST and the National Fire Protection Association (NFPA).

As part of UL's safety mission, in 2008, we began a self-funded research project to determine how fire-retardant-treated foams and fire barriers can affect fire growth. UL focused our research on open-flame testing to complement the smoldering ignition research undertaken by the CPSC and the furniture industry.

Our research consisted of material, mockup, and full-size furniture tests. We tested a variety of materials, including foams treated with and without fire-retardant chemicals, polyester microsuede cover fabric, and various barrier materials. Using a standard flame and ignition source, we measured for heat release rate and mass loss rate.

While we don't have video footage of flame-retardant-treated versus nontreated furniture to show you today, our tests found that, when compared to untreated contemporary furniture, contemporary furniture with flame-retardant foam shows a measurable, but not a meaningful difference in time to flashover or when the gas is emitted from burning materials actually ignite.

Furniture constructed with a flame barrier has flashover times 20 minutes greater than furniture without barriers. This would allow residents significantly more time to safely get out of their homes.

We then expanded the scope of our research to understand how the fire growth of different furniture materials affects survivability for the occupants.

The second video shows a series of fires in identically furnished living rooms. The only differences were the material used in the chair and sofa.

In the four screens, the top left screen contains contemporary or modern furniture. The top right screen contains legacy furniture. The two bottom screens contain contemporary furniture incorporating the fire barrier ignited in different locations.

At 45 seconds, we already see that the flame size in the modern furniture is growing at a faster rate. At the 1-minute mark, the smoke alarm would have sounded. It takes a person about 20 to 40 seconds to react.

At 1 minute 45 seconds, a fire extinguisher probably would not put out the modern furniture fire and the occupant would look to escape.

People take 60 to 90 seconds to gather belongings and children, call 9–1–1, and evacuate.

The modern furniture room in the top left of screen reached flashover at 4 minutes and 45 seconds.

Comparing this with the Chicago Fire Department's goal of being on scene within 3 to 5 minutes after notification, we can deduce that the rooms furnished with modern furniture often reach flashover before the fire services can arrive at the scene.

At 15 minutes, the fire started in the bottom left screen with contemporary furniture incorporating a fire barrier actually self-extinguished. And at 21 minutes and 45 seconds, the barrier-modified furniture in the bottom right screen flashes over.

The living room with legacy furniture finally flashes at 34 minutes and 15 seconds.

Based on the data drawn from earlier tests, we sought to evaluate smoke alarm response and occupant survivability in full-scale homes. We constructed two homes in UL's large-scale fire facility, a one-story, 1,200-square-foot home, and a two-story, 3,200-square-foot home.

We then repeated the previous experiments inside the homes. And though we are still analyzing the results, the preliminary data supports our original findings.

Based on the research we conducted, UL believes, first, modern furniture, whether treated or untreated with flame-retardant chemicals, does not provide sufficient egress time.

Second, for furniture with a flame barrier, the time to flashover is increased to greater than 20 minutes, allowing significantly more time for safe evacuation and fire service response.

PREPARED STATEMENT

With the convergence of flammability and human health impact concerns, UL is beginning to research the nexus of the two.

UL appreciates the opportunity to share our findings, and we look forward to working with you and other stakeholders moving forward.

Thank you.

Senator DURBIN. Thank you.

[The statement follows:]

PREPARED STATEMENT OF AUGUST "GUS" SCHAEFER, SR.

Thank you Chairman Durbin, Ranking Member Moran, and distinguished members of the subcommittee for the opportunity to share Underwriters Laboratories, Inc.'s (UL) research and expertise on the subject of furniture flammability. My name is August "Gus" Schaefer—Senior Vice President and Public Safety Officer at UL.

UL is an independent, not-for-profit standards developer and product testing and certification organization dedicated to pnhlic safety. Since our fonnding in 1894, UL's engineers and staff have helped develop safety standards and prodnct-testing protocols, conducted independent product safety testing and certification, and inspected manufacturing facilities aronnd the world. UL is driven by onr global safety mission, which promotes safe living and working environments hy the application of safety science and hazard-based safety engineering. The application of these principles manifests itself in the evaluation of tens of thousands of products, components, materials, and systems for compliance to specific reqnirements. Throngh these activities, UL actively engages the U.S. Government in its development and administration of Federal regulations and conformity assessment programs at the Federal, State, and local levels. UL works with all participants as a neutral party to ensnre the safest possible outcome for those who work with and rely on the products at issue.

FIRE RISK ASSOCIATED WITH UPHOLSTERED FURNITURE

According to the National Fire Protection Association (NFPA), more home fire deaths resulted from fires beginning with upholstered furnitnre and mattresses/bedding than any other canse. During the 5-year period of 2005–2009, these fires accounted for 19 percent and 14 percent of the deaths and 7 percent and 10 percent of the injnries, respectively. They also accounted for $824 million in direct property damage.[1]

During the past 30+ years, residential interiors have changed dramatically. Homes have increased in size, the number and amount of furnishings and possessions have grown, and petroleum-hased synthetic materials have snpplanted natnral materials in furnishings and home construction products. The combination of these factors has changed the smoke and gas characteristics of residential fires and in some cases, accelerated the speed of fire growth.

For a variety of reasons, mannfactnrers of home fnrnishings are tnrning away from materials like wood and natural fibers in favor of high-performance, lower-cost synthetic materials. For example, most upholstered furniture available today utilizes polyurethane foam for padding and synthetic fabric covers, replacing natural padding materials like cotton, down and feathers, and cover materials made of cotton, wool, linen or silk. While these material changes can lead to products that are easier to clean and more resistant to normal wear and tear, they also react differently when exposed to an ignition source. Studies by UL researchers have found that synthetic materials typically ignite faster, hurn more intensely, and release their fire-enabled energy faster creating greater amounts of smoke than natural materials posing a more ominous threat to occupants and their homes.[2]

The video that will be playing first will show a side-by-side comparison of a room filled with legacy furniture, or furniture you would expect to find in a home in the 1960s and 1970s, and a room with modern furniture purchased at a national department store chain. Both rooms were ignited by placing a lit stick candle on the right side of the sofa and the fires were allowed to grow until flashover. As you will see, the room with modern furniture achieves flashover conditions in a significantly shorter time.

The seemingly insignificant change from natural to synthetic materials in home furnishings has led to residential fires that grow faster and lead to the more rapid onset of untenable conditions. As a result, the amount of time available for safe egress from a home fire is much shorter than in the past. These results corroborate the National Institute of Standards and Technology's (NIST) findings for shorter available safe escape times in residential smoke alarm studies conducted in 2003[3] versus 1975[4] which they attributed in part to faster fire growth.

UNDERWRITERS LABORATORIES RESEARCH EXPLORING THE FIRE SAFETY OF UPHOLSTERED FURNITURE

As part of UL's safety mission, in 2008 we set out to conduct a self-fnnded research project to determine if commercially available products snch as fire-retardant foams and fire barriers (interliners) can retard and/or reduce the fire growth rate of upholstered furniture exposed to small open flames. Polyurethane foams are highly cellular materials that provide flexibility and comfort. Unfortunately, the physical design and chemistry (polyurethane chemical structure) is highly vulnerable to ignition, flaming liquefaction, and further burning. Flame retardants (most notably bromine and phosphorous) are used to quench the progressing fire growth. Because of the cellular foam structure, the quantities of flame retardants necessary to accomplish this task are extremely high, some as high as npward of 30 percent hy weight. Fire barriers are complex woven structures that have both polymeric fibers and inorganic coatings that develop a protective char on burning. When they are exposed to high-temperature flames, the organic polymers burn with the inorganic compounds and form combustion products that are brittle and have mechanical strength (rather than powdery ash). The creation of an inorganic "crust" is a way of slowing down or even preventing the high-temperature flames from impinging on the polyurethane foam. There are many other examples of intumescent or char-forming materials, such as intumescent coatings for steel beams, and polymeric jacketing materials used in plenum cable.

UL decided to focus our research on open-flame testing as we believed that the Consumer Product Safety Commission (CPSC) and the Upholstered Furniture Action Council (UFAC) were already addressing smoldering ignition. The scope of the project later expanded to fully understand the impact upholstered furniture materials play in fire growth and subsequent occupant tenability and survivability. Thus, apart from the ignition of upholstered furniture, our research sought to understand the dynamics of fires that include various constructions of upholstered furniture.

Our research can be divided into three phases. Phase 1 of our research consisted of material-level tests, furniture mock-up tests, and full-size furniture tests, the original scope of the study. Phase 2 compared various upholstered furniture configurations in a living room environment Finally, Phase 3 included a series of full-scale house fire experiments to determine smoke alarm response aud occupant tenability and survivability related to upholstered furniture fires.

PHASE 1: MATERIAL, MOCKUP, AND FULL-SIZED FURNITURE TESTING

Materials utilized in this investigation included 11 commercially available barrier materials constituting different chemistries and physical structures (iucludiug flat weaves, knits, and high lofts). Two comparable density polyurethane foam materials were also used: a nonfire retardant foam commonly used in upholstered furniture and a California Technical Bulletin (CA TB) 117 compliant fire-retardant treated foam. UL also utilized the most popular cover fabric from the largest upholstered furniture cover fabric supplier in the United States (CPSC 16 CFR part 1634 Type I compliant beige polyester microsuede).

Tests were conducted on three scales of combustibility:

—material-level tests;

—furniture mock-up tests; and

—full-size furniture tests.

The combustibility behavior of the individual sample materials and combinations of materials (i.e., foam/barrier liner/cover fabric) under well-ventilated, early stage flaming fire conditions was characterized using a cone calorimeter (ASTME 1354). In the furniture mock-up tests, cushions of the foam and barrier liner combinations evaluated in the material-level test phase were arranged to replicate an iuterior corner formed by the seat, back, and arm of a chair or sofa. The furniture mock-ups were ignited at the interior intersection of the three cushions using a BS 5852 Flaming Ignition Source 1 (match-flame equivalent). For the full-size furniture test, three of the foam and liner barrier combinations were compared to typical residential materials. Furniture pieces were ignited at the seat-back-arm interior corner, center of the seat-back cushions, and at the back leg area using the same BS 5852 Flaming Ignition Source 1 (match-flame equivalent) as for the furniture mock-ups. Heat release rate and mass loss rate were measured in both instances.

The results of Phase 1 indicated that contemporary furniture constructed with CA TB 117-compliant fire-retardant-treated foam show measurable difference in the time to flashover, but not a meaningful difference compared to contemporary furniture constructed with a nonfire-retardant foam commonly used in upholstered furniture. In addition, when a flame-suppressant technology such as a flame barrier is used between the decorative fabric and the foam, then this furniture (manufac-

tured to UL specifications with polyurethane foam) behaves closer to "legacy" furniture. Specifically the time to flashover is increased to greater than 20 minutes—which would allow residents significantly more time to safely get out of their homes.

The results of these experiments provide knowledge on the potential fire-growth reduction for the different investigated strategies, implementation feasibility, the interaction between different chemistries and components, and the influence of test scale and sample design on fire performance. Collectively, this information can be used by researchers, manufacturers and industry associations, and regulators such as CPSC and California Bureau of Home Furnishings and Thermal Insulation (CA BEARHFTI) to establish appropriate technical requirements, and a corresponding compliance program, for upholstered furniture akin to the CPSC program for mattresses.

PHASE 2: COMPARISON OF UPHOLSTERED FURNITURE ON LIVING ROOM FLASHOVER

As you will see in the second video, in Phase 2 we conducted a series of fires in a living room environment to better understand the impact upholstered furniture materials have in fire growth. The room environments were identically furnished with an engineered wood television stand, book case, coffee table, and end tables purchased from a national department store chain. In addition, the rooms had other fuel loads such as a 37-inch flat panel display television, plastic toy bins, stuffed toys, and polyester curtains. The only differences in the rooms were the materials used in the upholstered chair and sectional sofa. The top left screen contains contemporary upholstered furniture with polyester wrap covered polyurethane foam cushions, and polyester microsuede cover fabric. The top right screen is furniture constructed in legacy materials such as cotton batting around metal spring cushions and cotton cover fabric. The two bottom screens consist of barrier modified contemporary upholstered furniture with high-loft fire barrier covered polyurethane-foam cushions and polyester microsuede cover fabric. The fires were ignited by placing a lit candle on the right side of the sofa and allowed to grow until flashover. One of the barrier modified sets of furniture was ignited in the center of the sofa where the seat and back cushions for two spots meet.

At 45 seconds we can already see that the flame size on the contemporary furniture is growing at a faster rate than the other furniture pieces. At the 1-minute mark, the smoke alarm would have activated to notify the occupants. We can assume it would take an occupant at the earliest about 20–40 seconds to recognize the danger and to take appropriate actions, such as finding a fire extinguisher. At 1 minute and 45 seconds, the fire in the contemporary furniture environment would be difficult to handle with a fire extinguisher and the occupant would then look to escape. On average, people take 60–90 seconds to dress, call 911, gather personal belongings, and awaken two children. Once a call is placed to 911, a dispatcher will alert the local fire department to head to the scene. The Chicago Fire Department is the Nation's second-largest fire department and their goal is to be on-scene within 3–5 minutes after dispatch. Other departments may take longer such as those servicing rural areas. Additionally, this is just the time for the fire service to arrive; once at the scene, they still have to assess the scene.

The room furnished with contemporary upholstered furniture in the top left of screen transitioned to flashover at 4 minutes and 45 seconds. At 15 minutes the fire started at the interior corner of the barrier-clad contemporary furniture has self-extinguished. Flashover occurs for the barrier clad contemporary furniture ignited between the seats at 21 minutes and 45 seconds which is 17 minutes later than the identical furniture that does not have the fire barrier. At 34 minutes and 15 seconds, the living room furnished with legacy furniture flashes over, consistent with what we found for the used furniture in the modern vs. legacy side-by-side video. From this video, we can deduce that rooms furnished with contemporary furniture often reach flashover point prior to the fire service arriving at the scene of the fire.

PHASE 3: COMPARISON OF UPHOLSTERED FURNITURE ON OCCUPANT TENABILITY AND SURVIVABILITY

Based on the data drawn from Phase 2 and exemplified in the second video that you just witnessed, UL wanted to determine what the smoke alarm response and occupant tenability and survivability in an actual full-scale home. In March 2012 a series of full-scale house fire experiments was conducted in UL's large fire facility. One house was a one-story, 1,200 square-foot, 3 bedroom, 1 bathroom house (8 rooms total); the second house was a two-story, 3,200 square-foot, 4-bedroom, 2.5-bathroom house (12 rooms total). The second house featured a contemporary open floor plan with the two-story great room and foyer open to the upstairs bedrooms.

The living/great rooms were identically furuished with engineered wood television stand, coffee table, a lamp, aud end tables purchased from a national departmeut store chain. The only furuishings that differed iu the tests were the materials used iu the upholstered chair aud sectional sofa. The contemporary furniture was constructed using the same hardwood frames, but oue set consisted of polyester wrap covered polyurethane foam cushions, polyester microsuede cover fabric while the other introduced a high-loft fire barrier to cover the polyurethane foam cushions. The fires were ignited by placing a lit caudle ou the right side of the sofa and allowed to grow until temperatures in a remote location from the fire reacbed an unsurvivable level of 150 °C (302 °F). Preliminary data analysis supports Phase 2 findings but we are still currently analyzing the results of these recent experiments.

CONCLUSIONS

Based on the research we conducted, UL believes:

One, that the typical flame-retardant chemical concentrations used to meet fire regulations in upholstered fnrniture do not provide for sufficient fire egress times. The most common of those fire regulations is the BEARHFTI's CA TB 117 performance requirements.

Two, that when a flame-suppressant technology, such as a flame barrier, is used between the decorative fabric and the foam, then this furniture (manufactured to UL specifications with polyurethane foam) behaves closer to "legacy" furniture. Specifically, the time to flash over is increased to greater than 20 minutes—which would allow occupants significantly more time to safely evacuate their home and allow for fire service to respond to the fire.

Three, that barrier materials need not be made of a chemical flame retardant that may or may not pose a negative impact on human health or the environment. It is conceivable that manufacturers could incorporate various innovative barrier methods in upholstered furniture with minimal impact on current manufacturing methods. Some types of barriers such as high-loft barriers could be used as a replacement for polyester wrap thereby minimizing impact on manufacturing and labor. Other barriers, such as flat barriers similar to those incorporated by the mattress industry, could pose an additional mannfacturing step, but do yield increased fire-safety performance.

In addition to fire research UL has conducted on upholstered furniture, UL has also conducted studies in cooperation with the Fire Protection Research Foundation (a foundation under NFPA) on smoke characterization to understand smoke associated with materials commonly found in residential homes today and to provide data points to develop better smoke-sensing technology or smoke-suppression technology in end products. UL also has the ability to measure consumer exposure and indoor air quality to flame retardant and alternative chemicals under normal-use conditions and during combustion or fire processes for the measurement of toxic byproducts using environmental chamber technology. This technology allows the study and impact of alternative construction techniques like the use of fire barriers, reduction of synthetic materials, petrochemical-based construction materials; and the use of alternative, less-toxic flame retardants for bedding, furniture, construction materials, and electronics. This allows for system and component analysis under normal and abnormal conditions to help facilitate the development and validation of chemically safe, fire-resistant products.

UL appreciates this subcommittee's interest in furniture flammability-related matters and how all parties can work to enhance public safety. We appreciate the opportunity to share our knowledge and look forward to working with you and other stakeholders moving forward.

Senator DURBIN. Mr. Counts.

STATEMENT OF ANDY S. COUNTS, CEO, AMERICAN HOME FURNISHINGS ALLIANCE

Mr. COUNTS. Good afternoon. I'm Andy Counts, chief executive officer at American Home Furnishings Alliance. I want to thank you, Chairman Durbin and staff, for allowing me to participate in today's hearing.

The issue of upholstered furniture flammability has been a topic of discussion and debate at CPSC since it inherited the Flammable Fabrics Act in 1973.

Since this time, CPSC has considered several petitions on the issue and released multiple draft standards to address the flammability of upholstered furniture.

As these proposals progressed, CPSC's objective has moved from the risk of small open-flame ignition to the combined risk of small open flame and smolder ignition, and finally to the risk of smolder ignition only.

Consistently, over time, CPSC's statistics have shown that 90 percent of upholstered furniture fires result from smolder ignition.

California Technical Bulletin 117, or TB–117, is required for all upholstered furniture sold in the State of California and attempts to address both smolder and small open-flame ignition.

Unlike smolder ignition, small, open-flame resistance generally requires the treatment of fabric and cushioning materials with flame-retardant chemicals.

During the time that CPSC has been considering furniture flammability, evidence about the potential eco-toxicity and bioaccumulation of certain flame retardants have reshaped the thinking regarding fire and chemical risks. Restrictions on flame-retardant use and production are depleting the compliance toolbox of compounds equipped to achieve open-flame resistance in furniture and to meet TB–117.

In addition, CPSC staff has found that reformulated foam cushions used to comply with TB–117 do not meaningfully improve small open-flame performance.

TB–117 is the only reason flame-retardant chemicals are found in upholstered furniture. California Governor Jerry Brown recently issued a statement directing the State's Bureau of Electronic Appliance Repair, Home Furnishings and Thermal Insulation to revise TB–117 to end the reliance on flame-retardant chemicals.

As a result of this directive, a draft revised California standard has recently been released that will focus solely on smolder ignition.

According to a recent NFPA report, the long-term trend in smoking material fires has been down by 73 percent from 1980 to 2010.

More importantly, the trend line for upholstered furniture as the first item ignited by smoking materials is also declining. In 1980, NFPA estimated that there were 21,500 fires caused by smolder ignition of upholstered furniture. And by 2010, that number had been reduced to 1,500.

Likewise, civilian deaths due to smolder ignition in upholstered furniture have decreased from 1,030 in 1980 to 210 in 2010. When you factor in population growth over this period, you can begin to fathom the significance of these decreases.

This downward trend in fire statistics involving smoking materials and residential upholstery is to some degree the result of a successful industry fire standard. The voluntary program was developed by the Upholstered Furniture Action Council (UFAC) in 1977.

Unlike TB–117, the UFAC program does not require the use of any flame-retardant chemicals. UFAC construction criteria have been adopted by both the American Society for Testing and Materials as ASTM 1353, and NFPA. It is estimated that 90 percent of domestic furniture shipments comply with the UFAC standard.

We understand the frustration some have expressed about the pace of progress on this issue. However, we shouldn't disregard the technical challenges associated with achieving improved fire resistance for a product that is typically covered in fabric and filled with plastics, cellulosics, and other cushioning materials.

Add to this the differential performance of the tens of thousands of upholstery fabrics on the market, and you begin to understand the challenge CPSC shouldered.

An approach that addresses only smolder ignition is not perfect, but represents what is achievable at this point, given these sometimes competing factors.

We recommend that the CPSC immediately move to adopt ASTM 1353 to address the primary smolder ignition risk from upholstered furniture. That would provide CPSC with the time it needs to further investigate the feasibility of its barrier for smolder-prone fabrics and submit its draft testing methods to the necessary round robin laboratory analysis to ensure good repeatability and reproducibility. This round robin analysis is essential to the development of an enforceable standard.

PREPARED STATEMENT

We look forward to our continued work with the CPSC on this important issue and to assisting our members with compliance.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF ANDY S. COUNTS

The American Home Furnishings Alliance (AHFA) represents manufacturers and importers of residential furnishings that include upholstered furniture, wood furniture, home office, and decorative accessories. AHFA companies participate in a highly competitive global market characterized by ever-changing style preferences, margin pressures, and the tendency of consumers to postpone big-ticket purchases if their perceptions of value and function are not satisfied.

AHFA respectfully submits these comments regarding the effectiveness of upholstered furniture flammability standards and flame-retardant chemicals.

BACKGROUND INFORMATION

There is currently one mandatory flammability standard for residential upholstered furniture in the United States. That standard, California Technical Bulletin 117 (TB–117), is required for all upholstered furniture sold in the State of California.

Before we begin our discussion on the effectiveness of upholstered furniture flammability standards, we want to share with you several hard-learned facts based on 40+ years of experience with this topic. First, fire testing is not a precise science. Today's modern fire-testing methodology suffers from three important weaknesses. First, none of the present test methods have been reconciled with what actually happens in real-world fire scenarios, either qualitatively or quantitatively. Second, the precision of today's fire tests is reprehensibly poor with testing errors commonly exceeding 50 to 100 percent. Finally, computer models are only as good as the data driving them. As noted above, the precision and bias of the data is deficient so standard fire tests often lack the repeatability that agencies expect with mandatory standards. This makes a flammability standard extremely difficult to enforce.

Definition of the objective is 50 percent of the solution. There is no such thing as fire-proof furniture and it simply is not a realistic or practical goal. The U.S. Consumer Product Safety Commission (CPSC) did not conceive this at the beginning and therefore the objective of its rulemaking was not clearly defined. Initially it appeared that CPSC wanted to prevent any ignition of the cover fabrics. This proved to be unattainable because everything will burn and each fire is unique. Later, the agency moved away from "no ignition" toward "slowing" the progression of the fires

and thereby allow more egress time. The later is an achievable goal and one which we continue to believe can be met.

Third, there are no quick fixes or silver bullets when it comes to upholstered furniture flammability. There are a myriad number of configurations, fabrics, and fillings that are utilized by our industry to satisfy the consumer's needs and tastes. And the issue is counterintuitive. The materials that are most resistant to smolder ignition tend to be poor performers when it comes to resisting open-flame ignition and vice versa. These three facts have compounded the difficulties CPSC has encountered in this complex rulemaking.

THE NATIONAL DISCUSSION

The issue of upholstered furniture flammability has been a topic of discussion and debate at CPSC since it inherited the Flammable Fabrics Act from the Department of Commerce and the Federal Trade Commission in 1973. Since this time CPSC has considered several petitions on the issue and released multiple draft standards to address the flammability of upholstered furniture in 1997, 2001, 2004, and 2005. A proposed rule was finally promulgated in 2008. As these proposals progressed, CPSC's objective bas moved from the risk of small open-flame ignition to the risks of small open-flame ignition and smolder ignition, and finally to the risk of smolder ignition only.

We welcomed the 2008 proposal because it was the first to focus solely on the risk of smolder ignition which is the predominant flammability hazard associated with upholstered furniture. Consistently over time, CPSC statistics show that 90 percent of upbolstered furniture fires result from smolder ignition. Each year, there are approximately five times as many incidents of smolder ignitions as there are small open flame-related incidents.[1]

According to a recent National Fire Protection Association (NFPA) report,[2] "the long-term trend in smoking-material fires has been down, by 73 percent from 1980 to 2010." More importantly for this discussion, the trend line for upholstered furniture as the first item ignited by smoking materials is also declining. In 1980, NFPA estimated that there were 21,500 fires caused by smolder ignition of upholstered furniture and by 2010 that number had been reduced to 1,500.[3] Likewise, civilian deaths due to smolder ignition of upholstered furniture have decreased from 1,030 in 1980 to 210 in 2010.[4] Finally, civilian injuries have declined from 1,910 in 1980 to 260 in 2010.[5]

THE UPHOLSTERED FURNITURE ACTION COUNCIL

The downward trend in fire statistics involving smoking materials and residential upholstery is, to some degree, the result of a successful industry fire standard. This voluntary program was developed by the Upholstered Fnrniture Action Council (UFAC) in 1977. It has demonstrated that fabric and yarn changes along with the use of substrates between fabric and foam yield improved smolder performance. Unlike TB–117, the UFAC program does not require the use of any flame-retardant chemicals. Also unlike TB–117, UFAC program has undergoue rouud-robin testing and has shown to be repeatable and reproducible. Because of this, UFAC construction criteria were adopted by hoth the American Society for Testing and Materials (ASTME 1353) aud the NFPA (NFPA 260).

Perhaps the greatest contribution of the UFAC program has been to remove smolder-prone materials from the market and replace them with safer ones. Padding materials such as untreated cotton batting, sisal pads, loose sisal, jute pads, rubberized horsehair, and kapok could not pass any of the UFAC criteria and consequently disappeared from the marketplace.

Likewise, UFAC has contributed to the development of safer materials. In addition to inventing heat-conducting welt cords, it effectively set the standards for polyurethane foam and class 1 fabrics. Seating-grade and padding-grade flexible polyurethane foams must pass the UFAC filliug and padding test method. As a result, noncompliant foam is gone from the market. With respect to fabric covers, the UFAC test methods accelerated the use of thermoplastic fibers. This expanded the uumber of class I fabrics, the type most resistant to smolder iguition, and reduced the number of class II fabrics which require the use of a smolder-resistant barrier material. While it is estimated that 90 percent of domestic furniture shipments com-

[1] U.S. CPSC, Regulatory Options Briefing Package, October 28, 1997, p. 153.
[2] John R. Hall Jr., *The Smoking-Material Fire Problem*, March 2012, p. i.
[3] *Id.* at 21.
[4] *Id.* at 22.
[5] *Id.* at 23.

ply with the UFAC standard, the net resnlt has been to afford low-income consumers the benefit of the UFAC program even if their mannfacturers are not participating in UFAC. That is becanse these safer materials are the only ones that can be fonnd in the marketplace.

In the course of the current CPSC rulemaking, UFAC reviewed TB–117 promising CPSC to incorporate the best aspects of TB–117 as part of UFAC's construction criteria. However, when testing was completed, UFAC concluded that TB–117 foam was not more effective than the conventional foam required by UFAC. Therefore, it declined to modify its construction criteria. CPSC later tested TB–117 foam and confirmed that it demonstrated no significant added protection in small open-flame scenarios compared to UFAC complying upholstered furniture products.

SMALL OPEN-FLAME RESEARCH

The current emphasis on smolder ignition is a sensible response to the technical difficulties associated with the small open-flame approaches considered during the course of the rnlemaking. Early in the project, CPSC staff found that reformnlated foam cushions used to comply with TB–117 did not meaningfully improve small open-flame performance. Subsequent testing of so-called "TB–117 plns" foam revealed it performed worse than conventional foam and was inferior in some smoldering scenarios.

A 2001 proposal allowed the use of flame-blocking barriers as protection against open-flame ignition. However, CPSC staff found that barrier materials perform inconsistently depending on the cover fabrics and ignition sonrce. Some barriers were effective in conjunction with a number of outer fabrics, bnt not with others. Those failing fabrics were more appropriate candidates for a flame-retardant chemical treatment option.[6]

Currently available barrier technology utilized to meet California's standard for public occupancy furniture (TB–133) and to meet the Federal mattress standard (16 CFR 1633) is not well-snited for application to residential npholstered furniture. In addition to the complexities created by the various geometries and spatial relationships of furniture, existing barriers would negatively impact the band, drape, and seat of residential upholstered furniture. These barriers also lack important performance characteristics such as loft, resilieucy aud ueutral color, which are critical for the residential upholstered furniture market.

RESEARCH AND REGULATION OF FLAME RETARDANTS

TB–117 is the only reason flame-retardant chemicals are found in upholstered furuiture. The focus on smolder ignition minimizes the reliauce on flame-retardaut chemical treatments. Unlike smolder ignition, small open-flame resistance generally requires the treatment of fabrics and cushioning materials with halogenated compounds (i.e., bromine or chlorine). The widespread application of these chemicals to produce upholstered furniture components would certainly have resulted from the prescribed test methods proposed in the 1997, 2001, 2004, and 2005 CPSC briefing packages.

During the time that CPSC has been considering furniture flammability, evidence ahout the potential ecotoxicity and bioaccumulation of halogen flame-retardants have reshaped the thinking regarding fire and chemical risks. Restrictions on flame-retardant use and production are depleting the compliance toolbox of compounds equipped to achieve open-flame resistance in furniture and to meet TB–117.

In 2004, AHFA (then the American Furniture Manufacturers Association or AFMA) co-chaired and participated with other key industry stakeholders in a project sponsored by Environmental Protection Agency's (EPA) Design for the Environment' (DfE). The scope of this project was to develop an assessment tool to evaluate emerging flame-retardant chemistry that could potentially be used to replace existing chemical solutions used to meet existing flammability standards. The focus was to develop a science-based matrix to evaluate and screen the potential risk of emerging flame-retardant chemicals to human health and the environment. The resulting matrix did not provide the absolute certainty needed to determine if the flame-retardant chemistry was safe and effective.

In January 2010, EPA added polybrominated diphenyl ethers (PBDEs)—used as flame retardants in a wide range of products, including fabrics and foam—to its "chemicals of concern" list, meaning it considers them substances that "may present an unreasonable risk of iujury to healtb and the environment." The furniture industry had already voluntarily phased out the use of these chemicals in 2005. The only

[6] U.S. CPSC Upholstered Furniture Flammability: Analysis of Comments from the CPSC Staff's June 2002 Public Meeting, p. 30.

PBDE still on the market in North America, is decaBDE, a fabric flame-retardant effective across a full spectrum of fiber types. Critics of decaBDE often cite evidence that it can degrade (debrominate) into more hazardons congeners that are already the subject of regulatory action.

DecaBDE has been banned or substantially restricted in Washington State, Maine, and the European Union. Asian countries and other U.S. States are considering similar legislation. Without decaBDE, fabric mills indicate that achieving open-flame resistance would require the commercialization and testing of more specialized chemical formulations geared to particular fabric types. Environmental authorities and policy makers now appear to be moving toward restrictions on bromine and chlorine flame-retardant chemicals generally.

Last year in California, the Office of Environmental Health Hazard Assessment (OEHHA) added TDCPP (Tris (1,3-dichloro-2-propyl) phosphate), a flame-retardant chemical commonly nsed in furniture applications, to its list of chemicals subject to Proposition 65. Governor Brown recently issued a statement directing the State's Bureau of Home Furnishings and Thermal Insulation (BEARHFTI) to revise TB–117 to end the reliance on flame-retardant chemicals. In the present Federal rnlemaking, environmental advocates have urged CPSC to forego regulatory approaches that wonld encourage snch chemical use.

As a result of the Governor Brown directive a draft revised California standard (TB–117 2012) has recently been released that will focns solely on smolder ignition and take a similar approach to the 2008 proposed CPSC standard.

OTHER TRENDS SHAPING FIRE STATISTICS

Any current discussion of this issue should be made in the context of fire statistics that have improved significantly in response to a number of trends. In addition to the impact of voluntary industry standards such as UFAC, Americans are smoking less and are increasingly protected by working smoke and carbon monoxide detectors. Small open-flame statistics are being driven downward by the use of child-resistant lighters pursuant to CPSC regulations finalized in 1993 and a CPSC-sponsored voluntary performance standard for candles. In addition, all States have enacted requirements for reduced ignition propensity (RIP) cigarettes. The March 2012 NFPA study on smoking material fires estimates that RIP cigarettes alone will reduce fire deaths 30 percent from 2003, the last year before any State-implemented this legislation.[7] All of these developments can be expected to further reduce residential fires associated with upholstered furniture.

CONCLUSION AND RECOMMENDATIONS

We understand the frustration some have expressed about the pace of progress on this issue. However, we shouldn't disregard the technical challenges associated with achieving improved fire resistance for a product that is typically covered in fabric and filled with plastics, cellulosics, and other cushioning materials. Add to this the differential performance of the tens of thousands of upholstery fabrics ou the market; the synergy between fabrics and filling materials; and you begin to understand the challenge CPSC has shouldered.

Upholstered furniture flammability encompasses not only fire science, but consumer preferences, behavioral factors, the competitiveness of domestic industries and the increasing scrutiny of chemicals that may pose a risk to human health and the enviroument.

Our industry is committed to supporting government and private sector solutions based ou three criteria:

—safe;
—effective; and
—saleable.

To be "safe", a solution must not introduce new risks to consumers, workers, or the environmeut and not undermine the existing level of resistance to smolder ignition. To be "effective", a solution must reduce the number of residential fires involving upholstered furniture and must uot create a false sense of security to the cousumer. To be "saleable", a solution must result in furniture that is attractive, comfortable, durable, and affordable. A solution that meets the criteria of safe, effective, and saleable continues to form the basis for an iudustry supported Federal standard for residential upholstered furniture.

An approach that addresses only smolder ignition is not perfect, hut represents what is achievable at this point given these sometimes competing factors. We recommend that the CPSC immediately move to adopt ASTM 1353 to address the pri-

[7] Hall, *supra* at 11.

mary smolder-ignition risk from upholstered furniture. That will provide CPSC with the time it needs to further investigate the feasibility of its barrier for smolder-prone fabrics and to submit its draft test methods to the necessary round-robin laboratory analysis to ensure good repeatability and reproducibility. This round-robin analysis is essential to the development of an enforceable standard.

After finalization of a standard that addresses smolder ignition, CPSC resonrces can then be concentrated on determining if potential solutions to small open-flame risk exist and are justified. This effort must provide multiple options for compliance and a mechanism for identifying safe and effective flame-retardant chemistry.

Any mandatory flammability standard must also rely on the use of compliant components and not the use of composite testing. Furniture manufacturers are assemblers of components provided by third-party suppliers. The combination of these various components results in thousands of SKUs. This volume makes the testing of full-scale or mockup composites not only unreasonable, but impossible.

Finally, cost must be a consideration. The statistics of residential fires have told us repeatedly over the years that the residential fire problem in the United States primarily lies in households with lower incomes, less education, and a higher proportion of single parents. This segment of the population is the most sensitive to cost increases, yet this segment is clearly the most in need of the protection that safer upholstery will provide. Furniture that meets ASTM 1353 is proven to provide an acceptable level of fire protection at price poiuts that will primarily beuefit them and the firefighters charged with saving their lives.

We look forward to working with CPSC on this important issue and to assist our members with the compliance obligations they will face once a new rule is finalized.

Senator DURBIN. Thanks, Mr. Counts.

Peter Van Dorpe.

STATEMENT OF PETER VAN DORPE, CHIEF, TRAINING DIVISION, CHICAGO FIRE DEPARTMENT

Mr. VAN DORPE. Good afternoon. Thank you for having me here today. My name is Peter Van Dorpe. I've been a firefighter for 32 years. I'm a district chief in the Chicago Fire Department and in charge of the Training Division.

Since 2006, I have been one of the Chicago Fire Department's liaisons to and have served as a subject-matter expert for various agencies and universities that have been conducting fire-safety research. These agencies include UL, NIST, University of Illinois, Michigan State University, and New York Polytechnic, among others.

This research has been funded largely through the Department of Homeland Security's Assistance to Firefighters Grants Program.

Through both my experience on the fire ground and in the course of my participation in these research projects, I've become acutely aware of the significant changes that have occurred over the last 40 to 50 years in the way homes are built and the way that we furnish them. What you have seen here today, as dramatic as it is, demonstrates only a fraction of the changes that have taken place.

Put as simply as possible, we are making homes bigger. We're building them with less massive structural components and then we're filling them with more air and more fuel than ever before.

From a firefighter's perspective, this is a recipe for disaster for both the fire service and the public we have sworn to protect.

Part of the reason why I was selected to speak at this hearing is because I was already scheduled to be in Baltimore tomorrow to deliver a workshop at Firehouse Expo. Firehouse Expo is one of several conferences that I and my colleagues from the Chicago and New York City Fire Departments, UL, NIST, and other research partners attend each year to deliver the findings of its research to the American fire service.

We call it bringing science to the street, and our goal is to make sure that the firefighters that arrive at your door in your time of need come with a set of strategies, tactics, skills, and knowledge to best equip them to safely and effectively combat the fire they will face.

The first and most important part of reaching that goal is to make sure these firefighters understand the scope and magnitude of the changes in the modern fire environment. I hope to convey some sense of that change to you in this brief time we have today.

I will keep it simple: It's stuff, and there's more stuff, and that stuff is made out of plastic. And more stuff, more of that plastic stuff, is made out of plastic that contains its own air supply—extruded polyurethane foam in furniture.

All of this stuff is fuel, and we're packing more and more of it into our boxes that we live in every day.

How this stuff in these boxes behave, interact, and maintain their integrity under fire conditions goes largely unregulated, so long as that box is labeled one- or two-family occupancy and the stuff is intended to be used by the people that occupy those houses.

It should come as no surprise to us that most fire deaths occur in one- and two-family homes.

The statistics that support these statements are readily available and accessihle from NFPA, UL, NIST, the National Institute of Occupational Safety and Health, and a host of other universities and Government agencies.

Please allow me to share with you some lesser-known statistics. In 1903, 605 people died in the Iroquois Theater fire in Chicago. In 1911, 146 died in the Triangle Shirt Waist fire in New York City. There were 294 deaths in the Consolidated School fire of 1937, 492 in the Coconut Grove Supper Club fire of 1942, and 100 in the Station Night Club fire of 2003.

Indeed, the 10 largest single-building fatal fires over the last century have totaled more than 2,800 deaths. And that number does not include the 2,666 deaths that occurred in the fires that were in the aftermath of the September 11 attacks.

Each of these tragedies, as well as many like them throughout our history, brought about a response that was proportionate to the scope and magnitude of the event. Perhaps the most important part of the response to each of these events and those like them were the significant changes made in the way we design, build, inspect, and otherwise regulate the buildings we occupy and the things that we put in them.

We can and should be proud of the way we respond as a society to the disasters and tragedies that befall our communities. However, the tragedy that is the yearly fire death toll in the United States goes unaddressed largely because it goes unrecognized.

Each and every year, between 2,500 and 3,000 people die in fires in the United States. That's more than died in the September 11 attacks and more than died in the 10 most tragic fires in our history. And it happens year after year after year.

Eighty-five percent of those fire deaths occur in homes, and they most often occur in ones and twos. Hence, those of you who aren't professionally attuned to the situation are not familiar with the scope and magnitude of the problem.

I hope my testimony today will help bring it to the forefront for a time.

Statistically, three people died in fires while you slept last night, and another will die while we are here discussing the merits of the issues before us. Three more will die in the time you will make your way home tonight and end your day and return to sleep. Tomorrow and every day will be just like today unless and until we do something different about the way we build, protect, and furnish homes in this country.

When I'm teaching building construction to firefighters, I make it a point to focus on the hazards of lightweight construction and practices used in single-family homes. And I always begin and end by telling them, "It ain't about the gusset plates."

Gusset plates are a fastening method that has replaced traditional nails in lightweight wood truss construction. The fire service frequently points to them as the cause of early collapse of floor and roof systems in buildings using these systems.

What I mean to convey to them with this phrase is that we need to focus less on the components and more on the totality of the changes to the built environment and the fuel loads we are placing in them.

Similarly, I encourage you not to get lost in the weeds of which methods of reducing residential fire losses and fire deaths are the most efficient, effective, or environmentally friendly. For example, while the effects of adding fire-retardant chemicals to extruded foams and fills has been shown to be of limited value, this does not preclude the use of retardants in any and all circumstances.

Most approaches to reducing fire growth and propagation in furniture and finishes have value, and they should all be investigated and pursued.

The mattress industry has demonstrated that an approach that applies a variety of methodologies is the most likely to sustain success over the long run.

Most tragedies, and certainly those that arise in accidents in the home, are not the result of gross negligence or malice on anyone's part. Rather, they are the sum of what my colleague Vicki Schmidt, a volunteer firefighter and a State instructor in Maine, refers to as the pitter-patter of little defeats, those individually minor errors and omissions that we allow to accumulate and coalesce into tragic events.

Please permit me to outline for you what I believe to he some effective guidance for meeting the challenges before you. Increased residential firefighters' fire safety, and firefighter safety, requires reducing ignition sources.

Today, this is largely an issue related to behaviors including smoking, alcohol use, and the safe use of open flames such as candles. Reducing the development and prorogation of fires that do occur by addressing the flammability and fire development characteristics of home furnishings and finished materials, particularly those that contain extruded polyurethane foam and related materials.

Reducing the impact of fires that do occur upon the occupants through more thorough and effective regulations requiring active and passive fire protection and detection systems in homes. And,

yes, that does mean we need to advocate for residential fire sprinklers in all new construction.

Reducing the impact of fires that do occur upon the structural system of the home, by requiring structural assemblies used two-family homes be protected in the same way that they are required to be protected in other occupancies.

Finally, enabling the American fire service to do our job more safely and effectively by doing all of the above and by continuing to fund the fire-safety research and dissemination of life-saving information it is generating.

In closing, I wish to assure you that the challenge is not as difficult as you may think. Indeed, the problem has already been solved.

Look around you. Look above your heads. This is a fire-safe building. We have applied the lessons of the past and appropriate science and technology to design an occupancy that provides a safe and secure environment for its occupants.

PREPARED STATEMENT

We can do the same for residential occupancies. We have the knowledge and the technology to meet all the challenges, whether they be temporal, behavioral, financial, or environmental. All we need is the will to act.

Thank you.

[The statement follows:]

PREPARED STATEMENT OF PETER VAN DORPE

Good afternoon. My name is Peter Van Dorpe. I have been a firefighter for 32 years. I am a District Chief on the Chicago Fire Department in charge of the Training Division. Since 2006 I have been one of the Chicago Fire Department's liaisons and have served as a subject-matter expert for various agencies and universities that have been conducting fire-safety research. These agencies include Underwriters Laboratories (UL); the National Institute of Standards and Technology (NIST); the University of Illinois; Michigan State University; New York Polytechnic; and others. This research has been funded largely through the Department of Homeland Security's Assistance to Firefighters Grants program. Through both my experience on the fire ground and in the course of my participation in these research projects I have become acutely aware of the significant changes that have occurred over the last 40 to 50 years in both the way homes are built and the way that they are furnished. What you have seen here today, as dramatic as it is, demonstrates only a fraction of the changes that have taken place. Put as simply as possible, we are making homes larger, building them with less massive components, and then filling them with more air and more fuel than ever before. From a firefighter's perspective this is a recipe for disaster for both the fire service and the public we have sworn to serve and protect.

Part of the reason why I was selected to speak at this hearing is because I was already scheduled to be in Baltimore tomorrow to deliver a workshop at Firehouse Expo. Firehouse Expo is one of several conferences that I and my colleagues from the Chicago and New York City fire departments, UL, NIST and the other research partners attend each year to deliver the findings of this research to the American fire service. We call it "bringing science to the streets" and our goal is to make sure that the firefighters that arrive at your door in your time of need come with the set of strategies, tactics, and skills that best equip them to safely and effectively combat the fire they will face. The first and most important part of reaching that goal is to make sure our students nnderstand the scope and magnitude of the changes in the modern fire environment. I hope to convey some sense of that change to you as well in the brief time that I have with you today. I will keep it simple: Stuff. More stnff. More stuff made of plastic (petroleum). More stuff made of plastic with a built in air supply (polyurethane foam, i.e., furniture). All of this stuff is fuel and we are packing more and more of it into the boxes that we live in. How this stuff and these boxes behave, interact and maintain their integrity under fire condi-

tions goes largely unregulated so loug as the box is labeled "oue or two family occupaucy" and the stuff is intended to be used by the people that occupy it. It should come as uo surprise to us that most fire deaths occur in one- and two-family (read, "unregulated") occupancies. The statistics that support these statements are readily available and accessible from the National Fire Protectiou Association, UL, NIST, the National Institute of Occupational Safety and Health, etc.

In 1903, 605 people died in the Iroquois Theater fire in Chicago. In 1911, 146 died in the Triangle Shirt Waist fire in New York City. There were 294 deaths in the Consolidated School fire of 1937; 492 iu the Coconut Grove Supper Club of 1942; and 100 in the Station Night Club fire of 2003. Indeed, the 10 largest single building fatal fires over the last century total more than 2,800 deaths. Of course we are all aware of the 2,666 lives lost at the fires of September 11. Each of these tragedies, as well as many like them throughout our history, brought about a response that was proportionate to the scope and magnitude of the event. Perhaps the most important part of the response to each of these events and those like them were the significant changes made in the way we design, build, inspect, and otherwise regnlate the buildings we occupy and the things we put in them. We can and should be proud of the way we respond, as a society, to the disasters and tragedies that befall our communities.

However, the tragedy that is the yearly fire death toll in the United States goes nnaddressed, largely because it goes unrecognized.

Each and every year, between 2,500 and 3,000 people die in fires in the United States. That's more than died in the September 11 attacks and more than died in the 10 most tragic fires in our history, and it happens year, after year, after year. Eighty-five percent of these fire deaths occur in homes and they most often occur in one- and two-family homes. Hence, those of you who aren't professionally attuned to the situation are not familiar with the scope and magnitude of the problem. I hope my testimony today will help bring it to the forefront for a time. Statistically, three people died in fires while you slept last night. Another will die while we are here discussing the merits of the issues before us. Three more will die hy the time you make your way home tonight, end your day and return to sleep. Tomorrow and every day will be just like today; unless and until we do something different about the way we build, protect, and furnish homes in this country.

When I am teaching building construction to firefighters I make it a point to focus on tbe hazards of lightweight construction practices used in single family homes and I always begin and end by telling them, "it ain't about the gusset plates". Gusset plates are a fastening method that has replaced traditional nails in lightweight wood truss construction. The fire service frequently points to them as the cause of early collapse of floor and roof systems in buildings using these systems. What I mean to convey to them with this phrase is that they need focus less on the components and more on the totality of the changes to the built environment and the fuel loads placed in them. Similarly, I encourage you not to get lost in the weeds of which methods of reducing residential fire loss and fire death are the most efficient, effective or environmentally friendly. While the effects of adding fire-retardant chemicals to extruded foams and fills has been shown to be of limited value, this does not preclude the use of retardants in any and all circumstances. Most approaches to reducing fire growth and propagation in furniture and finishes have value and they should all be investigated and pursued. The mattress industry has demonstrated that an approach that applies a variety of methodologies is most likely to sustain its success over the long run.

Most tragedies, and certainly those that arise around accidents in the home, are not the result of gross negligence or malice on anyone's part. Rather, they are the sum of what my colleague Vicki Schmidt, a volunteer firefighter and State fire instructor in Maine refers to as the "pitter-patter of little defeats"; those individually minor errors and omissions that we allow to accumulate and coalesce into a tragic event.

Please permit me to outline for you what I believe to be some effective guidance for meeting the challenge before you. Increased residential fire safety requires:

Reducing Ignition Sources.—Today this is largely an issue related to behaviors including smoking, alcohol use, and open flames such as candles, etc.

—Reducing the development and propagation of fires that do occur by addressing the flammability and fire development characteristics of home furnishings and finish materials, particularly those that use or contain extruded polyurethane foam and related materials.

—Reducing the impact of fires that do occur upon the occupants through more thorough and effective regulations requiring active (i.e., residential sprinkler systems) and passive fire protection and detection systems in homes.

—Reducing the impact of fires that do occnr upon the structural system of the home by requiring structural assemblies used in one- and two-family homes to be protected in the same way they are required to be protected in other occupancies.
—Enabling the American fire service to do our job more safely and effectively by doing all of the above.

In closing, I wish to assure you that the challenge is not as difficnlt as yon may think. Indeed the problem has already been solved. Look around you. This is a fire-safe bnilding. We have applied the lessons of the past and the appropriate science and technology to design an assembly occupancy that provides a safe and secure environment for its occupants. We can do the same for residential occupancies. We have the knowledge and the technology to meet all the challenges, whether they be temporal, behavioral, financial, or environmental. All we need is the will to act. Thank you.

Senator DURBIN. Thank you, Mr. Van Dorpe, and thank you for what you do for a living. Men and women like you all across America keep us safe. We're grateful.

Mr. VAN DORPE. Thank you, Sir.

Seventy-five percent of the American fire service is volunteer.

Senator DURBIN. I know that. I know in Chicago we have a great fire department. We also, downstate, have a lot of great fire departments and volunteer efforts.

So thank you very much.

One of the things which was noted earlier, I want to mention to you. Tony Stefani, president of San Francisco Cancer Prevention Fund said in a recent study, "Firefighters show blood levels of PDBEs", these fire-retardant chemicals, "over 30 percent higher than the general population of California, and 60 percent higher than the general population of the United States."

One firefighter had a PDBE level 11 times greater than average for the general population. And the concentrations in the United States are 20 to 30 times higher than found in the general population of Japan, Hong Kong, and the United Kingdom.

So there is an environmental aspect to this, the exposure of your men and women as firefighters to these fire-retardant chemicals, which I guess Mr. Stefani is making a point to show us may have some long-term negative health impact.

Has there been any effort underway to measure this beyond his effort?

Mr. VAN DORPE. UL has conducted some smoke particulate studies. They began, I believe, in 2007. Those continue to today.

One of the things that we're finding is that, even when we wear all of our respiratory protection, we're still exposed to chemicals through dermal exposure. This stuff is migrating through our skins and into our bodies.

So the problem for us is getting more and more complex all the time. Every time we think we get a handle on how to deal with our exposure to chemicals, we find that there's another exposure out there.

Senator DURBIN. And you probably read the Chicago Tribune series, that there was a group calling themselves Friends of Firefighters who were testifying for the use of these flame-retardant chemicals. They were challenged. They had something to do with the State of Vermont, at least they said they did, but they were challenged as to whether they were speaking for firefighters or for the chemical industry.

Mr. VAN DORPE. I'm not familiar with the group.

Senator DURBIN. It's a point I hope you'll take a look at.

Mr. Schaefer, just for the record, you've stated it in general terms, but in politics and in the Chicago Tribune series, we follow the money.

Where was the money engaged in each of these undertakings?

Why did the tobacco industry decide they wanted to push flammability in furniture rather than a fire-safe cigarette? Why did the chemical industry want to push certain fire-retardant chemicals? What was the role of the furniture industry and such?

So, for the record, when it comes to UL, who is paying for your efforts in research?

Mr. SCHAEFER. For our efforts, they're self-funded through our public safety mission fund. Sometimes we do research work in partnership with organizations like NIST, and there, there would be grants and so on.

But for the most part, the research work we do is self-funded in the interest of advancing our safety mission.

Senator DURBIN. And to make it clear for the record, there are two approaches where—well, three, actually: legacy furniture, which was different than the furniture that we buy today; then furniture treated with fire-retardant chemicals, which you said does not produce any measurable impact of safety; and then barriers, which I assume is some sort of a cloth or fabric or something that stops the fire from spreading into the furniture. Three different levels, if I've got that correct.

Mr. SCHAEFER. Yes, that's correct.

Senator DURBIN. And the barriers, you say, don't necessarily have to include fire-retardant chemicals?

Mr. SCHAEFER. That's right, the barrier could be constructed even out of fiberglass, what you would see in insulation in your homes, so it's basically a neutral material. And there are other technologies that don't use flame retardants with barriers.

Senator DURBIN. I'm sorry, Senator Lautenberg missed the video. We want to make sure he gets a chance to see it later, but it was very dramatic in showing the difference in each.

So, Mr. Counts, as I understand what you're saying here, TB–117, the California standard relative to flame-retardant chemicals, kind of became a national standard, because furniture makers who are selling a lot of furniture in California are all around the country.

And now what I hear is, based on scientific evidence, the industry is backing away from the use of these chemicals, and the Governor in California has raised questions about the standard itself.

So I guess my basic question is, when it comes to furniture flammability today, is the furniture industry looking at their products in a different way in terms of how to make them safe, and not introduce toxic chemicals that may endanger customers?

Mr. COUNTS. Yes, Senator, we are.

In my written testimony, I noted that, in 2005, the furniture industry voluntarily phased out the use of PBDEs in our upholstery foam. EPA took action on that later in 2010, I believe.

So we're monitoring very closely European studies. We're working with our suppliers to make sure that all the research is avail-

able that's possible, working with Arlene Blum and others at Cal Berkeley, just to identify what chemicals may be trending at potential issues, and we look to phase those out as we can. And we'll be working with California on their new smoldering initiative as well.

Senator DURBIN. So you referred to something which I know nothing about, ASTM–1353, instead of the California TB–117.

Is this a new standard in terms of flammability and the safety of furniture you're recommending to CPSC and you think should be an industry standard?

Mr. COUNTS. ASTM–1353 is the embodiment of the Upholstered Furniture Action Council standard that was developed in 1977 to address smolder ignition.

If you look at the statistics on smolder ignition and the trends that I mentioned in my testimony, that along with smoke detectors and changing in lifestyles, decreasing smoking, et cetera, has added to the decrease in the trend there.

So that is the standard that we're looking to adopt.

Senator DURBIN. Officer Van Dorpe said something, which I thought to myself, I never thought of even looking for this. But he suggested, in his five things to make our homes safer, one of them is that we should be more sensitive to the furniture we buy, in terms of whether or not it is fire safe.

I cannot recall furniture ever being labeled fire safe. Is that something your industry does, advertises?

Mr. COUNTS. There is a UFAC hangtag that you can find on furniture, typically the retailer might not like hang tags on their furniture, and they'll rip that off, and you can't find it. There's the California TB–117 tag that's on there, occasionally. But those are the two standards.

Senator DURBIN. I'll bet you there aren't a half a dozen people in this room that would know what that meant if they saw it hanging from the back of a chair. I wouldn't have until this hearing.

Mr. COUNTS. Well, the hangtag is fairly descriptive, but like I said, sometimes it doesn't make it to the consumer.

Senator DURBIN. All right. Thank you much.

And that's the point I wanted to get to, Mr. Van Dorpe, is when it comes to our knowledge of what we're buying and whether it's safe, most consumers may not think of it, number one; and number two, wouldn't know what to look for.

Is there something that the firefighters recommend, in terms of that choice?

Mr. VAN DORPE. For a very long time, and this might be a little off topic, but for a very long time, the building industry said to the fire service, when we were concerned about the lightweight construction and taking mass out of buildings, where's your data, where's your data?

We finally have the data now, thanks to you all. So we've changed that discussion.

And oftentimes we hear when we talk about fire safety in the homes and sprinkler systems and fire-safe furniture and things like that, where the industries will say to us, well, consumers won't pay for that. I think we need to start asking them, where's your data?

Has anybody really asked? I mean, you can buy the safest car on the planet. There are manufacturers that will advertise their

cars that way, "We sell you the safest car. You'll pay a little more for it, but we promise you it's the safest car."

We can do the same approach with our homes. We can sell fire-safe homes. We can sell fire-safe furniture. You want a five-star home or a four-star home? What's the difference? One is more fire safe than the other.

We haven't even made the attempt, and we really should.

Senator DURBIN. Good point.

Senator Lautenberg.

Senator LAUTENBERG. Thanks very much, Mr. Chairman.

Sorry I missed the testimony of all of the witnesses. They bring good information to us.

Chief Van Dorpe, firefighters are called on to rush into homes that are burning on a regular basis. Inside those homes are hundreds of household products—we talked about that—including many that contain chemicals.

Now, could we protect the health of the firefighters by reforming our Federal chemical laws to reduce toxic substances in the homes?

Before you answer, I want to tell you something that I worked on some years ago. We had a fire in Elizabeth, New Jersey. And there's a lot of chemicals produced in the State of New Jersey.

And a couple of firemen were going into the burning building and their uniforms; their protective uniforms began to melt. And it was then that I wrote a law called "Right to Know", which became the law.

And when you think about the sofas and fire retardants and things of that nature that work against safe opportunities in fighting a fire, and the Right to Know.

And in this case, I just wonder, is there something that we might do that would change the nomenclature on fire retardants and on every sofa, everything, have a defining message that says, hey, be careful, that this can accelerate a fire beginning because of the chemicals there? Is there anything that you think your firefighter friends and the volunteers might do to protect themselves by having more knowledge about what's in these homes?

Mr. VAN DORPE. We can't have too much knowledge about the environment that we're operating in. And that environment is getting more and more complex all the time.

The challenge that we face is that, in the residential market, as soon as you start talking about our homes, most of the regulations, both for building codes and the restrictive regulations, go away. And that's where most of our fires are, and that's where most of our fire deaths are, and that's where most of our exposures are.

So what American fire service needs for you to do is to take what we already know about making buildings safer, making products safer, and apply that to all products, not just to those that are in hotels or in assembly buildings or other places, but across the board.

We know how to do this. The mattress industry has demonstrated it.

In Europe, England, and in the United Kingdom, if you Google "home fire", you know, home furniture fires, most of your responses come back with United Kingdom references, because they've done

the work, they've laid the groundwork and they've implemented a lot of these lessons.

So the information is out there. We just need to apply it.

Senator LAUTENBERG. What happened on 9/11, New Jersey lost 700 of its citizens in that calamitous occasion. But we still have had consequences of exposure by firemen and other emergency personnel. Still now, there are lots of them being treated and deaths are taking place because of the effects of the fumes and the dust and all of that.

And what happens when the toxic fumes are coming out there, black smoke, when they're burning? What happens to those who are trying to do their job, trying to save lives? What steps has your department taken to protect your firefighters from these health risks, these exposures?

Mr. VAN DORPE. We're doing several things, one of which is to ensure full encapsulation of the firefighters, the less skin we have exposed—the standard today is zero, no exposed skin—the less chemical exposure you have. Increasing our use of respiratory protection all the time, not just some of the time or when we think we really need it.

And then the other thing we do, we launder our equipment on a regular basis, because we find that if you don't do that, then those chemicals stay in your clothing, and then every time you put them on, you're re-exposing yourself, whether you're in a fire or not. So our turnout gear, our firefighting gear, gets laundered on a regular basis.

So we're taking what constructive steps we can to reduce that chemical exposure.

Senator LAUTENBERG. Last question for me, Mr. Chairman.

Mr. Schaefer, UL research suggests that flame-retardant chemicals in foam furniture do not provide significant benefits.

Based on your analysis, do you think there are safer and more effective ways than fire retardants to reduce fire hazards?

Mr. SCHAEFER. Fire retardants or alternate means?

Senator LAUTENBERG. Yes.

Mr. SCHAEFER. Yes, there are safe alternative ways, such as the use of fire barriers, where we saw very vividly there was a significant difference in the fire performance of furniture.

Senator LAUTENBERG. Define, if you would, a fire hazard. What would you define as a fire barrier?

Mr. SCHAEFER. A fire barrier is basically an inner covering that's placed over the foam material, for example. So it provides a shield, basically, between the source of the ignition, which could be the outer covering of the furniture, and the foam content.

And this technology has been used very effectively by the mattress industry, where they were also looking at flammability issues. And there's probably no piece of furniture that's in more intimate contact with a human being.

And they found, through the use of fire barriers, they could meet the flammability requirements and at the same time not introduce flame-retardant chemicals.

Senator LAUTENBERG. Mr. Chairman, I want to say thanks for bringing this subcommittee hearing up, because there's so much going on. And it took a Chicago Tribune expose to really bring at-

tention to one part of the thing that is never visible—you don't know—discharging toxic chemicals into the air, just by sitting on a sofa or something like that.

But we have to continue. When you talk about the number of deaths, Chief, that occur every day in the country as a result of fires, we've got to wake up to the alarm.

Senator DURBIN. Thanks, Senator Lautenberg. And thanks for your leadership on this.

Mr. Schaefer, before I conclude, I am struck by the fact that, though I'm a fan of CPSC—and we recently put a reform in place, we're now investing more Federal funds in the CPSC than we have ever, and I trust its leadership—when I listen to the fact that this started in 2003, this investigation, and it still isn't over, isn't finished—you talked about starting in 2008 and apparently getting into a lot more the impact of flame-retardant chemicals and ignition of furniture and so forth—I think I know the answer to this, and I think I may end up looking in a mirror, why is it that the CPSC takes so long to reach a conclusion, when, in your business, your not-for-profit undertaking, you seem to be able to do it in a shorter period of time?

Mr. SCHAEFER. I really can't comment what impacted CPSC. I do know, with other work we've done, there can be challenges with getting consistent, uniform test sample foams and things like that. I could speculate. I know there were considerable issues with import safety that came up in the last few years, and I'm sure that diverted some energy. And I know there were also funding challenges for CPSC in past years.

But I think, and this is where this subcommittee is to be applauded, sometimes it takes a spotlight on an issue to really get it elevated and acted upon.

Senator DURBIN. I still remember Chairman Tenenbaum's statement that they worked for 2 years to find a standard cigarette to use to determine whether the fire was being started in the proper way or in a consistent way. And 2 years seems like a long time to me, as a layman.

But let me just say thank you to this panel.

And, Chief, thank you very much.

Mr. Counts, thank you for your statements on behalf of the furniture industry.

Mr. Schaefer, very proud of UL, the work that you do in our State and around the country.

We wouldn't be here today were it not for the Chicago Tribune series. It really opened the eyes, not only of people in the Midwest, but all across the country and beyond about a very, very serious issue that affects every family with furniture. That's just about all of us. And every family that's concerned about that public health of the people living in their homes. Again, just about all of us.

And when it comes right down to it, I think what we found is there was, sadly, an unfortunate political effort under way to promote the use of chemicals in certain applications, which did not make us any safer. In fact, it endangered the public health of America.

It was a sinister and, in many respects, shameful exercise of our political system that led to the status that we found ourselves in

with these chemicals being used widely in the belief that they were keeping us safer.

We've learned a lot. And I think what I've heard today, the furniture industry and everyone has learned a lot in the process. I just hope that we can understand at the end there is a legitimate oversight role for Government, to take a look at the private sector and to keep us safe, whether it's the CPSC or EPA or many other agencies. And we have to make sure that we safeguard that, regardless of the administration, and make sure that we have the resources to deal with the challenges we face to get people the certainty they need in their lives.

PREPARED STATEMENTS

I'm going to ask unanimous consent that statements from the San Francisco Firefighters Cancer Prevention Foundation and the U.S. Fire Administration be included in the record.

Since there's no one here to object, that's going to happen.

[The statements follow:]

PREPARED STATEMENT OF SAN FRANCISCO FIREFIGHTERS CANCER PREVENTION FOUNDATION

Honorable members of the Financial Services and General Government Appropriations Subcommittee: First, I would like to apologize for not being physically present at this meeting. I had a previous commitment that I had to keep.

I would like to give you a little history about myself and the San Francisco Firefighters Cancer Prevention Foundation before my written testimony.

I am a retired Captain from the San Francisco Fire Department (SFFD) with 28 years of service. I spent the last 13 years of my career as an officer at Rescue 1, Station 1 and proud to say one of the busiest firehouses in the United States. After 26 years on the job, I contracted Transitional Cell Carcinoma in my right renal pelvis—a rare form of cancer usually found in people who work in the "chemical industry" according to my doctor. During my treatment and recovery, two more firefighters from my station also contracted Transitional Cell Carcinoma—only the common form, bladder cancer. It also seemed like every month we were attending a funeral of another firefighter that had lost his battle with some form of cancer. In 2006, with the support of the department's administration and San Francisco Firefighters Local 798, I formed the San Francisco Firefighters Cancer Prevention Foundation dedicated to the early detection and prevention of cancer in both active and retired firefighters. Since its inception we have conducted five major cancer screenings. Through these screenings we have identified five retired firefighters and one active firefighter with various forms of cancer. At the time of the screenings these individuals were not aware they had cancer.

Our foundation has also been involved in three studies. The first study (published in 2007) was conducted by the Department of Urology at UCSF and identified bladder cancer rates in the SFFD greater than the population in general and of major concern for the entire firefighting profession.

Our second study is currently being conducted by the Centers for Disease Control and Prevention (CDC) looking at causes of death in a cohort of 30,000 firefighters (5,538 participants from SFFD; 15,461 from Chicago Fire; and 10,652 from Philadelphia Fire) dating back to 1950. The study should be published with results sometime in 2014.

The third study is one that I will highlight in my testimony. It will be published very soon. The title of the study is "Halogenated Flame Retardants, Dioxins, Fnrans, and Other Persistent Organic Pollutants in Serum of Firefighters from Northern California". The "Firefighters from Northern California" that it refers to is a cohort of 12 firefighters from San Francisco. I have been given permission by one of the lead researchers, Susan D. Shaw, DPH, to discuss various findings of the study.

The question posed by Senator Durbin: "How has the use of flame-retardant chemicals affected the lives of firefighters and their ability to do their jobs?"

We must first remember that firefighters are exposed everyday in the same manner that the population in general is to the effects of flame retardants that escape

from household products and settle in dust whether it be in the workplace or at home . . . But once a firefighter enters a burning building it is a completely different set of circumstances.

Firefighters are fully aware that we work in a "chemical cocktail" every time we enter a building on fire. Does that hinder the fire extinguishment? The definitive answer is, "Absolutely not." It is onr job to extinguish the fire, preserve life and property, and get the job done. The firefighters' biggest fear is what occurs once the fire is extinguished and the "overhanl" process begins. It is during this period of time where "off gassing" occurs. Products of combustion have been extinguished but the emission of toxic gases continues. Most departments have Combustion Gases Indicators (CGIs) that are used to measure various toxins in the atmosphere once a fire is extinguished. Once the CGI indicates a "clear" atmosphere, firefighters are allowed to remove their scuba gear. The problem with this is that the CGIs have the ability to pick up a few toxic gases, but nowhere near the 100-plus toxic gases that remain in the atmosphere. We are now being told that even if all personal protective equipment remains in place brominated and chlorinated fire retardants have the ability to permeate the protective eqnipment worn by firefighters. Additionally, if this protective equipment is not properly decontaminated immediately when returning to quarters, firefighters risk continual exposures every time they don the protective equipment.

Flame-retardant chemicals (Polybrominated diphenylethers [PBDE]) are applied onto or in many common household goods, furniture foam, plastic cabinets, computers, small appliances, consumer electronics, wire insulation, back coatings for draperies, and upholstery to name a few. These gases are not picked up by CGIs. These chlorinated and brominated flame retardants produce both toxic dioxins and furans when they hurn which have been proven to cause cancer. The significantly elevated rates of cancer reported in firefighters (Kang et al. 2008, LeMasters et al. 2006, Hansen 1990) include four types that are potentially related to exposure to dioxins and furans:

—Multiple myeloma;
—Non-Hodgkin's lymphoma;
—prostrate; and
—testicular cancer.

A question that lingers in our profession is do these chemicals combine synergistically with other toxins in the atmosphere and exacerbate the effect of other toxic carcinogens? What we do know is that our rate of contracting various forms of cancer is increasing. We are also fully aware that these flame-retardant chemicals bioaccumulate in our blood, fat tissue, and in mother's milk.

Through our foundation, SFFD participated in a study examining the levels and patterns of halogenated compounds in the serum of the firefighters aud compares contaminant concentrations in this cohort with those in the general population and other studies in the United States and worldwide. The cohort iucluded 12 firefighters who willingly gave blood after two separate fires in San Francisco.

The study of our firefighters showed levels of PBDEs more than 30 percent more thau the general population of California and more than 60 percent more than the general population of the United States. We had one firefighter with a PBDE level of 442ng/g of lipid weight which is 11 times greater than the average of the general population of the United States. The PBDE concentration iu San Francisco firefighters was 20–30 times higher than levels found in the geueral population of Japan (Uemura et al. 2010), Hong Kong (Qin et al. 2011) and the United Kingdom (Thomas et al. 2006). With this information we are now hoping for a much broader study to take place.

Another issue that has to be addressed in regards to flame retardants is the rising cases of breast caucer we are seeing in our female firefighters in San Francisco. We have more than 200 female firefighters in San Francisco—the most of any major metropolitan city in the United States. Many of these women are nearing the age of retirement. To our knowledge there have beeu no major studies in regards to the health of female firefighters mainly because they have only been in the profession for 40-plus years. In our 40–49-year-old group of female firefighters we have 117 women. In that group we have had eight cases of breast cancer. The uational average of breast cancer for the 40–49-year-old female group is 1 in 69. It is a known fact that PBDEs bioaccumulate in mother's milk in the general population. It is also kuown that PBDEs are neurodevelopmental toxicauts. The unkuown is what level of PBDEs is in the mother's milk of a female firefighter and what effect that is having on their children. Our foundation is in the preliminary stages of a study addressiug the health issues of our female firefighters.

As far as the benefits of flame retardants, I think Dale Ray, a top official with the Consumer Product Safety Commission, who oversaw the 2009 tests at a labora-

tory outside Washington summed it up best in the Chicago Tribune series on flame retardants when he stated, "We did uot find flame retardants in foam to provide any significant protection. Moreover, the amount of smoke from both chair fires (one treated, one not treated) was similar". Ray noted that most fire victims die of smoke inhalation, not the flames.

It is probably to late for this generation of firefighters to be protected by a change in the current toxic flame-retardant standard. But the generations of firefighters to come will be forever thankful that this very important step was taken.

PREPARED STATEMENT OF THE UNITED STATES FIRE ADMINISTRATION

Mr. Chairman and members of the subcommittee, thank you for the opportnnity to address this hearing and to provide the views of the United States Fire Administration (USFA) on the topic of furniture flammability and home fire safety. I appreciate the opportunity to discuss these important issues, which are of growing concern to the USFA.

BACKGROUND

Over the past 40 years, the number of lives lost fighting fires across the United States has decreased dramatically. In 1971, this Nation lost more than 12,000 citizens and 250 firefighters to fire. Acting to halt these tragic losses, the Congress passed Public Law 93–498, the Federal Fire Prevention and Control Act, in 1974, which established the USFA. Since that time, through data collection, public education, research and training, USFA has helped reduce fire deaths by more than one-half—making our communities and our citizens safer.[1]

In spite of these efforts, America's fire death rate continues to be one of the highest per capita in the industrialized world. Fire kills approximately 3,500 people and injures another 18,300 each year. Inclnded in these fire fatalities are the approximately 100 firefighters who die on duty each year. Direct property losses due to fire reach more than $12 billion a year. Most of these deaths and losses are preventable.[1]

More than 80 percent of fire deaths occur in homes, an environment where citizens expect that they should be most safe. USFA is increasingly concerned about current trends that portend a looming catastrophe for the Nation: an aging population combined with changes in residential construction and use of highly flammable materials that create tremendous risk for fast-burning fires.

A summary of USFA's concerns is outlined below:

—Since the 1960s and 1970s, materials used in home furniture and furnishings have changed dramatically. Furniture fabrication has changed. Furniture that was once made with heavy wood frames, cotton batting, and wool fabric is now made with light wood or plastic frames, polyurethane foam, and synthetic fabric. Fires involving this newer furniture grow much, much faster than fires in older furnitnre. Research has shown that the time available to escape a flaming fire in a home has decreased significantly from 17 minutes in 1975 to only 3 minutes in 2003; a change that has been attributed to the increased combustibility of home furnishings.[2] Carpets, draperies, clothing, entertainment systems, computers, and many other items commonly found in homes are also made of synthetic materials that have similar burning characteristics in an established fire in a home. Many of these materials are required to pass tests for resistance to small sources of ignition, but once ignited, they burn fast and hot.

—The significant changes in the materials found in our homes are not limited to the contents and fnrnishings that occupants bring into their homes. Important building elements are now made of synthetic materials that burn faster and hotter than traditional construction materials. Vinyl siding and exterior finishes, window and door frames, doors, foam insulation board, and other components made of synthetic materials all contribute to faster fire spread. Though some of these items are required to pass tests for resistance to ignition, they too, burn rapidly once lighted.

[3] *A Review of the Sound Effectiveness of Residential Smoke Alarms*, CPSC–ES–0502, U.S. Consumer Product Safety Commission, December 2004.

—The past 30 years have seen a dramatic increase in the use of lightweight construction assemblies such as trusses and other engineered assemblies in home construction and remodeling. These assemblies fail earlier during a fire than traditional dimensional lumber, all other factors being equal. Failure of these assemblies can result in structural collapse that threatens the lives of both the building occupants and responding firefighters.

—During this same time period, architects have made use of the wide span capabilities of these engineered structural assemblies to create remarkable and spacious home plans. These large wide-open spaces allow for faster fire development than smaller rooms found in older homes.

—Recent advances in energy conservation features have also had an impact on how a fire grows in a home. As a result of increasingly air-tight window and door fixtures, among other efficiency improvements, firefighters are experiencing an increase in the number of serious events such as "backdrafts" and "smoke explosions" that threaten the lives of both trapped occupants and firefighters.

Despite the many benefits to the advances in building technologies and materials in modern times, these advances have developed over time without expectation or analysis of the resultant cumulative effect on occupant safety from fire within residences. The resulting adverse impact to fire safety was not anticipated.

While many in the fire service have long-recognized the potential impact of changes in building technologies and material construction, only in recent years have the risks associated with these issues come under investigation. Recent research clearly shows that these innovations have dramatically changed the way a fire develops, grows, and spreads in a home. Fires in homes today develop, grow, and spread faster than ever before.

Concurrent with this dramatic change in the development and behavior of fires in the home, we are beginning to experience the much-heralded aging of our population. As we age, we become less able to awaken to the sound of a smoke alarm[3] [4] [5] and we are less able to move quickly. The significant reduction in time available to escape a home fire combined with the declining sensory and mobility characteristics of older citizens is a recipe for disaster. USFA is concerned that the reductions in the number of fire deaths and injuries made over the last 40 years could be overcome by the potential for loss of life as a result of this deadly combination.

SITUATION

Citizens, firefighters, elected officials, and others across America share the USFA's concern over the relatively high number of fire deaths in America's homes, and the changing nature of fire hazards in our homes. The fire problem is becoming more complex, and it continues to defy simple fixes, despite the desire to find easy answers. The Consumer Product Safety Commission (CPSC) is taking on the important task of reducing the adverse impact of one of the known factors adding to the home fire hazard problem, the flammability of upholstered furniture. They are doing so with scientific research and consideration by agencies such as Underwriters Laboratories (UL) and the National Institute of Standards and Technology (NIST).

UL has recently completed an extensive project on furniture flammability. While UL's work has not been fully published at this time, what we have seen demonstrates beyond all doubt that modern furniture presents a much greater fire challenge than the furniture used by our grandparents. While it is not the only way to improve fire performance of upholstered furniture, the positive impact that the current fire barrier technology can provide was clearly demonstrated in this work.

NIST has done outstanding multidimensional work addressing the subject of furniture flammability, and is continuing to explore several avenues that show great promise. USFA applauds the work done at NIST and looks forward to ongoing collaboration with their research team.

CPSC has proposed a regulatory approach that is based on the best science currently available. USFA supports the work that CPSC has done on the topic and recognizes their effort as a thoughtful approach to improving home fire safety by attacking one significant part, flammability of upholstered furniture, of an increasingly complex residential fire problem.

---

CONCLUSION

USFA believes that the approach proposed by CPSC is an important step in improving home fire safety, but that it is not a final solution. As our collective understanding of the underlying science improves, we anticipate that there will be opportunities for voluntary improvements by the industry or a need for additional regulatory actions.

Thank you, Mr. Chairman, for providing this opportunity to provide the views of USFA on the topic of furniture flammability and home fire safety. I appreciate the opportunity to discuss these issues, and look forward to providing further information as requested.

ADDITIONAL COMMITTEE QUESTIONS

Senator DURBIN. We're going to keep the record open for 1 week, until noon on Wednesday, July 24. We may be sending you some questions along the way, follow-up questions.

[The following questions were not asked at the hearing, but were submitted to the witnesses for response subsequent to the hearing:]

QUESTIONS SUBMITTED TO INEZ M. TENENBAUM

QUESTIONS SUBMITTED BY SENATOR RICHARD J. DURBIN

CONSUMER PRODUCT SAFETY COMMISSION'S UPHOLSTERED FURNITURE FLAMMABILITY STANDARD

Question. In your testimony, you reference that much of the delay has resulted from the necessity of developing standard reference materials (such as standard cigarettes or standard foam) for testing. Are there remaining standard reference materials that need to be developed before you can move forward with finalizing the proposed rule?

Answer. The research to determine the specifications for Standard Reference Material (SRM) foam was completed in July 2012. Consumer Product Safety Commission (CPSC) staff is working with the National Institute of Standards and Technology and manufacturers to acquire SRM foam for testing as soon as possible. The staff also may conduct some additional work to select the best staudard cover fabric for testing in accordance with the proposed rule.

Question. Under the rulemaking authorities that you currently have, what steps still remain in order to complete the standard, and what is your best estimate of when the standard might be completed?

Answer. The remaining steps in the rulemaking include:

—testing to determine the necessary revisions to finalize the proposed rule;
—testing the materials subject to the proposed rule to determine that compliance can be achieved;
—evaluating furniture constructed with compliant materials to estimate the reduction of deaths and injuries that could result from the proposed rule; and
—drafting the text of the final rule and developing the final regulatory analysis.

The staff will also continue to work cooperatively with the State of California's Bureau of Electronic & Appliance Repair, Home Furnishings & Thermal Insulation (BEARHFTI) as that agency proceeds with its work to revise Technical Bulletin 117 (CA TB 117). TB 117 currently contains performance standards that effectively require the use of flame retardants in upholstered furniture. Future changes in TB 117 could have an impact on the rulemaking proceeding. With those caveats, CPSC staff estimates, subject to Commission direction, completion of the final rule in 2015.

CALIFORNIA TECHNICAL BULLETIN 117

Question. What role does California TB 117 (CA TB 117) play with regard to your efforts to finalize a standard for upholstered furniture flammability?

Answer. There is a high degree of compliance with CA TB 117, not only in California, but also across the Nation. The existing CA TB 117 is essentially a de facto national standard. CPSC staff continues to work cooperatively with BEARHFTI on possible revisions to CA TB 117, and elements of the Commission's proposed rule are incorporated into California's latest draft revised regulation, known as CA TB 117–2012. As CPSC moves forward with its own rulemaking, the Commission staff will continue to monitor CA TB 117–2012 developments and will consider the potential effects of a revised California regulation on the level of consumer safety.

Question. Does the fact that the California Governor recently ordered that CA TB 117 be revised impact your efforts?

Answer. The revision of CA TB 117 will not impede CPSC's efforts to address the fire risk associated with ignitions of upholstered furniture. Throughout the upholstered furniture rulemaking process, CPSC staff has always envisioned a rule that does not require the use of flame retardants to meet performance standards. Revising or removing the open-flame requirement of CA TB 117 would eliminate the practical need for manufacturers to use flame retardants in upholstered furniture sold in California and across the United States. Accordingly, CPSC staff is carefully monitoring the progress of the CA TB 117 revision efforts.

Question. What will be the effect if CA TB 117 is completed prior to your standard?

Answer. As required uuder the Flammable Fabrics Act (FFA), CPSC preliminarily determined that the proposed rule was needed to address au unreasouable risk of fire injnry or death to the public when it issned a proposed rule iu 2008. The proposed rule included an assessment of reasonable alternatives to the proposal, inclnding reliance upon the existing California regnlations. If a revised TB 117–2012 were completed prior to our rule, CPSC would need to evaluate the revision to determine whether a Federal rule is still needed to address the fire risk.

Question. If California fails in their efforts to update CA TB 117, can CPSC preempt CA TB 117 with your proposed rule?

Answer. In general, section 16 of the FFA provides that whenever a flammability standard or other regulation for a prodnct is in effect under the FFA, no State may establish or continue in effect a flammability standard or other regulation for that product, if the standard or regulation is designed to protect against the same risk of occurrence of fire as the FFA standard or regulation, unless the State standard or regulation is identical to the FFA standard or regulation. Because the CPSC rule and CA TB 117 are both desigued to address the same unreasonable risk of occurrence of fire presented by flammable upholstered furniture, any Federal rule by CPSC would have preemptive effect. I should note, however, that the decision as to whether our rule has preemptive effect ultimately will be determined by the courts.

RESPONSE TO AMERICAN HOME FURNISHINGS ALLIANCE RECOMMENDATIONS

Question. The American Home Furnishings Alliance (AHFA) recommends that CPSC immediately adopt American Society for Testing and Materials (ASTM) 1353 as a Federal mandatory standard while continuing work on the CPSC proposed standard?

Answer. The Upholstered Furniture Action Council (UFAC) voluntary guidelines are based on tests prescribed in the ASTM E1353 test method. The vast majority of upholstered furniture sold in the United States conforms to the voluntary guidelines. While some elements of tbe CPSC's proposed flammahility performance tests are similar to the ASTM 1353 standard, CPSC staff reviewed the ASTM/UFAC approach and concluded that it was inadequate because conforming furniture can still iguite and burn from smoldering cigarettes. The CPSC proposal incorporated significant improvements to the ASTM/UFAC method and is more stringent. Mandating the ASTM E1353 method, as embodied in the current UFAC guidelines, would impose modest costs, but also provide only negligible safety benefits.

Question. How does ASTM 1353 differ from what CPSC is proposing?

Answer. There are two principal, substantive differences between the ASTM tests and the smoldering ignition tests in CPSC's proposed rule. The first involves relatively small differences in the test methods themselves. The second involves larger differences in the acceptance criteria that determine the stringency of the performance tests.

With regard to the test methods, the ASTM method measures char length from the lit cigarette placed on an upholstery mockup. The mockup is encased in a box that artificially restricts airflow to an unrealistically low rate. The cover fabric is classified as either "Class 1" or "Class 2" based on the char length resulting from the test. If the char is within the 2-inch specified length, the cover fabric is Class 1 under the UFAC guidelines and may be used without restriction; if the char exceeds the 2-inch specified length, the fabric is Class 2 under the UFAC guidelines. For Class 2 fabrics, the use of a smolder-resistant barrier (typically polyester batting) beneath the cover fabric is prescribed to provide additional smolder resistance for the finished article of furniture. The UFAC/ASTM approach represents the status quo in the industry; virtually all fabrics are classified as Class 1, although in tests conducted by CPSC staff, some Class 1 fabrics were so smolder prone that they produced dangerous smoldering or transitioned to flaming combustion even when a

polyester batting layer that would have been required for Class 2 fabrics was present.

The main difference is in the acceptance criteria. CPSC's proposed rule classifies furniture as "Type I" or "Type II" based on acceptance criteria of the proposed test. CPSC's proposed Type I smoldering test for upholstery cover fabrics uses the hasic UFAC/ASTM mockup test configuration, but controls airflow without a box, limits maximum allowable smoldering time to 45 minutes, and limits mass loss of the (nonflame-retardant) polyurethane foam substrate beneath tbe fabric to 10 percent. This test is a much better indicator of the likelihood of continued combustion and fire growth, and it identifies more effectively smolder-prone cover fabrics.

While most cover fabrics are still expected to pass the smoldering resistance test and be used in complying, Type I furniture, fahrics that fail the smolder-resistance test can only be used in Type II furniture. Type II furniture is that which is constructed with a fire-blocking barrier beneath the cover fabric. Compliant Type II barriers must pass a stricter smolder-resistance test; they must also pass a flame-resistance test that simulates the potential transition from smoldering to flaming combustion.

Question. What is your response to AHFA's recommendation that your proposed standard rely on the use of compliant components (individual pieces that are used to construct the fiual furniture) instead of on the use of composite testing (testing of the completed furniture)?

Answer. CPSC's proposed rule relies on the use of complying component materials, rather than on composite assemblies, consistent with AHFA's recommendation. The principal advantage of this approach is economic efficiency-suppliers of the various components can test and certify their materials, and furniture manufacturers can choose from among many complying materials, without having to duplicate compliance tests for each of thousands of potential combinations. Balanced against the desire for low cost, however, is the need to ensure that complying components will perform as intended when assembled into the wide range of constructions and geometrics in finished articles of upholstered furniture. CPSC staff will continue to be mindful of these issues as they move forward with the rulemaking.

FLAME-RETARDANT CHEMICALS

Question. The Environmental Protection Agency (EPA) has jurisdiction over evaluating the toxicity of flame-retardant chemicals under the Toxic Substance Control Act but, in 1977, CPSC attempted to use their authority under the Federal Hazardous Substances Act to ban the use of a flame retardant—"tris", a harmful carcinogen—from use in children's clothing. Though the ban was overturned on procedural grounds, could the CPSC use this authority to take similar steps to ban the use of certain toxic flame-retardant chemicals in upholstered furniture?

Answer. While EPA has authority to regulate flame-retardant chemical risks under the Toxic Substances Control Act, CPSC has authority under the Federal Hazardous Substances Act (FHSA) to regulate a "bazardous substance", as defined in the FHSA, that is intended or packaged in a form that is suitable for use in the household. In other words, the CPSC does not regulate chemicals, but it can regulate a product, such as upholstered furniture, if that product contains a hazardous substance and the Commission is able to make the requisite findings under the FHSA. See 15 U.S.C. 1261(f) and (q)(1)(B); 1262(f) through (i).

CPSC staff has conducted risk assessments for fabric, foam, and barrier flame retardants. Staff identified one foam flame retardant, known as TDCP or "chlorinated tris", as a potential carcinogen. To regulate upholstered furniture containing this or other flame retardants under the FHSA, CPSC would have to find that upholstered furniture containing the chemical is u "hazardous substance" under the FHSA and that cautionary labeling would not adequately protect public health and safety. A "hazardous substance", as defined in the FHSA, includes a substance that is toxic and "may cause substantial personal injury or substantial illness during or as a proximate result of any customary or reasonably foreseeable handling or use." See 15 U.S.C. 1261(f)(1)(A). FHSA also requires, among other things, a final regulatory analysis of the costs and benefits of the regulation, a description of alternative approaches to regulation, as well as an analysis of the costs and benefits of those alternatives, and why they were not chosen as part of the final rule.

To date, CPSC staff has worked cooperatively with EPA staff outside of the FHSA rulemaking context to identify and address potential risks associated with a category of flame-retardant chemical compounds known as polybrominated diphenyl ethers (PBDEs) that had been used in upholstered furniture to meet CA TB 117. EPA proposed a Significant New Use Rule (SNUR) for two PBDEs (penta- and octa-BDE) in 2004 and another SNUR (deca-BDE) in 2012. Penta- and octa-BDEs are

now out of prodnction, and deca-BDE prodnction is expected to cease by December 31, 2013. Going forward, CPSC staff and EPA staff will continue to work cooperatively on issues related to flame retardants.

Questions Submitted to James J. Jones

Questions Submitted by Senator Richard J. Durbin

FLAME-RETARDANT CHEMICALS

Question. Tris(1,3-dichloro-2-propyl)phosphate (TDCP) is the chlorinated version of a chemical known as "tris" that the Consumer Product Safety Commission (CPSC) attempted to ban from children's sleepwear in the late 1970s after it was found to be carcinogenic. Despite its similarity to tris, TDCP is a widely used flame retardant in furnitnre cushions and baby products. Along with components of Firemaster 550, Environmental Protection Agency (EPA) has placed a chlorinated flame retardant, Tris(2-chloroethyl)phosphate (TCEP), on a list of chemicals that will be reviewed next year under its Toxic Substances Control Act (TSCA) work plan. However, EPA did not place TDCP on the list. Why not?

Answer. In March 2012, following the development of the "TSCA Work Plan Chemicals: Methods Document", a screening process to identify chemicals for review based on their combined hazard, exposure, persistence, and bioaccumulation characteristics, EPA identified 83 work plan chemicals for risk assessment under TSCA.[1] Of these, an initial seven chemicals were identified for risk assessment development in 2012.[2] Although TDCP has chemical characteristics similar to other flame retardants, it did not meet any of the specific listing criteria identified in the TSCA Work Plan methods document. Specifically, it was not identified as a known or probable human carcinogen by the Integrated Risk Information System, International Agency for Research on Cancer, or National Toxicology Program, and was not reported as being in children's products through the 2006 Information Use Reporting or the Washington State Children's List. Consumer products were not a screening category for step 1 in the Work Plan development process.

On June 1, 2012, EPA identified 18 additional chemicals from the TSCA Work Plan, which the Agency intends to review and for which the Agency will develop risk assessments in 2013 and 2014, including three flame-retardant chemicals:

—Bis(2–Ethylhexyl)-3,4,5,6-tetrabromophthalate (TBPH);

—2–Ethylhexyl-2, 3,4, 5-tetrabromobenzoate (TBB); and

—Tris(2-chloroethyl)phosphate (TCEP).[3]

EPA is currently developing a strategy, scheduled for completion by the end of this year, to address these three flame-retardant chemicals as well as a broader set of flame-retardant chemicals. This effort will assist EPA in focusing risk assessments on those flame-retardant chemicals that pose the greatest potential concerns. EPA anticipates initiating the risk assessments in this category of chemicals in 2013.

Question. Polybrominated diphenyl ethers (PBDEs) are a large class of flame-retardant chemicals that have been shown to be harmful to humans and the environment. What can be done to remove products with these chemicals from American homes and properly dispose of them?

Answer. EPA's regulatory efforts for addressing concerns with PBDEs include a Significant New Use Rule (SNUR) issued in 2006, a recently proposed SNUR, and a proposed test rule for PBDEs. EPA has also engaged producers and importers in negotiations and commitments to voluntarily phase out certain PBDEs.

In 2003, the sole U.S. manufacturer agreed to voluntarily phase out production of pentaBDE and octaBDE by December 31, 2004. In conjunction with this phase out, EPA issued a SNUR in 2006 which designated the manufacture and import of six PBDE compouuds as a significant new use. The SNUR required persous who iutended to manufacture or import tetra-, penta-, hexa-, hepta-, octa- and nonaBDE to submit information to EPA for review before engaging in the new use. Additionally, the SNUR ensured that no uew manufacture or import of pentaBDE or octaBDE could occur after January 1, 2005.

Following negotiations with the EPA in 2009, the sole importer and two domestic mauufacturers of decaBDE voluntarily agreed to stop produciug decaBDE by Decemher 31, 2012, for all uses except certain military and transportation uses, and

---

[1] http://www.epa.gov/oppt/existingchemicals/pubs/wpmethods.pdf

[2] http://www.epa.gov/oppt/existingchemicals/pubs/workplans.html#2012

[3] http://www.epa.gov/oppt/existingchemicals/pubs/workplans.html#2013

to stop providing decaBDE for all uses by December 31, 2013. Ou April 2, 2012, the EPA proposed to amend the 2006 SNUR hy expanding the scope to include processors of PBDEs and articles containing PBDEs. The proposed amended SNUR wonld also designate the manufacturing, importing, and processing of decaBDE, inclnding in articles, as significant new nses. Along with the proposed SNUR, EPA also proposed a test rule for those persons that manufactnred, imported, or processed commercial PBDEs after December 31, 2013. With a test rnle in effect, manufactnrers, importers, and processors conld be required to conduct health and safety studies to inform data gaps.

To aid companies in moving to safer alternatives, EPA recently puhlished, with public participation through its Design for the Environment program, a draft report: "An Alternatives Assessment for the Flame-Retardant Decabromodiphenyl Ether." Public comments were due by September 30, 2012, and EPA expects to finalize the report in the coming months.[4]

While these efforts may result in a reduction of products containing PBDEs in American homes, we would note that CPSC has authority to require recalls if it determines that a product presents an unreasonable risk of injury or death. EPA is not aware of CPSC requiring a recall of furniture as a result of the product containing PBDE. Iu terms of disposal, PBDE-containing furniture can be disposed of in municipal solid waste landfills.

FUTURE EFFORTS REGARDING FLAME RETARDANTS

Question. EPA has started a new plan to re-evaluate all of the flame retardants on the market with the latest testing and analysis methods to see if any of these chemicals poses a risk to the public's health. Once you've completed the new plan, what will the next steps be?

Answer. As indicated in the response to question one, EPA is currently developing a strategy, scheduled for completion by the end of this year, on the three flame-retardant chemicals identified earlier this year, as well as on a broader set of brominated flame retardant chemicals.

The strategy will assist EPA in focusing its risk assessments efforts on those flame-retardant chemicals that appear to pose the greatest potential concerns. EPA anticipates initiating the risk assessments on brominated flame retardants in 2013. If an assessment indicates significant risk, EPA will evaluate and pursue appropriate risk reduction actions. If an assessment indicates no significant risk, EPA will conclude its current work on that chemical.

EUROPE BANS OR GREATLY RESTRICTS FLAME RETARDANTS

Question. Furniture flammability is not just an issue here in the United States. However, many European countries have taken alternative steps to ensure flammability standards can be met without causing public health concerns. The United Kingdom has banned the use of conventional, flexible polyurethane foams in the manufacture of upholstered furniture for sale. In addition, many European countries have banned the use of PDBEs and greatly restricted other flame-retardant chemicals. Does EPA examine how other countries are regulating flame-retardant chemicals?

Could any of these methods be applied here in the United States?

Answer. EPA is aware of what other countries are doing on flame retardants and will consider any data or assessments that are available to us. EPA's authority for regulating PBDEs and other industrial chemicals must be consistent with TSCA, this country's chemicals management legislation. While TSCA provides the authority to take action to prohibit or limit the manufacture, import, or use of a chemical, the requirements needed to take that action have proven very challenging.

CPSC also encourages the use of harriers to reduce the use or need for chemical flame retardants while still meeting, or exceeding flammability standards.

In 2006, CPSC published a regulation on the allowable rate of heat release from a mattress;[5] this has effectively reduced both the size and growth rate of fires in mattresses that were in compliance with the new standard. Additionally, in 2008, CPSC proposed a rule establishing flammability standards on the smolder propensity of upholstered furniture.[6]

TOXIC SUBSTANCES CONTROL ACT

Question. Following the series of articles in the Chicago Tribune that highlighted the potential health risk of flame retardant chemicals, many of my constitnents responded that the Federal Government should have protected the public from these chemicals. What steps has EPA taken outside of legislation to more effectively regulate hazardous chemicals such as flame retardants?

Answer. EPA engaged in negotiations in 2003 and again in 2009 with manufacturers and importers of PBDEs. EPA considers commitments from chemical companies to voluntarily phase out certain chemicals from the market an important strategy of chemical management. EPA is using SNURs to ensure if any PBDEs that have been voluntarily phased out were to be reintrodnced into commerce, they would first be snhject to EPA's review.

In addition to those actions, EPA believes that its cnrrent approach to identifying chemicals for review aud assessment utilizing the "TSCA Work Plan Chemicals: Methods Document", is a significant step to ensuring the safe use of chemicals. If, throngh this process, EPA identifies chemicals that pose a concern, the Agency will evaluate and pursue appropriate risk reduction actions, as warranted, using existing TSCA authority. If an assessment indicates no significant risk, EPA will conclude its current work on that chemical. However, identification of chemicals as Work Plan Chemicals does not mean that EPA would not consider other chemicals for risk assessment and potential risk management action uuder TSCA and other statutes. EPA will consider other chemicals if warranted by available information. EPA will also continue to use its TSCA information collection, testiug, and subpoena authorities, including sections 4, 8, and 11(c) of TSCA, to develop needed information on additional chemicals that cnrrently have less-robust hazard or exposure data.[7]

QUESTIONS SUBMITTED TO GUS SCHAEFER

QUESTIONS SUBMITTED BY SENATOR RICHARD J. DURBIN

UNDERWRITERS LABORATORIES TESTING ON UPHOLSTERED FURNITURE FLAMMABILITY

Question. In 2008, Underwriters Laboratories (UL) initiated a series of tests to determine the most-effective ways to improve flammability of upholstered furniture exposed to small open flames (namely, candles or lighters). UL has completed all phases of the study and is currently finalizing the data for an upcoming report. During your testimony you showed two powerful videos that demonstrate the way modern fnrniture burns. But that is only part of your current research.

When do you expect to finalize and publish the results of the study referenced in your testimony?

Answer. We expect to finalize and publish our findings in a report dne to be released in early fall 2012. The project report for the initial investigation (material, mock-up, and furniture tests), or Phase I, is still on schedule for the aforementioned release date. Phase II (living room burns) and Phase III (house fires with egress estimations) will be finalized and published in the subsequent 2–4 months.

Question. Will the results be made available to the public?

Answer. Yes, UL intends to post our reports upon completiou on the Upholstered Furniture Flammability project Web page: www.ul.com/fireservice. This Web page was created in July 2011 to provide the puhlic with an overview of the project, our published findings, fire demonstration videos, and other related material.

RESPONSE TO TESTIMONY FROM THE AMERICAN HOME FURNISHING ALLIANCE

Question. Testimony from the American Home Furnishing Alliance (AHFA) has outlined several concerns regarding the repeatability of flammability testing and the difficulty this testing presents for manufacturers and for creating new standards. Is it difficult to prodnce reliable, repeatable tests to properly evaluate flammability performance?

Answer. Results of fire tests and other physical tests are impacted by the method itself (e.g., equipment and reagents, procednres, environment conditions, etc.), the operator, and the sample.

Standard Test Methods such as those developed by the Consumer Product Safety Commission (CPSC), ASTM International, the International Organization for Standardization (ISO), the Upholstered Fnrniture Action Council (UFAC), and UL minimize variations from testing and the test operators by clearly defining a fixed set

[7] http://www.epa.gov/opptiexistingchemicals/pubs/workplans.html#not

of equipment requirements, measurement methodologies, and procedural protocol. The sample thus becoues the main source of variation. In fact, there are defined protocols (ASTM Committee E11 quality and statistics, ISO TC 46/SC 8 Quality—Statistics and performance evaluation) for verifying that the sample, and not the test method, is the limiting repeatability factor.

By following good scientific practice, reliable and repeatable tests for evaluating flammability properties can be developed. UL, ASTM International, and ISO have long histories of developing standard test methods. The developed tests are used on a daily basis for research, manufacturer quality control, product certification, and are referenced in fire and building codes worldwide.

Question. AHFA also raised some concerns regarding the incorporation of barrier technology into upholstered furniture. How would you describe the comfort level of furniture containing barriers?

Answer. While UL did not factor in "comfort" implications into the scope of its formal research. However, the furnitnre UL created for its research that incorporated barriers looked, felt, and sounded (for example, no crackling or squeaks when sitting or rising) the same as fnrniture made without the barrier.

UL did investigate a variety of representative barrier types including "high-loft" barriers and "flat" barriers as a part of this research, but did not test all available barriers. Depending on what type of barrier is used in different parts of the furniture (cushions, arm rest, flat surface, etc.), some of these barriers could result in furniture that may look, feel, and possibly sound different than furniture without the barrier.

Question. Do you believe incorporating barrier technology into fnrniture wonld significantly increase the cost to manufacture?

Answer. From our written testimony: UL's general experience tells us that industry is usually able to develop cost-effective and efficient approaches to address enhanced safety requirements.

Question. In your testimony, you discuss the disproportionately higher number of home fire deaths related to upholstered furniture. In AHFA testimony, Mr. Counts discusses how improvements such as smoke alarms and residential sprinklers have has greatly diminished home fire deaths. In the past 30 years, what factors have you found to be responsible for reducing the number of home fires related to upholstered furniture?

Answer. While smoke alarms and more recently, residential sprinklers, have contributed to a reduction in fire deaths related to upholstered furniture, the fact remains that fires beginning with upholstered furniture and mattresses/bedding are responsible for more home fire deaths than any other item (National Fire Protection Association [NFPA] report "Home Fires that Began with Upholstered Furniture", 2011). During the 5-year period of 2005–2009, these fires accounted for 19 and 14 percent of deaths and 7 and 10 percent of the injuries, respectively. They also accounted for $824 million in direct property damage. Contemporary upholstered furniture, or furniture constructed with modern synthetic material, leads to a disproportionate number of potentially preventable fire deaths as evidenced by the NFPA report:

"Overall, fires beginning with upholstered furniture accounted for 2 percent of reported home fires bnt 1 of every 5 (19 percent) home fire deaths."

One of the most notable fire protection technologies since the 1980s is the introduction of residential fire sprinklers. Bnt like the current furnitnre flammability discussion around barrier fabrics, the mandating of residential fire sprinklers has faced resistance by many within the construction industry becanse of added cost to homes.

The city of Scottsdale, Arizona, for instance, mandated the installation of residential sprinklers since 1986. The Scottsdale Fire Department published a report detailing the positive effects of their sprinkler ordinance. Key findings include:

—More than 50 percent of the homes in Scottsdale (41,408 homes) are protected with fire sprinkler systems.
—From 1986–2001, there were 598 home fires. Of the 598 home fires, 49 were in single-family homes with fire sprinkler systems:
—There were no deaths in sprinkler-installed homes.
—13 people died in homes without sprinklers.
—There was less damage in the homes with sprinklers:
  —Average fire loss per home with sprinklers: $2,166
  —Average fire loss per home without fire sprinklers: $45,019.
  —Annual fire losses in Scottsdale from 2000–2001 were $3,021,225, compared to the national average of $9,144,442.

The full report can be downloaded from the Home Sprinkler Coalition site at http://www.homefiresprinkler.org/fire-department-15-year-data.

QUESTIONS SUBMITTED TO ANDY S. COUNTS

QUESTIONS SUBMITTED BY SENATOR RICHARD J. DURBIN

CONSUMER PRODUCT SAFETY COMMISSION FLAMMABILITY STANDARD

Question. Earlier testimony has shown increased flashover (combnstion) times, resulting in fires that bnrn more quickly, leaving less time for consnmers to escape homes in the case of fire, and also less time for firefighters to respond to fires.

Do yon believe cnrrent upholstered furniture flammability standards are adeqnately protecting consumers from the risk of furniture fires?

Answer. Yes, the voluntary Upholstered Furniture Action Council (UFAC) standard as reflected in American Society for Testing and Materials (ASTM) 1353 is adeqnately protecting consnmers from the risk of fnrnitnre fires. Despite the absence of a mandatory national standard, incidents of deaths and injuries from upholstered fnrniture fires have steadily declined over the last few decades in spite of a large increase in the population of this conntry (see if we can quantify from census figures). A recent National Fire Protection Association report said that there has been a 93-percent decline since 1980. While many factors have contributed to this decline, the safer construction criteria developed by UFAC undoubtedly played a significant role in the downward trend in the number of ignitions of upholstered furniture.

Regardless of the extrapolation method used to estimate the national level death and injury figures, the risk level associated with death or injury in a cigarette- or small, open-flame-ignited upholstered furniture fire is lower than many other risks commonly accepted by individuals without concern. Despite population growth, the risk of fire fatalities and the nnmber of npholstered furnitnre fires continue to fall. In recent years, the risk has been extremely low: In 1980 the death rate for cigarette fires was 4.34 per million popnlation; by 2002 this death rate had been reduced to 0.53 per million popnlation. The death rate for small open-flame fires in 1980 was 0.61 per million population; by 2002 this death rate had been reduced to 0.53 per million population. A risk level of under 1 per million is considered by experts to be de minimis, below many everyday risks that are essentially nnavoidable.

Question. In your opinion, what is the most-effective way to reduce upholstered furniture flammability?

Answer. We believe that the fire statistics demonstrate the effectiveness of ASTM 1353 and this standard achieves that without the use of flame-retardant chemicals. Since smolder ignition continnes to be to the primary sonrce of ignition for npholstered-furnitnre-related fire deaths and injuries, Consumer Prodnct Safety Commission (CPSC) should mandate the consensus based and proven requirements of ASTM 1353. Making it a Federal mandatory standard wonld further enhance the level of compliance achieved by this voluntary standard becanse noncompliant domestic and imported product would now be subject to the standard. In addition, the labeling requirements of a mandatory standard would help to edncate that consumer on the potential dangers of upholstered furnitnre flammability.

CPSC has been working on a proposed new upholstered furniture flammability standard for the last 5 years. The proposed standard conld be met without utilizing flame-retardant chemicals. It is my nnderstanding that a significant portion of the delay in finalizing the rule has been establishing standard reference materials for testing.

Question. In your opinion, what additional issues does CPSC still need to resolve before finalizing the rule?

Answer. CPSC has allowed the perfect to become the enemy of the good. Instead of embracing the proven volnntary standard that is ASTM 1353, CPSC has attempted to make improvements to the testing methods. This has resulted in test methods that have not been shown to be repeatable or reprodncible. Until CPSC subjects their test methods to ronnd robin testing, they will be nnenforceable. The test methods embodied in ASTM 1353 have been proven both repeatable and reproducible in laboratory round robin stndies.

CPSC recently reported on a barrier material that it believes is effective against smolder and open-flame ignition. We need to obtain more information about this product so it too can be tested in a ronnd robin to determine if it will be effective with a large nnmber of textiles and a large nnmber of confignrations. This is essential because we are not aware of any other barrier material that can comply with the CPSC proposed test method for barriers.

Both CPSC and Underwriters Laboratories (UL) have shown that barriers significantly reduce flammability compared to other strategies for reducing flammability. However, in your testimony, you indicated several concerns with barriers, particularly increased manufacturing costs and impact on "saleability".

Question. How do manufacturers incorporate barriers into their furniture?

Answer. Some commercial applications of furniture are required to meet the requirements of California Technical Bulletin 133 (TB–133). This standard requires the use of flame-resistant barriers in construction and the majority of these barriers utilize flame-retardant chemicals. In fact, it is our understanding that the barrier that UL used in its video shown at the hearing incorporates a fair amount of flame-retardant chemistry. The perceived human and environmental concerns with flame-retardant chemistry make furniture manufacturers reluctant to incorporate these barriers into residential furniture where consumers are exposed to them on a 24/7 basis unlike commercial furniture used in the hospitality industry.

Unlike a mattress that is a single horizontal slab, the various geometries and spatial relationships of furniture prevent the application of a barrier as a slip on sock or bag. Instead these barriers mnst be incorporated by upholstering the barrier prior to the cover fabric therefore doubling the amount of labor typically involved. Snrveys have shown that this process increases manufacturing costs an average of $150 for a chair and $300 for a sofa. This would equate to an increase of approximately $300 and $600, respectively, at retail.

Question. Are there any other technologies manufacturers are currently considering to address furniture flammability?

Answer. The industry has been working to address the issue since the 1970s and this effort has resulted in a movement from smolder prone components (legacy furniture) to smolder resistant ones (modern furniture). This movement has contributed to the dramatic decrease in deaths and injuries associated with upholstered furniture fires. We continue to explore new component options as the technology evolves.

Question. You testified that there are no quick fixes to npholstered furnitnre flammability since a variety of materials and combinations are needed to satisfy customers' needs and tastes. Do yon believe that it's likely that consumers are not taking into account flammability and the changing nature of furniture materials with regard to flammability? If given a choice—being aware of the increased risk over legacy materials and the quick ignition time—don't you think that might influence consumers' purchases?

Answer. Keep in mind that the movement away from "legacy materials" was due to their propensity to ignite when exposed to a smolder ignition source. As the data trends indicate this movement has undoubtedly saved lives. Some purchasers of new upholstery receive the UFAC hangtag which warns them that upholstery may burn rapidly and emit toxic gases. A number of consumers have contacted us regarding these warnings so we think that there is a good level of awareness that furniture will burn. A national standard would include a labeling requirement that could be used to further educate consumers as to the potential dangers of upholstered furniture flammability.

Question. Since legacy furniture burns much more slowly, are there some parts of the legacy furniture that it might make sense for industry to return to manufacturing? If not, why not?

Answer. The Federal Government's original investigation into smoldering ignition found that the materials being used in the so called legacy furniture were the most prone to cause smoldering ignitiou when exposed to a lit cigarette. It has taken several years to remove these products from the marketplace and the absence of such legacy products is one of the reasons that cigarette ignition of upholstered furniture has declined over the years. By reintroducing these materials, we are concerned that the downward trend would reverse and we would see a commensurate increase in the incidents of smoldering ignition of upholstered furniture.

Question. Barriers iu between the fabric and the cushion of furuiture are being considered as an improvement over flame-retardant chemical materials. If manufacturers are reluctant to use some of the new barriers due to reasons of comfort, are there some other options or technologies available? If using a barrier, could more material be used alongside it to add comfort?

Answer. Barriers are used to address the risk of small open-flame ignition. As discussed above the risk of this type of fire occurring iu the home is already extremely small and difficult to address because it is often the result of arson or child play. CPSC has found that many of the open-flame ignitions are not "addressable" within the meaning of their statute. Regardless of this fact, iudustry would embrace barriers if they could maintain "saleability". This would involve several factors including health concerns, comfort, and affordability. Existing barrier technology does not

meet these criteria. CPSC should move to address the primary risk of smolder ignition by adopting ASTM 1353. Resources can then be focused on evaluating small open-flame solutions to determine their effectiveness and feasibility.

CONCLUSION OF HEARING

Senator DURBIN. I want to thank everybody for attending, and I hope you got as much out of this hearing as we did.

Once again, thanks to the Chicago Tribune for leading us in this effort.

[Whereupon, at 4:10 p.m., Tuesday, July 17, the hearing was concluded, and the subcommittee was recessed, to reconvene subject to the call of the Chair.]

OVERSIGHT OF THE CONSUMER PRODUCT SAFETY COMMISSION

THURSDAY, AUGUST 2, 2012

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON COMMERCE, MANUFACTURING, AND TRADE,
COMMITTEE ON ENERGY AND COMMERCE,
Washington, DC.

The subcommittee met, pursuant to call, at 9:40 a.m., in room 2322, Rayburn House Office Building, Hon. Mary Bono Mack (chairman of the subcommittee) presiding.

Members present: Representatives Mack, Blackburn, Bass, Harper, Lance, Guthrie, Olson, McKinley, Pompeo, Kinzinger, Barton, Butterfield, Schakowsky, Sarbanes, and Waxman (ex officio).

Staff present: Paige Anderson, Commerce, Manufacturing, and Trade Coordinator; Kirby Howard, Legislative Clerk; Brian McCullough, Senior Professional Staff Member, Commerce, Manufacturing, and Trade; Gib Mullan, Chief Counsel, Commerce, Manufacturing, and Trade; Andrew Powaleny, Deputy Press Secretary; Shannon Taylor Weinberg, Counsel, Commerce, Manufacturing, and Trade; Michelle Ash, Democratic Chief Counsel, Commerce, Manufacturing, and Trade; Felipe Mendoza, Democratic Counsel, Commerce, Manufacturing, and Trade; and William Wallace, Democratic Policy Analyst.

OPENING STATEMENT OF HON. MARY BONO MACK, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mrs. BONO MACK. Good morning. The subcommittee will now come to order.

It has been a year now since Congress, at the urging of our subcommittee, approved key reforms to the Consumer Product Safety Improvement Act of 2008. Today we are going to check under the hood, talk to members of the Consumer Product Safety Commission, and see how it is working.

And the Chair now recognizes herself for an opening statement. And I appreciate that general counsel changed the clock from 86 minutes to 5 minutes, but I will keep it to 5 minutes.

So, established in 1972, the Consumer Product Safety Commission is an independent agency created by Congress to protect consumers against unreasonable risks of injuries associated with consumer products. By and large the CPSC does an admirable job of protecting Americans, and I remain very supportive of its work, but on occasion the agency makes some puzzling, head-scratching deci-

sions which create economic hardships for U.S. businesses without appreciably improving the safety of certain products.

By law the CPSC has the authority to regulate the sale and manufacture of more than 15,000 different consumer products, ranging from baby cribs to toys and from all-terrain vehicles to swimming pools. Without question the CPSC has very broad authorities, which makes congressional oversight critically important. The agency has the power to ban dangerous consumer products, issue recalls of products already on the market, and research potential hazards associated with a wide range of consumer products.

Today the CPSC learns about unsafe products in several ways. The agency maintains a consumer hotline and Website through which consumers may report concerns about unsafe products or injuries associated with products. It also operates the National Electronic Injury Surveillance System, which collects data on product-related injuries treated in hospital emergency rooms.

The broad reach of the CPSC was on full display in 2007, which has been referred to as the "year of the recall" in the U.S. Fueled by the Chinese toy scare, the CPSC alone imposed a record 473 recalls in 2007, many of these recalls involving lead in toys and other children's products. These much-publicized safety issues prompted Congress to take action and resulted in passage of the Consumer Product Safety Improvement Act of 2008, also known as CPSIA.

Among other things, CPSIA increased funding and staffing for the CPSC, placed stricter limits on lead levels in children's products, restricted certain phthalates in children's toys and child-care articles, and required the CPSC to create a public database of their products. The public database, saferproducts.—excuse me, yes, saferproductsdot.gov—no, OK, staff thinks I wouldn't nntice saferproducts.gov—thank you, staff.

So, this remains a source of controversy. Manufacturers continue to express their concern that most of the complaints are not vetted by the CPSC before they are made public, opening the door to all kinds of mischief, whether to fuel lawsuits or to try and ruin a competitor's brands.

Within months of enactment of CPSIA, it became clear that implementing a number of provisions would be extremely problematic, prompting the agency to issue several significant stays of enforcement prior to 2011, including the imposition of lead limits for ATVs, off-road-use motorcycles and snowmobiles. Why the agency even considered such limits is one of those puzzling, head-scratching decisions. So last year, after several hearings, and after bicameral and bipartisan negotiations, both the House and the Senate passed H.R. 2715, offered by myself and my good friend and colleague Mr. Butterfield. On August 12, 2011, President Obama signed that legislation into law. Our purpose was to relieve unfair and costly burdens imposed on American businesses, while still maintaining critically important consumer safeguards. Today I am very anxious to learn how well that new law is working.

[The prepared statement of Mrs. Bono Mack follows:]

The Statement of the Honorable Mary Bono Mack
Chairman
Subcommittee on Commerce, Manufacturing, and Trade
Hearing on
"Oversight of the Consumer Product Safety Commission"
August 2, 2012

Established in 1972, the Consumer Product Safety Commission is an independent agency created by Congress to protect consumers against unreasonable risks of injuries associated with consumer products. By and large, the CPSC does an admirable job of protecting Americans, and I remain very supportive of its work.

But on occasion, the agency makes some puzzling, head-scratching decisions, which create economic hardships for U.S. businesses, without appreciably improving the safety of certain products.

By law, the CPSC has the authority to regulate the sale and manufacture of more than 15,000 different consumer products, ranging from baby cribs to toys...and from all-terrain vehicles to swimming pools.

Without question, the CPSC has very broad authority, which makes Congressional oversight critically important. The agency has the power to ban dangerous consumer products, issue recalls of products already on the market, and research potential hazards associated with a wide range of consumer products.

Today, the CPSC learns about unsafe products in several ways. The agency maintains a consumer hot line and website through which consumers may report concerns about unsafe products or injuries associated with products. It also operates the National Electronic Injury Surveillance System, which collects data on product-related injuries treated in hospital emergency rooms.

The broad reach of the Consumer Product Safety Commission was on full display in 2007, which has been referred to as the "Year of the Recall" in the United States. Fueled by the Chinese toy

scare, the CPSC alone imposed a record 473 recalls in 2007 – many of these recalls involved lead in toys and other children's products.

These much-publicized safety issues prompted Congress to take action and resulted in passage of the Consumer Product Safety Improvement Act of 2008, also known as CPSIA. Among other things, CPSIA increased funding and staffing for the CPSC, placed stricter limits on lead levels in children's products, restricted certain phthalates in children's toys and child care articles, and required the CPSC to create a public database of their products.

The public database…saferproducts.dot.gov…remains a source of controversy. Manufacturers continue to express their concern that most of the complaints are not vetted by the CPSC before they are made public, opening the door to all kinds of mischief, whether to fuel law suits or to try and ruin a competitor's brand.

Within months of enactment of CPSIA, it became clear that implementing a number of provisions would be extremely problematic, prompting the agency to issue several significant stays of enforcement prior to 2011, including the imposition of lead limits for ATVs, off-road youth motorcycles, and snowmobiles. Why the agency even considered such limits is one of those puzzling, head-scratching decisions.

So last year, after several hearings and after bicameral and bipartisan negotiations, both the House and the Senate passed H.R. 2715, offered by myself and my good friend and colleague, Mr. Butterfield. On August 12, 2011, President Obama signed the legislation into law.

Our purpose was to relieve unfair and costly burdens imposed on American businesses, while still maintaining critically important consumer safeguards. Today, I am very anxious to learn how well the new law is working.

Mrs. BONO MACK. And with that, the gentlelady from Illinois is now recognized for 5 minutes for her opening statement.

Ms. SCHAKOWSKY. Thank you.

Let me just say that Mr. Butterfield will be here. He is on the floor and unable to come now, but I want to yield first to Mr. Waxman, who is the ranking on the full committee, for his opening statement.

OPENING STATEMENT OF HON. HENRY A. WAXMAN, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF CALIFORNIA

Mr. WAXMAN. Thank you very much, Ms. Schakowsky, for your courtesy in allowing me to go ahead of you at this time because of scheduling problems that I have.

I want to thank you, Madam Chair, for holding this hearing to conduct oversight on the activities of the U.S. Consumer Product Safety Commission, and I am pleased that we have all four Commissioners here today to provide testimony.

This month will mark 4 years since enactment of the Consumer Product Safety Improvement Act of 2008, or what is called CPSIA. It will mark 1 year since enactment of Public Law 112–28, which gave the Consumer Product Safety Commission additional flexibility in implementing the law.

This law was a landmark piece of legislation. It fundamentally changed how we protect children from potentially dangerous products. Implementation of this law has been the predominant focus of the Commission. The goal of the law was to transform the agency's mission. The Commission used to be an underfunded, ineffective, reactive agency. Today the Commission is still underfunded, unfortunately, but it is no longer ineffective and reactive. Today the agency is on a path toward anticipating risks to children and acting to prevent them.

No transformation is easy, and this has been no different. There were some rough waters in the early days of implementation, and a year ago we had to act to pass some targeted fixes to the law. But make no mistake about it, this law has been a success. Thanks to this safety law, we now have strong standards for products used by infants and children, including cribs, toddler beds, walkers, and bath seats. We now have a product registration system that enables manufacturers or retailers of durable infant and toddler products to contact parents with recall or other safety information.

We now have a consumer products safety information database where the public can file and view reports about harm from consumer products. And we also have testing of products to ensure that they are safe before they ever make it into our children's hands.

And the results of the law are clear. Toy-related deaths have fallen, recalls due to lead have declined by 80 percent, and recalls overall have continued to decline as products have become safer. Border enforcement is also up.

These protections matter to parents. They matter to children. So I look forward to hearing—the hearing today from the Commissioners about their continuing work. While I may not be able to be here throughout your testimony, I certainly will have a chance to

review it after you have given it, as I have for your statements that have been entered into the record. And I thank all four of you for being here and yield back the balance of my time.

Mrs. BONO MACK. Thank the gentleman.

And at this point I will recognize Ms. Schakowsky for 5 minutes for a statement. We have nobody requesting time on our side.

OPENING STATEMENT OF HON. JANICE D. SCHAKOWSKY, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ILLINOIS

Ms. SCHAKOWSKY. Well, I thank you, Madam Chairman, for holding this hearing. I think it is important for the subcommittee to hear from the Consumer Product Safety Commission about its activities, and particularly the ongoing implementation of the landmark Consumer Product Safety Improvement Act.

A few weeks ago, I joined Chairman Tenenbaum, and Danny Keysar's mother, Linda Ginzel, at a press conference to mark the adoption of the strongest standard in the world for play yards. The play yard standard is significant because it was a dangerous product that led to Danny's death at his day-care center when it really was used as a crib, collapsed and choked him. And the portion of this CPSIA that I authored and that mandated the new standard bears his name.

I mention the play yard standard because it is a specific example of how the CPSIA's safety standard for toys and children's products will save lives. That was our goal at the outset of drafting the legislation, and it is the one that we met.

Last year we passed a bill with some narrow fixes so that implementation of the law could continue smoothly. And I welcome today's opportunity to review progress, but want to say clearly that I believe it is absolutely critical that we continue to support and uphold the fundamentals of this historic legislation.

I want to highlight that CPSIA was a bipartisan effort. It passed the House 424 to 1, from the beginning to the end, and is a model for what this Congress can achieve on behalf of the American people.

And, Chairman Tenenbaum, I commend you for your leadership on implementing the safety standards for children's products, and also for your ongoing work to improve the safety of table saws and window coverings, and I thank you for leading this Commission in a way that continues to provide safety and security to the American consumer. And I also deeply thank Commissioners Adler, Nord, and Northup for their service, and for being here today. And I yield back the balance of my time.

Mrs. BONO MACK. I thank the gentlelady.

And we turn our attention now to the panel that we have before us today. Each of our witnesses has prepared an opening statement that will be placed into the record. You will each have 5 minutes to summarize the statement in your remarks, but I am sure you all are very familiar with this—the way it works.

Our distinguished panel includes the Honorable Inez Tenenbaum, Chairman of the Consumer Product Safety Commission, and we thank you very much for postponing or changing your travel plans to be with us today, and thank you very much for that.

We also have with us the Honorable Robert Adler, Commissioner at the CPSC; the Honorable Nancy Nord, Commissioner; and our former colleague, it is great to see her again, the Honorable Anne Northup, another Commissioner at the CPSC.

So good morning. Thank you all very much for being here today. And with that, Chairman Tenenbaum, you may begin with your 5 minutes.

STATEMENTS OF INEZ M. TENENBAUM, CHAIRMAN, CONSUMER PRODUCT SAFETY COMMISSION; ROBERT S. ADLER, COMMISSIONER, CONSUMER PRODUCT SAFETY COMMISSION; NANCY A. NORD, COMMISSIONER, CONSUMER PRODUCT SAFETY COMMISSION; ANNE M. NORTHUP, COMMISSIONER, CONSUMER PRODUCT SAFETY COMMISSION

STATEMENT OF INEZ M. TENENBAUM

Ms. TENENBAUM. Thank you. Good morning, Chairman Bono Mack and members of the Subcommittee on Commerce, Manufacturing, and Trade. I am pleased to be here today to discuss the U.S. Consumer Product Safety Commission's operations and activities to keep consumers safe from dangerous and defective consumer products.

The agency is in the strongest position to meet its mission than it has been in more than a decade. In the limited time I have today, I would like to focus on a few recent achievements as well as look ahead to 2013.

The first area I would like to use is the CPSC's ongoing work to ensure that infant and toddler products meet some of the world's strongest safety standards. In the years leading up to the passage of the CPSIA, there were numerous instances of injuries and deaths to infants and small children in defective infant and durable nursery equipment. As a result the CPSA contains section 104, which requires mandatory safety standards for most infant and toddler products.

When I assumed the chairmanship of the Commission in the summer of 2009, there were no mandatory safety standards for any of these products. Since then I have moved to implement this mandate as quickly as possible. In December 2010, the Commission passed the toughest crib safety standard in the world. Subsequently we also passed mandatory safety standards for baby walkers, baby bath seats, bed rails, toddler beds, and play yards.

In addition to infant and toddler products, the Commission has also implemented the CPSIA's requirement that all children's products in the market be subject to periodic independent assessment of the safety by a third-party testing laboratory. We provided manufacturers with a great amount of flexibility and choice on how to comply as long as they have a high degree of assurance that their children's products are compliant. We are currently reviewing our staff's report on the potential ways to reduce third-party testing costs consistent with ensuring compliance as required by Public Law 1228.

I am also very proud of the work by Commission staff to implement and maintain the publicly searchable database saferproducts.gov. Overall saferproducts.gov is a model of open gov-

ernment and consumer empowerment, and I appreciate the hard work by many of this subcommittee to further improve saferproducts.gov during the Public Law 1228 debate.

The best way to ensure that dangerous consumer products never get into the hands of consumers is to ensure that they never enter the United States. As Chairman I have place special emphasis on the past year on the continued development of the CPSC's Office of Import Surveillance. This office works hand in hand with U.S. Customs and Border Protection officers in major U.S. ports of entry to inspect and detain shipments that violate U.S. Consumer Product Safety standards. In fiscal year 2011, CPSC import surveillance staff was able to stop approximately 4.5 million units of violative and hazardous consumer products from entering the United States.

In 2013, funding permitted, I am optimistic that the CPSC will be able to take additional steps toward full implementation of a fully integrated targeting system, often referred to as the risk assessment methodology, or RAM. This will allow CPSC staff to analyze a greater number of import shipments, identify those that are more likely to violate consumer safety laws, and ensure that our limited resources are dedicated to those shipments.

I would also like to highlight a number of positive collaborative relationships we have established. The first is in the area of educating parents to ensure that infants have a safe sleep environment. As part of this I have reached out to major retailers who sell sleep products like cribs and play yards to ask them to join me in educating parents that the safest way for their baby to sleep is alone in a crib on its back.

Accidental ingestion of coin and button cell batteries is another area in which we are keenly focused. We had very productive meetings with the major battery manufacturers, and a range of possible solutions from design changes to safer packaging have been discussed.

The third collaborative model is occurring in youth sports, particularly in the area of head injuries in football. I am very pleased that after much hard work initiated by my office, a group effort led by the National Football League is under way to provide economically disadvantaged youth football programs with new helmets, and to conduct an education campaign to bring about a culture change in this sport.

In the coming months and years, I see a CPSC addressing hazards I have already mentioned as well as moving to address emerging hazards. At CPSC we are carrying out a statutorily required, proactive regulatory agenda, and consumers are safer because of this approach.

With an increasing focus at the ports, with more meaningful standards coming online, and with even greater public/private efforts, I envision safer and safer products in the hands of consumers. They deserve no less.

Chairman Bono Mack, thank you for the opportunity to testify. I am happy to answer any questions you may have later. Thank you.

Mrs. BONO MACK. Thank you very much.

[The prepared statement of Ms. Tenenbaum follows:]

Statement of
Inez M. Tenenbaum
Chairman
U.S. Consumer Product Safety Commission

Before the
U.S. House Committee on Energy and Commerce
Subcommittee on Commerce, Manufacturing, and Trade

"Oversight of the Consumer Product Safety Commission"

August 2, 2012

Good morning, Chairman Bono Mack, Ranking Member Butterfield, and Members of the Subcommittee on Commerce, Manufacturing, and Trade. I am pleased to be here today to discuss the U.S. Consumer Product Safety Commission's (CPSC) operations and activities to keep consumers safe from dangerous and defective consumer products.

The past year has been yet another active and challenging one for the Commission and our professional staff—and I am pleased to report that once again we have risen to the challenge. The agency is in the strongest position to meet its mission than it has been in more than a decade. In the face of a flat budget, the CPSC's professional staff has worked tirelessly to implement the remaining provisions of the Consumer Product Safety Improvement Act of 2008 (CPSIA), as well as the clarifying amendments in Public Law 112-28. At the same time, the Commission has also continued to engage extensively with outside stakeholders in the consumer, manufacturing, and international communities to both educate and engage on new ways to improve our safety mission.

In the limited time I have today, I would like to focus on a few recent achievements, as well as briefly look ahead to where I believe we will be in 2013:

The Strongest Juvenile Product Standards in the World

In the years leading up to passage of the CPSIA, there were numerous instances of injuries and deaths of infants and small children in defective durable infant and toddler products. No parent should ever have to experience such a tragedy, especially if government can play a meaningful role in addressing these hazards. As a result of the leadership shown by Congresswoman Jan Schakowsky and many others in Congress, the final version of CPSIA contained section 104, which requires mandatory safety standards for most infant and toddler products.

When I assumed the Chairmanship of the Commission in the summer of 2009, there were no mandatory safety standards for any of these products. Since then, I have moved to implement this mandate as quickly as possible. In December 2010, the Commission passed the toughest crib safety standards in the world. Subsequently, we also passed mandatory safety standards for baby walkers, baby bath seats, bed rails, and toddler beds.

One of my proudest moments as Chairman came just a few weeks ago. As many of you know, section 104 is also called the "Danny Keysar Child Product Safety Notification Act" or "Danny's Law." In May 1998, Danny was placed in a previously recalled play yard at his child care center when it collapsed, trapping his neck in the "V" of its folded rails and suffocating him. Danny was only 16 months old.

On the morning of June 27, the Commission unanimously honored Danny's memory by passing new, mandatory play yard safety rules. That afternoon, I met with Danny's mother, Linda Ginzel, and we were able to personally let her know that after 14 years of her advocacy we finally had a new standard that would prevent the deadly rail collapse that took Danny's life—and the lives of nearly 20 other small children.

I accepted this position to help make a difference, and I believe we are. But, we are not done. Section 104 commands that we address other priority items, and Commission staff has now turned their attention to rules for bassinets, cradles, strollers, and infant carriers.

I recognize that we are in a period of some economic uncertainty and that some want a moratorium on any new federal regulations. I understand and appreciate these views, but I would also ask them to step into the shoes of Danny's mother—or other parents who have lost children in similar preventable tragedies. These regulations may add some small, additional costs to these products. But the cost of inaction is much higher and is not something I am willing to accept as Chairman.

Continued Commitment to Other Critical Safety Issues

In addition to the durable infant and toddler safety standards, the Commission also continues to make progress on several other key safety rules.

Last October, the Commission fulfilled the capstone of the CPSIA by implementing the requirement that all children's products on the market be subject to a periodic, independent assessment of their safety. Congress required this rule, and after much thoughtful deliberation and discussion, the Commission approved a very balanced approach to achieving the rule's purpose. We provided manufacturers with a great amount of flexibility and choice in terms of how they wish to comply, as long as, in the end, they have a high degree of assurance that their children's products are compliant.

We are currently awaiting our staff's report on potential ways to reduce third party testing costs consistent with ensuring compliance. I look forward to working with my fellow Commissioners on this issue to see if there are areas of consensus that can assure compliance and children's safety.

At the same time, however, I believe Congress got it exactly right both when passing CPSIA and then reaffirming the overall third party testing requirement in Public Law 112-28. Parents deserve to know the products their children use are being independently tested and are safe.

I have also accelerated efforts to finalize our upholstered furniture flammability rule. CPSC staff has proposed a rule that would address the risk of injury or death resulting from smoldering fires, often caused by cigarettes, without requiring the use of flame retardants. I was pleased to read that the Governor of California recently directed that state's Bureau of Home Furnishings to revisit state rules that effectively require the use of flame retardant in many household upholstered furniture items, and I know Commission staff is monitoring this work closely. I am hopeful that Commission staff will generate a rule that will bring safer, more fire resistant upholstered furniture into homes across the nation.

Additionally, the Commission recently initiated rulemakings to deal with two other critical safety issues. The first is table saw injuries. Every day, 11 people on average suffer amputations from power saws. Through this rulemaking, Commission staff will explore technological solutions that could help save consumers from these life altering injuries.

The second is liquid gel fuels and firepots. Last December, the Commission voted unanimously to publish an Advance Notice of Proposed Rulemaking, just months after nearly all bottles of pourable gel fuels used in firepots were recalled. The recall was prompted by at least 65 serious incidents that resulted in two deaths and at least 34 victims who had to be hospitalized due to second and third degree burns to the face, hands, and other parts of the body. The ANPR is examining whether it is possible to make pourable gel fuels safe for consumers to use.

I would also like to briefly address the issue of small rare earth magnets. While I am not able to comment on the matter publicly, I can say that recent action by the Commission to authorize legal action to protect children from serious hazards associated with the ingestion of rare earth magnets is consistent with the approach Congress sought when enacting CPSIA.

SaferProducts.gov—Transparency for Consumers

I am also very proud of the work by Commission staff to implement and maintain the publicly searchable database of product safety reports required by section 212 of the CPSIA—SaferProducts.gov. I realize the roll out of the database in March 2011 caused some concern in certain segments of the regulated community. After almost 17 months of operation, however, I think SaferProducts.gov has gained wide approval and acceptance.

As of July 27, 2012, almost 10,000 reports of harm had been collected in the database, and posted to the public portal on SaferProducts.gov. Approximately 97 percent of those reports were submitted by consumers. Many of these reports contain detailed information on the product involved; and, utilizing the procedure specified in the Public Law 112-28 amendments, approximately 88 percent of the reports eligible for posting now contain a nonblank value for the model or serial number, and 73 percent of eligible reports contain numeric content for the model or serial number. In addition, approximately 85 percent of the report submitters agreed to have their contact information shared with manufacturers.

Business interest in the database has also grown. As of July 27, 2012, 3,487 entities are registered for the SaferProducts.gov business portal. These registrations allow companies to receive fast, e-mail notification of consumer incident reports. The business portal also allows companies to file section 15 product incident reports and provides companies with the capability to submit retailer incident reports. The general public has also come to see

SaferProducts.gov as a resource with over two million visits to the database since its launch.

Overall, SaferProducts.gov is a model of open government and consumer empowerment, and I appreciate the hard work by many on this subcommittee to further improve SaferProducts.gov during the Public Law 112-28 debate.

Robust Surveillance of Imported Consumer Products

One of the best ways to ensure that dangerous consumer products never get into the hands of consumers, especially children, is to ensure that they never enter the U.S. stream of commerce in the first place. Congress recognized the importance of import surveillance in section 222 of the CPSIA, and as Chairman I have placed special emphasis in the past year on continued development of CPSC's Office of Import Surveillance (OIS).

This office works hand in hand with U.S. Customs and Border Protection (CBP) officers in major U.S. ports of entry to inspect and detain shipments that violate U.S. consumer product safety standards. As of July 25, the Commission has 20 full-time employees located in 15 U.S. ports of entry, along with approximately 30 other employees who support their mission through testing and analysis activities.

While this is a small group, they have demonstrated extremely impressive performance metrics for the American people. During fiscal year 2011, OIS staff screened nearly 10,000 products at the ports, collected almost 1,800 samples, and found over 1,100 violations of safety standards. As a result, CPSC staff was able to stop approximately 4.5 million units of violative or hazardous consumer products from entering the United States. Many of these products were toys that had lead above the statutory limits or small parts that could present a choking hazard for children younger than three years of age.

In the coming year, CPSC will continue to deepen its relationship with the U.S. Department of Homeland Security and CBP. In 2011, CPSC became the first agency to receive data for incoming shipments through the International Trade Data System's (ITDS) Interoperable Web Services program. This data allows CPSC staff to view port shipment information in near real time, and develop targeting rules to identify the highest risk shipments. In recent months, OIS staff has been working with the ITDS data and CPSC case data to come up with baselines of effectiveness for targeting.

In 2013, funding permitting, I am optimistic that CPSC will be able to take additional steps toward full implementation of the section 222(a) mandate through a pilot test of the operation of a fully integrated targeting system—often referred to as the Risk Assessment Methodology or "RAM." This will allow CPSC staff to analyze a greater number of import shipments, identify those that are more likely to violate consumer safety laws, and ensure that our limited resources are dedicated to those shipments.

The benefits of a full roll out of the RAM are two-fold. First, the RAM will allow us to deploy limited resources toward suspect shipments and increase the correlation between samples collected and violations found. Second, it will have positive effects for "known" importers and members of the business community who would hopefully face fewer delays through better advance analysis of import data and risk metrics before products arrive at ports.

Constructive Collaborations to Address New and Emerging Issues

Another key area of achievement is the pursuit of public-private collaborations and consensus based solutions, whenever we can, to new and emerging product safety issues. While this is not always possible, I think we have made great strides in several areas.

The first is in the area of educating parents to ensure that infants have a "safe sleep" environment. As part of this, I have reached out to major retailers who sell sleep products like cribs and play yards to ask them to join me in educating parents that the safest way for their baby to sleep is alone, in a crib, on their back. So far, I have been pleased that several retailers have been enthusiastic about working with CPSC to get out the safe sleep message on their websites and in their brick and mortar stores, as well.

Retailers have suggested creative ideas including, but not limited to, displaying cribs absent of pillows and blankets in their stores, showing our safe sleep video on a continuous loop in their baby departments, adding safety information to their baby registry packets, and including safe sleep tips in the crib assembly instructions that come with new cribs. I believe this education effort, combined with the new, mandatory safety standards discussed earlier, will play a critical role in ensuring that all babies can sleep safely.

Accidental ingestion of coin and button cell batteries is another area on which we are keenly focused. We are seeing an alarming increase in the severity of the injuries associated with these batteries, which we all know have become commonplace in our homes. They are found in our remote controls, our key fobs, our watches, and many other household products. Children are swallowing them and the results can be devastating in as little as a few hours. Specifically, the larger, 20 millimeter (mm) sized batteries are posing the greatest harm. The 20 mm batteries are coin sized and likely to lodge in a child's esophagus upon ingestion. At that point, time is of the essence, as the resulting chemical burn that occurs can—and has—led to severe injuries and death.

Along with our professional staff, we have had very productive meetings with the major battery manufacturers about a range of possible solutions, from design changes in the longer term to safer packaging and other steps in the shorter term. I am hopeful that these efforts, as well as many that are happening independently by industry, will yield tangible safety results in the near future.

The third example of this constructive, collaborative model is occurring in youth sports, particularly with the issue of head injuries in football. I am grateful for the increased

attention and awareness associated with this issue. The consequences of a brain injury can be severe and long lasting. I believe addressing its risks require a true team effort. Along those lines, I am very pleased that, after much hard work initiated by my office, a group effort led by the National Football League (NFL) is underway to provide economically disadvantaged youth football programs with new helmets and to conduct an education campaign intended to accelerate the much needed culture change in that sport.

While this program is in its infancy, I have great hopes that our bringing the NFL, the NFL Players Association, the National Collegiate Athletic Association (NCAA), helmet manufacturers, helmet reconditioners, the helmet standards body, and others together can serve as a model of effective, collaborative public-private problem solving.

Responsible Regulatory Review

Before I look ahead, I would also like to address the Commission's ongoing efforts to review our existing rules and regulations. As I noted earlier, I strongly believe that we needed new mandatory safety standards in several areas, such as infant and toddler products, and I am very pleased Congress, through the CPSIA, gave us the authority to act quickly in those areas. At the same time, however, I also recognize the need to responsibly review those rules and either modify or delete outdated rules when it is in the public interest.

In April 2012, the Commission's professional staff presented an extensive regulatory review package to the Commission. In this package, Commission staff formulated a plan that not only incorporated the elements drawn from the President's Executive Orders (EO) 13579 and 13563, but also set forth a defined method and schedule for identifying and reconsidering any Commission rules that are obsolete, unnecessary, unjustified, excessively burdensome, counterproductive, or ineffective, or that otherwise require modification without sacrificing the safety benefits of the rules. The plan also encourages public input and participation to find the right balance of priorities and resources. Furthermore, the plan incorporates the requirement in Public Law 112-28 that the Commission seek and consider comments on ways to reduce the cost of third party testing requirements.

Commissioners Nord and Northup have expressed concern over the scope of the staff proposed regulatory review plan, and have called for additional resources to be dedicated to the rule review process. I respect these views, but I am unwilling to put at risk efforts underway to achieve the mission of the agency, namely protecting consumers. The proposal by the Commission's professional staff is a very fulsome and appropriate review plan and notes that the diversion of additional staff resources to this project could delay some of the Commission's key safety activities. This is not acceptable to me, nor should it be acceptable to America's consumers, especially parents.

Even with the staffing improvements brought about through the enactment of CPSIA, the CPSC is still a small agency with finite resources. Then Acting Chairman Nord recognized these limitations in 2007 when she completely suspended the CPSC's

retrospective rule review process citing resource constraints. As Chairman, I am pleased that we have been able to reinvigorate this process—and stand by the balanced approach presented in the Commission staff's proposed regulatory review package.

The Road Ahead: Continuing to Restore Confidence in the Safety of Consumer Products

At CPSC, we are carrying out a statutorily required proactive regulatory agenda, and consumers are safer because of this approach. While we have made great strides in a number of areas, I assure you, that we will continue to accelerate reasonable and rational safety efforts at every opportunity. In the coming months and years, I see a CPSC addressing hazards I have already mentioned, as well as moving to address emerging ones. With an increasing focus at the ports, with more meaningful standards coming online, and with even greater public-private efforts, I envision safer and safer products in the hands of consumers. They deserve no less.

* * * * *

Chairman Bono Mack, thank you again for the opportunity to testify on the Commission's ongoing efforts to keep American consumers safe from defective and hazardous consumer products.

I am happy to answer any questions you may have.

Mrs. BONO MACK. Commissioner Adler, you are recognized for 5 minutes.

STATEMENT OF ROBERT S. ADLER

Mr. ADLER. Thank you very much. Good morning.

Mrs. BONO MACK. If you can just pull it much closer for—a little bit closer. And is it turned on?

Mr. ADLER. I have no idea. The one that says push?

Mrs. BONO MACK. Thank you.

Mr. ADLER. Let me try that again.

Good morning, Chairman Bono Mack and members of the Subcommittee on Commerce, Manufacturing, and Trade. Thank you for the opportunity to testify today along with my fellow CPSC Commissioners. I am pleased to be here today to discuss an agency that I have been associated with in some fashion since its establishment in 1973 and have been a Commissioner at since August of 2009.

This October will mark the 40th anniversary of the passage of the landmark Consumer Product Safety Act, and looking back now, I believe Congress and the agency should take great pride in what the agency has accomplished, especially considering the immense scope of our mission, which is to protect the public from any and all unreasonable risks associated with roughly 15,000 categories of consumer products.

What has the agency accomplished? As a starting point I would cite the estimated 30 percent reduction in the rate of deaths and injuries associated with consumer products since the agency's inception. And I would particularly point to the dramatic drop in death and injuries to children, such as the reductions of over 90 percent in childhood poisoning deaths and crib-related deaths.

In short, CPSC has produced an excellent return on investment. By our calculation this drop in deaths and injuries has resulted in over $16 billion in reduced societal costs, or many, many times the resources the CPSC has been given to do its job. And as a very small agency, we have had to produce these benefits at very low cost.

Of course, even efficiency has its limits. As of 5 years ago, the CPSC had shrunk to a skeleton crew of less than 400 and a budget of $62 million. To Congress' credit, in 2008, almost unanimously you passed the CPSIA, providing the agency with more tools and directing it to do more work and do it faster. Put simply, the CPSIA revitalized an agency that was underfunded and undermanned, and for that I am sure consumers across the country are grateful.

Undoubtedly the biggest change felt by the children's product community has been the mandate in the CPSIA that all children's products be tested by third-party independent laboratories before they enter the market, and on a continuing basis thereafter. Let me assure you that we at the Commission have worked very hard to implement this mandate in a thoughtful and measured way, and I can report that we finally reached the point where the final rule will take effect in February.

Of course, such a strong safety step forward carries broad implications for our regulated community, and we know that and are

fully aware of our need to work closely with them as we implement the law.

As we approach the fourth anniversary of CPSIA, it is worth reflecting on two common themes in the law. The agency needed more resources and other tools to accomplish its safety mission, and it needed to change its approach to vulnerable populations, particularly children. I think we will keep this in mind as we move forward into the future.

I do want to note one particular provision in the CPSIA because it is something the Congress changed in the CPSIA. I believe that in section 9 of the CPSA, and other sections of our laws, we have the most burdensome cost-benefit requirements in the entire Federal Government. Under these requirements, by my count, the Commission has managed to issue a grand total of nine safety rules in 31 years, or roughly one every 3 ⅓ years.

The Congress recognized this, and Congress took major strides to lessen the burden. Congress didn't abolish the need for cost-benefit; Congress retained it in the Regulatory Flexibility Act. And to drive the point home, you prescribed extraordinarily short deadlines for the promulgation of rules for children's products. This approach, to me, clearly has succeeded. By the most conservative count possible under these procedures, we have issued 10 safety rules in the past 4 years, or 2 ½ rules every year as opposed to 1 every 3 ⅓ years.

In closing, I want to share one major concern about a growing and increasingly vulnerable population, older Americans, of which I am now one. In fact, despite being only 13 percent of the population, older Americans suffer 60 percent of the deaths and injuries associated with consumer products. The fact that I now fit within this demographic has definitely helped me understand what a serious challenge we face in the coming years as America ages.

I look forward to working with my colleagues and the members of this subcommittee as we focus on our mission to protect our citizens from risks of unreasonable injury or death.

Thank you very much.

Mrs. BONO MACK. Thank you, Commissioner.

[The prepared statement of Mr. Adler follows:]

U.S. CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

Statement of
Robert S. Adler
Commissioner
United States Product Safety Commission

Before the
House Committee on Euergy and Commerce
Subcommittee on
Commerce, Manufacturing, and Trade

August 2, 2012
Rayburn House Office Buildiug, Room 2322

"Oversight of the
Consumer Product Safety Commission"

Good morning Chairman Bono-Mack, Ranking Member Butterfield, and the members of the Subcommittee on Commerce, Manufacturing, and Trade. Thank you for the opportunity to testify along with my fellow CPSC Commissioners. I am pleased to be here today to discuss an agency that I have been associated with in some fashion since its establishment in 1973 – and I have been a Commissioner at since August 2009.

Agency Accomplishments

In May 1973, the CPSC opened its doors following the recommendations of the 1970 Final Report of a Congressionally established study commission, the National Commission on Product Safety (NCPS). The NCPS recommended the creation of a conspicuously independent federal regulatory agency given extensive authority to issue regulations and mandatory safety standards for a wide variety of consumer products. There was a need for such a body because, at the time, product safety was regulated sparsely and only by a patchwork pattern of laws that extended to a very small portion of consumer products.

This October will mark the 40th anniversary of the passage of the act that brought to life the recommendations of the NCPS — the landmark Consumer Product Safety Act (CPSA). Looking back now, I believe Congress and the agency should take great pride in what the agency has accomplished, especially considering the large scope of our mission – to protect the public from any and all unreasonable risks associated with roughly 15,000 categories of consumer products found in stores, homes, schools, and recreational settings. Another way to think about our responsibility is if a product is not food, or a drug, gun, bullet, boat, plane, or a car – we are probably responsible for it.

What exactly has the agency accomplished? As a starting point, I note an estimated 30 percent decline in the rate of deaths and injuries associated with consumer products over the last 30 years. And I would particularly point to the dramatic drop in death and injuries to children. For example, we have seen:

- a 92% drop in childhood poisoning;
- a 92% reduction in crib deaths;
- a 100% reduction in child suffocations from abandoned refrigerators; and
- an 88% reduction in baby walker injuries.

Additionally we have seen improvements such as a 92% reduction in fatal electrocutions and a 46% reduction in residential fire deaths. In short, the CPSC has produced an excellent return on investment. By our calculation, this drop in deaths and injuries has resulted in over $16 billion in reduced societal costs – or many, many times the resources the CPSC has been given to do its job. And, as a very small agency, we have had to produce these benefits at a very low cost.

Of course, even efficiency has its limits. As of five years ago, the CPSC had shrunk from its 1980 high of 978 employees to a skeleton crew of less than 400 employees and a budget of $62 million. To Congress' credit, you saw that the agency increasingly suffered from too much to do and too little to do it with. So, in 2008, almost unanimously, you passed the Consumer Product Safety Improvement Act (CPSIA), providing the CPSC with more tools and directing it to do more work - and do it faster.

Update on Implementation of the CPSIA

The CPSIA, which will mark its fourth anniversary in two weeks, has sometimes been referred to as a "toy bill" - but in truth it is a law that is broad in scope and has served to save an agency that was underfunded and undermanned. And, for that, I am sure consumers across the country are grateful for this legislation.

For example, in 2007, despite over $600 billion per year of consumer products being imported, including more than 70% of the toys sold in the United States, the agency had no employees stationed full-time at our nation's ports. That year, CPSC collected a grand total of 723 samples of imported consumer products and was finding violative products in its collected samples at a rate of less 42%. Today, because of the CPSIA, we have a division at the CPSC devoted solely to import compliance, and we have personnel stationed full-time at 15 of the country's busiest ports of entry. As opposed to the meager numbers of 2007, during the first half of 2012 alone, we screened almost ten times as many samples (6,600) and prevented more than 1 million units of violative or dangerously defective products from entering the United States. And in the tradition of CPSC, we have become significantly more effective at our job, finding violative products in our collected samples at a rate exceeding 60%. Unquestionably, a large part of this success has been because of our partners at U.S. Customs and Border Protection (CBP), but it is also because of increased funds, personnel, and authority provided by the CPSIA.

Among other non-children's product requirements, the CPSIA:

- Made the sale or distribution of a recalled product illegal, which created a tremendous incentive for retailers to become even stronger safety partners with the agency (which they have);
- Raised the maximum civil penalty amount for violations from $1.825 million to $15 million;
- Required the promulgation of a mandatory ATV standard which banned three-wheeled ATVs and required all ATV manufacturers or importers to submit an action plan to the Commission prior to distribution;
- Funded the upgrade of our siloed information technology systems, allowing the agency to lay the groundwork for 21st century technology solutions to help us more quickly identify hazard

patterns from the wide variety of data the agency receives. The CPSIA also required the creation of a public consumer product hazard database. This database allows consumers to almost simultaneously inform the CPSC, the product's manufacturer, fellow consumers, other manufacturers, retailers, and the media of hazardous (and potentially hazardous) products. The need for such a database was a direct result of the ultra-restrictive "section 6b" of the CPSA. This provision inhibits, to the point of virtual prohibition, the CPSC from releasing to the public in a timely fashion manufacturer specific safety information that almost every other federal health and safety agency releases on a regular basis; and

- Increased CPSC staff to over 500 FTEs and its budget to just over $100 million.

Of course, there is no question that the CPSIA also changed the landscape for children's products. The law required the promulgation of a number of mandatory federal safety standards, where none existed for toys and other durable nursery products. The CPSIA also set maximum levels for lead paint and lead content in children products at 90 and 100 parts per million, (respectively) and banned the use of certain phthalates in children's toys and child care articles.

Undoubtedly, the biggest change felt by the children's product community was the law's requirement that all children's products be tested by a third-party independent laboratory before they enter the market — and on a continuing basis thereafter. This section of the law, often referred to as the "testing and certification requirement," mandated the agency write regulations to accredit third-party laboratories and establish procedures for manufacturers to comply with the law's testing requirements. Clearly, such a strong safety step forward carried broad implications for the regulated community. And that's why we have worked long days (and sometimes, nights) to implement this mandate in a thoughtful and measured way. And I can report, after much review and many re-drafts, we have finally reached the point where the final rule on continued third-party testing and certification will take full effect on February 8, 2013.

The CPSIA was the first major overhaul of the Commission and its authority and priorities in almost 20 years. Looking at the law as a whole, I see two common themes: the agency needed more resources and other tools to accomplish its safety mission, and it needed to change its approach to vulnerable populations, particularly children. I believe both of these themes remain important considerations not only as we near the completion of the bulk of our CPSIA rulemakings but also as we look to the future.

Resources for CPSC Personnel

When we talk about the tools the agency possesses to accomplish our safety mission we are mainly talking about resources and rulemaking authority. The CPSIA had a major impact on both. Over two-thirds of the CPSC's budget goes to our personnel. Accordingly, when the agency fell below 400 employees in 2007, this translated into fewer compliance officers out in the field conducting investigations and inspections; fewer engineers and toxicologists and

epidemiologists to make hazard determinations and help write performance standards; and it also meant there was no money for staff to be stationed full-time at any of our nation's 300 plus ports.

The increase in our budget over the last few years has translated directly into action because it means technical experts and law enforcement officials can be hired to help us fulfill our mission. We now have a state-of-the-art testing lab, but it must continue to be staffed appropriately to optimize its potential. Our fire engineering staff has made great strides in research regarding fires associated with cooktops and space heaters, and our carbon monoxide team has done some compelling work on portable generators and gas furnaces. Without continued funds for these talented scientists, the projects are likely to stall. Highly skilled technical experts must be hired and retained to allow us to stay on top of existing or emerging hazards, whether the material is a heavy metal (including lead), a chemical like phthalates, or new discoveries like nanotechnology.

After our engineers and other technical experts, the largest part of the CPSC budget goes to our compliance activities. As described above, we now have an import division and have 20 staff members full-time at 15 ports – but we need still more resources. Despite our tremendous progress, we are inspecting less than 1% of the 14 million consumer product shipments that enter the United States every year. We recently submitted a report required by the CPSIA that details a seven-year plan to implement a complete risk management program across the country. It will cost real money, but if we do it right, it will save more money than it costs, and of course it will save many lives.

The same is true for our domestic compliance activities – more resources translate directly to more law enforcement at the retail and consumer level. Our field staff covers the entire country as best they can, but there are still 12 states in which we do not have even one field officer. There is no substitute for having trained investigators on the ground, getting to know their territory every-day instead of just flying or driving in on an emergency basis.

All of this said, I fully recognize that you have many difficult budgetary decisions facing you in the months ahead, and this is a time of limited resources for all Americans and therefore all federal agencies as well. But, I ask that when you consider the CPSC, you keep in mind that the return on investment received for our budget is lives saved, injuries prevented, and unnecessary societal costs reduced – especially for the nation's most precious asset: our children.

A Reasonable Rulemaking Process

The other major tool CPSIA sharpened for us was making a particularly significant modification in how we engage in rulemaking. Given the CPSIA's focus on moving expeditiously on children's safety, the law directed the agency to use section 553 of the APA (Administrative Procedure Act) when promulgating CPSIA rules. This was a significant change because under

normal circumstances, the agency is required to suffer through the broad and extravagant set of cost-benefit requirements added in 1981 to the CPSA (and other acts enforced by the CPSC) when promulgating consumer product safety rules.

While there was no specific mention of the rationale for this decision in the CPSIA, it seems logical to conclude that Congress understood that CPSC's normal-cost benefit provisions make efficient rule promulgation almost impossible. This is because they easily surpass in their stringency and scope the cost-benefit provisions of the various Executive Orders on cost-benefit analysis recommended by the Office of Management and Budget, including Executive Orders 12866, 13563, and 13579. In fact, in the 31 years since the CPSC was saddled with these unique requirements, we have managed to promulgate a total of only 9 consumer product safety rules – or roughly one every 3 1/3 years.

In order to move the rulemaking process with respect to toys and other children's quickly, the CPSIA substituted the much more streamlined and focused cost-benefit procedures of the Regulatory Flexibility Act (RFA). And to drive the point home for us, the law prescribed extraordinarily short deadlines for the promulgation of a toy standard as well as specific children's product safety rules such as cribs, infant walkers, baby bath seats, toddler beds, toddler bed rails, and portable play yards, among other children's products.

Significantly though, by giving the CPSC the authority to promulgate all of these rules under Section 553 of the APA, Congress made sure that the RFA's analysis of the impact to small businesses would be considered. In other words, the agency's cost-benefit analysis would focus on the group that was least likely to have had a voice in the writing of the voluntary standard – small businesses.

Put another way, Congress pointed to a different set of procedures when it wanted us to promulgate rules quickly – procedures that do not include the 1981 added cost-benefit requirements. I believe this approach succeeded. By the most conservative count possible, the CPSC has issued 10 consumer product safety rules in the last 4 years that would have otherwise been subjected to our usual snail-like rulemaking process. This experience has only reinforced my belief that the type of rulemaking contemplated by section 553 of the APA or even under the relevant Executive Orders makes for a more reasonable regulatory process than the one laid out in the CPSC's statutes.

Unfortunately, I do not need to go back into the Commission's ancient history to find examples of non-children's products where rulemaking that is in the interest of protecting consumers has been significantly delayed because of these unique cost-benefit obstacles. In October 2011 the Commission unanimously published an Advance Notice of Proposed Rulemaking (ANPR) on table saws, more than eight years after receiving a petition on the hazard. A final rule, which

would attempt to address a product associated with almost 40,000 annual emergency department treated injuries, including 4,000 amputations, is likely to be several years away, in no small part because of CPSA's onerous section 9 cost-benefit requirements.

Vulnerable Consumers - Children

Congressional desire for the CPSC to change its approach to vulnerable consumers is also evident from the way it described children's products to include "a consumer product designed or intended primarily for children 12 years of age old or younger." This was a wider range than we had previously been using to address children's products. The level of concern regarding this population was also clear from the requirement for pre-market, independent third-party testing of children's products. This process is a sea change in product safety in the United States because it demands for the first time that all children's product manufacturers (not just the extra cautious ones) test and certify their products are safe prior to placing them on store shelves. I believe over time this change will pay dividends in reduced death and injury costs for the public *and* manufacturers.

It has not been surprising that there has been a lot of concern in the regulated community regarding third-party testing because it was such a significant change in the way children's products have been brought to market. It is nearly impossible to contemplate the imposition of third-party testing and not realize that there would be increased costs to producers of children's products. Yet, I have long believed that for most manufacturers the increased costs would be minimal because they were already engaging in many of these safety processes pre-CPSIA, except they were testing their products at an even more sophisticated level than the one required by the CPSIA. But for many manufacturers, particularly the medium and smaller firms, this new requirement caused significant change. This is why I have been so pleased by our staff's efforts to continually walk the extra mile, or two miles, for small and medium sized businesses, both in the rules and in the guidance documents we provide. At every step of the process, I believe we have tried to maintain the necessary, but delicate, balance of new safety requirements with new burdens.

The CPSIA's direction to CPSC regarding extremely strict lead limits was another example of how hazards for vulnerable populations were going to be addressed differently from the past. By now, everyone is aware that children's products may not contain more than 100 parts per million (ppm) of lead. And I hope everyone is aware that lead is a powerful neurotoxin that accumulates over time. Even low levels of lead are widely associated with learning disabilities, decreased growth, hyperactivity, impaired hearing, and brain damage.

There are two observations that I'd like to make on this issue: First, by mandating that we drop the lead level, unless the Commission determined it was not technologically feasible for a product or product category to meet the 100 ppm total lead content limit, Congress took a very

proactive approach to this chronic hazard. The law basically said we will not wait for bodies to pile up 20 years from now only to discover that it was because of slow, but steady, lead accumulation from products, including children's products. I have previously noted that, were it my decision, I might have recommended a slower and less precipitous drop in levels, but all things considered, I believe Congress got it right. Along those lines, I am pleased that we at the CPSC continue to look for easier and less costly ways for all manufacturers to test for lead – and was supportive of P.L. 112-28's changes regarding testing relief for small batch manufacturers.

Second, I hope we have put to rest the notion that lead content level was set arbitrarily or without safety levels in mind. There was clear evidence at the time Congress chose 600, 300, and 100ppm that they were selected for well-considered reasons. I note that this past spring, the Centers for Disease Control and Prevention (CDC) revised their lead guidelines *downward*, so that any child with more than 5 micrograms of lead per deciliter of blood would be considered at risk of lead poisoning. I believe that, as scientific methods increase in sophistication, we are going to see health experts recommending even lower limits over time.

Vulnerable Senior Consumers – Looking Ahead

In addition to mandating that our agency take new approaches to consumer product safety, I also believe that there was another underlying message in the CPSIA: attend to all vulnerable populations, wherever you find them. While this concept has been an important part of the agency's make-up since its founding, the passage of the CPSIA was a clear message to reinvigorate this priority.

Accordingly, of late, I have become increasingly concerned by what I feel has been a lack of focus regarding injuries to an overlooked vulnerable population – older Americans. Our data demonstrates that this critical demographic is the second most vulnerable group after children, particularly those Americans over age 75. The fact that I now fit in this demographic has definitely helped me understand what a serious challenge we face as America ages. In fact, here are some underreported facts about older Americans:

- Despite making up only 13 percent of our population, older Americans suffer 60 percent of the deaths associated with consumer products and Census statistics predict that by 2030, one in five Americans will be 65 or older.
- Today, roughly 40 million people in the U.S. are ages 65 and older. This number is projected to more than double to 89 million by 2050;
- Today, the "oldest old" – those 85 and older – have the highest growth rate in the country: twice that of those 65 and older and almost four times that for the total population. This group now represents 10% of the older population and will more than triple in number by 2050.

And, unfortunately, this explosive population growth brings some unwelcome news on the health and safety front. CPSC's data show that injuries and death from consumer products begin to accelerate dramatically once we hit age 75. In fact, the rate of emergency room-treated injuries for those 75 and older is approximately twice that of 65-74.

I recently called for a National Action Plan to address injuries to seniors modeled on a similar plan put together by CDC regarding injuries to children. Unfortunately, there is no comprehensive plan for this group that often faces similar vulnerabilities. I believe such a plan is needed, for example, to prevent the type of falls that take place every day in and around seniors' homes that lead not just to bumps and bruises, but to hospitalizations and fatalities. The CDC estimates that one out of every three people in the U.S. age 65 or older will suffer a fall this year, resulting in more than 19,000 deaths and a cost to society of more than $28 billion.

The other leading cause of injuries and deaths to seniors is fire. The CPSC's staff report that almost 400,000 fires occur annually, resulting in roughly 2,500 deaths, 12,600 injuries and $6.43 billion in property loss. But, the problem is more serious for seniors. The U.S. Fire Administration estimates, for example, that adults age 75-84 are nearly four times as likely to die in a home fire. And, adults over age 84 are nearly five times as likely to die compared to the general population.

In 2007, there were more unintentional fire and burn deaths to older Americans than any other demographic category, and the odds of surviving fires get worse as we get older. Our nation's firefighters and emergency responders are brave, dedicated, and proactive, but they cannot prevent these fire deaths alone.

In short, the hazards to our seniors occupy many fronts. Sometimes products that seem benign to youth may take on a more ominous character when older Americans use them. Other times there's a product like adult bedrails that appear to be associated with an entrapment hazard that looks similar to the hazard that our recent children's bed-rail rule was written to address, but sadly appears to have a much higher death and injury count.

Next year CPSC will be issuing a report on injuries and deaths to older Americans to help us identify which products we should focus our energies on first. The last time we undertook such a project, in 2004, we estimated that the combined injury and death costs to older Americans totaled more than $100 billion per year. I believe our new data will assist in a larger national effort where all stakeholders work to determine which hazards to our seniors are easily addressable and which hazards require new types of technology and consumer education.

But even with good data and a renewed focus, these societal wide issues cannot be solved by our small agency alone. Addressing injuries to this vulnerable population will take an enormous

effort by a range of experts, every-day citizens, non-governmental organizations, families, foundations, and federal, state, and local governmental actors. I look forward to working with my colleagues and interested members of this Subcommittee as we focus on our continued mission to protect vulnerable citizens of all ages from risks of unreasonable injury or death.

Thank you for the opportunity to testify today and share my thoughts on the Consumer Product Safety Commission. I look forward to your questions.

Mrs. BONO MACK. And welcome, Commissioner Nord. You are recognized for 5 minutes.

STATEMENT OF NANCY A. NORD

Ms. NORD. Thank you so much. I am delighted to be here.

You have in front of you four different statements representing the views, the opinions, the observations and, in some cases, the criticisms of the four Commissioners of the CPSC. And yes, we all agree on many things. Of course, we all agree that children are our most vulnerable consumers and, more importantly, our most precious asset.

Of course, we all agree that increased resources for engineers, compliance officers, scientists, port inspectors, and yes, dare I say, some lawyers has allowed us to really bump up our game in carrying out our mission.

Of course, a state-of-the-art testing lab, which I am very proud to have initiated the efforts for, has met with rave reviews, and moving our information technology systems into the 21st century has met with strong approval.

Indeed, we find common ground in dealing with serious issues like mandatory safety standards for infant and toddler products and using our new authorities to address hazards like drawstrings. And we are all very, very proud of the great work that our staff is doing, especially in the ports and out in the field.

So in many cases it is not the what, it is the how. And I am very concerned that we are falling short on the how, whether it is on big items or things with smaller significance.

As I mentioned in my written statement, I have major concerns about how we develop the testing and certification rule; how we have defined children's products; how we have justified dropping the lead content limits from 300 parts per million to 100 parts per million. That is 99.99 percent lead free.

I have concern about how our limited resources are being used. Did we really need to spend almost $2 million on consultants to tell us how to rewrite our strategic objectives and our mission statement? Will we know how we are going to be spending our funds come the October 1st beginning of the fiscal year if we have yet to establish our priorities in an operating plan?

But more importantly than resources, it is how rules are being proposed, considered, and promulgated. If staff strongly suggests the Commissioners not move forward with finalizing the testing rule, but rather seek public input as directed by Congress, and the majority ignores that and puts a rush on the rule, how can we say that that is thoughtful and measured decision-making?

When Commissioners decry the use of cost-benefit analysis and say, well, the Regulatory Flexibility Act is all we need because that focuses the impact on the impact on small businesses, yet consistently turns around and disregards the information that is in the Regulatory Flexibility Act because it doesn't lead to a desired regulatory result?

When a claim is made that section 6(b) of our law is ultra-restrictive and inhibits to the point of virtual prohibition releasing information to the public in a timely way, yet the agency in the past year three times has released inaccurate and misleading informa-

tion, contrary to 6(b), that almost jeopardized the major recall in one case and caused the agency to do a public retraction in another?

We can all agree that each Commissioner here today has a strong commitment to safety, and that differences of opinion as to regulatory issues should not be viewed as a lack of commitment. And believe me, I am not looking for trouble from my colleagues, but I am very troubled about how we approach issues.

Interestingly, I note that one of my colleagues with whom I often disagree in the statement says, quote, "The necessary but delicate balance of new safety requirements with new burdens."

I agree it is necessary. I agree it is delicate. I think that the agency's actions, over the past 2 years in particular, fall quite wide of the mark and have created a great imbalance between safety and new burdens, and as a result American consumers are overpaying for safety. We cannot close our eyes to the harm that we are causing many businesses that produce perfectly safe products and pretend that that harm does not exist. I think we need to work harder to find the balance that is missing.

Thank you.

Mrs. BONO MACK. Thank you, Commissioner.

[The prepared statement of Ms. Nord follows:]

U.S. CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MARYLAND 20814

COMMISSIONER NANCY A. NORD

Statement before the
Subcommittee on Commerce, Manufacturing, and Trade
of the Committee on Energy and Commerce of the
United States House of Representatives:

August 2, 2012

Saving lives and reducing injuries wisely

I would like to thank the Chair, Congresswoman Bono Mack, and the Ranking Member, Congressman Butterfield, for holding this oversight hearing today at a critical time for the agency. Congress created the Consumer Product Safety Commission to protect the public against unreasonable risks of injury associated with consumer products in a manner that would provide for efficient regulations that were minimally burdensome to manufacturers and importers.[1] Balancing the dual goals of safety and efficiency is a challenging task, not to be treated lightly. Although we all share the same goals, I am deeply concerned that we have over-read our congressional mandate and failed to consider the effects our actions have on the important balance between safety and efficiency. I believe that the agency needs to rethink its approach, especially in view of the increasing demands on our agency's limited resources. [2]

---

[1] *See, e.g.*, H.R. Rep. No. 92-1153, at 25 (1972) ("The Commission's decisions under this legislation will necessarily involve a careful meld of safety and economic considerations. This delicate balance, the committee believes, should be struck in a setting as far removed as possible from partisan influence.").

[2] *See* U.S. Consumer Product Safety Commission, Estimates of Hospital Emergency Room-Treated Injuries Associated with the Use of Certain Consumer Products, *2011 & 2010 Annual Report to The President and Congress.*

Congress made changes to our statutes in 2008 through the Consumer Product Safety Improvement Act (CPSIA), and our small agency, with increased but limited funding, has been working hard to implement it. CPSIA provided the agency with more resources, greater powers, and specific directives to address several types of hazards. (The law included a number of changes that I had recommended.) At the same time, the new law attached some stringent requirements that unduly restricted the agency in its mission to reduce risks based on severity and exposure.

Although the CPSIA's dramatic redirection of the agency has resulted in some safety improvements, the redirection also led to major problems in the form of unrealistic deadlines, workload prioritization difficulties, project delays, and numerous unintended consequences. Wise implementation was called for.

The art of good management is making wise choices that focus the resources of regulators and manufacturers to achieve maximum safety in a cost-effective manner. We could have reached our shared goal of consumer safety, particularly for children, without the needless expense, job loss, and businesses closure that we have seen. Unfortunately, our agency is forcing consumers to *overpay for safety* through passed-on costs for unnecessary testing, limited choice, and limited safer alternatives. More circumspection would have avoided this over-regulation.

Examples of over-regulation

The Testing Rule

The best example of over-reading the law is the Testing Rule.[3] Implementing one of the key provisions of CPSIA, the Testing Rule read an overly broad mandate into the statute: that all testing of children's products—including ongoing periodic testing—must always be performed

[3] Testing and Labeling Pertaining to Product Certification, 76 Fed. Reg. 69,482 (Nov. 8, 2011) (codified at 16 C.F.R. pt. 1107) (citations here refer to the staff's briefing package, available at http://www.cpsc.gov/library/foia/foia11/brief/certification.pdf).

by a third party. Had the Commission not insisted on this approach, the agency could have developed a testing protocol that considered the risk of the product and the testing needed to assure compliance with related safety rules, thus maintaining a balance between achieving safety goals and doing so cost-effectively.

This is particularly important because the Testing Rule is such a costly one. The Commission's staff conducted a limited but eye-opening analysis of some of the costs of this rule in a Regulatory Flexibility Analysis. Here is some of what the staff told us:

- *Who is impacted*—Staff explained that the rule "will have a significant adverse impact on a substantial number of small businesses,"[4] and a "disproportionate impact on small and low-volume manufacturers."[5] Our staff told us that firms are likely to mitigate "the adverse impacts [of the rule by] . . . rais[ing]their prices to cover their costs."[6] American families should expect to bear the brunt of this rule's impact.
- *Size of the costs*—"The costs of the third party testing requirements are expected to be significant."[7] "A typical profit rate is about five percent of revenue . . . . Therefore, a new cost that amounted to one percent of revenue could, all other things equal, reduce the profit by 20 percent."[8] According to our staff's analysis, a small manufacturer would hypothetically spend 11.7% of revenue on these testing costs.[9] These estimates point to a negative revenue result for small manufacturers.
- *Manufacturers' options*—Staff said the following:

---

[4] *Id.* at 198

[5] *Id.* at 178.

[6] *Id.* at 134.

[7] *Id.*

[8] *Id.* at 187.

[9] *Id.* at 188 & 193.

- "[S]ome manufacturers might attempt to redesign their products . . . by reducing the features . . . used in the products."[10]
- "Manufacturers and importers could also be expected to reduce the number of children's products that they offer."[11]
- Some manufacturers and importers would "exit the market for children's products entirely"[12] and others "may go out of business altogether."[13]
- "The requirements of the final rule could be a barrier that inhibits new firms from entering the children's product market."[14]

And then there are the additional costs to consider, including

- costs of testing plans deemed insufficient by *post hoc* agency judgments about what should have been done, and
- costs for administrative work related to the periodic testing, which staff estimated could reasonably be expected to add 15% to 50% to testing costs. [15]

Confounding the situation was the majority-dictated procedure to promulgate the Testing Rule *before* seeking public comment about costs (as directed by H.R. 2715). It did not matter that Congress specifically, just weeks before, directed the agency to re-examine the specific balance between safety and efficiency. Nor did it matter that our technical staff strongly recommended against the approach the majority took to put the rule out and receive comments later.

These results could have been avoided while still assuring compliance with safety rules if the Commission had not overreached in its implementation of the testing rule, ignoring any balance.

Changing random sampling to representative sampling

Congress told us in H.R. 2715 that periodic tests on children's products could be performed on "representative samples," rather than "random samples," as our statute previously read.

Unfortunately, while the Commission unanimously agreed on language defining "representative samples", which is what Congress told us to do, Commissioner Northup and I could not agree with our colleagues to impose burdensome new recordkeeping provisions that have high estimated costs and little estimated value. This new recordkeeping would be in addition to the significant recordkeeping burden already imposed by the Testing Rule. So rather than advance the agreed upon definition, two of my colleagues chose over-regulation and let the whole effort fail. No doubt this unnecessary and burdensome provision will be back before the Commission when the Democrat majority is restored in October.

Definition of *children's product*

The pattern of implementing CPSIA without attempt to balance between safety and efficiency has been repeated over and over. In promulgating an interpretive rule about the definition of the term *children's product*, the Commission listed four factors but indicated little about how they might be applied. Yet, even the five commissioners themselves could not agree on whether particular products fell in the definition. But a manufacturer must decide early on—at the design and manufacturing stages—whether their product is a children's product for tracking label and third-party testing purposes, knowing that this decision can be second-guessed by the CPSC at some later point. Safety is not advanced here, and the costs for product sellers in the "truth or consequences" definition guessing game are real and severe.

100 ppm limit for lead content

Another clear example of regulatory imbalance was the Commission's decision to drop the lead content limit for children's products from 300

parts per million (ppm) (99.96% lead free) to 100 ppm (99.99% lead free). This decision was particularly disturbing because the Commission had specific leeway in the statute to impose some balance through its judgments concerning the technological feasibility of such action. The majority once again chose imbalance and ignored warnings about the consequences.

The Commission's failure with respect to the lead limit is compounded by the testing variability that staff described (and which we have heard about from manufacturers and importers).

- "Testing variability means that ensuring compliance with the 100 ppm limit may require that lead in components or products are, in fact, significantly below the limit."[16] "Levels significantly below 100 ppm may not be technologically feasible for some products."[17]
- "The economic implications of test failures may be quite significant and include needless scrapping of failing materials, as well as the potential for increased recalls."[18]

Among the potential economic impacts, highlighted by staff, of lowering the lead content limit to 100 ppm are the following:

- "Cost increases are likely to be reflected . . . as a combination of price increases and reductions in the types and quantities of children's products available to consumers . . . . In some cases, the price increases could be significant."[19]
- "[S]ome firms may reduce the selection of children's products they manufacture or exit the children's market altogether. In some cases, the firms may even go out of business."[20]

---

[16] U.S. Consumer Product Safety Commission Staff, Briefing: Technological Feasibility of 100 ppm for Lead Content, 29 (June 22, 2011) (available at http://www.cpsc.gov/library/foia/foia11/brief/lead100tech.pdf).

[17] *Id.*

[18] *Id.*

[19] *Id.*

[20] *Id* at 30.

- "[I]t is likely that the costs will have relatively greater consequences for smaller manufacturers and artisans . . . ."[21]
- "The higher costs associate with metal components will probably result in efforts to substitute lower cost materials. Plastics, for example might be substituted for metal parts in some products. Certain substitutions might affect the utility of the products. The use of plastic . . . may reduce a product's durability in some applications . . . ." [22]

Noteworthy is the fact that the Commission specifically rejected a safe-harbor remedy suggested by staff to ameliorate these impacts. "A safe harbor would be *unlikely to result in any adverse health effects but could provide some relief to manufacturers of children's products.*"[23]

Congress's direction to examine the balance of safety and testing costs

Almost a year after H.R. 2715 (Pub. L. 112-28) became law, we now hope to soon receive a staff report addressing public comments and making recommendations about how to reduce third party testing burdens. I, like over 25 other commenters from a wide range of industries and organizations, submitted cost reduction proposals for staff to consider (see Attachment A). It has been illuminating to see the different issues raised by both small and large businesses, domestically and internationally. Among several common themes is the overarching message that the costs of third-party testing are severely impacting the global supply chain without a commensurate advancement in safety—the balance is out of whack.

Here is a sample of concerns illustrating common themes.

- *Harmonization*—One of the largest complaints from the public is the lack of alignment of international, federal, and state standards. That lack of alignment results in higher costs without additional safety.

---

[21] *Id.*

[22] *Id.*

[23] *Id* at 31 (emphasis added).

- *Small volume testing*—Many companies still endure high testing costs on their small volume productions because they are not so extremely small so as to qualify for the small-batch exemption. The result? Companies cease to produce small runs, innovation is thwarted, and the consumer choice is limited to fewer useful products.
- *Inter-lab variability*—Commenters from several industries reported inaccuracies among laboratory results, especially with such minute levels as the 100 ppm lead requirement. How is safety advanced when everyone agrees there are continuing discrepancies?
- *Reducing testing redundancies*—Because of liability concerns many large retailers require testing to be done by specific third party testing laboratories. So if a manufacturer sells to five different retailers, then the manufacturer may be required to perform the same exact test on the same exact product five times.
- *Over-defining standards*—Unnecessary testing has been required due to overreaching, expansive statutory interpretations, including the over-broad identification of children's product safety rules.

One possible solution to consider is a testing regime that allows manufacturers to focus their resources on riskier elements of their products, rather than testing benign elements with the same frequency and intensity as more dangerous elements. Elements of such a testing regime could include first-party testing and production controls, in addition to the option of third-party testing. The current testing rule does not provide that flexibility. Another solution would be to exempt partially or wholly from third-party periodic testing products for which compliance with applicable safety standards is known to be high without mandatory testing. I believe that Section 3 of CPSIA may give the agency the ability to reduce testing costs in this manner while assuring compliance with safety rules.

Conclusion

No one wants to turn back the clock on safety. To say otherwise is stretching for a straw-man argument. What is real, however, is the unnecessary economic harm our CPSIA regulations have on those who manufacture and sell consumer products (see attachment B), and by extension, consumers who buy and use them. The balance between safety

and efficiency could have been achieved with wise, careful rulemaking. As regulators and consumers, we do not live in a risk-free world. Wise decisions need to be made about what risks are acceptable, what exposures are unavoidable, and what costs are necessary to achieve consumer safety.

Attachment A

Commissioner Nancy A. Nord

Cost Reduction Proposals

Cost Driver: Excessive Testing

- Use risk analysis to determine extent of testing and when third party testing should be required, on rule by rule or other basis
- Provide small volume testing exemption
- Make clear (through rule and accompanying enforcement policy) that retailers may and should rely on testing done by manufacturer or importer
- Permit first party after-sale confirmation testing in some instances or other quality control/quality assurance mechanism to enable manufacturer to line up back-up component suppliers
- Establish and implement trusted vendor program
- Implement staff-proposed alternatives referenced in Testing Rule briefing package

Cost Driver: Third Party Testing

- Rules of general applicability are not children's product safety rules and products subject to them need not be tested by third party
- Periodic testing need not be performed by third party testing lab unless agency determines otherwise for a specific rule.
- Clarify periodicity requirements in rule

Cost Driver: Variability of Testing Results

- Establish range within which results will be accepted. Clarify status of de minimis variations

Cost Driver: Lead, Phthalates and Other Chemical Testing

- Correlate testing requirements to safety and risk—that is, adopt solubility standards instead of content standards
- Use content testing as safe harbor with solubility testing as a backup
- Permit Agency to recommend appropriate lead level
- Permit recycled materials to meet 300 ppm limit rather than 100 ppm limit for lead

Attachment A

- Use more expansive and clearer definition of "inaccessibility"
- Implement staff alternatives referenced in briefing package on 100 ppm
- Implement more extensive use of screening tests

Cost Driver: Differing Regulatory Requirements

- Evaluate adequacy of the testing regime in the European Union's toy safety standard, EN71 and, if adequate, consider it to be substantial equivalent of US standard
- Align definition of "child care article" with European definition
- Apply substantial equivalency principle to requirements from other jurisdictions
- Adopt more expansive preemption provisions to address differing state and local requirements

International Sleep Products Association

[Christopher Hudgins, International Sleep Products Association, Comments submitted to CPSC re Application of Third Party Testing Requirements; Reducing Third Party Testing Burdens, (January 23, 2012)]

Due to CPSIA and CPSC's new requirements for third party testing:

"...expensive tests that can cost $850 to $1650 each to conduct, including the value of the product destroyed during the test...If the new rules require a manufacturer to conduct even 20 tests annually, that could add over $30,000 in additional testing costs.

These added costs occur at a time when many mattress manufacturers are struggling to recover from the recent economic recession, which has significantly reduced sales and forcing many employees to lay off workers. Our market, measured in terms of wholesale dollars and units, shrank from 2007 to 2009 by nearly 20% and the industry lost more than $1.2billion in sales. Although the industry began to recover in 2010, the uncertain economic and regulatory outlook has made employers in the industry cautious about expanding too fast. In the last few years, mattress producers and suppliers of every size have either closed their doors, undergone bankruptcy, or restructured and downsized. Many still struggle to remain in business."

Fashion Jewelry and Accessories Trade Association

Attachment B

[Sheila Millar, Fashion Jewelry and Accessories Trade Association, Comments submitted to CPSC re Application of Third Party Testing Requirements; Reducing Third Party Testing Burdens, (January 23, 2012)]

"FJATA recently conducted a survey of its members to assess the impact of testing and certification requirements. The results emphasize the nature and scope of the burden that third party testing imposes.

- Almost 70% of FJATA members responding to the survey reported that products failed third party testing at amounts *within* 5% of the target levels. Nearly 50% reported that the test results were *just over the limit*. Another 20% reported that test results were *within 10%* of target limits.
- Most of the testing failures involved lead.
- 92% report having to implement price increases as a direct result of the new burdens imposed by CPSIA.
- More than 62% have had to change suppliers to ensure compliance with CPSC requirements.
- 24% have substantially reduced product offerings for children as a result of CPSIA.
- 16% have eliminated children's products from their product lines entirely."

"With the exception of a few significant multi-national vendors, the majority of FJATA's members are small businesses, many of which remain family owned."

Mrs. BONO MACK. And again, a welcome to our former colleague. It is great to have you here. And, Commissioner Northup, you are recognized for 5 minutes.

STATEMENT OF ANNE M. NORTHUP

Ms. NORTHUP. Thank you. I am delighted to be here, and as the Commissioner that is rotating off the Commission at the end of October, this will probably be my last opportunity to share with this committee some of my observations and concerns as we go forward.

I appreciate the remarks of the other three Commissioners that preceded me. I agree with Commissioner Nord, who talked about many of the accomplishments that we have done, the durable goods standards, the mandatory standards, our work at the borders and imports. All of those are claims that I think all of us are very supportive of.

But I am going to specifically talk about several examples of the impact of what this Commission has done and share it with the committee so that they can judge whether or not that is what they anticipated when they passed the CPSIA and as they have funded this Commission.

The dropping from 300 parts per million to 100 parts per million was done last year. August 1st it took effect. That meant we reduced from 99.97 percent lead free, to 99.99 percent lead free. Our staff found—and I am taking this right out of their proposed package—that it contributed minimally to the overall lead exposure of children. That is the benefit of it. Conversely, the Commission's economist concluded that mandating the lower lead limit would have significant adverse economic impacts, including the use of more expensive low-lead materials, costly reengineering of products to use lower-lead materials, increased testing costs, increased consumer prices, reduction in the type and quality of children's products available to consumers, businesses exiting the children's market, and manufacturers going out of business.

There is no question that these effects have been felt. Unfortunately the businesses that have left the market or that have gone out of business are no longer here to testify to you and to provide information to you because they have left the market.

What did this do? This created an enormous new hidden tax on consumers and parents. Many, many manufacturers have shared with us the bells and whistles that they took out of their products, the lack of choices, the fewer models that they offer, the cost increases that they have had to pass on to consumers for something that has almost no measurable benefit to a child.

That is the kind of decision that has concerned me throughout my term, this sort of out-of-context rulemaking that we do. I know, as Members of Congress, that as you pass legislation, you consider what is good for consumers. At the same time you consider the unemployment rate, the cost of living, all of the other global impacts that you have that you bear on your shoulders. But when you are at the Commission, no one has to think about any of those other things. In the name of safety, this Commission has taken actions that far overreach any necessary protection to consumers.

Probably the biggest decision that we made that I have found so discouraging, and I think it is important to share with you, is our

reversal on unblockable drains. The Virginia Graeme Baker Act required that we protect children, protect the public from deaths in pools where—it is called evisceration, where a blockable drain can trap a child or an adult so that they cannot become free, and they are eviscerated. And after you passed this law, you gave us a great deal of choice. We could have backup systems or any other technology that we thought was equal to that. In the meantime American inventors came up with several inventions with the ability to change a blockable drain to an unblockable drain. And the Commission found that that met the requirement.

After a year, and at great cost to many the pool owners that adopted this new technology, the Commission reversed itself because one Commissioner changed their vote. And it meant that that unblockable drain cover no longer satisfied the law. And so now everyone has to have a backup system. A vacuum alert, which is the primary system they use, is not dependable. It goes off when it shouldn't. It doesn't go off when it is supposed to, as it didn't in Tennessee just last month. It is not available to private pools. It is much more expensive. We were overwhelmed with the number of letters that came into us and told us that this was a less safe direction to take, and yet we proceeded down that direction at great cost to the public.

We estimate over 1,100 pools have closed—not our agency, but the association that oversees pools. We know that many States have said they simply can't bring pools into compliance, and here there was a much less costly, much more available technology that could have been available to pools, but was reversed by our Commission. I can certainly answer more questions about this if there is more time.

In the end, though, this Commission has made many decisions, many rules, completely disregarding the cost, the lack of choice it is going to give consumers, the inability of small companies to comply with these regulations all in the name of children's safety despite the fact that our staff has told us many of these will not increase safety for children.

[The prepared statement of Ms. Northup follows:]

Testimony of Anne M. Northup
Commissioner
United States Consumer Product Safety Commission

Hearing: "Oversight of the Consumer Product Safety Commission."

Before the

U.S. House of Representatives
Committee on Energy and Commerce

Subcommittee on Commerce,
Manufacturing, and Trade

August 2, 2012

Chairman Bono Mack and Ranking Member Butterfield, thank you for the opportunity to provide testimony to this Subcommittee in connection with your Oversight of the Consumer Product Safety Commission. I have testified before this Committee several times since my tenure as a Commissioner began in August 2009. On those occasions, I have brought to your attention the severe economic impact of the Commission's regulations on the American marketplace, and, in particular, the unforeseen adverse consequences of the Consumer Product Safety Improvement Act (CPSIA). While I do not intend to repeat that testimony today, **attached** is a sample list of businesses impacted by the CPSIA, as well as other economic data.

Since the passage of the CPSIA, both President Obama and Congress took action intended to reduce the economic burdens of excessive and unjustified regulation. In January and July 2011, President Obama issued Executive Orders 13563 and 13579 calling on regulatory agencies to "afford the public a meaningful opportunity to comment" during the rule-making process, "use the best, most innovative, and least burdensome tools for achieving regulatory ends" and to "take into account benefits and costs [of regulation], both quantitative and qualitative." E.O. 13563. The President also asked independent regulatory agencies to formulate plans for the retrospective review of existing regulations in order to "determine whether any such regulations should be modified, streamlined, expanded, or repealed so as to make the agency's regulatory program more effective or less burdensome in achieving regulatory objectives." E.O. 13579.

Congress, for its part, passed in August 2011, H.R. 2715, which requires the Commission to (1) consider opportunities to reduce the cost of third party testing and permits it to prescribe new or revised third party testing regulations if it determines doing so will reduce third party testing costs consistent with assuring compliance with applicable product safety rules, bans, standards, and regulations; (2) report to Congress those opportunities to reduce third party testing costs that would require new legislative authorization; (3) exempt from third party testing, or provide an alternative testing requirement for, covered products produced by small batch manufacturers; and (4) issue standards and protocols calling for "representative" rather than "random" samples to be selected for periodic third party testing to ensure continued compliance following initial certification testing.

While the intent of the President's Executive Orders and H.R. 2715 are admirable, both have fallen short of having the desired impact on the CPSC. Over the past 18 months, the Commission's majority has done nothing to slow the feverish regulatory pace that has become the norm at our agency and refused to provide an opportunity for public comment on several of our most controversial and sweeping rules. It also has yet to formulate a plan for retrospective rule review that embraces the President's call for meaningful regulatory burden reduction. Instead, we are hearing new calls for the Commission to be free from the obligation to rationally justify its rulemaking.

Another Year of Regulatory Overreach

Just since August 2011, the Commission majority:

- reduced the acceptable limit of lead in a children's product from 300ppm to 100ppm, notwithstanding CPSC staff's determination that no health benefit would result, while businesses would incur substantial compliance costs;
- finalized its very complex and burdensome rule implementing the CPSIA requirement that manufacturers periodically procure third party laboratory tests of every component of every children's product to ensure continued compliance with all applicable safety standards, irrespective of any risk posed by the product or of the cost of the testing, proceeding despite Congress's passage of H.R. 2715 requiring the Commission to seek public comment on ways to reduce the cost of third party testing, letters from members of Congress urging the Commission to consider ways to reduce the costs of third-party testing *before* implementing the rule, and the recommendation of its professional career staff that the rule should be reproposed to permit consideration of public comment;
- without allowing for notice and a comment period, changed its interpretation of the term "unblockable drain" in the Virginia Graeme Baker Pool and Spa Safety Act, resulting in the closures of hundreds of pool throughout the country, and an *increase* in the risk of pool drain entrapment; and
- sought to impose additional burdensome record-keeping requirements with no offsetting benefit to product safety, in its interpretive rule defining the term "representative sample".

Moreover, none of these actions were preceded by any effort to determine the qualitative or quantitative costs, let alone by consideration of whether the benefits justified the costs, or whether less burdensome alternatives were available. Clearly, Cass Sunstein, Administrator of the Office of Information and Regulatory Affairs, was not talking about the CPSC when he wrote in a 2011 op-ed for *The Wall Street Journal*: "This insistence on pragmatic, evidence-based, cost-effective rules is what has informed our [the Administration's] regulatory approach over the past two and a half years."[1]

The Decision to Reduce the Children's Product Lead Limit from 300 ppm to 100 ppm.

A 3-2 majority of the CPSC voted in August 2011to require every single children's product component to be 99.99% lead free, down from 99.97% lead free. Commission scientists determined that the newly banned products containing between .03% and .01% lead contributed minimally to the overall lead exposure of children (a.k.a. the benefit). Conversely, the Commission's economists concluded that mandating the lower lead limit would have significant adverse economic impacts, including the use of more expensive low-lead materials; the costly reengineering of products to use lower lead materials or to

[1] Cass Sunstein, "21st Century Regulation: An Update on the President's Reforms," *The Wall Street Journal*. May 25, 2011.
http://online.wsj.com/article/SB10001424052702304066504576345230492613772.html

make newly noncompliant components inaccessible; increased testing costs; increased consumer prices; reductions in the types and quantity of children's products available to consumers; businesses exiting the children's product market; manufacturers going out of business; reduction in the utility and durability of products (a.k.a. the cost). This is a rule that would have failed the cost-benefit test.

The Premature Finalization of the Periodic Testing Rule.

H.R. 2715 was enacted on August 12, 2011, and contains a number of provisions to lessen the cost and burden of third-party testing and certification of every component of a children's product. These provisions include exempting certain products entirely from third-party testing and certification, directing the Consumer Product Safety Commission to provide relief to small batch manufacturers, and requiring the Commission to seek public comment on ways to reduce the cost of third-party testing for all manufacturers and importers. H.R. 2715 thus signaled Congress's intent to reduce such testing whenever possible consistent with assuring product safety.

The decision to finalize the third-party testing rule based on the original 2008 CPSIA statutory language, rather than repropose it to solicit public comment on the new issues raised by H.R. 2715, complicates compliance by an already overburdened regulated community. The third-party testing rule (often referred to as the Fifteen Month Rule), codified at 16 C.F.R. § 1107, is the largest and most widely applicable rulemaking the Commission has ever undertaken. It includes the promulgation of protocols and standards for the *additional* third-party testing *after certification tests of sufficient samples have already been performed* of a certified children's product to ensure continued compliance with all applicable safety standards. It applies both when there is a material change in the product and periodically, during production, even in the absence of a reason to believe a certified product is no longer compliant. This rule may be the most intrusive imposition of requirements on a segment of the manufacturing community ever. Its prescriptive mandates insinuate the Commission deeply into the production process of any company that manufactures a children's product for the United States market.

According to the CPSC's economists, "[t]he costs of the third-party testing requirements are expected to be significant for some manufacturers and are expected to have a disproportionate impact on small and low-volume manufacturers." Just the costs of testing alone -- excluding the costs of samples consumed in destructive tests, the costs of shipping the samples to the testing laboratories, and any related administrative and record keeping activity – is expected to consume over eleven percent of a small manufacturer's revenue. Given that a typical profit is only about five percent of revenue, it is reasonable to expect a large number of small business closures resulting from the third-party testing requirement. They cannot simply raise their prices and remain competitive.

Further, Commission economists predict that in response to the "significant increase in their costs due to the final rule", manufacturers will redesign their products to reduce the features and component parts, reduce the number of children's products they offer, exit the children's product market, or go out of business completely. The costs associated with the new rule are also expected to be a "barrier that inhibits new firms from entering the children's product

market", including, in particular, ones serving a niche market, such as products for children with disabilities. Safety and performance related innovation will also be stymied, as manufacturers "delay implementing some improvements to a product's design or manufacturing process in order to avoid the costs of third party testing."

By hastily finalizing the testing and certification rule, the Commission finalized the rule without considering the cost reducing measures urged by Congress, let alone ensuring that its benefits justify its substantial costs.

The Revocation of the More Protective Definition of Unblockable Drain.

The VGB Act requires public pools and spas with a single main drain which is small enough to be completely covered by a human body and thus create a life-threatening suction (known as a "blockable drain"), to be equipped with a system to prevent entrapment. These systems are often referred to as "backup systems". Although five systems/devices are enumerated in the Act as permissible backup systems, the Commission has long recognized the safety vacuum release system to be the most commercially viable and therefore most likely to be used by pool owners. "Unblockable drains" were exempt from the requirement to have one of these back-up systems, because their size and/or configuration prevented a deadly suction from ever occurring

In April 2010, following extensive input from the public, the Commission issued a final rule that interpreted the phrase "unblockable drain" to include an "unblockable drain cover." As a result, pools and spas with a single main drain equipped with an appropriately sized "unblockable drain cover" were not required also to be equipped with a vacuum release or other back-up system.

The Commission adopted this definition based on the recommendation of its staff of career technical experts. In their opinion, an unblockable drain cover is superior to a vacuum release back-up system because it *prevents* all entrapments. A vacuum release system, in contrast, only protects against one kind of entrapment (evisceration), only *stops* an entrapment incident after it has already occurred, and does so only after a delay of up to 4 seconds. As a consequence, once an evisceration takes place, it is already too late for a vacuum release to save a child. And the back-up system does not protect against other types of entrapments such as hair entrapment, mechanical (i.e., necklace) entrapment, or limb entrapment.

Besides the built-in limitations of the vacuum release systems, their unpredictability in practice has been well documented by those who are responsible for aquatic systems, including pool managers, pool maintenance companies, public safety experts and public and private recreation managers. The repeated complaints of malfunction include unwarranted shut off, failure to shut off, incompatibility with the filtration and cleaning systems and regular disconnection as a result of repeated failures. Just last month in Tennessee a child was rescued just in time after the vacuum system backup failed to engage.

The Commission acted in accordance with the expert advice of its technical staff. It did so only after also considering the contrary views presented by the inventor of the vacuum release system, who wanted the Commission to mandate the use of his product; pool safety advocates, many of whom were influenced and mobilized by the backup system manufacturer; and, a few members of Congress who had been lobbied by the back-up system manufacturer. While these parties argued that an unblockable drain cover does not provide the "layers of protection" required by the VGB Act, a majority of Commissioners recognized that the VGB Act's overriding intent to prevent child drowning was best served by reasonably and lawfully interpreting "unblockable drain" to include these newly invented systems that cover a blockable drain and convert it to an unblockable drain. The wisdom of their judgment is confirmed by the fact that, since that time, there has not been a single entrapment incident in a pool equipped with a compliant unblockable drain cover.

Then, in September 2011, Commissioner Bob Adler, who had previously voted with the majority, placed on the agenda a vote to revoke our original interpretation of "unblockable drain" to no longer permit consideration of these new covers. Moreover, Commissioner Adler and his two Democrat colleagues did so without notice to the public or any opportunity for public comment, and without a public briefing before the vote. They even refused my colleague Nancy Nord's request to at least notify, prior to the vote, the state agencies responsible for pool administration and safety and obtain their input. And after the majority rushed through this significant change, the Chair took the virtually unprecedented step of choosing not to issue a press release even informing the public of the Commission's decision.

While the vacuum release systems can be expensive to purchase, the real cost can be their integration with the other complicated systems including the compressors, the pump, the filtration cleaning process and the state health codes that require water turnover at specific rates. At the pool to which I belong, the price of compliance went from an original price of several thousand dollars to almost $50,000 for final installation. It is therefore not surprising that we later learned from numerous municipal park and recreation departments, as well as nonprofit groups created to promote aquatic recreation safety, that, as a result of the Commission's precipitous and inexplicable action, many state, municipal and other public pool operators will be unable to afford this new and expensive mandate coming shortly on the heels of the expensive work required to come into compliance with the Commission's original interpretation. As a result, many public pools opened late or closed, with the brunt of the losses suffered by economically-disadvantaged regions. There have been no injuries associated with compliant pool drains since 2008. But the CPSC estimates that 4400 children under 15 suffered emergency room treated submersion injuries in 2011. Children cannot learn to swim in closed pools, and economically disadvantaged children are at the greatest risk of drowning.

To date, over 1100 pools have closed throughout the country as a result of the cost of maintaining their operation.[2] This outcome is inconsistent with even the most basic concepts of rational cost-benefit based rulemaking.

This abrupt change in the law has also put out of business the manufacturers of unblockable drain covers, who no longer have a market for their product. Cash strapped public pool owners required to install vacuum release systems will not also bear the additional cost of an unblockable drain cover when it is no longer required. Unfortunately, the absence from the market of unblockable drain covers also leaves private pool owners without the most effective means to prevent drain entrapment in pools with single main drains. And many who are unable to afford even the inferior protection of a vacuum release system will be left with no protection against drain entrapment. Ironically, the Virginia Graeme Baker Act was named after a little girl who was eviscerated in the drain of her family's private pool. The Commission's reinterpretation makes it more likely other families will suffer the same tragic loss.

The Attempt to Impose Unjustifiably Burdensome Recordkeeping Requirements with the Interpretation of "Representative Sample".

In H.R. 2715, Congress changed the sampling requirements for periodic testing from using random samples to representative samples. This provided significant relief to manufacturers, because "random" sample has a highly technical/mathematical meaning in manufacturing processes, as distinguished from "representative' sample, which has only a common usage meaning. Congress directed the Commission to establish protocols and standards for testing "representative samples".

The Draft Final rule for the testing of representative samples prepared by CPSC staff properly recognized Congress' intent by defining "representative" according to its common meaning. It afforded manufacturers the flexibility to select samples that best suited their product and production process, so long it provided a basis for inferring the compliance of the untested samples.

But the Draft Final rule also included costly new record keeping requirements that were not mandated by law. The draft final rule would have required the creation and maintenance of records that our own economists estimate would cost manufacturers $32.3 million in the first year alone, with another $1.3 million to $6.5 million every year thereafter. And this cost is in addition to the enormous burden of the record keeping already required by 16 C.F.R. part 1107 – Testing and Labeling Pertaining to Product Certification. Regardless of which of the three alternative testing intervals a manufacturer selects to comply with the continued testing requirement under that rule, it must create and maintain for five years extensive records that far exceed what is necessary to ensure continued compliance under the CPSIA and to facilitate enforcement.

[2]Mick Nelson, USA Swimming. Personal Interview, July 24, 2012

These additional recordkeeping burdens were not imposed because my colleague Nancy Nord and I were able to block approval of the rule. But there can be little doubt that when the Democrats regain their majority at the end of my term in October 2012, there will still be no cost-benefit analysis, and the recordkeeping requirements of the representative sample rule will become law.

Little Hope for the Future

Opportunities remain for the Commission to ameliorate the unjustified burdens it has imposed on the industries it regulates, but I fear the formation of a majority with the will to do so is doubtful. The Commission has yet to formulate a plan for meaningful rule review, and the Chair is seeking new opportunities to regulate without regard for cost.

The Failure to Complete a Rule Review Plan

In July 2011, the President gave each independent regulatory agency 120 days to develop and release to the public a plan for the periodic review of its existing significant regulations to determine whether any should be modified, streamlined, expanded, or repealed so as to make the agency's regulatory program more effective or less burdensome in achieving regulatory objectives. Under Chairman Tenenbaum's leadership, staff did not present a draft plan to the Commission until the end of April 2012. Since that time, I have become increasingly pessimistic about the prospects that a Commission majority will agree to undertake *meaningful* rule review within the spirit of the President's request.

I have two principal concerns with the draft plan released to the public that, unless there is a change in the regulatory philosophy of the Democrats on the Commission, are unlikely to be allayed. First, rule review should, as the President requested, focus on the reduction of regulatory burdens, with prioritization for review given to those rules that impose the greatest burden on commerce. The goal of regulatory review should be to *meaningfully* reduce regulatory burdens. Instead, the draft plan expands the scope of the rules subject to review to include very minor provisions, and does not call for prioritization based on cost or any other measurable burden. In fact, the Democrats recently made the disingenuous claim in an op-ed that they were doing more than the President requested by potentially selecting for review any Commission regulation, not just significant ones. But this expansion in scope has already had its intended effect: the draft plan calls for the retrospective review of two minor and obsolete rules that have long since been superseded by other requirements. Thus, by claiming to do more, the Democrats seek political cover for a plan that does less. It also places equal, if not greater emphasis, on selecting rules with the intent to "strengthen" them and thereby increase the burdens they impose. .

Second, a full cost-benefit analysis – in the President's words, both qualitative and quantitative – should be performed on those rules that are selected for review. Otherwise, the President's goal of ensuring that benefits justify costs cannot possibly be achieved.

In deference to the Commission's internal rules discouraging public disclosure of private deliberations, I will not detail the Commissioners' efforts to negotiate a compromise rule review plan. Suffice it to say that we would not still be negotiating three months after receiving staff's draft plan if a Commission majority shared these core principals.

Efforts to Exempt More Rules From Cost-Benefit Analysis

Under existing law, the CPSC cannot promulgate a consumer product safety rule until it has performed an analysis of the potential benefits and costs of the rule. That analysis must then show that the benefits expected from the rule bear a reasonable relationship to its costs and that the rule imposes the least burdensome requirement to reduce the risk of injury. However, the CPSIA took the extraordinary step of exempting the Commission from those requirements as we established new mandatory rules governing certain toddler and infant products.

Having had the freedom to regulate without the need for a rational justification, the Chair now seeks to expand those powers. In her July 17, 2012, testimony before the Senate Committee on Appropriations, Subcommittee on Financial Services and General Government, Chairman Tenenbaum urged the Subcommittee to amend the Flammable Fabrics Act to permit "this type of flexibility for rules regarding flammability of upholstered furniture" because it "would be very helpful and may allow for expedited consideration of the proposed rules."

The Commission has been studying means to address the risk of the flammability of upholstered furniture and contemplating potential rulemaking *for over twenty years*. Action has yet to be taken because it is such a complicated issue, both in terms of demonstrating the efficacy of risk reduction alternatives, and ensuring that they do not have unintended and more harmful consequences, such as has occurred with the introduction of potentially hazardous flame retardant chemicals in California.

There is no doubt that a proposed rule addressing the flammability of fabrics could be "expedited" if there was no need to establish the efficacy of the rule, or that its quantitative and qualitative costs are justified. But such rulemaking would likely close businesses, increase the cost to American consumers, and reduce choices and options in the market, all for unproven benefits. This is exactly what both Congress and the President recognize is undermining the country's economic recovery.

Many speeches have been made and much has written by both the current administration and Congress urging federal regulatory agencies to reduce the crushing costs of excessive regulation by following the simple common sense approach of measuring the costs and benefits of regulation, and only imposing justified burdens. Three years as a Commissioner has taught me how difficult such a seemingly simple approach can be, when it is obstructed by individuals whose regulatory philosophy is: more is better, and don't bother me about the cost.

Mrs. BONO MACK. Thank you, Commissioner, and again, I thank you all very much for your testimony and for your hard work and your dedication to these issues.

And now I recognize myself for 5 minutes for questioning and would like to direct my first question to Commissioner Tenenbaum. It might be a little bit outside of the ordinary question you get, but something that I have been looking at and you all came screaming to mind is the problem with bath salts. In recent months the news has been overflowing of the reports on the health implications of designer drugs that are sold and labeled as bath salts. The CDC has reports on file that date back to 2010 showing numerous instances of people being hospitalized and even dying from these substances. Despite the fact that the DEA has banned some ingredients, online pharmacies and small minimart-type stores continue to sell them. They are labeled bath salts, and they clearly say on them "not for human consumption." And it is an attempt to avoid the DEA ban. And despite that fact, there is no legitimate purpose as a bath salt.

Does the CPSC have any jurisdiction to regulate the sale of products like legitimate bath salts?

Ms. TENENBAUM. Thank you, Madam Chairman.

That may fall under the category of cosmetics under the Food and Drug Administration, but I would like to check with our legal staff when I return to the Commission and get you an answer for that. But it might be a cosmetic and, as such, would not be under our jurisdiction.

Mrs. BONO MACK. Has this ever risen to the level of your interest? Have you seen it out there? Have you seen the stories and said, "Can I take a look at that?"

Ms. TENENBAUM. I have seen the stories. I don't believe our staff has investigated it because it might not fall under our jurisdiction.

Mrs. BONO MACK. Could you possibly take a look and see if there is—I mean, these have very seriously——

Ms. TENENBAUM. Certainly, I certainly will.

Mrs. BONO MACK [continuing]. Dangerous substances that are out there, and I would hope that Commissioner Adler as well would take a strong look at that and see how we can throw the kitchen sink without these dangerous bath salts.

Ms. TENENBAUM. And we also could meet with the FDA to talk about how jointly we could address the hazards. So we will follow up on that for you.

Mrs. BONO MACK. I appreciate it very much.

Also something, I did send you a letter, Commissioner Tenenbaum, about the thought of launching a Facebook fan page. Can you tell me what the status of the Commission's plans are? Did you happen to send a letter back to me on this matter?

Ms. TENENBAUM. No. First of all, all the Commissioners have voiced support for the concept of having social media and using social media to educate the public on risks such as soft bedding, carbon monoxide, drowning, and furniture tip-overs. There is an issue, however, on whether or not Facebook would violate section 6(h) of the CPSA, which requires us that if we obtain information on a manufacturer, that we cannot give that information out publicly without obtaining the consent of the manufacturer. So the issue is

can someone—if we had a Facebook, and a person posted something about a manufacturer as a comment, would that mean we obtained information; as such would we have to scrub all of that information and ascertain its accuracy before it is posted? That would require too much resources from the Commission.

So we have not made a decision. Our general counsel's office is continuing to work on all of the issues, and we will provide you with that memorandum when or if we decide to go forward with Facebook.

Mrs. BONO MACK. So to clarify, the general counsel just has not opined on that matter yet at all?

Ms. TENENBAUM. She and her staff have worked hard on that, and it is not completed. Other offices in the Commission, other Commissioners had raised other legal issues that required more legal research, and so they have not finished that memorandum.

Mrs. BONO MACK. Thank you.

And Commissioner Northup?

Ms. NORTHUP. Madam Chair, I think it would mislead, misrepresent the position of at least myself and maybe Commissioner Nord that we are all in support of opening a Facebook page. While we acknowledge that we can understand the benefit, I, at least, and, I think, Commissioner Nord, believe it absolutely would violate the overarching rules in our Commission, and that 6(b) is not exactly as the chairman described it. That sort of misrepresents 6(b)'s requirements.

But I would also point out to you that the database, in the database, that you all suspended the 6(b) requirements for the database, and then we wrote that rule, and it is now under attack in the courts. Someone has filed suit against us that they have not—that we have violated the laws. If we lose that case, it would almost certainly say that any putting up of Facebook would violate the protections of 6(b).

And I might say it will make—if we lose that case, we could possibly undo millions of dollars of work we have done on this and have to rewrite the rule, something that I claimed all the way through the process.

Mrs. BONO MACK. Thank you very much.

At this point I will recognize Mr. Butterfield for 5 minutes.

Mr. BUTTERFIELD. I thank the chairman, and also thank the gentlelady from Illinois for sitting in the Chair for me this morning. I have had a very busy morning, and I thank her very much.

In March 2011, I wrote a letter to Chairman Upton and to the chairman of this subcommittee asking that the subcommittee hold a hearing concerning questions about the level of protection new and used football helmets provide athletes of all ages. In particular, concerns had been raised around this time about what kind of injuries can be prevented with the football helmet, and about whether used helmets continue to provide a sufficient level of protection against the injuries they are designed to guard against.

So far this subcommittee hasn't acted to look further into these issues. I understand the CPSC has been engaged on these issues since they first drew scrutiny, and that you plan to become more engaged through a new initiative with the NFL and the CDC, among others. So I am going to ask the Chairman, Chairman

Tenenbaum, can you please discuss all aspects of the work the CPSC is doing in this area, the status of that work, and where you plan or might like to see these efforts go?

Ms. TENENBAUM. Thank you. I would be happy to talk about our work with the NFL. Like you, I am very concerned with the brain injuries in football and sports, especially those that affect young people, high school and college athletes. Because these injuries have such devastating consequence, this issue has been a priority for me. And our efforts have a short-, medium-, and long-term focus.

In the short term, we would like to have a partnership with the NCAA, and the NFL, and the CDC, major manufacturers, and the voluntary standards to see what kind of reconditioning steps that we can take. All manufacturers with the exception of one have agreed to put a label on the new helmet which says the date that the helmet was manufactured, and gives a date that it should be reconditioned, optimally within 10 years.

We also have worked with the NFL and will be making announcements this weekend in order to drive a culture change and have education in terms of how to avoid head injuries when playing football. Also, the NFL has funded a program for four communities where they will give helmets to schools where economically disadvantaged youth play. So these new helmets will help tremendously as well.

Mr. BUTTERFIELD. Well, thank you for your work in that area. Is there anything we can or should do legislatively to support what you are doing?

Ms. TENENBAUM. Well, we have—the research on helmets is not complete in terms of we have not found that there is a helmet that will prevent concussions. So we hope to monitor that. We hope this committee will stay interested in that and work with us on it because that would ultimately prevent injuries.

Mr. BUTTERFIELD. Thank you.

Mr. Adler, is there anything that you can add to this conversation about helmets?

Mr. ADLER. What I want to add is my personal thanks and commendation to the Chair for taking this on as a personal task and for dedicating a very valuable staff person to go around the country and work on this. I think what you have heard from the results that she has discussed are really wonderful results. I think she deserves almost total credit for doing that, and I think it is an important endeavor, and I hope it continues.

Mr. BUTTERFIELD. Well, when I met with her in my office a few months ago, she told me it was one of her priorities.

Mr. ADLER. Well, it is, and I think she and her staff have done an excellent job.

Mr. BUTTERFIELD. Yes. All right.

Let's see. One of the biggest victories for consumers, consumer advocates, and those of us who believe in government transparency was the creation through CPSIA of the publicly available Consumer Product Safety Information Database. This database launched in March of last year at www.saferproducts.gov. There consumers can both file safety complaints about consumer products and view complaints by other consumers that have met the stand-

ards for inclusion in the database. And before Congress mandated creation of this database, the American public had almost no access to information provided by consumers to the CPSC about injuries from the products they use.

Let me ask the Chairman or Mr. Adler, can you please discuss some of the statistics and trends you are seeing related to the database, like how many complaints are being filed and what types of complaints, et cetera?

Ms. TENENBAUM. We receive on average 600 per month. In total we received a little over—almost 9,600 reports of harm posted on the saferproducts.gov as of July the 27th of this year. Over 1,000 of these reports have been assigned to follow-up by our investigators, resulting in 875 completed investigations to date.

There were some on the Commission that said this would be a place where trial lawyers would try to salt the database. We have found that 97 percent of all reports are of consumers who own the product and who have had experience personally with the product. The three top categories have been kitchen appliances, 33 percent; nursery equipment or supplies is about 8 percent; and toys are about 5 percent.

When you amended the CPSA to Public Law 112–28, you asked to us require the serial number. We found that the model of the serial number now, 88 percent are filling that portion in; 88 percent is nonblank. So we have used it to recall two products, and we think that it has been generally well accepted.

Mr. BUTTERFIELD. Thank you. I believe my time is expired. I thank you, and I thank you all of the Commissioners for the service that you render to our country.

I yield back.

Mrs. BONO MACK. Thank you, Mr. Butterfield.

The Chair recognizes Mr. Guthrie for 5 minutes.

Mr. GUTHRIE. Thank you, Madam Chairman, for the recognition, and thank you for my colleague from Kentucky here with us today, and who some of you may know, or may not know, her sister was one of our great Olympians in 1984. And so talking about swimming pools and athletes here today, it is really—how proud she made Kentucky and how proud she made America.

There is another Louisvillian, I can tell this, Chris Burke. Many of you know about Chris. He played at St. X. He hit the walk-off home run for Houston to beat the Braves. And somebody said about him, said when he was like 6, he was out hitting the ball every day. And they said he lived a moment of a lifetime, but he spent a lifetime getting to that moment. You know how hard our Olympic athletes are working to get there, and it is always great to praise your sister. Those great billboards in Louisville are always fun to see.

In Shelby County in my district, there is a table saw manufacturer, and I am not going to ask a question, I just want to bring up—and their concern, you were going down—the Commissioner is looking at table saw technology, and nobody is saying that what—the technology you are looking at is not safer and makes things safer. Their concern is, is it patented, and the expense of it. So just making sure that there are some—as we look at new standards as opportunities for other types of technologies and things move for-

ward, that creates the same kind of safety standards. So I just wanted to bring that forward.

But I want to talk to Commissioner Northup on the President has issued Executive Orders on regulations, and he talked in the State of the Union how the regulations are strangling the economy in a lot of ways, and putting forth opportunities to move forward. I think there were two Executive Orders, and I guess my question—I can tell you what they are, but I think you guys are aware of them; if not, I can go through. But I just want to know what the CPSC has done to implement the Executive Orders of the President on reviewing regulations.

Ms. NORTHUP. Well, we are considering a package right now, although it has been a couple of months. It has been sort of dangling out there without agreement.

Let me just say that the President and Mr. Cass Sunstein have both written extensively about it. They have both said their primary purpose, and I have a quote right here, is to insist on pragmatic, evidence-based, cost-effective rules. They specifically talked about looking at major rules, rules that affected a significant portion of the economy. They also talked about doing cost-benefit analysis.

You have seen both in the previous testimony of the Chair in the Senate and now Commissioner Adler today the sort of resistance to cost-benefit analysis, that the benefit has to justify the cost. And this has been something we have publicly debated. I think that in the name of safety, you can just about adopt the most expensive, as we have seen, new standards that drive businesses out of business. So I believe we ought to do some cost-benefit analysis on the rules that we look at.

The second thing is we need to look at major rules, and this year, for example, we have talked about two retrospective ones. One is the testing of toy caps. Toy caps, that is an old standard, was—has long been out of date. Nobody uses it. It was absolutely a nothing regulation. Nobody was using it. It has been overcome by the new F963 toy standards, new testing standards. And so to say we used retrospective review to bring the toy cap standards into modern times is to ignore, in my opinion, the intention of the Executive Orders and the spirit of them.

And so as we talk about what our plan is going forward, I think we should agree that we are going to look at major rules, rules that have a significant economic impact as the President and Mr. Sunstein have talked about in their articles and, secondly, agree that we will do some cost-benefit analysis, and the conclusion of cost-benefit is that the benefit will be in proportion to the cost.

Right now we have Reg Flex analysis. You will hear some of the Commissioners talk about, well, isn't that enough? But we have blown through rule after rule where it is clear that the analysis of the economic impact does not justify the new safety. It didn't matter. With Reg Flex analysis, all you have to do is the analysis; you don't have to create a finding that it is justified.

Mr. GUTHRIE. Well, thank you. I am about out of time. And I just want to say, as we look at the reg review process in your Commission and all over, in terms of just the number of regs that we were looking at, what is actually hurting the economy? And there is a

cement plant, Louisville Cemex over on Dixie Highway, that is in my district actually that is threatened by some regulations coming forward. So we can look at numbers of regs to look at or what actually makes big impact, and we need to look at ones that make big impact on the economy.

I yield back.

Ms. NORTHUP. Of course, I agree.

Mrs. BONO MACK. Thank you.

And, Ms. Schakowsky, you are recognized for 5 minutes.

Ms. SCHAKOWSKY. Thank you.

You know, I am looking at your testimony, Commissioner Nord—no, I guess it was Northup—and you have in there "the feverish regulatory pace." You know, we passed the CPSIA 4 years ago, and this idea that somehow we are in a feverish regulatory pace—and it was in Mr. Adler's testimony that in the 31 years that—since the CPSC was saddled with unique requirements, I think you are talking about the emphasis on cost-benefit analysis, there were nine consumer product safety rules, over roughly one every 3½ years. And so in the last 4 years, I am happy to say there is 10 safety rules that came out.

And, you know, I mean, I have worked with kids in danger on this crib stuff for a very long time, and the play yards for a very long time. I don't think that most consumers would think this is about a feverish regulatory pace of finally getting this done.

So I want to ask you, Chairman Tenenbaum, how would the old way have impacted your ability to improve the safety of durable infant and toddler goods? Would you have been able to promulgate the crib rule as quickly as you did, or the play yard rule, and what impact would that have had on the safety of our children, which ought to be, it seems to me, the chief focus of the hearing today?

Ms. TENENBAUM. Thank you, Congresswoman Schakowsky.

We would not have been able to promulgate the infant durable nursery equipment rules on the schedule that Congress mandated that we promulgate them. We are required under the CPSIA to put forth two rules every 6 months on durable nursery equipment. Since the CPSC—CPSIA passed, we have written 41 rules, all of which were required by the law. We have not gone off afield and created rules. All of the rules were required of us under the CPSIA. So had we not been able to work with the standards committee and industry to write the standards for the crib and then adopt it as our rule, it would have taken years to do cost-benefit analysis.

I am not against cost-benefit analysis. I think sometimes it is justified, but when you are looking at trying to have rules that protect the safety of children and infants as this Congress—as Congress passed under CPSIA, having the Administrative Procedures Act helped us expedite the process, and we worked hand in glove with industry. Industry helped write these rules.

Ms. SCHAKOWSKY. Thank you.

Ms. NORTHUP. May I respond?

Ms. SCHAKOWSKY. Actually I have a question for Mr. Adler on a totally different subject, and I just want to get it in, because I have a—I am cochair of a seniors task force of the Democratic Caucus. And you briefly mentioned about older Americans and a particular

vulnerability, and I am just wondering if you could explain that a little further.

Mr. ADLER. Yes. One of the things that the Congress has been particularly sensitive to is vulnerable populations. And as it turns out, the vulnerable population we have been dedicating our attention and resources to over the years, properly so, has been infants. But as part of this growing, almost exploding demographic, I have been very concerned about the impact of dangerous products on the senior population.

If you look at the injury patterns for seniors, they almost always exceed the population at large. It is not as though—and falls are a huge part of it, and fires are another huge part.

There are a number of products that we could probably take some measures to help the elderly with, and I will give you just one quick example. The Commission just wrote a section 104 rule for infant bed rails. Well, as it turns out, the elderly suffer death at a much greater rate from bed rails than infants do.

And it may well be that the fix for adult bed rails is not too different from infant bed rails. In other words, there are many, many projects that we ought to be addressing themselves to.

The CDC just came up with a national plan for dealing with childhood injuries, and I have called for a national plan with CDC for adult injuries as well. It is a very, very important issue, and I hope to convince my colleagues to pay more attention to it. And I thank you for asking.

Ms. SCHAKOWSKY. Thank you.

I am out of time, and I yield back.

Mrs. BONO MACK. Thank you, Ms. Schakowsky.

The Chair recognizes the vice chair of the subcommittee, Mrs. Blackburn, for 5 minutes.

Mrs. BLACKBURN. Thank you, Madam Chairman; and thank you all for being with us this morning. Nice and timely. I will have to say you have created quite a little stir in the last week over an issue of Buckyballs. And I would just like to ask, Madam Chairman, how it is that you have taken such a hard-line stance against Buckyballs.

And I tell you, reading all this and looking at it after the information came out, and having two grandchildren, one that just turned four and one that just turned three, you can compare this to toys like Hungry Hungry Hippo, which comes with all these marbles. It has been on the market for about 30 years. There is a Fishing Well that also comes with marbles. It has been on the market for a long time. These are toys that we play with.

So you know what I am having a hard time doing is understanding how you could come down against Buckyballs and Buckycubes when it is clearly noted that they are for children ages 14 and above and Hungry Hungry Hippo and Fishing Well are for children that are 3 and above. So it doesn't make a whole lot of sense to me as to what you are doing. So I was wondering: Why?

Ms. TENENBAUM. Well, I appreciate that question. It certainly is timely.

I want to explain to you why we cannot comment on the merits. We did not ban Rare Earth magnets, which is what Buckyballs and

the category that they are. We referred the matter to an administrative law judge. That administrative law——

Mrs. BLACKBURN. I am going to stop you right there, if I may, please, ma'am.

You made the decision to go ahead with the recall, didn't you?

Ms. TENENBAUM. No, we did not. We made the decision to refer the matter to an administrative law judge. That judge will make the determination what to do with the product.

Mrs. BLACKBURN. What caused you to make that decision? We as Members of Congress have the right to ask you that question.

Ms. TENENBAUM. Well, we will be the appellate body if the administrative law judge's decision——

Mrs. BLACKBURN. All right. Then let's talk about the administrative law judge.

Ms. TENENBAUM. I just wanted to lay the groundwork why I can't really get into the merits. Because we will be the appellate judges, so to speak.

So let me say that we have a well-documented record as being alarmed by the serious and hidden hazards to children. The difference between Rare Earth magnets and marbles is that marbles do not cling together in the intestine. Children have had—a large number of children have had invasive surgery to remove these balls once they are in their intestine because they clamp, causing a huge blockage.

Mrs. BLACKBURN. They are clearly labeled "Not for Children." So let me ask you this: What about sparklers? We have just had July 4th. So why don't you outlaw sparklers?

Ms. TENENBAUM. We do set limits on sparklers in terms of the heat they can generate. We do have rules.

Mrs. BLACKBURN. But you have injuries. You don't issue recalls.

We have just built a playhouse for the grandsons. My husband engineered this great thing. He had all sorts of power tools out there, and they had their little Black & Decker play set. What about power tools?

Ms. TENENBAUM. There are a number of hazard in the marketplace. That is why the Consumer Product Safety Commission exists.

Mrs. BLACKBURN. What about alcoholic beverages?

Ms. TENENBAUM. There certainly are.

Mrs. BLACKBURN. You have always got these alcohol poisoning cases and things of that nature.

So let me go back to this administrative law judge.CPSC does not have an administrative law judge, correct?

Ms. TENENBAUM. No, we referred this to an administrative law judge for a hearing, and that judge will determine whether or not the product——

Mrs. BLACKBURN. Where is that judge going to come from?

Ms. TENENBAUM. That judge would be right here in Washington, DC, probably, or it might be in Maryland.

Mrs. BLACKBURN. So when this case is filed, the lawyers who try the case have to be separated from those who advise the Commission, correct?

Ms. TENENBAUM. That is correct.

Mrs. BLACKBURN. OK. Now that the lawyers all work together in the Office of the General Counsel, how will you ensure appropriate separation with these two groups of lawyers?

Ms. TENENBAUM. Our Office of Legal Counsel has set up a wall, and we are all abiding by that.

Mrs. BLACKBURN. A physical wall or an understood——

Ms. TENENBAUM. A wall within the legal context so there will be no communication.

Mrs. BLACKBURN. All right. And the Director of Compliance recently left that position and is now working with the Office of General Counsel also, is that correct?

Ms. TENENBAUM. That is correct, but I can't comment on the involvement of that official.

Mrs. BLACKBURN. And who is now the Acting Director of Compliance?

Ms. TENENBAUM. Marc Schoem. But he has recused himself and has not been involved in this case.

Mrs. BLACKBURN. Is he a lawyer?

Ms. TENENBAUM. No, he is Acting Director.

Mrs. BLACKBURN. It is supposed to be a lawyer. The CPSA requires that a lawyer be the Director of Compliance.

Ms. TENENBAUM. We do. And it is in transition. And so we have, I believe, 90 days.

Mrs. BLACKBURN. So you have got 90 days to make that right.

Ms. TENENBAUM. We have 90 days in order to fill the position with a lawyer.

Mrs. BLACKBURN. OK.

Ms. TENENBAUM. I am saying it is 90 days. It could be more. I have to look at the statute.

Mrs. BLACKBURN. The Commission authorized the filing of the complaint against Buckyballs last month, right?

Ms. TENENBAUM. Yes. It was a bipartisan decision.

Mrs. BLACKBURN. And it was signed by the executive director?

Ms. TENENBAUM. Yes.

Mrs. BLACKBURN. Is he a political appointee?

Ms. TENENBAUM. Yes, he is. An SES as well.

Mrs. BLACKBURN. We have got other questions. I am out of time. You have been generous. Thank you, Madam Chairman.

Mrs. BONO MACK. I thank the gentlelady.

The Chair recognizes Mr. Kinzinger for 5 minutes.

Mr. KINZINGER. Thank you, Madam Chair.

Ms. Nord, if I have some time at the end, I will let you to respond to my colleague from Illinois.

I want to thank the Commissioners for being here. I want to touch on a topic that has the potential to impact several manufacturing sectors, which is important to my district.

As the Commissioners are aware, phthalates are important components in products ranging from wire coverings, flooring, and in automobiles. The Chronic Hazard Advisory Panel's review of phthalates could set a precedent for the use of the product outside of children's toys, and I want to ensure the science that is used is transparent, properly peer-reviewed, and publicly available.

Chairman Tenenbaum, OMB has described peer review as one of the important procedures used to ensure the quality of published

information meets the standards of the scientific and technical community. To ensure the scientific integrity of the document, the draft report should be released for public comment before it goes to peer review, stakeholder participation should be encouraged, and the peer reviewer should be provided with all the data and studies provided to the CHAP.

Can you ensure us that the peer review of the CHAP's draft report will be conducted in accordance with current OMB guidelines for peer review of highly influential scientific assessments, with particular attention to the need for transparency and public participation?

I think this should probably be a fairly quick answer.

Ms. TENENBAUM. The Chronic Hazard Advisory Panel is continuing its work. We keep an arm's-length relationship with that panel because they operate independently. I would like to talk with our Office of General Counsel to see how they are proceeding in terms of the peer review and write you a letter and get back with you.

Mr. KINZINGER. That would be great. I would love to hear back. Because I think obviously to have that as an open and transparent process for something so big and so important is essential. We will stay on top of that, and I appreciate your responding to that, too.

Do you believe that the CHAP should review all relevant data, including the most recent best available peer-reviewed scientific studies?

Ms. TENENBAUM. I certainly do.

Mr. KINZINGER. What procedures have you put in place to ensure that the CHAP and the Commission are weighing all relevant data and the best available science?

Ms. TENENBAUM. Again, the Chronic Hazard Advisory Panel was mandated under CPSA, and we created it to look at phthalates, the three that were temporarily banned and other phthalates if they so find that others should be in the report. We are awaiting their report. The Commissioners do not interact with the CHAP because it has to be an independent body, but our staff has been there to make sure they follow appropriate procedures.

If you have questions, if you will just submit them to us, we will write you and give you the full detail on how the CHAP has operated.

Mr. KINZINGER. You all specifically, though, comply with OMB's peer-review process and everything like that, right?

Ms. TENENBAUM. The peer-review process was vetted through the Office of General Counsel, and they were advising the CHAP on how to proceed with that.

Mr. KINZINGER. Can you assure me, before the Commission issues its final rules under section 108, that you will publish a proposed rule for comment first?

Ms. TENENBAUM. I will have to get back with you on that. I don't know that that is the procedure that we will follow. We will receive the report and then—but we will answer your questions fully on the procedure.

Mr. KINZINGER. But prior to that what would be your concerns with publishing a proposed rule for comment?

Ms. TENENBAUM. Well, I want to first make sure that the CHAP operates independently and that it has no undue influence by any of the Commissioners and that it makes its best scientific findings. And then we will also, in the spirit of transparency, which we operate at the Commission, we will follow what the advice is of counsel on how to proceed.

Mr. KINZINGER. We look forward to staying in touch with you.

Ms. TENENBAUM. We will certainly answer your questions in written form, too, so that you will have these.

Mr. KINZINGER. Ms. Nord.

Ms. NORD. Thank you.

In responding to the question about a feverish regulatory pace compared to what we were doing before, I just would like to draw the committee's attention to the information in Commissioner Adler's statement about all the accomplishments of the agency from 1972 through the 30 years following and how big an impact this agency has made. So I don't think that we were acting at a snail's pace.

With respect to the crib standard, first of all, I supported the crib standard. All of us did. In fact, I initiated when I was the acting chairman the AMPR that got the thing rolling. What I am concerned about is the manner in which we implemented the standard, and I think it flows directly from the fact that we didn't do the hard workup front.

Just to give you a flavor of this, the staff came up with an effective date. The staff in their Reg Flex analysis said that they didn't anticipate that small retailers would be impacted. The retailers had worked out a deal with manufacturers for a retrofit kit. We did not even approve the use of that retrofit kit until about a month before the rule goes into effect. Another group comes in and says, oh, we can't meet the effective date; can we have longer time? We give them 2 years. Another group comes in 2 weeks before the effective date and says, we can't make this date. We give them another year.

It was just a very sloppy rollout of a rule. And that is of concern.

Mr. KINZINGER. Thank you.

Thank you, Madam Chair.

Mrs. BONO MACK. Thank you, Mr. Kinzinger.

Mr. Sarbanes, you are recognized for 5 minutes.

Mr. SARBANES. Thank you. Thank you, Madam Chair.

Thank you, Chairman Tenenbaum and Commissioners, for being with us this morning.

There is a staggering number of products, obviously, that we import, and in certain categories of percentages it is equally staggering when you think of it. Apparently, as I understand it, 99 percent of toys, 96 percent of apparel, 95 percent of fireworks, 78 percent of electrical products sold in the U.S. are manufactured someplace else. So the task, the charge, the responsibility of the Commission to kind of keep its eyes open as these imports are coming in to make sure that the standards we would like to see are being applied, obviously, that is an important part of what the Commission does.

And you have taken steps, I know, to improve that oversight and monitoring. In fact, as a result of the CPSIA and the increased au-

thorization levels for the Consumer Protection Safety Commission, I think you have now increased the number of employees that are posted at U.S. ports of entry to do this kind of oversight, and monitoring has gone from zero, which, of course, was completely ineffectual, to now 20. The U.S. has more than 300 ports of entry.

So the question is, if you have got, as I understand, employees posted in only about 15 of them, how is this going? From what I have heard, you have made great strides in the oversight, but I would be interested, Chairman Tenenbaum, in your perspective on the effort and is having the kind of coverage you now have producing a kind of deterrent effect with respect to the other ports of entry so that you know that the things coming in meet the standards. What other things can we do on that front?

Ms. TENENBAUM. Well, thank you, Congressman.

You are right. We have 20 members of our Ports Surveillance Team. And we have over 300 ports of entry. That is why it is very important that we have the methodology to target succinctly products that we think are violative coming into the ports and also that we have a very strong relationship with Customs and Border Protection.

CBP allowed us to be the first agency to have a memorandum of understanding. We now have live streaming data through their CTAC office, their Center, so that we know when shipments are coming into the port and what are in those containers before they reach the port.

With the pilot project that we have implemented, Risk Analysis Methodology, we are able to then look at repeat offenders, also products that are highly suspect or those that we monitor closely like electronics and fireworks, and we are able to with pretty great accuracy target those shipments before they are even into port and then interdict them and not let them be unloaded.

Mr. SARBANES. Would your experience—if you caught something at one of the 15 ports that you are monitoring, I guess what I am hearing is you are then in a position to be alerted to those kinds of imports coming into many other ports of entry and take action.

Ms. TENENBAUM. We are. We know repeat offenders. We also know if there is a company that doesn't have a record with us.

We are hoping to establish—and we have already created this Importer Self-Assessment Product Safety Program with CBP where we know those that are consistently in compliance, and we don't hold those shipments up. And we can let them go through the port and unload quickly. But those where you have suspect cargo or cargo that is repeatedly in noncompliance or repeat offenders, we are able to target them.

The most-stopped products are children's products. The largest categories are lead, continuing to see lead violations, flammability, and small parts that pose a choking hazard. So we are able to, with our RAM and working with CBP, be highly effective.

Mr. SARBANES. And over time is there a plan—again, I don't understand your methodology, because I haven't studied it—but would the ports of entry that you are covering with your personnel, would you rotate that? Or the ones that have been chosen ones that you want to continue to monitor always because of the nature of them? How does that work?

Ms. TENENBAUM. Well, with 20 people, we also rely on our field investigators. So we have 90 field investigators in 38 States. If we know a shipment is coming in, we can move those investigators to that port to work with CBP and the person already stationed there. So we can move people around.

And I think that is why it is so important that we get this data before the ships enter the port where this live streaming data that CTAC provides us, we know the contents of the container before it reaches us.

Mr. SARBANES. Thank you.

I yield back.

Mrs. BONO MACK. Thank you very much.

The Chair recognizes Mr. Pompeo for 5 minutes.

Mr. POMPEO. Thank you, Madam Chairman.

I am not surprised.

Now I will talk about the database a little bit. I still contend that it is happy hunting ground for the plaintiffs bar, in direct contrast to what Ms. Tenenbaum said. She said in her written statement: I think the saferproducts.gov has gained wide approval and acceptance.

I know there is a lawsuit. Ms. Nord, do you agree with that statement, that it has gained wide approval and acceptance?

Ms. NORD. I don't. I have heard a number of concerns expressed that indicate that there is not wide approval and acceptance out there.

With respect to plaintiffs using the database, when this thing rolled out and I was given a briefing on it by a consultant, the consultant went into the database and very randomly pulled up a record. The consumer was listed as a law firm. And so that has since intrigued me. And just 2 weeks ago I asked our staff if they had any idea of how many of those so-called consumers were actually law firms, and they said they had no way of knowing, but they assumed quite a few.

When the chairman says 97 percent of the users of the database or submitters of the database are consumers, you should understand that consumer is defined so broadly to mean any living person. And you don't have to have a relationship with the product or any interaction with the product in order to file a complaint as a consumer.

Mr. POMPEO. I appreciate that.

Ms. Northup, there is a lawsuit filed by some businesses. Has the court yet ruled on whether the agency has misinterpreted the law? I certainly think that it did. But has the court ruled?

Ms. NORTHUP. We don't have that information yet. As I said earlier, when we wrote the rule I wrote extensively at that time that I thought that we were writing the rule in a way that we would be vulnerable to a lawsuit. The claims made in the lawsuit were litigated publicly, and the claims they made were the very ones that we made in our argument that I think will stand. I agree with them.

If we do lose that, it will mean that our rule will have to be rewritten. It means our software will have to be redesigned. It means we could be vulnerable to a class action lawsuit by other people that feel that it has been arbitrary and capricious, was the idea

what I wrote extensively about. And so this is why paying attention to the law and not rushing to regulate and glossing over facts is important.

Another fact that is important not to gloss over is that when you say 88 percent of the items have something in the model or serial number, you should know that in many cases it is not the model or serial number. And we know that. And it is important that we give that information honestly to you. It might say: yellow high chair. And so, of course, if good information is good for consumers, bad information is really harmful to consumers.

Mr. POMPEO. I appreciate you clarifying some of the responses Ms. Tenenbaum gave.

Ms. Tenenbaum, yes or no, if the Federal court rules against the CPSC in the pending database lawsuit, will the agency pledge to immediately take down the database?

Ms. TENENBAUM. Will you repeat your question?

Mr. POMPEO. Yes, ma'am, I certainly will.

Yes or no, if the Federal court rules against CPSC in the pending database lawsuit, will the agency pledge to immediately take down the database?

Ms. TENENBAUM. No. That is not the scope of that lawsuit.

Mr. POMPEO. I appreciate the answer.

Ms. TENENBAUM. The lawsuit is under seal, and we cannot talk about it.

Mr. POMPEO. I understand. So your answer is no.

When we passed H.R. 2715 last year, it gave the CPSC authority to take steps to reduce the cost of complying with CPSIA and particularly the cost of third-party testing. I am very concerned about it. Why has the agency not done anything about that yet?

Ms. TENENBAUM. We have done something. In fact, under this Public Law 112–28 we were required within 60 days to go out for comment, and we did. We went out for comment, we received those comments, and the staff is writing now the report, which we will receive any day now. So we have done that.

In terms of rule review, the executive orders ask us to look at any rule that has an impact of a hundred million dollars annually on the economy. That is one of the rules that we are going to look at in terms of rule review.

So we have followed what Congress passed.

And regarding the model numbers for the database, 73 percent have a numeric value. So 73 percent——

Mr. POMPEO. Is it an accurate numerical value?

Ms. TENENBAUM. Yes, I assume it is. If it is in there as accurate. It doesn't say "yellow high chair." It gives the model number.

Mr. POMPEO. I appreciate that.

Ms. Nord, I hope you will encourage the Commission to do more under the authority to reduce the cost of third-party testing. Are there other things you all could be doing?

Ms. NORD. There are a number of things we could be doing. In fact, I submitted a whole list of about 40 items to the staff.

But I think the takeaway for you all should be that third-party testing is really, really expensive. So let's use that for the riskiest items. Let's have the most aggressive testing for the riskier items, and let's ease off for things that have less risk or where we know

there is high compliance. We can adjust that under the statute as it exists now.

Mrs. BONO MACK. I hate to cut you off, but your time has expired, and we are trying to get in as many members and questions before we have a series of votes on the floor.

Just to let members know, it is my hope we can get everybody through. So if we try to stick to under the gavel even, that would be great.

The Chair recognizes Mr. McKinley for 5 minutes.

Mr. MCKINLEY. Thank you, Madam Chairman.

I think it is always broad looking at the consumer product safety. I am not always sure what all that incorporates. It is consumer product safety. Do those little compact light bulbs, do they fit under your purview?

Ms. TENENBAUM. Are you talking about button batteries or the light bulbs?

Mr. MCKINLEY. The compact fluorescent units, CFBs.

Ms. TENENBAUM. Yes.

Mr. MCKINLEY. They have mercury in them. And we know that a typical household with 30 of those is the equivalent of a ton of coal being introduced inside your house. Same amount of mercury in a ton of coal as in 30 light bulbs. I just wonder, are people actually following the rules? They are taking them in a little bag and taking it up to a special disposal? Or how many of them are just throwing them in the trash can and they go to the landfill?

Ms. TENENBAUM. I don't have that data, but I share your concern.

Commissioner Adler, did you have anything to add?

Mr. ADLER. No, other than to say those definitely are our jurisdiction. Our jurisdiction is incredibly broad, as the chairman noted.

Mr. MCKINLEY. I don't know where you are going with it, because I don't think anyone is adhering to the guidelines. And the fact that we have such a fear right now of the mercury poisoning from burning coal but yet we just put 30 light bulbs in our house that bring in as much mercury as—I hope you will take it more seriously about the direction.

But let me add a couple of other things, if I could.

The lead in Chinese marbles, I understand that not too long ago there were some lead—lead was detected in some children's marbles, and those marbles obviously were rejected, appropriately. But the United States manufacturers who had never had marble detected in there now are going through some very draconian testing to see that they stay in compliance, but they have never not been in compliance. So they are being punished because of what China was doing.

Ms. TENENBAUM. The law, as passed by Congress, requires all children's products to undergo third-party testing to make sure that the lead content is below 100 parts per million, and that was set by statute as well. So domestic and imported——

Mr. MCKINLEY. Do you determine the frequency of testing to make sure? Surely you are not going to test every marble.

Ms. TENENBAUM. No. You have to test a sample initially. You pull a sample and test that. If you have a material change in the manufacturing——

Mr. MCKINLEY. Who pays for that test when you come into a plant?

Ms. TENENBAUM. The manufacturer has to pay for it.

Mr. MCKINLEY. So here is a manufacturer that has never had a violation, but maybe once a quarter they have had someone come in and do some testing. But now we are up to less than once a month they are coming in, and it is costing you $3,000-some for every one of those series of tests. And they have done nothing wrong. There has been no grounds for this other than the fact that China was trying to—once again, like they did with drywall, now they have done it with marble, that has caused this company now to spend thousands of dollars. Is that reasonable?

Ms. TENENBAUM. Well, under the law that Congress passed, all children's products must be third-party tested initially, if there is a material change, and periodically. And that is the law.

Mr. MCKINLEY. Well, there is no change on this.

So let me go to the next, the indoor air quality. Would indoor air quality be a product safety—the fact that we have carpet formaldehyde, resins, cleaning agents, other things that—we seem to be so concerned with—and rightfully so—the health of our children and adults, and we put them in an indoor air quality that has—90 percent of your time you are spending indoors, and they are exposed to all these elements. And we say, but they get asthma when they go outside. They get asthma when they go near a coal-fired powerhouse. But they spend 90 percent of their time in a home.

Ms. TENENBAUM. That is the jurisdiction of the EPA, just as the disposal of the mercury containing lights.

Mr. MCKINLEY. You just kind of wash your hands.

Ms. TENENBAUM. No, I don't. I respect the jurisdiction of other agencies.

Mr. MCKINLEY. Then you support that? Of having—you have some standard. You say it falls under your purview, but yet the disposal of it is not. You give that to the EPA.

Ms. TENENBAUM. The law gives it to the EPA.

Mr. MCKINLEY. Would you change the law?

Ms. TENENBAUM. Well, we work in partnerships with many agencies.

Mr. MCKINLEY. Would you change the law so that it stays under you so you can have control over it? Because it sounds like you——

Ms. TENENBAUM. No, you have to change the law. I am an executive branch. I follow the law.

Mr. MCKINLEY. Would you change the law? Because you seem like you say I am ready to get rid of it.

Ms. TENENBAUM. No, that is not at all what I said. I was just trying to clarify the jurisdiction of EPA and our agency.

Mr. MCKINLEY. Thank you.

I yield back my time.

Mrs. BONO MACK. The gentleman, Mr. Lance, you are recognized.

Mr. LANCE. Thank you very much, Madam Chair; and Chairman Tenenbaum and distinguished members of the Commission, thank you for your service to the Nation.

I am interested in how we can explore ways to increase efficiency and decrease costs and reduce red tape burdens without compromising safety. Commissioner Nord, thank you for the suggestions

that you have made regarding this, particularly for small-volume manufacturers.

Can you speak, Commissioner Nord, to the timeframe in which we might implement the changes you have suggested, considering the fact that Commissioner Northup may be leaving the Commission?

Ms. NORD. Yes. I am so sorry to see Commissioner Northup leave our body, because she has made such a contribution.

Mr. LANCE. I certainly agree with that.

Ms. NORD. When we were considering the testing and certification rule, the rule that was put out for comment had a low-volume exemption from testing in it. That was removed from what came up to the agency for a vote. I offered an amendment to put that back in. That amendment failed on a 3–2 vote. At that point, we had another Commissioner.

And so certainly a low-volume exemption would certainly be a way to get at this. I have been talking with a number of people who have said we have just stopped doing low-volume manufacturing because we can't afford the testing costs. I was out in southern California talking to a clothing manufacturer, and they were very explicit about it.

There are a number of other things that we can do to help companies that are struggling with how to comply with this rule. It is a very broad—overly broad, in my view—rule that imposes costs without real benefits. So I hope that the agency will reconsider its position.

Mr. LANCE. Thank you. I would urge the agency to do so. I would be happy to work with all members of the Commission on this issue, because I think it is important moving forward.

On recreational vehicles, off-highway vehicles, would you please comment, Commissioner Nord or Commissioner Northup, on the fact that if the CPSC is going to include a pass/fail test as the main criteria to evaluate the stability of these vehicles, this might cause some challenges. Shouldn't a test that is meant to pass or fail a vehicle be repeatable so that one can be assured that the same result is achieved?

Ms. NORD. Of course, any test that we would mandate, regardless of the product, has got to be repeatable. You can't put in place a testing method that nobody can predict the results from. So of course we must have repeatable tests.

Mr. LANCE. Thank you.

Commissioner Northup, do you have an opinion on that as well?

Ms. NORTHUP. No. I have not participated in the ATV because I have a conflict of interest with my husband's company.

Mr. LANCE. Thank you.

Madam Chair, I will cede the minute and a half I have left to colleagues.

Mrs. BONO MACK. We thank you very much and recognize Mr. Harper for 5 minutes.

Mr. HARPER. Thank you, Madam Chair, and thank you, Chairman, each of the Commissioners, thank you for your time, your service.

Chairman Tenenbaum, if I may ask you a few questions, I was certainly pleased to read your op-ed in The Hill last week where

you indicated that you were taking a more collaborative approach with the window covering industry regarding cord safety. I am further pleased that you have spent the time visiting manufacturing facilities to better understand the difficulties in eliminating cords for all products. Can you tell me, without revealing any proprietary information, about these visits and what you have learned?

Ms. TENENBAUM. Thank you.

It was my pleasure to travel across the United States and meet with the three major manufacturers as well as the major retailers of window coverings. I have expressed concern about the strangulation hazard for children publicly, and the Window Covering Manufacturers Association and other stakeholders are in the process of rewriting a voluntary standard, which we will have in September.

But what I have learned is that there is concern from the industry about the strangulation hazard. There are many new technologies which would remove completely this hazard. However, the industry also is—they are willing to work with us; however, they don't want to see a standard that completely does away with the cord. They can make the cord where it is not accessible to children and there are all kinds of technology that they share with us, but they don't want to eliminate having a cord entirely.

However, I am very optimistic, meeting with retailers and with the association, that everyone wants to do a massive education campaign. So that if you are buying shades and you have children at home, then you would go cordless. You would go cordless or have no shades. You could have shutters or draperies. But you remove the hazard if there are children in the home. So I am very encouraged by my conversations with them.

Mr. HARPER. How are you proposing that we move forward from here?

Ms. TENENBAUM. In September, we will receive the standard from the Window Covering Manufacturers Association. They will have voted on it. And we will continue to work with them to see how we can more and more eliminate the hazard.

We also want to work with major retailers so they can train employees at the point of sale, so that there are kiosks online that have baby registries that can also bring to the attention of people that if you have a child in the home you need to go cordless. But see if we can't address some of the fatalities and reduce the number of fatalities by an educational program that was robust.

Mr. HARPER. I am certainly a big supporter of cooperation between government and industry, particularly when it comes to some of these safety issues and how best to achieve the safest product possible.

You also discussed in your op-ed your efforts to better educate the consumer. With this in mind, can you tell me about your plans for the rest of this year and next with the Window Covering Safety Council and your efforts to educate new parents about potential hazards to children associated with window covering?

Ms. TENENBAUM. We are in the process of working with major retailers and also associations to draft that plan. So that is in process, Congressman. But we are committed. I am personally committed, because I think we can reduce the number of fatalities with a robust education program and collaboration with the industry.

Mr. HARPER. Does the Commission plan on utilizing any of its funds towards this education effort?

Ms. TENENBAUM. Well, we have limited funds. Unlike the pool safety campaign, where Congress gave us a direct appropriation, we don't have one for this. But it would be a great help to us to have one. But I think working with industry and with the retailers we can accomplish a lot without extra funding.

Mr. HARPER. Are promoting education and raising awareness some of the best tools that you have in your arsenal?

Ms. TENENBAUM. No question about it. That is how social media fits in, as well as working with people, so that we can all have a strong education campaign on any hazard.

Mr. HARPER. Thank each of you for being here, and I yield back, Madam Chair.

Mrs. BONO MACK. Thank you very much.

The Chair recognizes Mr. Olson for 5 minutes.

Mr. OLSON. I thank the Chair. I understand that votes have been called, so my comments will be brief.

But I want to thank the witnesses. Thanks for coming. Thanks for your expertise.

Chairwoman Tenenbaum, nice to see you again outside of a big storage facility outside the Port of Houston. Nice and cool here as opposed to the heat we had, even though it was the fall. Good to see you again.

As my nameplate says, I am from Texas. As you all know, Texans love the outdoors. They like to go tubing on the Hill Country rivers. They like to fishing on our lakes, the Gulf of Mexico. They like to go out there and do some hunting. Or just look at the hright stars of the Texas night sky. And one way to get access to all these great things is with ROVs. So I am very concerned when I hear that the Federal Government may be threatening the quality of life in my home State.

And so my question is for you, Commissioner Tenenbaum. I would like follow up with the line of questions by my colleague from New Jersey about the pass/fail stability tests. I understand CPSC staff supports adoption of a pass/fail stability based on the CPSC methodology. In a recent meeting, however, CPSC revealed that it has conducted no repeatability testing of its methodology or results. Do you agree to it being appropriate to base a mandatory pass or fail standard on the sample size of a single test—one test?

Ms. TENENBAUM. Well, let me premise this by saying I will need to get back with you on what the staff is talking to the Recreational Off-Highway Vehicle Association and manufacturers.

One of the things that has been brought to our attention is the number of deaths and injuries in 7 years, between 2003 and 2010. We had 165 deaths and 329 serious injuries from ROVAs is what we call, or ROVs. And 70 percent involve lateral stability turnover.

So we are looking and working with industry to develop a stronger lateral stability test. We have issues of understeerage and occupant protection. I do hope that the industry will work with us to develop a standard. My staff met with the ROVA representatives on July 19, and we are saying that we need to upgrade that standard to prevent the turnovers. And we could go to a mandatory

standard, but it is always better if we can agree with industry and come up with a strong voluntary standard.

Mr. OLSON. Yes, ma'am. I am sorry I cut you off. I am running out of time here.

Commissioner Nord, any comments on that line of questioning, ma'am?

Ms. NORD. Well, lateral stability has been just a really perplexing problem not only with ROVs but also withATVs, and it has been something that we have been struggling with for years. So if we are going to be putting forward a standard that addresses lateral stability, we have got to make sure we have get it right, got to make sure we solve the problem, and we have got to make sure that we have a test that works and is repeatable. And I think that is where we are working forward.

I fully agree with my chairman when she says that it is best to try to work cooperatively with industry to come up with something in a voluntary mode, and I hope that we can do that.

Mr. OLSON. In working cooperatively with industry, are we allowing the industry representatives to observe the testing to have some firsthand knowledge of what you are doing there so they can respond right on the scene?

Ms. TENENBAUM. Well, collaboratively means that we share information. They have shared their stability tests with us. They came in and shared it with us, and the staff had some issues with it. We need to be very open and collaborative in sharing these tests, and also the industry should realize that and say, "Yes, we have a lot of lateral turnovers, and we want to address it voluntarily."

Mr. OLSON. Sharing is a two-way street. Industry shares with you. You share with them.

I yield back the balance of my time.

Mrs. BONO MACK. I thank the gentleman very much.

As you all have heard, our votes have been called. We are down to the wire. So to begin to sum things up, I ask unanimous consent that a letter from the National Association of Manufacturers be included in the record of the hearing. It has been previously shared with Democrat staff.

Without objection, so ordered.

Rosario Palmieri
Vice President
Infrastructure, Legal and Regulatory Policy

August 1, 2012

The Honorable Mary Bono Mack
Chairman
Subcommittee on Commerce, Manufacturing and Trade
Committee on Energy and Commerce
U.S. House of Representatives
Washington, DC 20515

The Honorable G. K. Butterfield
Ranking Member
Subcommittee on Commerce, Manufacturing and Trade
Committee on Energy and Commerce
U.S. House of Representatives
Washington, DC 20515

Dear Chairman Bono Mack and Ranking Member Butterfield:

On behalf of the National Association of Manufacturers (NAM), the largest industrial trade association and the voice for 12 million men and women who make things in America, I submit these comments for the record for the hearing to be held by the Subcommittee on Commerce, Manufacturing and Trade entitled, "Oversight of the Consumer Product Safety Commission," scheduled for August 2, 2012.

One year ago today, the House of Representatives and Senate both passed your legislation—H.R. 2715 (Public Law No. 112-28)—to provide relief of burdens imposed on manufacturers and retailers by the Consumer Product Safety Improvement Act (CPSIA) of 2008. We applaud your leadership in improving the safety of consumer products while seeking to minimize the burdens imposed on stakeholders. Manufacturers of consumer products are committed to providing safe products and ensuring a well-functioning and credible product safety regime—one that gives all stakeholders the confidence they need that products meet all applicable safety standards and regulations.

As the Subcommittee discusses the progress of the Consumer Product Safety Commission (Commission or CPSC) as it implements the requirements of H.R. 2715, we urge the Subcommittee to include in its oversight other CPSC actions that pose significant costs and challenges to manufacturers. At risk are jobs and the health of U.S. companies who make consumer products.

Reducing Regulatory Burdens

Manufacturers strongly support efforts to reduce third-party testing burdens as the Commission implements the CPSIA and H.R. 2715. With the passage of H.R. 2715, Congress

directed the Commission to identify ways to reduce "third party testing costs consistent with assuring compliance with the applicable consumer product safety rules, bans, standards, and regulations." Congress clearly intends for safety in consumer products to be maintained without imposing an undue burden on manufacturers, retailers and consumers. In July 2011 the President issued Executive Order 13579, asking independent regulatory agencies to comply with the provisions of Executive Order 13563. The latter order states that our regulatory system "must identify and use the best, most innovative, and least burdensome tools for achieving regulatory ends."

Since the passage of H.R. 2715, stakeholders in the business community have submitted comments and participated in meetings with the Commission to encourage actions that would significantly reduce third-party testing burdens. The business community is concerned that, despite a directive by Congress, the Commission has been slow to adopt significant burden-reducing initiatives since H.R. 2715 was adopted.

Pursuant to H.R. 2715, in November 2011 the CPSC requested public comments on reducing the burdens associated with third-party testing. The business community has offered a number of suggestions to the Commission in response.

We are pleased that the Commission appears to embrace the wider adoption of alternative technologies, such as X-ray fluorescence (XRF) spectrometry and High Definition (HD) XRF. H.R. 2715 also modified Section 108 of the CPSIA to exclude inaccessible component parts from the phthalates limits, much as they are excluded from lead limits. The CPSC has voted to issue a Federal Register notice soliciting comments on guidance that generally mirrors the inaccessible components exception for lead. We urge the Commission to act on the other recommendations submitted and to promptly take the following steps to assure safety while reducing the costs and burdens of testing:

- The Commission should adopt a clear statement of statistical uncertainty with respect to tests results, particularly heavy metal and phthalates tests. Since the initial adoption of CPSIA, manufacturers have faced problems with inconsistent test results where products may pass one test but fail another. Products fail lead tests if any laboratory reports a single result above 100 parts-per-million (ppm), no matter how small the margin. Statistical variability in test results is a known problem and guidance from the Commission would help avoid costs of the destruction and retesting of safe products.

- We encourage the Commission to further promote non-destructive testing and to assess how manufacturers who have invested in alternative technology can rely on it directly. Currently, manufacturers who have invested and use XRF equipment in-house must still have products tested at third party testing laboratories unless they register as firewalled accredited laboratories. Even where XRF is used, destructive testing is still often necessary because products with many components must be disassembled in order to properly test them.

- The Commission should exclude paint and surface coatings present in a product at extremely low total weight from testing requirements when no risk of harm exists. Manufacturers report that the current testing regime requires them to make and supply products solely for destructive testing purposes. This is because where a product contains very small amounts of paint, laboratories must scrape surface coatings from

many products to generate an adequate sample. The toy safety standard, ASTM F963, mandated by CPSIA, includes an exemption for small amounts of paint for testing all other heavy metals, apart from lead, only because the Commission has not adopted a similar risk-based exclusion. Where a product does not contain enough paint, even in composite form, to provide a sufficient sample for a laboratory to test, it is surely an example of a situation where the enormous expense of testing, including product destruction, cannot be justified.

- The Commission should consider mechanisms to rely on other agency requirements to establish compliance with CPSIA standards. Many consumer products are effectively regulated by agencies such as the Food and Drug Administration (FDA) and the Federal Trade Commission (FTC). Executive Order 13563 stresses improved coordination across agencies to reduce costs and simplify and harmonize rules. The Commission, however, has been slow to work with other federal agencies in identifying areas of regulatory cooperation that could greatly reduce burdens.

- The Commission should expand its efforts to identify the types of plastics that do not contain one of the prohibited ortho-phthalates. Phthalate testing is particularly expensive, and the inaccessible components parts exception for phthalates will lead to significant reductions in third-party testing burden without sacrificing safety. By exempting materials known to not pose a health risk from unnecessary, expensive testing, the Commission can reduce third-party testing burdens without posing a risk to consumers.

As originally enacted, CPSIA required periodic testing of "random samples" of children's products. After the Commission proposed to implement the random sampling requirement by establishing an elaborate scheme of statistical selection that was incomprehensible to most companies, and especially to small businesses, H.R. 2715 modified this requirement by substituting the term "representative samples." Recently, the Commission deadlocked on a vote to issue a rule that offered a definition of "representative samples," largely because the rule also included additional detailed recordkeeping requirements that arguably provide minimal value at high cost. We all agree on the need to guard against the risk of testing pre-selected "golden" samples. The Commission should avoid complicating a relatively simple and straightforward standard by adding significant and unnecessary paperwork.

SaferProducts.gov: Confidentiality and Material Inaccuracy

Section 212 of the CPSIA requires the Commission to establish a publicly available database "on the safety of consumer products, and other products or substances regulated by the Commission." Consumers can report incidents involving consumer products in the database known as SaferProducts.gov. The reports are then published. Because the accuracy of information available through this database is critically important, Congress required that the Commission provide the manufacturer of a consumer product a submitted report for the database before its publication. Manufacturers are to be provided the opportunity to object to publication of confidential materials or materially inaccurate information.

Regulations adopted by the Commission as it implemented the database requirements of the CPSIA provide a procedure allowing manufacturers to request the deletion of confidential material and the exclusion of materially inaccurate information. See 16 C.F.R. § 1102.24; 16

C.F.R. § 1102.26. Both types of requests are made electronically via web-based forms within the database portal, and responses to those requests are transmitted via email from a generic mailbox. The identity of the Commission staff person or persons making the determination and transmitting information associated with the requests is not revealed.

The Commission's regulations do not provide a process of review or appeal from the original finding of the anonymous staff member, and Commissioners have acknowledged publicly that no review or appeal process exists within the agency. Information in the database about a company's products is important to manufacturers, and it is vitally important that confidential or inaccurate information not be published with the imprimatur of a government-maintained database. That is why Congress established the protections against these types of disclosures in the enacting legislation. At present, the process of reviewing requests to delete confidential or materially inaccurate information is completely opaque, and decisions are made anonymously. Once the decision is made, there is no opportunity for review or even an opportunity to identify who made the decision.

Manufacturers are sensitive to the information on their products that is available publicly. Unfounded negative or inaccurate information could be devastating. A company dissatisfied with the staff-level determinations on publishing confidential or materially inaccurate information has no alternative to respond other than litigation, which is authorized by the statute. See 15 U.S.C. § 2055a(c)(2)(C)(ii); 16 C.F.R. § 1102.24(h). Few companies are willing to bear that cost, and our court system should not be clogged with disputes that could be easily resolved by an inter-agency review process.

To ensure the accuracy of information submitted to the database, we urge the Commission to establish an internal process by which companies could seek review of denials of claims of confidentiality or material inaccuracy.

Coercive Use of Section 6(b) in Recall Cases

Section 6(b) of the Consumer Product Safety Act (CPSA), as amended, requires the CPSC to provide notice to a manufacturer or private labeler before the public disclosure of information. See 15 U.S.C. § 2055(b). The CPSIA shortened the time period for notice from 30 days to 14 days. It also amended the prohibition against releasing information reported to the Commission by firms under section 15(b) of the CPSA concerning products that are non-compliant, defective or create an unreasonable risk of serious injury or death by allowing the Commission to make disclosures of that information if the Commission had made a public interest finding that the public health and safety requires a lesser period of notice than the 14 days provided. See 15 U.S.C. § 2055(b)(5).

CPSIA amendments to this section were not intended to fundamentally change the obligation of the Commission to provide a rational process for comment and agency evaluation before potentially damaging and misleading information is released about companies and brands. To the contrary, the Commission has used the release of information to force product recalls before affording product manufacturers due process going to the merits of a claim. Manufacturers are sometimes forced to choose between unreasonable Commission demands—even if there is not a threatening hazard justifying drastically limited due process procedures—or having a demand for a product destroyed by a CPSC press release. This is particularly harmful to small firms.

Section 15 of the CPSA allows the CPSC to order a recall after a firm has an opportunity for a hearing on whether its product has a defect that creates a substantial hazard. However, not infrequently, the staff has preliminarily determined that a product presents a defect and substantial product hazard with little technical data or evidence. The Commission then has used the threat of a public interest health and safety finding and notice under section 6(b) to coerce firms—especially small businesses—to undertake recalls of their products. A firm has no opportunity to formally make its arguments to the Commissioners before they make their findings. The firm instead faces an ultimatum that results in either the destruction of product or damage to its reputation. Most small firms do not have the resources to file a Federal Court action to attempt to enjoin such a press release on short notice.

An initial determination of potential risk posed by baby slings and the tactics of the CPSC led to at least one recall and subsequent shut-down of a business. The CPSC subsequently changed course under united pressure and educational efforts from the industry and parents who understood the virtues of the products. Similar threats have been effective against many other firms making the actual issuance of such public health and safety notices a relative rarity.

The Commission should use public health and safety notices sparingly in cases of the most serious risks. It should issue such notices not based on gut feelings about risk but based on solid technical evidence and careful consideration of the firm's position. The staff should not have wide latitude to threaten such notice as a way of coercing firms into undertaking product recalls. Section 15 hearings should be the rule to ensure due process to firms before such notice and recalls except in rare, extreme cases.

Use of Social Media

Manufacturers, particularly small manufacturers, of consumer products are sensitive to the type of information publicly available through the internet. Small businesses do not have the resources to monitor and respond to digital information that can spread quickly among consumers. When information is inaccurate or harmful to a business, the results can pose a significant burden on that business and, in the case of small businesses, inflict irreversible damage.

We urge the Commission to modify initiatives to expand the use of social media that would enable information to be published on a public website without having been fully vetted by the Commission and in accordance with applicable laws and regulations. A rise in popularity of social media is not an appropriate reason for the Commission to engage in activities that are outside the scope of its governing statute and existing policies on information dissemination. Providing vehicles to publish unverified information on a website endorsed by the Commission would circumvent well-defined protections for manufacturers and trivialize efforts by Congress and the Commission to ensure the accuracy of information published by the agency.

We are concerned with the Commission's use of social networking and microblogging services to disseminate information subject to section 6 of the CPSA. The agency routinely publishes information identifying products and companies ahead of a formal press release and seemingly in violation of statute and CPSC-established regulations on the disclosure of information.

Civil Penalty Investigations

Traditionally, the Commission had an informal policy that information reported to the Commission by firms under section 15 of the CPSA, as amended, would be reviewed for timeliness within one year after the recall was announced and that an investigation would be commenced within that period. This practice enabled companies to have certainty about whether a penalty would be sought within a reasonable period of time after an issue arose. The CPSC recently has abandoned that practice without any notice to stakeholders and is commencing penalty investigations in cases where recalls occurred two, three or even four years ago.

The Commission staff also now asserts a broad document retention requirement when communicating with companies about reports filed or cases closed, advising companies to "preserve all information, documents, records and samples, now in existence or created hereafter, related to" the product at issue. This broad document preservation request, coupled with the potential for initiating penalty investigations up to five years after the product issue arises, leads to tremendous expense and uncertainty for companies without adding to product safety. Penalty investigations can be conducted soon after a recall is commenced, when the issue is fresh in the minds of those concerned, and persons familiar with the issue are still available, and applicable documents are readily located. Whether or not a violation occurs, expansive recordkeeping requirements and burdensome document requests place a significant burden on businesses.

Upon identifying a potential issue with a product, a firm engages in voluntary and costly corrective actions to minimize risk. Cases through the Commission's Fast Track Product Recall Program receive increased scrutiny for penalties merely because the affected firm does not contest the hazard determination at the beginning. These firms, that try to do the right thing and quickly remove potentially hazardous products from the marketplace, now face a lengthy and costly penalty investigation for their efforts. The Commission's actions are a major disincentive to companies to engage in the successful Fast Track recall process.

Rulemakings to Establish Mandatory Standards

Over the past few years, the CPSC has proceeded with rulemakings to establish mandatory standards for a variety of consumer products despite the prevalence of effective industry standards. Pursuant to the CPSA, in order to issue a mandatory rule, the Commission must find that an existing or voluntary standard would not be adequate, the benefits of the rule bear a reasonable relationship to its costs and the rule is the least burdensome requirement that prevents or adequately reduces the risk of injury. To issue a mandatory standard, the Commission also must make a finding that an existing voluntary standard would not prevent or adequately reduce the risk of injury in a manner less burdensome than the proposed CPSC mandatory standard. See 15 U.S.C. § 2058(f)(3). Despite the law, the CPSC has begun rulemaking proceedings that lack support and threaten industries.

Recreational Off-Highway Vehicles

In October 2009, the CPSC began a rulemaking to establish a mandatory safety standard for a relatively new class of vehicles called recreational off-highway vehicles (ROVs). Despite industry efforts to develop ANSI-accredited voluntary safety standards, the CPSC is moving forward with a mandatory standard without adequate data supporting the restrictive

design standards the agency is demanding. Industry analysis has shown that at least 90 percent of serious incidents with ROVs would not have been affected by the CPSC proposals, but were instead caused by operator actions. In addition to robust design standards, the industry has implemented a comprehensive safety plan and education initiative, which includes a hands-on driver course and state-of-the-art online education program, intended to address driver and passenger behavior that has contributed to crashes resulting in avoidable serious incidents. The CPSC's insistence on a mandatory standard will compromise the mobility and utility of the vehicles in the off-highway setting for which they are intended, negatively impacting consumer demand and costing thousands of domestic manufacturing and retail jobs. With its command and control regulatory policy, the CPSC will greatly harm an entire class of recreational vehicles with no clear improvements to safety and no justification for the costs the agency seeks to impose on manufacturers and consumers.

Table Saws

On October 11, 2011, the Commission initiated a rulemaking to establish mandatory safety standards for table saws. The rulemaking, in its current trajectory, would seek to impose a standard that could only be achieved through the use of one patented technology, thus creating a government-sponsored monopoly for the patent attorney who owns the technology. Regulation should not be used to advantage one technology or one company over another.

The Commission is proceeding with a rulemaking despite no finding that the existing voluntary standard would not prevent or adequately reduce the risk of injury in a manner less burdensome than the proposed CPSC mandatory standard. To address concerns by the agency, the industry recently updated the Underwriters Laboratory (UL) voluntary standard so that since 2010 all table saws sold must meet the new safety standard. Data used by the CPSC on table saw injuries are outdated and are not relevant to the new voluntary standards. In fact, the data used by the CPSC to proceed with the mandatory standard was collected from table saws that met the old standard. If the CPSC proceeds with a mandatory standard, such action would undermine industry's incentive to develop new alternative table saw safety technology and would impose unnecessary increased costs on consumers. Unfortunately, this rulemaking illustrates a trend at the agency where the CPSC fails to conduct adequate cost-benefit analyses with its rulemakings and imposes prohibitive costs on manufacturers and consumers without accounting for the actual risks associated with products.

Window Coverings

For the past 15 years, CPSC staff has participated in industry efforts to update the voluntary standards for corded window coverings and assisted in a nationwide education campaign to reduce the risks posed to small children. We are encouraged by the Commission's involvement in the standards development process, and the improved voluntary standards will effectively reduce the risk of injury in a manner less burdensome than a mandatory standard.

There are efforts in Congress to add authorizing language to the Financial Services and General Government Appropriations bill that would require the Commission to promulgate a rule mandating the elimination of corded window coverings. The CPSA, the Federal Hazard Substances Act and the Flammable Fabrics Act require the Commission to regulate various products through an open and transparent process. That process requires assessing the voluntary standard to see if there is substantial compliance and conducting a cost-benefit analysis. The appropriations rider is unique because it essentially amends the underlying statute

by specifying administrative procedures not currently applicable to the CPSC. This legislative provision was not discussed at a Congressional hearing, and industry was not provided the opportunity to present its position.

The Commission has not publicly responded to this effort that removes its discretion to regulate products within its jurisdiction and takes away jurisdiction from the Energy and Commerce Committee. We urge the Commission and lawmakers to oppose these attempts to force the CPSC to issue mandatory standards and to subvert the well-established and effective voluntary standards-setting process.

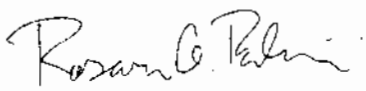
Addressing Complicated and Contradictory State and International Regulations

Companies face an expanding array of laws and regulations between states and among different countries. The proliferation of current and planned regulations at the state and local level within the United States has made it next to impossible for companies to comply with one regulation while at the same time not violating another. For example, 28 states have introduced chemical legislation for consumer products. Testing and compliance costs associated with differing requirements could strangle small businesses, and contradictory regulations will force companies to choose between two states to sell their products. Although the Commission and the Administration have stated goals of improving international regulatory cooperation, the patchwork of state, local and federal regulatory requirements increasingly disconnect the U.S. from the global marketplace. We encourage the CPSC to work with local and state officials to ensure consistency with stete and federal regulations and that standardized testing requirements flow from federal requirements to minimize testing costs.

Conclusion

The decisions and actions of the Consumer Product Safety Commission greatly impact manufacturers, who support effective regulation and share the Commission's mission to protect consumers. The business community looks forward to working with the Subcommittee in ensuring the Commission implements the provisions of law as Congress intended, while protecting consumers and minimizing regulatory burdens imposed on U.S. businesses. Thank you for your consideration of these comments.

Sincerely,



cc: Members of the Subcommittee on Commerce, Manufacturing and Trade

Mrs. BONO MACK. And, again, I would like to thank all of the Commissioners very much for your time today. I think you have shed a lot of light on some very important consumer product safety issues. I know that our committee looks forward to an ongoing and productive dialogue.

I would like to thank my colleagues, especially Mr. Butterfield and Ms. Schakowsky, for working together in a bipartisan fashion to pass H.R. 2715 last year. We enacted a very good bill that saved a lot of American jobs while providing important protections to U.S. consumers. We call that a win-win around here.

So I will be asking questions for you to submit back to us. Specifically, Ms. Northup, I had one all teed up for you. I will ask you in writing, if you could submit in return, simply to give us your conclusions in writing about your service. And thank you for your service as you leave the Commission. We are going to ask a big softball question for you. Say all you want. How would you improve the world of consumer product safety? So we look forward to that in writing.

I remind members they have 10 business days to submit questinns for the record. I ask the witnesses to please respond promptly to any questions that you receive.

I wish you all a very wonderful August and safe travels.

The hearing now is adjourned.

[Whereupon, at 11:16 a.m., the subcommittee was adjourned.]

[Material submitted for inclusion in the record follows:]

STATEMENT OF CONGRESSMAN G. K. BUTTERFIELD
DEMOCRATIC RANKING MEMBER

HOUSE COMMITTEE ON ENERGY AND COMMERCE
SUBCOMMITTEE ON COMMERCE, MANUFACTURING, AND TRADE

HEARING: "OVERSIGHT OF THE CONSUMER PRODUCT SAFETY COMMISSION"
AUGUST 2, 2012

Chairman Bono Mack, thank you for holding today's hearing on oversight of the Consumer Product Safety Commission. The CPSC serves as the watchdog on behalf of American consumers, ensuring that the products that we use every day in our homes and offices are safe and do not pose an unreasonable risk of injury or death.

In 2008, Congress provided the Commission with expanded enforcement authority, ratcheted down on the amount of lead allowed in children's products, mandated safety standards for durable infant and toddler products, and created a public consumer product safety information database. We did all this through the Consumer Product Safety Improvement Act of 2008, the C-P-S-I-A (sip-see-uh), which passed the House by a vote of 424 to 1 and was signed by President Bush in August 2008.

However, as we all know so well in Congress, sometimes our good intentions result in some unintended consequences. For example, some very small businesses were impacted by CPSIA that perhaps should not have been.

To fix some of these problems, without compromising significant health and safety protections, Chairman Bono Mack and I, over the span of many months, worked out legislation to give the CPSC more flexibility in implementing CPSIA. That law, enacted a year ago, provided targeted relief for ATVs, bicycles, books, and made the strong lead content limit prospective so that products manufactured prior to August 14, 2011 could be sold at the 300 parts per million level in an effort to take some pressure off of retailers and manufacturers who still had inventory that would violate the law.

Chairman Tenenbaum, I know with CPSIA, and the amendments to CPSIA passed last year, Congress has given the CPSC many important tasks. But I want you to know that I am proud of the Commission that you lead. The CPSC has oversight over more than 15,000 consumer products. That's no small task. Under your leadership, we finally took steps to remove drop-side cribs from the marketplace. Newborns and infants were dying at an alarming rate in these cribs after sliding between the mattress and side of the crib and suffocating to death.

Under your leadership, we've seen agency staff utilized in ways that are proactive, such as by putting them at ports of entry to inspect products and prevent dangerous products from ever making it to store shelves.

Thank you, Chairman Tenenbaum, for leading this Commission in a way that continues to provide safety and security to American consumers. I also thank Commissioners Adler, Nord, and Northup for their service and for being here today.

Madam Chairman, I yield back the balance of my time.

UNITED STATES
CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

CHAIRMAN INEZ M. TENENBAUM

November 9, 2012

The Honorable Mary Bono Mack
Chairman
House Committee on Energy and Commerce
Subcommittee on Commerce, Manufacturing, and
Trade
2125 Rayburn House Office Building
Washington, DC 20515

Dear Chairman Bono Mack:

Attached please find responses to the written questions for the record submitted by you and certain other Members of the Subcommittee in connection with the August 2, 2012, hearing entitled "Oversight of the Consumer Product Safety Commission." An electronic version of these responses will also be provided to Mr. Brian Kirby Howard, Legislative Clerk for the Subcommittee.

Thank you again for the opportunity to testify before the Subeommittee. Should you have any questions or require additional information, please do not hesitate to contact me or Christopher Day, Director of Congressional Relations, at (301) 504-7660 or by e-mail at cday@cpsc.gov.

Very truly yours,

Inez M. Tenenbaum

Attachment

The Honorable Mary Bono Mack

REDUCING REGULATORY BURDENS AND COSTS

1. **H.R. 2715 granted you the authority to exempt products, or classes of products, from the tracking label requirements. Has the Commission granted any exemptions? Has the Commission conducted any analysis on what products or classes are likely candidates to exempt from the requirement? If not, why not?**

   Section 6 of H.R. 2715 (now P.L. 112-28) stated that "the Commission may, by regulation, exclude a specific product or class of products from the requirements in subparagraph (A) [tracking label requirement] if the Commission determines that it is not practicable for such product or class of products to bear the marks required by such subparagraph." To date, the Commission has not issued any regulations under this new authority. Instead, the Commission issued a Statement of Policy (SOP) concerning tracking labels on July 20, 2009. (A copy of the SOP is available at http://www.cpsc.gov/about/cpsia/sect103policy.pdf.) In that Statement, the Commission noted that no specific labeling system was required. ("At this point, the Commission is not imposing any such uniform requirements, but expects that manufacturers will use their best judgment to develop markings that best suit their business and product.") The Statement also recognized six circumstances where it might not be practicable for manufacturers to include tracking labels on a product, including products sold in bulk vending machines.

   The Commission also noted its desire to reduce burdens posed by the tracking label requirement, particularly by avoiding duplicative requirements. To that end, the Statement provided: "The Commission believes that required information already permanently marked either to brand the product or otherwise to comply with other Commission or federal regulations, such as those promulgated under the Textile, Wool and Fur Acts or country of origin labeling rules, could be considered part of the 'distinguishing marks' called for by Section 103(a). Any such marking would have to be permanent as required by Section 103(a)." Given the flexibility provided in the Statement of Policy, the lack of stakeholder requests for exemptions, and the need to take action on safety priorities, the Commission has not yet conducted an analysis of candidates that could be exempted from the tracking label requirement.

2. **Using the authority H.R. 2715 provided, the Commission voted to approve a petition and grant a functional purpose exemption from lead content limits for certain metal components of children's ride-on tractors. Would the reasoning of this exemption extend to other products? Is the Commission going to reconsider previously submitted petitions or take the initiative to exempt other materials provided the exemptions will result in no measurable impact on public health or safety? If not, please explain.**

   Under the new authority provided, the Commission granted a functional purpose exemption for certain metal components of children's ride-on tractors. 77 FR 20614 (April 5, 2012). In addition, the Commission granted the same exemption to similar children's products such as other children's ride-on products that contain similar aluminum alloy component parts. Any

future petition would likely be factually unique, thus making it difficult to predict the likely disposition of future petitions. In the ride-on-tractor petition, however, I was pleased that this petitioner identified and requested only a minor increase in the permissible lead content limits for a few specific components of the children's ride-on tractors produced by his company.

The Commission has not considered previously submitted petitions because the new authority requires certain findings that were not required prior to H.R. 2715. However, the Commission will consider any petition resubmitted in accordance with the requirements for parties wishing to resubmit any previously submitted petitions set forth in section 101(b)(1)(F) of the CPSIA.

The Commission, subject to resource allocations in future operating plans, has also directed CPSC staff to undertake certain work to reduce third party testing costs consistent with assuring the compliance of children's products. Among the materials to be reviewed for possible determinations regarding lead content limits include adhesives in manufactured woods and synthetic food additives.

3. **We passed H.R. 2715 in part due to the huge financial burden manufacturers have had to face in regards to testing costs since the passage of CPSIA. Does the CPSC know how many jobs were lost or how many companies are not able to invest in new jobs (except testing companies) due to this new financial hardship? Has the Commission undertaken any analysis of the effect of increased costs on innovation and product development?**

The Commission has implemented the third party testing provisions as mandated by Congress in CPSIA and the H.R. 2715 amendments. The Regulatory Flexibility Act (RFA) statement associated with the third party testing rule contains staff economic impact projections. After discharging our statutory duty pursuant to section 14(i)(3)(B) of the CPSA (as amended by P.L. 112-28) to review public comments associated with the reduction of third party testing costs consistent with assuring compliance, the Commission voted to direct staff to further investigate, pending resource allocations in future Commission operating plans, a number of options that staff indicated potentially may reduce third party testing consistent with assuring compliance.
See http://www.cpsc.gov/library/foia/ballot/ballot13/3rdparty.pdf.

4. **H.R. 2715 required the Commission to seek comments on ways to reduce third party testing costs and to issue new or revised testing regulations within one year - which was August 12. The Commission noticed a request for comment last November. Where is the Commission with respect to revising or issuing new testing regulations?**

On August 29, 2012, CPSC staff submitted to the Commission a briefing package, "Consideration of Opportunities to Reduce Third Party Testing Costs Consistent with Assuring the Compliance of Children's Products." On October 10, 2012, the Commission voted to direct staff to further investigate, pending resource allocations in future Commission operating plans, a number of options that staff indicated potentially may reduce third party

testing consistent with assuring compliance. *See* http://www.cpsc.gov/library/foia/ballot/ballot13/3rdparty.pdf.

5. **Has the CPSC considered allowing compliance with the European Toy Safety directive (EN-71) to be regarded as an acceptable demonstration of compliance with the US Toy Standard (ASTM F963)? If not, why not?**

   As part of the vote mentioned in response to your previous question, the Commission directed the staff, pending resource allocations in future Commission operating plans, to draft a Request for Information (RFI) for publication in the *Federal Register* to determine which, if any, tests in international standards are equivalent to tests in comparable CPSC-administered children' product safety rules. *See* http://www.cpsc.gov/library/foia/ballot/ballot13/3rdparty.pdf. The provisions of EN-71 would very likely be included within the scope of any undertaken RFI on this subject and would be considered accordingly.

6. **CPSC's periodic testing rule will take effect in February 2013. This rule will exponentially increase the testing, record keeping and other burdens imposed by the CPSIA. We ore aware that there has been a proposal to offer--free-of-charge for small businesses--privately developed software that could help enable compliance with this extremely complex new regulation. This would be very similar to the IRS "Free File" program, which makes available, free-of-charge, tax filing software for millions of moderate-income Americans every year.**

   a. **How does the Commission view such a program? Would such a program require Commission approval?**

      While nothing prohibits private companies that wish to offer such a service from doing so, the Commission cannot endorse a company's privately developed software. Because 15 software companies participate in the IRS "Free File" program, the government is not in the position of favoring a particular company in that instance.

   h. **Testing for phthalates is expensive, averaging between $300 and $500 per toy or product component. Last year the Commission, in an apparent attempt to reduce this hurden, excluded from testing "materials known not to contain phthalates." Has the Commission developed a list of such materials? If not, why not?**

      On August 17, 2009, the Commission published a notice of availability regarding a Statement of Policy (SOP) for testing component parts for phthalates (74 FR 41400). The SOP includes lists of materials that "do not normally contain phthalates and, therefore, might not require testing" for phthalates. The Statement of Policy is available at http://www.cpsc.gov/about/cpsia/componenttestingpolicy.pdf.

      On October 3, 2012, the Commission directed the staff, pending resource allocations in future operating plans, to explore certain opportunities to reduce third party testing costs consistent with assuring compliance. One of the nine activities approved by the

Commission is to research the feasibility of a list of materials determined not to contain prohibited phthalates. Another activity is to investigate the use of Fourier transform infrared spectroscopy to determine compliance to the phthalates content limit. The staff briefing package describing these activities is available at http://www.cpsc.gov/library/foia/foia12/brief/reduce3pt.pdf.

7. **Also with respect to phthalates, H.R. 2715 requires the Commission within one year after enactment to address inaccessibility, either by adopting the same guidance as applies to lead inaccessibility or by promulgating a rule providing new guidance for phthalates. What is the status of the Commission complying with H.R. 2715?**

   On July 31, 2012, the Commission published "Proposed Guidance on Inaccessible Component Parts of Children's Toys and Child Care Articles Containing Phthalates." 77 FR 45297. The comment period on the proposed guidance closed October 1, 2012. CPSC staff is currently in the process of reviewing the comments and developing a staff briefing package with proposd final guidance for the Commission's consideration.

8. **We have been told that the there was a staff effort to develop guidance on what products constitute a "toy." What is the status of that effort?**

   The Commission published staff draft guidance on which children's products constitute "toys" on Feb. 12, 2009. *See* http://www.cpsc.gov/about/cpsia/draftphthalatesguidance.pdf. The Commission has considered the possibility of publishing additional guidance but there are no plans for staff to send a new briefing package to the Commission at this time.

9. **The proliferation of conflicting product safety standards at the State level has become a significant issue for manufacturers and retailers. How does the CPSC plan to address this rapidly growing patchwork problem?**

   Several of the Commission's statutes contain explicit provisions concerning the federal preemption of state standards (*see, e.g.* section 26 of the Consumer Product Safety Act, section 18 of the Federal Hazardous Substances Act, section 16 of the Flammable Fabrics Act, and section 7 of the Poison Prevention Packaging Act). The CPSIA also added some provisions concerning preemption (for example, section 106(h) of the CPSIA regarding state toy standards). Whether any particular state product safety standard would be preempted by a particular CPSC standard would be a question for the courts in an individual case. A court would likely look to these statutory provisions in resolving such a question.

10. **The CPSIA requires that the CPSC issue accreditation requirements for test labs at least 90 days before a standard goes into effect. The publication of accreditation requirements triggers a 90-day clock at the end of which a manufacturer will be required to certify products to the standard based on third party testing. I understand that an updated version of the toy safety standard (ASTM F963-11) has gone into effect but the CPSC has yet to publish corresponding accreditation requirements.**

a. Is the Commission of the opinion that the deadline for issuing accreditation criteria does not apply if a standard is revised?

Staff has interpreted that the 90-day deadline stated in section 14(a)(3)(B)(6) of the CPSA does apply when the Commission issues accreditation criteria for revised standards, such as the now-mandatory standard ASTM F963-11. As of August 14, 2011, the Commission is required to follow the rulemaking procedures of the Administrative Procedure Act (5 U.S.C. § 553) to issue notices of requirements for accreditation of third party conformity assessment bodies. Accordingly, on May 24, 2012, the Commission published "Proposed Requirements Pertaining to Third Party Conformity Assessment Bodies." 77 FR 31086. That *Federal Register* notice included a proposed revision to the notice of requirements for the ASTM F963-11 revised standard. CPSC staff intends to forward to the Commission a draft final rule for "Requirements Pertaining to Third Party Conformity Assessment Bodies" before the end of this year.

b. If the Commission does intend to issue new accreditation criteria, will it also continue to recognize results from labs that were accredited under the prior version of the standard?

For those tests that are equivalent (unchanged), or are functionally equivalent in the older and newer versions of the standard, test results from testing laboratories accredited to the older version of the standard will be accepted for children's product certification purposes. For new tests that were not in the older version of the standard or for tests that were substantially changed, accreditation to the newer version of the standard will be required for test results to be accepted for children's product certification.

11. I understand that some manufacturers maintain that CPSC lacks jurisdiction over infant car seats, even if they can also be used outside of a vehicle, because they are "motor vehicle equipment" subject to the exclusive jurisdiction of the Department of Transportation. Does the Commission have a memorandum of understanding with DoT about this? Do you believe that it would be helpful for us to clarify the Commission's jurisdiction over child seats?

We do not have a memorandum of understanding with the Department of Transportation, but CPSC staff has been working with ASTM and representatives from the National Highway Traffic Safety Administration (NHTSA) to revise the hand held carrier standard. CPSC staff also intends to send the Commission a package proposing to make it a mandatory rule under section 104 of the CPSIA.

The hand held carrier standard focuses on injuries that occur when the carrier is used outside the vehicle as a carrier, infant seat, or attached to a stroller. However, because the product is dual-use, CPSC is careful not to recommend design or labeling changes that may impact the carrier's function as a car seat, or conflict with NHTSA's regulations. Car seats are, however, covered by the product registration card rule in section 104 of the CPSIA.

At the time the product registration card rule was proposed, we received comments from car seat manufacturers requesting that we harmonize our requirements with NHTSA in light of its program for car seat registration. As a result, we made some changes to the rule and discussed those changes in the preamble to the final rule. 74 FR 68668, 68671 (December 29, 2009). However, clarification of the Commission's jurisdiction of infant car seats used outside a motor vehicle would be helpful.

12. **One factor driving up the cost of third party testing is that different retailers often demand that testing be done by their own lab or one that they have special trust in. An individual test may cost $250, for example, but the manufacturer may need to have the same $250 test done by six different labs to satisfy all the different retailers. That adds up to a whopping $1500. Is this an area where the CPSC can help reduce costs?**

No. The scenario described above is an independent business relationship that a manufacturer has established with the retailer.

REGULATORY REVIEW

1. **Has the CPSC taken into consideration Executive Orders 13563 and 13579 in the rules it has enacted since these Executive Orders were issued? If not, why not?**

Executive Order 13579, "Regulation and Independent Regulatory Agencies" (E.O. 13579), focuses specifically on independent agencies. Section 1 of the Executive Order sets out a general policy for "wise regulatory decisions," noting that "[t]o the extent permitted by law, such decisions should be made only after consideration of their costs and benefits." It states that independent regulatory agencies should promote the goals, and to the extent permitted by law, comply with the provisions of Executive Order 13563, "Improving Regulation and Regulatory Review" (E.O. 13563). Except for rules that Congress has explicitly directed the Commission to issue under the CPSIA, the rules that the Commission has proposed or finalized since the President issued the Executive Orders follow the principles and policies set forth in E.O. 13579 and 13563. For rules required by the CPSIA, the Commission makes its decisions based on the considerations directed in that law.

2. **The Commission has now issued a number of mandatory standards for durable nursery products such as cribs. Those standards are exempt from some of the rulemaking requirements that usually apply to consumer product safety standards. Do you think that these durable nursery standards nevertheless impose the least burdensome requirements that adequately reduce the risk of injury?**

Because rules issued under section 104 of the CPSIA were specifically exempted by Congress from the procedures and findings required for rules issued under section 9 of the CPSA (codified at 15 U.S.C. §§ 2051–2089) and are statutorily required to provide the highest level of safety that is feasible, Commission staff has not done an analysis to determine whether these rules impose the least burdensome requirements that adequately reduce the risk of injury. I note, however, that most of the rules the Commission has issued

under this provision to date are substantially the same as the relevant voluntary standards for those products that are developed by the industry.

3. **Does CPSC have any authority to regulate bath salts when used for non-therapeutic purposes? Does it make any difference if there is proof that the manufacturer or seller is aware of the misuse? How can CPSC coordinate efforts with the Drug Enforcement Administration or the Food and Drug Administration to address the sale and consumption of synthetic chemicals found in household products, such as bath salts, K2 and spice?**

   The product you ask about goes by the street name "bath salts" because they are sold in powder form and may look like bath salts. However, they are in fact designer drugs that have effects similar to amphetamine and cocaine. Chemically, they are entirely different from actual bath salts. We do not consider these to be a household product under the regulatory authority of CPSC, but rather are drugs under the authority of the Drug Enforcement Administration. DEA provides a fact sheet concerning bath salts on its website (http://www.justice.gov/dea/druginfo/drug_data_sheets/Bath_Salts.pdf).

4. **In a recent Op-Ed you stated the CPSC would turn to tip-over issues in the coming months. Every year there are a few incidents involving kitchen ranges tipping when installers do not install the provided anti-tip brackets, the use of which is prescribed in most building codes. Tipover events can result in grievous harm, particularly to children or to the elderly. A number of these incidents occur in low income housing, including HUD-supported housing. Have you reached out to HUD on this issue? Would you consider establishing a joint initiative with HUD to require its employees and contractors to install anti-tip brackets in HUD-supported housing and to set up programs to check existing ranges for compliance?**

   In Fall of 2011, CPSC worked with the U.S. Department of Housing and Urban Development's (HUD) Healthy Homes Program to communicate CPSC information on tipover safety through HUD's newsletters. In 2013, CPSC will work to develop and implement an initiative with HUD, and possibly with retailers, aimed at installing anti-tipover devices on ranges in public housing.

5. **How often has the staff used the threat of a Commission press release under the public interest health and safety provision to encourage firms to agree to conduct a recall?**

   On three occasions, the Commission staff has determined the public health and safety required the release of safety information to the public and sought Commission approval for a release of such safety information to the public.

   a. **Has the CPSC instituted any procedural changes or given staff any guidance to guard against abuse of this tool of persuasion? If yes, please submit for the record copies of any such guidance or procedure documents. If no, please explain why the CPSC has not crafted such official staff guidance or procedure documents.**

The reasons for issuing a press release where the Commission has found that the public health and safety requires a lesser period of notice than set forth in section 6(b)(1) of the CPSA, and the circumstances where it may be appropriate to make such finding, are detailed in Commission regulations at 16 CFR 1101.23.

b. **When the CPSC decides to meet to consider issuing a press release under its public interest health and safety authority, does the Commission notify the relevant product manufacturer? If not, why not?**

If the Commission considers issuing a press release and making a public health and safety finding in that release, it does so pursuant to the requirements of section 6(b) of the Consumer Product Safety Act, 15 U.S.C. 2055(b), which requires CPSC to provide notice to the manufacturer.

c. **Before issuing a press release under its public interest health and safety authority, does the Commission give the relevant manufacturers an opportunity to be heard or submit evidence? Does the Commission automatically receive all materials provided to the staff?**

If Commission staff recommends use of this authority, the Commission votes to issue a press release that makes a public health and safety finding, shortening the time period for disclosure. As part of the decision to make such a finding and shorten the section 6(b)(1) time periods, the Commission will receive the relevant information and background materials from staff.

d. **What factors does the Commission use to determine when a hearing under section 15 is appropriate versus use of a press release?**

Use of a press release to warn the public about a hazard does not inhibit the Commission staff's ability to also seek further notice and a remedy through an administrative proceeding under section 15 of the CPSA. In cases that present a significant risk of injury to the public, it may be beneficial to first provide a warning to the public about the hazard before the Commission staff is ready to commence with an administrative proceeding.

6. **The Commission's resources have roughly doubled since 2008 under the CPSIA. Despite the growth of the Commission and its budget, we repeatedly hear there are not enough resources to accomplish everything the Commission would like to accomplish.**

a. **How does the Commission prioritize investigations and enforcement matters? Do you prioritize those hazards that present the greatest risk to the greatest percentage of the population?**

Yes, the Commission prioritizes those hazards that present the greatest risk to the greatest percentage of the population. The Office of Compliance and Field Operations and the Office of Import Surveillence are responsible for enforcing mandatory rules and

requirements as well as the surveillance of consumer products on the market and at ports of entry to ensure that hazardous products do not enter the distribution chain. Enforcement of existing and newly mandated rules and targeted surveillance activities allow for a multidisciplinary approach to enforcement. Identifying those products that present a risk (in an effort to be more preventive than reactive) through review of incident reports, trade complaints and other information sources requires close and constant interaction with technical and epidemiological staff.

b. How does the Commission identify those hazards? Is the CPSC using data-driven, fact-based analysis, or is the Commission following something more like the precautionary principle?

CPSC collects data from a variety of data sources to aid in the identification of hazards associated with the use of consumer products. This data is used to identify hazards and develop appropriate mitigation strategies. The Commission applies the criteria in 16 CFR 1009.8(c) to establish Commission priorities.

7. Over the last 10 years, the number of traffic fatalities and injuries has declined significantly. In fact, the most recent data from the National Highway Traffic Safety Administration (NHTSA) shows traffic fatality rates at a 60-year low. Part of this may be attributable to the sluggish economy, but there have been significant advancements in safety, too. How do the injury and fatality statistics for CPSC compare? Are deaths and injuries relating to consumer products declining significantly also?

A significant decline in reported consumer product-related deaths and estimated injuries in the past ten years does not appear evident in available data. The age-adjusted consumer product-related rates of deaths and injuries have increased in the most recent decade for which data are available. However, the CPSC's work to ensure the safety of consumer products—such as toys, cribs, power tools, cigarette lighters, and household chemicals—has contributed to a decline in rate of deaths and injuries associated with consumer products over the past 40 years.

8. In working with voluntary standard organizations, the CPSC staff often provides incident data, including its own in-depth investigations of incidents, to help inform the process.

a. How meaningful are these anecdotal data?

Anecdotal incident data provide a meaningful minimum number of known incidents. What is unknown is the degree to which this might understate the actual number of incidents that occurred nationally.

The value in the anecdotal data comes from the detailed descriptions of the hazard scenarios that they can provide. In particular, through in-depth investigations, staff can obtain answers to important questions that normally are not included in media reports, death certificates, or the CPSC's National Electronic Injury Surveillance System

(NEISS) cases that are coded from medical records. Collection of anecdotal incident data also accelerates staff's awareness of fatal incidents as the lag for reporting via death certificates differs by state. It should also be noted that not all data used by CPSC is anecdotal. NEISS, for example, is a national probability survey that supports national estimates of consumer product-related injuries seen in U.S. hospital emergency facilities.

b. If the data are not statistically representative of a problem, why do the standards need to address the problem?

If even the minimum number of known incidents is suggestive of an unreasonable risk to public safety, then it is our duty to address these risks. The greater concern might actually be how many incidents are occurring that are not reported.

c. Does it mean that the standards are protecting against problems that are rare, making the products more expensive than they need to be?

No. Our evidence based standards take into consideration the severity of injury and the addressability of the hazard that are suggestive of an ongoing risk to public safety. The general limitation of our anecdotal incident data is the degree to which it understates the actual occurrence of serious incidents.

d. Do you think a standard should protect against every risk that has ever happened, no matter how rare? If not, how do you determine when the standard should guard against a risk and when it is unnecessary to do so?

As a matter of public record, you will not find a statement from CPSC staff or the Commission stating that standards should protect against every risk that has ever happened no matter how rare. Standards development involves a multidisciplinary team that conducts not only a review of reported incidents but often includes testing and research on the products, input from health and behavioral scientists, and economic assessments of the potential costs to manufacturers and importers of proposed standards. The general concern lies with the likelihood of *future* occurrence and the potential severity of these incidents. The Commission must determine which risk areas of public safety to address in a given year, with our limited resources, and prioritize accordingly.

9. According to an October 2011 CPSC memo available on the Commission's website, both total injuries and injury rates to children from toys have increased during the period from 2006-2010, which covers the period since the CPSIA was enacted providing the CPSC new authorities and additional resources. While more injuries may not be indicative of defective or unsafe products, can you explain why the injury rate is increasing?

The October 2011 Toy-Related Deaths and Injuries Calendar Year 2010 report (http://www.cpsc.gov/library/toymemo10.pdf) showed an increase in the estimated number

of toy-related emergency department treated injuries for all ages and for children younger than 15 years of age and younger than five years of age. However, neither the five year trend since 2006 nor the year over year comparison between 2009 and 2010 indicates that the increases ares statistically significant. While the estimated injuries appear to increase, Commission staff cannot rule out that the apparent differences observed in the estimates are attributable to random variation. Therefore, because Commission staff cannot establish that a true change has occurred, any attempts to pinpoint causal factors would be speculative.

10. The largest manufacturer of portable gas cans recently declared bankruptcy, due mostly to questionable liability suits. As a result, there may be a shortage of new gas cans manufactured in the U.S., but people will still need to fuel their lawn mowers and deliver gas to vehicles on the side of the road. It is a distinct possibility that people will return to using milk jugs or other inappropriate containers that can lead to very serious harm. Is there anything the CPSC can do to head off this grave problem? Do you require any additional authority to act?

I do not believe there is any need for action from the CPSC with regard to this company's filing for bankruptcy. According to the company's website, it filed for reorganization under Chapter 11 of the Bankruptcy Code this past summer, has been continuing as an ongoing concern while in Chapter 11, and, as the company's Q&A on its website states: "It is business as usual." *See* http://www.blitzusa.com/chapter11/Customer%20Q&A%20FINAL%20110811.pdf.

More recently, news reports indicate that another company has bought the manufacturing plant and plans to resume manufacturing gas cans there. *See* http://www.tulsaworld.com/business/article.aspx?subjectid=461&articleid=20120915_461_E1_MIAMIO656046.

11. Last September, the Commission voted to reverse its April 2010 interpretive rule on the term "unblockable drain" as used in the Pool and Spa Safety Act. The CPSC apparently determined that certain drain covers were insufficient to comply with the law, requiring any public pool owner/operator – including state and local governments - to install an additional backup drain system at considerable additional expense.

a. How many times has the CPSC called for a vote to switch a previous Commission vote?

While I am not able to provide an exact count, occasionally the Commission changes a previous vote. For example, the Commission has sometimes voted to initiate rulemaking and later decided to terminate the rulemaking. In 1988, the Commission published an advance notice of proposed rulemaking (ANPR) to enlarge the dimensions of the small parts cylinder used to evaluate whether toys or other articles intended for children under three years of age contain small parts. 53 FR 20865. In 1990, the Commission voted to terminate the rulemaking. 55 FR 26076. In 1985, the Commission published an ANPR concerning all-terrain vehicles (ATVs). 50 FR 23139. In 1991, the Commission voted to terminate that rulemaking. 56 FR 47166. In 1994, the

Commission published an ANPR to amend the baby walker standard. 59 FR 39306. In 2002, the Commission terminated that rulemaking. 67 FR 31165.

b. Did the Commission seek legal advice as to whether there should be notice and comment prior to reconsidering the interpretation? If yes, please provide a copy of such advice for the record.

Any memorandum containing legal advice to the Commission is confidential and protected from disclosure by the deliberative process attorney client privileges. The Commission has not waived its privileges to disclose the contents of any legal memorandum, and we would respectfully suggest that providing any such memo in response to a request where it will be included on the public record would waive the privilege.

c. After reconsideration, the CPSC established May 28, 2012 as the new compliance deadline. Does that remain the official compliance deadline? How many pools are currently compliant with the CPSC's revised determination?

The compliance date for facilities that relied on the Commission's interpretive rule for unblockable drains and installed large, compliant, unblockable drain covers over smaller outlets (sumps) was extended and noticed in the *Federal Register* by the Commission on May 24, 2012. The new compliance date is May 23, 2013.

Staff is still reviewing files to identify previously compliant facilities that used unblockable drain covers in the manner defined by the interpretive rule. Staff has conducted almost 6,200 inspections and has found approximately 100 facilities that would no longer be considered compliant based on the revocation of the interpretative rule.

d. Please provide for the record an estimate of how much pool owners and operators spent on unblockable drain covers to comply with the original interpretation. Please also provide for the record an estimate how much more will those same pool owners and operators have spent or need to spend on modifications to comply after CPSC's about face.

CPSC staff does not have the necessary data available to provide such an estimate.

12. There were a number of media reports in July reporting the CPSC had filed a lawsuit against the makers of "Buckyballs." At the hearing, you testified that the case would be heard by an administrative law judge. Vice Chairman Blackburn inquired from where the administrative law judge would be selected. In response, you replied from "Washington, D.C., probably, or it might be in Maryland."

a. From which agency will the administrative law judge be borrowed? Does the CPSC specify from which agency they would like to borrow an administrative law judge? Does the CPSC specify any particular criteria such as background or

expertise when it requests an administrative law judge? If yes, please detail your request (agency or particular criteria) for the record.

The Commission staff did not specify from which agency it wanted to borrow an administrative law judge. The Commission staff was notified by the Office of Personnel Management that the administrative law judge would be loaned from the U.S. Coast Guard. The Acting Chief of Administrative Law Judges for the Coast Guard selected the judge(s) to be loaned to the Commission in this matter.

b. **In recent years, the lawyers of the Compliance staff have been transferred en masse to the Office of the General Counsel. The one exception was the head of the Office of Compliance, who must by law, be an attorney. Recently, however, the head of Compliance was also transferred to the Office of General Counsel. What steps is the Commission taking to ensure appropriate segregation of the attorneys prosecuting the case from those that must advise the Commission?**

The position of Director, Office of Compliance and Field Operations was not transferred to the Office of General Counsel but instead continues to report to the Deputy Executive Director, Safety Operations. It should also be noted that the former Director, Office of Compliance and Field Operations requested reassignment to the Office of General Counsel thus vacating the position of Director, Office of Compliance and Field Operations.

The former head of Compliance and Field Operations is an attorney in the Regulatory Affairs Division of the Office of the General Counsel and is not advising the Commission on the Buckyballs litigation. The Office of General Counsel maintains a separation of functions in which attorneys prosecuting the action will not be advising the Commission. *See* 16 C.F.R. 1025.68.

c. **Why was the complaint in the Buckyballs matter signed by the Executive Director of the agency? Doesn't that associate him with the prosecution of the case such that he will have to be separated from the Commission too?**

The Acting Director of Compliance and Field Operations is recused as a matter of law from participating in this matter. Because there is no person occupying the position of Assistant Executive Director for Compliance and Field Operations and the Acting Director is recused by law, a majority of the Commission agreed to have the Executive Director sign the complaint. The Executive Director does not render a decision in an adjudicative proceeding and does not advise officials who render such decisions, as explained in Commission regulations at 16 C.F.R. 1025.68.

The Honorable Charles F. Bass

1. **I'm aware that there is a proposed ruling to allow use of X-Ray Fluorescence (XRF) to certify products as lead free. It's my understanding that there are multiple XRF**

techniques, including handheld XRF and so-called HD XRF. It appears from the proposed rule that both techniques would be acceptable, but can you confirm to the committee that the rule will enable use of both the widely-accepted handheld XRF techniques which are deployed across the supply chain, as well as the emerging HD XRF methods?

The "Proposed Rule: Requirements Pertaining to Third Party Conformity Assessment Bodies" includes provisions to widen the use of both "HD XRF" (a common shorthand for Energy Dispersive X-Ray Fluorescence Spectrometry Using Multiple Monochromatic Excitation Beams, as described in ASTM F2853-10e1) as well as "handheld" XRF (more generically known as Energy Dispersive X-Ray Fluorescence Spectrometry, as described in ASTM F2617-08) for third party testing for certification. These provisions would enable the use of either type of XRF, with limitations as described in the proposed rule, for measuring lead in homogeneous metals, glass, crystals and other materials. This proposed rule would not widen the use of "handheld" XRF to include determinations of lead in painted surfaces of consumer products because at present no XRF method is available other than HD XRF (ASTM F2853-10e1) for determining compliance to 16 CFR part 1303 for painted surfaces on children's products with respect to the limit of 0.009 percent lead by weight.

2. **Knowing that one of the priorities of the CPSC is to increase public awareness around the dangers of carbon monoxide poisoning, would you please share with the Committee what activities the Commission is currently undertaking?**

Prevention of carbon monoxide poisoning deaths and injuries caused by consumer products is a key priority for the CPSC. To comprehensively address this hazard, the Commission has taken a two-pronged approach that focuses on both product innovation and consumer outreach and education.

On the product innovation side, CPSC staff has focused a great deal of effort on reducing carbon monoxide poisoning deaths from portable gasoline generators. In just the three year period from 2006 to 2008, there were an estimated 233 non-fire carbon monoxide poisoning deaths to consumers associated with the use of portable gasoline-powered generators in the United States. In September of this year, CPSC staff released a report detailing the development and demonstration of a prototype portable generator that can dramatically reduce carbon monoxide (CO) emissions from certain common portable gasoline-powered generators. When the prototype was tested in the common fatal scenario of a generator operating in the attached garage of a single family home, health effects modeling performed on the results showed that the prototype increased the hypothetical garage occupant's escape time interval to 96 minutes compared to only eight minutes provided by the original, unmodified unit. A copy of this report may be found on the CPSC website. (http://www.cpsc.gov/LIBRARY/FOIA/FOIA12/os/portgen.pdf)

CPSC also engages in robust education and outreach using a variety of outlets. The Commission communicates the dangers of carbon monoxide poisoning through the use of earned media, conducting television, radio and print interviews most often as rapid response in conjunction with major, power-disrupting storms such as hurricanes and snow storms,

when greater use of generators exposes more people to the hazard. We also use social media outreach, e-publication downloads from the dedicated CO Information Center page on CPSC.gov and the distribution of messages to grassroots partners through our Neighborhood Safety Network. Twice a year CPSC issues reminders to install fresh batteries in CO and smoke alarms in conjunction with daylight savings time.

In addition, CPSC has used its OnSafety blog, YouTube, Twitter and its FireSafety.gov website to promote new developments in technology including making CO alarms more effective and, this year, new developments in reducing CO emissions in generators. These efforts have resulted in an estimated audience impression of more than 100 million people during FY2012. This year, Congressional District offices in areas generally impacted by hurricane season were provided CO informational safety packets to share with their constituents. This information is also posted to the CPSC's website. Field staff has also provided Congressional offices with informational materials in the wake of severe weather events causing power outages. As the winter season approaches, CPSC will continue to promote CO awareness by warning consumers of dangers associated with home heating equipment. During FY2013, CPSC will also begin staging a second CO Poster contest for school children that became the most popular contest on Challenge.gov when first held.

The Honorable Greg Harper

1. **Chairman Tenenbaum, I was pleased to read your op-ed in The Hill last week where you indicated that you are taking a more collaborative approach with the window covering industry regarding cord safety. I am further pleased that you have spent the time visiting manufacturing facilities to better understand the difficulties in eliminating cords for all products. Can you tell me, without revealing any proprietary information, about these visits and what you learned? How are you proposing to move forward from here?**

Commission staff has recently participated in several meetings with the Window Covering Manufacturers Association (WCMA) and individual members. In addition, I traveled this past summer to personally meet with the leadership of several manufacturers and to tour their production facilities. During these meetings, we discussed the types of window covering products currently on the market, as well as individual manufacturer efforts to redesign window coverings to eliminate or substantially reduce the strangulation hazard posed by some corded window coverings.

Overall, my discussions during these visits were positive and indicate a willingness to work together towards consensus solutions. It is my hope that we can use these discussions as a springboard to work cooperatively to meaningfully improve consumer awareness of the strangulation risk corded window covering products can pose to young children, as well as resolve outstanding concerns regarding the current WCMA window covering safety standard to address the stragulations risk from corded window coverings.

2. **Chairman Tenenbaum, I am a big supporter of promoting government and industry cooperation. I think it is important for both to understand the need for safety and how best to achieve the safest product possible. You also discussed in your op-ed your efforts to better educate the consumer. With this in mind can you tell me about your plans for the rest of this year and next with the Window Covering Safety Council and your efforts to educate new parents about potential hazards to children associated with window coverings?**

   CPSC has again partnered with the Window Covering Safety Council to jointly launch safety messaging during Window Covering Safety Month in October 2012. This year's collaborative efforts included my participation in the Council's public service announcement and a statement for its media release. CPSC has also tweeted safety messages, direct responses to consumers' questions, and links to reference materials during the October 9, 2012, #Cord Safety Twitter party hosted by the Window Covering Safety Council. In addition, a newly launched window covering safety information center on CPSC's website promotes repair kits offered by the Window Covering Safety Council along with other information.

   a. **Can you tell us more about the CPSC's collaborative programs with the Council?**

      Please see previous answer.

   b. **Aren't promoting education and raising awareness some of the best tools the Consumer Product Safety Commission has in its arsenal?**

      Promoting education and raising awareness is part of our comprehensive effort, along with enhancing voluntary standards, encouraging technologocial safety innovations,and ongoing compliance initiatives designed to ensure the highest level of protection for children. Identifying and addressing the most pressing consumer product safety priorities, working with stakeholders to build safety into products, timely and accurate detection of risks, and quick response to remove hazards, all work with our goal of raising awareness to reduce product-related deaths and injuries.

<u>The Honorable Brett Guthrie</u>

1. **As you know, the power tools industry developed a revised set of voluntary safety standards in November of 2007 for table saws. Products using those new standards were introduced to the marketplace thereafter and were required to meet those standards beginning in early 2010. That voluntary standard was enhanced in October of 2011 with improved performance standards under a broader set of cutting conditions.**

   a. **Is it accurate that the CPSC had not collected any data from the current products that are compliant with the current voluntary standards, and that the CPSC based**

its advanced notice of proposed rulemaking for a mandatory rule on data from older, noncompliant saws?

The Commission published an advance notice of proposed rulemaking (ANPR) concerning table saw blade injuries on October 11, 2011. 76 FR 62678. The voluntary standard was revised in October 2011. Thus, incident data reflecting the new voluntary standard is not yet available for the staff to review. Any subsequent steps in the rulemaking that the Commission decides to pursue (notice of proposed rulemaking and final rule) would include a review of data available at those stages.

b. Is CPSC now collecting more up-to-date information on accidents incurred under the 2007 voluntary standard for table saws?

CPSC staff continuously receives reports related to consumer products through various means, including news clippings, death certificates, and consumer submitted reports. Table saw-related incident reports are reviewed by CPSC staff to leverage any information available. These reports are anecdotal and may or may not be related to a table saw that is compliant under the 2007 voluntary standard. CPSC staff also collects emergency department-treated injury data via the National Electronic Injury Surveillance System (NEISS).

Though this system does collect information about table saws, it is not possible to differentiate pre- and post-2007 voluntary standard-compliant saws within the data. A special study would be required to gather this level of detail—similar to the special study that was performed on stationary saws in 2007-2008. Another study of this nature is not planned for table saws. However, CPSC staff has awarded contracts for the collection of data concerning if and how owners of new table saws are using the modular blade guard system that is part of the current voluntary standard.

c. If so, will this data be weighed equally when considering a proposed mandatory safety standard for table saws?

The data that CPSC staff will be collecting is from a convenience sample of new table saw users who will be recruited to participate in the study. This study will not be in the same form as the previous table saw injury study, and it cannot be used in the same manner. CPSC staff's goal in collecting this data is to better understand if and how consumers are using the modular blade guard system that is part of the current voluntary standard. This information will be used along with additional information collected to guide CPSC's staff recommendations during the rulemaking process. In addition to the information gathered from this study, CPSC staff will consider any and all other relevant incident data that is available when it considers a possible proposed standard for table saws.

2. Doesn't the CPSC need to gather data on the <u>compliant</u> saws using the current voluntary standard before you can move forward with a mandatory standard? As I understand it, the CPSC is statutorily directed to rely on voluntary standards over a

mandatory standard as long as "compliance with such voluntary standards would eliminate or adequately reduce the risk of injury addressed and it is likely that there will be substantial compliance with such voluntary standards." (15 U.S.C. § 2056(b))

The CPSC must consider the adequacy of, and level of compliance with, applicable voluntary standards before it can issue a final mandatory consumer product safety standard for a product. CPSC staff has awarded contracts for the collection of data concerning if and how owners of new table saws are using the modular blade guard system that is part of the current voluntary standard. This will aid staff in determining whether the current voluntary standard would eliminate or adequately reduce the risk of injury addressed. The study will be completed prior to the issuance of any final mandatory rule.

a. **How would the CPSC be able to judge the risk of injury under, and substantial compliance with, the new voluntary standards if you have not collected and analyzed data on the table saws using those standards?**

   The ANPR is the beginning of the rulemaking process. As the rulemaking progresses, the CPSC will collect and analyze the data that become available, including compliance with any applicable voluntary standards. Prior to the issuance of any final mandatory rule, CPSC staff will complete an analysis of the effectiveness of current voluntary standards.

3. **Following up on the CPSC advanced notice of proposed rulemaking for table saws, one of the main options CPSC asks for comments on for a mandatory rule is a patented technology, owned and controlled by one company, based on blade contact flesh detection technology. I understand it was this company's CEO who originally petitioned the CPSC to consider rulemaking in this area.**

   a. **Is CPSC aware that the Federal Trade Commission recently testified before Congress raising concerns about a patent holder using adopted standards to demand higher royalties or licensing fees as result of a standard? The FTC testimony noted that "[i]ncorporating patented technologies into standards has the potential to distort competition by enabling [standard essential patent] owners to use the leverage they acquire as a result of the standard setting process to negotiate high royalty rates and other favorable terms after a standard is adopted that they could not have credibly demanded beforehand." (http://www.ftc.gov/os/testimony/120711standardpatents.pdf)**

      The ANPR presented three regulatory alternatives to address table saw blade contact injuries: (1) a voluntary standard, (2) a mandatory rule with performance requirements, and (3) a labeling rule specifying warnings and instructions. The Commission has not determined which, if any, option to pursue. We note that section 7 of the CPSA requires the Commission to express any mandatory consumer product safety standard in terms of performance requirements, rather than mandating any particular design.

b. **Are you concerned that a single patent holder, such as the single patent holder in possession of flesh detection technology for table saws, could demand higher royalties or refuse to license on reasonable and non-discriminatory terms if their patented technology is incorporated into a mandatory standard? Does the CPSC share the FTC's concern about incorporating patented technologies into standards?**

Please see the previous answer.

The Honorable Pete Olson

1. **I understand that the Commission has spent $566,360.00 on a contractor by the name of SEA Ltd. to conduct testing of ROVs and that SEA issued a report about its initial work in April 2011. Despite multiple requests from the Recreational Off-Highway Vehicle Association and its member companies to meet with SEA and to learn more about its work and despite the fact that industry has initiated several meetings with CPSC to share information and discuss the issues, CPSC waited 15 months to hold a meeting between SEA and industry, and that meeting finally occurred just a few weeks ago. Is withholding information and access to CPSC consultants funded at taxpayer expense your idea of government transparency? How do you expect industry to be responsive to CPSC's positions when you withhold critical information from it?**

The CPSC has maintained openness throughout this process and has not withheld information collected by SEA Ltd. In April 2011, CPSC staff published a 494 page report with SEA's test methodology and test results on nine recreational off-highway vehicles (ROVs) of different makes and models. The vehicles were tested between May 3, 2010, and October 12, 2010. The six months between the completion of testing and publication of the data involved analysis of the data, drafting a final report, and agency clearance to publish documents. In August 2011, CPSC staff published additional results for a tenth vehicle that was tested in May 2011. Furthermore, in July 2012, CPSC staff hosted a public meeting to allow SEA to present its data and to answer questions from ROHVA.

The CPSC staff has worked with ROHVA and continues to work with ROHVA as evidenced by the multiple public meetings and comment letters submitted by CPSC staff during the voluntary standard canvass process.

2. **I understand that, while industry was waiting for 15 months to get more information about SEA's work, ROHVA proactively conducted extensive testing on its own to evaluate the testing approach described in the SEA report. During the long overdue meeting, I understand that SEA revealed details regarding its testing methodology that had not been previously disclosed, which may require ROHVA to conduct more testing to effectively evaluate the SEA testing approach. Extensive time and resources were wasted as a result of CPSC's failure to disclose information about its contractor's work. I understand that SEA also has conducted other testing for CPSC that still has not been disclosed to ROHVA. Will you commit to providing timely and complete disclosure of**

all information regarding the work of CPSC contractors with respect to ROVs and to change course and work collaboratively with industry to promote safety?

As noted above, in April 2011, CPSC staff published a 494 page report with SEA's test methodology and test results on nine recreational off-highway vehicles (ROVs) of different makes and models. The vehicles were tested between May 3, 2010, and October 12, 2010. The six months between the completion of testing and publication of the data involved analysis of the data, drafting a final report, and agency clearance to publish documents. In August 2011, CPSC staff published additional results for a tenth vehicle that was tested in May 2011. In July 2012, CPSC staff hosted a public meeting to allow SEA to present its data and to answer questions from ROHVA.

CPSC staff has not received any reports with test methodology or test results from ROHVA on any of the testing it has performed. In public meetings with the CPSC, ROHVA has only presented slides with selective data. In addition, CPSC staff believes that the limited data that ROHVA has provided is based on an incorrect formula to calculate a key value. For reasons unknown, ROHVA did not use the correct formula used by the National Highway Traffic Safety Administration (NHTSA), by SEA, and by ROHVA's own voluntary standard (ANSI/ROHVA 1-2011).

I note again that CPSC staff has worked with ROHVA and continues to work with ROHVA as evidenced by the multiple public meetings and comment letters submitted by CPSC staff during the voluntary standard canvass process.

3. **I assume you would agree that a pass-fail test must be reproducible from one lab to another and that the government cannot mandate that all testing be conducted by a single entity at a single facility. Has CPSC or its contractors conducted any testing to determine whether its pass-fail test methodology and results are reproducible at facilities other than the one SEA used?**

CPSC staff agrees that a pass-fail test must include a protocol that is repeatable and can be performed by any qualified test facility. The ANPR for ROVs began a rulemaking process that could result in a mandatory consumer product safety standard for ROVs. As part of the ongoing rulemaking effort on ROVs, CPSC staff has performed standard vehicle dynamics tests that have been developed by NHTSA to gather information on the dynamic characteristics of these vehicles. If and when requirements are finalized, they will include performance requirements that can be tested with a protocol that is repeatable and can be tested by any qualified test facility.

4. **Has the CPSC attempted to establish a correlation between vehicle characteristics that will be dictated by its proposed tests and standards and the incidents that you say you are trying to prevent? What were the results of the correlation analyses? Do you intend to move forward with a mandatory standard in the absence of evidence of such a correlation?**

The CPSC published an advance notice of proposed rulemaking (ANPR) concerning recreational off-highway vehicles (ROVs) on October 28, 2009, 74 FR 55495. The ANPR

began a rulemaking process, one result of which could be a mandatory standard for ROVs. CPSC staff is assessing public comments received in response to the ANPR and is evaluating other relevant data and information to develop a staff briefing package for the Commission. The Commission will consider the staff's briefing package when determining whether to issue a notice of proposed rulemaking (NPR).

CPSC staff has completed a multidisciplinary review of more than 400 reported ROV-related incidents where victim, vehicle, and incident characteristics were analyzed. The results indicate significant hazard patterns that include vehicle rollovers, and victims ejected and hit by the vehicle resulting in death or injury. This analysis will be part of the staff's briefing package for a possible NPR. If the Commission decides to issue an NPR, the public would have another opportunity to comment, staff would prepare a briefing package with all relevant data and information concerning a possible final rule, and at that point the Commission would decide whether to publish a final rule.

5. **I understand that in the early 1990s CPSC conducted a multi-disciplinary study of ATV incidents to determine the causes of crashes, but that CPSC has not conducted such a study of ROV incidents. Since CPSC has not conducted such a study, ROHVA again proactively conducted its own multi-disciplinary study of ROV incidents. In November 2011, ROHVA presented its analysis to CPSC staff that concluded the testing standards in dispute would have had absolutely no impact on the occurrence of at least 90% of serious incidents. Does CPSC have any evidence that contradicts ROHVA's finding?**

CPSC staff has completed a multidisciplinary review of more than 400 reported ROV-related incidents where victim, vehicle, and incident characteristics were analyzed. The results indicate significant hazard patterns that include vehicle rollovers, and victims ejected and hit by the vehicle resulting in death or injury. Using the results of this analysis, CPSC staff is working to create standards that would reduce these identified hazard patterns.

6. **Has CPSC done any analyses comparing the relative safety of ROVs that existed when CPSC issued its ANPR in 2009, ROVs that conform to the current voluntary standard, and ROVs that would conform to CPSC staff's proposed mandatory standard?**

On October 28, 2009, the CPSC published an advance notice of proposed rulemaking (ANPR) concerning recreational off-highway vehicles (ROVs). 74 FR 55495. The ANPR began a rulemaking process that could result in a mandatory consumer product safety standard for ROVs. CPSC staff has not completed the rulemaking effort on ROVs and has no current proposed mandatory standard.

The ROVs that existed when CPSC issued its ANPR in 2009 meet almost all the requirements in the current voluntary standard.

7. **I understand that federal law reserves mandatory standards for those products where industry fails to develop voluntary standards to prevent unreasonable risks of injury. If that is the case, why would CPSC move forward with a mandatory ROV standard when industry has been proactive in developing standards and has tried repeatedly to work with your agency? If CPSC believes that the current voluntary standard does not**

adequately address unreasonable risk of injury related to ROV use, what exactly is inadequate about the voluntary standard? What data does CPSC have to support its claim that those aspects of the voluntary standard are inadequate?

As stated above, the CPSC published an ANPR in 2009 that discussed a voluntary standard, as well as a mandatory standard, as regulatory options. Before the Commission could issue a final mandatory rule in the proceeding it would need to determine that either (1) the voluntary standard is not likely to result in the elimination or adequate reduction in the risk of injury, or (2) it is unlikely there will be substantial compliance with the voluntary standard. At this point, the Commission has only issued an ANPR and has not made any determinations about the adequacy of the voluntary standard.

CPSC staff has worked with ROHVA and continues to work with ROHVA as evidenced by the multiple public meetings and comment letters submitted by CPSC staff during the voluntary standard canvass process. CPSC staff's comment letter to ROHVA dated March 10, 2011, summarizes CPSC staff's concerns with the voluntary standard in the areas of lateral stability, vehicle handling, and occupant protection. (A copy of the letter is available at http://www.cpsc.gov/volstd/atv/commcanvass03102111.pdf.)

The Honorable Mike Pompeo

1. ***Database/ Facebook / 6(b)***

What is the status of the lawsuit brought against the CPSC last year by anonymous companies over the agency's botched interpretation of the database language in the Consumer Product Safety Improvement Act of 2008? Would you please notify the subcommittee and my office as soon as there are further developments in that case?

CPSC was sued by a single anonymous company, Company Doe, as reflected in the publicly available docket for the case (Case No. 11-2958, D. Md.). A redacted version of the decision in the case, dated July 31, 2012, was posted on PACER on October 22, 2012. The portions of the case not on the public docket are under seal and CPSC cannot comment further.

On September 28, 2012, the government filed a notice of appeal at the district court as shown on the publicly available docket for the U.S. Court of Appeals for the Fourth Circuit, docket number 12-2210. The agency cannot comment beyond what is available on the public docket because the case is under seal.

Has the court decided whether the agency misinterpreted the statute, as the companies claimed—and as I believe?

A redacted version of the decision in the case, dated July 31, 2012, was posted on PACER on October 22, 2012. The case is under seal and the Commission cannot comment on the decision beyond what is in the redacted version of the decision.

In your written testimony you stated: "I think SaferProducts.gov has gained wide approval and acceptance." How can you say that in the face of a lawsuit by industry? How many regulations issued by CPSC in the last 5 years have led to lawsuits? Doesn't the presence of a lawsuit tend to argue against the idea that the database has gained wide approval and acceptance?

The lawsuit involves one single anonymous company and a singular report, not a lawsuit by industry. With more than 11,000 reports of harm or potential harm publicly posted to date, the SaferProducts.gov consumer database continues to serve as a vital safety tool for use by parents, doctors, emergency responders, and consumers across the country to alert the public to potentially hazardous products. None of the underlying regulations the Commission has issued in the last five years, including the database rule, has been challenged in court. No party has sought judicial review of any regulation issued during that time period.

In your oral testimony, you indicated that if the federal court rules against the CPSC in the pending database lawsuit, the agency will not pledge to immediately take down the database that was constructed in violation of the statute. Why not? Please explain what remedy you believe would be appropriate, what remedy the plaintiffs are seeking, and what remedy the agency's professional staff recommends in the event that the agency loses the lawsuit.

Section 6A of the CPSA requires the Commission to maintain the publicly available database, and by law the Commission may not take it down. The recent decision concerning one incident reported to the SaferProducts.gov consumer database does nothing to change the agency's statutory mandate and enduring commitment to provide the public with a timely and searchable database containing reports of harm relating to the use of consumer products. Consistent with the remedy set forth by the decision, the Commission did not post the individual report.

Is the agency still considering starting a Facebook page that would violate the requirements Congress has put in place for any kind of public database?

I believe that the CPSC has the authority to provide the public with product safety information through the use of Facebook—a free resource with almost one billion followers that almost all other federal agencies already use. Furthermore, I believe that using Facebook will allow CPSC to reach new audiences with critical information that will save lives and prevent injuries. However, I plan to further study this subject prior to deciding whether to authorize the CPSC's Office of Communications to use Facebook as an additional means to distribute critical consumer product safety information.

I am told that the agency is refusing to accept appeals over material inaccuracies. If true, why?

Section 6A(c)(4) of the CPSA, 15 U.S.C. § 2055a(c)(4), sets forth Commission procedures for determining claims of material inaccuracy for reports of harm or comments that are

submitted to CPSC. No provisions of the CPSA or Commission regulations provide for appeals of Commission determinations regarding claims of material inaccuracy.

I am told that the agency does not remove duplicate references on the database to the same underlying incident. If that is true, why not?

We do not publish two reports that are exactly the same. When we do publish two different reports that are about the same incident we link them. Linked reports are displayed in the database as "associated reports" and count as a single report in search results.

2. ***Phthalates/ testing lab irregularity***

We have heard from manufacturers that they frequently experience instances where products pass lead or phthalates tests at one laboratory and fail at another laboratory.

Apart from the testing costs themselves, costs of these failures to the manufacturer include, among others: 1) costs of removal from store shelves, 2) costs of destroying failed products, 3) costs of reformulating products, and 4) costs of notifying CPSC because the products are non-compliant.

CPSC has been asked repeatedly to issue a clear statement on statistical uncertainty with regard to testing results. Some industry groups have said that addressing statistical uncertainty bands for laboratory test results to deal with the known problem of inter-laboratory variability may be the single most important action CPSC could take to help reduce costs associated with CPSIA testing and certification requirements. When and how does the Commission plan to address this concern? Why has the agency thus far refused to establish statistical variability parameters?

Perhaps some industry groups are unaware that there are many international guidelines in use that deal with the issue of measurement uncertainty. These include documents such as the ISO Guide to the Expression of Uncertainty in Measurement; the EURACHEM/CITAC Guide: Use of uncertainty information in compliance assessment; ASME B89.7.3.1-2001, Guidelines for Decision Rules: Considering measurement uncertainty in determining conformance to specification; and ILAC-G8:03/2009, Guidelines on the reporting of compliance with specification.

Current ILAC guidelines, which are consistent with the other international guidelines, and ISO/IEC 17025 clearly address the matter of statistical uncertainty and how testing labs should give appropriate consideration to measurement uncertainty when assessing compliance with specification. These requirements ensure the specification limit mandated by Congress, for both lead and phthalates, is not breached by the measurement result plus the expanded uncertainty.

CPSC methods require testing Certified Reference Materials (CRMs) that closely match the material of the tested product, along with samples, to verify the test method. CPSC methods require the results for the CRMs yield relative standard deviations well within

±20 percent. CPSC staff experience is that this is easily achieved for these well characterized materials.

In some cases, firms may be referring to measurement uncertainty where material variability is actually the driving factor for differences seen between laboratories as different samples are tested and different results are obtained.

3. *Third Party Testing Relief*

When this Congress passed H.R. 2715 last year, it gave the CPSC authority to take steps to reduce the costs of complying with the CPSIA—and particularly the costs of third party testing. Did the agency's professional staff recommend issuing the third party testing rule despite H.R. 2715? Or did the staff recommend making adjustments to the rule and/or seeking additional public comment before issuing the rule in the wake of H.R. 2715? If the agency's professional staff recommended that the third party testing rule be revised to take advantage of the authority given in H.R. 2715, what recommendations for further relief did the staff offer that the Commission declined to accept?

The agency's professional staff did not recommend issuing the rule at that time. However, at the time the recommendation was made to repropose the rule, staff did not have recommendations for further relief developed.

In H.R. 2715 Congress gave you the authority to address the exorbitant cost of third party testing. Based on our directive and your existing authority, do you have sufficient authority to solve the third party testing cost problem? Why has more relief not been granted even though Congress acted to enable it? Do you believe the agency is prevented from granting further relief? If so, what legal changes are needed to enable further relief from third party testing costs? Where exactly are you barred from providing relief?

Based on the language of H.R. 2715, the staff developed a set of recommended potential opportunities for Commission consideration regarding reducing third party testing costs consistent with assuring compliance. Fifteen of the sixteen recommended opportunities did not require additional authority to be granted to the Commission.

The Request for Comments was published in the *Federal Register* on November 8, 2011. *See* http://www.cpsc.gov/businfo/fmotices/fr12/3ptreduce.pdf. After the comment period ended, the professional staff considered the comments and conducted its own examination of the testing and labeling (16 CFR part 1107) and component part testing (16 CFR part 1109) rules. Within one year of the passage of H.R. 2715, the project team completed its work and presented to the Commission a set of recommended opportunities for third party testing burden reduction consistent with assuring compliance. As noted, the Commission recently voted, pending resource allocations in future operating plans, to direct the staff to pursue nine of the actions it had identified. The staff will proceed with that direction pursuant to Commission direction in subsequent operating plans.

I believe the Commission lacks the authority to implement one of the staff recommended opportunities regarding the use of process certification techniques for children's product certification purposes. Section 14 of the CPSA requires third party testing for children's product certification, material change, and periodic testing. All of the tests in the applicable children's product testing rules require third party conformity assessment body testing. The statute does not allow the Commission to alter the basic requirement of third party testing.

What specific changes did the agency make to its third party testing rule specifically by taking advantage of the authority given in H.R. 2715? In other words, what new relief did the agency provide in the rule that it was not going to provide anyway before that statute passed?

No specific changes have to date been made to the testing and labeling rule (16 CFR part 1107) in response to H.R. 2715 (other than moving forward with addressing the statutory change from random samples to representative samples) because the rule was at the final rule stage, and further changes would not have been subject to notice and comment. The Commission published a Request for Comment, as directed by section 14(i)(3) of the CPSA (and amended by H.R. 2715), regarding reducing third party testing burdens consistent with assuring compliance. The Commission also issued a notice of proposed rulemaking regarding the testing of representative samples.

4. ***Phthalates / Chronic Hazard Advisory Panel***

The Chronic Hazard Advisory Panel appointed by the CPSC Commissioners is late in submitting its report on phthalates. I am hearing from manufacturers that use phthalates that the CHAP process has not been transparent. Chairman Tenenbaum, you promised transparency at the CPSC. Will you pledge to release the results of the peer review done on the CHAP study as well as the charge given to peer reviewers by the CPSC?

The report of the CHAP is a highly complex scientific document. As such, it has taken the CHAP members longer to complete because of the breadth of the data that needed to be analyzed and the nature of the analysis itself (a cumulative risk assessment involving a variety of different phthalates and exposures). In addition, one of the CHAP members became seriously ill during the first several months of 2012. CPSC staff would disagree with the assertion that the CHAP process has not been transparent. In fact, in the two and a half years since the CHAP was convened, virtually every meeting, phone call, piece of correspondence, and all data submitted has been made available to the public on the CPSC website (http://www.cpsc.gov/about/cpsia/chapmain.html). The CHAP invited prominent research scientists to present their latest results and heard public testimony and written comments from interested parties. The CHAP members even agreed to an industry request to submit and discuss additional scientific studies at one of its public meetings, which took additional time.

The CHAP members also encouraged stakeholders to make their actual data (versus summaries of data) publicly available so that the CHAP might consider that data along with all other available public information. Some stakeholders chose not to release the more detailed data, because of concerns about proprietary business information. The CHAP evaluated any and all relevant data made available to it, including information provided by the industry that was made public.

Staff will continue to strongly support and encourage the open and transparent process CPSC has employed since the inception of the CHAP as the CHAP concludes its work.

Will peer reviewers be given all of the supporting information and not just the risk assessment itself to conduct their peer review?

The very nature of a scientific peer review requires that all relevant data, supporting information, and the full public record be made available to peer reviewers so that they can be as informed as possible in understanding the scientific approaches taken and conclusions reached.

Will CPSC consider the CHAP report a Highly Influential Scientific Assessment (HISA) and treat it accordingly?

CPSC understands the scientific importance of the CHAP report and will comply with the requirements regarding the report and the ensuing rulemaking set forth in section 108 of the CPSIA.

For example, to the extent that the CHAP's analysis relies on cumulative risk assessment, will the agency ensure that the framework of the cumulative risk assessment is itself peer reviewed?

Assessing the cumulative risk assessment approach taken by the CHAP would be one of the elements of a scientific peer review.

Will the CPSC refrain from issuing an interim rule when it issues the CHAP report, instead allowing full opportunity for public comment on any proposed rule that follows the CHAP report?

Section 108(b)(3) of the Consumer Product Safety Improvement Act (CPSIA) provides that, not later than 180 days after the Commission receives the CHAP's report, "the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule [related to the findings of the CHAP]." After the CHAP issues its report, the Commission plans to pursue rulemaking in accordance with these requirements.

5. ***Obama Executive Order***

President Obama issued an Executive Order instructing all federal agencies, including independent agencies like the CPSC, to find ways to reduce the costs of regulations

already on the hooks. It is my understanding that the CPSC intends to fulfill that requirement in the upcoming year by taking a look at existing regulations on mid-sized rugs and on animal testing.

Is that true? When is the last time the CPSC even performed animal testing? Please ask the professional staff to estimate the percentage of the total cost of complying with all CPSC regulations that is represented by complying with these two regulations. Do you believe that these two regulations are among those whose revision promises to meet the goal of the executive order to reduce the onerous costs of the regulations put out by your agency, or does it make a mockery of the executive order to pick these two relatively minor regulations?

On July 11, 2011, President Obama issued Executive Order 13579, Regulation and Independent Regulatory Agencies (E.O. 13579)." The Executive Order stated that "independent regulatory agencies should consider how best to promote retrospective analysis of rules that may be outmoded, ineffective, insufficient, or excessively burdensome, and to modify, streamline, expand, or repeal them in accordance with what has been learned." E.O. 13579 further stated that independent regulatory agencies should develop and release a public plan for the periodic review of existing significant regulations. CPSC staff drafted a plan for retrospective review of existing rules. (The Commission was not able to agree on a plan, voting 2-2 on the staff's draft plan.)

The staff's draft plan set forth criteria for choosing rules to review and, as directed by OMB memorandum M-11-28, included an initial list of candidate rules for review over the next two years. The initial selection of rules was based on the staff's assessment of resources available and the limited period of time remainingin the fiscal year. The draft plan provided for review in FY 2012 of the toy caps rule, animal testing rules, and an assessment of burdens related to third party testing. The draft plan proposed and sought public comment on the potential for review of the following rules in FY 2013: (1) continued assessment of how to reduce burdens related to third party testing; (2) alternatives to third party testing that would be available for small batch manufacturers; (3) clarifying size definitions under the carpet and rug flammability standards; and (4) eliminating requirements related to the Federal Caustic Poison Act.

The CPSC has not performed animal testing since September 2008. CPSC staff considered this to be an example of "outmoded, ineffective" regulations that should be modified and updated as contemplated by E.O. 13579. With regard to the carpet and rug flammability standards, under current regulations there is a gap in coverage that has created confusion for manufacturers, particularly now that third party testing is required for some carpets and rugs. CPSC staff cannot estimate the total cost of complying with all CPSC regulations that is represented by complying with these two regulations. I note, however, that E.O. 13579 is not focused solely on reducing costs of existing regulations, but also asks agencies to "modify, streamline, expand, or repeal" those rules that "may be outmoded, ineffective,[or] insufficient." I also note that the CPSC staff's draft plan called for review of burdens related to third party testing, requirements that several public commenters felt impose significant costs that should be reduced.

6. *ROVs (Recreational Off-highway Vehicles)*

Why does the CPSC seem intent on pressing forward for a mandatory standard on ROVs rather than working with industry the way NHTSA does with the automobile companies to devise meaningful safety tests with repeatable results?

On October 28, 2009, the CPSC published an advance notice of proposed rulemaking (ANPR) concerning recreational off-highway vehicles (ROVs). 74 FR 55495. The ANPR began a rulemaking process that could result in a mandatory consumer product safety standard for ROVs. Throughout this process, CPSC staff has repeatedly met with industry representatives to facilitate an exchange of information and improvements to the voluntary standard as evidenced by multiple public meetings and comment letters submitted by CPSC staff during the voluntary standard canvass process. As the CPSC continues with the rulemaking process, one of the considerations will be the adequacy of the voluntary standard. Under section 9(f)(3)(D) of the CPSA, before the Commission can issue a final mandatory consumer product safety rule it must make certain findings about the adequacy of the relevant voluntary standard and the likely level of compliance with the voluntary standard.

7. *Buckyballs*

The CPSC routinely relies on the sufficiency of warning labels to keep children away from other adult products like, say, gasoline cans. Why then does the agency believe that warning labels are not an adequate solution to deal with the safety risk posed by a desk toy marketed to adults like Buckyballs? Has the agency taken steps to ban Buckeyballs and similar products as a banned hazardous substance, akin to lawn darts? If not, why not?

On September 4, 2012, the CPSC published a notice of proposed rulemaking (NPR) proposing a safety standard for magnet sets. 77 FR 53781. The preamble to the NPR (and the staff's briefing package upon which the NPR is based) explains why the Commission believes the standard it proposes is necessary to address the risks posed by sets of small, powerful magnets and why warning labels are not likely to adequately reduce the risk of injury. Specifically, the preamble notes that these magnets pose a unique hazard that many children, adults, and health care providers may not recognize. The injuries resulting from swallowing these magnets can be far more severe than swallowing other small items. When magnets are ingested they become attracted to each other, trapping intestinal tissue, and resulting in perforation of the intestine or bowel. Furthermore, while the magnet sets are marketed to adults, they have a strong appeal to children and are widely available to children.

While warning labels are appropriate in certain circumstances, the CPSC does not believe that they would be adequate to reduce the risk of injury with this product. The preamble to the proposed rule discusses the limitations of warnings for this product (*see* 77 FR at 53788-89). For example, magnet sets are likely to become separated from their packaging, and the magnets could not be individually labeled. Thus, users and parents may not see the warnings. Another limitation is the difficulty conveying in a label the unique and more severe hazard

that ingesting powerful magnets present compared to swallowing other small nonmagnetic objects. Furthermore, among the users of this product are adolescents who may swallow the magnets while imitating body piercings. Parents may not understand the risk posed to adolescents and may allow them to have the product in spite of warnings, and adolescents may not heed the warnings.

The magnet set NPR was issued under sections 7 and 9 of the Consumer Product Safety Act. (We note that the ban of lawn darts was mandated by Congress. P.L. 100-61, 102 Stat 3183, November 5, 1988.) The proposed rule would set size and strength requirements and would prohibit magnet sets that do not meet those requirements. Under the proposal, if a magnet set contains a magnet that fits within the CPSC's small parts cylinder, magnets from that set would be required to have a flux index of 50 or less, or they would be prohibited.

8. ***Budget***

How many agency employees attended the ICPHSO meeting in Orlando, Florida in February, 2011? What was the total cost of their travel and attendance at the conference?

Twenty-six agency employees attended the ICPHSO Training and Symposium Conference in Orlando, Florida in February, 2011. The total cost of their travel and attendance was $35,641.20.

Staff attendance at ICPHSO was a critical element in our global education and outreach efforts involving many of our stakeholders. The staff attending this conference participated in and led multiple interactive workshops and plenary sessions reaching over 700 stakeholders in one training session. These stakeholders included manufacturers, importers, distributors, retailers, consumer advocates, testing laboratories, trade associations, and domestic and international regulators (attendees represented over thirty countries).

How much money has the agency budgeted (and how much has it already spent) for redesigning its logo and ordering items featuring the new logo?

The final cost for the CPSC logo was $7,829.44. There are no additional expenditures planned. No new items have been ordered specifically to replace items with the existing seal. The new logo is currently being used on the agency's website, in staff presentations, on social media platforms, and other public facing platforms. As new publications, videos and agency products are being ordered or replaced, use of the agency logo will be included in the design and production.

How much money has the agency budgeted (and how much has it already spent) for consulting services for the agency's new strategic plan?

The contract support costs for the Strategic Plan required by the Government Performance and Results Act was $977,155. The contract costs for the Operational Review was $919,079. The total contract costs were $1,896,235. The last invoice was paid in November 2010. There is no money budgeted for a strategic plan in FY 2013.

How much money has the agency budgeted (and how much has it already spent) on an editor to ensure that documents reflect your preferred writing style? How does the agency justify this expense given that anything published in the Federal Register will be edited according to the style of that publication anyway?

The agency has one career employee that, as part of his/her job responsibilities, reviews documents, reports and other written materials that are disseminated to the public and Congress. However, this employee is, first and foremost, a seasoned attorney who serves in the Office of the General Counsel. This employee's legal duties include reviewing contracts and contract solicitations for legal sufficiency; participating in the development of procedural rules for various aspects of Commission activities; providing legal review and advice on budget, appropriations, directives, and other general law issues; coordinating with other federal agencies having concurrent jurisdiction with the Commission (based upon direction from the Commission and key staff personnel), including negotiating and drafting memoranda of understanding with other federal agencies; and providing legal guidance on responses to petitions and advising on legal aspects of decision making on these petitions. In addition to these legal duties this employee serves as CPSC's legal editor and its Plain Writing Officer, per the Plain Writing Act of 2010. This position is a GS-14.

The Honorable Adam Kinzinger

1. **I understand that CPSC is in the process of finalizing a Standard for the Flammability of Residential Upholstered Furniture that would allow furniture manufacturers two options for fulfilling the national requirements. One option would be through compliance with a smoldering-ignition test, known as "Type I." The second "Type II" approach would require the use of an interior barrier to meet both a smoldering and an open-flame test.**

    a. **What data supports allowing the Type I smolder-only option, given that open-flame risk for upholstered furniture is still a concern in American homes based on National Fire Protection Association data?**

    As stated in the 2008 Notice of Proposed Rulemaking (NPR), addressable residential upholstered furniture fires resulting from smoking material (primarily cigarettes) were responsible for 90 percent of deaths and 65 percent of injuries in the 2004-2006 period. The focus of the 2008 NPR was to address the primary ignition scenario based on the national fire data.

2. **Dr. Matt Blais of Southwest Research Institute recently issued a paper demonstrating that flame retardants in foam not only help to prevent a fire from starting, but also limit the overall heat release from an upholstered furniture fire. This is significant because reducing the overall heat release from a burning piece of furniture may delay the time to "flashover" in a room.**

In view of this research, do you agree that limiting the use of flame retardants in furniture would forfeit this added critical function that flame retardants provide?

Recent open flame ignited large scale tests conducted by CPSC included FR foams that met the California Technical Bulletin 117 (TB-117) requirements. The flame retardant (FR) foams tested by CPSC have not shown much improvement in flammability performance when tested in bench and large scale. It is important to note, however, that these large scale test results did not intend to represent all TB-117 or FR treated foams and the results are relevant to these specific materials. Furthermore, it was not within the scope of this test program to investigate the reason for the poor performance of the TB-117 foams.

It is possible that the FR technology applied for the TB-117 foam reported in Dr. Blais' study far exceeded the minimal requirements of TB-117.

A presentation in early 2012 from a researcher from Underwriters Laboratories at a NIST workshop showed that foams reported to meet TB-117 had reduced burn duration in cone calorimeter (small scale) tests, lower heat release in mockup tests, and did not show much improvement in full scale performance. All FR chemicals are not equally effective in reducing fire risk.

3. **Section 108 of the CPSIA requires the CHAP (and ultimately the Commission) to consider the possible health effects of any alternative plasticizers. Phthalates have been widely evaluated, by the Commission and other agencies, and found to be safe for intended uses– whereas many potential substitutes have not undergone significant scientific review. We are very concerned about the potential hazards to consumers of banning chemicals whose hazards we know only to replace them with chemicals whose possible hazards we don't understand. What is the Commission's policy regarding the possible replacement of phthalates with chemicals that have not been equally reviewed or assessed?**

CPSC staff reviews all possible chemical hazards, including possible phthalate replacements, using a standard risk assessment approach. The staff bases a recommendation to the Commission for regulation of a chemical under the FHSA on an assessment of both exposure and risk, not just the presence of the chemical. In considering exposure, the CPSC considers several factors: total amount of the chemical in the product; bioavailability of the chemical; accessibility of the chemical to children; age and foreseeable behavior of the children exposed to the product; foreseeable duration of the exposure; and marketing, patterns of use, and life cycle of the product.

The CPSC also assesses the toxicological data by evaluating available data from animal studies; human exposure data, if available, with specific attention to issues such as the routes of exposure; length of exposure (i.e., acute or chronic time frames); specific form of chemical; and dose-response relationships. CPSC staff estimates doses that correspond to substantial personal injury or substantial illness, for assessment under the FHSA. Staff evaluates all of the information and data collected in the product, toxicological, and exposure assessments to make conclusions about whether a product may be a hazardous substance.

4. **The CPSC's mission is to protect the public against unreasonable risks, not all risks, from consumer products. The CPSIA likewise mandates "using sufficient safety factors to account for uncertainties regarding exposure and susceptibility of children, pregnant women and other[s]." We are concerned that the CHAP is favoring a precautionary approach and departing from the reasoned, scientifically-based approach that is contemplated by the governing statutes. For example, there has been discussion in public CHAP meetings about using uncertainty factors that are significantly more conservative than the factors that would be employed under CPSC guidelines – more in line with European precautionary standards. This approach goes against the U.S. standard of judging substances or products for actual risks and could have serious economic consequences if it is adopted by CPSC or elsewhere in the U.S. government.**

   a. **Will the Commission adhere to a scientific, risk-based approach rather than the precautionary principle as it conducts rulemaking under Section 108?**

      The Commission will adhere to the statutory criteria set forth in Section 108 of the CPSIA as it conducts its rulemaking.

   b. **What steps, if any, is the Commission taking to ensure that the final rule issued is based on sound science and not simply precaution?**

      The Commission will adhere to the provisions set forth in Section 108 of the CPSIA to ensure the final rule is promulgated pursuant to the law.

5. **The CPSC is charged with regulating over 15,000 products worth billions of dollars to the American economy each year. According to President Obama's executive order 13579 on Improving Regulation and Regulatory Review, the agency is responsible for "developing a regulatory system that protects public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation." As you prepare a rulemaking on phthalates and phthalates alternatives in children's products, your agency should use its regulatory oversight responsibilities consistent with Executive Order 13579 and work to limit unnecessary burdens on small businesses and America's innovators. Please explain the measures that the CPSC will employ to ensure that any rulemaking associated with the CHAP's report will not stifle economic growth, innovation, competitiveness, and job creation.**

   Section 108(b)(3) of the Consumer Product Safety Improvement Act (CPSIA) provides that, not later than 180 days after the Commission receives the CHAP's report, "the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule [related to the findings of the CHAP]." After the CHAP issues its report, the Commission plans to pursue rulemaking in accordance with these requirements. Public input will inform the rulemaking process and provide the proper balance between economic growth, innovation, competitiveness, and job creation and the statutory requirements regarding phthalates mandated by the CPSIA.

6. **According to OMB's Peer Review Bulletin, a scientific assessment meets the criteria to be considered "highly influential" if "the agency or the OIRA Administrator determines that the dissemination could have a potential impact of more than $500 million in any one year on either the public or private sector or that the dissemination is novel, controversial, or precedent-setting, or has significant interagency interest." Because state, federal and international regulatory agencies have expressed significant interest in the CHAP's scientific report, and because this report could profoundly affect future rulemakings with widespread impacts, this report clearly meets the criteria of a "highly influential" scientific document.**

   a. **Please explain whether the Commission plans to treat the CHAP's scientific report as "highly influential"? If not, why?**

      CPSC understands the scientific importance of the CHAP report and will comply with the requirements regarding the report and the ensuing rulemaking set forth in section 108 of the CPSIA.

   b. **Was OMB consulted on this decision?**

      Staff has consulted with OMB on the Peer Review Bulletin.

7. **OMB's Peer Review Bulletin requires a high level of transparency and public involvement in the peer review of "influential scientific assessments," like the CHAP report. According to the OMB Bulletin:**

> **In order to obtain the most expert reviewers, agencies must "consider requesting that the public, including scientific and professional societies, nominate potential reviewers." This public involvement is crucial to assuring that the reviewers meet other criteria in the OMB Bulletin, including assuring that the reviewers "shall be sufficiently broad and diverse to fairly represent the relevant scientific and technical perspectives and fields of knowledge" and be independent of the agency.**
>
> **agencies are also instructed, "[w]henever feasible and appropriate," to "make the draft scientific assessment available to the public for comment at the same time it is submitted for peer review (or during the peer review process) and sponsor a public meeting where oral presentations on scientific issues can be made to the peer reviewers by interested members of the public."**
>
> **This last obligation is echoed in the CPSC's rules, which state that: "In order for the Consumer Product Safety Commission to properly carry out its mandate to protect the public from unreasonable risks of injury associated with consumer products, the Commission has**

determined that it must involve the public in its activities to the fullest possible extent."

CPSC's clearance procedures underscore the need for transparency in the case of complex assessments like the CHAP report. According to the clearance procedures, CPSC's staff and contractor technical reports related to health science and other issues having potentially high impacts on important public policies and private-sector decisions, "should be highly transparent." CPSC's clearance procedures also stipulate that "CPSC places great emphasis on its review process to ensure the quality of information disseminated." These procedures specify that "a report prepared by a contractor to the Commission [must be] subject to a review process by Commission staff."

a. **Please confirm that the CPSC will organize a peer review of the CHAP report that meets the requirements of OMB's Peer Review Bulletin.**

A potential peer review plan is currently under development but has not yet been finalized.

b. **Has the CPSC solicited nominations of prospective reviewers? If so, what process was used and when?**

In August, 2011, CPSC asked the National Academy of Sciences (NAS) to provide names of scientists with expertise in areas relevant to the work of the CHAP on phthalates. NAS provided names to CPSC which were then vetted within the CPSC Office of the General Counsel for any possible conflicts of interest.

c. **How will CPSC assure that its reviewers fairly represent the relevant scientific perspectives and fields of knowledge?**

CPSC conveyed to the NAS information regarding the nature of the scientific issues to be considered in the CHAP report and trusted the knowledge and expertise of the NAS to nominate the most appropriate scientists for the peer review work. Based on CPSC staff's knowledge of the risk assessment and phthalates scientific literature, staff believes the nominees who will peer review the CHAP draft report have the appropriate range of expertise to undertake that work.

d. **Will CPSC make the CHAP report publicly available for comment so that reviewers can gain the benefit of the public's scientific views and knowledge?**

The very nature of a scientific peer review requires that all relevant data and information be made available to the peer reviewers so that they can be as informed as possible in understanding the scientific approaches taken and conclusions reached by the CHAP members. The peer reviewers are highly trained scientists and experts in the

same areas as the CHAP members. Peer reviewers will have access to the full public record and will be provided all supporting information including all reference papers cited in the report.

e. **Will CPSC hold a public meeting on the CHAP report?**

Section 108(b)(3) of the Consumer Product Safety Improvement Act (CPSIA) provides that, not later than 180 days after the Commission receives the CHAP's report, "the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule [related to the findings of the CHAP]." After the CHAP issues its report, the Commission plans to pursue a rulemaking in accordance with these requirements. A public meeting is one additional option CPSC could use as a forum for public input.

f. **If CPSC does not intend to peer review the CHAP report, how will it "involve the public . . . to the fullest possible extent" and be able to say that the "information in the reports [is] highly transparent"?**

Please see the answers to the questions above.

g. **If the CHAP conducts a peer review using undisclosed reviewers, and uses a charge that no one has seen, does CPSC intend to claim that this is "its review process", will constitute a "CPSC-established review procedure", and will meet the requirement of the OMB Peer Review Bulletin that "each agency shall conduct a peer review on all influential scientific information that the agency intends to disseminate"?**

A potential peer review plan is currently under development but has not yet been finalized.

8. **CPSC's rules also provide that, "[t]o ensure public confidence in the integrity of Commission decision-making, the Agency, to the fullest possible extent, will conduct its business in an open manner free from any actual or apparent impropriety." You echoed this commitment during your confirmation hearing, pledging that the agency "will work to ensure that the Chronic Hazard Advisory Panel conducts an impartial . . . study . . . as required by the CPSIA." Without full transparency, the "peer review" process that the CPSC apparently is planning could appear to the public and key stakeholders as an attempt to use like-minded allies to add a veneer of scientific reliability to a biased process. If the Commission allows this to occur, or relies upon it to discharge the Commission's own responsibilities, how can the Commission claim that the process is "impartial," let alone "free from any actual or apparent impropriety"?**

A potential peer review plan is currently under development but has not yet been finalized.

CPSC staff believes that the CHAP process has been transparent. In the two and a half years since the CHAP was convened, virtually every meeting, phone call, piece of correspondence, all data submitted, etc. has been made available to the public on the CPSC website

(http://www.cpsc.gov/about/cpsia/chapmain.html). The CHAP invited prominent research scientists to present their latest results and heard public testimony and written comments from interested parties. The CHAP members even agreed to an industry request to submit and discuss additional scientific studies at one of its public meetings, which took additional time.

The CHAP members also encouraged stakeholders to make their actual data (versus summaries of data) publicly available so that the CHAP might consider that data along with all other available public information. Some stakeholders chose not to release the more detailed data, because of concerns about proprietary business information. The CHAP evaluated any and all relevant data made available to it, including information provided by the industry that was made public.

9. **The OMB Peer Review bulletin instructs that, "[w]henever feasible and appropriate," agencies should "make the draft scientific assessment available to the public for comment at the same time it is submitted for peer review (or during the peer review process) and sponsor a public meeting where oral presentations on scientific issues can be made to the peer reviewers by interested members of the public." The CPSC echoes this point in its own rules and has said it must involve the public in its activities to the fullest extent possible in order to properly carry out its mandate to protect the public from unreasonable risks of injury associated with consumer products.**

   a. **How does the CPSC plan to involve the public in the review process?**

      A potential peer review plan is currently under development but has not yet been finalized.

   b. **If CPSC does not solicit public comment, how will it: "[E]nsure that [the report] is accurate and not misleading" and otherwise "ensure the quality of information disseminated" in the report?**

      CPSC will follow the statutory criteria set forth in Section 108 of the CPSIA in discharging its statutory mandate regarding the CHAP report and the ensuring rulemaking.

10. **Section 108 of the CPSIA clearly calls for the CHAP to prepare a thorough report that provides an accurate characterization of the scientific data for six phthalates and alternatives. As highlighted during the hearing, the law states that the CHAP must review "all relevant data, including the most recent, best-available, peer-reviewed scientific studies . . . that employ . . . objective methods." During the hearing, I asked you specifically about this language and whether you personally support that the CHAP review encompasses the full weight of scientific evidence. To that question, you affirmatively responded, "I certainly do."**

    a. **Please explain what measures the Commission will utilize to ensure that the CHAP does not omit certain pieces of scientific research, and instead identifies and**

actively considers all relevant data in determining what is the best-available science.

It is the responsibility of the CHAP to conduct the examination and I have confidence its work will satisfy the requirements of Section 108 of the CPSIA.

b. Please explain how the Commission will properly consider the full weight of scientific evidence and literature.

Section 108(b)(3) of the CPSIA provides that, not later than 180 days after the Commission receives the CHAP's report, the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule based on the CHAP report." Once the final CHAP report has been submitted to the Commission, CPSC staff will pursue rulemaking in accordance with the requirements of Section 108 of the CPSIA.

The Honorable G. K. Butterfield

1. **At the Subcommittee hearing on August 2, 2012, you briefly addressed the CPSC's decision to file an administrative complaint in order to stop Maxwell & Oberton from continuing to distribute Buckyballs and Buckycubes because of the serious injuries to children resulting from the ingestion of the high-powered magnets that compose these products. I understand that you are limited in your ability to respond to questions concerning this matter because it is currently being litigated, but to the extent possible, can you please provide the Subcommittee with additional information about the types of injuries caused by these products when they are ingested by children?**

   On September 4, 2012, the Commission published a notice of proposed rulemaking (NPR) concerning magnet sets. 77 FR 53781. The preamble to the NPR provided information about the injuries that can result when children swallow these products (*see* pp. 53784-86). The NPR is available on the Commission's website at: http://www.cpsc.gov/businfo/frnotices/fr12/magnetnpr.pdf.

   Detailed information on specific cases that involved young children requiring surgical intervention, including abdominal surgey and intestinal resectioning, is provided on pages 17-21 of the CPSC staff briefing package, available at: http://www.cpsc.gov/library/foia/foia12/brief/magnetstd.pdf.

   The North American Society for Pediatric Gastroenterology, Hepatology and Nutrition (NASPGHAN) also released the results of a member survey on October 23, 2012, that details injuries reported in 480 magnet ingestion cases over the past 10 years. A summary of this survey is available at: http://www.aap.org/en-us/about-the-aap/aap-press-room/Pages/Warning-Labels-Ineffective-at-Preventing-High-Powered-Magnet-Ingestions.aspx.

2. **In her written testimony, Commissioner Nord criticized the Commission's determination that it was technologically feasible to limit total lead content for children's products to 100 parts per million as specified by Congress in section 101 of the Consumer Product Safety Improvement Act of 2008 (Pub. L. No. 110-114). Commissioner Nord stated: "This decision was particularly disturbing because the Commission had specific leeway in the statute to impose some balance through its judgments concerning the technological feasibility of such action." Can you please explain what the statute actually allowed the Commission to do and how the Commission arrived at its determination?**

In the CPSIA, Congress established a very high threshold for the agency to exempt any children's product or component thereof that does not comply with the current statutory lead limit of .01 percent (100 parts per million). The statute states that beginning on August 14, 2011, all children's products must comply with the reduced lead limit "unless the Commission determines that a limit of 100 parts per million is not technologically feasible for a product or product category. The Commission may make such a determination only after notice and a hearing and after analyzing the public health protections associated with substantially reducing lead in children's product." Rather than leave the definition of "technological feasibility" to the discretion of the Commission, the statute provides an explicit definition, stating that the reduced lead limit *shall* be deemed technologically feasible with regard to a product or product category if:

> (1) A product that complies with the limit is commercially available in the product category;
> (2) Technology to comply with the limit is commercially available to manufacturers or is otherwise available within the common meaning or the term;
> (3) Industrial strategies or devices have been developed that are capable or will be capable of achieving such a limit by the effective date of the limit and that companies, acting in good faith, are generally capable of adopting; or
> (4) Alternative practices, best practices, or other operational changes would allow the manufacturer to comply with the limit.

If *any* one of the four criteria was satisfied, the Commission could not make a finding that it was not technologically feasible for a product or product category to meet the .01 percent lead limit. Our staff worked extensively to solicit input from the regulated community concerning the technological feasibility of compliance with the .01 percent lead limit for children's products and categories of children's products. Based on their analysis of all the information sought out by and submitted to the agency, our professional staff could not recommend that the Commission make a determination that it was not technologically feasible for any children's product or category of children's products to meet the .01 percent lead limit based on the statutory criteria necessary to support such a finding.

3. **In her written testimony, Commissioner Northup stated: "The goal of regulatory review should be to *meaningfully* reduce regulatory burdens." (Emphasis in original.) Her testimony suggests no other goals for regulatory review.**

a. Do you believe that the only goal of regulatory review is the reduction of regulatory burdens, as suggested by Commissioner Northup?

I believe the reduction of regulatory burdens is one of many goals of regulatory review. However, I do not agree with my former colleague that the single most important criterion for setting priorities should be the cost of the regulation to business. While I agree that cost should always be a significant factor, I do not believe any one factor should automatically take precedence over the others except, perhaps, for preventing or reducing deaths and injuries. That said, I note that the staff draft plan for prioritizing candidates for retrospective review includes numerous criteria that recognize the importance of costs in the reviews. Among these criteria are the cost of the regulation, including the impact on small businesses; the cost associated with the regulation; overlapping regulatory requirements; and the paperwork burden associated with the regulation.

In addition to these cost related criteria, staff has recommended a number of noncost related factors, including advancements in technology, age of a regulation, and input from stakeholders. I believe that all of staff's proposed factors should be considered when selecting rule review projects.

b. Do you believe that the Commission's proposed regulatory review plan provides the type of balanced approach called for in the President's Executive Orders? Please explain the benefits of this type of balanced approach compared to the one advocated by Commissioner Northup.

I believe the proposal by the Commission's professional staff is a very fulsome, balanced, and appropriate review plan. In the package presented to the Commission, staff formulated a plan that not only incorporated the elements drawn from the President's Executive Orders (EO) 13579 and 13563, but also set forth a defined method and schedule for identifying and reconsidering any Commission rules that are obsolete, unnecessary, unjustified, excessively burdensome, counterproductive, or ineffective, or that otherwise require modification without sacrificing the safety benefits of the rules. The plan also encourages public input and participation to find the right balance of priorities and resources. The plan also incorporates the requirement in Public Law 112-28 that the Commission seek and consider comments on ways to reduce the cost of third party testing requirements.

Furthermore, the plan contemplates the agency's finite resources, specifically considering ways to address review without diverting staff resources from some of the Commission's key safety activities. As I said in my testimony, diverting resources from our core safety mission is not acceptable to me, nor should it be acceptable to America's consumers, especially parents.

UNITED STATES
CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MD 20814

COMMISSIONER

October 19, 2012

The Honorable Mary Bono Mack
Chairman
Subcommittee on Commerce, Manufacturing, and Trade
Committee on Energy and Commerce
U.S. House of Representatives
2125 Rayburn Building
Washington, DC 20515

Dear Chairman Bono Mack,

Thank you for inviting me to testify at your Thursday, August 2, 2012 hearing entitled, "Oversight of the Consumer Product Safety Commission." I appreciated the opportunity to share my views with Members of the Subcommittee. Attached are my answers to the Subcommittee's questions for the record.

Sincerely,

Robert Adler

Robert S. Adler
Commissioner

Attachment

cc:
G.K. Butterfield, Ranking Member
Subcommittee on Commerce, Manufacturing, and Trade

The Honorable Brett Guthrie

1. **As you know, the power tools industry developed a revised set of voluntary safety standards in November of 2007 for table saws. Products using those new standards were introduced to the marketplace thereafter and were required to meet those standards beginning in early 2010. That voluntary standard was enhanced in October of 2011 with improved performance standards under a broader set of cutting conditions.**

   Is it accurate that the CPSC had not collected any data from the current products that are compliant with the current voluntary standards, and that the CPSC based its advanced notice of proposed rulemaking for a mandatory rule on data from older, noncompliant saws?

   The Commission published an advance notice of proposed rulemaking (ANPR) concerning table saw blade injuries on October 11, 2011. 76 FR 62678. The voluntary standard was revised in October 2011. Thus, incident data reflecting the new voluntary standard is not yet available for the staff to review. Any subsequent steps in the rulemaking that the Commission decides to pursue (notice of proposed rulemaking and final rule) would include a review of data available at those stages.

   The comment period for the ANPR closed March 16, 2012. I am hopeful that all of the relevant stakeholders, including table saw manufacturers, have submitted any data in their possession regarding any injuries associated with saws that are compliant with the newer voluntary standard. I eagerly await CPSC staff's review and evaluation of the comments received in connection with the ANPR.

   a. **Is CPSC now collecting more up-to-date information on accidents incurred under the 2007 voluntary standard for table saws?**

      CPSC staff continuously receives reports related to consumer products through various means, including news clippings, death certificates, consumer submitted reports, etc. Table saw-related incident reports are reviewed by CPSC staff to leverage any information available. These reports are anecdotal and may or may not be related to a table saw that is compliant under the 2007 voluntary standard. CPSC staff also collects emergency department-treated injury data via the National Electronic Injury Surveillance System (NEISS). Though this system does collect information about table saws, it is not possible to differentiate pre- and post- 2007 voluntary standard-compliant saws within the data. A special study would be required to gather this level of detail; similar to the special study that was performed on stationary saws in 2007-2008. Another study of this nature is not planned for table saws. However, CPSC staff has awarded contracts for the collection of data concerning if and how owners of new table saws are using the modular blade guard system that is part of the current voluntary standard.

Additionally, I am hopeful that all of the relevant stakeholders, including table saw manufacturers, have submitted any data in their possession regarding any injuries associated with saws that are compliant with the newer voluntary standard during the extended open comment period for the ANPR.

b. **If so, will this data be weighed equally when considering a proposed mandatory safety standard for table saws?**

According to CPSC staff the data that we plan to collect is from a convenience sample of new table saw users who will be recruited to participate in the study. This study will not be in the same form as the previous table saw injury study, and it cannot be used in the same manner. CPSC staff's goal in collecting this data is to better understand if and how consumers are using the modular blade guard system that is part of the current voluntary standard. This information will be used along with additional information collected to guide CPSC's staff recommendations during the rulemaking process. In addition to the information gathered from this study, CPSC staff will consider any and all other relevant incident data that is available when it considers a possible proposed standard for table saws. In particular, I am hopeful that the relevant stakeholders that have access to data the CPSC is not aware of regarding any injuries associated with saws that are compliant with the newer voluntary standard submitted this data during the extended open comment period for the ANPR.

2. **Doesn't the CPSC need to gather data on the compliant saws using the current voluntary standard before you can move forward with a mandatory standard? As I understand it, the CPSC is statutorily directed to rely on voluntary standards over a mandatory standard as long as "compliance with such voluntary standards would eliminate or adequately reduce the risk of injury addressed and it is likely that there will be substantial compliance with such voluntary standards." (15 U.S.C. Sec. 2056(b)).**

The CPSC must consider the adequacy of, and level of compliance with, applicable voluntary standards before it can issue a final mandatory consumer product safety standard for a product. CPSC staff has awarded contracts for the collection of data concerning if and how owners of new table saws are using the modular blade guard system that is part of the current voluntary standard. This will aid staff in determining whether the current voluntary standard would eliminate or adequately reduce the risk of injury addressed. The study will be completed prior to the issuance of any final mandatory rule.

a. **How would the CPSC be able to judge the risk of injury under and substantial compliance with the new voluntary standards if you have not collected and analyzed data on the table saws using those standards?**

The ANPR is the beginning of the rulemaking process. As the rulemaking progresses, the CPSC will collect and analyze the data that become available, including compliance with any applicable voluntary standards. Prior to the issuance of any final mandatory rule, CPSC staff will complete an analysis of the effectiveness of current voluntary standards.

3. **Following up on the CPSC advanced notice of proposed rulemaking for table saws, one of the main options CPSC asks for comments on for a mandatory rule is a patented technology, owned and controlled by one company, based on blade contact flesh detection technology. I understand it was this company's CEO who originally petitioned the CPSC to consider rulemaking in this area.**

   a. **Is CPSC was aware that the Federal Trade Commission recently testified before Congress raising concerns about a patent holder using adopted standards to demand higher royalties or licensing fees as result of a standard? The FTC testimony noted that "[i]ncorporating patented technologies into standards has the potential to distort competition by enabling [standard essential patent] owners to use the leverage they acquire as a result of the standard setting process to negotiate high royalty rates and other favorable terms after a standard is adopted that they could not have credibly demanded beforehand." (http://www.ftc.gov/os/testimony/120711standardpatents.pdf)**

   Speaking only for myself, while I was aware of the FTC's testimony, I am not convinced that the issue to which the FTC was speaking is directly related to the question of a voluntary or mandatory table saw safety performance standard. The Commission's ANPR presented three regulatory alternatives to address table saw blade contact injuries: (1) a voluntary standard, (2) a mandatory rule with performance requirements, and (3) a labeling rule specifying warnings and instructions. We have not yet determined which, if any, option to pursue. With any option the Commission pursues, we are required under section 7 of the CPSA to express any mandatory consumer product safety standard in terms of performance requirements, rather than mandating any particular design.

   b. **Are you concerned that a single patent holder, such as the single patent holder in possession of flesh detection technology for table saws, could demand higher royalties or refuse to license on reasonable and non-discriminatory terms if their patented technology is incorporated into a mandatory standard? Does the CPSC share the FTC's concern about incorporating patented technologies into standards?**

   As mentioned in the previous answer above, when the CPSC writes mandatory product safety standards, we do not mandate a particular technology. We write performance standards and allow manufacturers to decide how to meet them. Ultimately, I am not in favor of a monopoly if such a result is avoidable. It is my understanding that while there is a patented flesh sensing technology that appears

to eliminate the risk of serious blade contact injuries, I have also heard there are other competing technologies that I am hopeful will be brought to market to provide both consumers and manufacturers with a variety of means to address this very serious consumer hazard.

The Honorable Charles F. Bass

1. **I'm aware that there is a proposed ruling to allow use of X-Ray Fluorescence (XRF) to certify products as lead free. It's my understanding that there are multiple XRF techniques, including handheld XRF and so-called HD XRF. It appears from the proposed rule that both techniques would be acceptable, but can you confirm to the committee that the rule will enable use of both the widely-accepted handheld XRF techniques which are deployed across the supply chain, as well as the emerging HD XRF methods?**

   The "Proposed Rule: Requirements Pertaining to Third Party Conformity Assessment Bodies" includes provisions to widen the use of both "HD XRF" (a trademarked name for Energy Dispersive X-Ray Fluorescence Spectrometry Using Multiple Monochromatic Excitation Beams, as described in ASTM F2853-10e1) as well as "handheld" XRF (more generically known as Energy Dispersive X-Ray Fluorescence Spectrometry, as described in ASTM F2617-08) for third-party testing for certification. These provisions would enable the use of either type of XRF, with limitations as described in the proposed rule, for measuring lead in homogeneous metals, glass, crystals and other materials. This proposed rule would not widen the use of "handheld" XRF to include determinations of lead in painted surfaces of consumer products because at present no XRF method is available other than HD XRF (ASTM F2853-10e1) for determining compliance to 16 CFR part 1303 for painted surfaces on children's products with respect to the limit of 0.009 percent lead by weight.

2. **Knowing that one of the priorities of the CPSC is to increase public awareness around the dangers of carbon monoxide poisoning, please share with the Committee what activities the Commission is currently undertaking?**

   Prevention of carbon monoxide poisoning deaths and injuries caused by consumer products is a key priority for the CPSC. To address this hazard comprehensively, the Commission has taken a two-pronged approach that focuses on both product innovation and consumer outreach and education.

   On the product innovation side, CPSC staff has focused a great deal of effort on reducing carbon monoxide poisoning deaths from portable gasoline generators. In just the three year period from 2006 to 2008, there were an estimated 233 non-fire carbon monoxide poisoning deaths to consumers associated with the use of portable gasoline-powered generators in the United States. In September of this year, CPSC staff released a report detailing the development and demonstration of a prototype portable generator that can dramatically reduce carbon monoxide (CO) emissions from certain common portable gasoline-powered generators. When the prototype was tested in the common fatal scenario of a generator operating in the attached garage of a single family home, health effects modeling performed on the results showed that the prototype increased the hypothetical garage occupant's escape time interval to 96

minutes compared to only 8 minutes provided by the original, unmodified unit. A copy of this report may be found on the CPSC website. (http://www.cpsc.gov/LIBRARY/FOIA/FOIA12/os/portgen.pdf)

Additionally, CPSC staff also recently released a report titled "Evaluation of the Durability and Longevity of Chemicals Sensors Used In-Situ for Carbon Monoxide Safety Shutdown of Gas Furnaces." According to the report, gas furnaces continue to be one of the leading causes of unintentional CO poisoning deaths associated with consumer products. From 2006 through 2008, gas furnaces, including central, wall, and floor furnaces, accounted for 48 percent of the CO deaths associated with all gas-fueled products and 17 percent of CO deaths associated with all consumer products. This report was based on a test program that evaluated the durability and longevity of sensors operating in a gas furnace as a CO shutoff device. The test results demonstrated that, despite being exposed to the operating environment of a gas furnace and the aging conditions of a corrosion test, the catalytic bead CO sensors and the NDIR CO2 sensors maintained their basic electrical operability (*e.g.*, continued sensitivity to target gas, continued strong linear relationship, and a continued ability to distinguish between shutoff and non-shutoff CO or CO2 levels). Based on this, CPSC staff concluded that the sensors were durable enough to withstand the operating environment within a gas furnace and that the results provided an indication that the sensors could reach a lifespan commensurate with that of a gas furnace. In other words, these findings demonstrate that chemical sensors exist that can withstand the harsh operating environment of a furnace and have the potential to survive throughout the lifespan of the furnace. Additional technical work is needed, including an evaluation of the mechanical integrity of the sensors after aging – which was not part of the scope of this test program, but should be considered in future test and evaluation efforts. A copy of this report may be found on the CPSC website. (http://www.cpsc.gov/library/foia/foia12/os/cosensorlongevity.pdf)

CPSC also engages in robust education and outreach using a variety of outlets. The Commission communicates the dangers of carbon monoxide poisoning through the use of earned media, conducting television, radio and print interviews most often as rapid response in conjunction with major, power-disrupting storms such as hurricanes and snow storms, when greater use of generators exposes more people to the hazard. We also use social media outreach, e-publication downloads from the dedicated CO Information Center page on CPSC.gov, and the distribution of messages to grassroots partners through our Neighborhood Safety Network. Twice a year, CPSC issues reminders to install fresh batteries in CO and smoke alarms in conjunction with the change in daylight savings time.

In addition, CPSC has used its OnSafety blog, YouTube, Twitter and its FireSafety.gov website to promote new developments in technology, including making CO alarms more effective and, this year, new developments in reducing CO emissions in generators. These efforts have resulted in an estimated audience impression of more than 100 million people during FY2012. This year, Congressional District offices in areas generally impacted by hurricane season were also provided CO informational safety packets to share with their constituents. This information is

also posted to the CPSC's website. Field staff has also provided Congressional offices with informational materials in the wake of severe weather events causing power outages. As the winter season approaches, CPSC will continue to promote CO awareness by warning consumers of dangers associated with home heating equipment. During FY2013, CPSC will also begin staging a second CO Poster safety contest for school children that became the most popular contest on Challenge.gov when first held.

The Honorable G. K. Butterfield

1. **At the hearing, Commissioner Northup stated that she believed that if the CPSC launched a Facebook page, it "absolutely would violate the overarching rules in our Commission" and that if the Commission loses the lawsuit concerning the public consumer product safety information database the decision "would almost certainly say that any putting up of Facebook would violate the protections of 6(b)." However, the House report accompanying its version of the original Consumer Product Safety Act indicates Congress was concerned with protecting sensitive business information the agency might obtain in carrying out its duties to protect the public from unsafe products. The House report states that the CPSC will have "access to a great deal of information which would not otherwise be available to the public or to Government. Much of this relates to *trade secrets or other sensitive cost and competitive information*." (Emphasis added.) Do you agree with Commissioner Northup's view that launching a Facebook page would violate Section 6?**

   At the outset, Commissioner Northup has confused two unrelated topics. Any court ruling related to the database has virtually no relevance to the issues surrounding Facebook and section 6(b) of the CPSA. Section 6A(f)(1) of the Consumer Product Safety Act, as amended by the Consumer Product Safety Improvement Act (CPSIA), specifically exempts the disclosure of information in the database from the provisions of section 6(a) and 6(b) of the CPSA. Since section 6(b) does not generally apply to the disclosure of information in the database, I fail to see any connection between the database lawsuit and 6(b) issues relating to Facebook.

   With regard to Facebook, I note two points. First, Facebook requires any and all entities creating a Facebook "fan page" to permit members of the public to comment on any postings by the entities – no exceptions. Accordingly, were the CPSC to create such a page on Facebook, we would have no choice but to permit public comments to be posted on Facebook irrespective of any desire we might have that Facebook not post the comments. Second, every other federal health and safety agency of which I am aware – e.g. FDA, FTC, OSHA and NHTSA – all have Facebook pages. In fact, the CPSC is one of the very few federal agencies that does not have a Facebook page. This means that, unlike other agencies and most members of Congress, CPSC currently has no ability to share – at no cost to the agency or taxpayers – its critical safety messages with the approximately 1 billion Facebook users in a medium with which they interact on a daily basis.

   As a matter of law, I disagree with Commissioner Northup's view that launching a Facebook page would violate section 6(b). Section 6(b) applies only to information "obtained under the [CPSA] or to be disclosed to the public in connection therewith...." In my opinion, comments filed at a page where Facebook – not the CPSC – publishes the comments regardless of the wishes of the agency are neither "obtained" under the CPSA nor are they "to be disclosed to the public in connection with" the CPSA. They are Facebook's records, not the agency's records. I

understand that a wide array of independent and executive branch agencies have adopted a similar view and treat such postings as Facebook's records, not theirs. And because CPSC will neither control nor vouch for any comments posted on Facebook, section 6(b) simply will not apply to a CPSC page on Facebook.

It is my strong hope that the CPSC will take immediate steps to set up a Facebook page. I propose that we establish a strong, clear disclaimer immediately viewable on the web site that makes unequivocally clear that CPSC neither controls nor vouches for any comments posted on Facebook. Moreover, to make sure that members of the public find a place to share their injury experiences, I believe the agency should place a prominently displayed link, to our database, SaferProducts.gov, so that they can file a report of harm about a specific consumer product.

2. **At the hearing, Commissioner Northup criticized your decision to have the Commission revisit its interpretation of the term "unblockable drain" in the Virginia Graeme Baker Pool and Spa Safety Act. As a result of your decision, the Commission voted to bring its interpretation of the Act in line with what Congress intended; that is, public pools and spas with single main drains must be equipped with drain covers and secondary anti-entrapment devices. Can you please respond to Commissioner Northup's criticism of your decision to revisit this issue and the Commission's decision to bring its interpretation of the law line with Congress's intent?**

Before I explain the reasons for switching my vote, I need to address Commissioner Northup's demonstrably false accusation that my vote led to the closure of 1100 pools throughout the country. Anyone knowledgeable about the state of public finances knows that the problem in recent years has been state and local budget cutbacks that have led to the firing of teachers, fire-fighters and police officers, as well as the closure of some municipal pools. These budget challenges are the main reason for public pool closures, not Commission actions to implement the Congressionally-directed requirements of the Virginia Graeme Baker Pool and Spa Safety Act (VGBA).

Moreover, as far as I can tell, after the Commission's original vote, very few public pools actually chose the installation of unblockable drain covers as their method of complying with the VGBA. According to CPSC compliance investigators, less than five percent of the pools they have inspected installed such drain covers. The reason for such modest numbers is that unblockable drain covers have turned out to be more expensive than most secondary anti-entrapment devices, so where cost is a critical factor, almost no one has purchased unblockable drain covers.

Perhaps even more dispositive of Commissioner Northup's claim is the fact that no public pool has ever faced closure by the CPSC for having purchased an unblockable drain cover. At my urging, the Commission granted an extra year to those pool owners who had bought an unblockable drain cover to bring their pools into VGBA compliance. In fact, they have until May 2013 to bring their pools into VGBA

compliance. It's hard to see how a requirement that has yet to be enforced could have forced any pools to close.

With respect to my changed vote, I will simply say that I carefully studied the legal issues before the first vote and cast my vote in good faith. After I cast that vote, I was contacted by numerous pool users and by several Members of Congress, including Representative Debbie Wasserman Schultz, one of the prime supporters of this legislation, who insisted that I had misinterpreted the law. Having carefully listened to their arguments, I promised to reconsider the issue. I thereupon spent almost a year contacting and consulting with numerous parties, including pool owners, trade associations, water park owners, consumer groups, drain cover manufacturers, SVRS manufacturers, congressional staff, and CPSC staff. As I spoke to the various parties, I slowly became convinced that the concept of "unblockable drain covers" as a method of complying with VGBA arose primarily as a post-enactment idea, not as anything contemplated by the authors of the bill at the time they wrote the legislation. To be sure of this, I researched the entire history of the VGBA so that I could be as certain as possible about the correct interpretation of the law. Given my conclusion, I found it hard to maintain my original view that an unblockable drain cover could be considered an "unblockable drain" under VGBA.

Having reached the conclusion that I had misinterpreted the term "unblockable drain" in the VGBA, I felt that fairness and deference to the will of Congress required me to change my vote. This was entirely my decision based solely on my new reading of the law. I deeply regret any inconvenience or extra costs that any pool owner will face as a result of my vote.

U.S. CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MARYLAND 20814

COMMISSIONER NANCY A. NORD

October 31, 2012

The Honorable Mary Bono Mack
Chairman
Subcommittee on Commerce, Manufacturing and Trade
U.S. House of Representatives
2416 Rayburn House Office Building
Washington, D.C. 20515

Dear Chairman Bono Mack:

Attached are responses to additional questions submitted by Members of the Subcommittee on Commerce, Manufacturing and Trade for the record of the hearing held on August 2, 2012. In some instances, the questions request technical information. In those cases I have requested that the CPSC staff technical experts provide the information requested and I have noted that the response is from the CPSC staff.

It was my pleasure to testify at this important hearing and I am pleased to provide any additional information that may be helpful to the Subcommittee.

Sincerely,

Nancy A. Nord
Commissioner

cc: The Honorable G.K. Butterfield
Ranking Member
Subcommittee on Commerce, Manufacturing, and Trade

The Honorable Brett Guthrie

1. *As you know, the power tools industry developed a revised set of voluntary safety standards in November of 2007 for table saws. Products using those new standards were introduced to the marketplace thereafter and were required to meet those standards beginning in early 2010. That voluntary standard was enhanced in October of 2011 with improved performance standards under a broader set of cutting conditions.*

   Is it accurate that the CPSC had not collected any data from the current products that are compliant with the current voluntary standards, and that the CPSC based its advanced notice of proposed rulemaking for a mandatory rule on data from older, noncompliant saws?

Staff's response

The Commission published an advance notice of proposed rulemaking (ANPR) concerning table saw blade injuries on October 11, 2011.[1] The voluntary standard was revised in October 2011. Thus, incident data reflecting the new voluntary standard is not yet available for the staff to review. Any subsequent steps in the rulemaking that the Commission decides to pursue (notice of proposed rulemaking and final rule) would include a review of data available at those stages.

   a. *Is CPSC now collecting more up-to-date information on accidents incurred under the 2007 voluntary standard for table saws?*

Staff's response

CPSC staff continuously receives reports related to consumer products through various means, including news clippings, death certificates, consumer submitted reports, *etc.* Table saw-related incident reports are reviewed by CPSC staff to leverage any information available. These reports are anecdotal and may or may not be related to a table saw that is compliant under the 2007 voluntary standard. CPSC staff also collects emergency department-treated injury data via the National Electronic Injury Surveillance System (NEISS). Though this system does collect information about table saws, it is not possible to differentiate pre- and post-2007 voluntary standard-compliant saws within the data. A special study would be required to gather this level of detail; similar to the special

[1] 76 Fed. Reg. 62,678.

study that was performed on stationary saws in 2007 through 2008. Another study of this nature is not planned for table saws. However, CPSC staff has awarded contracts for the collection of data concerning if and how owners of new table saws are using the modular blade guard system that is part of the current voluntary standard.

b. *If so, will this data be weighed equally when considering a proposed mandatory safety standard for table saws?*

Staff's response

The data that CPSC staff will be collecting is from a convenience sample of new table saw users who will be recruited to participate in the study. This study will not be in the same form as the previous table saw injury study, and it cannot be used in the same manner. CPSC staff's goal in collecting this data is to better understand if and how consumers are using the modular blade guard system that is part of the current voluntary standard. This information will be used along with additional information collected to guide CPSC's staff recommendations during the rulemaking process. In addition to the information gathered from this study, CPSC staff will consider any and all other relevant incident data that is available when it considers a possible proposed standard for table saws.

2. *Doesn't the CPSC need to gather data on the compliant saws using the current voluntary standard before you can move forward with a mandatory standard? As I understand it, the CPSC is statutorily directed to rely on voluntary standards over a mandatory standard as long as "compliance with such voluntary standards would eliminate or adequately reduce the risk of injury addressed and it is likely that there will be substantial compliance with such voluntary standards." (15 U.S.C. Sec. 2056(b)).*

Staff's response

The CPSC must consider the adequacy of, and level of compliance with, applicable voluntary standards before it can issue a final mandatory consumer product safety standard for a product. CPSC staff has awarded contracts for the collection of data concerning if and how owners of new table saws are using the modular blade guard system that is part of the current voluntary standard. This will aid staff in determining whether the current voluntary standard would eliminate or adequately reduce the risk of injury addressed. The study will be completed prior to the issuance of any final mandatory rule.

a. *How would the CPSC be able to judge the risk of injury under and substantial compliance with the new voluntary standards if you have not collected and analyzed data on the table saws using those standards?*

Staff's response

The ANPR is the beginning of the rulemaking process. As the rulemaking progresses, the CPSC will collect and analyze the data that become available, including compliance with any applicable voluntary standards. Prior to the issuance of any final mandatory rule, CPSC staff will complete an analysis of the effectiveness of current voluntary standards.

3. *Following up on the CPSC advanced notice of proposed rulemaking for table saws, one of the main options CPSC asks for comments on for a mandatory rule is a patented technology, owned and controlled by one company, based on blade contact flesh detection technology. I understand it was this company's CEO who originally petitioned the CPSC to consider rulemaking in this area.*

   a. *Is CPSC was aware that the Federal Trade Commission recently testified before Congress raising concerns about a patent holder using adopted standards to demand higher royalties or licensing fees as result of a standard? The FTC testimony noted that "[i]ncorporating patented technologies into standards has the potential to distort competition by enabling [standard essential patent] owners to use the leverage they acquire as a result of the standard setting process to negotiate high royalty rates and other favorable terms after a standard is adopted that they could not have credibly demanded beforehand." (http://www.ftc.gov/os/testimony/120711standardpatents.pdf)*

Staff's response

The ANPR presented three regulatory alternatives to address table saw blade contact injuries: (1) a voluntary standard, (2) a mandatory rule with performance requirements, and (3) a labeling rule specifying warnings and instructions. The Commission has not determined which, if any, option to pursue. We note that section 7 of the CPSA requires the Commission to express any mandatory consumer product safety standard in terms of performance requirements, rather than mandating any particular design.

b. *Are you concerned that a single patent holder, such as the single patent holder in possession of flesh detection technology for table saws, could demand higher royalties or refuse to license on reasonable and non-discriminatory terms if their patented technology is incorporated into a mandatory standard? Does the CPSC share the FTC's concern about incorporating patented technologies into standards?*

Staff's response

Please see the previous answer.

The Honorable Charles F. Bass

1. *I'm aware that there is a proposed ruling to allow use of X-Ray Fluorescence (XRF) to certify products as lead free. It's my understanding that there are multiple XRF techniques, including handheld XRF and so-called HD XRF. It appears from the proposed rule that both techniques would be acceptable, but can you confirm to the committee that the rule will enable use of both the widely-accepted handheld XRF techniques which are deployed across the supply chain, as well as the emerging HD XRF methods?*

Staff's response

The "Proposed Rule: Requirements Pertaining to Third Party Conformity Assessment Bodies" includes provisions to widen the use of both "HD XRF" (a common shorthand for Energy Dispersive X-Ray Fluorescence Spectrometry Using Multiple Monochromatic Excitation Beams, as described in ASTM F2853-10e1) as well as "handheld" XRF (more generically known as Energy Dispersive X-Ray Fluorescence Spectrometry, as described in ASTM F2617-08) for third-party testing for certification. These provisions would enable the use of either type of XRF, with limitations as described in the proposed rule, for measuring lead in homogeneous metals, glass, crystals and other materials. This proposed rule would not widen the use of "handheld" XRF to include determinations of lead in painted surfaces of consumer products because at present no XRF method is available other than HD XRF (ASTM F2853-10e1) for determining compliance to 16 CFR part 1303 for painted surfaces on children's products with respect to the limit of 0.009 percent lead by weight.

Commissioner Nord's further response

On two occasions—with the passage of the Consumer Product Safety Improvements Act and with Public Law 112-28—Congress has signaled that it wants the Commission to use new and emerging technologies to reduce the costs of the testing mandated by the law. XRF technology, and in particular the advanced forms the staff described above, have the potential for significant cost reductions. The Commission currently has a rulemaking underway that potentially could result in allowing wider use of this technology. I am not convinced that regulatory package currently out for comment presents the proper formula for encouraging deployment of this technology across the supply chain. This is an area where, as we consider the proposed rule and consistent with comments received, the

Commission could provide strong leadership for effectively encouraging the development and use of new technologies for reducing the very considerable costs of testing that the law and our regulations now impose.

2. *Knowing that one of the priorities of the CPSC is to increase public awareness around the dangers of carbon monoxide poisoning, please share with the Committee what activities the Commission is currently undertaking?*

Staff's response

Prevention of carbon monoxide poisoning deaths and injuries caused by consumer products is a key priority for the CPSC. To comprehensively address this hazard, the Commission has taken a two-pronged approach that focuses on both product innovation and consumer outreach and education.

On the product innovation side, CPSC staff has focused a great deal of effort on reducing carbon monoxide poisoning deaths from portable gasoline generators. In just the three year period from 2006 to 2008, there were an estimated 233 non-fire carbon monoxide poisoning deaths to consumers associated with the use of portable gasoline-powered generators in the United States. In September of this year, CPSC staff released a report detailing the development and demonstration of a prototype portable generator that can dramatically reduce carbon monoxide (CO) emissions from certain common portable gasoline-powered generators. When the prototype was tested in the common fatal scenario of a generator operating in the attached garage of a single family home, health effects modeling performed on the results showed that the prototype increased the hypothetical garage occupant's escape time interval to 96 minutes compared to only 8 minutes provided by the original, unmodified unit. A copy of this report may be found on the CPSC website.[2]

CPSC also engages in robust education and outreach using a variety of outlets. The Commission communicates the dangers of carbon monoxide poisoning through the use of earned media, conducting television, radio and print interviews most often as rapid response in conjunction with major, power-disrupting storms such as hurricanes and snow storms, when greater use of generators exposes more people to the hazard. We also use social media outreach, e-publication downloads from the

[2] http://www.cpsc.gov/LIBRARY/FOIA/FOIA12/os/portgen.pdf.

dedicated CO Information Center page on CPSC.gov and the distribution of messages to grassroots partners through our Neighborhood Safety Network. Twice a year CPSC issues reminders to install fresh batteries in CO and smoke alarms in conjunction with daylight savings time.

In addition, CPSC has used its OnSafety blog, YouTube, Twitter and its FireSafety.gov website to promote new developments in technology including making CO alarms more effective and, this year, new developments in reducing CO emissions in generators. These efforts have resulted in an estimated audience impression of more than 100 million people during FY2012. This year, Congressional District offices in areas generally impacted by hurricane season were also provided CO informational safety packets to share with their constituents. This information is also posted to the CPSC's website. Field staff has also provided Congressional offices with informational materials in the wake of severe weather events causing power outages. As the winter season approaches, CPSC will continue to promote CO awareness by warning consumers of dangers associated with home heating equipment. During FY2013, CPSC will also begin staging a second CO Poster contest for school children that became the most popular contest on Challenge.gov when first held.

The Honorable Mike Pompeo

1. *Database/Facebook/§ 6(b)*

    a. *What is the status of the lawsuit brought against the CPSC last year by anonymous companies over the agency's botched interpretation of the database language in the Consumer Product Safety Improvement Act of 2008?*

The CPSC was sued by an anonymous company. Although the case proceeded under seal, the court released a redacted version of its opinion and order on October 22, 2012, in *Doe v. Tenenbaum*.[3] Among other things, the court granted the company's motion for summary judgment against the CPSC with respect to the agency's decision to publish a report about the company's consumer product. The company complained that the report—in several iterations—was materially inaccurate.

The court found that the CPSC acted arbitrarily and capriciously in deciding to publish the report on SaferProducts.gov. Specifically, the court found that the report of harm did not demonstrate that the product was "related to" the harm at issue in the report. The court found that the agency, through multiple revisions of the report, engaged in speculation—and mere speculation was insufficient to demonstrate actual connection between the product at issue and the harm described. The court further found that the agency's decision to publish the report was inconsistent with previous decisions *not* to publish reports wherein the CPSC's judgment, it would be materially inaccurate to publish a report where "the evidence in the report of harm did not show that the product was the source of the problem."[4]

On September 28, 2012, the government filed a notice of appeal at the district court as shown on the publicly available docket for the U.S. Court of Appeals for the Fourth Circuit, docket number 12-2210.

---

[3] No. 8:11-cv-02958-AW, 2012 U.S. Dist. LEXIS 153323 (D. Md. Oct. 22, 2012).

[4] *See id.* at *46–47, *quoting* Government Accountability Office, GAO 12-30, Consumer Product Safety Commission: Action Needed to Strengthen Identification of Potentially Unsafe Products 15 (2011), http://www.gao.gov/assets/590/585725.pdf.

b. *Has the court decided whether the agency misinterpreted the statute, as the companies claimed—and as I believe?*

Yes. As described above, the court found that the CPSC misinterpreted the words "relate to" in the database provision of the CPSIA. The court struck down the agency's speculative finding of a connection between the product at issue here and the harm in the report. Further, the court found that the agency deviated from its past practice in deciding to accept this report, though it had rejected others in the past because they did not demonstrate sufficient connection between the product and the harm alleged.

c. *In Chairman Tenenbaum's written testimony she stated: "I think SaferProducts.gov has gained wide approval and acceptance." Do you agree?*

I do not agree. The lawsuit in this case is only the tip of the iceberg relative to complaints about the database. We regularly receive complaints about materially inaccurate information in reports, and must spend significant resources to address those complaints. Following on the court's decision in this case, CPSC staff is reviewing old reports that are already published to determine whether the connection between the product and the harm alleged in each report is sufficiently strong. Indeed, one analysis of the database done by outside parties found that the "the 'reports of harm' language in Section 6A(b)(1)(A) of the Consumer Product Safety Act (CPSA) is not truly applicable to a substantial majority of the cases reported on the database thus far." More than two-thirds of the reports analyzed did not involve any injury at all, and most of the injuries reported required either no medical attention or only first aid.[5]

Further, we have also failed to address a persistent concern of brand name owners: if their brand is listed in a report, they currently have no ability to complain about any material inaccuracy except by going outside the regular database process, and even then they are not permitted to post a response on the database because they are not considered either the manufacturer or the private labeler of the product. The Commission has long been aware of this problem, but has not yet chosen to address it, citing concerns about the amount of resources required to solve the

[5] See Lee Bishop & Steve McGonegal, *How Much "Harm" is Reported in Safer Products Database "Reports of Harm"?*, Product Safety Letter (May 27, 2012), http://www.productsafetyletter.com/Free/209.aspx.

problem. But we have known about the problem from the outset, and it seems duplicitous to fail initially to address the problem and then refuse to fix it by citing resource constraints. We should have done it properly in the first instance, and the amount of resources required to address it should not be cited as a reason not to correct it when we have the chance.

When the CPSC's regulations establishing the database were being promulgated, my colleague, Commissioner Northup, and I offered several proposals which, if adopted, would have addressed the problems now becoming apparent with the operations of the database. For example, we proposed that, consistent with the statute, only those who were actually "consumers" in that they purchased or actually used the product or experienced the harm (or their representatives such as parents or guardians) be able to file reports as "consumers." This was rejected in favor of allowing report filing by virtually anyone including advocates, plaintiff's attorneys, journalists, and others with no relation to or knowledge of the incident. As another example, we offered an amendment that would have established an appeal process so that there would be some discipline, consistency, and due process to decisions regarding materially inaccurate information. Unfortunately, each of the amendments we offered was summarily rejected by a majority of Commissioners on a party-line vote.

d. *How many regulations issued by CPSC in the last 5 years have led to lawsuits?*

The only lawsuit that I am aware of against the CPSC, based on its regulations, issued within the last 5 years is *Doe v. Tenenbaum*. In this case, as described above, while the court did not directly address our regulations establishing the database, it did overturn our decision to post the incident. Had our regulations provided a more transparent and less arbitrary process, our decisions might have been different and, hence the outcome of any case, assuming one was filed, might also have been different.

e. *Doesn't the presence of a lawsuit tend to argue against the idea that the database has gained wide approval and acceptance?*

Yes. The database was launched in March 2011, and this lawsuit was filed a scant 7 months later. We have received many complaints about the database, and continue to do so. What is more, it is not clear *who* is using the reports made available in the database. Indeed, to date, more than

hearing about consumers researching products in the database, we are hearing about professionals—defense and plaintiffs' attorneys, consumer advocates, and statisticians—using the database to analyze CPSC activity. Given its rather difficult design, I would not expect many consumers to turn to it to identify safe or unsafe products. Thus, I do not believe that the database has been approved or accepted by the group it was supposed to benefit—consumers.

f. *In Chairman Tenenbaum's oral testimony, she indicated that if the federal court rules against the CPSC in the pending database lawsuit, the agency will not pledge to immediately take down the database that was constructed in violation of the statute. Why not? Please explain what remedy you believe would be appropriate, what remedy the plaintiffs are seeking, and what remedy the agency's professional staff recommends in the event that the agency loses the lawsuit.*

If a court found that the Commission acted arbitrarily and capriciously in promulgating the rule establishing the database, I believe that the Commission would be required to take the database down, at least until appropriate corrections in the rule were implemented. In this case, however, the court only determined that the agency acted arbitrarily and capriciously in deciding to publish a particular report: The court did not make a larger decision about the legality of the database. Instead, because the plaintiff only sought to enjoin the agency from publishing the report, and the court granted the relief, the agency has complied with the court's order by not publishing the report.

g. *Is the agency still considering starting a Facebook page that would violate the requirements Congress has put in place for any kind of public database?*

The Commission and staff have been considering establishing an organization page for the CPSC on Facebook. Because Facebook's terms of service would require the CPSC to allow members of the public to submit comments on any post without first being approved by the agency, establishing a Facebook page could violate § 6(b) of the CPSA. Specifically, by creating posts on Facebook, the agency would—by operation of Facebook's commenting policy—effectively invite the public to submit comments on subjects related to the post (or, for that matter, on any subject under the sun). And because the CPSC created the page, the Commission would be republishing those comments—again, by operation

of Facebook's commenting policy—without going through the § 6(b) clearance process.

The CPSC's clearance process enables the Commission to comply with its statutory mandate to provide only accurate and meaningful information to the public. Currently, information is not to be released either before staff has verified its accuracy or before the company whose information is implicated has had the chance to verify or contest the accuracy and fairness of the information. Establishing a Facebook page and creating posts would necessarily create violations of § 6(b)—and would degrade the Commission's credibility in the eyes of the public and the regulated community.

h. *I am told that the agency is refusing to accept appeals over material inaccuracies. If true, why?*

When the rules establishing the database were considered, Commissioner Northup and I offered an amendment to establish an appeal process. This amendment was rejected on a party-line 3-to-2 vote. I believe that it is my colleagues' position that no appeal process is necessary or required by the CPSIA to address material inaccuracy claims.

But the CPSA and CPSIA do not exist in a vacuum. Background principles of constitutional and administrative law—and the Administrative Procedure Act—establish the requirement that agencies afford due process of law to affected parties. Indeed, the judge in *Doe v. Tenenbaum* construed the agency's actions regarding the database as inconsistent with the decision in the case, leading to the determination that the decision to publish here was arbitrary and capricious. The failure to establish a regular process has meant that there was no guarantee that the CPSC was making material-inaccuracy determinations consistently. An appeals process would help correct that error.

i. *I am told that the agency does not remove duplicate references on the database to the same underlying incident. If that is true, why not?*

Staff's response

We do not publish two reports that are exactly the same. When we do publish two different reports that are about the same incident we link them. Linked reports are displayed in the database as "associated reports" and count as a single report in search results.

j. *What other problems exist with the database as currently constructed, including problems that may not be resolved by the pending lawsuit?*

As noted above, the Commission currently has no regular process for addressing reports that come in tied to brand names whose owners are neither the manufacturers nor private labelers of the products at issue. Because brand-name owners have legitimate concerns about brand deterioration, they deserve the right to contest claims about products bearing their brand that they believe to be materially inaccurate. Our staff has acknowledged that this is an issue worthy of attention, but a supposed dearth of resources has held the CPSC back from addressing it. That should be corrected.

Further, and more fundamentally, I do not believe that the database, as currently designed, benefits consumers as intended. First, it is difficult to use for consumers who hope to obtain information about products, rather than to submit information about products. The database is more likely to be used by attorneys and advocates to mine for their analytical purposes. Consumers Union has used reports in the database to spur the CPSC to look at kitchen-appliance incidents.[6] More skeptical practitioners before the agency have analyzed the database to suggest that it is does not contain much useful information about actual injuries.[7] Companies that are the subjects of reports on the database are finding it more useful than the people it was intended to serve—they are reaching out to consumers who submit reports to attempt to resolve the consumers' complaints. Thus, while it seems there may be some benefits to the database, those benefits do not appear to be accruing to consumers. If the database were cheap and easy to maintain, there might be an argument for it to continue (with necessary modifications) in some form similar to its present form. But the database is neither cheap nor easy to maintain.

While the information that comes directly from consumers is and always has been useful, the resources required to make and sustain a public-facing database seem ill-used. As noted, the database is difficult to

---

[6] *See* Consumers Union, *Appliance fires: Is your home safe?*, Consumer Reports (Mar. 2012), https://consumerreports.org/content/cro/en/consumer-reports-magazine-march-2012/kitchen-fire-safety.print.html.

[7] *See* Lee Bishop & Steve McGonegal, *How Much "Harm" is Reported in Safer Products Database "Reports of Harm"?*, Product Safety Letter (May 27, 2012), http://www.productsafetyletter.com/Free/209.aspx.

use—consumers would more readily turn to and be better served by private sources like Amazon or eBay to find information from other consumers about specific products. But the CPSC still plows resources into editing each consumer report. As I have heard from various staffers throughout the agency, the resources dedicated to maintaining the public-facing aspect of the database would be better spent on monitoring and responding to safety concerns.

2. *Phthalates/testing lab irregularity*

> *We have heard from manufacturers that they frequently experience instances where products pass lead or phthalates tests at one laboratory and fail at another laboratory.*
>
> *Apart from the testing costs themselves, costs of these failures to the manufacturer include, among others: 1) costs of removal from store shelves, 2) costs of destroying failed products, 3) costs of reformulating products, and 4) costs of notifying CPSC because the products are non-compliant.*
>
> *CPSC has been asked repeatedly to issue a clear statement on statistical uncertainty with regard to testing results. Some industry groups have said that addressing statistical uncertainty bands for laboratory test results to deal with the known problem of inter-laboratory variability may be the single most important action CPSC could take to help reduce costs associated with CPSIA testing and certification requirements. When and how does the Commission plan to address this concern? Why has the agency thus far refused to establish statistical variability parameters?*

I agree that dealing with variability of testing results is probably one of the most significant actions the CPSC could take in dealing with the costs and burdens of testing. As the question states, the implications of failing test results go beyond just the costs of testing the product. I believe that it is imperative, if the current testing regime is to remain in place, that the Commission address this problem in a more constructive manner than it has to date.

With respect to both lead and phthalates testing, we are requiring that testing be done for what are, essentially, trace levels. Variable test results may come about because of a lack of homogeneity of the materials being tested or because of differing conditions in the laboratories doing the testing. It is no answer to say that in a controlled setting with controlled materials, test results will be the same but that is what has been our

answer to this question when it has been raised. This answer does not address the problem and, as a result, we have seen excessive and expensive testing. We have also seen phasing out of certain materials such as recycled materials since testing predictability cannot be assumed when these materials are used. Further as we continue to roll out testing requirements and certify more labs, this issue may grow.

Use of statistical uncertainty bands would help address the issue. Since we are testing at the trace level, public health and safety would not be impacted by such a strategy. For example, our staff has already told us that any health impacts of lowering the lead limits were probably already achieved at the 300 ppm level so allowing acceptable ranges at a certain percentage above 100 ppm but below 300 ppm would help reduce costs without impacting safety.

I believe that the Commission has the authority to implement such a suggestion. The Commission has put in place public enforcement policies on any number of occasions. However, public Commission discussions on this topic indicate that the current Commission will not do that without direction from Congress.

3. *Third-Party Testing Relief*
When this Congress passed HR 2715 last year, it gave the CPSC authority to take steps to reduce the costs of complying with the CPSIA—and particularly the costs of third-party testing.

    a. *Did the agency's professional staff recommend issuing the third-party testing rule despite HR 2715? Or did the staff recommend making adjustments to the rule and/or seeking additional public comment before issuing the rule in the wake of HR 2715? If the agency's professional staff recommended that the third-party testing rule be revised to take advantage of the authority given in HR 2715, what recommendations for further relief did the staff offer that the Commission declined to accept?*

The agency's professional staff recommended that, in light of the passage of Public Law 112-28, the Commission delay finalizing the testing rule and instead re-propose it to seek and consider public input about the costs and burdens of the rule. This recommendation was not agreed to, presumably because the term of one of the Democratic members of the Commission was drawing to a close so a Commission majority for controlling the contents and timing of the rule was not assured. Instead

the Commission finalized the testing rule with the rule going into effect in February 2013.

As directed by the Congress, the agency did request input from the public on ways to reduce testing costs. A number of constructive suggestions were made and some of those made their way into the staff recommendations that were considered by the Commission earlier this month. A copy of the staff recommendations is attached.[8] The Commission adopted a minimized version which speaks to just over half of the proposals made by the staff.[9] However, the Commission's final "cost reduction" plan does not address the timing or resources for the staff activity needed to put even this reduced plan into place. Consequently, I believe that it is unlikely that the exercise we have gone through to identify ways to reduce testing costs will result in real cost reductions as Congress envisioned when it passed Public Law 112-28.

b. *In HR 2715 Congress gave you the authority to address the exorbitant cost of third-party testing. Based on our directive and your existing authority, do you have sufficient authority to solve the third-party testing cost problem? Why has more relief not been granted even though Congress acted to enable it? Do you believe the agency is prevented from granting further relief? If so, what legal changes are needed to enable further relief from third-party testing costs? Where exactly are you barred from providing relief?*

In response to the direction given the Commission in Public Law 112-28, Commissioner Northup and I submitted a report outlining statutory changes that would reduce the costs and burdens of testing without impacting safety. That report is attached.[10] To summarize that report, we recommend the following.

- The absolute requirement for third party testing of all children's products should be repealed since the Commission can require such testing in appropriate cases under other provisions of the Act. This would allow the agency and the regulated community to focus testing resources on those products that pose risks

---

[8] *See* Attachment A.

[9] *See* Attachment B.

[10] *See* Attachment C.

without burdening products which we do not believe pose a risk.

- The lead limits should be set at 300 ppm rather than 100 ppm. Under this suggestion the Commission would still be able to lower the limit to an appropriate level for particular products based on risk and exposure to more effectively protect public health. This would help address the lab variability issue discussed above. It would also allow greater use of recycled materials, which are effectively prohibited currently. It would give manufacturers of children's products greater flexibility with respect to material choices and result in less costly and more appropriate material choices.
- The definition of "children's product safety rule" should be clarified so that products subject to safety rules of general applicability do not have to be third-party tested. (I believe that the Commission has misread the law in this respect but lacking Commission initiative to correct this error, Congress should act.) There are certain CPSC rules that address general safety issues such as the flammability characteristics of fabrics. It makes no sense to treat a fabric differently because that fabric may at some point find its way into a child's garment rather than an adult garment. Having different testing regimes for the same fabric makes no sense since there is no evidence that third-party testing addresses more effectively any identified safety hazard that was not addressed by the testing regime set out in our regulations which have been on the books for many years and have been working well.

Implementing these three recommendations would allow us to focus our resources on those risks that especially impact children, and would limit the scope of the most expensive and onerous third-party testing requirements to risks that require this attention. Within the category of third party testing, the staff recommended that the Commission request from Congress the authority to equate production plans to third party testing in certain cases. There are other things the Commission could implement now that would minimize testing costs. For example, I believe that the statute does not require that ongoing periodic testing must be done by a third-party testing lab but that is what the rule adopted by the majority requires.

c. *What specific changes did the agency make to its third-party testing rule specifically by taking advantage of the authority given in HR 2715? In other words, what new relief did the agency provide in the rule that it was not going to provide anyway before that statute passed?*

The recommendations the Commission adopted only directed the staff to further investigate certain cost saving ideas.[11] The staff was given no direction as to when these tasks are to be completed. Further I do not anticipate that the FY 2013 operating plan the Commission will soon consider will contain resources for funding this work. I understand that a majority of the Commission believes that by asking for public comments and considering those comments, we have carried out the requirements of Public Law 112-28. In other words no actual work to reduce costs is likely to happen in the foreseeable future. This is not a position that I agree with.

4. *Phthalates/Chronic Hazard Advisory Panel*

a. *The Chronic Hazard Advisory Panel appointed by the CPSC Commissioners is late in submitting its report on phthalates. I am hearing from manufacturers that use phthalates that the CHAP process has not been transparent. Will you pledge to release the results of the peer review done on the CHAP study as well as the charge given to peer reviewers by the CPSC?*

Staff's response

The report of the CHAP is a highly complex scientific document. As such, it has taken the CHAP members longer to complete because of the breadth of the data that needed to be analyzed and the nature of the analysis itself (a cumulative risk assessment involving a variety of different phthalates and exposures). CPSC staff would disagree with the assertion that the CHAP process has not been transparent. In fact, in the two and a half years since the CHAP was convened, virtually every meeting, phone call, piece of correspondence, all data submitted, etc. has been made available to the public on the CPSC website.[12] The CHAP invited prominent research scientists to present their latest results and heard public testimony and written comments from interested parties. The

[11] *See* Attachment B.

[12] http://www.cpsc.gov/about/cpsia/chapmain.html.

CHAP members even agreed to an industry request to submit and discuss additional scientific studies at one of their public meetings, which took additional time.

The CHAP members also encouraged stakeholders to make their actual data (versus summaries of data) publicly available so that the CHAP might consider that data along with all other available public information. Some stakeholders chose not to release the more detailed data, because of concerns about proprietary business information. The CHAP evaluated any and all relevant data made available to it, including information provided by the industry that was made public. However, the lack of publicly available toxicity data on some phthalates that are currently in use limited the CHAP's risk assessment capabilities for those chemicals.

Staff will continue to strongly support and encourage an open and transparent process as the CHAP concludes its work.

b. *Will peer reviewers be given all of the supporting information and not just the risk assessment itself to conduct their peer review?*

Staff's response

Yes, the very nature of a scientific peer review requires that all relevant data and information be made available to the peer reviewers so that they can be as informed as possible in understanding the scientific approaches taken and conclusions reached by the CHAP members. The peer reviewers are highly trained scientists and experts in the same areas as the CHAP members. The CHAP members requested having their scientific peers give them feedback on the report. Peer reviewers will have access to the full public record and will be provided all supporting information including all reference papers cited in the report.

c. *Will CPSC consider the CHAP report a Highly Influential Scientific Assessment (HISA) and treat it accordingly?*

Staff's response

CPSC staff believes the CHAP report is a highly influential scientific assessment and will treat it accordingly.

d. *For example, to the extent that the CHAP's analysis relies on cumulative risk assessment, will the agency ensure that the framework of the cumulative risk assessment is itself peer reviewed?*

Staff's response

Assessing the cumulative risk assessment approach taken by the CHAP will be one of the important elements of the scientific peer review.

e. *Will the CPSC refrain from issuing an interim rule when it issues the CHAP report, instead allowing full opportunity for public comment on any proposed rule that follows the CHAP report?*

Staff's response

Section 108(b)(3) of the Consumer Product Safety Improvement Act (CPSIA) provides that, not later than 180 days after the Commission receives the CHAP's report, "the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule [related to the findings of the CHAP]." In accordance with the direction of the CPSIA, after the CHAP issues its report, the Commission plans to propose a rule that would request public comment on its proposal before issuing a final rule

5. *Obama Executive Order*
President Obama issued an Executive Order instructing all federal agencies, including independent agencies like the CPSC to find ways to reduce the costs of regulations already on the books. It is my understanding that the CPSC intends to fulfill that requirement in the upcoming year by taking a look at existing regulations on mid-sized rugs and on animal testing. Is that true? When is the last time the CPSC even performed animal testing? Please ask the professional staff to estimate the percentage of the total cost of complying with all CPSC regulations that is represented by complying with these two regulations. Do you believe that these two regulations are among those whose revision promises to meet the goal of the executive order to reduce the onerous costs of the regulations put out by your agency, or does it make a mockery of the executive order to pick these two relatively minor regulations?

First, it must be said that it is unfortunate but not surprising that the CPSC Commissioners could not agree on a plan to review rules as directed by the President. This was a failure of imagination and leadership.

Despite the Commission's failure to actually adopt any plan, however, the staff still plans to look at rather unimportant rules for "updating," including the flammability of mid-sized carpets and rugs, and labeling requirements under the Federal Caustic Poisons Act. Whatever these rules are, they are not particularly noteworthy and their modification would not reduce or eliminate any notable burden on the economy. Former Commissioner Northup and I proposed a plan that would have focused squarely on the most burdensome rules on the Commission's books.

In reading the President's remarks regarding the relevant executive orders, the heavy emphasis on burden reduction rings through loud and clear. "We know what it will take for America to win the future. . . . We need to make America the best place on earth to do business. . . . [A key] responsibility of government [is] breaking down barriers that stand in the way of your success. . . . [Some of the] barriers we're trying to remove are outdated and unnecessary regulations. . . . [I]f there are rules on the books that are needlessly stifling job creation and economic growth, we will fix them."[13] But the Commission has not followed through on the President's charge. The CPSC squandered this opportunity.

The agency cannot operate without regard to the larger world around us. Rules that impose unwarranted burdens harm consumers by slowing invention and innovation, raising barriers to business and job creation, eliminating safe products and their makers from the market, and raising administrative costs for the businesses that can survive the onslaught of federal mandates. For the Commission's mandates to be taken seriously and followed, they must be well-founded and practical. The plan that Commissioner Northup and I proposed was the opportunity to make sure our rules fit those criteria.

While staff declined to specifically estimate the proportion of the agency's burden on the economy that the rules currently under consideration for "rule review" comprise, allow me to assure you that it is small. There is no question that these reviewing these rules amounts to window-dressing when what is called for—both by the President and by present circumstances—is burden reduction that truly eliminates deadweight regulations.

---

[13] President Barack Obama, *Remarks to the U.S. Chamber of Commerce* (Feb. 7, 2011), http://www.whitehouse.gov/the-press-office/2011/02/07/remarks-president-chamber-commerce.

6. *ROVs (Recreational Off-highway Vehicles)*

Why does the CPSC seem intent on pressing forward for a mandatory standard on ROVs rather than working with industry the way NHTSA does with the automobile companies to devise meaningful safety tests with repeatable results?

Staff's response

On October 28, 2009, the CPSC published an advance notice of proposed rulemaking (ANPR) concerning recreational off-highway vehicles (ROVs).[14] The ANPR began a rulemaking process that could result in a mandatory consumer product safety standard for ROVs. Throughout this process, CPSC staff has repeatedly met with industry representatives in open meetings to facilitate an exchange of information and improvements to the voluntary standard. As the CPSC continues with the rulemaking process, one of the considerations will be the adequacy of the voluntary standard. Under section 9(f)(3)(D) of the CPSA, before the Commission can issue a final mandatory consumer product safety rule it must make certain findings about the adequacy of the relevant voluntary standard and the likely level of compliance with the voluntary standard.

7. *Buckyballs*

The CPSC routinely relies on the sufficiency of warning labels to keep children away from other adult products like, say, gasoline cans. Why then does the agency believe that warning labels are not an adequate solution to deal with the safety risk posed by a desk toy marketed to adults like Buckyballs? Has the agency taken steps to ban Buckyballs and similar products as a banned hazardous substance, akin to lawn darts? If not, why not?

On September 4, 2012, the agency published a notice of proposed rulemaking that, if finalized as proposed, would effectively ban powerful magnet sets including Buckyballs and similar magnet products. The rationale for proceeding in this manner is set out in the preamble of the NPR.[15] In brief summary, the agency's staff is of the view that package warnings will not be effective for this product and that an intense

---

[14] 74 Fed. Reg. 55,495.

[15] *See* 77 Fed. Reg. 53,781.

educational campaign to warn against this risk will not be effective either. The concern over the effectiveness of warnings balanced against the severity of the injuries to children we are seeing from misuse of this adult product led to the proposal in the NPR.

Banning adult products because they are being misused by children is relatively new territory for the CPSC. Lawn darts do not provide an analogy both because of how that product was used and because that ban was mandated by the Congress.[16] The agency will proceed with this action under sections 7 and 9 of the Consumer Product Safety Act which requires a review of regulatory options. We are also proceeding against the manufacturers of Buckyballs and a similar product to seek a mandatory recall on the basis that these products present a substantial product hazard. We have not gone to court to have these products declared an imminent hazard, an authority we also possess.

My concerns about how the agency is proceeding against powerful magnet sets are discussed in the attached statement.[17]

[17] *See* Attachment D.

The Honorable Pete Olson

1. *I understand that the Commission has spent $566,360.00 on a contractor by the name of SEA Ltd. to conduct testing of ROVs and that SEA issued a report about its initial work in April 2011. Despite multiple requests from the Recreational Off-Highway Vehicle Association and its member companies to meet with SEA and to learn more about its work and despite the fact that industry has initiated several meetings with CPSC to share information and discuss the issues, CPSC waited 15 months to hold a meeting between SEA and industry and that meeting just occurred two weeks ago. Is withholding information and access to CPSC consultants funded at taxpayer expense your idea of government transparency? How do you expect industry to be responsive to CPSC's positions when you withhold critical information from it?*

I do not believe, as a general matter, that it is proper to withhold information developed by a government consultant and to do so is not effective government transparency.

2. *I understand that, while industry was waiting for 15 months to get more information about SEA's work, ROHVA proactively conducted extensive testing on its own to evaluate the testing approach described in the SEA report. During the long overdue meeting, I understand that SEA revealed details regarding its testing methodology that had not been previously disclosed, which may require ROHVA to conduct more testing to effectively evaluate the SEA testing approach. Extensive time and resources were wasted as a result of CPSC's failure to disclose information about its contractor's work. I understand that SEA also has conducted other testing for CPSC that has not been disclosed to ROHVA. Will you commit to providing timely and complete disclosure of all information regarding the work of CPSC contractors with respect to ROVs and to change course and work collaboratively with industry to promote safety?*

Staff's response

In April 2011, CPSC staff published a 494 page report with SEA's test methodology and test results on nine recreational off-highway vehicles (ROVs) of different makes and models. The vehicles were tested between May 3, 2010 and October 12, 2010. The 6 months between the completion of testing and publication of the data involved analysis of the data, drafting a final report, and agency clearance to publish documents. In August 2011, CPSC staff published additional results for a tenth vehicle

that was tested in May 2011. In July 2012, CPSC staff hosted a public meeting to allow SEA to present their data and to answer questions from ROHVA.

CPSC staff has not received any reports with test methodology or test results from ROHVA on any of the testing they have performed. In public meetings with the CPSC, ROHVA has only presented slides with selective data. In addition, the limited data that ROHVA has provided is based on an incorrect formula to calculate a key value. For reasons unknown, ROHVA did not use the correct formula used by the National Highway Traffic Safety Administration (NHTSA), by SEA, and by ROHVA's own voluntary standard (ANSI/ROHVA 1-2011).

CPSC staff has worked with ROHVA and continues to work with ROHVA as evidenced by the multiple public meetings and comment letters submitted by CPSC staff during the voluntary standard canvass process.

3. *I assume you would agree that a pass-fail test must be reproducible from one lab to another and that the government cannot mandate that all testing be conducted by a single entity at a single facility. Has CPSC or its contractors conducted any testing to determine whether its pass-fail test methodology and results are reproducible at facilities other than the one SEA used?*

Staff's response

CPSC staff agrees that a pass-fail test must include a protocol that is repeatable and can be performed by any qualified test facility. The ANPR for ROVs began a rulemaking process that could result in a mandatory consumer product safety standard for ROVs. As part of the ongoing rulemaking effort on ROVs, CPSC staff has performed standard vehicle dynamics tests that have been developed by NHTSA to gather information on the dynamic characteristics of these vehicles. If and when requirements are finalized, they will include performance requirements that can be tested with a protocol that is repeatable and can be tested by any qualified test facility.

4. *Has the CPSC attempted to establish a correlation between vehicle characteristics that will be dictated by its proposed tests and standards and the incidents that you say you are trying to prevent? What were the results of the correlation analyses? Do you intend to move forward with a mandatory standard in the absence of evidence of such a correlation?*

Staff's response

The CPSC published an advance notice of proposed rulemaking (ANPR) concerning recreational off-highway vehicles (ROVs) on October 28, 2009.[18] The ANPR began a rulemaking process, one result of which could be a mandatory standard for ROVs. CPSC staff is assessing public comments received in response to the ANPR and is evaluating other relevant data and information to develop a staff briefing package for the Commission. The Commission will consider the staff's briefing package when determining whether to issue a notice of proposed rulemaking (NPR).

CPSC staff has completed a multidisciplinary review of more than 400 reported ROV-related incidents where victim, vehicle, and incident characteristics were analyzed. The results indicate significant hazard patterns that include vehicle rollovers, and victims ejected and hit by the vehicle resulting in death or injury. This analysis will be part of the staff's briefing package for a possible NPR. If the Commission decides to issue an NPR, the public would have another opportunity to comment, staff would prepare a briefing package with all relevant data and information concerning a possible final rule, and at that point the Commission would decide whether to publish a final rule.

[18] 74 Fed. Reg. 55,495.

5. *I understand that in the early 1990s CPSC conducted a multi-disciplinary study of ATV incidents to determine the causes of crashes, but that CPSC has not conducted such a study of ROV incidents. Since CPSC has not conducted such a study, ROHVA again proactively conducted its own multi-disciplinary study of ROV incidents. In November 2011, ROHVA presented its analysis to CPSC staff that concluded the testing standards in dispute would have had absolutely no impact on the occurrence of at least 90% of serious incidents. Does CPSC have any evidence that contradicts ROHVA's finding?*

Staff's response

CPSC staff has completed a multidisciplinary review of more than 400 reported ROV-related incidents where victim, vehicle, and incident characteristics were analyzed. The results indicate significant hazard patterns that include vehicle rollovers, and victims ejected and hit by the vehicle resulting in death or injury. Using the results of this analysis, CPSC staff is working to create standards that would reduce these identified hazard patterns.

6. *Has CPSC done any analyses comparing the relative safety of ROVs that existed when CPSC issued its ANPR in 2009, ROVs that conform to the current voluntary standard, and ROVs that would conform to CPSC staff's proposed mandatory standard?*

Staff's response

On October 28, 2009, the CPSC published an advance notice of proposed rulemaking (ANPR) concerning recreational off-highway vehicles (ROVs).[19] The ANPR began a rulemaking process that could result in a mandatory consumer product safety standard for ROVs. CPSC staff has not completed the rulemaking effort on ROVs and has no current proposed mandatory standard.

The ROVs that existed when CPSC issued its ANPR in 2009 meet almost all the requirements in the current voluntary standard.

7. *I understand that federal law reserves mandatory standards for those products where industry fails to develop voluntary standards to prevent unreasonable risks of injury. If that is the case, why would CPSC move forward with a mandatory ROV standard when industry has been proactive in developing*

[19] 74 Fed. Reg. 55,495.

standards and has tried repeatedly to work with your agency? [If CPSC believes that the current voluntary standard does not adequately address unreasonable risk of injury related to ROV use, what exactly is inadequate about the voluntary standard? What data does CPSC have to support its claim that those aspects of the voluntary standard are inadequate?]

Staff's response

As stated above, the CPSC published an ANPR in 2009 that discussed a voluntary standard, as well as a mandatory standard, as regulatory options. Before the Commission could issue a final mandatory rule in the proceeding it would need to determine that either (1) the voluntary standard is not likely to result in the elimination or adequate reduction in the risk of injury; or (2) it is unlikely there will be substantial compliance with the voluntary standard. At this point, the Commission has only issued an ANPR and has not made any determinations about the adequacy of the voluntary standard.

CPSC staff has worked with ROHVA and continues to work with ROHVA as evidenced by the multiple public meetings and comment letters submitted by CPSC staff during the voluntary standard canvass process. CPSC staff's comment letter to ROHVA dated March 20, 2011, summarizes CPSC staff's concerns with the voluntary standard in the areas of lateral stability, vehicle handling, and occupant protection.

Attachment A

Chairman's Motion

Since the passage of Public Law 112-28, the United States Consumer Product Safety Commission ("CPSC" or "the Commission") has been considering opportunities to reduce third-party testing costs consistent with assuring the compliance of children's products with all applicable safety rules, bans, standards or regulations. Subject to the resources allocated by the Commission to carry them out in subsequent CPSC Operating Plans, the Commission approves the following actions by its Staff:

1. International Standards Equivalency to Children's Product Safety Rules: The Commission directs staff to draft a Request For Information (RFI) for publication in the Federal Register to determine which, if any, tests in international standards are equivalent to tests in comparable CPSC-administered Children's Product Safety Rules. The RFI shall include questions regarding how establishing equivalency between tests in CPSC's regulations and comparable international standards would reduce overall third party testing burdens, while assuring compliance with the applicable children's product safety rules, regulations, standards, or bans. The burden of demonstrating equivalence shall be on the submitter of information. Upon receiving the responses to the RFI, staff shall review the responses and summarize any recommended course of action for the Commission. This summary shall include the costs of the course of action, including any additional research that might be warranted. Staff shall seek Commission approval prior to formally establishing a list of equivalent tests to those in CPSC-administered Children's Product Safety Rules.

2. Determinations Regarding Heavy Metals: The Commission directs staff to draft a Request For Information (RFI) for publication in the Federal Register regarding whether there are materials that qualify for a determination, under the Commission's existing determinations process, that do not, and will not, contain higher-than-allowed concentrations of any of the eight heavy elements specified in Section 4.3.5 of ASTM F963-11. (The elements are antimony, arsenic, barium, cadmium, chromium, lead, mercury, and selenium.) The burden for demonstrating whether any material qualifies for a determination shall be on the submitter of the information requested in the RFI. Upon receiving the responses to the RFI, staff shall review the responses and summarize any recommended course of action for the Commission. This summary shall include the costs of the course of action, including any additional research that might be warranted.. Staff shall seek Commission approval regarding a determination relating to any of the eight heavy metals specified in Section 4.3.5 of ASTM F963-11.

3. Determinations Regarding Phthalates: The Commission directs staff to draft a Request For Information (RFI) for publication in the Federal Register regarding whether there are materials that qualify for a determination, under the Commission's existing determinations process, that do not, and will not, contain prohibited phthalates, and thus are not subject to third party testing. The burden

for demonstrating whether any material qualifies for a determination shall be on the submitter of the information requested in the RFI. Upon receiving the responses to the RFI, staff shall review the responses and summarize any recommended course of action for the Commission. This summary shall include the costs of the course of action, including any additional research that might be warranted. Staff shall seek Commission approval regarding a determination relating to materials that do not, and will not, contain prohibited phthalates.

4. Fourier Transform Infrared Spectroscopy (FTIR): The Commission directs staff to investigate whether Fourier Transform Infrared Spectroscopy (FTIR) can be effective as a screening technology for determining that a plastic component part contains no phthalates. A summary of the results of this investigation, including any additional costs expected to complete the investigation, shall be provided to the Commission no later than 1 year after the investigation has commenced.

5. Determinations Regarding Adhesives in Manufactured Woods: The Commission directs staff to draft a Request For Information (RFI) for publication in the Federal Register regarding whether any adhesives used in manufactured woods can be determined not to contain lead in amounts above 100 ppm. The burden for demonstrating which, if any, adhesives should qualify for a determination shall be on the submitter of the information requested in the RFI. Upon receiving the responses to the RFI, staff shall review the responses and summarize any recommended course of action for the Commission. This summary shall include the costs of the course of action, including any additional research that might be warranted. Staff shall seek Commission approval regarding a determination relating to adhesives used in manufactured woods.

6. Determinations Regarding Synthetic Food Additives: The Commission directs staff to draft a Request For Information (RFI) for publication in the Federal Register regarding whether the process by which materials are determined not to contain lead in amounts above 100 ppm can be expanded to include synthetic food additives. The burden for demonstrating which, if any, synthetic food additives should qualify for a determination shall be on the submitter of the information requested in the RFI. Upon receiving the responses to the RFI, staff shall review the responses and summarize any recommended course of action for the Commission. This summary shall include the costs of the course of action, including any additional research that might be warranted. Staff shall seek Commission approval prior to formally publishing a determination relating to synthetic food additives.

7. Guidance Regarding Periodic Testing and Periodic Testing Plans: The Commission directs staff to draft a guidance (in the form of a "FAQ" or similar forms of guidance) to clarify that manufacturers who do not engage in ongoing or continued production of a previously third-party certified product, (such as an importer or a manufacturer with short production runs) are not required to conduct periodic testing as defined in Section 1107. This guidance should also make clear

that those manufacturers who do not engage in periodic testing for the reasons described above are not required to create a periodic testing plan. This guidance shall be provided to the Commission for approval no later than December 31, 2012.

8. Accreditation of Certain Certification Bodies: The Commission directs staff to develop a Staff technical report for Commission consideration on the feasibility of CPSC-acceptance of certification bodies to perform third party testing of children's products as a basis for issuing Children's Product Certificates, and to undertake activities to ensure that continuing production maintains compliance with certification requirements as a basis for increasing the maximum periodic testing interval from 1 to 2 years.

Attachment B

Insert:

9. "Staff Findings Regarding Production Volume and Periodic Testing: The Commission directs staff to report back to the Commission whether, and, if so, on what basis staff is able to make the following findings:
(1) including a low volume exemption of fewer than 10,000 units of a product from periodic testing requirements for a maximum of three years is consistent with assuring compliance with all applicable children's product safety rules, regulations, standards or bans;
(2) the selection of the 10,000 unit figure for such an exemption is based on statistically significant and readily available safety, compliance and/or economic data. If so, staff shall provide the data along with its reason(s) for making the finding based on such data;
(3) providing such an exemption is consistent with providing a high degree of assurance of compliance of all children's products, as required under 16 CFR § 1107 ("the testing and certification rule"); and
(4) providing such an exemption is practicable from an enforcement and compliance standpoint, in light of available resources, anticipated future levels of funding and agency safety enforcement and compliance priorities.

Any staff work on this report would not affect the effective date of 16 CFR § 1107."

Attachment C

U.S. CONSUMER PRODUCT SAFETY COMMISSION
4330 EAST WEST HIGHWAY
BETHESDA, MARYLAND 20814

COMMISSIONER NANCY A. NORD
AND
COMMISSIONER ANNE M. NORTHUP

Report to Congress pursuant to 15 U.S.C. § 2063(d)(3)(C) on opportunities to reduce the cost of third-party testing consistent with assuring compliance

October 26, 2012

The Consumer Product Safety Commission (CPSC) is implementing the Consumer Product Safety Improvement Act (CPSIA) without attention to the costs of its actions. These costs burden the American economy at the wrong time, often without measurably improving safety. As Commissioners who have seen the unintended consequences of the CPSIA first hand, and pursuant to Congress's request for legislative recommendations that would reduce testing and compliance costs for American businesses without impacting product safety,[1] we recommend that Congress consider the following changes.

1. Repeal the requirement for third-party testing.
2. Increase the permissible limit of lead in children's products to 300 parts per million and direct the Commission to set a lower limit for a particular material, product, or component where it is necessary to protect against a real risk of harm.
3. Change the definition of "children's product safety rules" to rules applicable to products intended exclusively for children.

Background

Last year, Congress directed the CPSC to ask the public for suggestions on ways "to reduce the cost of third-party testing requirements consistent with assuring compliance with any applicable consumer product safety rule, ban, standard, or regulation."[2] The Commission was directed then to review the public's comments, and given authority to adopt new or revised third-party testing regulations if it determined that modification would reduce third-party testing costs consistent with assuring compliance with

[1] *See* 15 U.S.C. § 2063(d)(3)(B).

[2] 15 U.S.C. § 2063(d)(3)(A).

applicable rules.[3] Finally, Congress asked the Commission to submit a report to Congress if the agency identified opportunities that it lacked authority to adopt.[4] This report is presented by Commissioners Nancy A. Nord and Anne M. Northup in response to that request.

The Commission's work to carry out these statutory requirements continues. After the agency solicited and received from the public many concrete, specific suggestions for the reduction of testing costs, CPSC staff developed a non-exhaustive list of 16 potential changes to third-party testing rules. As described by staff, many have the potential to reduce costs only for narrow industry segments, or would otherwise not make a significant dent in third-party testing costs. The Commission recently voted to direct staff to investigate further 9 of the 16 suggestions, though it conditioned all of the work on future Commission votes to allocate the necessary resources.

Whether the work will actually be funded and whether the Commission will actually prescribe new or revised regulations is doubtful. Not only is it clear that no cost-reduction changes will be implemented this fiscal year, it also does not appear that the Commissioners will be able to agree on legislative recommendations as Congress requested. Therefore, we identify below legislative changes that we believe would reduce the cost of third-party testing while ensuring compliance with regulations currently applicable to children's products.

1. Repeal the requirement for third-party testing.

The CPSC is responsible for ensuring that noncompliant and potentially dangerous children's products do not reach American consumers. The CPSC has new and better tools to enforce our standards and detect violators, including the use of better technology and collaboration with the U.S. Customs and Border Patrol (CBP). But under current law, businesses large and small face the suffocating burden of third-party testing and certification requirements that do not advance the cause of safety.

Imposing third-party testing on every component of every children's product is an overly broad solution to the problems that arose during the flurry of recalls in 2007. But requiring all children's products to be third-party tested has proven to be a business-crushing and job-killing mandate without any commensurate benefit. And *it is a requirement that no other advanced economy—not even the European Union—has adopted.*

The third-party testing requirement is too burdensome.

According to the agency's economists, in response to the "significant increase in their costs due to the final rule," manufacturers will redesign their products to reduce the features and component parts, reduce the number of children's products they offer, exit

[3] *See* 15 U.S.C. § 2063(d)(3)(B).

[4] 15 U.S.C. § 2063(d)(3)(C).

the children's product market, or go out of business completely. The costs associated with the new rule will "inhibit[] new firms from entering the children's product market," including those serving a niche market like children with disabilities. Safety and performance related innovation will also be stymied, as manufacturers "delay implementing some improvements to a product's design or manufacturing process in order to avoid the costs of third party testing."[5] Some argue that third-party testing before sale will result in fewer recalls. But *most recalled products contain design or manufacturing defects that are unrelated to the Commission's product- and material-specific safety standards.*

Moreover, the continuing third-party testing requirements make the agency micromanage business and manufacturing operations. Specifically, most manufacturers must undertake a complex analysis and prepare either a periodic-testing plan or a production-testing plan for each product manufactured at each manufacturing site. These plans will be subject to extensive *post hoc* review by the CPSC, with no real guidance on what constitutes an adequate testing plan. And manufacturers who make multiple products at a single site or who frequently change the product will continually need to change their testing plans, potentially every day. The threat of "gotcha" compliance activity is real, and is exacerbated by the extensive record-keeping requirements that add nothing to safety.

Manufacturers must "document [(1)] the production testing methods used to ensure continuing compliance and [(2)] the basis for determining that the production testing plan provides a high degree of assurance that the product being manufactured continues to comply with all applicable children's product safety rules."[6] But businesses have told us that documenting their complicated production processes will be costly and burdensome. For some smaller companies, the documentation requirements are simply impossible. This assessment was borne out both by CPSC economists and by the public's comments.

Indeed, for small businesses, the burdens of the testing requirements will often be insurmountable. Testing alone—excluding the costs of destroyed samples, shipping, and administrative activity—could consume over 11% of a small manufacturer's revenue.[7] Since a typical profit is about 5% of revenue, we expect many small businesses to close because of the testing requirements, particularly after the continuing testing

[7] *Regulatory Flexibility Analysis* at 127–28.

requirements take effect in February 2013. They cannot simply raise their prices and remain competitive. We already have anecdotal evidence that this is happening.

Moreover, the testing rule's burdens fall most heavily not just on small businesses, but also on the good actors that we should want to help and for whom the third-party testing cost is particularly unjustified. More than ever, today's manufacturers have the tools and incentives to produce safe, compliant products. Modern production processes and quality assurance systems enable manufacturers to produce uniform compliant products without the need for confirming third-party tests. And the damage from noncompliance can be devastating: The cost of destroyed products, brand name damage, loss of future contracts, higher penalties, and class-action lawsuits, have already resulted in overseas manufacturers taking aggressive steps to ensure compliance, regardless of prescriptive government mandates.

The third-party testing requirement disadvantages companies with robust in-house testing programs, those with more creative and effective ways of ensuring compliance internally, and domestic American companies who have never had a violation but who nonetheless must pay the most for third-party testing. Indeed, there are entire industries that have had very few, if any, safety violations; yet, they are required to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety.

Bad actors, on the other hand, can easily escape the costs of the testing rule. Those who wish to make a fast profit without regard for public safety will not comply with third-party testing requirements, thereby achieving an unfair price advantage. Companies with a casual attitude toward safety standards compliance will be casual about maintaining accurate records to support CPSIA-mandated testing. And because the requirements of 16 C.F.R. § 1107 are so complicated and expensive, it is easy to imagine the many shortcuts a manufacturer could take to reduce its costs while projecting the image of compliance. The CPSC does not have the manpower or the expertise to police manufacturers' internal record-keeping controls, as it would take an army of investigators all over the world to accomplish such a task. Instead, the detection method of ensuring compliance has remained and will remain the default method of compliance for companies producing violative products, while those committed to ensuring compliance and already effectively doing so are bearing the unnecessary additional burden of third-party testing.

Detecting and intercepting products is the key component of the CPSC's strategy.

Advocates for third-party testing characterize it as a "prevention" model that is superior to what they view as the Commission's traditional "detection" model, because they believe that it will keep dangerous products out of commerce in the first place. The evidence does not bear this out. Preventing the manufacture and importation of noncompliant children's products has always been and remains the focus of the CPSC's efforts. The policy disagreement is over the most effective means of doing so.

Mandating third-party testing is based on the out-of-date, "command and control" paradigm that government can and should achieve its policy outcomes by dictating the precise decisions and actions of the private sector. The better policy mandates an outcome and—through a strong enforcement mechanism—demands penalties for noncompliance. This allows the market to find the most efficient means of compliance and encourages a stronger commitment to compliance in the regulated community.

Today, thanks to Congress, the Commission also has vastly-improved enforcement tools relative to those available even a few years ago. The Commission has authority to impose significantly higher penalties for violations. And the agency can confiscate violative products at the border and destroy them. Relatedly, with the advent, in early 2008, of our agency's Import Surveillance Division, we have continued to increase the number of full-time CPSC investigators posted at key U.S. ports. We have also expanded cooperation with CBP to maximize the number of products screened at all U.S. ports.

Today, the Commission intercepts non-compliant toys and other children's products through these broader border-control efforts, through the use of x-ray technology, and through a data-driven targeting program that searches ship manifests before they reach port and flags previous offenders and first-time shippers for closer inspection. Using this detailed and timely information, and through closer cooperation with CBP, the CPSC seized and denied entry to 49% more shipments of noncompliant products in 2010 than in 2009. These tools are more effective at ensuring compliance with safety standards than policing all children's product manufacturers for certifications to mandatory third-party tests.

These difficult economic times call for a regulatory regime that carefully balances the costs and benefits of executive agency action. And consumer product regulation, in particular, must take into account the desire of American families for a dynamic marketplace with new products that are also safe and affordable. The requirement that all children's product manufacturers repeatedly third-party test every component of their products threatens to increase the cost and drastically reduce the availability of children's products for parents of modest means. Public and private resources could instead be redirected toward the alternative production processes and enforcement methods that can achieve the same goal much more efficiently. *Indeed the CPSC staff suggested that the Commission request from Congress some flexibility in this area.*[8] Therefore, we recommend a regulatory system that encourages implementation of the quality

[8] DeWane Ray & Randy Butturini, Office of Hazard Identification & Reduction, CPSC, *Memorandum: Consideration of Opportunities to Reduce Third Party Testing Costs Consistent with Assuring the Compliance of Children's Products*, 13 (Aug. 29, 2012), in Staff Briefing Package, *Consideration of Opportunities to Reduce Third Party Testing Costs Consistent with Assuring the Compliance of Children's Products* (Aug. 29, 2012), http://www.cpsc.gov/library/foia/foia12/brief/reduce3pt.pdf.

assurance process that best achieves results for a particular company or industry, without a third-party testing requirement.

2. Increase the permissible limit of lead in children's products to 300 parts per million and allow the Commission to set a lower limit for a particular material, product, or component where it is necessary to protect against a real risk of harm.

The CPSIA lowered the permissible amount of lead in children's products to 600 ppm, and then to 300 ppm, over a fixed period. Congress then directed that the limit be lowered to 100 ppm unless the Commission determined that this was not "technologically feasible" for a product or product category. The CPSIA also directed the Commission to consider "the public health protections associated with substantially reducing lead in children's products." Rather than use the discretion that Congress gave us to consider feasibility and public health, the agency took an approach that turned the statute on its head. The agency interpreted the term "technologically feasible" to require the use of a low-lead material if it exists anywhere in any market, regardless of the suitability of the material for a particular use, the cost of the substitute, or its availability to all manufacturers in the quantities needed. In effect, "feasible" was replaced with "imaginable" in the statute.

The analytical approach taken by the Commission completely ignored economic feasibility. As long as "low-lead materials are available, but are available only at higher prices," the Commission assumed technological feasibility, because "there is no economic basis for determining at what point a cost increase would make production not technologically feasible."[9] But it is inconceivable that the Commission could not identify *any* point at which the cost of manufacturing a product would exceed the price at which a market could exist to purchase it. Such questions are asked and answered every day by every business that manufactures a product. Even if it were plausible that economists cannot identify in the *abstract* prohibitively high production costs, the evidence before the Commission clearly demonstrated that such costs would be imposed by the reduction of the lead limit to 100 ppm. Commission staff concluded that the costs associated with a 100 ppm lead limit would be substantial and would drive products and businesses from the market.

A predictable and troubling result of this decision—related to third-party testing—is laboratory and materials variability. When assessing lead content at the trace level of 100 ppm, laboratories are reportedly finding different results. It is difficult to find low-

[9] Robert J. Howell, Office of Hazard Identification & Reduction, CPSC, et al., *Memorandum, CPSC Staff's Reponse to Commissioner Northup's Questions: Technological Feasibility of 100 Parts Per Million Total Lead Content Limit*, 24–25 (July 8, 2011), in Staff Briefing Package, *Staff Responses to Commissioners' Questions* (July 8, 2011), http://www.cpsc.gov/library/foia/foia11/brief/leadquestions.pdf.

lead materials that consistently meet the 100 ppm requirement in the marketplace, and particularly so for recycled materials. Members of the public raised this issue in response to our request for comments under Public Law 112-28. Since a failing test result can have major financial implications, this result should be of great concern to the Commission. But there has been no inclination to address the problem. Test-result variability drives up costs needlessly—when it comes to public health, the difference between 100 ppm and 300 ppm of lead is virtually nonexistent.

We do not believe that returning to a 300 ppm lead limit would harm children's health. The Commission's staff examined the health impact of the decision to reduce the lead limit to 100 ppm and concluded that "the contribution of products containing between 100 ppm and 300 ppm lead to the overall lead exposure in children is minimal." Claims to the contrary—that swallowing objects containing 300 ppm or less of lead reduces children's I.Q.—are based on an "incorrect characterization of a CPSC staff analysis first released in 2005."[10]

In short, this was a classic example of a regulation being imposed without the scientific data to support it. Because of the significant harm to the economy, consumer choice, businesses and the workers they employ—and in the absence of any public-health justification—the 100 ppm lead limit should be repealed. Congress should instead give the Commission the discretion to set the appropriate lead level for a material, product, or component where the health benefits and scientific evidence justify such a level.

3. Change the definition of "children's product safety rules" to cover only products intended exclusively for children.

The Commission's definition of "children's product safety rule" is a similarly non-risk-based imposition of the costly third-party testing requirement. The CPSIA requires third-party testing for compliance with all "*children's* product safety rules." Prior to the CPSIA, the Commission promulgated numerous "*consumer* product safety rules," such as those governing carpets and rugs, vinyl, clothing textiles, and mattresses. The Commission's majority interpreted the term "children's product safety rule" to include such rules.

Thus, any product made for a child is subject to a "product safety rule," compliance with which must be tested under the third-party testing rule. This means that, for example, a rug with the image of a children's cartoon character must be tested not only

[10] Dominique J. Williams & Kristina M. Hatelid, Directorate for Health Sciences, CPSC, *Memorandum: Response to Public Comments: Technological Feasibility of 100 ppm Total Lead Content in Children's Products*, 38 (May 11, 2011), in Staff Briefing Package, *Technological Feasibility of 100 ppm for Lead Content* (June 22, 2011), http://www.cpsc.gov/library/foia/foia11/brief/lead100tech.pdf.

for lead and phthalates (rules that clearly are focused on children's safety), but also for flammability (a requirement that covers general safety, not just children's safety). A blue rug that is made of the same material and located in the living room does not, however, have to be subjected to the same tests. This makes no sense.

A clear distinction can and should be made between "children's product safety rules" and more general "consumer product safety rules." Fundamentally, no safety improvement is gained by requiring the third-party testing of a lamp or rug merely because its design makes it suitable for children, when there is a greater risk that a rug will encounter a fire hazard in a kitchen or adjacent to the living room fireplace than in a child's room.

Indeed, the CPSIA defined children's products as those primarily designed or intended for children under 13. To make treatment of products and testing requirements consistent, "children's product safety rules" should be clearly defined by statute to mean safety rules that relate exclusively to children's products, and not to products intended for general use and governed by longstanding consumer product safety rules. There is no risk associated with these products that necessitates *new* third-party testing requirements.

Conclusion

All of us at the CPSC appreciate very much Congress's effort to reform the CPSIA by asking the Commission to consider ways to reduce needless burdens that are destroying jobs and undermining the nation's economic recovery. This report identifies and discusses briefly only a few of the recommendations that we believe would significantly decrease the costs of third-party testing without impacting safety. We would welcome the opportunity to elaborate upon the ideas presented here, and to share additional opportunities we have identified.

COMMISSIONER NANCY A. NORD

Statement on the Commission's decision to publish the Notice of Proposed Rulemaking on a Safety Standard for Magnet Sets

August 27, 2012

I voted to publish the Notice of Proposed Rulemaking on a Safety Standard for Magnet Sets because I believe that rulemaking is the appropriate way to address hazards that may be posed by this product. The hazard pattern described in the NPR deserves the attention and study of the Commission and the public through the rulemaking process. My vote was not without reservations, however, because I am not convinced that the proposal before us—which amounts to a ban on all magnet sets sold today—best reduces or eliminates the hazard while minimizing disruption to manufacturing and commerce as required under our statute.[1]

In particular, the proposed standard proceeds on the belief that warnings do not work for this relatively new product because (it is assumed) warnings are and will be ignored or otherwise not communicated effectively. But in the absence of a robust and comprehensive program to educate and warn about this hazard, it is unclear that warnings will be ineffective and our conclusion that such is the case is speculative. And applying this principle broadly would eviscerate many of the safety standards that the Commission (and Congress) have deemed acceptable. The long-term policy implications stemming from the rationale for the proposed ban on other products subject to warnings have not been explored but are presented by this rulemaking.

I am also concerned that the proposed ban may be overly broad. There are two hazard patterns here: one involving young children and the other involving older children and teenagers. A tailored approach might adequately reduce the risk associated with magnet sets but not eliminate the product from the marketplace. In addition, the proposed standard—particularly as amended by the majority—includes products that have not been demonstrated to pose the same risk. Overinclusive rules needlessly strangle commerce and innovation, and should be avoided. I hope that the comments in response to this NPR will help resolve these concerns, particularly by proposing less-

[1] *See* Consumer Product Safety Act § 9(f)(1)(D), 15 U.S.C. § 2058(f)(1)(D).

burdensome alternatives and by providing data that sheds light on how best to address the different hazard patterns before us.

Despite my concerns about the proposed standard, I voted for this to be put to the public because this is the right way to pursue the regulatory process when a significant hazard involving a class of products is brought to the attention of the Commission. When the Commission believes that a hazard is so imminent that it cannot wait for the results of rulemaking, we have statutory authority to act. In this case, however, instead of using that authority, we have brought compliance actions against certain companies and asked others to withdraw the products from the market in an attempt to reach the entire market. This amounts to back-door rulemaking. Approaching the hazard through the front door—that is, through the rulemaking process—is more appropriate. In this way, we do not take formal or informal actions that reach conclusions about a potential hazard before the Commission has all the relevant evidence and all affected stakeholders have the opportunity to be heard.

Congress created the Commission's regulatory procedures to allow for open and transparent rulemaking, and to ensure that the Commission has the right scientific, medical, and economic analysis before making decisions. That process must not be short-circuited. Thus, I look forward to examining this matter further—and as quickly as possible—once the public has weighed in and we have more data.

Congress of the United States

House of Representatives

COMMITTEE ON ENERGY AND COMMERCE
2125 RAYBURN HOUSE OFFICE BUILDING
WASHINGTON, DC 20515-6115

Majority (202) 225-2927
Minority (202) 225-3641

October 5, 2012

The Honorable Anne Northup
Commissioner
U.S. Consumer Product Safety Commission
4330 East West Highway
Bethesda, MD 20814

Dear Commissioner Northup,

Thank you for appearing before the Subcommittee on Commerce, Manufacturing, and Trade hearing entitled "Oversight of the Consumer Product Safety Commission," held on Thursday, August 2, 2012.

Pursuant to the Rules of the Committee on Energy and Commerce, the hearing record remains open for 10 business days to permit Members to submit additional questions to witnesses, which are attached. The format of your responses to these questions should be as follows: (1) the name of the Member whose question you are addressing, (2) the complete text of the question you are addressing in bold, and then (3) your answer to that question in plain text.

To facilitate the printing of the hearing record, please respond to these questions by the close of business on Friday, October 19, 2012. Your responses should be e-mailed to the Legislative Clerk, in Word or PDF format, at Kirby.Howard@mail.house.gov.

Thank you again for your time and effort preparing and delivering testimony before the Subcommittee.

Sincerely,

Mary Bono Mack

Mary Bono Mack
Chairman
Subcommittee on Commerce,
Manufacturing, and Trade

cc: G.K. Butterfield, Ranking Member, Subcommittee on Commerce, Manufacturing, and Trade

Attachment

Subcommittee on Commerce, Manufacturing and Trade
"Oversight of the Consumer Product Safety Commission"

Questions for the Record Submitted by Chairwoman Mary Bono Mack

1. **Based on your experience as a Commissioner, how do you believe the Commission could both better ensure consumer product safety and do so more economically and efficiently?**

My three years as a Commissioner have opened my eyes to the incredible costs this agency imposes on the regulated community and to the substantial taxpayer resources the agency expends, often with little or no commensurate safety benefit.

In some cases, the two are closely linked. For instance, the third-party testing requirement is an extremely burdensome and ineffective means of ensuring compliance with our safety standards, and has cost the agency an enormous amount of resources to implement. Similarly, the public database requires product manufacturers to focus resources on protecting against inaccurate public reports, and conducting public relations damage control when the CPSC's minimal safeguards do not prevent the publication of false or misleading information harmful to a business's reputation. At the same time, enormous CPSC staff time is dedicated to vetting reports for posting on the public database, despite the existence of far more useful private sector aggregators of product safety information.

Other aspects of the CPSC's operations are costly only to taxpayers, but are no less in need of reform. The overhead associated with maintaining a five member Commission when a single administrator would be more effective and efficient is one example.

Based on these and other observations I have made during my tenure, I have identified a number of reforms to the CPSC that I believe would greatly improve its efficiency while reducing burdens on the regulated community and better protecting the public from unsafe products. Explained in detail below, I recommend the following changes, some of which would require new legislation to accomplish: (1) Repeal the requirement that all children's products be third-party tested irrespective of risk and instead let the Commission exercise its authority to require third-party testing by a manufacturer, or of a children's product or component part, only as it is deemed appropriate based on reasonable risk based guidelines; (2) replace the 5-member Commission with a single administrator; (3) shut down the public facing database at *saferproducts.gov*; (4) reform the CPSIA to allow the agency to focus on risk; (5) remove impediments to the Commission's working toward the international harmonization of safety standards; (6) require that all CPSC rules be justified by a cost-benefit analysis; (7) require products that do not meet an applicable voluntary standard to bear a mark so stating; and, (8) moderate our role in voluntary standards development to not pressure standards bodies to include requirements that would not survive the cost-benefit analysis required for mandatory standards setting.

Repeal the Requirement That All Children's Products Be Third-Party Tested Irrespective of Risk And Instead Let the Commission Exercise Its Authority to Require Third-Party Testing By a Manufacturer, Or of a Children's Product or Component Part, Only As It Is Deemed Appropriate Based on Reasonable Risk Based Guidelines.

Imposition of the third-party testing requirement on every component of every children's product in response to "the year of the recall" was a classic example of legislative overreach. There may be appropriate circumstances for requiring particular manufacturers of particular products to bear the cost of third-party testing and certification in order to protect against the risk of consumer injury, and the Commission has the authority to make that call. But requiring all children's products to be third-party tested has proven to be a business crushing and job killing mandate without a justifying benefit. Through the use of better technology and collaboration with the U.S. Customs and Border Patrol (CBP), the CPSC has new and better tools to enforce our standards without the suffocating burden of the law's new mandates.

The CPSIA was enacted in 2008 in response to a media storm over a large number of Chinese manufactured children's toys that were recalled due to lead in paint that exceeded a standard in place since 1970. No child was injured by lead paint in the toys, and the offending manufacturers were soundly rebuked under existing law, through mandatory recalls, the imposition of the largest penalty in the history of the CPSC, and a thirty million dollar class action lawsuit settlement for one manufacturer.

The news of the recalls created a political climate suited to fulfill a long held goal of consumer advocates: the reduction in the lead content of children's products virtually to zero, the elimination of phthalates without any known risk to children, and the requirement that all children's products be tested by third party laboratories to ensure compliance with these and all other applicable safety standards. Thus, the CPSIA requires, with limited exceptions, that before a children's product enters commerce, sufficient samples of every component must be individually tested by a third-party laboratory and certified as free from lead and phthalates, and compliant with all other applicable product safety rules. Furthermore, the related tracking labels and record keeping are such a complicated morass that only the most sophisticated manufacturers can comply.

The CPSIA also required the Commission to establish protocols and standards for ensuring that after the initial third-party testing, children's products are subject to additional testing during production. The Commission carried out this mandate through the promulgation of 16 C.F.R. § 1107, which requires the additional third-party testing of a certified children's product to ensure continued compliance with all applicable safety standards, both when there is a material change to the product, and periodically during production even in the absence of a reason to believe a certified product is no longer compliant. The rule's prescriptive mandates insinuate the Commission deeply into the production process of any company that manufactures a children's product for the United States market.

Specifically, unless a manufacturer is one of the few large businesses with a ISO/IEC 17025:2005 accredited in-house laboratory, the rule requires it to undertake a complex analysis and formulate either a periodic testing plan or a production testing plan for each product manufactured at each manufacturing site. Manufacturers who make multiple products at a single site or who frequently change the product manufactured at a site will need to continually formulate and update their periodic testing and production testing plans, potentially as often as every day. They also must "document the production testing methods used to ensure continuing compliance and the basis for determining that the production testing plan provides a high degree of assurance that the product being manufactured continues to comply with all applicable children's product safety rules." Businesses have told us that documenting their complicated production processes will be costly, burdensome and simply impossible for some smaller scale companies.

The CPSC is responsible for ensuring that noncompliant and potentially dangerous children's products do not reach American shores. Advocates for third-party testing characterize it as a "prevention" model that is superior to what they view as the Commission's traditional "detection" model, because they believe that it will keep dangerous products out of commerce in the first place. The evidence does not bear this out.

Preventing the manufacture and importation of noncompliant children's products has always been and remains the focus of the CPSC's efforts. The policy disagreement is over the most effective means of doing so. Mandating third-party testing is based on the out-of-date, "command and control" paradigm that government can and should achieve its policy outcomes by dictating the precise decisions and actions of the private sector, rather than mandating an outcome with penalties for noncompliance, implementing a strong enforcement mechanism, and allowing the market to find the most efficient means of compliance.

The more forward thinking and effective approach to ensuring the compliance of manufacturers to consumer product safety law is therefore to create within that community, through a "carrot and stick" approach, a commitment to compliance, enhance the CPSC's partnership with CPB and our use of emerging risk assessment management technology at ports to better target potentially noncompliant products for inspection and prevent them from entering the stream of commerce. Recent technological and organizational advances have markedly improved the efficacy of these enforcement tools, increasing substantially the likelihood that noncompliant products will be detected and destroyed. In addition, modern production processes and quality assurance systems enable manufacturers to produce uniform compliant products without the need for confirming third-party tests. The cost of destroyed products, name brand approval, loss of future contracts, higher penalties, and class-action lawsuits, have already resulted in overseas manufacturers taking aggressive steps internally to ensure compliance, irrespective of prescriptive government mandates regarding the proper means for doing so.

Third-party testing is very expensive for all manufacturers and importers, but its cost burden is insurmountable for many small businesses. According to the CPSC's economists, the costs of testing alone -- excluding the costs of samples consumed in destructive tests, the costs of shipping the samples to the testing laboratories, and any related administrative and record keeping activity – is expected to consume over 11% of

a small manufacturer's revenue. Given that a typical profit is only about five percent of revenue, it is reasonable to expect a large number of small business closures resulting from the third-party testing requirement, particularly after the obligation to conduct periodic and material change tests takes effect in February 2013. They cannot simply raise their prices and remain competitive.

Commission economists predict that in response to the "significant increase in their costs due to the final rule", manufacturers will redesign their products to reduce the features and component parts, reduce the number of children's products they offer, exit the children's product market, or go out of business completely. The costs associated with the new rule are also expected to be a "barrier that inhibits new firms from entering the children's product market", including, in particular, ones serving a niche market, such as products for children with disabilities. Safety and performance related innovation will also be stymied, as manufacturers "delay implementing some improvements to a product's design or manufacturing process in order to avoid the costs of third party testing."

The requirement that all children's products be tested at a third-party lab, regardless of risk, also disproportionately hurts companies with robust in-house testing programs, those with more creative and effective ways of ensuring compliance internally, as well as domestic American companies who have never had a violation, but who nonetheless must pay the most for third-party testing. In the latter regard, there are entire industries that have had very few, if any, safety violations; yet, they are required to comply with onerous third-party testing, certification, tracking and labeling requirements that will not improve safety. And, of course, those without a commitment to an ongoing enterprise who wish to make a fast profit without regard for public safety will not comply with third-party testing requirements in any event, thereby achieving an unfair price advantage.

While the crippling costs of third-party testing are unquestionable, its benefits are speculative and overstated. Some argue that third-party testing before sale will result in fewer recalls. But most recalled products contain design or manufacturing defects that are unrelated to the Commission's product and material specific safety standards. Moreover, given the Commission's decision to reduce the lead in the substrate of children's products well below a level presenting any risk to health, recalls of products violating the new standard do not even necessarily protect against a real risk of injury.

Additionally, the manufacturers most likely to honor the third-party testing requirement are also the least likely to produce noncompliant products. Good corporate citizens wishing to maintain their market reputation have already improved their internal mechanisms to ensure compliance regardless of third-party testing requirements, but will also incur the cost of third-party testing consistent with their commitment to follow the law. Indeed, the CPSIA's micromanagement of a company's testing, certification and tracking of each and every component of a product will be less helpful than the sophisticated internal controls manufacturers are currently using and continue to develop and perfect. For instance, we have learned that since the discovery in 2007 that the lead paint in certain violative products was introduced through inadequately supervised component suppliers, manufacturers have reduced their number of suppliers, and now

undertake more frequent internal testing. Component suppliers, in turn, take more care to ensure compliance because they are aware that manufacturers will not risk continuing to use a supplier who fails even once to provide compliant components.

In contrast, a "bad actor" with a casual attitude toward safety standards compliance will be just as casual about maintaining accurate records to support CPSIA-mandated certifications. Because the requirements of 16 C.F.R. § 1107 are so complicated and expensive, it is easy to imagine all of the shortcuts a manufacturer could take to reduce its cost, creating the impression of compliance. The CPSC does not have the manpower or the expertise to police manufacturers' internal record keeping controls, as it would take an army of investigators all over the world to accomplish such a task. Even now, when the CPSC seizes a noncompliant product at the port through our more sophisticated targeting, we do not investigate the certificate or prosecute the paperwork failure. Thus, the detection method of ensuring compliance has remained and will remain the default method of compliance for companies producing violative products, while those committed to ensuring compliance and already effectively doing so are bearing the unnecessary additional burden of third-party testing.

Today, the Commission also has enforcement tools vastly improved over those available even a few years ago. These are a more effective use of taxpayer dollars to ensure compliance with safety standards than is policing all children's product manufacturers for certifications to mandatory third-party tests. The Commission now has authority to confiscate and destroy at the border products that violate federal safety standards. Since the advent in 2008 of our agency's Import Surveillance Division, we have continued to increase the number of full-time CPSC investigators posted at key U.S. ports. We have also expanded cooperation with CBP to maximize the number of products screened at all U.S. ports. Today, the Commission intercepts non-compliant toys through more extensive border control efforts; application of x-ray technology; and, computer databases that search ship manifests before they reach port, flagging for inspection previous offenders and first-time shippers. Using this more detailed and timely information, and through closer cooperation with CBP, the CPSC seized and denied entry to 49% more shipments of noncompliant products in 2010 than in 2009. Clearly then, there is no evidence that the CPSIA reduced the numbers of noncompliant products being made, and the third party tests, certifications and attendant mandates did nothing to contribute to the CPSC's ability to catch them.

The CPSIA also increased the incentive for compliance by increasing the maximum civil penalty amounts from $8,000 to $100,000 for each "knowing" violation and from $1.825 million to $15 million for any related series of violations. As a result, the average out of court settlement reached by the CPSC for violations of its statutes increased 61% between 2008 and 2009, and another 43% in 2010 over the amounts collected in 2009. The CPSC also can now more easily seek criminal penalties, and can require a company recalling a product to give a refund, replacement and/or repair, rather than allowing companies to select the remedy they prefer.

It is well recognized that these difficult economic times call for a regulatory regime that carefully balances the costs and benefits of executive agency action. And consumer product regulation, in particular, must take into account the desire of American families for a dynamic marketplace with new and more interesting products that are also safe and affordable. The requirement that all children's product manufacturers repeatedly third-party test every component of their products is a tremendously costly and not very effective means to prevent violative products from entering commerce. It also threatens to increase the cost and drastically reduce the availability of children's products for parents of modest means. Public and private resources should therefore instead be redirected toward the alternative production processes and enforcement methods that can achieve the same goal much more efficiently.

Replace the 5-member Commission with a Single Administrator

I believe the CPSC could be run more efficiently by a single Administrator, than by a Commission of five or even three. In fact, similar proposals have been considered in the past: http://www.gao.gov/products/T-HRD-87-14. Managing a small agency simply does not require more than an Administrator. Additionally, I have confidence that Chairman Tenenbaum (or a future Administrator) would be able to run the agency much more efficiently without the pressures from her Democrat and Republican colleagues, who wish constantly to influence her actions in one direction or another. Reducing from five Commissioners to an administrator would save the substantial costs of office space, Commissioner and staff salaries, travel costs and all other expenses associated with a Commissioner's office.

The Chairman is already solely accountable for all of the agency's core functions, including setting the rulemaking agenda, public relations, human resources duties, and budgeting. The other four Commissioners may be asked to sign off on these things from time to time as a formality or to provide input, but ultimately all accountability lies with the Chair.

Rulemaking involves the participation of five Commissioners. However, I would argue that this "participation" rarely involves more than duplicative analytical efforts—all of which usually result in a 3-2, party-line vote. This also means five different Commissioners, all their staffs (12 people), plus dozens of technical staff and lawyers are reviewing, editing and analyzing the exact same rule-making documents.

Despite my efforts, I was unable to meaningfully influence the major rulemakings we considered when all five Commission seats were filled. In fact, divided along party lines, the Chair was often pushed to align her position with one or both of the other two Democrat Commissioners. For example, the Commission issued a Notice of Proposed Rulemaking on the Definition of Children's Product that was so ambiguous we might just as well not have defined the term at all. In response, the Commission received many excellent comments from manufacturers and retailers illustrating how the parameters of the definition provided very little, if any, certainty for products that fell around the outer edges of the law's age limit. Then, after weeks of review by technical staff, the Office of

General Counsel, and all Commissioners' staffs, the final rule approved by the Majority was *worse* than the proposed rule, in that it unjustifiably broadened the parameters so that even more products fell under the purview of the CPSIA. Without four other Commissioners pulling her in opposite directions, one Administrator would be solely responsible for fair, well-thought-out rulemaking decisions.

Having five Commissioners also means that many day-to-day activities of the Commission must happen five different times, which can drain staff time. Moreover, each Commissioner needs his/her own weekly briefings with various professional staff to remain current on the status of rulemakings, compliance issues, legal matters, public relations, administrative and staffing problems, and other issues. Unfortunately, it is not useful to combine most meetings with other Commissioners, who may have different agendas. Nor is it even legal under the Sunshine Act for more than two Commissioners to meet privately to discuss substantive matters. As a result, professional staff spend much of each week in repetitive "update" meetings with each Commissioner and away from their core duties. They also spend five times more time than necessary answering Commissioner and Commissioner staff questions, when they could be doing so for one Administrator.

During the course of these meetings and through other Commissioner and Commissioner staff initiated contact, CPSC Commissioners seek to influence the agency's professional staff to take or forego actions based on the Commissioner's policy preferences. These conflicting directions can sow confusion and dissention in the ranks of CPSC's career staff. I have learned from CPSC staff that the work environment created by being pulled in opposite directions can be difficult and stressful. A single administrator guiding the staff to advance the presidential administration's agenda would foster a more productive and satisfied workforce.

The CPSC still remains a relatively small agency, despite the new rules it has promulgated and its responsibility to enforce those rules. Other regulatory agencies, such as NHTSA and FDA are run by Administrators that are accountable to Cabinet secretaries and the White House. I could imagine a similar arrangement for the CPSC.

The Public Facing Database at *saferproducts.gov* Should Be Shut Down

Over the last three years, I have worked without success to improve the public facing database authorized by § 6A of the CPSA (§ 212(b) of the CPSIA), so that it would provide reliable and accurate product safety information to inform consumer choice and reduce the risk of injury. Instead, and over my objections, *saferproducts.gov* has become a public website bearing the imprimatur of the Federal Government that is badly designed and hard to navigate, provides incomplete information, and is populated by unverifiable reports of dubious accuracy. Furthermore, it is absorbing a disproportionate share of this agency's time, talent and budget.

In past testimony before Congress, I have advocated for reforms to the law that would improve the database. Specifically, I have proposed that the Commission only publish

reports of harm that are received from individuals with firsthand knowledge of the product, individual or incident giving rise to the alleged risk of harm. I have also asked that reports be required to identify to the CPSC (but not necessarily publicly) the victim or product owner, so that the Commission can conduct an investigation to verify the accuracy of a claim. I have also urged that sufficient information be included to specifically identify the exact product at issue before a report is published. Such information could include the model number, model name and date of manufacture, or other information necessary to prevent consumer confusion. However, even had these reforms been adopted, the data base today would be of little use to American consumers.

Out of all of my suggestions, the single one even addressed by Congress was the need for specific model information. But H.R. 2715 amended the CPSIA to require only that the Commission *try* to obtain product model information; the Commission is still permitted to and does post reports of harm not specifically identifying the subject product. Such reports continue to mislead consumers, potentially doing more harm than would no report at all.

Today, I strongly recommend that the public facing portion of the Commission's new database be shut down. There is simply no safety benefit in making all of our incident reports public, and doing so diverts resources that would be better spent advancing the Commission's safety mission.

This Commission should have a public database funded by taxpayers only if it is different and better than any source of information that already exists in the public domain, such as websites like *Amazon.com* or *Yelp.com*. Unfortunately, our public database is less useful than similar sites that are already available to the public, and is, in fact, more likely to mislead the public. This is because our inability to routinely verify reports leads to the publication of inaccurate information. It is also because we do not permit satisfied customers to comment in response to a report that a product presents a risk of injury, thereby providing a one-sided picture without the balance and sense of proportionality that consumers need in order to choose among competing products.

The contrast between *Amazon.com* and *saferproducts.gov* is illustrative. *Amazon.com* has a much more user-friendly and informative design, giving consumers an intuitive and easy to navigate interface that shows, at the point of purchase, the most popular models of a product, the degree of customer satisfaction (on a five star scale), complaints and comments about the product, and responses to complaints and comments from other consumers that provides a balanced perspective. Consumers contemplating a purchase want to learn about the safety experiences of others who already own the product; such useful information is unavailable on our website. *Amazon.com*'s aggregation of far more comments – both positive and negative – also provides a more accurate view of a product's safety. For instance, on *Amazon.com*, when a product that has sold a million units has a handful of purchasers that question its safety, a potential consumer has enough information to put the complaints in perspective. In contrast, the same number of complaints about a product on *saferproducts.gov*, where there is no way to determine how many products have been sold or the experience of the vast majority of purchasers,

could well lead a consumer to avoid the product. Worse yet, that consumer might instead purchase another product that actually is dangerous, but because of its smaller volume of sales, is the subject of fewer or no reports. *Amazon.com* has the added advantage of sending a hyperlink to everyone who buys a particular product, thereby ensuring both that a broader perspective is provided, and that there is no confusion regarding what exact product is the subject of a comment. A consumer searching the CPSC website for product information, on the other hand, has no way of targeting a particular model, and to the extent he or she finds information that appears to correspond to a particular product, without the actual model number, the product could very well be something else. In fact, we know that consumers posting reports to *saferproducts.gov* occasionally even misidentify the manufacturer, and sometimes this is done with so little specificity that the manufacturer does not realize the mistake.

Today consumers are used to navigating through websites and databases with hyperlinks that are intuitive and do not require the ability to sort data and cull information using very exact terms. The CPSC database is difficult to use and is missing many of the basic programming that is so common today. And that problem is only going to get worse. We are not equipped to maintain, upgrade and build on our public database. It is expensive to contract outside of the agency, and continuity is difficult to maintain, because of budget issues and limitations for contracting through multiple fiscal years. An organization like *Amazon.com* can afford to spend millions of dollars every year to take advantage of emerging technology, build their institutional capacity for programing within their company and stay current with fast changing customer expectations. The CPSC cannot hope to match this investment, and dedicating more resources in an attempt to meet consumers' expectations would just send good money after bad.

Further, the Commission has limited resources for enforcement, and the public database diverts Commission staff time, appropriated funds and product safety focus from addressing genuine risks to screening and preparing the reports for public disclosure. Every report that is entered into our database requires the personal attention of multiple members of our staff to: review and edit for clarity, determine that the report meets the criteria for inclusion (about 40% do not reach this threshold), send the report to the manufacturer for review and possible comment, and make a determination of inaccuracy if the manufacturer so requests. Manufacturer claims of inaccuracy can lead to lengthy and complicated negotations over whether the report can be posted at all, and, if so, how it must be edited to ensure its accuracy.

These time consuming tasks by staff are unrelated to the most important part of our mission, which is to identify unsafe products on the market and to take appropriate action to protect consumers. The agency has yet to estimate the number of new FTEs we may need, year after year, to administer the public database. However, one conservative estimate is that it will take twenty-two new FTEs to handle the case work generated by these requirements, and that does not include complicated cases requiring the investigation and resolution of a material inaccuracy charge by a manufacturer. But there is no question that as more staff has been hired and assigned to process database reports rather than to perform the more important work of watching for trends and catching new serious risks,

our agency has failed both to identify significant emerging risks that have been reported, and to take timely action to prevent severe injuries to additional consumers.

Additionally, because inaccurate database reports are indistinguishable from accurate ones, the media's attention can focus on either inaccurate reports or less serious risks, pressuring the agency to prioritize its efforts based on publicity rather than risk level. Because the reputation of the agency is involved, a single press story can drive our resources to costly and complicated investigations of incidents, even when there has been no serious injury and Commission staff has a high level confidence either that the company has addressed the risk or that human error was at fault.

Shutting down the public database will by no means result in the waste of the substantial appropriations already dedicated to the Commission's IT initiative of the last several years. That initiative involved combining the numerous "silos" of data sources and data management into a single integrated system. That new integrated data system will continue to permit all of the product safety incident data, irrespective of source, as well as the software used to manage investigations of potentially risky products, to share a single format and "talk to each other", so to speak. Staff will retain their new capacity to monitor seamlessly every aspect of an incident and stage of an investigation, whether at the port, in the laboratory, in the office of compliance or in the legal department. These new features will continue to enhance the overall efficiency of the Commission.

Reform the CPSIA to Allow the Agency to Focus on Risk

The best way to allow the agency to perform its core functions—to assess and reduce risk—would be to reform the CPSIA's non-risk based mandates. In addition to the reforms addressed separately in response to this question (including repealing the requirement for the third party testing of all children's products), such reforms should include: repealing the 100 ppm lead content standard; defining children's products for purposes of the heavy metal and phthalate limits as products intended for children 6 and under, rather than for all children under 13; and, defining children's product safety rules as rules applicable to products intended exclusively for children, not general use products with incidental children's themes. Such reforms would free up agency resources to focus on known hazards and to better prioritize our regulatory agenda. It would also free up business resources to expand, build new products and stay competitive with what the marketplace is demanding in the future.

My objections to the 100 ppm lead limit are discussed in detail in response to Question 2, below. With respect to the age-based definition of children's product, the CPSIA defines a "children's product" as any product intended primarily for use by children twelve years old or younger. The CPSIA thus treats all products intended primarily for use by children under thirteen the same, regardless of whether they are intended for one-year olds or twelve-year olds. Recognizing the substantial difference in risk presented by the products used by different age groups, CPSC staff has suggested to the Commissioners that lowering the age range of products impacted by the CPSIA would be

one of the most efficient ways to amend the law in order to exclude those products which many believe should be outside its scope.

The 12-and-under age range affects many products that are also used by teenagers, thus creating enforcement difficulties over marginal products. Producers argue that the products are primarily intended for children age thirteen and older, and the Commission examines marketing and other factors to assess the claim. Some blurring of the age lines will happen regardless of the age cut-off, but there are many more products subject to this uncertainty for "tweens" (*e.g.*, certain sporting goods, apparel, etc.)

In addition to enforcement difficulties, the benefits of the law are vastly reduced as applied to products for older children who are well past the age when they mouth things or constantly put their hands in their mouths. Thus, Congress could amend the statute to apply only to products primarily intended for children age six and under, while giving the agency discretion to raise that age limit for particular materials or categories of products that are found in the future to pose a risk to older children. And in any event, the CPSC would retain the authority to issue a stop-sale order or to recall any product determined to pose a "substantial product hazard" under the Federal Hazardous Substances Act.

The Commission's definition of "children's product safety rules" is a similarly non-risk based imposition of the costly third-party testing requirement. The CPSIA requires third-party testing for compliance with all "*children's* product safety rules." Prior to the CPSIA, the Commission promulgated numerous "*consumer* product safety rules", such as those governing carpets and rugs, vinyl, clothing textiles and mattresses. Over my objection, the Commission's Majority has required any such products intended for use in a children's room to be third party tested to those general consumer product safety rules. For instance, a rug with the image of a Disney character and intended for a child's room that the CPSIA clearly required to be third-party tested to lead and phthalates limits must, because of this interpretation, now also be third party tested to the rug flammability standard; but, a blue rug that is made of the same material and located in the living room does not.

I believe a clear distinction can and should be made between "children's product safety rules" and more general "consumer product safety rules." Fundamentally, no safety improvement is gained by requiring the third-party testing of a lamp or rug based on its design, when there is a greater risk that a rug will encounter a fire hazard in a kitchen or adjacent to the living room fireplace than in a child's room. And children play throughout the house. The CPSIA defined children's products as those primarily designed or intended for children under 13. "Children's product safety rules" should be consistently construed to mean safety rules that relate exclusively to children's products, and not to products intended for general use and governed by a longstanding consumer product safety rule. The Commission did not have to adopt a contrary view, but it did, even though there is no risk associated with these products that necessitates *new* third-party testing requirements. Congress could clarify this.

Remove Impediments to the Commission's Working Toward the International Harmonization of Safety Standards

Congress's imposition of statutorily set mandatory standards for lead and phthalates and its requirement that the Commission make mandatory the ASTM F-963 toy safety standard and standards for durable nursery products, has markedly diminished the Commission's ability to harmonize United States and other international safety standards. We have no flexibility to modify our standards to find common ground, and because our standards are often not risk based and cannot be justified on the basis of a cost-benefit analysis, other jurisdictions are unwilling to adopt our standards. This has resulted in a large number of European and other foreign manufacturers abandoning the American market for children's products and reducing the choice of our consumers. It also erects barriers to entry in foreign markets for American manufacturers, who must incur the cost of compliance and testing to multiple standards.

For example, the ASTM toy safety subcommittee recently established a work group to consider aligning the U.S. and international standards for accessible soluble heavy metals in toys. If adopted by the ASTM toy subcommittee, the new standards would then need to be approved by Commission vote, because the CPSIA made the ATSM F-963 standard mandatory, effective 2009. That the Commission could be an impediment to the ATSM's efforts to harmonize its standards with international norms illustrates how mandatory, government imposed, standards can inhibit the harmonization of international product safety standards. ASTM-F-963 had been a voluntary standard before the CPSIA made it mandatory in early 2009, and it is quite complex. In theory, the greater efficiencies achieved through harmonization should benefit manufacturers and consumers.

When I was in China in 2010 visiting factories and American companies, I saw that they perform three or four different "small parts" tests, all from different heights, simply because of the requirements of different countries. Harmonization would reduce that burden, but the CPSIA's requirement that toys sold in the United States satisfy ASTM F-963 has tied the Commission's hands in its negotiations to "harmonize" with the Europeans. Overall, locking in the ATSM-F-963 standard has severely limited the potential for improvements to safety and efficacy that would otherwise be achievable by learning from and adopting where appropriate the toy safety standards of other countries.

I can recommend several statutory changes that could spur greater global harmonization without compromising product safety. First, Congress could permit the Commission to recognize an exception to a statutory or other mandatory standard in cases where compliance with the analogous foreign standard would not increase the risk of injury. Second, to account for cases where an analogous foreign standard does not provide adequate protection, Congress could authorize the Commission to accept the foreign standard as a baseline, with supplemental requirements as necessary to address risk. In that way, compliance with both jurisdictions' standards could be achieved with the investment necessary to satisfy one, and the marginal additional cost necessary to satisfy the additional requirements of ours. While still more costly than complete

harmonization, the costs of complying with the standards of two jurisdictions under those circumstances would be substantially less than were the two standards completely different. Finally, Congress itself could make a finding that particular European standards provide sufficient protection from injury, and permit manufacturers selling in the United States to satisfy either standard.

Congress Should Require That All CPSC Rules Be Justified By a Cost-Benefit Analysis.

Under existing law, the CPSC cannot promulgate a consumer product safety rule until it has performed an analysis of the potential benefits and costs of the rule. That analysis must then show that the benefits expected from the rule bear a reasonable relationship to its costs and that the rule imposes the least burdensome requirement to reduce the risk of injury. 15 U.S.C. § 2058. However, the CPSIA expressly excepted the CPSC from its existing statutory mandate to perform cost-benefit analyses of its legislative rulemaking under the statute. Cost-benefit analysis was not prohibited, but the majority of Commissioners opposed the exercise and as a result, no cost-benefit analysis was performed of the CPSC's Testing and Certification rule, or the law's new mandatory standards requirements. Nonetheless, the Commission did examine the costs to small businesses of these regulations under the Regulatory Flexibility Act, and determined that they would be crippling. Of course, the RFA requires no consideration of a rule's benefits, and is not an impediment to rulemaking, no matter how economically destructive the cost.

Having had the freedom to regulate without the need for a rational justification, the Chair now seeks to expand those powers. In her July 17, 2012, testimony before the Senate Committee on Appropriations, Subcommittee on Financial Services and General Government, Chairman Tenenbaum urged the Subcommittee to amend the Flammable Fabrics Act to permit "this type of flexibility for rules regarding flammability of upholstered furniture" because it "would be very helpful and may allow for expedited consideration of the proposed rules."

The Commission has been studying means to address the risk of the flammability of upholstered furniture and contemplating potential rulemaking *for over twenty years*. Action has yet to be taken because it is such a complicated issue, both in terms of demonstrating the efficacy of risk reduction alternatives, and ensuring that they do not have unintended and more harmful consequences, such as has occurred with the introduction of potentially hazardous flame retardant chemicals in California.

There is no doubt that a proposed rule addressing the flammability of fabrics could be "expedited" if there was no need to establish the efficacy of the rule, or that its quantitative and qualitative costs are justified. But such rulemaking would likely close businesses, increase the cost to American consumers, and reduce choices and options in the market, all for unproven benefits. This is exactly what both Congress and the President recognize is undermining the country's economic recovery.

Given the Chair's public posture, and based on my experience as a Commissioner in the political minority, unable to persuade the Democrat majority voluntarily to undertake cost-benefit analyses of its significant rulemaking, it is essential that Congress mandate that a cost-benefit analysis establish that the benefits of a regulation are proportionate to its costs before it is promulgated. This should apply to all economically significant regulatory actions, not only legislative rules.[1] In addition, such analyses should be performed by an independent entity.

Cost-Benefit Analyses of Regulatory Actions Should Be Performed by an Independent Entity.

A federal agency that is required or willing to undertake a cost-benefit analysis of a significant regulatory action is not always equipped to do so. The CPSC, for instance, lacks the expertise and resources to perform thorough economic analyses of all of its rules. Indeed, to my knowledge, the CPSC has only performed one full cost-benefit analysis in its history.[2] For example, if the CPSC had been required to perform a cost-benefit analysis of CPSIA's main testing and certification rule, it would have had to outsource the study, given the sheer scope of the rule and number of different industries impacted.

I do not believe that the CPSC employs professional staff with the expertise to evaluate or identify complex private markets dependent upon each other, the effects of the regulation on international competitiveness, or any of the other factors relevant to a thorough cost-benefit analysis. It is likely that many other Federal regulatory agencies also would be unable to do so.

Even if Commission staff had the knowledge, experience and resources to perform cost-benefit analyses of the CPSC's major regulatory actions, our Economics department is constrained by its lack of independence. The Economics staff must report to the political leadership of the agency whose bias toward a particular outcome is often well-known. As the staff is forced to make basic assumptions in connection with their analysis, they can tilt those assumptions to avoid undeserved but recurring criticism. Furthermore, political leadership is often setting an unrealistic schedule for final rulemaking. Such time contraints preclude the performance of thorough cost benefit analyses of complex regulatory actions.

Finally, cost benefit analysis is not the prime consideration of an agency with a mission unrelated to cost. Fundamentally, regulatory agencies do not view their primary job to be assessing the economics of decisions. Rather, regulatory agencies focus on regulating—

[1] For certain rules, such as "Notices of Requirements" under the CPSIA, where the "Notice" itself may not have costs associated with it, but the act of issuing the "Notice" triggers an underlying statutory requirement to test and certify (imposing huge costs), I would recommend requiring that the agency perform a cost-benefit analysis of ***both*** the rule itself and the underlying statutory requirement that is associated with it/triggered by it.

[2] The Commission's 2006 final mattress rule on flammability (16 CFR Part 1633) contained a cost-benefit analysis.

with the natural tendency to regulate more. In other words, the more "tweaks" or requirements that can be added in the name of safety, the better—and the costs of such decisions, even when considered, are always secondary.

An expert independent entity with its sole purpose to conduct cost-benefit analyses of all economically significant rules taken by any federal regulatory agency would be an effective way to address agencies' lack of expertise, resources and independence. This is similar to the responsibilities of the Congressional Budget Office (CBO) prior to the passage of House Bills and, in fact, a new office could be created within CBO to provide this analysis for regulatory agencies as they implement laws.

I recognize the costs associated with creating a new office within CBO responsible for performing cost-benefit analyses for other federal agencies. But that cost would be partially offset by the fact that "regulatory flexibility analyses" performed under the RFA would no longer be needed. Moreover, a single office performing all cost-benefit analyses would gain efficiency and expertise that would allow the analyses to be done more quickly, more correctly and more independently.

> All Significant Regulatory Actions Should Require a Cost-Benefit Analysis, Not Just Legislative Rules Subject to Notice and Comment Rulemaking Under 5 U.S.C. § 553(b).

Many of the regulatory mechanisms employed by the CPSC that imposed considerable costs on manufacturers were not legislative rules. Indeed, much of the Commission's regulatory activity under the CPSIA has not been through the 5 U.S.C. § 553(b) notice and comment rulemaking applicable to legislative rules. As a result, neither full cost-benefit analyses nor other forms of economic review were required. In fact, some of the most costly (and unnecessary) decisions made by the agency have come through party-line votes on interpretive rules[3], Notices of Requirements[4], and petition decisions. Thus, in considering a requirement that agencies conduct cost-benefit analyses to justify regulatory action, Congress should take into account the full scope of regulatory decisions that an agency makes – not simply the most obvious regulatory vehicle, legislative rules.

---

[3] For instance, the Commission voted 4-1 to interpret the word "any" in CPSIA § 101(b)(1)(A) to mean "zero," rendering the absorbability exclusion of the original statute meaningless, and resulting in the rejection of a petition from a manufacturer to exclude the brass axle of a toy car that had *less absorbable lead* than the FDA permits in a piece of candy.

[4] Notices of Requirements (NOR) are ostensibly procedural regulations that provide notice to testing laboratories on how to become CPSC-recognized labs for the purposes of third-party testing under the CPSIA. However, their issuance triggers the underlying statutory requirement that all children's products be third-party tested to the particular standard listed in the NOR—a huge, new, non-risk-based requirement of the statute with sweeping economic impact. The Majority has used them to require manufacturers to third-party test to many general consumer product safety standards that I believe should not have been construed as "children's products safety rules" subject to third-party testing under the CPSIA.

Make It More Difficult for Congress to Suspend the Requirement For a Cost Analysis Before a Bill Becomes Law.

The CBO is charged with the important task of performing cost analyses of proposed legislation. However, in the past, that required analysis has been suspended by a majority vote in the House. CPSIA was such a statute, and its unintended economic consequences attest to the need for the required thorough examination of economic impact before passage. This could be avoided through a requirement that a statutorily required cost-benefit analysis could be waived only by a super majority of Congress.

Products That Do Not meet an Applicable Voluntary Standard Should Be Required to Bear a Mark So Stating.

The CPSC cannot set a mandatory standard where there is "substantial compliance" with a voluntary standard that eliminates or adequately addresses the risk of injury associated with the product. 15 U.S.C. § 2058(f)(3)(D). Consequently, there will always be the potential for some manufacturers not to comply with an applicable voluntary standard, under circumstances where the CPSC cannot impose a mandatory standard.

This lack of universal compliance with voluntary standards creates an unfair trading environment that puts consumers at risk of harm. Compliance with voluntary standards can be a substantial cost component of a product, and manufacturers who do not follow them can therefore charge a lower price for the product. This harms the good corporate citizens who are at a competitive disadvantage because they care about consumer safety, and it harms consumers who are unlikely to be aware that a voluntary safety standard even applies to the product they opt to purchase because it is cheaper.

But making all voluntary standards mandatory is not feasible either. There are thousands of voluntary standards and they evolve as products change in an ever changing market. The voluntary standards committees and the CPSC collaboratively monitor products for emerging hazards and product advancements and develop revisions to the voluntary standards. Mandatory standards lock in product and testing requirements that may not meet future risks. It would be impossible to imagine the CPSC having the resources to undertake continuous rulemaking to revise each and every voluntary standard that is developed and/or revised.

The solution to this problem is a more informed public. Voluntary standards bodies often adopt a mark of compliance that allows those manufacturers who follow the standard to inform the public that the product is compliant. But manufacturers that do not comply with a voluntary standard are not now required to mark their product as not in compliance with an applicable voluntary standard. Requiring them to do so would permit the public to make an informed decision between a cheaper, potentially less safe product, and a product that may cost more, but is compliant with a voluntary standard intended to protect the public from harm.

The Commission Should Not Encourage Voluntary Standards Bodies to Adopt Requirements That Would Not Survive the Cost-Benefit Analysis Required for Mandatory Standards Setting.

A corollary to the need for cost-benefit analysis in all CPSC rulemaking is the prevention of CPSC pressure in voluntary standards setting that can result in unjustifiably costly voluntary standards. Over the last three years, I have heard with increasing frequency and urgency complaints from businesses participating in voluntary standard setting that the CPSC plays with a heavy hand. In particular, CPSC staff are said to use the pressure of threatened mandatory standards and other regulatory and public relations pressure to influence the voluntary standard setting process. The problem with that approach is that it allows the CPSC to dictate "voluntary" outcomes that might not survive the cost-benefit analysis and least burdensome alternative requirements for the establishment of a mandatory standard.

The CPSC can play an important role by sharing its data and the expertise of its scientists and engineers, but it should allow voluntary standard setting bodies to make their own decisions, free from coercive influence. Section 9 of the CPSA authorizes the CPSC to impose more stringent standards than those established by industry consensus when it is in the public interest to do so. And the agency should impose a mandatory standard only after making the findings required by Section 9, including that "the benefits expected from the rule bear a reasonable relationship to its costs" and that "the rule imposes the least burdensome requirement which prevents or adequately reduces the risk of injury for which the rule is being promulgated." 15 U.S.C. §2058(f)(3)(E) and (F). Seeking to instead set standards through pressure on voluntary standards bodies improperly circumvents that statutory requirement.

2. Why did you oppose lowering the lead limit for children's products from 300ppm to 100 ppm?

The CPSIA mandated that the permissible amount of lead in children's products be reduced to 600 ppm, and then 300 ppm, over a fixed time period. Congress then gave the Commission discretion to determine whether a further reduction of the lead limit to 100 ppm was "technologically feasible." Specifically, Congress required the Commission to reduce the permissible amount of lead in children's products from 300 ppm to 100 ppm, *unless* the Commission determined that it was not "technologically feasible" to do so for a product or product category. The CPSIA also directed the Commission to consider "the public health protections associated with substantially reducing lead in children's products." I voted against reducing the lead limit to 100 ppm, because I concluded, based on the information presented by the CPSC's expert staff following the required statutory notice and a public hearing, that doing so was not technologically feasible, it would result in no measurable health benefit, and it would have devastating economic consequences.

The Commission majority concluded the reduction to 100 ppm was technologically feasible by erroneously interpreting Congress' direction in CPSIA § 101(d)(1) that it consider whether a "product" complying with the 100 ppm limit is available in "the product category" as referring to raw materials, not children's products. Based on this

incorrect reading of the statute, the Commission was able to rely on raw materials tests with no link to any identifiable children's product as its basis for concluding that "most" children's products on the market today already satisfy the 100 ppm standard.

Although the commercial availability of substitute low-lead raw materials appropriate for use in children's products is a consideration in determining the technological feasibility of 100 ppm children's products under CPSIA § 101(d)(2), the fact that it merely exists is simply not enough. A common sense reading of "technological feasibility", as well as judicial constructions of analogous statutes, confirm that Congress intended the Commission to consider not just the physical possibility of manufacturing a product with 100 ppm of lead, but whether it is economically feasible to produce and market the product.

But the analytical approach taken by the Commission completely ignored economic feasibility. As long as "low-lead materials are available, but are available only at higher prices" the Commission assumed technological feasibility, because "there is no economic basis for determining at what point a cost increase would make production not technologically feasible."[5] Even if it were plausible that economists cannot identify in the abstract prohibitively high production costs, this Commission should at least know it when it sees it. And the Commission had before it evidence, explicit in the published Briefing Package, that the costs associated with a 100 ppm lead limit will be substantial and will drive products and businesses from the market.

According to the Commission's own staff, the significant adverse economic impacts likely to result from setting a 100 ppm lead limit, include: the need to use more expensive low-lead materials rather than the nonconforming materials used today; the costs associated with reengineering products to make use of new materials; the costs of making leaded components inaccessible; increased testing costs; increased consumer prices; reductions in the types and quantity of children's products available to consumers; businesses exiting the children's product market; manufacturers going out of business; reduction in the utility of products due to the substitution of materials; reduction in the durability of products due to the substitution of materials; and, the loss of the value of all inventory not satisfying the new standard.

Even without considering economic feasibility, the Commission's conclusion that low-lead materials are available as substitutes for the materials currently used in children's products was inconsistent with the record. The conclusion was supported only by evidence that some suppliers expressed a willingness to provide some quantity of the materials. There is no evidence that the materials offered reliably contain the low-lead level specified, or that they are accessible to the manufacturers that would be required to use them to meet a 100 ppm standard. To the contrary, evidence obtained by the Commission demonstrated that suppliers were unable to provide materials that consistently met the specified low-lead standard, and that materials specified as low-lead were not accessible to many manufacturers.

[5] Staff Responses to Commissioner Questions, July 8 2011 ("Staff Responses") at 24-25 (Response to Northup Question 15).

The Majority wholly fails to account for the fact that an unavoidable 15% variability in test results at the 100 ppm level causes fully compliant products to fail tests. As a result, a product must have no more than 87 ppm in order to reliably and consistently test at no higher than 100 ppm. And that in turn means that an 87 ppm lead limit must be both technologically possible *and* economically feasible before the 100 ppm limit could be found to be technologically feasible. Neither conclusion was supported by the evidence before the Commission.

The Commission's staff also examined the health impact of the decision and concluded that "the contribution of products containing between 100 ppm and 300 ppm lead to the overall lead exposure in children is minimal." In so concluding, the staff specifically debunked claims made by the American Academy of Pediatricians (AAP) that exposure to children's products containing less than 300 ppm of lead is harmful and, in particular, that swallowing objects containing 300 ppm of lead or less measurably reduces a child's IQ. According to Commission staff, these conclusions by AAP were based on an "incorrect characterization of a CPSC staff analysis first released in 2005." Indeed, the Commission "does not have data showing that children's products containing up to 300 ppm will result in excess exposures to lead." And per the Commission's experts, "no information or studies were presented by [AAP] concerning exposure estimates for children who use specific products containing relatively low concentrations of lead (i.e., up to 300 ppm)."

Because of the significant harm to the economy, consumer choice, businesses and the workers' they employ, I concluded that the reduction in lead from 300 ppm to 100 ppm was not technologically feasible. Further, given the "minimal" lead exposure from products containing between 100 and 300 ppm of lead, and the absence of any scientific basis for concluding that children can be exposed to excess levels of lead from products containing 300 ppm of lead, the evidence before the Commission established that reducing the lead level produced no health benefits. In short, this was a classic example of the costs of a regulation far exceeding the benefits, and for that reason, I could not support it.[6]

a. Why did the Commission grant Joseph L. Ertl Inc.'s petition to permit it to manufacture its children's ride on tractor models using metal containing 300 ppm of lead, given that the Commission adopted without exception the statutory limit of 100ppm?

H.R. 2715 gave the CPSC authority to except from the 100 ppm lead content limit a product, class of product, material, or component part that: (1) requires the inclusion of lead because it is not *practicable* or not technologically feasible to manufacture it by removing excessive lead or by making the lead inaccessible; (2) is not likely to be placed in the mouth or ingested; and (3) will have no adverse effect on public health or safety, taking into account normal and reasonably foreseeable use and abuse. 15 U.S.C. § 1278a(b)(1)(A)(i)-(iii).

[6] A more detailed explanation of my vote not to reduce the lead limit to 100 ppm is available at: http://www.cpsc.gov/pr/northup07202011.pdf.

In April 2012, the Commission concluded that certain children's ride-on pedal tractor component parts made with aluminum alloys by Joseph L. Ertl, Inc. (Ertl) and other manufacturers satisfied the three statutory criteria, and in so doing, belied the conclusions reached by the majority that reduced the lead limit for all children's products to 100 ppm in August 2011. The vote demonstrated bipartisan acceptance, based on the expert advice of CPSC's professional staff, of the principles that (1) lead in children's products presents a risk of harm only to the extent that children can absorb the lead to which they are exposed; and (2) metal substrate containing 300 ppm of lead that is not likely to be placed in the mouth, ingested, or *extensively* contacted by children does not present a health risk, because it does not measurably increase blood lead levels.

Staff's determination that no measurable increase in blood lead level would result from a child's exposure to certain aluminum alloy components of a ride on tractor containing 300 ppm of lead was not a close call. Staff has conducted extensive wipe-testing of metal jewelry items and vinyl bibs containing far more lead – up to 100,000 ppm (equivalent to 10 percent lead), and these tests resulted in average lead transfers per wipe of less than 0.02 micrograms of lead. *See* Staff Briefing Package: Request for Exception from CPSIA Section 101(a) lead content limit for Pedal Tractors from Joseph L. Ertl, Inc., Scale Models of Dyersville Die Cast Divisions (March 21, 2001) ("Ertl Briefing Package") at 30. Based on "[e]xtensive scientific literature and several physiologic models" describing the relationship between exposure and blood lead level, staff estimated that even exposure to as much as 1.2 micrograms per day, in *addition* to default inputs for lead from sources such as diet and soil, does not result in a measurable increase in the blood lead level of children ages 3-7 years. *Id.* at 31. Staff further estimated that a child could have between no contacts and several contacts with a ride on pedal tractor on any given day. *Id.* at 31-32. Thus, even using an average per wipe exposure of materials having far more lead than the component parts at issue here, and the relatively high number of 60 contacts per day (1.2/.02 = 60), there would still be no measurable increase in blood lead levels, and therefore no adverse impact on public health or safety.

Notably, Ertl also satisfied the other two criteria for the grant of an exception to the 100 ppm lead content limit, based on circumstances that are likely present in connection with many other products containing lead in metal substrate. With respect to practicability, the Commission concluded that Ertl could not practicably manufacture the pedal tractor components using aluminum alloy with 100 ppm of lead in part because the minimum quantity available for purchase represented a seven year supply at Ertl's rate of manufacture, and would require about 15% of the company's yearly sales to purchase it. Ertl Briefing Package at 13. Other materials, such as plastic, zinc or steel were determined not to be practicable, because they would either change the "appearance" of the product, result in a much heavier product, or require Ertl to invest in new metal stamping technology and training, which would increase the per unit production cost. Ertl Briefing Package at 3. Staff had a choice between recommending that Ertl be required to use aluminum alloy containing 200 ppm or 300 ppm of lead, both of which were equally attainable in the quantities needed. Staff concluded that 300 ppm was practicable, because the 200 ppm alloy would increase manufacturing costs by 1% over that of the

300 ppm alloy. *Id.* Making the aluminum alloy inaccessible by introducing a covering was deemed not practicable because it "would represent a change in [the] current manufacturing process." *Id.*

While practicability must be assessed on a case-by-case basis, several important principals can be gleaned from staff's approach to the Ertl petition. First, a petitioner may be entitled to retain the current appearance of a product for "aesthetic" reasons, i.e., metal vs. plastic, if its customers prefer it. *Id.* Indeed, significant differences in "general appeal to consumers" can support considering a model made with a different material to be a "different product." *Id.* at 20. In addition, a petitioner need not undermine the functionality of the product in order to reduce its lead content, by, for instance, increasing its weight to an extent that impedes maneuverability. The Ertl case also highlights the importance of cost differentials. The fact that introduction of a new material would increase the cost of manufacture by necessitating a change in the manufacturing process was a factor in favor of granting the petition. Indeed, even a 1% increase in total manufacturing cost justified favoring aluminum alloy with 300 ppm of lead over aluminum alloy with 200 ppm of lead. The accessibility of an alternative with less lead is also key, and in that regard, the mere fact that a market exists does not warrant a finding of practicability. As the Ertl case demonstrates, the need to warehouse amounts in excess of that needed for ongoing manufacturing purposes also weighs against a finding of practicability.

With regard to the likelihood that a component will be placed in the mouth or ingested, the size and location of the component are central considerations. So long as the component is too large to be ingested or placed in the mouth, the only route of lead exposure is through hand to mouth activity. And as staff's health sciences experts concluded, a child's blood lead level is not measurably increased merely through hand to mouth contact with a component containing 300 ppm of lead in metal substrate that the child does not extensively contact. *See* Draft *Federal Register* Notice – Petition Requesting Exception from Lead Content Limits; Notice Granting Exception (as amended March 30, 2012) at 5. Notably, in the case of the Ertl ride on tractor, this included the main body casting, which CPSC's human factors experts determined was the component most likely to be touched by a child playing on the tractor. Ertl Briefing Package at 26.

The Ertl decision highlighted the potential utility of the functional purpose exception included with the 2011 amendments to the Consumer Product Safety Improvement Act, but recognition of the principles underlying the decision comes too late and at far greater cost than was necessary. As originally enacted, the CPSIA permitted the Commission to exclude from the reduced lead limits products that would neither "result in the absorption of any lead into the human body, taking into account normal and reasonably foreseeable use and abuse of such product by a child," nor have any other adverse impact on health or safety. CPSIA § 101(b)(1). It is clear from staff's conclusion in the Ertl case that many product components containing 300 ppm – or even 600 ppm -- of lead in metal substrate that are too large to be ingested or placed in the mouth would not result in the *measurable* absorption of any lead. Yet the Commission determined in 2009 that no material, product

or component qualified for the absorbability exclusion in the law. During the succeeding three years, many businesses that might satisfy the criteria applied in Ertl under the new functional purpose exception have closed, substantially reduced their product line, or compromised the durability or functionality of their products, because they could not practicably reduce the lead in their products, despite the fact that the products presented no risk of meaningful lead exposure.

The Ertl petition vote similarly exposes the nnnecessary economic harm caused by the Commission's party-line vote to reduce the lead standard to 100 ppm based on the questionable conclusion that there is no product, class of products, materials or components for which it is not "technologically feasible" to do so. Most obviously, the conclusion was reached for alnminum alloy, which we now know does not present a risk of harm to children at 300 ppm of lead when used in larger component parts. The testing that underlies staff's conclusion that such aluminum alloy is not a health risk could support the same finding for other metal substrate containing 300 ppm of lead when used in a component that is not ingestible or able to be placed in the mouth. But instead of adopting a blanket exception, the Commission has left it to individual manufacturers to bear the expense and delay of petitioning the Commission for relief.[7]

h. The European Union has adopted a standard of 90 ppm? Is that a tougher standard than the US?

No. Although the target ppm number is lower, their standard refers to the amount of lead that can be **released** (as opposed to its content). This measure is referred to as the migration rate, or the leachable level. Thus, the European standard correlates with the actual risk of injury presented by an object containing lead. Our standard limits the total lead content in snbstrate, regardless of how much of that is or is not bioavailable – i.e., the risk it presents – when touched or consumed. In addition, the European Union does not require the third party testing of children's products to ensure compliance. Manufacturers and distributors selling products within the EU may rely on less costly first party testing to ensure compliance. Notably, I am aware of no evidence that there is any greater prevalence of children's products violating the respective jurisdiction's lead content limits in the EU, where third party testing is not required, than in the U.S., where it is.

Because the American standard requires in practice much lower levels of lead and a certification of compliance based on costly third party tests, it is significantly more expensive to manufacture children's products for the United States market. This puts small American manufacturers, in particular, at a competitive disadvantage. A small European manufacturer can afford the relatively modest compliance costs of selling exclusively in the E.U., until it has grown large enough to reach the economies of scale necessary to profitably absorb the additional cost of selling to the American market. A small American manufacturer, on the other hand, must incur our high compliance costs

[7] A more detailed explanation of my vote on the Ertl petition is available at: http://www.cpsc.gov/pr/northup04052012.pdf.

from the beginning, and as we have learned over the last several years, many will go out of business before growing to a size sufficient to amortize testing costs over a large enough number of products to realize an economically viable profit margin. For the same reason, an entrepreneur contemplating where to locate a new children's product business is now more likely to choose the EU over the United States, due to the formidable barriers to entry created by our much higher compliance costs.

> Since the advent of our 100 ppm lead limit and third party testing requirement, a substantial proportion of European children's product manufacturers have abandoned the United States market. In addition to reducing choices for American consumers, this has resulted in the loss of numerous businesses and jobs that depended on the distribution in the United States of European products. In particular, we have learned from the Hand Made Toy Alliance that a large number of their members who were Mom and Pop retailers specializing in the sale of imported wooden and other specialty European manufactured toys have closed due to the unavailability of stock.

c. How did establishing a statutory lead standard affect our ability to move toward "world standards" through increased harmonization?

Mandating a statutory lead limit, rather than permitting the CPSC to set a limit based on the risk presented by lead in various products and materials as measured by the best available science, has tied the agency's hands in its harmonization efforts. Other countries may not be similarly willing to hamstring their economies with unnecessary regulation, and we are statutorily unable to change our position to reach a consensus around a rational science based standard.

3. The President's Executive Orders 13563 and 13579 requested that Agencies conduct Retrospective Rule Review. This was part of a broader exhortation that rule-making bodies seek to reduce unnecessary and unjustified regulatory burdens by: a) selecting for review and modifying where appropriate significant rules that have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities; b) using "notice and comment" rulemaking to ensure stakeholder participation and fully informed regulatory bodies; c) performing cost benefit analyses both before rulemaking and in connection with reviewing rules already in place; and d) choosing the least costly requirements to achieve regulatory goals. What has the CPSC done to implement these Executive Orders?

The four Commissioners were unable to reach a majority consensus on a plan for the retrospective review of existing regulations, instead splitting 2-2 along party lines in support of two very different plans.

The Plan for Retrospective Review of Existing Rules supported by the Commission Democrats does not adhere to the President's regulatory principles. Their plan ignores the repeated admonitions by the President and his spokesman that retrospective rule review target the most burdensome rules in order to yield the greatest potential cost savings. Instead, the plan takes credit for cost reduction measures that the Commission is already statutorily obligated under H.R. 2715 to consider, and initiates the review of insignificant additional rules.

Specifically, H.R. 2715 requires the Commission to seek public comment on opportunities to reduce the cost of third-party testing requirements and to prescribe new or revised third-party testing regulations if doing so will reduce third party testing costs consistent with assuring compliance with the applicable consumer product safety rules. H.R. 2715 also requires the Commission to consider alternative third-party testing requirements for manufacturers who meet the statutory definition of "small batch manufacturers." The Commission is obligated to carry out those statutory mandates in 2012 and 2013, and would do so irrespective of the President's Executive Orders.

Once these mandatory measures are stripped away from the rules proposed by the Democrats to be reviewed in FY2102 and 2013, their narrow view of regulatory review becomes apparent. In 2012, they would include as part of the Rule Review Plan the Commission's reconsideration of its Toy Caps Rule and Animal Testing Rules. The Toy Caps Rule was revoked because its requirements were superseded by the Commission's adoption of the more stringent toy caps standard contained in ASTM F 963. In other words, no manufacturer was testing to the standard contained in our Toy Caps Rule, and it therefore imposed no burden whatsoever. Similarly, the Commission's recent revisions to the Animal Testing Rules resulted in very minor changes that had negligible, if any, impact on the economic burden of testing to the rules. The change to Federal Caustic Poison Act regulations promulgated under the Federal Hazardous Substances Act proposed to be undertaken pursuant to the rule review plan in 2013 also amounts to nothing more than a housekeeping measure that will not meaningfully reduce the costs of compliance. Including each of those initiatives among the rules selected for review is incompatible with the intent of E.O. 13579, and would set the precedent that the Commission does not share the President's goal of reforms "with the potential to have significant economic impact."

Even worse, the fourth and final new initiative – contained in the plan supported by the Democrats among the rules to be reviewed in fiscal year 2013 – is intended to strengthen existing rules and would *increase not decrease* the regulation's compliance costs. Specifically, the plan calls for a review of the carpet and rug flammability standards in order to fill a gap in coverage that has permitted some rugs and carpets to avoid testing. While I support the extension of existing rules where necessary to ensure product safety, rule review in response to the President's Executive Order is not the place to do that. Our core mission is to protect product safety, and we should always be on the lookout for opportunities to address product hazards. Rule review, in contrast, is a separate initiative intended to reduce nnnecessary economic burdens.

Consistent with the inconsequential rules the Democrats would select for the Commission's first two fiscal years of rule review, their plan sets in place a framework and selection criteria that is unlikely ever to result in meaningful cost reduction. This is because their plan does not explain how the selection of rules for review will be prioritized. This omission would be less important if the Democrats had not also opted to "broaden" the scope of rules potentially subject to review beyond the "significant" rules identified by the President. E.O. 13579 asks independent regulatory agencies to review existing "significant" regulations, defined as those that have an annual effect on the economy of $100 million or more, or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety.[8] Rather than focus on such significant regulations, the Democrats would include as potential candidates for review all of the agency's existing regulations, guidance documents, and unfinished proposed rules, and would even use the regulatory review process to perform clean up on the regulatory agenda – the list of regulatory actions the Commission proposes undertaking in the future. The President asked that agencies "give priority, consistent with law, to those initiatives that will produce significant quantifiable monetary savings or significant quantifiable reductions in paperwork." The plan supported by the Democrats does no such thing, and, by lumping in every action the Commission ever has or ever will take, ensures that the regulatory actions selected for review are unlikely to result in meaningful cost reductions.

Equally damning, no cost benefit analyses would inform the Commission's review of the regulations selected under the plan supported by the Commission Democrats. Without such an analysis, there is no way to ensure that the benefits of a rule justify its costs, or to take appropriate action when they do not. This is a far cry from the Obama administration's vision of "chang[ing] the regulatory culture of Washington by constantly asking what's working and what isn't" based on "real-world evidence and data." Cass Sunstein, *21st-Century Regulation: An Update on the President's Reforms*, Wall Street Journal, May 25, 2011. Where is the "insistence on pragmatic, evidence-based, cost-effective rules" that Cass Sunstein claims has "informed [the Obama administration's] regulatory approach"? *Id.*

The alternative plan supported by the Commission's Republicans would honor the President's request by creating a framework that could lead to real cost reductions while maintaining public health and safety. It would have done so without straining the Commission's resources or substituting housekeeping measures for real regulatory reform.

The Republican Plan recognizes that in both 2012 and 2013, substantial resources will be devoted to carrying out the cost reduction mandates of H.R. 2715. As a result, it does not call for any additional resources to be dedicated to Rule Review in 2012 or 2013. More importantly, it also does not undermine the long term goal of real burden reduction by characterizing housekeeping measures such as revision of the Toy Caps Rule, Animal Testing Rules and Federal Caustic Poison Act Regulations as retrospective rule review. I

[8] 58 Federal Register 190 (October 4, 1993).

do not object to revising those rules, and the Republican Plan expressly acknowledges the importance of such work, so long as it does not substitute for meaningful rule review.

The Republican Plan also ensures that rules selected for review in future years will have the potential to significantly reduce the unnecessary economic burdens of compliance with the Commission's regulations. This is achieved first by requiring, consistent with the President's request, that the Commission's selection of rules for review give priority to "those requirements imposing the highest burden and cost of compliance."

In addition, unlike the plan supported by the Commission's Democrats, our plan requires that cost-benefit analyses be performed during the course of rule review so that rational, informed decisions can be made regarding whether the benefits of a regulation justify its costs. This exercise is particularly important for regulations promulgated under the Consumer Product Safety Improvement Act over the last several years, none of which were required to be justified by cost-benefit analyses. I understand that Congress intended the expedition of certain rules due to a perceived need for immediate action, and that cost-benefit analyses could therefore not be performed. For instance, we could not have issued mandatory standards for two durable nursery and toddler products every six months if such standards needed to be justified based on a cost-benefit analysis. But I do not believe that the President intended the Commission to exclude such rules from a cost-benefit analysis during retrospective review, nor do I think Congress would object. Now that the rules are in place and enforceable, there is no issue of delay impacting safety. And if a cost-benefit analysis of an existing rule reveals that a toddler product safety standard or test has no safety benefit but imposes substantial costs, the rule should be changed.

On the other hand, we could and should have performed cost-benefit analyses before issuing other rules governing the periodic third-party testing of children's products to ensure continued compliance. We were not precluded by statute from doing so, and there was ample time. Retrospective rule review would be our first opportunity to determine whether all of the requirements of those rules can be justified under a cost-benefit analysis, and the Republican Plan would have allowed for that.

Other differences between the Republican and Democrat Rule Review Plans also illustrate our commitment to, and the Democrats' rejection of, meaningful rule review. For instance, their plan repeatedly emphasizes the need for a rule to be in place for a substantial time period before retrospective review is undertaken. Whether intentional or not, such an approach would ensure that our rules that impose the greatest burden – those promulgated over the last several years and which were never justified by a cost-benefit analysis – would not be subject to review. The Republican Plan instead recognizes that retrospective review of even a relatively new rule is warranted where "its burdens quickly prove to be more substantial than anticipated or out of proportion with the benefits realized or because the burden and/or cost of the regulation were never given the consideration required by the EOs in the rulemaking process."

The plan supported by the Democrats is also replete with references to the review of rules whose burdens can only be characterized as trivial compared to our most costly rules. For instance their plan touts minor changes to address manufacturer confusion over our durable infant and toddler product registration program. In discussing the consideration of "technological advances" as a factor in the selection of rules for review, their plan focuses on past revisions of rules "to remove requirements for obsolete testing equipment that is no longer available." But removing requirements for testing that cannot possibly still be performed does not reduce anyone's compliance burden. Such requirements should be removed as a housekeeping measure, not a burden reduction exercise. The Republican Plan correctly focuses consideration of technological advances on the way in which new technology can make a rule less burdensome.

Finally, the plan supported by the Democrats gives equal, if not greater, weight to selecting rules for review in order to strengthen them. Thus, they view the Plan's review processes as "intended to facilitate the identification of rules that warrant repeal or modification, including those that require strengthening, complimenting, or modernizing." While I agree that the Commission could properly conclude after selecting and analyzing a rule that it should be strengthened or complimented, I believe it is inconsistent with the President's intent to target rules in order to strengthen them, rather than to reduce their unnecessary burdens.[9]

a. Before the CPSIA, Section 9 of the CPSA required the Commission to conduct a cost benefit analysis before promulgating a mandatory safety standard for any consumer product. The CPSIA excepted durable nursery products from that requirement, and also empowered the Commission to issue broad regulations governing third party testing, all without any cost benefit analysis. But the requirement that the Commission conduct an analysis of the economic impact of the rules on small businesses under the Regulatory Flexibility Act remained in place. What have you learned from your experience participating in the promulgation of those rules where a cost benefit analysis was neither required nor performed?

I have learned that in the absence of a mandatory cost benefit analysis, this Commission as currently configured will promulgate rules whose costs most likely exceed their benefits, and the Regulatory Flexibility Act (RFA) is no impediment to its doing so. For example, neither the staff packages that came before the Commission proposing mandatory standards for durable nursery products, nor the rules establishing the framework for third party testing of children's products, contained cost-benefit analyses. All of them did, however, contain cost analyses performed under the RFA to determine the rules' impact on small businesses, not the entire market. These economic analyses, although always based on a highly speculative and cursory look at a rule's effects,

[9] A more detailed explanation of my vote on Commission's plan for retrospective review of existing rules is available at: http://www.cpsc.gov/pr/northup08152012.pdf; and http://www.cpsc.gov/pr/northup09192012.pdf.

invariably concluded that the costs to many small businesses would rise significantly, resulting in a large number of business closures and attendant job losses. But unlike traditional cost-benefit analyses, as contemplated by the President in E.O.s 13563 and 13579, and as required under Section 9 of the CPSA, the RFA does not require that the benefits of a rule ever be found to justify its costs. As a result, the RFA does not require agencies to forgo or modify any rulemaking as a consequence of that analysis, and in my experience, the CPSC has never done so, no matter how economically disastrous the impact of a regulatory action was projected to be. Nor have the results ever caused any of my Democrat colleagues to vote against or request a change in a rule.

b. Do you believe the CPSC, as presently configured, would voluntarily perform cost benefit analyses in the absence of a statutory requirement to do so?

No. And the public pronouncements by the Democrat Commissioners confirm the fact. Mr. Adler has stated publicly that the Commission would perform the cost-benefit analysis of CPCS Section 9 when not statutorily obligated to do so, only "over [his] dead body." Chairman Tenenbaum, for her part, is advocating for the exclusion of additional classes of products from the CPSC Section 9 requirement that mandatory standards be justified under a cost-benefit analysis. For instance, she has asked Congress to exempt from Section 9 mandatory standards for upholstered furniture flammability. Notably, this request comes on the heels of mounting evidence that the existing proposals for addressing the problem of upholstered furniture flammability cannot be scientifically proven to do so. Thus, without any proven benefit to be derived from the rule, the Chair would now like to impose the cost anyway. The statutory requirement that a cost benefit analysis is performed to establish the justification for a rulemaking before massive economic disruption is needlessly imposed, is intended precisely to combat that regulatory mindset.

c. At a recent hearing in the Senate on the flammability of upholstered furniture, Chairman Tenenbaum testified that a suspension of the cost benefit requirement of the FFA similar to what Congress provided in the CPSIA for durable nursery products would facilitate rule-making in this area. Do you agree with her position?

No. As discussed immediately above, I believe the suspension of cost-benefit analysis requirement for upholstered furniture would likely lead to a costly rule with no proven benefits.

4. In March 2010, the Commission voted to allow "unblockable drain covers" to qualify a single main drain as an "unblockable drain" under the Virginia Graeme Baker Pool and Spa Safety Act, so as not to require the use of a backup system. In September 2012, the Commission reversed itself and now requires all pools with single main drains to install a backup system. Why did you oppose that change, given the claim by its proponents that a backup system provides an additional layer of protection?

The Virginia Graeme Baker Pool and Spa Safety Act is intended to protect against the deadly consequences of excessive spa and pool drain suction, including evisceration when a pool drain is completely blocked by a person sitting or lying on it, and drowning when a person's hair, limb or jewelry becomes ensnared in a drain. VGB Act § 1404(c)(1)(A)(ii) requires public pools and spas with a single main drain of a size small enough to create a life-threatening suction by being completely covered by a human body (known as a "blockable drain"), to be equipped with a device or system to prevent entrapment. These systems are often referred to as "backup systems". "Unblockable drains" were exempt from the requirement to have one of these back-up systems because their size and/or configuration prevented a deadly suction from ever occurring. Although five systems/devices are enumerated in the Act as permissible backup systems, the Commission has long recognized the safety vacuum release system (SVRS) to be the most commercially viable and therefore most likely to be used by pool owners.

In April 2010, following extensive input from the public, the Commission issued a final interpretive rule that defined "unblockable drain" as a suction outlet *and all of its components*, including a cover/grate, that cannot be shadowed by a "Body Blocking Element" intended as a proxy for a human body. As a result, pools and spas with a single main drain equipped with an appropriately sized "unblockable drain cover" were not required also to be equipped with an SVRS or other back-up system.

The Commission adopted this definition based on the recommendation of its staff of career technical experts. In their opinion, an unblockable drain cover is superior to an SVRS because it *prevents* entrapment. An SVRS, in contrast, *stops* an entrapment incident after it has already occurred, and does so only after a delay of up to 4 seconds. As a consequence, once an incident resulting of entrapment, or evisceration takes place, it is already too late for an SVRS to save a child.

SVRS also have a well-deserved reputation for unreliability. Despite the majority's rush to make this change without public input, the Commission received unsolicited letters from pool maintenance companies, many of whom stood to benefit financially by this change, attesting to problems with SVRS and predicting that most of these systems would soon be disabled by pool owners because of the problems they create. Directors of parks and recreation departments from all over the country also wrote advising us that unblockable drain covers are superior to SVRS, from a safety perspective. As these letters explain and Commission staff has confirmed, SVRS are electro-mechanical devices prone to malfunction by stopping pool pumps without cause or simply shutting down completely. The former problem interferes with the essential mixing of sanitation

chemicals in pool water, leading to potentially life threatening bacterial outbreaks. When an SVRS ceases operating completely, a blockable drain once again becomes an inescapable death trap.

In April 2010, the Commission followed the expert advice of its technical staff. This was done only after also considering the contrary views presented by SVRS and other back-up system manufacturers who wanted the Commission to mandate the use of their product, pool safety advocates, many of whom were influenced and mobilized by SVRS manufacturers, and a few members of Congress who had been lobbied by the back-up system industry. In particular, the Pool Safety Council (PSC), made up largely of the vacuum release industry, spent $100,000 on lobbying expenses in 2009. PSC is led by Paul Pennington, President and primary owner of Vac-Alert, one of the least expensive and, according to letters to the Commission, least reliable backup systems. In fact, Paul Pennington testified before the Commission on April 5, 2011, that he helped Representative Debbie Wasserman Schultz draft the original legislation that became the VGB Act. These parties argued that an unblockable drain cover provides unreliable protection due to the risk of dislodgment and does not provide the "layers of protection" required by the VGB Act. Nonetheless, a majority of Commissioners recognized that the VGB Act's overriding intent to prevent child drowning was best served by reasonably and lawfully interpreting "unblockable drain" to include these newly invented systems that cover a blockable drain and convert it to an unblockable drain. The wisdom of their judgment is confirmed by the fact that, since that time, there has not been a single entrapment incident in a pool equipped with a compliant unblockable drain cover.[10]

a. What reasons did the Democrat Majority give for supporting the change, and do you believe those reasons had merit?

Commissioner Adler claims that his mind was changed by letters from interested citizens and members of Congress, and by private meetings he held with Representative Debbie Wasserman Schultz. But in none of these letters or meetings was any *new* evidence or argument presented that was not already considered and rejected by Commission staff as outweighed by paramount safety considerations. And while I am heartbroken for parents who lost their children to drain entrapment incidents, this Commission should not make decisions based on the *ex parte* views of a single interest group or the self-serving *post hoc* rationales of a handful of the hundreds of members of Congress whose votes pass a bill. Our job is to consider all of the relevant evidence in light of the expert advice of the career professionals who have dedicated their lives to consumer safety, not to swing haphazardly in the strongest blowing emotional breeze of the moment.

Representative Debbie Wasserman Schultz's view of what the legislation means is irrelevant after its passage. No court would give weight to her preferred interpretation of a bill that was passed by 435 Members of the House and 100 Members of the Senate and signed by the President. No small group, even the authors, can unilaterally decide that

[10] A more detailed explanation of my vote to oppose the revocation of the Commission's prior interpretation of "unblockable drain" is available at: http://www.cpsc.gov/pr/northup10042011.pdf.

the legislation means only what they intended when they voted for it. Once it is in the hands of the Executive agency, Members of Congress can again influence it only by further refinements of the law passed by all the Members of Congress. Representative Wasserman Schultz's effort to protect children in swimming pools is admirable, but it is the CPSC's responsibility to interpret and administer the law based on our technical expertise and experience in safety. It is doubtful the Rep. Wasserman Shultz heard from the wide array of safety experts that contacted the Commission, or has the technical expertise of our staff. Rather, she appears to have been swayed by the lobbying of the SVRS manufacturer, and Mr. Adler was the conduit for her granting of a political gift.

To the extent any substantive reason was given, none had merit. Particular emphasis has been placed on the possibility that unblockable drain covers can be removed or damaged. But Commission experts were aware of this characteristic of unblockable drain covers and still judged them to provide greater protection than SVRS. Their view of the relative safety of the two alternatives has not changed. Moreover, as the Commission learned from the many unsolicited letters responding to the *Federal Register* notice announcing the revocation vote, advances in drain cover design, construction and installation have substantially reduced, and could completely eliminate, the risk of cover dislodgment. It is in order to consider such new and unknown evidence that notice and comment are required before the promulgation of regulations changing enforceable obligations.

Another red herring is the claim that requiring an SVRS or other entrapment prevention device will ensure the "layers of protection" required by the VGB Act. Revoking the interpretation of "unblockable drain" that permitted the use of an unblockable drain cover did not *add* any protection. Public pools are *not* now required to have an unblockable drain cover *and* a back-up system. With the new interpretation, they are instead likely to have a "blockable drain" with an unreliable SVRS or other back-up system. The sophisticated unblockable drain covers are expensive and their availability may disappear altogether. That means a superior form of protection has been exchanged for an inferior one, not that a new layer of protection has been added.

b. Did the Commission seek and consider public comment before changing its definition of "unblockable drain" to not permit the use of an unblockable drain cover?

No. And the Commission's failure to provide an opportunity for notice and public comment before revoking its prior interpretation of "unblockable drain" almost certainly violates the APA, and without doubt will entitle the Commission's new construction to no deference in court.

Under the APA, a legislative rule must proceed through notice and comment rulemaking; an interpretive rule need not. Although the majority styles its action as the mere revocation of an interpretive rule, much more is at stake for the pool and spa owners impacted by its decision. The revocation eliminates the exemption from the back-up system requirement granted to single unblockable drains equipped with an unblockable drain cover. Moreover, the Commission's *Federal Register* notice announcing the

change clearly signals its intent to enforce the new rule against pool and spa owners who have installed unblockable drain covers but do not also have an additional entrapment prevention device/system enumerated in the Act. Under these circumstances, a court could well deem the revocation a legislative rule and find that the failure to undertake notice and comment violated the APA. *See Jerri's Ceramic Arts, Inc. v. CPSC*, 874 F.2d 205, 208 (1989).[11] At the very least, the revocation is a reinterpretation of statutory language without a rational justification that would be entitled to little, if any, deference. *See Watt v. Alaska*, 451 U.S. 259, 273 (1981) (holding that an agency interpretation that conflicts with the agency's earlier interpretation is entitled to considerably less deference than a consistently held agency view). The fact that extensive public comment was received and considered before the original interpretation was adopted confirms that the Commission also recognized its importance.

Mr. Adler argued that no public input was necessary because his reversal was neither policy nor evidence based, but merely a change in his interpretation of the legislation. There is a word for statutory language that is so susceptible to alternate construction that even a single lawyer cannot make-up his mind about its meaning. And when statutory language is ambiguous, it should be informed by the underlying intent of the law. The VGB Act was passed in order to reduce the risk of children drowning due to entrapment in pool drains. The Commission's reconstruction of "unblockable drain" makes that tragic outcome more likely.

Moreover, Mr. Adler's claimed disavowal of the need for public input or consideration of factors beyond his personal legal views is belied by his own statement on the revocation. After recounting the unsolicited letters, almost all of which are identical form letters, and private meetings that lead him to reconsider his views, Mr. Adler proclaimed that "as a policy maker sworn to uphold the law, I believe it is my duty to listen to all points of view and when a persuasive case is made to reconsider my position. So in response to these requests, I took it upon myself to reexamine both the safety considerations associated with 'unblockable drain covers' and the legislative history of the VGBA."

But of course, by refusing public comment, Mr. Adler ensures that "all points of view" will not be heard – only those of the activists whose form letters he reads and the well placed politicians with whom he holds private meetings. And as for "safety considerations", Mr. Adler's position is incomprehensible. He refused to obtain data showing the safety impact of the original interpretation, or input from knowledgeable

[11] In *Jerri's Ceramic Arts*, the court held that a "Statement of Interpretation" expanding the small parts prohibition to cover fabrics in addition to hard components was actually a substantive rule change that required notice and comment rulemaking. The court explained that interpretive rules simply state what the administrative agency thinks a statute means, and only "reminds" affected parties of existing duties, whereas substantive rules impose new rights or duties. It concluded that adding fabric to the small parts prohibition was substantive because it had "the clear intent of eliminating a former exemption and providing the Commission with the power to enforce violations of a new rule." 874 F.2d at 208. Similarly, removal of the option to use a drain cover to create an unblockable drain eliminates an exemption from the back-up system requirement, and the *Federal Register* notice announcing the change informs pool owners that pools with only an unblockable drain cover and no back-up system will henceforth be considered to be in violation of the VGB Act.

sources about the current safety features of unblockable drain covers. Instead, he appears to have relied on information obtained through public input solicited in 2009 and the one-sided viewpoints presented to him since. Mr. Adler is entitled to change his position for any reason he likes, but the closed procedure leading to this change dispels any pretense of open mindedness.

c. Did the CPSC General Counsel recommend a "Notice and Comment" process?

I am not at liberty to discuss the CPSC General Counsel's privileged communications with Commissioners. However, Congress is entitled to review the written opinion, and I suggest they obtain it in full to learn the GC's advice on the subject.

d. What unsolicited input did the CPSC receive from pool and spa professionals?

The Commission received a large number of unsolicited letters from pool and spa professionals, many of whom stood to gain financially from the Commission's reversal. They overwhelmingly opposed the change as costly and less safe. Here are a few examples:

- David Distad (Environmental Health Specialist, Renwood, MN) stated that SVRS is a large unnecessary expense that may be more than some of his municipalities can handle;
- Linda Bruer (Director of Parks and Recreation for City of Ballwin, MO) estimates $30,000 to comply with SVRS;
- Terrence LeBeau (GM – Halogen Supply Company) states: "My staff of technical support specialists have a good deal of hands on experience with these (SVRS). They are unreliable, inaccurate, and operationally problematic…All of these devices carry some form of cautionary verbiage that states: will not prevent disembowelment";
- Justin DeWitt (Chief of General Engineering, IL Dept. of Health) states: "The Department's experience has been that the majority of SVRS installed fail to operate properly due to lack of testing, maintenance, incorrect installation, disabling or adjustment to avoid nuisance trips";
- James Bastian (Chairman, Westport Pools in MO) states: "We have seen dozens (SVRS) disabled by the pool owner's maintenance personnel because of the unreliability of the systems";
- Susan Campbell (Oklahoma City Health Department) states: "[It is a] sad fact that devices (SVRS) are not maintained and are difficult for us to test";
- Thomas Diven (City of Fenton – Parks and Recreation) states: "[W]hat is being proposed [by the CPSC] may actually increase the risk of drowning…these proposed changes have not been sufficiently researched and are not required";
- Bill Soukup (President, Commercial Pool, Inc.) states: "I can assure you that SVRS will not work as manufacturers have indicated. Many will be disabled shortly after being installed because they are very, very problematic";

- Justin DeWitt (Chief of General Engineer, IL Dept. of Health) states: "The Department's experience has been that the majority of SVRS installed fail to operate properly due to lack of testing, maintenance, incorrect installation, disabling or adjustment to avoid nuisance trips."

e. What is the risk of entrapment and how does that compare with other risks associated with swimming.

There have been no entrapment injuries associated with compliant pool drains since 2008. But there were over 1500 drownings just between May 1 and August 26, 2011. Even counting potentially non-compliant pool drains, three persons of all ages were injured and none died in circulation entrapment incidents in 2010. By contrast, in 2010, 5600 children under 15 were treated in emergency rooms for pool and spa submersion injuries (i.e., those unrelated to drain suction), and between 2007 and 2009, an average of 390 children under 15 died each year due to pool and spa submersion incidents.

We have learned from numerous municipal park and recreation departments, as well as nonprofit groups created to promote aquatic recreation safety, that many state, municipal and other public pool operators will be unable to afford this new and expensive mandate coming shortly on the heels of the expensive work required to come into compliance with the Commission's original interpretation. As a result, many public pools will open late or close, with the brunt of the losses suffered by economically-disadvantaged regions. Children cannot learn to swim in closed pools, and economically disadvantaged children are at the greatest risk of drowning.

5. Section 6(b) of the CPSA prohibits the Commission from releasing to the public information about a consumer product when the manufacturer of the product can be readily ascertained, without first ensuring that the information is accurate and fair, and giving the manufacturer a chance to include comments or other information with the disclosure. The public database authorized by the CPSIA suspended these protections for manufacturers, but put in their place other detailed requirements that provided similar protection to the manufacturers of products that are the subject of database reports. What is your opinion of whether the Commission could host a Facebook account without violating CPSA § 6(b)?

By way of background, *Facebook* is a social media site which is hosted by Facebook, Inc. Account holders manage and control the content of their page, but they cannot prevent the public from uploading comments in real time, and cannot control the information that an individual may submit in a comment other than to remove it after it has been posted. A CPSC *Facebook* page would be part of the agency's overall media strategy, with the goal of attracting as much traffic to the site as possible in order to more widely disseminate product safety information.

I do not believe the Commission could host a *Facebook* account without violating CPSA § 6(b). Section 6(b)(1) prohibits the agency from publicly disclosing any product specific information that is "obtained, generated or received by the agency" and from which the manufacturer or private labeler (hereinafter "manufacturer") of the product can be readily ascertained, without first providing the manufacturer the opportunity to challenge the accuracy of the information and to include with the disclosure any comments or other information it wishes to provide. 15 U.S.C. § 2055(b)(1); 16 C.F.R. § 1101.11(a). In the event the Commission rejects a challenge to the accuracy of the information proposed to be published, it must notify the manufacturer and give it five days to sue to enjoin the publication before the Commission releases the information. 15 U.S.C. § 2055(b)(2) & (3).

These protections could not be afforded manufacturers whose products became the subject of comments posted by the public on the CPSC's *Facebook* page. There would be no opportunity to object to the publication of inaccurate information *before* its publication, either initially to the CPSC, or through an action to enjoin the publication in court. There would also be no opportunity to include a manufacturer's comments with the publication, including after publication. *Facebook* streams comments in the order they are received, so even if a manufacturer wished to add its own comment to a previously posted item, the comment would likely not appear anywhere near the item to which it relates. In addition, even if the CPSC were to commit the immense resources necessary to monitor and remove from its *Facebook* page all product specific public comments, such removal would not cure the § 6(b) violation. Once published, a comment could be copied, forwarded or otherwise preserved and republished in ways over which the Commission could not exert control. And in any event, the initial publication is a violation of the law, regardless of what follows.

Given that §6(b) clearly could not be followed in connection with public comments posted on a CPSC *Facebook* page, the only remaining question is whether such comments fall within the protections of §6(b). Section 6(b) as interpreted by the Commission applies only to information that is "obtained, generated or received by the agency", and then "published" by the agency. I believe comments posted by the public to a CPSC *Facebook* page would meet both of these criteria.

The first condition is easily met, as comments posted to a *Facebook* page hosted and monitored by the agency would necessarily be "obtained" and "received" by the agency.

I also believe, under the circumstances, that comments posted to the website by third parties must be considered to be "published" by the Commission, rather than by Facebook, Inc. Although the site is owned and operated by Facebook, Inc., the Commission would need to affirmatively establish its own page and would exercise control over what it posts to the site and what it chooses to remove from the site. Moreover, the Commission is aware that its *Facebook* page would invite the posting by the public of product safety related information, and that the Commission would encourage the public to view the website to obtain product safety information. Having knowingly created such a forum, the Commission could not reasonably claim that

comments posted to its *Facebook* page by the public should be deemed to be "published" by Facebook, Inc., rather than the Commission.

It would also be unreasonable to deem content posted to the site to be "published" by the commenter. Congress addressed that scenario in the CPSIA when it authorized the Commission to publish on the public facing database *saferproducts.gov* product specific information submitted by the public. It recognized that § 6(b) applied, and waived its requirements provided the Commission afforded other protections against the publication of inaccurate information. In the absence of those protections, *saferproducts.gov* would function very much like a *Facebook* page: product specific information posted by the public would be simultaneously received and disclosed by the Commission. Congress clearly understood that comments posted by the public on a site sponsored by the Commission are "published" by the Commission under § 6(b). Otherwise, the §6(b) waiver Congress provided for *saferproducts.gov* would not have been necessary.

Moreover, because a CPSC sponsored *Facebook* page would not screen postings based on the criteria required for *saferproducts.gov* under the CPSIA, the Commission could not prevent comments that would not be eligible for publication on the database from being posted on its *Facebook* page, in blatant contravention of the will of Congress.

a. Has your General Counsel been asked to provide an opinion as to whether the Commission could host a *Facebook* page consistent with the requirements of the law?

Yes, but I am not at liberty to discuss the CPSC General Counsel's privileged communications with Commissioners. However, Congress is entitled to review the written opinion, and I suggest they obtain it in full to learn the GC's advice on the subject. At an August 2, 2012, hearing before the U.S. House of Representatives Committee on Energy and Commerce, Subcommittee on Commerce, Manufacturing, and Trade, Chairman Tennenbaum promised to provide the General Counsel's legal memorandum to the Committee if and when the Commission decides to launch a *Facebook* page. The Subcommittee may wish to consider asking to see it before a decision is made.

b. What is the status of the agency's plan to launch a *Facebook* page?

I have not been updated on the status of the CPSC's *Facebook* initiative in several months. Generally speaking, the Chair does not keep me informed of her deliberations over decisions she deems "administrative", even when, as in this case, I have made clear that I consider a decision to raise policy issues that require a majority vote by the Commission before being implemented. The two Democrat Commissioners have taken the position that a majority is required before a decision can even be characterized as "policy", and therefore have avoided votes on a number of decisions I do not believe were within the administrative authority of the Chair to implement without majority support.

6. H.R. 2715 (codified as P.L 112-28) was passed in an effort to address some of the unforeseen adverse consequences of the CPSIA. In your opinion, has the CPSC taken appropriate advantage of the new law to ameliorate the problems caused by the CPSIA?

Certain provisions of H.R. 2715 *required* the Commission to take action, and being legally bound, the Commission followed the law. For instance, it has exempted "covered products" made by "small batch manufacturers" from third party testing pending its adoption of alternative testing rules or the granting of a permanent exemption. The Commission has also granted an exception to the 100 ppm lead limit to a manufacturer clearly entitled to it under the criteria established by Congress. But with respect to those provisions where the Commission was authorized to exercise discretion in ameliorating the CPSIA's adverse consequences, it has either minimized the opportunity or affirmatively acted to thwart the spirit of H.R. 2715.

The Democrat majority's intent to do so became clear shortly after the passage of H.R. 2715, when they ignored the advice of the Commission's expert staff to repropose the final third-party testing and component parts rules based on the statutory changes, and instead rushed the packages to a vote. The Commission later ignored the will of Congress again when it was unable to promulgate a rule on "representative" samples because the Democrats insisted on unjustifiably burdensome recordkeeping requirements. Finally, the Commission was able to muster majority support to consider further only half of the measures recommended by its staff to reduce the burdens of third party testing.

Signed into law in August 2011, H.R. 2715 gave the Commission one year to seek public comment on opportunities to reduce the cost of third party testing requirements, and, based on the public comments, to consider issuing new or revised third party testing regulations if doing so would reduce third party testing costs while still assuring compliance with applicable standards. Congress even invited the Commission to propose changes to the law to provide it with additional authority to address the costs of third-party testing, if necessary. H.R. 2715 also substituted "representative samples" for "random samples" as the basis for selecting samples for periodic continued testing, and required the Commission to undertake notice and comment rulemaking to define the new statutory phrase.

Draft Final Rule 16 C.F.R. 1107.26(a)(4).

At the time H.R. 2715 became law, the Commission had yet to promulgate a final rule under 15 U.S.C. § 2063(i)(2)(B)(i) establishing protocols and standards "for ensuring that a children's product tested for compliance to an applicable children's product safety rule is subject to testing periodically and when there has been a material change in the product's design or manufacturing process, including the sourcing of component parts."

Because of the obvious impact on § 2063(i)(2)(B)(i) rulemaking of Congress's mandate that the Commission seek public comment on ways to reduce the cost of third-party

testing, our CPSC career staff recommended that the final third-party testing rule and a rule to permit the testing and certification of component parts be reproposed along with the NPRs on cost reduction and representative samples, so that a final comprehensive rule could emerge that addresses Congress's H.R. 2715 mandate and protects regulated industries from detrimental reliance on a tentative "final" rule. The Commission also received letters from members of Congress urging the Commission to consider ways to reduce the costs of third-party testing *before* implementing the rule.

The Majority instead insisted on a vote and passed the rule governing periodic and material change testing, and the component parts rule, by a 3-2 party line margin. Given the advice of Commission staff and common sense, it is apparent that the Majority's precipitous action resulted from their desire to dictate the content of the rules before they lost their majority upon the then impending retirement of Commissioner Moore. But as a result, the Commission irrationally complicated compliance by the regulated community.[12]

Representative Sample

The Commission was also unable to take advantage of Congress's amendment permitting "representative" rather than "random" samples to be selected for periodic testing. Notwithstanding Congress's intent that the change be part of an overall plan to reduce the unnecessary costs of third party testing, the Democrats insisted on an unjustifiably costly rule that the Commission's Republicans' could not support.

Commission staff prepared a final rule that properly recognized Congress' intent to define "representative" according to its common meaning. The draft final rule would have reasonably afforded manufacturers the flexibility to select samples for periodic testing according to the methodology that best suited their product and production process, so long it provided a basis for inferring the compliance of the untested samples. As staff explained in the preamble to the draft final rule, "various methods can be used to determine that the selected samples are representative, depending upon the rule, ban standard, or regulation being evaluated." Draft Final Rule at 5.

Had the draft final rule stopped there, it would have had my support. Instead, it included costly new record keeping requirements not mandated by law and without adequate justification. The draft final rule would have required the creation and maintenance of:

> Records documenting the testing of representative samples, as set forth in 1107(21)(f), including the number of representative samples selected and the procedure used to select representative samples. Records must also include the basis for inferring compliance of the product manufactured during the periodic testing interval form the results of the tested samples.

[12] A statement explaining my opposition to the periodic testing and component parts rules is available at: http://www.cpsc.gov/pr/northup10262011.pdf.

Draft Final Rule 16 C.F.R. 1107.26(a)(4).

CPSC's economists estimate the aggregate manufacturers' cost of compliance with this additional record-keeping to be $32.3 million for the first year alone, and another $1.3 million to $6.5 million every year thereafter. And this cost is in addition to the enormous burden of the record keeping already required by 16 C.F.R. part 1107 – Testing and Labeling Pertaining to Product Certification. 16 C.F.R. § 1107.21 gives manufacturers three options for satisfying the requirement that, after initial certification, a third party lab conduct periodic tests of every component of every children's product to ensure continued compliance with all applicable children's product safety rules. Each of these options requires the creation and maintenance for five years of extensive records.

These extensive record keeping requirements already far exceed what is necessary to ensure continued compliance under the CPSIA and to facilitate enforcement. Yet the Democrats would have imposed even more, requiring a written record of the procedure used to select the samples and a narrative explaining the basis for inferring compliance of the product manufactured during the periodic testing interval from the results of the tested samples. I am unable to identify any benefit to imposing that additional recordkeeping burden that would justify the tens of millions of dollars it would cost. Given the number of products we regulate and the numbers coming in at the ports that are noncompliant and still result in no enforcement action, the odds of any manufacturer ever having to produce such documents is very slim. Imposing the high record keeping cost on all manufacturers so that a miniscule percentage could be reviewed during an investigation is unjustified. Moreover, the reasons offered by others are unpersuasive.

Proponents of the representative sample record keeping requirement argued that the act of creating these records will encourage manufacturers to think more carefully about sampling issues. However, it is not the Commission's responsibility to regulate good business practices, nor does it have the experience or expertise to gauge what is best for any particular business. And businesses creating such records would need to anticipate what CPSC investigators – with no business experience, let alone with respect to the particular product or manufacturing process -- might look for in the context of a defect investigation or enforcement action, rather than making decisions based on their own experience and expertise.

It was also claimed that the Commission needs the records for enforcement purposes, so that it can learn the sampling procedure and basis for it while investigating noncompliant product. But that information is available to the Commission even without the added burden of the recordkeeping requirement. The CPSC can learn the information orally or through written documents prepared by the target business when and if they are subject to an investigation.

Finally, it has been argued that the CPSC needs records of the representative sampling procedure and basis in order to determine whether the entry into commerce of noncompliant product was caused by nonrepresentative sampling or inaccurate third party testing. But regardless of whether the CPSC were satisfied with a manufacturer's

explanation of its sampling procedure and basis, and irrespective of whether the manufacture maintained the records sought to be required by the Final Rule, laboratory error as a contributing cause could not be ruled out. There will therefore always be the need to investigate laboratories that tested samples from a batch or lot later determined to contain noncompliant product.[13]

Proposals to Reduce the Burden of Third-Party Testing

As required by H.R. 2715, over the past year, the Commission solicited and Commission staff analyzed public comments addressing ways to reduce the costs of third party testing requirements consistent with assuring compliance with any applicable consumer product safety rule, ban, standard, or regulation. Commission staff then submitted to the Commissioners a briefing package recommending that the Commission direct the further study of 16 ways to reduce third party testing costs. After extensive negotiations among the Commissioners, there was majority support for the continued consideration of only 9 of the 16.

As a result, a lot of good ideas with the potential to reduce testing costs while continuing to protect consumers from the risk of harm were not supported by a majority of the Commissioners. Chief among these were establishing an exception from testing for a *de minimis* amount of paint or plasticized material, modifying the maximum periodic testing interval based on the risk of noncompliance to a regulation or portion of a regulation, and seeking Congressional authorization to permit manufacturers to use production process certification in lieu of third party testing as a basis for certifying compliance.

I do not know whether any of these ideas could successfully reduce third-party testing costs while assuring compliance, but the Commission was not called upon to make that determination through this vote. We needed only to decide whether these ideas should be abandoned forever, or explored further. Based on staff's recommendation, and in light of Congress's intent that we make every effort to reduce the costs of testing where possible consistent with assuring compliance, I can see no justification for ruling them out at this early stage.

Our narrowing the scope of potential cost reduction measures was not warranted by resource constraints. As the language of the ballot makes clear, the Commission has not committed any resources to the actions it has approved. Rather, it has merely identified a list of projects that may someday be undertaken "[s]ubject to the resources allocated by the Commission to carry them out in subsequent CPSC Operating Plans." The Commission's safety priorities as defined by future Commission majorities will always take precedence over the cost reduction projects in the allocation of future resources. And future Commissions will be able to select among the list of cost reduction projects in order to prioritize their completion in whatever order they deem advisable. Under these

[13] A statement explaining in greater detail my opposition to the rule establishing protocols and standards for the testing of representative samples to assure compliance is available at: http://www.cpsc.gov/pr/northup07232012.pdf.

circumstances, current and future resource limitations do not justify refusing even to consider these additional staff recommended ideas.

Finally, we need to step back and recognize the statutory impediments staff faced in formulating their proposals, and the very limited nature of the ideas that resulted. Many of the proposals put forth by staff are caveated with admissions that their applicability may be limited to a very few products or manufacturers, or might turn out to result in only a modest reduction in testing costs, if any. Thus, while the Commission should make the most of the opportunity presented by this exercise and staff's hard work in brainstorming cost saving measures, it is clear that real cost reduction for third party testing, certification and labeling will only be possible through much more substantial changes in the law.[14]

The Future of H.R. 2715

The Commission has undertaken much of the work H.R. 2715 directed the Commission to do to ameliorate the unforeseen negative consequences of the CPSIA. But important work remains to be done, and I am concerned that, once the Democrat majority is restored with my departure, the chance for meaningful reform will have passed.

With respect to the Representative Sample rule, the Democrats were unable to impose unjustifiably burdensome recordkeeping requirements. I expect that they will soon revisit the rulemaking and pass 2-1 those same unnecessary and costly requirements.

I am also not optimistic that the Commission will move forward as aggressively as it should to explore even the fraction of third-party testing cost reduction ideas it has approved. The resources to do so still remain to be allocated, and without a tie vote to provide balance to the Democrats lack of enthusiasm for cost reduction, I expect very little will be done.

7. **Initial third party testing and certification have now been required since January 1, 2012. How is the Commission using this to ensure that all products comply with the lead standard, phthalate standard and the toy standards, to name a few of the new requirements.**

To my knowledge, the Commission has undertaken no enforcement action related to the requirement that all children's products be certified as third party tested before entering commerce. The vast majority of products subject to third-party testing are manufactured abroad and enter the United States via cargo container ship. The Commission uses a sophisticated risk assessment methodology to focus its border enforcement efforts on those imported products that are most likely to violate CPSC safety standards or otherwise present a risk of harm. Products are not stopped at the border to check their certifications, the validity of which would be impossible to spot check in any event. And

[14] A more detailed explanation of my vote on the consideration of opportunities to reduce third party testing costs is available at: http://www.cpsc.gov/pr/northup10112012.pdf.

no enforcement actions based on certificate violations have been taken when products stopped for other reasons have either lacked or had a noncompliant certificate. Nor am I aware of the Commission ever using the information on a certificate that accompanied a noncompliant product to investigate a finished product or component manufacturer, or the lab that purportedly performed the third party tests that certified as compliant the violative product. Furthermore, such investigations would be an enormous waste of resources. In short, to date, third party testing has amounted to a massively expensive exercise borne only by those manufacturers and distributors with the business ethics to comply with the law, while bad actors that continue to sell untested products either at lower prices or with better profit margins face no enforcement.

○

Responses to Questions for the Record
Nomination of Mr. Elliot Kaye to be
Chairman, Consumer Product Safety Commission
Senate Committee on Commerce, Science and Transportation
Hearing on April 8, 2014

Questions from Senator Mark Pryor

1) **When we met, you and I discussed some of the burden relief efforts at the CPSC, in particular, making determinations that certain materials don't include lead, heavy metals, or other toxic substances. Could you please state for the record your commitment to ensuring these determinations are made in a timely manner?**

   If confirmed, I assure you that I will continue to work with the U.S. Consumer Product Safety Commission's (CPSC) Commissioners and staff to try to expand our list of determinations as quickly as resources, actionable data, and consumer product safety priorities permit.

   a. **Based on your experience as Executive Director, what yon think Congress can or should do to expedite these determinations?**

      Congress could assist CPSC in overcoming two related challenges with this process.

      First, to date the Commission unfortunately has yet to receive actionable data to expand our list of determinations. Though, I am hopeful that recent events will assist with this effort. On April 3, 2014, CPSC staff hosted a public workshop on potential ways to reduce third-party testing costs through determinations consistent with assuring compliance. Staff invited interested parties to participate in or attend the workshop and to submit written comments. I attended this workshop, and found the information provided by the participants to be incredibly informative. However, CPSC staff noted throughout the workshop that we will need more specific data to provide the requested relief. It would certainly assist our efforts if Members of Congress would also encourage stakeholders to submit any actionable information and data they might possess.

      Second, staff time associated with these efforts does compete with time allocated to pressing and meaningful safety work. At our funding levels, the Commission has struggled to strike the right balance in ensuring that botb our consumer product safety work and our determinations process can proceed in a timely fashion. Additional funding would allow us to work on a greater number of important activities.

2) **We also discussed imports, and the need for the CPSC to go after bad actors who willing and repeatedly skirt U.S. regulations. How do you tbink tbe current**

importation program is working, and how would the modifications to that program you mention in your testimony function?

As directed by Congress in Section 222 of the CPSIA, CPSC began a risk assessment methodology (RAM) to enhance our targeting capabilities at the ports. Because of existing funding levels, CPSC employs a pilot scale version of the RAM. It allows us to better target certain high risk products at U.S. ports of entry, thus focusing our efforts more on those companies who choose not to follow the rules. CPSC developed the program in very close collaboration with U.S. Customs and Border Protection (CBP). The pilot scale RAM Surveillance System integrates with and analyzes a limited set of existing CBP data to identify certain targeted imports with high violation risk.

To date, we view the pilot as a success for consumers, the trade, and CPSC. As mentioned, we are focusing better on those companies that chose not to follow the rules. We believe, however, that Section 222 called for CPSC to run more than a pilot-scale version of the RAM program. For this reason, CPSC requested a $5 million start-up appropriation, as well as a longer term funding mechanism in our FY 2015 Budget Request to begin building out the RAM to full-scale. To address violative consumer products more comprehensively, the CPSC would like to scale the import surveillance program to a national program, capable of analyzing 100 percent of the consumer product-related import entry lines by FY 2020.

This approach would not only fulfill the mandate from the CPSIA, but also it would be consistent with the goals articulated in President Obama's Executive Order 13659, Streamlining the Export/Import Process for America's Businesses. We believe a full-scale RAM program would significantly enhance consumer product safety and consumer confidence, while also providing tremendous benefits to compliant trade. If I am confirmed, this will continue to be a top priority for me.

a. **How has the CPSC been working with importers who have been following the current rules and procedures?**

   During the last few years, as we have developed an even closer and more efficient working relationship with CBP, we have been able to create more opportunities to work with and assist compliant trade. For instance, CPSC has worked closely with CBP to conduct the Importer Self-Assessment – Product Safety (ISA-PS) pilot program. The ISA-PS pilot program is a voluntary approach to product safety compliance and provides recognition and support to participating companies that ensure product safety compliance for products regulated by the CPSC. We believe that as we continue to enhance our working relationship with CBP, especially consistent with Executive Order 13659, compliant trade will continue to benefit significantly.

Questions from Senator Roger Wicker

1) **Upholstered furniture flammability is an issue of importance to my constituents, due to the number of people who are employed in this sector in Mississippi. State regulators in California, after years of deliberation and research, have developed a furniture flammability standard that focuses on smolder ignition. Do you agree or disagree with the California approach, and what are your views on the ueed for a national furniture flammability standard?**

To the extent that California's new standard, Technical Bulletin 117-2013, addresses a portion of the risk associated with upholstered furniture fires while also discouraging the use of harmful chemicals to do so, that is a very positive step forward. However, I believe consumers and other stakeholders nationally would be well-served by a national standard. Particularly, I believe this would he the case if the standard can achieve the aims of TB117-2013, hut in a fashion that addresses an even larger percentage of associated fires. I helieve the Commission should work toward a feasihle standard that could mitigate the most deaths and injuries possible.

Presently, CPSC staff is considering all of the information in the public record along with additional materials and availahle scientific studies and relevant data, such as analyses of fire hazard data, death and injury data, and the technical and economic feasibility of an approach. Taking all of this information into account, staff will recommend a proposed rule to the Commission for consideration. If confirmed, and subject to available resources, I would encourage CPSC staff to move as expeditiously as possihle with this effort.

2) **It is my understanding that the Commission is considering adopting a mandatory rulemaking that would call for use of a specific flesh-sensing technology by certain bench-top table saw manufacturers. Conld the adoption of such a rulemaking stifle competition in the marketplace for tahletop saws or make such saws prohibitively expensive for some consumers to purchase? What is your view on the need for such a mandatory regulation?**

About 11 people per day suffer an amputation because of incidents involving table saws. Based on data reflecting the patterns and prevalence of life-altering injuries associated with these products, on Octoher 11, 2011, the Commission voted unanimously (5-0) to approve an Advance Notice of Proposed Rulemaking (ANPR) on table saws. However, the Commission has also directed CPSC staff to remain very involved in the development of an improved voluntary standard that might potentially address the hazard. Ideally, the voluntary standards process will produce, in a timely fashion, a revised standard that effectively addresses the hazard patterns CPSC staff has identified.

Please know that, if confirmed, I will carefully review all of the comments and feedback we receive from stakeholders on this issue, as well as continue to monitor the progress of the voluntary standards process. The Commission's aim is to address this hazard, ideally through a strong voluntary standard.

Question from Senator Tim Scott

1) **In carrying out its mission of protecting the public against unreasonable risks of injury, the Commission often relies on voluntary standards in partnership with the involved industries. It is my understanding that even though an important industry in my state has worked to develop enhanced table saw safety standards, which are currently working to significantly reduce user injuries, the Commission is considering proposing a mandatory standard that could essentially eliminate the most portable and affordable saws from the market. Can you assure me that you will give full and fair consideration to existing voluntary standards and their relative impact on consumers when considering the imposition of new mandatory standards?**

   Yes. This is the approach I have taken to date while serving at the Commission, and, if confirmed, I would continue this approach.

   About 11 people per day suffer an amputation because of incidents involving table saws. Based on data reflecting the patterns and prevalence of life-altering injuries associated with these products, on October 11, 2011, the Commission voted unanimously (5-0) to approve an Advance Notice of Proposed Rulemaking (ANPR) on table saws. However, the Commission has also directed CPSC staff to remain very involved in the development of an improved voluntary standard that might potentially address the hazard. Ideally, the voluntary standards process will produce, in a timely fashion, a revised standard that effectively addresses the hazard patterns CPSC staff has identified.

   Please know that, if confirmed, I will carefully review all of the comments and feedback we receive from stakeholders on this issue, as well as continue to monitor the progress of the voluntary standards process. The Commission's aim is to address this hazard, ideally through a strong voluntary standard.

Questions from Senator Ron Johnson

1) **Mr. Kaye, if you are confirmed, when you are considering a mandatory standards are you willing to take into account not only consumer safety but also:**

   a. **A consumer's rights to afford products, access products, and assume a reasonable amount of risk?**

      Yes, because many of our statutes require that associated rulemakings consider concerns such as these.

   b. **A company's ability to survive and the number of jobs that will be lost if your standard is put in place?**

      Again, yes, because many of our statutes require that associated rulemakings consider concerns such as these.

2) **Mr. Kaye, if you are confirmed, will you consider closing open rulemakings that threaten to impose mandatory standards on companies that are successfully operating under voluntary standards? Coming in as a new chairman and closing outdated dockets will provide the agency with a clean slate.**

The Consumer Product Safety Act (15 U.S.C. 2056(b)), the Federal Hazardous Substances Act (15 U.S.C. 1262(g)(2)), and the Flammable Fabrics Act (15 U.S.C. 1193 (b)(2)) require the CPSC to rely on voluntary standards rather than promulgate mandatory standards, provided that the voluntary standards would eliminate or adequately reduce the risk of injury or death addressed, and it is likely that there will be adequate compliance with the voluntary standard by industry. If during the course of mandatory rulemaking activities an adequate voluntary standard is adopted and there is substantial compliance, the Commission must, by statute, terminate its rulemaking activities. If confirmed, I would abide by this statutory framework.

a. **For example, CPSC currently has a mandatory rulemaking on Recreational Off-Highway Vehicles (ROVs) that has been open for more than four years, imposing an atmosphere of uncertainty on the industry. During your nomination hearing there was a bipartisan call to eliminate this uncertainty. Would you consider closing this rulemaking to provide business certainty?**

CPSC's end goal is to reduce the death and injury hazards associated with ROVs. ROV-related deaths are on the rise—jumping 65 percent from 2011 to 2012. Between January 2003 and April 2011, the CPSC knows of at least 428 reported ROV incidents—231 of which involved fatalities and 388 of which involved injuries (including serious injuries such as de-gloving, fractures, and crushed hands, feet, and arms). The Commission directed staff as part of the CPSC's Fiscal Year 2014 Operating Plan to draft for Commission consideration a Notice of Proposed Rulemaking (NPR) on ROVs. Absent the Commission directing otherwise, CPSC staff plans to provide the Commission with the draft NPR by the end of the current fiscal year.

Importantly, though, CPSC staff continues to work with the voluntary standards body to revise its standard in a manner that adequately addresses the deaths and injuries associated with these vehicles. CPSC staff has exchanged a number of letters with the voluntary standards body on the technical aspects of the standard and has also accepted an invitation to participate in the next meeting regarding possible revisions. These are positive signs that this issue might be addressed as part of this process. If a voluntary standard adequately addressees the death and injury hazards and industry substantially complies, CPSC will abide by the statute and defer to the voluntary standard.

I am sensitive to the desire to come to a speedy resolution on an effective performance standard for ROVs. If confirmed, I assure you that I will actively

listen to all stakeholders and continue to diligently work with the Commission and its staff to achieve a meaningful solution, as quickly as possible.

b. **The CPSC is also considering a proposed mandatory rule on tabletop saws that would, in essence, eliminate the most popular category of table saws from the market: bench top table saws. However, there are already existing and effective voluntary standards in place. Since the current voluntary standards are working to significantly reduce the nnmher of blade contact injuries and the mandatory standards under consideration will result in serious unintended consequences to consumers and businesses, will you assure me that you will avoid finalizing this rulemaking?**

About 11 people per day suffer an amputation because of incidents involving table saws. Based on data reflecting the patterns and prevalence of life-altering injuries associated with these products, on October 11, 2011, the Commission voted unanimously (5-0) to approve an Advance Notice of Proposed Rulemaking (ANPR) on table saws. However, the Commission has also directed CPSC staff to remain very involved in the development of an improved voluntary standard that might potentially address the hazards. Ideally, the voluntary standards process will produce, in a timely fashion, a revised standard that effectively addresses the hazard patterns CPSC staff has identified.

Please know that, if confirmed, I will carefully review all of the comments and feedback we receive from stakeholders on this issue, as well as continue to monitor the progress of the voluntary standards process. The Commission's aim is to address this hazard, ideally through a strong voluntary standard.

c. **I also nnderstand that the Underwriters Lab is specifically looking into the adoption of a voluntary standard relating to the incorporation of flesh sensing technology into table saws. While the Underwriters Lab considers this issue do you agree that you should take this draft rule/mandatory standard regarding this same issne off the table?**

Section 7 of the CPSA (15 U.S.C. 2056(b)) requires the CPSC to rely on voluntary standards rather than promulgate mandatory standards provided that the voluntary standards would eliminate or adequately reduce the risk of injury or death addressed and adequate compliance with the voluntary standard by industry is likely. If during the course of mandatory rulemaking activity an adequate voluntary standard is adopted and there is substantial compliance, the Commission must, by statute, terminate its rulemaking activity. If confirmed, I would abide by this statutory framework.

SENATE COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION
NOMINATIONS HEARING
APRIL 8, 2014

QUESTIONS FOR THE RECORD
SENATOR CLAIRE MCCASKILL

QUESTIONS FOR MR. ELLIOT F. KAYE:

Question 1. **What do you believe is the CPSC's core mission?**

I believe the U.S. Consumer Product Safety Commission's (CPSC) core mission is to protect consumers from the unreasonable risk of injury associated with the use of consumer products within the CPSC's jurisdiction.

Question 2. **Do you think the CPSC's budget is adequate to achieve this mission?**

Long-term historical funding trends, in conjunction with the effects of sequestration, make it very difficult to believe the CPSC's budget is adequate to achieve its mission. The legacy of lower funding levels has been either in unattended or significantly delayed product safety work. Given the current climate of tight budgetary constraints, the most recent funding trends, beginning with the appropriated amount for the current fiscal year, give reason for optimism that one day the agency may be funded at levels that more closely resemble its authorization levels. Higher funding levels would allow the CPSC first and foremost to address additional consumer product hazards more quickly while also providing more certainty for consumers and industry.

Question 3. **Where do you find the greatest need for more resources or more focus by the Commission?**

As I mentioned in my opening statement, I believe more resources are needed to expand our import surveillance program. The CPSC faces great challenges in identifying noncompliant products at the ports. In the CPSIA, Congress directed the CPSC to begin a risk assessment methodology to better target hazardous and violative imports. The agency has been running a successful pilot of that program and is now requesting a funding mechanism to run a full scale version. I believe consumers are better served by CPSC catching these products before they enter U.S. markets, and compliant trade is better served by CPSC staff focusing on those companies not following the rules.

I also believe greater attention should be placed on addressing certain chronic, hidden hazards. These hidden risks can come from long-term exposure to toxic chemicals or hazardous metals contained in consumer products. I am particularly concerned with how vulnerable populations might be affected by these hidden hazards. I believe Congress recognized and addressed the risk of some hidden hazards in the CPSIA, setting new chemical and element limits as well as providing the agency with enhanced authorities to try to address those hazards in the marketplace—and even before they enter the marketplace. With more resources, the agency could expand on Congress' success and potentially address more hazards in the marketplace.

Question 4. **Now that the CPSC is nearly done with its rulemaking work as mandated nnder the Consnmer Product Safety Improvement Act of 2008, what other priorities shonld the Commission focus on?**

Although CPSC has fulfilled many of the rulemaking requirements mandated by the CPSIA, some required work remains, particularly with regard to durable infant products, ATVs, and the Chronic Hazard Advisory Panel work associated with phthalates. Beyond this work, I believe the Commission should continue its focus on expanding the agency's import surveillance program. Additionally, I helieve the Commission should focus more on addressing hidden, chronic hazards, as well as hidden mechanical hazards, such as those associated with window blind cords.

Question 5. **The Consumer Prodnct Safety Improvement Act of 2008 empowered the Commission with stronger enforcement authorities. Some of these inclnde: 1) the ability to determine the type and form of a corrective action a manufacturer must take; 2) an increase in maximum civil penalties; 3) the authority to immediately remove particularly hazardons products from store shelves without judicial approval; and 4) the ability to quickly destroy non-compliant products at the ports. Much of the power of the CPSC rests with the Chairman of the Commission. Will yon nse these authorities aggressively to protect the public?**

Yes. If confirmed, I would use all of the tools at the agency's disposal to protect the public.

Question 6. **If you are confirmed as Chairman, how do you see the agency changing under your leadership?**

If confirmed, I would hope to build on the successes of Chairman Inez Tenenbaum and Acting Chairman Robert Adler. Chairman Tenenbaum particularly deserves great credit for seeing the agency through the implementation of the major provisions of CPSIA. The agency now has a chance to address persistently deadly product hazards that were not a focus of the CPSIA, such as window blind cords. As we move beyond CPSIA implementation, the CPSC could focus more on consumer product hazards associated with seniors—a group of great concern given its rapidly expanding numbers.

With all of these efforts, if confirmed, I would hope to continue my work in building a wide coalition of stakeholders to try to find meaningful safety solutions through collaboration. Although tbis approach does not fit every situation, my experience at the agency has been tbat more often than not, collaboration leads to meaningful results. I would also hope to further engage our sister agencies. The CSPSC has a very productive working relationship with Customs and Border Protection at the ports and with the Centers for Disease Control and Prevention on brain safety in youth sports. I would like to find even more ways to have CPSC and other agencies pool resources and expertise to address safety issues in a more efficient and effective manner.

I would also like to see CPSC take better advantage of digital communications. The agency has some work to do to be more on the leading edge of using all available communications tools to keep the public better informed.

Finally, I am optimistic that, if confirmed, the new composition of the Commission would be conducive to very meaningful collaborative work among the Commissioners. The Chairman is responsible for setting a tone and leading by example. If confirmed, I would take this responsibility very seriously.

Question 7. **Some businesses still have legitimate concerns about some of the unintended impact of new regulations on their operations. Will you commit to working through the implementation of this law in a commonsense manner that recognizes the inherent flexibility of the Act?**

Yes. My approach while at the CPSC has been to reach out to a wide coalition of stakeholders to try to find meaningful solutions through collaboration. If confirmed, I would continue this approach.

Question 8. **Any agency, no matter its size, would have difficulty protecting the public from all potentially unsafe products.**

> ***Question 8a.*** **How will you reach the millions of consumers who have probably never heard of the CPSC to notify them of recalls and warn them about the unforeseen risks in their homes? How will you reach rural communities?**
>
> I believe that all consumers, no matter where they live and no matter what their circumstances, deserve to be informed about consumer product dangers. I believe the CPSC could work more effectively with the regulated community to find ways to reach consumers in more creative ways. While many consumers may not have heard of CPSC, they certainly are familiar with large retailers, for example. If confirmed, I would like to work more with retailers on improving ways to reach consumers regarding product safety hazards across many different communities. I would certainly appreciate the opportunity to work with you and your staff on ways to enhance our efforts in this regard.
>
> As mentioned, I would also like to see CPSC take better advantage of digital communications as part of this effort. Although print and broadcast media might work well with certain segments of the population, the CPSC could enhance its ability to also connect with the public through their smartphones.
>
> I would also like to see an expansion of CPSC's Neighborhood Safety Network (NSN) program, which delivers product hazard and recall information to more than 9,000 community leaders and organizations serving underserved communities nationwide. These community contacts, including tribal leaders, fire departments, and health clinics, share our materials widely with their constituents.

Question 8b. **Related to this, recall participation rates remain low. What are your recommendations to improve those rates?**

I definitely share your concern about the distressingly low response rate that many recalling firms experience in carrying out a voluntary recall. Although low recall participation rates unfortunately plague many agencies including the CPSC, I believe one potential avenue for improvement is more direct communication with affected consumers. Manufacturers that have email addresses and/or phone numbers of their customers, either through club membership, catalogue purchases, or product registration cards, are able to generate greater awareness of product recalls. CPSC staff, in their proposed voluntary recall notice rule, encourages retailers to make a greater effort to assist manufacturers in identifying and contacting potentially affected consumers. CPSC staff also is proposing to launch a study in the coming year that explores the question of why some consumers hear about recalls, but decide not to respond while others do. If confirmed, I would continue to work with agency staff and industry to address this issue. I would also engage our sister agencies, as well as interested stakeholders, to see if we could identify better and more creative ways to improve recall rates.

Questions for the Record
Nomination of Mr. Joseph Mohorovic
to be Commissioner, Consumer Product Safety Commission
Senate Committee on Commerce, Science and Trausportation
Hearing on April 8, 2014

Chairman Rockefeller

1) Intertek's Faulty Testing of Chinese-Manufactured Gas Heaters

Mr. Mohorovic, several weeks ago, a federal jury in the Western District of Pennsylvania awarded a $6 million verdict against the company where you are currently employed, Intertek. This verdict and judgment included $5 million of punitive damages. The name of this case was Brand Marketing Group v. Intertek (12cv1572).

The facts of this case are the following: a U.S. company called Brand Marketing Group contracted to supply the Ace Hardware store chain with "Thermablaster" vent-free gas room heaters.

Brand Marketing Group hired a Chinese company, Reecon M&E, to manufacture the heaters. Reecon hired Intertek's Chinese subsidiary, Intertek Shenzhen, to test the heaters and certify that they complied with American National Standards Institute (ANSI) safety standards.

According the facts established during the trial, Intertek's Chinese testers did not have the proper training or experience to test the heaters. They had never tested heaters before and they misunderstood the ANSI standards, partly due to their poor command of English. They mistakenly applied the standard for outdoor grills to the Thermablaster heaters. As a result, Intertek falsely certified that the heaters met the ANSI Z.21.11.2b standard for room space heaters.

Relying on Intertek's certification, Brand Marketing Group shipped thousands of potentially unsafe heaters to Ace Hardware. When it became aware that the heaters did not comply with the standard, Ace sued Brand Marketing and won a $611,000 judgment. Brand Marketing then sued Intertek, which resulted in the $6 million jury award.

Q: Mr. Mohorovic, did you have any involvement in the testing of the Thermablaster heaters that were at issue in this case?

A: No.

Q: Are you involved in the safety testing of consumer gas heaters (also known as "hearth products")? If yes, please explain your role.

A: No.

Q: In your current position as a Senior Vice President at Intertek responsible for "global performance, growth and strategic management," what role do you play in making sure that your company properly applies U.S. standards to products manufactured in China? What responsibility do you have for certifying that products made in China and other countries are safe for U.S. consumers?

A: I am not directly involved in our engineering or certification activities, but Intertek has multiple systems in place to ensure that the testing and certification of products is conducted in compliance with applicable standards, in China and around the world.

Q: Is it common for Intertek to outsource the safety testing of products manufactured in China to Chinese testers?

A: Intertek does not outsource safety testing. Just like other Nationally Recognized Testing Laboratories approved by OSHA, Intertek operates a global system of laboratories and inspectors that support manufacturers who elect to have their products tested and certified. Intertek laboratories are accredited by accreditation bodies, meaning that they must qualify their sites as having the equipment, trained personnel, and quality system necessary to operate. In addition to being accredited, the Intertek laboratory in issue in this litigation is an OSHA approved and audited site.

Q: How many products have testers employed by Intertek's Chinese subsidiary certified as safe for the U.S. market?

A: Intertek does not maintain records of active certifications by country of origin. However, Intertek currently has over 80,000 products authorized for the use of the ETL certification mark, indicating compliance with recognized national standards. The plaintiff in this case was not an Intertek customer and was never authorized to use an Intertek mark and did so without Intertek's knowledge or consent.

Q: Is it common for Intertek to employ safety testers in other countries where products are manufactured, rather than U.S. testers?

A: All Nationally Recognized Testing Laboratories, including Intertek, serve the globalized supply chain and in doing so, operate laboratories where the product manufacturers are located. For this reason, Intertek and its competitors, maintain extensive operational quality systems, together with internal audits and external audits by accreditation bodies and OSHA. Contrary to the misinformation generated in this lawsuit, engineers working in product conformity are trained and use the English language on a daily basis, as almost all product standards are maintained in English.

Q: Why does Intertek rely on foreign testers to determine whether products comply with U.S. standards?

A: It is important to recognize that Intertek serves the global commercial market. The supply chain for the United States is built in part on manufacturers located in other countries. Requiring that testing for the United States market he completed only in the United States would entail a dramatic change in the process and cost related to bringing products to market, and might also constitute a restraint of trade. To be clear, Intertek, and its competitors, do not (and cannot) dictate where testing must be completed, hut serve the market as it exists.

Q: Does Intertek regularly claim that these testers are "expert" in U.S. standards such as the ANSI standards?

A: Intertek engineers apply product standards to products on a daily basis. Intertek engineers receive extensive and ongoing training in the relevant product categories they work within, regardless of the country. The United States sites are subject to the same requirements and supervision as the foreign laboratories. As a general rule, Intertek personnel are highly knowledgeable on the product standards and their application to products.

Q: When Intertek outsources testing to foreign testers, how does Intertek make sure that the testers are properly applying U.S. standards and that the testers actually understand the U.S. standards?

A: As the global system of product standards is almost entirely in English, command of the language is a job requirement for all Intertek engineers. In conducting testing and evaluation of products, Intertek engineers have access to supervising engineers and, ultimately, a Chief Engineer for each product category to ask questions and obtain support. Intertek conducts internal audits of all of its sites and undergoes external audits by its accreditors and OSHA. After a product is certified it is subject to ongoing factory inspections to check on continuing compliance with the relevant standard.

Q: Why should consumers and the CPSC rely on Intertek's certification that a product is safe and meets that standards of the U.S. market?

A: The ETL mark is used on more than 80,000 different products. Intertek maintains processes to investigate and address all reports of non-compliances. On an annual hasis, Intertek receives reports on well less than one percent of the products it lists. Of these reports, the large majority involve manufacturing defects, component changes, end of life failures, misuse of the product, competitor complaints, or mismarking. All reports are investigated and if it is determined that a dangerous condition exists, Intertek will work with the product owner to report the issue to the CPSC. In the case at issue, Intertek suspended the manufacturer and then forced the plaintiff, over his strenuous objections, to report the problem to the CPSC and to remove the product from the market. Intertek

stopped this product from being sold on the United States market. Intertek works every day to improve the compliance of products with recognized standards and is proud of its role in supporting the voluntary testing and certification activities of manufacturers in the United States and around the world.

2) GAO Report on "Burrowing" in the Federal Workforce

On May 1, 2006, the Government Accountability Office (GAO) issued a report with the title, "Conversions of Employees from Noncareer to Career Positions, May 2001-April 2005" (GAO-06-381). This report examined 144 federal employment cases in which employees working at agencies through political appointments converted to career federal positions (a practice known as "burrowing").

The report found that in most of the 144 cases, the agencies and employees followed the proper procedures for political-to-career conversions. But in 18 cases, the report found that the agencies and employees did not follow the proper procedures.

One of these 18 cases involved the conversion of a Schedule C Special Assistant to the then-CPSC Chairman Hal Stratton to a Senior Executive Service (SES) position in the agency with the job title, "Director, Office of International Programs and Intergovernmental Affairs, Office of the Executive Director." GAO did not name this employee, but described the employee's "previous experience in the private sector, and as an elected official to the New Mexico State Legislature." (p. 68)

The resume you submitted to the Committee in the course of your nomination shows that you held the same positions at the same time as the person described in this GAO report.

Q: Mr. Mohorovic, are you the CPSC employee described in the GAO report I have cited in the paragraph above?

A: Yes. I had discussed this matter with CPSC human resources staff previously and am happy to now fully explain what I understand to have occurred.

According to GAO, when CPSC submitted your name to a Qualifications Review Board (QRB) convened by the Office of Personnel Management (OPM), the Board determined that you did not have the executive experience required for an SES position in the federal government. Although your appointment was eventually approved by a second QRB, GAO notes that you did not provide sufficient evidence to support your claim that you were a "senior manager and leader."

Q: Mr. Mohorovic, can you describe in detail what your qualifications for this SES position were in November, 2003?

A: The QRB did not determine that I did not possess the necessary executive experience required for an SES position in the federal government. Instead, the QRB initially determined that my SES application did not sufficiently document my

management experience and suggested I provide additional evidence of my leadership credentials. Therefore, I believe it is important to focus on these qualifications. Prior to my experience at CPSC, I had extensive and direct line management experience as a State Legislator, in my role as the Chief of Staff to the New Mexico Senate Minority Staff, and as Finance Director of both the Republican Party of New Mexico and the campaign to Reelect Governor Gary Johnson. As for my leadership credentials, I point to the "2001 Leader Award" presented to me by the Greater Albuquerque Chamber of Commerce and my inclusion in the New Mexico Business Weekly's "Top Forty Under 40" issue identifying those forty leaders under the age of forty "dedicated to changing the status quo in New Mexico." While a more exhaustive list is contained within my actual SES application, I believe these examples provide meaningful insight into the management and leadership qualifications the QRB ultimately deemed sufficient in this specific area.

Q: Can you explain how you were more qualified than the 23 other people who applied for this job?

A: By my understanding, GAO reports that twenty-four candidates applied for the position. An independent CPSC Executive Resource Board comprised of non-political, career, SES senior executives reviewed the applications, according to, as I understand, all relevant statutes and regulations governing such decisions. The GAO report cites that I was the highest rated candidate among the total applicant pool. I do not know and was not allowed to know who from the CPSC comprised the ERB, nor do I know of any other applicants so I cannot speak to their qualifications relative to my own.

Q: How did you respond when the QRB determined that you did not have the senior management experience for this SES job?

A: The QRB did not determine that I did not have the senior management experience necessary for the position. Instead, the QRB initially determined that my SES application did not sufficiently document my management experience and suggested I provide additional evidence of my leadership credentials. OPM's QRB forwarded the written rationale for its decision to me via the CPSC Office of Human Resources. The QRB clearly anticipated a revised application, inviting the agency to "present other examples of his experience." I revised the application to address the QRB concerns. The revised application was approved by a second QRB at OPM comprised of entirely different career-SES participants. Although the second QRB did not make any specific comment on the application, it is apparent that they believed that the comments of the first QRB were successfully addressed in the revised application.

Throughout the process, the CPSC followed standard SES procedure. There is nothing unusual about the re-submission of applications to the QRB. CPSC has followed this procedure before in the case of other applicants for a career SES position. In these cases, after the candidate was initially asked to amend their application by the QRB, the candidate made revisions and re-submitted their application. And second QRBs

approved those candidates. Such outcomes are identical to what transpired with my application.

Q: How did you respond to the charge that you were not qualified for this job, and that you won the job through political influence rather than through a fair application process?

A: I would take strong issue with any such allegation or comment. At the time of my application, the QRB, composed of non-political, career SES managers from other federal agencies, ultimately agreed that I had the skills and experience necessary to lead the CPSC Office of International Programs and Intergovernmental Affairs. The applicants were also rated internally at the CPSC by non-political, career SES senior managers. The selection process was in no way subject to political influence. The GAO did not conclude that it was nor has there ever been an allegation of the same to my knowledge.

Q: How do you respond today to the charge that you were not qualified for this job, and that you won the job through political influence rather than through a fair application process?

A: I would likewise take issue with any such comment. I stand behind my solid record of public service as testament to my qualifications for the job. For two years, I directed and led the groundbreaking work of the CPSC Office of International Programs, work that directly established and led to the foundation for the direct international cooperation the CPSC experiences today with a number of countries with regard to the sharing of product safety information and expertise. The International Programs efforts I led aimed at taking the U.S. safety message directly to the source– clearly articulating the standards and expectations of the U.S. government to international consumer product manufacturers.

The Senate Commerce Committee found this episode troubling. In its report on S. 2045, the "Consumer Product Safety Commission Reform Act of 2007" (Report # 110-265), the Committee specifically discusses the GAO report I describe above and criticizes the CPSC for "promoting a nonqualified appointee working for then Chairman Stratton to a Senior Executive Service (SES) position." (p. 3) The Committee strongly encouraged the CPSC "to develop a human resource selection protocol to ensure that non-political Commission staff have clear opportunities for development and promotion, and that candidates for SES position be technically qualified for the demands of that position." (p. 4)

Q: Mr. Mohorovic, given these allegations of political favoritism, how can you assure me that you are not going to inappropriately politicize the CPSC?

A: I do not believe these allegations have merit so there should be no such concern. You can be assured tbat, if confirmed, I will do everything in my power to ensure that the CPSC continues to adhere to merit system principles of fair and open competition.

Q: Can you please discuss how you would, in the words of the Committee report, "ensure that non-political Commission staff have clear opportunities for development and promotion"?

A: Ensuring that the CPSC has an effective human resources development plan for the qualified promotion of non-political staff is primarily within the sphere of the CPSC Chairman. However, to extent proper, I will work with the Chairman and the Director of Human Resources to ensure a process by which defined personnel and activity goals are set for staff with clear delineation of career-laddering opportunities within CPSC and externally within the Federal workforce.

Senator Nelson

1) In your committee questionnaire you noted that one of your priorities if confirmed as a Commissioner will be pursuing the harmonization of standards.

Q: Can you provide additional information about what types of activities you plan to pursue in that area?

A: Thank you for the question. I was not able to fully elucidate this in my oral and written testimony, hut I believe it is a critical issue going forward for the CPSC. The US and international regulatory landscape for consumer products is evolving extremely rapidly. As these new standards and requirements evolve, there is ample room for the CPSC to engage on an international basis to ensure that if the same objective is being sought (e.g., 100 parts per million of lead in children's products), that the same or similar testing, certification and enforcement will occur. In my experience, such is not generally the case today. I will work as a commissioner to ensure that harmonization does not in any way reduce the protection of American consumers that U.S. standards provide but instead encourages similar standards ahroad and reductions in redundancies and inefficiencies.

Q: Since standards vary substantially from jurisdiction to jurisdiction, how do you harmonize without potentially impacting safety? Do you harmonize up to the highest standard – or look for something else?

A: There a number of ways to accomplish harmonization without any reduction in consumer safety. Having spent the last 10 years in the consumer safety testing industry, I helieve this to indeed be the case. For example, there exists a "drop test" to determine the presence or absence of small parts that could cause a choking hazard in young children's products. As it turns out, however, the drop test is almost identical for the US and European markets, with only slight variations in the height of the drop and the

flooring underneath. This, in my mind, is a prime example of where standards can and should be harmonized to ensure both safety and efficiencies for international commerce. I would look for approaches consistent with President Obama's Executive Order 13609. The end goal might not be harmonization of a standard in all cases. CPSC and other jurisdictions may explore ways to reduce unnecessary differences in regulatory requirements through mutual recognition agreements or other vehicles to reduce regulatory trade burdens without subjecting American consumers to increased consumer product safety risk. Many international differences in standards are not based on differences in risk assessment and stringency of protection but local and parochial practices which will benefit from dialogue and scrutiny to avoid unnecessary nontariff trade barriers.

2) In your written testimony, you stated that you would like to further consult members of the international safety community for ideas and information that could further inform CPSC decision making.

Q: To that end, do you support efforts by CPSC staff to enter into further information sharing agreements with foreign product safety regulators?

A: Generally speaking, yes, I do. As the former Director of International Programs at the CPSC, I have seen first-hand how important it is for the CPSC and its cohort agencies internationally to share product safety information, and sometimes on an urgent basis. If there are unnecessary barriers to that sharing of information, and barriers that can be reduced or eliminated by the CPSC, consistent with its laws and regulations, then I would generally support such efforts.

3) Section 6(b) of the Consumer Product Safety Act generally prohibits Commission disclosure of information obtained about a consumer product if that information names or otherwise identifies the manufacturer or the name of such consumer product, unless the manufacturer consents to release of the information.

This is true even where the consumer product is linked to a serious injury or death.

Q: Do you support the current version of section 6(h), or do you think it should he changed to provide additional flexibility?

A: It would be premature for me to comment on this matter, which is of course the subject of a pending regulatory action by the CPSC. However, I would opine that any effort to make what I know to be a currently paper- and mail-based notice system more modern and efficient would likely be a desirable outcome from both the agency and its stakeholders.

Senator Wicker

1) Upholstered furniture flammability is an issue of importance to my constituents, due to the number of people who are employed in this sector in Mississippi. State regulators in

California, after years of deliberation and research, have developed a furniture flammability standard that focuses on smolder ignition. Do you agree or disagree with the California approach, and what are your views on the need for a national furniture flammability standard?

A: Thank you Senator. Because the issue you raise is the subject of an open and ongoing rulemaking before the CPSC, I am unable to comment on the specifics of your question. However, I am generally familiar with this issue and its implications to both the US and international furniture industry, and assure you that, if confirmed, I will make every effort to ensure that the Commission's actions are consistent with hoth consumer safety and US and international harmonization of standards and requirements. . .

2) It is my understanding that the Commission is considering adopting a mandatory rulemaking that would call for use of a specific flesh-sensing technology by certain bench-top table saw manufacturers. Could the adoption of such a rulemaking stifle competition in the marketplace for tabletop saws or make such saws prohibitively expensive for some consumers to purchase? What is your view on the need for such a mandatory regulation?

A: As with the previous question, and with all due respect, because this is the subject of an open rulemaking before the agency, I am unable to opine on that specific matter. This is no doubt an important issue and all aspects of a possible standard should be carefully considered, and I assure you that, if confirmed, I will do so.

Senator Scott

1) In carrying out its mission of protecting the public against unreasonable risks of injury, the Commission often relies on voluntary standards in partnership with the involved industries. It is my understanding that even though an important industry in my state has worked to develop enhanced table saw safety standards, which are currently working to significantly reduce user injuries, the Commission is considering proposing a mandatory standard that could essentially eliminate the most portable and affordable saws from the market. Can you assure me that you will give full and fair consideration to existing voluntary standards and their relative impact on consumers when considering the imposition of new mandatory standards?

A: I fully agree that voluntary standards are incredibly important to ensuring the safety of products for American consumers. While I am not fully knowledgeable of all of the details and current status of the particular issue of table saws (which is undergoing active regulatory consideration by the CPSC) I can assure you that I will give this important issue my full and immediate consideration should I be confirmed.

Senator Mark Pryor

Question for Mr. Joseph Mohorovic

Question 1. When we met, I asked you if there would be any controversy surrounding your nomination. While you said there was none, I have been reminded of a GAO report that focused

on a potential impropriety of your transition from a noncareer, political appointee at the Commission, to a career position. Please explain what happened, and whether or not this should factor into your nomination?

Answer: Thank you for the question, Senator. First, I do not believe this issue to be a controversy and am surprised to see it raised in relation to my confirmation. That said, I do appreciate the opportunity to set the record straight on this matter. Having reviewed the GAO report and all relevant information it addresses in detail, it is clear to me that the CPSC used proper appointing authorities and adhered to merit system principles of fair and open competition in selecting a candidate who successfully competed to fill the career SES vacancy. CPSC staff followed all applicable procedures and reviewed all applicants without bias before choosing a candidate to submit to the Qualification Review Board (QRB).

CPSC advertised the position vacancy as CPSC-001-04, in accordance with the procedures set forth at 5 C.F.R. §317.501(b)(2). Next, the CPSC Executive Resource Board (ERB), composed of career SES managers, conducted the merit staffing process as required by subsection (c) of the regulation. The independent CPSC ERB comprised of non-political, career, SES senior executives reviewed the twenty four applications. The GAO report cites that I was the highest rated candidate among the total applicant pool as scored exclusively by non-political, career, CPSC SES managers. None of these managers were political appointees. This process was performed according to all OPM merit-based hiring procedures.

The CPSC then submitted me as the best qualified applicant to a QRB at OPM, in accordance with 5 C.F.R. §317.502. The review is conducted by OPM completely independent of CPSC.

OPM initially determined that my SES application did not sufficiently document my management experience and suggested I provide additional evidence of my leadership credentials. OPM's QRB forwarded the written rationale for its decision to me via the CPSC Office of Human Resources. The QRB clearly anticipated a revised application, inviting the agency to "present other examples of his experience." I revised the application to address the QRB concerns. The revised application was approved by a second QRB at OPM comprised of entirely different career-SES participants. Although the second QRB did not make any specific comment on the application, it is apparent that they believed that the comments of the first QRB were successfully addressed in the revised application.

Throughout the process, the CPSC followed standard SES procedure. There is nothing unusual about the re-submission of applications to the QRB. CPSC has followed this procedure before in the case of other applicants for a career SES position. In these cases, after the candidate was initially asked to amend their application by the QRB, the candidate made revisions and re-submitted their application. And second QRBs approved those candidates. Such outcomes are identical to what transpired with my application.

Reviewing the GAO report and all relevant information, it is clear that the CPSC used proper appointing authorities and adhered to merit system principles of fair and open competition in selecting me as a candidate who successfully competed to fill the SES vacancy. CPSC staff followed all applicable procedures and reviewed all applicants without bias before choosing a

candidate to submit to the QRB. CPSC did not engage in any prohibited personnel practices, nor does GAO allege otherwise. For these reasons, I do not believe this to be an issue that should factor into my confirmation.

SENATE COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION
NOMINATIONS HEARING
APRIL 8, 2014

QUESTIONS FOR THE RECORD
SENATOR CLAIRE MCCASKILL

QUESTIONS FOR MR. JOSEPH P. MOHOROVIC:

Question 1. What do you believe is the CPSC's core mission?

Answer: I believe the CPSC's core mission is well-defined in the 2011-2016 Strategic Plan. CPSC's mission is to protect the public against unreasonable risks of injury from consumer products through education, safety standards activities, regulation and enforcement.

Question 2. Do you think the CPSC's budget is adequate to achieve this mission?

Answer: Of course I would need to review the resourcing recommendations of the staff, but I haven't seen any reason to believe that current funding levels are inadequate. In fact, I note that the CPSC is operating under a budget surplus and the Commission is making adjustments accordingly to the FY 2014 Operating Plan.

Question 3. Where do you find the greatest need for more resources or more focus by the Commission?

Answer: From 1998 to 2007, the amount of consumer products under CPSC's jurisdiction imported from China alone quadrupled. With almost one million importers and over three hundred ports of entry, it is indisputable that the challenge of ensuring compliant imports is daunting. CPSIA doubled funding levels for CPSC. But that funding came with significant new mandates to enforce as well. I believe that modernization of CPSC's import compliance program presents the greatest need for more resources and focus by the Commission.

Question 4. Now that the CPSC is nearly done with its rulemaking work as mandated under the Consumer Product Safety Improvement Act of 2008, what other priorities should the Commission focus on?

Answer: I believe the CPSC should focus on addressing the compliance of imports. The vast majority of products under CPSC jurisdiction are imported. And a disproportionate share of recalled products comes from imported products. I can think of no better way of assuring consumer safety than by ensuring the compliance of imports to U.S. safety expectations. To accomplish this, I believe a two-prong strategy is necessary.
First, foreign suppliers must understand the safety expectations of consumer products bound for the United States. I believe success will be had by better leveraging existing

communication networks including international consumer groups, retail networks, the testing community, manufacturing and standard developing organization networks. Second, CPSC must conduct a robust and effective import surveillance program. I would like to see CPSC work with Customs & Border Protection to develop public-private partnerships that facilitate the fast flow of low-risk, legitimate, compliant cargo. I would also like to see CPSC's import screening methods incorporate the most sophisticated techniques and the best data to leverage resources and intercept non-compliant cargo at higher rates.

Question 5. You have worked for Intertek – a company whose business is to conduct third-party testing – for many years. What will you bring from this job that will inform your work as a Commissioner?

Answer: After having spent almost a decade working for one of the largest international providers of quality assurance and safety services to the consumer goods industry, I understand intimately the challenges faced by manufacturers and retailers operating in global supply chains. With an enduring commitment to public service, I'd like to offer my risk management skillset to help modernize the CPSC and effectively regulate for safety in the 21st Century.

Ranking Member John Thune
Questions for the Record
Nomination of Robert Adler to be
Commissioner, Consumer Product Safety Commission (Reappointment)
Senate Committee on Commerce, Science, and Transportation
Hearing on June 11, 2014

1) **In January and July 2011, President Obama issued Executive Orders 13563 and 13579 calling on regulatory agencies to "afford the public a meaningful opportunity to comment" during the rule-making process, "use the best, most innovative, and least burdensome tools for achieving regulatory ends" and to "take into account benefits and costs [of regulation], both quantitative and qualitative." The President also asked independent regulatory agencies to formulate plans for the retrospective review of existing regulations in order to "determine whether any such regulations should be modified, streamlined, expanded, or repealed so as to make the agency's regulatory program more effective or less burdensome in achieving regnlatory objectives."**

Please provide a detailed explanation of what steps the CPSC has taken to comply with these Executive Orders.

Although as an independent agency, the Consumer Product Safety Commission is not legally obligated to comply with Executive Orders, we always strive within the framework of our governing statutes to follow the spirit of Presidential Executive Orders. With respect to Executive Orders 13563 and 13579, in order for me to respond adequately, I need to briefly review the history of the CPSC's rulemaking. I do so to make the point that we have undertaken both the promulgation of regulations and their retrospective review in the full spirit of the policies incorporated in the Executive Orders. So, I hegin with several observations:

1. Since 1981, the CPSC has been required under amendments to the Consumer Product Safety Act (and the other acts it enforces) to conduct an extensive cost-benefit analysis when we promulgate safety rules. Under these amendments, our cost-benefit approach is as comprehensive, if not more so, as that set forth in any Executive Order issued by the Office of the President.

2. Over the years, the CPSC has promulgated extremely few mandatory safety rules requiring cost-benefit analyses, a grand total of nine in thirty three years – or about one every 3.5 years – opting instead to work with the voluntary standards sector and to negotiate individual Corrective Action Plans for the recall of specific hazardous products.

3. Under the Regulatory Flexibility Act of 1980, the CPSC chose to undertake a retrospective review of every safety rule under its jurisdiction from its beginning, not just those identified as having a "substantial impact on a number of small entities" (and, therefore, requiring a mandatory review).

4. In addition to the retrospective review of agency regulations mandated by the Regulatory Flexibility Act, the CPSC has voluntarily undertaken a comprehensive review of its regulations in recent years in a spirit consistent with Executive Order 13563 and anticipates continuing to do so in the future.

Least Burdensome Tools: With respect to our utilization of the least burdensome tools for achieving our regulatory ends, in 1981, Congress added a broad and comprehensive set of cost-benefit requirements to the Consumer Product Safety Act (and the other acts enforced by the CPSC) for consumer product safety rules promulgated hy the CPSC. These provisions, contained in section 9 of the CPSA, easily match, if not surpass, in their stringency and scope the cost-benefit provisions of the various Executive Orders on cost-benefit analysis recommended by the Office of Management and Budget. Among other things, they require the CPSC, prior to promulgating almost every safety rule, to:

- Make findings with respect to the degree and nature of the risk of injury the rule is designed to eliminate or reduce; the approximate number of consumer products, or types or classes thereof, subject to such rule; the need of the public for the consumer products subject to such rule, and the probable effect of such rule on the utility, cost, or availability of such products to meet such need; and any means of achieving the objective of the order while minimizing adverse effects on competition or disruption or dislocation of manufacturing and other commercial practices consistent with the public health and safety.

- Prepare a final regulatory analysis of the rule containing the following information: a description of the potential benefits and potential costs of the rule, including costs and benefits that cannot be quantified in monetary terms, and the identification of those likely to receive the henefits and hear the costs; a description of any alternatives to the final rule which were considered by the Commission, together with a summary description of their potential benefits and costs and a brief explanation of the reasons why these alternatives were not chosen; a summary of any significant issues raised by the comments submitted during the public comment period in response to the preliminary regulatory analysis, and a summary of the assessment by the Commission of such issues.

- Find that the rule (including its effective date) is reasonably necessary to eliminate or reduce an unreasonable risk of injury associated with the product; that the promulgation of the rule is in the public interest; in the case of a rule declaring the product a banned hazardous product, that no feasible consumer product safety standard under the CPSA would adequately protect the public from the unreasonable risk of injury associated with the product; in the case of a rule which relates to a risk of injury with respect to which persons who would be subject to such rule have adopted and implemented a voluntary consumer product safety standard that compliance with such voluntary consumer product safety standard is not likely to result in the elimination or adequate reduction of such risk of injury; or it is unlikely

that there will be substantial compliance with such voluntary consumer product safety standard.

- Find that the benefits expected from the rule bear a reasonable relation to its costs and that rule imposes the least burdensome requirement, which prevents or adequately reduces the risk of injury for which the rule is being promulgated.

- Give interested persons an opportunity for the oral presentation of data, views, or arguments, in addition to an opportunity to make written submissions.

Speaking from personal experience, I note that the analysis and findings contained in section 9 of the CPSA (and similar provisions in other acts the agency enforces) have resulted in rulemaking proceedings that span years of effort and cost the agency millions of dollars. I do not believe that one could reasonably expect any more analysis by a regulatory agency, especially one with such limited resources that is directed to save the lives of young children.

Making The Agency's Regulatory Program More Effective or Less Burdensome in Achieving Regulatory Objectives: Both in response to the extremely detailed, time-consuming requirements in section 9 of the CPSA and because of its success in working with the voluntary standards sector, the CPSC has opted, wherever possible, to look to the promulgation and strengthening of voluntary standards as an alternative to developing mandatory standards. The Commission, of course, has always retained the option to undertake mandatory rulemaking where voluntary standards have proven to be inadequate. As I noted, the burdens of mandatory rulemaking have resulted in the Commission's promulgation of only nine standards in the 33 years since the 1981 amendments. In sharp contrast, the Commission has actively participated in the development or enhancement of hundreds of voluntary standards in that same time period. As I shall mention, the Commission's infrequent promulgation of mandatory rules and reliance on voluntary standards has not gone without criticism in Congress, especially when it comes to protecting the lives and safety of young children.

There are limits on the use of voluntary standards in protecting American consumers, but they have, of necessity, become important tools in CPSC's approach to product safety.

CPSC and the Regulatory Flexihility Act (RFA): Section 610 of the RFA requires agencies to periodically review rules that have a significant impact on a substantial number of small entities. Each agency is required to publish a plan demonstrating its approach to its review. Accordingly, as far back as September 1981, the CPSC published its plan for reviewing existing rules under the RFA, as well as subsequent rules within 10 years of their publication.

The CPSC has gone far beyond the requirements of the RFA in its plan. In fact, the agency not only has solicited and reviewed comments for rules that we have determined would have a significant economic impact on a substantial number of small entities, we have actually conducted a review of every safety rule under our jurisdiction. In addition

to soliciting comments from the general public in the Federal Register, we have directly contacted affected parties and their trade associations through appropriate trade publications. Moreover, the Commission has made an effort personally to contact those persons who submitted comments during the earlier rulemaking proceedings. Based on the information received in the comments, as well as other information available to the Commission, CPSC staff has then conducted an assessment of the degree of economic impact on small entities and sought to identify appropriate actions required to minimize the impact on those entities consistent with the objective of the statute under which the regulations were issued.

Under section 610(b) of the RFA, the Commission has sought comments on, and reviewed its rules according to, the following factors: (1) the continued need for the rule; (2) the nature of complaints or comments received concerning the rule from the public; (3) the complexity of the rule; (4) the extent to which the rule overlapped, duplicated, or conflicted with other federal rules (and the Commission also considered, to the extent feasible, the extent to which the rule overlapped, duplicated, or conflicted with state and local government rules); and (5) the length of time since the rule had been evaluated or the degree to which technology, economic conditions, or other factors had changed in the area affected by the rule.

Since 1981 and the passage of the RFA, our agency has carefully reviewed its regulations. This effort has continued over the last 30-plus years. On the whole, I believe these reviews have been good both for consumers and the regulated community. Under the RFA (and other provisions of the CPSA requiring rule reviews), the Commission has issued reports involving 17 rules under the CPSA, as well as nine rules promulgated under the Federal Hazardous Substances Act (FHSA), eight rules under the Flammable Fabrics Act (FFA), and four rules under the Poison Prevention Packaging Act (PPPA).

Voluntary Regulatory Review Efforts: In addition to the rule reviews required by the RFA, the Commission also has recently voluntarily undertaken efforts to review its regulations in a manner consistent with the spirit of Executive Order 13563 and similar Executive Orders. Specifically, almost ten years ago, the Commission published a notice in the Federal Register announcing a pilot rule review program. In the notice, the agency committed itself to using OMB's Program Assessment Rating Tool (PART) to help provide a consistent approach to rating programs across the federal government.

In the notice, the Commission listed four rules for review, and asked for public comment on each regulation. Specifically, the notice asked: 1) whether the regulation is consistent with CPSC program goals, 2) whether the regulation is consistent with other CPSC regulations, 3) whether the regulation is current with respect to technology, economic or market conditions, and other mandatory or voluntary standards, and 4) whether the regulation could be streamlined to minimize regulatory burdens, particularly those affecting small businesses.

Out of this pilot program, the Commission then conducted annual reviews that looked at four to six rules per year in 2005, 2006, and 2007. From this review, the CPSC clarified its rules regarding standards for carpets, rugs and bicycles. In addition, the Commission also recently established projects to examine amendments to the electrical toy and cigarette and multi-purpose lighter rules.

We continue the review process today. In the coming years, staff will be looking at ways to maximize openness and public participation, as well as ways to most effectively target rules that may require revision, repeal, or strengthening to protect the public against the risk of unreasonable danger from consumer products. If re-confirmed, I assure you that I will follow this process closely.

In addition, specifically please:

2) **Identify existing CPSC regulations that you believe to be outmoded, ineffective, or excessively burdensome.**

As I have noted above, CPSC staff is currently engaged in a comprehensive review of all existing agency rules pursuant to the mandate in the Regulatory Flexibility Act. I am comfortable with the staff approach, which is a methodical and thorough review of agency rules.

a. **List all of what you believe to be outdated or obsolete reporting requirements for the CPSC.**

Like all other federal agencies and departments, the CPSC faces a multitude of requirements for filing reports with the Congress and OMB. I believe that most of these reporting requirements provide those who oversee us with the necessary information to maintain accountability over the agency. To the extent that our reports are carefully scrutinized, I believe that they serve a useful purpose.

I support periodic review of required reports to identify outdated, obsolete, or duplicative reporting requirements. I know the Government Performance and Results Modernization Act directed the Office of Management and Budget to provide to Congress a list of Congressionally-mandated reports that agencies believe require Congressional modification. In compiling a list of reports, OMB sought the advice of agencies and departments including the CPSC. CPSC staff identified two reports. Specifically, the CPSC Inspector General recommended the consolidation of two duplicative annual reports regarding Inspector General reviews of improvements and employee complaints concerning the CPSC. This recommendation was also included in S. 2109, the Government Reports Elimination Act of 2014, introduced on March 11, 2014 by Senator Mark Warner, and cosponsored by Senators Claire McCaskill and Kelly Ayotte.

b. **Provide a plan to this Committee within 60 days outlining specific actions you plan to take to ensure that the CPSC aggressively implements burden reduction opportunities and a timetable for when those actions will occur.**

During my time as Acting Chairman I have taken specific actions to attempt to reduce the cost of third party testing requirements consistent with assuring compliance with any applicable consumer product safety rule, ban, standard, or regulation. These actions have included holding an all-day forum, on April 3, 2014, on burden reduction open to all stakeholders. At this forum, we heard numerous thoughtful nominations of ideas from our stakeholders for product determinations. Unfortunately, because of the highly technical nature of many of these suggestions, CPSC scientific staff must carefully test the claims made by the participants. As I mentioned at my re-nomination hearing, one of the most promising suggestions for exempting phthalate testing based on the hardness of plastics has been shown not to be accurate. Following the forum, several stakeholders asked the Commission to reopen the record so they could submit more information to our staff for consideration in making the scientific case for determinations. The record will remain open until July 16, 2014, and I look forward to reviewing the comments and ideas we receive.

In addition, last month, I introduced an amendment to the Commission's 2014 Mid-Year Review and Proposed Operating Plan Adjustments to examine potential ways to reduce third party testing costs through determinations consistent with assuring compliance with underlying requirements. The amendment was adopted. It provides funds for a study to assist the Commission in determining whether untreated wood or other natural materials are materials that do not, and will not, contain any of the eight specific heavy metals in levels that exceed allowable limits listed in the mandatory Toy Standard, ASTM F-963. Because wood was on the list of determinations for lead first published in August 2009 in the Federal Register, and currently found at 16 CFR § 1500.91, that identify those products or product components that will never contain violative amounts of lead, I am hopeful that this study will find similar results for the eight heavy metals listed in ASTM F-963.

In terms of steps I would take upon re-confirmation as a Commissioner, I look forward to working with my colleagues, particularly Chairman-nominee, Elliot Kaye, to continue to seek ways to reduce third party testing requirements consistent with assuring compliance with any applicable consumer product safety rule, ban, standard, or regulation. During his nomination hearing, he agreed to provide such a plan 60 days from his confirmation as Chairman on this topic, and I assure the Committee I will work closely with Mr. Kaye on this plan.

c. Provide detailed recommendations on how you would propose to increase public participation in CPSC's rulemaking process, and how you would propose to reduce uncertainty in the CPSC's rulemaking process.

I believe that the CPSC's approach to public participation is among the most comprehensive in the federal government. Since the agency was first established,

we have stressed the importance of promoting public participation. Here are some examples of the ways that the agency has addressed this important issue:

- Open Meetings Policy: Unlike most other agencies, whenever CPSC employees meet with outside parties on matters of substantial interest, we require that the meetings be announced in advance in our public calendar and provide that any member of the public, including the press, who wishes to can attend the meeting. See 16 CFR§ 1012, et seq.
- Freedom of Information Act: CPSC has one of the most liberal FOIA policies in the federal government. As part of that policy, the agency states that even records that may be exempted from disclosure will be made available as a matter of discretion when disclosure is not prohibited by law or is not against the public interest. See 16 CFR § 1015, et seq.
- Oral Presentations in Regulatory Proceedings: Unlike most other regulatory agencies, rulemaking under Section 9 of the Consumer Product Safety Act (15 U.S.C. 2058(d)(2)) and Section 4 of the Flammable Fabrics Act (15 U.S.C. 1193(d)) require the agency to provide interested persons an opportunity for the oral presentation of data, views, or arguments in addition to the opportunity to make written submissions. See 16 CFR § 1052.
- Publicly Available Database: Pursuant to section 6A of the Consumer Product Safety Improvement Act of 2008, the Commission, in March 2011, established a user-friendly product safety database in which members of the public can report and read about risks of harm associated with consumer products. See 16 CFR § 1102, et seq.
- Annual Priorities Public Hearing: Section 4(j) of the Consumer Product Safety Act (CPSA) (15 U.S.C. 2053(j)) requires the Commission to establish an agenda for action under the laws it administers and, to the extent feasible, to select priorities for action at least 30 days before the beginning of each fiscal year. Section 4(j) of the CPSA provides further that before establishing its agenda and priorities, the Commission must conduct a public hearing and provide an opportunity for the submission of comments.
- Contributions to Costs of Participants in Development of Consumer Product Safety Rules: In appropriate cases, tbe Commission will contrihute to the costs of those who participate in its rulemaking proceedings, particularly where consumer participants need to acquire technical expertise. See 16 CFR § 1105.

With respect to reducing uncertainty, I believe that the agency maintains an effective, open line of communication to the regulated community, both in communicating its intentions and in listening to feedback from this community. I do not see that our approach to the regulatory process promotes substantial uncertainty. One specific approach that I believe Congress could take to reduce uncertainty in our processes would be to provide greater flexihility for CPSC rulemaking. At the moment, whenever we follow the burdensome procedures in the various acts we enforce, years may pass before we enact a rule, and that, no doubt, leaves many stakeholders in a state of uncertainty.

d. Provide detailed recommendations on how yon would propose to improve coordination with other federal agencies to eliminate redundant, inconsistent, and overlapping regulations.

The CPSC on a regular basis enters into Memoranda of Understanding (MOUs) with fellow agencies such as the Environmental Protection Agency, the Food and Drug Administration, the Occupational Safety and Health Administration, and Customs and Border Protection, to coordinate our regulatory approaches to the extent permitted by our respective laws. On the whole, I think these agreements have been quite successful in eliminating redundant, inconsistent, and overlapping regulations.

3) **Through passage of H.R. 2715 in Angust 2011, Congress mandated that the CPSC issue regulations to reduce third party testing costs consistent with assuring compliance with rules, bans, standards and regulations. The deadline for issuing those Congressionally-mandated regnlations was August 2012. H.R. 2715 clearly directs the agency to reduce unnecessary testing burdens that are killing small businesses and have prevented small businesses from entering into the children's product market. This should be an agency priority.**

At a recent hearing on the CPSC midyear review of the hudget, your colleague Commissioner Buerkle proposed an amendment to develop a plan to reduce third party testing burdens. Each of these proposed rules would amend well-functioning regulations that have been in place for years and would advance safety. She stated that she was extremely disappointed in the agency's progress to fnlfill H.R. 2715's mandate to provide meaningful relief to reduce third party testing burdens. You have stated time and again that the Commission does not have the resources to reduce testing burdens, and yet the Commission has recently proposed three regnlations that are not congressionally mandated.

Why has the Commission failed to responsibly respond to a Congressional mandate that it reduce the third party testing burden?

To the best of my knowledge, I have never stated that the Commission does not have the resources to reduce testing burdens. I have also stated that burden reduction is and remains a high priority item for me. Further, I have said that we are a very small agency with limited resources for the many worthy projects, including burden reduction, before us.

As I stated before the Committee during my June 11 re-nomination hearing, Congress, in section 2(a)(3) of P.L. 112-28, did not simply direct CPSC to address third party testing burden reduction. Instead, the mandate in that law was, within a year, to seek public comment on opportunities "to reduce the cost of third party testing requirements consistent with assuring compliance with any applicable consumer product safety rule, ban, standard, or regulation." We have done that and have dedicated many staff months to assessing the various approaches suggested in the law and in the many comments we

received in response to our Requests for Information (RFI) published in the Federal Register.

A solid consensus has emerged from the many commenters who have responded to our requests for information. Most see little potential burden reduction in Commission initiatives that retain third party testing costs. Instead, they seek to have the Commission expand on a list of determinations for lead first published in August 2009 in the Federal Register and currently found at 16 CFR § 1500.91. This list identifies those products or product components that will never contain violative amounts of lead. Once a determination is made, such products or product components need not be subject to third party testing. Ideally, based on technical and scientific data, we will be able to expand this list both to include more materials and to also find materials that are used in the manufacture of children's products that will never contain violative amounts of phthalates or the eight heavy metals found in ASTM F-963.

The Commission, on April 3, 2014, held an all-day forum on burden reduction and heard numerous thoughtful nominations from our stakeholders for product determinations. Unfortunately, because of the highly technical nature of many of these suggestions, CPSC scientific staff must carefully test the claims made by the participants. As I mentioned at my re-nomination hearing, one of the most promising suggestions for exempting phthalate testing based on the hardness of plastics has been shown not to be accurate. Nevertheless, the Commission and its staff are proceeding with our work and we hope to provide testing relief as we confirm the scientific validity of the various suggestions.

In addition, last month, I introduced an amendment to the Commission's 2014 Mid-Year Review and Proposed Operating Plan Adjustments to examine potential ways to reduce third party testing costs through determinations consistent with assuring compliance with underlying requirements. The amendment was adopted. It provides funds for a study to assist the Commission in determining whether untreated wood or other natural materials are materials that do not, and will not, contain any of the eight specific heavy metals in levels that exceed allowable limits listed in the mandatory Toy Standard, ASTM F-963. Because wood was on the list of determinations for lead first published in August 2009 in the Federal Register, and currently found at 16 CFR § 1500.91, that identify those products or product components that will never contain violative amounts of lead, I am hopeful that this study will find similar results for the eight heavy metals listed in ASTM F-963.

4) **In 2010 the agency issued an interpretation of *unblockable drain* (in the VGB Pool & Spa Safety Act) which was revoked 17 months later because you decided to change your vote on that matter. The change in interpretation was counter to the advice of the agency technical and legal staff and was done without notifying the public or seeking input from those who had relied on and expended resources complying with the earlier interpretation. I am deeply troubled that this shows disregard for process and does not allow those impacted by a decision to have a chance to weigh**

in. Pool owners spent their limited, and in many cases public funds, complying with the federal mandate only to have their efforts negated by the reversal and without explanation or process.

a. Are there other examples that you can give me where one commissioner can effect so drastic a reversal in policy?

On December 19, 2007, Congress enacted the Virginia Graeme Baker Pool and Spa Safety Act (VGBA" or "the Act"). The purpose of the Act was to prevent child drowning and entrapment in swimming pools and spas. Among other things, the Act imposed requirements for secondary anti-entrapment devices on most public pools and spas. On April 2, 2010, I cast a vote interpreting the term "unblockable drain" as permitting public pools and spas with an "unblockable drain cover" to comply with the Act without the necessity of installing a secondary anti-entrapment device. After long and painful consideration – and after many meetings with numerous stakeholders, including trade associations, pool manufacturers, pool installers, drain cover manufacturers, and Safety Vacuum Release System (SVRS) manufacturers – I decided to join my colleagues in withdrawing the previous interpretation and establishing a new interpretation of the term "unblockable drain." Under this new interpretation, the Commission would not allow a removable unblockable drain cover to render a drain unblockable.

Under the VGBA, an "unblockable drain" is defined as a "drain of any size and shape that a human body cannot sufficiently block to create a suction entrapment hazard." However, in preparation for the vote on April 2, 2010, I could not find additional guidance in the VGBA or its legislative history indicating whether Congress intended that that drains with unblockable drain covers could be considered "unblockable drains." So, when I attempted to interpret the term, I found myself drawn to the definition that made the most sense to me at the time – a definition that allowed the use of an unblockable drain cover to render a drain unblockable.

After the April 2010 vote, however, I received over 140 letters from citizens and members of Congress, including those who were intimately involved in drafting the statute, who disagreed with my interpretation of the statute. The members of Congress insisted that they did not intend that drains with unblockable drain covers be considered unblockable drains. In addition, I met twice with Representative Debbie Wassermann Schultz, unquestionably one of the members of Congress most involved in writing VGBA, who reiterated this position.

I understand that consumers and industry alike need stability in the marketplace. They look to the decisions of regulators and rely on those decisions when purchasing, using, and manufacturing consumer products. Although I was hesitant at first to reexamine my previous vote, as a policy maker, I believe it is my duty to listen to all points of view, analyze all relevant data, and, if

appropriate, reconsider my vote. So I took it upon myself to reexamine both the safety considerations associated with unblockable drain covers and the legislative history of the VGBA.

I spent considerable amount of time comparing the safety of large unblockable drain covers to the safety of smaller, perhaps less sturdy, drain covers with a secondary anti-entrapment device. When I cast my vote in April 2010, I believed that large unblockable drain covers seemed to provide a greater measure of safety than smaller drain covers with secondary anti-entrapment systems. I reached that conclusion based on my understanding that a properly installed unblockable drain cover protects swimmers from a wide variety of entrapment hazards.

In addition, I believed, if required to install a secondary system, the vast majority of public pools would opt for an anti-entrapment device called a Safety Vacuum Release System, or SVRS, and a small drain cover. The reason was simple: an SVRS, at the time, seemed the cheapest secondary anti-entrapment system on the market. I had safety concerns regarding the use of an SVRS. Unfortunately, an SVRS will not engage if a swimmer's hair becomes entangled in a drain nor will it trigger quickly enough in some instances to prevent a swimmer having his or her organs eviscerated from sitting on a drain. In other words, the usefulness of an SVRS is essentially limited to those instances in which a swimmer's body fully blocks a drain. By contrast, an unblockable drain cover carefully and properly installed would prevent any form of entrapment that a drain might cause.

What made the policy call so difficult, however, was the fact that an unblockable drain cover can operate only if it is properly installed and stays on the drain. In other words, if a drain cover is removed and there is no secondary system like an SVRS then swimmers would be at risk of entrapment in the drain below. Unfortunately, we did not have any significant data regarding the likelihood of drain covers coming off or staying on. But, as critics of my previous vote stated, all drain covers come off from time to time for seasonal maintenance – a point I freely concede.

Based on the communications I received and the discussions I had with many stakeholders, I became persuaded that my interpretation was not what many Members intended when they wrote the law. Given the close call between the safety implications and/or benefits of the two interpretations and my belief that my previous interpretation was contrary to Congressional intent, I cast my vote to reinterpret the term "unblockable drain."

I am aware that some pool owners purchased and installed unblockable drain covers in reliance on the Commission's previous interpretation. It is my understanding, however, that the number who did so was quite limited because compliant unblockable drain covers turned out to be as expensive – or more expensive – as the SVRS systems. I should add, that in order to give these individuals sufficient time to come into compliance with our new interpretation, I

recommended, and the Commission agreed, to stay enforcement of our new interpretation until the start of the pool season the following year.

b. Are you concerned by the precedent you have set that allows for one commissioner moving from minority to majority to change the outcome of a statutory interpretation months or even years after the issue has been decided, and do it without public notice and comment?

Although interpretive rules, under the Administrative Procedure Act, do not require notice-and-comment procedures, I believe that my many open meetings over the course of months leading up to the vote provided most stakeholders with ample notice that I was re-considering my vote. The prospect of a Commissioner changing his or her mind during the course of service on the Commission is a real one. For example, at about the same time I changed my vote on unblockable drain covers, Chairman Tenenbaum changed her vote on whether vacation rental homes with pools could fall within VGBA's jurisdiction. Obviously, such changes should be approached with great care and thought. I regret any disruption my changed vote caused in the market and repeat my apology to anyone adversely affected.

5) Did you speak with one or more members of Congress on the issue of unblockable drains, as defined by the VGB Pool & Spa Safety Act, before you decided to reverse your decision? If so, please describe such conversations.

As stated in my answer above, I received many letters from members of Congress urging me to re-consider my vote on unblockable drain covers. In addition, as described above, I met twice with Congresswoman Debbie Wasserman Schultz, one of the primary authors of the Virginia Graeme Baker Pool and Spa Safety Act. Congresswoman Wasserman Schultz provided me with an extensive narrative about events leading up to passage of the VGBA. As one of the original co-sponsors of the law and a member from Florida with deep concerns about drownings in her district, she had a clear understanding about the legislative intent behind the law.

6) There is a perception by many that CPSC has become too political in its approach to product issues. How will you ensure that the CPSC appropriately considers science-based information in the Commission's decision-making process?

One of best features about the CPSC is its outstanding staff of technical experts, including engineers, epidemiologists, chemists, physicists, communications experts and attorneys. This enables the agency to maintain a scientific and data-based approach to addressing product safety issues. I do not believe product safety should ever be based on partisan politics. In fact, most of the decisions at the agency – roughly 85 percent – are unanimous votes in accordance with staff recommendations. Of course, reasonable minds can disagree regarding policy options for regulation. Different policy makers can look at the same injury and fatality data and reach opposite conclusions about whether

those data demonstrate that an unreasonable risk of injury exists. That is a normal aspect of how collegial bodies with Commissioners having different policy perspectives operate.

7) **Mr. Adler, as I noted at the hearing, we all want to ensure the safety of products in the marketplace. Still, the Consumer Product Safety Act is a carefully crafted statute that balances public safety and the rights of individuals engaged in lawful commerce. In the Buckyballs case, when the company did not agree to a voluntary recall, the agency sued to mandate a recall. Yet, rather than going to court to seek an injunction against the sale of the product during the litigation, as the law allows, the agency contacted retailers and asked them to remove the product from shelves, thereby nearly guaranteeing the bankruptcy of the company. If the CPSC was concerned about the dangers of the product during the litigation, why did the agency not follow the law and go to court to seek a court approved injunction?**

The law allows the Commission a variety of regulatory options that we weigh whenever we discover serious hazards in the marketplace. As alleged by CPSC staff, Buckyballs present an extremely serious hazard when someone, often a young child, ingests two or more magnets. The magnets attract each other through the walls of the intestines resulting in progressive tissue injury, beginning with local inflammation and ulceration, progressing to tissue death, then perforation or fistula formation. Such conditions can lead to infection, sepsis, and death. At the time of filing an administrative complaint, CPSC staff had learned of more than two dozen high-power magnet ingestion incidents, with at least one dozen involving Buckyballs. Surgery was required in many of the incidents and ingestion of high-power magnets is alleged to have resulted in at least one death.

What made these incidents so compelling, aside from the destructiveness of the ingestions, is the fact that the magnets, by themselves, look benign and the harm from ingesting them does not occur immediately or obviously. In fact, as alleged in the Commission's complaint, doctors examining patients with ingested magnets could find it difficult to give an immediate or accurate diagnosis because the symptoms mimic other less serious digestive disorders, which could lead to the erroneous belief that no treatment was necessary or a delay in a surgical intervention that could exacerbate life-threatening internal injuries.

All of these high-risk elements led staff to consider a variety of options, including going to various retailers to ask them voluntarily to remove these dangerous products. Section 15 (c) and (d) of the Consumer Product Safety Act [15 USC § 2064(c) and (d)] authorize the Commission to seek remedial action not only from manufacturers, but also from distributors and retailers. Accordingly, in weighing options, CPSC Compliance staff concluded that one effective and expeditious step would be to work with the retailer community in addressing the hazard. I note that, in addition, to working with retailers, staff also took the rare step of filing an administrative complaint against the respondents, signaling their strong concerns about the hazard.

8) **In the Buckyballs case, CPSC then sought to extend the "responsible corporate officer" doctrine to establish personal liability for the costs of the recall on Craig Zucker, one of the priucipals of the bankrupt company that sold Buckyballs.**

   a. **Did the Commission vote to amend its complaint to seek personal liability in this case? If not, why not?**

      On July 25, 2012, as authorized by the Commission, CPSC staff filed an Administrative Complaint against Maxfield and Oberton seeking a recall of the magnet products sold by the company. Subsequently, staff filed an amended complaint seeking to add Craig Zucker, individually and as an officer of Maxfield and Oberton, after he dissolved Maxfield and Oberton Holdings as an additional respondent. The Administrative Law Judge preliminarily granted CPSC staff's request to add Mr. Zucker individually as a respondent. Because the Commission negotiated a Consent Agreement with Mr. Zucker that supersedes the judge's ruling, the Commission did not rule on this issue. My own view is that, in an appropriate case, the Commission has the authority to include individuals as respondents, but I have made no determination whether this was such a case.

   b. **With regard to the Buckyballs case, if the decision to name the former president of the company as an individual respondent in an administrative complaint was done without the approval of the commissioners, why did Commission staff claim in a pleading that the Commission approved the decision?**

      The staff decision to name Mr. Zucker as an individual respondent was done with the broad authority granted to staff to file an administrative case pursuant to section 15 of the Consumer Product Safety Act. Because the Administrative Procedure Act (APA) requires that members of the Commission hear appeals from decisions by administrative law judges once we have authorized the filing of a case, we take great precautions to avoid involvement in administrative trial strategy because of our need to avoid even the appearance of bias that might affect our ability to serve as an appellate body. I believe that staff's decision to name Mr. Zucker as an individual respondent was well within the authority granted them to pursue the case. Whether the Commission, as a matter of policy, should be involved in such a decision is something that I am currently contemplating.

   c. **Do you believe the CPSC's Rules of Practice for Adjudications require a vote of the Commission to amend a complaint previously authorized by the Commission to add a new party or to add a different legal theory of liability?**

      In this case, no. In other cases, depending on what the new legal theory of liability or who the new party is, my answer might differ. The Rules of Practice are designed to empower the Presiding Officer with broad discretion in hearing

cases. In this case, I note the Presiding Officer did issue a preliminary ruling permitting the addition of Mr. Zucker as a respondent.

d. Were you involved in the decision to amend CPSC's complaint against Maxfield and Oherton to name Craig Zucker in his individual capacity?

As I have noted, the decision to amend the complaint was made by CPSC staff pursuant to authority granted them by the Commission to file an administrative case in accordance with section 15 of the CPSA.

e. Should commission staff, withont the approval of the Commission, proceed with snch a significant move as naming an individnal as a respondent?

The decision to name Mr. Zucker was made by CPSC staff pursuant to the broad authority granted by the Commission to file the administrative case. I believe that staff's decision to name Mr. Zucker as an individual respondent was well within the authority granted them to pursue the case. Whether the Commission, as a matter of policy, should be involved in such decisions is something that I am currently contemplating.

9) Do you believe that companies, and individuals managing those companies, have a legal right to challenge a CPSC determination that a product recall is warranted based on legitimate, but different, interpretations of applicable statutes as applied to specific facts?

Yes.

10) There have been snggestions that the CPSC pursued Mr. Zucker personally in response to his aggressive response in fighting the CPSC. Did that happen?

No. As someone who has worked in two branches of government, I know we are constantly subject to criticism, sometimes in very harsh terms. I believe that one of the greatest freedoms that American citizens have is the right to criticize their government. As far as I can tell, CPSC staff also believes that and does not take such criticism personally.

11) **When, and under what circumstances do yon believe it is appropriate to pierce the corporate veil and hold a principal of a company personally liahle for a product recall? Wouldn't you agree that this step is ordinarily only used when there is criminal condnct alleged? Yet the commission took this extraordinary step in the Buckeyballs case by adding Mr. Zncker individually, why?**

This is not an area of law that I have researched thoroughly. According to various authorities, the law varies from state to state and from jurisdiction to jurisdiction. Because I continue to research the issue, I cannot provide a definitive answer regarding

when such an action is warranted. I note that adding an individual like Mr. Zucker in an administrative case is rare.

12) Section 6(b) of the Consumer Product Safety Act requires the CPSC to "take reasonable steps to assure" that any disclosure of information relating to a consumer product safety incident is accurate and fair. You have not been shy about expressing your opinion about section 6(b). Congress, however, has had several opportunities—including passage of the Consumer Product Safety Improvement Act—to amend the statute, but chose to preserve the regulatory authority and protections of section 6b.

Under your leadership, the Commissiou recently proposed au interpretative rule that would, among other things, significantly narrow the information subject to section 6(b) protections, exempt information that is "publicly available," permits commission staff to *not* notify firms when it releases information "substantially the same as" information previously disclosed and especially troubling, eliminates protections from disclosure of information subject to attorney-client privilege.

What is your definition of "publicly available" because, based on the proposed rule, information posted on a blog would be "publicly available?" How will the Commission substantiate its reliability and factual accuracy before inclusiou in communications or investigations of the CPSC? If information about an investigation, whether or not it is accurate, somehow is posted on the Internet, will that information then be exempt from section 6(b)?

As a starting point, I note that the proposed revisions to section 6(b) of the CPSA are still under review, so I am keeping an open mind regarding the comments filed in response to the Commission's Federal Register Notice of Proposed Rulemaking.

It is no secret that I have a general dislike for some of the provisions of 6(b), especially when they impose substantial costs in time and money on the Commission's Freedom of Information Act staff. I see no useful purpose in compelling the Commission to follow these cumbersome procedures – which apply only to CPSC and no other health and safety agency – when we are acting as a repository of information in similar fashion to a public library. Further, in some instances, safety information delayed is consumer safety denied. However, it is my duty to uphold all of CPSC's statutes as written and, if re-confirmed, I pledge to continue do so.

With respect to the language regarding "publicly available" information in the NPR, in my judgment, this is clarifying what has generally been the practice of the Commission over the years more than anything new. As noted in the Commission's Notice of Proposed Rulemaking, 79 Fed. Reg. 10712, 10714 (February 26, 2014), neither the statute nor the CPSA's legislative history suggest that information that is readily available to the public is, or should be, subject to section 6(b). I believe that the NPR gives a good description regarding what "publicly available" information is, namely, information that has been disseminated in a manner intended to reach the public in

general, such as news reports; articles in academic and scientific journals; press releases distributed through news of wire services; or information that is available on the Internet.

I cannot speak generally regarding information posted on the Internet about a company under investigation because the statute treats such information in different ways depending on its status. Information submitted to the Commission pursuant to section 15(b) reports that might trigger an investigation must be treated as confidential by the agency unless the Commission has reasonable cause to believe a product is in violation of a safety rule or other provision of the law, or the product is the subject of a legal proceeding or the manufacturer has consented to its release. Nothing in the proposed modification to the agency's 6(b) rule will change that.

13) What problem is the Commission looking to fix with the proposed rule on information disclosures under section 6(b)? What kind of data was used by the Commission in determining that a change was needed?

The proposed rule is intended to update the Commission's 6(b) rule, which has not been revised since its promulgation in 1983 – a time when the Internet did not exist. The proposed rule is intended to modernize and streamline the Commission's processing of information disclosure under section 6(b). Among the pieces of information that the Commission relied on in proposing the changes were its assessments of the ongoing 6(b) costs and time delays in processing FOIA requests, which total in the hundreds of thousands of dollars and in days, sometimes months, in releasing information to the public.

14) Congress recognizes the importance of ensuring the accuracy and fairness of information disclosed by the Commission. What responsibility does the Commission have to prevent release of unreasonable and unsubstantiated information that could cause harm to businesses or brands as well as ill-serve the public we seek to protect?

The Commission has the same responsibility that any federal health and safety agency has to ensure accuracy and fairness of information that it discloses. It is a critical responsibility that the CPSC takes very serious. Why the extra restrictions in 6(b) that extend to no other health and safety agency need to apply to a resource-limited agency like CPSC remains unclear to me. However, it is my duty to uphold all of CPSC's statutes as written and, if re-confirmed, I pledge to continue do so.

15) Mr. Adler, will you commit to me that, if reconfirmed, you will follow not only the letter of the law when it comes to disclosure laws applicable to the Commission, but also the spirit of these rules, which are designed to prevent inaccurate, misleading and incomplete information that could hurt both consumers and manufacturers?

Yes.

16) The CPSC has, in recent years, been increasingly looking to retailers and manufacturers to undertake voluntary product safety recalls and other corrective

actions, as well as holding them accountable for failure to report and other penalty investigations. However, there has been more than a 20 percent decline in voluntary recalls between 2010 and 2013, and it appears this decline will continue through the current year. What do you think of this recent trend, and do you think it is something that should be publicly explored by the Commission? If reconfirmed, will you in fact explore this issue?

I read no particular message in the decline in voluntary recalls because it could be the result of any number of factors, including safer products in the marketplace, more targeted CPSC actions against repeat offenders, CPSC's increased work with Customs and Border Protection at our nation's ports, or a more diffuse marketplace because of the Internet. If re-confirmed, I will look into the issue, and work on this issue with my fellow Commissioners, particularly the Chairman, who is the individual responsible for the administrative and management direction of the agency.

Senator Dean Heller
Questions for the Record
Nomination of Robert Adler to be
Commissioner, Consumer Product Safety Commission (Reappointment)
Senate Committee on Commerce, Science, and Transportation
Hearing on June 11, 2014

17) The CPSC's voluntary recall system—especially the agency's "fast-track " recall system—provides a quick and effective means of getting potentially dangerous products off the market and out of consumers' hands. However, the agency has come under growing criticism for a slowdown in the pace that recalls are being negotiated, as such delays could ultimately harm consumers. In the past four years, the agency has had three directors of compliance and I understand the position is now empty again. This raises concerns about the effect of such turnover on management of the agency. Please provide the Committee with information detailing how long it generally takes the Commission to negotiate fast track recalls, and whether that time has increased over the past several years?

I strongly support the agency's Fast Track Program and, as Acting Chairman, have taken steps to ensure that it continues to be effective. I have requested that CPSC staff undertake a review of the program that I have dubbed "Fast Track 2.0." Among other things, I have asked for a review of the types of hazards that should be included in the program and which should not. I have also asked for a review of the types of information that companies should provide when they seek Fast Track status and a review of how these recalls generally should proceed.

Under the guidelines for Fast Track, a product recall must begin within twenty days of a report to the Commission. In practice, according to staff, it currently takes roughly 60 days from the moment that a firm notifies the Commission of a problem until its Corrective Action Plan is agreed upon. The discrepancy in time frames, according to staff, is that firms often report a potential issue prior to presenting all of the required information to begin an official "fast track" recall. This first contact with the Commission is included in that 60-day figure. Further, according to staff, "fast track" recall negotiations do not begin in earnest until the firm presents the Commission with:

- a full report as defined by 16 C.F.R. § 1115.13(d) (which includes 15 detailed items of information, including when and where a product was manufactured, how many items need to be recalled, the nature of defect, and other important pieces of information),
- a fully developed action plan for recall, including types of media to be used, and
- a fully drafted press release explaining the nature and details of recall.

Over the past three fiscal years, the average time from the moment that a firm notifies the Commission of a potential problem until the completion of that firm's Corrective Action Plan has ranged between 55 and 60 days. Encouragingly, the time it takes for negotiating and issuing press releases (a significant portion of the time that it takes to conduct voluntary

recalls) has shown a steady decrease in Fiscal 2014, including an almost 10% decrease to just over 20 days.

All of this said, I continue to believe that Fast Track is a worthy program that needs to be improved.

18) Can you assure the Committee that you will work to make sure the fast track system continnes to be as effective as it has been in the past?

Yes.

19) Are you aware of the letter dated May 30, 2014, that former CPSC Chairman Ann Brown sent to Representatives Fred Upton and Henry Waxman expressing concerns with the proposed voluntary recall rule?

Yes.

Are you aware of the comments to the docket suhmitted by Senators Casey and Toomey and a separate letter by Senator King expressing similar concerns with the proposed rule?

Yes.

Do you agree with former Chairman Brown and the Senators that the proposed Voluntary Recall Rule could threaten the history of collaboration that the CPSC has with its stakeholders?

I have read former Chairman Brown's letter, and the Senators' letter. I have also reviewed many of the stakeholder comments we have received about our proposed rule. I continue to review those comments and to pay special attention to those that raise concerns about the impact of the proposed rule on the Fast Track program. Needless to say, I greatly respect and admire Ms. Brown, and I agree with her that Fast Track is an excellent program.

The CPSC has always and should always continue to work collaboratively with its stakeholders on behalf of the American public. I see nothing in the proposed rule that would threaten that relationship. That said, the Voluntary Recall Notice Rule is only a proposed rule, and, in light of its controversial nature, I am carefully reviewing the comments from all stakeholders. I retain an open mind as to what the final version of the rule might look like.

20) Regarding the CPSC's recently proposed rule that would expand staff's role on voluntary standards setting bodies, are you concerned that an individual at the CPSC—whether that person is a Commissioner or a staff member who is not the voting member—could influence the standards development process?

The rule to which you refer grew out of a report from May 2012 by the U.S. Government Accounting Office (GAO), "Consumer Product Safety Commission: A More Active Role in Voluntary Standards Development Should be Considered." (See http://www.gao.gov/assets/600/590990.pdf.)

The GAO Report recommended that the Commission review its policy for staff participation in voluntary standards development activities and determine the feasibility of the agency's staff assuming a more active role in developing voluntary standards. Specifically, the GAO Report recommended that CPSC staff be allowed – not required – in appropriate cases to vote on balloted provisions of voluntary standards. The Report also suggested that staff be allowed to hold leadership positions at various levels of standards development organizations, including task groups, subcommittees, or committees. GAO concluded that changing the CPSC's regulations to allow staff to participate more actively in voluntary standards activities could result in stronger voluntary standards without compromising the CPSC's or the voluntary standards groups' independence.

As a result of this GAO Report, Commission staff proposed conforming amendments to 16 CFR 1031, the Commission's regulation on participation in voluntary standards activities. These amendments followed GAO's recommendations to allow staff, on an optional basis, to vote on voluntary standards or take a leadership role on voluntary standards group committees.

The proposed rule noted that such activity might result in a more effective voluntary standards process and accelerate standards development and implementation. Further, such participation could gain CPSC staff greater access to and familiarity with the latest technologies, and would provide an opportunity for staff to help establish standards to advance CPSC's safety goals. In addition, "full" federal government participation in standards development increases the likelihood that the standards can meet both public and private sector needs. 141 Cong. Rec. H14334 (daily ed. December 12, 1995) (Statement of Rep. Morella). A single standard that satisfies both industry and the CPSC would benefit both by simplifying applicable requirements – only a single set of standards would apply.

Finally, optional staff participation in voluntary standards development groups by voting and taking leadership roles would be consistent with the guidance reflected in OMB Circular A-119 Revised, "Federal Participation in the Development and Use of Voluntary Consensus Standards and in Conformity Assessment Activities" (February 10, 1998). Among other things, OMB Circular A-119 encourages agency representatives serving as members of voluntary consensus standards bodies to "participate actively and on an equal basis with other members," and to "vote . . . at each stage of the standards development process unless prohibited from doing so by law of their agencies."

The role voluntary standards play in the safety of American consumers and the ability of the CPSC to do its job cannot be overemphasized. I have long believed that we must work in concert with voluntary standards organizations to help those organizations create

the best standards they can. This is why I am so delighted by the progress I have seen in the voluntary standards community over the past forty years. Groups such as ASTM, ANSI, and UL have dramatically improved their technical skills, their efficiency in drafting standards, their openness and transparency, and their outreach to all stakeholders – especially consumers – affected by their work. I am pleased to see CPSC work so closely with these groups, and I have little doubt that our partnership with them will only grow and deepen in the years to come in the interest of better standards for consumers and product manufacturers alike. That said, it is only a proposed rule and I am still reviewing all comments from all stakeholders and retain an open mind as to what the final version of the rule might look like.

21) **Given your nnderstanding of the voluntary standards process, how can staff's role help henefit or potentially hurt the process?**

Because of the disclaimers required of Commission staff in the proposed rule, I see no indication that the proposed rule's approach to staff involvement would suggest the Commission will play other than a constructive role. The law is fairly clear regarding CPSC's approach to voluntary standards. If the Commission, in the course developing a mandatory standard, determines that an existing voluntary standard adequately addresses a risk of injury and is substantially complied with, the Commission must stop its work and defer to the voluntary standard. Nothing in this proposed rule changes that.

I appreciate your concern and will be sure to pay particular attention to this issue when the final rule is presented to the Commission. I continue to review all the comments from all stakeholders of the proposed rule and retain an open mind as to what the final version of the rule might look like.

22) **Many are concerned that partisanship at the Commission has increased, as demonstrated hy the many party-line votes the Commission has taken since 2008, when the Consumer Product Safety Improvement Act was enacted. While the Commissioners have been able to find consensus on routine business items before the Commission, on more substantive matters such as rulemakings and establishing hudget and enforcement priorities, a partisan division is all too often evident. Why do you think the atmosphere at CPSC has become so partisan?**

I do not consider consumer product safety to be a partisan issue. I believe people serve as CPSC Commissioners with the same goal–to fulfill the mission of the CPSC and reduce the risk of injury or death to consumers from hazardous consumer products. Sometimes we may disagree on the path we should take to achieve this goal, but that does make the Commission a partisan body.

I have always worked to establish a good relationship – both personal and professional – with my fellow Commissioners, particularly with the current Commissioners. I greatly value these relationships. I believe we have worked tirelessly and respectfully to achieve common ground. If re-confirmed, I would continue these efforts.

23) Mr. Adler, if you're reconfirmed to the CPSC, you will become the most senior Commissioner, and will continue to occupy a role with significant influence on the culture of the Commission. Will you commit to work to bring about a culture change at the agency, for instance, by working with the minority Commissioners to achieve consensus – including working with Commissioner Buerkle and Mr. Mohorovic, should he be confirmed?

Yes. If re-confirmed, I assure you that I will continue to work with all of my fellow Commissioners to achieve consensus.

24) As you know, the position of General Counsel at the CPSC had been a non-political career position designed to ensure a mechanism of checks and balances. Though this has not always been the case, it seems to me that the General Counsel's office should provide independent and credible opinions to the Commissioners and be free from political influences. After all, each Commissioner is not short of staff to provide political counsel. Please explain whether or not yon believe that the General Counsel's office should provide independent and objective views of matters considered by the Commission?

I believe a General Counsel, regardless of his or her employment status, should provide independent, objective advice. Federal employees, career and non-career, are bound by a code of ethics, requiring them to be loyal to the law and ethical principles, and attorneys are further bound by their own code of ethics. Further, the position of General Counsel is one that is filled by a member of the Senior Executive Service. Based on my years of working at and monitoring the Commission, I have no reason to believe that a non-career General Counsel would act any differently than a career General Counsel in terms of the advice he or she gives to the Commission.

25) In 2008, by approving the Consumer Product Safety Improvement Act, Congress mandated under Section 108 that the CPSC establish a Chronic Hazard Advisory Panel (CHAP) to review specific phthalates used in children's toys and childcare articles. I am concerned that Section 108 of the CPSIA is not being carried ont in a transparent manner. During the CHAP's review process, the Commission decided to conduct a peer review of the CHAP's draft report on phthalates and phthalate alternatives completely behind closed doors. There have been no public meetings or conference calls over the past two years, which is rare for a process under the guidance of the CPSC. Because the report is over 24 months late and the process has not been transparent to the public – with no public meetings since February 2012 – 1 want to know what the Commission will do to ensure a full and transparent implementation of this Congressional mandate. Will you implement an open and transparent process that allows for public input on the Panel's report prior to the start of the CPSC's rulemaking process?

Not later than 180 days after the Commission's receipt of the final CHAP report, as mandated by the statute, "the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule [related to the findings of the CHAP]." This

rulemaking procedure, as contemplated by the Administrative Procedure Act (APA), includes an open and transparent process that allows for public input during the course of promulgating the mandated rule. The rulemaking process under section 553 of the APA will give stakeholders and the public generally the opportunity to submit information and comments, all of which will be publicly available.

In addition, as former Chairman Inez Tenenbaum previously announced, upon receipt of the final CHAP report, the Commission intends to publicly release the following additional documents:

- CHAP draft Final Report;
- Peer reviewers' Report which includes comments on the draft final report submitted to the CHAP, and charge questions submitted to the peer reviewers;
- Identities and affiliations of the peer reviewers;
- Any other data acquired by the CHAP that has not been previously cleared for public release by the CHAP.

Also, currently on the CPSC's CHAP web page is every meeting, phone call, piece of correspondence, and all data submitted by the public since the CHAP was convened, with certain exceptions. For copyrighted material, such as journal articles, CPSC staff generally post the transmittal letter and the journal citation only. If the article is open access, CPSC staff has included a link to the article. For government reports available online, the staff has posted the transmittal letter, citation, and Web link. All of this information is publicly available at: http://www.cpsc.gov/about/cpsia/chapmain.html.

26) With regard to the Chronic Hazard Advisory Panel, how should the CPSC ensure that all alternatives are subjected to the same level of scrutiny as the chemicals in question, in order to clearly justify which chemical is safer, before issuing a final decision?

It is difficult to answer this question without having received the CHAP report at this time. However, I am committed to following both the letter and the spirit of the direction given to the Commission in Section 108 of the CPSIA. I look forward to receiving the report and having the Commission commence the rulemaking contemplated in the law.

27) With regard to the Chronic Hazard Advisory Panel, how will you ensure that thoroughly tested chemicals in the market place today will not be penalized when compared against a less tested alternative?

It is difficult to answer this question without having received the CHAP report at this time. However, I am committed to following both the letter and the spirit of the direction given to the Commission in Section 108 of the CPSIA. I look forward to receiving the report and having the Commission commence the rulemaking contemplated in the law.

28) Please provide the Committee with the full list of scientific studies that were evaluated by the Chronic Hazard Advisory Panel and then made available to the

peer reviewers. Please also submit to the Committee a timeline for the release of the report and the issuance of a draft rule.

Because of the statutory mandate that the CHAP operate as an independent panel, and in the interest of scientific integrity, the submission to the Commission of the final CHAP report is not in the control of the Commission, nor does the Commission have knowledge of the scientific studies that the CHAP may have chosen to evaluate. All studies submitted by the public for consideration by the CHAP have been conveyed to the CHAP.

Not later than 180 days after the Commission's receipt of the final CHAP report, as mandated by the statute, "the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule [related to the findings of the CHAP]." This rulemaking procedure, as contemplated by the Administrative Procedure Act (APA), includes an open and transparent process that allows for public input during the course of promulgating the mandated rule. The rulemaking process under section 553 of the APA will give stakeholders and the public generally the opportunity to submit information and comments, all of which will be publicly available.

In addition, as former Chairman Inez Tenenbaum previously announced, upon receipt of the final CHAP report, the Commission intends to publicly release the following additional documents:

- CHAP draft Final Report;
- Peer reviewers' Report which includes comments on the draft final report submitted to the CHAP, and charge questions submitted to the peer reviewers;
- Identities and affiliations of the peer reviewers;
- Any other data acquired by the CHAP that has not been previously cleared for public release by the CHAP.

Also, currently on the CPSC's CHAP web page is every meeting, phone call, piece of correspondence, and all data submitted by the public since the CHAP was convened, with certain exceptions. For copyrighted material, such as journal articles, CPSC staff generally post the transmittal letter and the journal citation only. If the article is open access, CPSC staff has included a link to the article. For government reports available online, the staff has posted the transmittal letter, citation, and Web link. All of this information is publicly available at: http://www.cpsc.gov/about/cpsia/chapmain.html.

29) **Given that the CHAP report meets a number of the requirements for a "highly influential" assessment, and that the Commission must comply with the standards established by the Office of Management and Budget's Final Information Quality Bulletin (OMB Bulletin) for Peer Review, can you assure the Committee that the CHAP report peer review will be completed in full conformauce with the Bulletin?**

It is my understanding that OMB was consulted with respect to its Peer Review Bulletin. Further, CPSC understands the scientific importance of the CHAP report and will comply

with the requirements regarding the report and the ensuing rulemaking set forth in section 108 of the CPSIA.

30) **With regard to the Chronic Hazards Advisory Panel, Chairman Tenenbaum assured Congress that the CPSC was fully committed to an open and transparent process. The OMB Guidelines, on page 40, outline public participation in line with a transparent process by stating: "the agency shall make the draft scientific assessment available to the public for comment at the same time it is submitted for peer review (or during the peer review process) and sponsor a public meeting where oral presentations on scientific issues can be made to the peer reviewers by interested members of the public." When will the draft assessment be made available for public comment, and when will the public meeting take place to allow for oral presentations on scientific issues?**

Not later than 180 days after the Commission's receipt of the final CHAP report, as mandated by the statute, "the Commission shall, pursuant to section 553 of title 5, United States Code, promulgate a final rule [related to the findings of the CHAP]." This rulemaking procedure, as contemplated by the Administrative Procedure Act (APA), includes an open and transparent process that allows for public input during the course of promulgating the mandated rule. The rulemaking process under section 553 of the APA will give stakeholders and the public generally the opportunity to submit information and comments, all of which will be publicly available.

In addition, as former Chairman Inez Tenenbaum previously announced, upon receipt of the final CHAP report, the Commission intends to publicly release the following additional documents:

- CHAP draft Final Report;
- Peer reviewers' Report which includes comments on the draft final report submitted to the CHAP, and charge questions submitted to the peer reviewers;
- Identities and affiliations of the peer reviewers;
- Any other data acquired by the CHAP that has not been previously cleared for public release by the CHAP.

Also, currently on the CPSC's CHAP web page is every meeting, phone call, piece of correspondence, and all data submitted by the public since the CHAP was convened, with certain exceptions. For copyrighted material, such as journal articles, CPSC staff generally post the transmittal letter and the journal citation only. If the article is open access, CPSC staff has included a link to the article. For government reports available online, the staff has posted the transmittal letter, citation, and Web link. All of this information is publicly available at: http://www.cpsc.gov/about/cpsia/chapmain.html.

31) **The CPSC issued several proposed rules that could fundamentally change the process for how the Commission works with regulated entities. For the most controversial proposals, many comments have urged the CPSC to work with stakeholders to help the agency in meeting its policy objectives. The first of the most controversial proposals was a potential change to the 1110 Rule on certificates of**

compliance, and the CPSC wisely took a step back and announced its intent to hold a meeting with stakeholders to rethink the proposal. Did the CPSC learn that it is more effective to engage with the broad range of stakeholders before issuing a proposed rule, perhaps in the form of holding a public meeting with stakeholders, an Advance Notice of Proposed Rulemaking (ANPR) or both?

I believe that stakeholder input plays an integral role in the rulemaking process. With respect to the 1110 Rule on Certificates of Compliance, I carefully reviewed the issues raised by commenters during the comment period, as well as requests from stakeholders. Many commenters had very detailed, practical implementation concerns that deserved further exploration that I had not seen during the Commission's briefing and subsequent public meeting. This is why I voted to reopen the comment period and conduct a public workshop with stakeholders to gain a better understanding of how to more effectively enhance the 1110 Rule.

32) Do you believe that warnings are an effective tool in communicating hazards to the public?

I think the best way to answer this question would be to put it into the larger context of how CPSC staff works to address and mitigate hazards. CPSC staff follows the standard "safety hierarchy" method when trying to reduce the risk of injury: (1) eliminate the hazard, (2) guard against the hazard, and (3) warn of the hazard.

In certain situations, a warning can be an effective tool. We have seen this in the case of button cell batteries and strollers. But, warnings are sometimes less effective in reducing risk than either eliminating or guarding against the hazard. There are lots of details that can make a warning effective: large font, bright colors, simple language, multiple languages, prominent placement, or conspicuous graphics. But, warnings cannot be relied upon in all situations to reduce unreasonable risks of death and injuries. In some cases, a warning may not adequately express the severity of the risk of harm presented to the consumer. In other cases, a warning may not be effective because the product presents a poor medium for written information. For example, the product may be too small. Also, warnings are not very effective on products where the consumer at risk cannot understand the warning, for example with infants – which explains why Congress enacted the Poison Prevention Packaging Act authorizing the agency to issue rules that require child-resistant closures on dangerous household chemicals.

33) Do you believe there are certain hazards that cannot, under any circumstance, be warned or educated against?

Yes. Some hazards are so hidden or occur so unexpectedly that warnings cannot prevent serious injuries or fatalities.

34) Procedurally, how do you believe those hazards, which cannot be warned or educated against, should be determined by the agency?

As stated above, CPSC staff follows the standard "safety hierarchy" method when trying to reduce the risk of injury: (1) eliminate the hazard, (2) guard against the hazard, and (3) warn of the hazard.

In determining the effectiveness of product and/or public warnings, CPSC staff analyzes the use and utility of the product, the hazard, the pattern of injury, changes in reported injuries following design or labeling adjustments, and whether the risk is foreseeable.

35) **Section 104 of the Consumer Prodnct Safety Improvement Act mandated that the CPSC adopt two mandatory rules on durable infant goods rules every 6 mouths. Given tbe nature and diversity of durable infant products, do you feel as though this mandate by Congress is too mnch? If so, how do you propose working with staff to ensure that industry leaders have the resources and time necessary to thoroughly vet their concerns through the ASTM process?**

Section 104 of the CPSIA, is also known as the "Danny Keysar Child Product Safety Notification Act." The Act was named after Danny because he was entrapped and died in a twice-recalled portable crib. I have gotten to know Danny's parents, Linda Ginzel and Boaz Keysar, very well and their efforts to keep other infants from suffering the same tragedy that happened to Danny make them true American heroes in my book.

It is true that Section 104 mandates a significant amount of work to the Commission in the area of durable infant and toddler products. However, I helieve the work has allowed the Commission to promulgate some of the most stringent safety standards in the world for our most vulnerable and involuntary risk takers – small children. And while the statutorily mandated time frames are short, I believe that the Commission has successfully worked with ASTM and the durable infant products industry to make sure that all voices can be appropriately heard when promulgating these standards. Given the proper resources, I believe the "104 model" of rulemaking could serve as a template for all Commission rulemakings.

Senator Roy Blunt
Questions for the Record
Nomination of Robert Adler to be
Commissioner, Consumer Product Safety Commission (Reappointment)
Senate Committee on Commerce, Science, and Transportation
Hearing on June 11, 2014

Harmonization of Standards

The public identified the need to comply with different standards all addressing the same type of hazard as a problem and Congress asked the agency to address this as a potential burden reduction opportunity in PL 112-28. The agency has done little to investigate whether compliance with a standard in another jurisdiction would provide an equivalent level of safety or try to harmonize safety standards with those in other jurisdictions.

- **Does the agency need new authorities to accomplish this effort?**

- **If not, why has more not been done to address this problem?**

Although no other international standard is identical to a CPSC-administered children's product safety rule, there are many tests within certain other international standards that are the same, or more stringent than, their equivalent test within the CPSC-administered children's product safety rule. For example, the toy abuse tests in the European standard EN71, part 1,1 and the International Standard ISO 8124-12 are the same, or more stringent than, their corresponding tests in ASTM F963-11.3.

Although CPSC could explore harmonization more, this would not change the statutory requirement for third party testing of children's products. What we have been told by members of the regulated community is that they would prefer the agency focus its attention on ways to reduce burdens that would release them from testing entirely. As I stated before the Committee during my June 11 re-nomination hearing, Congress, in section 2(a)(3) of P.L. 112-28, did not simply direct CPSC to address third party testing burden reduction. Instead, the mandate in that law was, within a year, to seek public comment on opportunities "to reduce the cost of third party testing requirements consistent with assuring compliance with any applicable consumer product safety rule, ban, standard, or regulation." We have done that and have dedicated many staff months to assessing the various approaches suggested in the law and in the many comments we received in response to our Requests for Information (RFI) published in the Federal Register.

A solid consensus has emerged from the many commenters that have responded to our requests for information. Most see little burden reduction potential in Commission initiatives that retain third party testing costs. Instead, they seek to have the Commission expand on a list of determinations for lead first published in August 2009 in the Federal Register and currently found at 16 CFR § 1500.91. This list identifies those products or product components that will never contain violative amounts of lead. Once such a determination is made, such products or product components need not be subject to third party testing. Ideally, based on technical and

scientific data, we will be able to expand this list both to include more materials and to find materials that are used in the manufacture of children's products that will never contain violative amounts of phthalates or the eight heavy metals found in ASTM F-963. Once such a determination is made, such products or product components need not be subject to third party testing.

The Commission, on April 3, 2014, held an all-day forum on burden reduction and heard numerous thoughtful nominations from our stakeholders for product determinations. Unfortunately, because of the highly technical nature of many of these suggestions, CPSC scientific staff must carefully test the claims made by the participants. As I mentioned at my re-nomination hearing one of the most promising suggestions for exempting phthalate testing based on the hardness of plastics has been shown not to be accurate. Nevertheless, the Commission and its staff are proceeding with our work and we hope to provide testing relief as we confirm the scientific validity of the various suggestions.

In addition, last month, I introduced an amendment to the Commission's 2014 Mid-Year Review and Proposed Operating Plan Adjustments to examine potential ways to reduce third party testing costs through determinations consistent with assuring compliance with underlying requirements. The amendment was adopted. It provides funds for a study to assist the Commission in determining whether untreated wood or other natural materials are materials that do not, and will not, contain any of the eight specific heavy metals in levels that exceed allowable limits listed in the Toy Standard, ASTM F-963. Because wood was on the list of determinations for lead first published in August 2009 in the Federal Register, and currently found at 16 CFR § 1500.91, that identify those products or product components that will never contain violative amounts of lead, I am hopeful that this study will find similar results where the eight heavy metals listed in ASTM F-963 are concerned.

Partisanship at CPSC

I hope you will agree that the Commission should hold its safety mission above partisan politics. Many are concerned that partisanship at the Commission has increased, as demonstrated by the many party-line votes the Commission has taken since 2008, when the Consumer Product Safety Improvement Act was passed. While the Commissioners have been able to find consensus on routine business items before the Commission, on more substantive matters such as rulemakings and establishing budget and enforcement priorities, a partisan division is all too often evident.

- **Why do you think the atmosphere at CPSC has become so partisan?**

  I do not consider consumer product safety to be a partisan issue. I believe people serve as CPSC Commissioners with the same goal–to fulfill the mission of the CPSC and reduce the risk of injury or death to consumers from hazardous consumer products. Sometimes we may disagree on the path we should take to achieve this goal, but that does make the Commission a partisan body.

I have always worked to establish a good relationship – both personal and professional – with my fellow Commissioners, particularly with the current Commissioners. I greatly value these relationships. I believe we have worked tirelessly and respectfully to achieve common ground. If re-confirmed, I would continue these efforts.

- **Mr. Adler, if you're reconfirmed to the CPSC, you will become the most senior Commissioner, and will continue to occupy a role with significant influence on the culture of the Commission. Will you commit to me today to work to bring about a culture change at the agency, for instance, by working with the minority Commissioners to achieve consensus – including working with Commissioner Buerkle and Mr. Mohorovic, if he is also confirmed?**

  Yes. If re-confirmed, I assure you that I will continue to work with all of my fellow Commissioners to achieve consensus.

Independence of CPSC General Counsel

As you know, the position of General Counsel at the CPSC had been a non-political career position designed to ensure a mechanism of checks and balances. Though this has not always been the case, it seems to me that the General Counsel's office should provide independent and credible opinions to the Commissioners and be free from political influences. After all, each Commissioner is not short of staff to provide political counsel.

- **What is your opinion? Do you think that the General Counsel's office should provide independent and objective views of matters considered by the Commission?**

  I believe a General Counsel, regardless of his or her employment status, should provide independent, objective advice. Federal employees, career and non-career, are bound by a code of ethics, requiring them to be loyal to the law and ethical principles, and attorneys are further bound by their own code of ethics. Further, the position of General Counsel is one that is filled by a member of the Senior Executive Service. Based on my years of working at and monitoring the Commission, I have no reason to believe that a non-career General Counsel would act any differently than a career General Counsel in terms of the advice he or she gives to the Commission.

Working with stakeholders

The Commission issued several proposed rules that could fundamentally change the process for how the Commission works with regulated entities. For the most controversial proposals, many comments have urged the CPSC to work with stakeholders to help the agency in meeting its policy objectives. The first of the most controversial proposals was a potential change to the 1110 Rule on certificates of compliance, and the CPSC wisely took a step back and announced its intent to hold a meeting with stakeholders to rethink the proposal.

- **Did the CPSC learn that it is more effective to engage with the broad range of stakeholders before issuing a proposed rule, perhaps in the form of holding a public meeting with stakeholders, an Advance Notice of Proposed Rulemaking (ANPR) or both?**

  I believe that stakeholder input plays an integral role in the rulemaking process. With respect to the 1110 Rule on Certificates of Compliance, I carefully reviewed the issues raised by commenters during the comment period, as well as requests from stakeholders. Many commenters had very detailed, practical implementation concerns that deserved further exploration that I had not seen during the Commission's briefing and subsequent public meeting. This is why I voted to reopen the comment period and conduct a public workshop with stakeholders to gain a better understanding of how to more effectively enhance the 1110 Rule.

- **Would you support greater use of stakeholder working groups and requests for information as the CPSC examines ways to improve the effectiveness of its programs?**

  Yes. I always welcome the input of stakeholders. If re-confirmed, I promise to carefully consider the views of all interested parties.

Public Outreach

The digital age provides new opportunities for more direct contact to consumers for distributing important information and education.

- **How important are public/private partnerships in the strategies for outreach to consumers and please explain how the agency can engage and utilize the private sector in furthering its mission, one that is shared by manufacturers.**

  Very important. The CPSC is a small agency with a very large safety mandate. In order to inform and educate the public, the CPSC often relies on our non-governmental partners in the private sector and the not-for-profit sector to help us amplify our outreach. Whether through the use of social media, media interviews, or in-store messaging, CPSC has a rich history of collaborating with associations and companies on campaigns such as safe sleep for babies, drowning prevention, poison prevention, and window blind safety, to name only a few. A number of companies and organizations have effectively used social media platforms to inform their customers and constituents of product hazards. Because of the significant positive results for consumers that often come from these relationships, it is my hope that CPSC will continue to explore opportunities to work with industry and other groups on information and education campaigns.

- **How would you handle situations when consumers are being injured by using products incorrectly or contrary to label instructions?**

At the outset, let me say that every accident involves three factors: the product, the consumer, and the surrounding environment. Depending on the circumstances, it is often hard to pin down precisely what role each factor plays in an accident. That is why the Commission employs an extensive epidemiological and human factors staff to assist us in our approach to protecting consumers. I find it hard to generalize about the cause of some injuries by pointing to consumers' ignoring label instructions if the labels warn of hazards that consumers should not expect to exist. For example, the Commission entered into a civil penalty agreement with a manufacturer of infant flotation seats that failed without warning, plunging young children into water over their heads. The manufacturer had a warning label that parents should not leave children unattended in pools with the flotation device. That, however, did not address the fact that the seats were defective and failed without warning, placing infants in life-threatening situations.

That said, the Commission has a group of talented technical experts who often provide advice and guidance to outside groups regarding the efficacy of their warning labels. I believe that the market is a better informed, safer arena because of CPSC staff's technical input, and, if re-confirmed, I will continue to support their efforts.

- **What role would the CPSC play in such situations?**

CPSC's response would be dependent upon the product, the hazard, the pattern of injury, and whether the risk is foreseeable.

- **Do you believe that warnings are an effective tool in communicating hazards to the public?**

I think the best way to answer this question would be to put it into the larger context of how CPSC staff works to address and mitigate hazards. CPSC staff follows the standard "safety hierarchy" method when trying to reduce the risk of injury: (1) eliminate the hazard, (2) guard against the hazard, and (3) warn of the hazard.

In certain situations, a warning can be an effective tool. We have seen this in the case of button cell batteries and strollers. But, warnings are sometimes less effective in reducing risk than either eliminating or guarding against the hazard. There are lots of details that can make a warning effective: large font, bright colors, simple language, multiple languages, prominent placement, or conspicuous graphics. But, warnings cannot be relied upon in all situations to reduce unreasonable risks of death and injuries. In some cases, a warning may not adequately express the severity of the risk of harm presented to the consumer. In other cases, a warning may not be effective because the product presents a poor medium for written information. For example, the product may be too small. Also, warnings are not very effective on products where the consumer at risk cannot understand the warning, for example, with infants – which explains why Congress enacted the Poison Prevention Packaging Act authorizing the agency to issue rules that require child-resistant closures on dangerous household chemicals.

- **Do you believe there are certain hazards that cannot, under any circumstance, be warned or educated against?**

  Yes. Some hazards are so hidden or occur so unexpectedly that warnings could not avoid serious injuries or fatalities.

- **Procedurally, how do you believe those hazards, which cannot be warned or educated against, should be determined by the agency?**

  As stated above, CPSC staff follows the standard "safety hierarchy" method when trying to reduce the risk of injury: (1) eliminate the hazard, (2) guard against the hazard, and (3) warn of the hazard.

  In determining the effectiveness of product and/or public warnings, CPSC staff analyzes the use and utility of the product, the hazard, the pattern of injury, changes in reported injuries following design or labeling adjustments, and whether the risk is foreseeable.

Senator Ron Johnson
Questions for the Record
Nomination of Robert Adler to be
Commissioner, Consumer Product Safety Commission (Reappointment)
Senate Committee on Commerce, Science, and Transportation
Hearing on June 11, 2014

1) **Mr. Adler, if you are re-nominated, when you are considering a mandatory standard, are you willing to take into account not only consumer safety but also:**
   a. **A consumer's right to afford products, access products, and assume a reasonable amount of risk?**

      Yes. Our statutes and regulations require that the Commission focus its efforts on unreasonable risks of serious injuries or death associated with consumer products when undertaking mandatory rulemaking, not all risks. We are required by our statutes and regulations to factor the effect on a product's cost, availability and utility that would result from a mandatory rulemaking.

   b. **A company's ability to survive and the number of jobs that will be lost if your standard is put in place?**

      Yes.

2) **A number of questions have been raised about the CPSC's proposed rulemaking to revise the voluntary recall rule. There is concern that the revised rule, if finalized, may actually delay recalls and make the process more adversarial and legalistic. Such a result would be unfortunate and not in consumers' best interests, and so I wanted to make you aware of my concerns about what has been proposed. Recalls are most effectively and efficiently done when they are voluntary. Do you agree that changing the rules in a way that is likely to make negotiations more adversarial and legalistic could result in significant delays, which are ultimately not in the best interest of consumers?**

I am in full agreement that effective recalls are in the best interest of consumers. It is for this reason that I voted to publish a Notice of Proposed Rulemaking for a proposed Voluntary Recall Notice Rule last year. The intent of the proposed rule, as I read it, is to improve the quality of recalls to protect consumers.

While I recognize that some have suggested that the changes proposed in the rule may, in some instances, slow the process of voluntary recall negotiations, I do not at this point have any evidence to that effect. Nothing proposed in our rule will require firms to take any actions beyond those they currently do. They will still have to provide the same information, propose the same recall plans and the same methods of publicizing them – and no more. For example, the current Voluntary Recall rule requires that recalling firms sign their Corrective Action Plans. See 115.20(a)(1)(ix). The proposed rule contemplates only that recalling firms actually uphold the agreement they have voluntarily entered into. That said, it is only a

proposed rule and I am still reviewing all comments from all stakeholders and retain an open mind as to what the final version of the rule might look like.

3) **The Commission's proposed rulemaking has been justified by advocates on grounds that legally binding corrective action plans (CAPs) will ensure parties adhere to the terms of the plan. Others have described this proposal as "a rule in search of a problem," arguing that parties usually adhere to the terms of their agreements. Please provide a detailed accounting of instances where parties have violated the agreed-npon terms of a CAP.**

Although it is true that the overwhelming majority of firms that conduct voluntary recalls in cooperation with the CPSC do so in good faith and live up to the terms of their Corrective Action Plans, from time to time some firms fail to do so. In that respect, one may liken it to firms insisting on entering into binding contracts even with companies they trust and have done business with for years. Notwithstanding the small number of non-cooperators, prudence still dictates that one take protective measures – especially where the lives and limbs of American consumers are involved. In the product safety context, even a small number of non-cooperators may still leave consumers exposed to millions of individual hazardous product units.

The changes in the proposed rule are designed to help address the small number of recalcitrant firms that "slow walk" their agreed upon activities, whether they he with respect to setting up a consumer recall hotline, undertaking education efforts, or fulfilling a repair remedy. Unfortunately, the Commission staff does not maintain a database of "slow walkers." Moreover, due to the restrictions of confidentiality associated with enforcement activities as well as the information disclosure restrictions of 15 USC §2055(b), I would be unable to name these firms even if CPSC staff maintained such a list.

I believe that the proposed rule will change very little, if anything, for the vast majority of firms that engage in voluntary recalls with the Commission. Most firms take their responsibilities very seriously and should generally be unaffected by the rule change.

Finally, it is important to note that this is a proposed rule. In view of the controversial nature of the proposal, I am carefully reviewing all comments from our stakeholders with particular care, and I retain an open mind as to what the final version of the rule might look like.

4) **If a party were to violate the terms of a corrective action plan, what recourses are currently available to the Commission to affect a recall?**

Under existing CPSC rules, voluntary recall plans cannot be legally binding. See 16 CFR § 1115.20(a) ("A corrective action plan is a document signed by a subject firm...which has no legally binding effect.") Accordingly, the options available to the Commission where a firm fails to live up the terms of a Corrective Action Plan are somewhat limited. Aside from criticism and cajolery, the primary legal alternative for the CPSC would be to file a lawsuit, either in federal district court for injunctive relief or with an administrative law judge seeking

to have a product declared a substantial product hazard. These are resource-intensive, time-consuming actions that do not speed safety for consumers.

Perhaps the most significant remedy available to the Commission would arise if the non-cooperating firm were to engage in the sale, resale, or attempted sale of a product subject to a voluntary recall. In such a case, section 19 of the CPSA, 15 USC § 2068(a)(2)(B), would permit the agency to seek civil penalties for these acts. However, any other violative activity by a firm, including its failing to repair a product for consumers or fulfilling its commitment to remove a product from the stream of commerce is not a term of an agreement that the Commission can currently enforce as part of a voluntary recall action plan.

5) **Serious concerns have been raised about the legal basis for the Voluntary Recall Rule, with two important substantive changes being a requirement that voluntary recalls be made legally binding and empowering staff to require compliance program elements within a corrective action plan. What legal authority has Congress given the CPSC to make voluntary recalls legally binding? I am not aware of any.**

If a firm chooses to enter into a binding Corrective Action Plan with the Commission, the decision to do so is a voluntary act. This is no different from any other contract that millions of parties voluntarily enter into. Section 27(g) of the CPSA, 15 USC § 2076(g), specifically authorizes the Commission "to enter into contracts with governmental entities, private organizations, or individuals for the conduct of activities authorized by this Act."

That said, I again note that this is a proposed rule. I am carefully reviewing all comments from all stakeholders and retain an open mind as to what the final version of the rule might look like.

6) **What legal authority has Congress given the CPSC to impose and regulate internal compliance programs in voluntary recall agreements?**

If a firm chooses to enter into a binding agreement with the Commission, the decision to do so is a voluntary act.

7) **I understand that a recent revision to the monthly report that companies undertaking volnntary recalls file with the CPSC added without notice or explanation a new reqnirement for snch companies to monitor resale or anction sites. As Acting Chairman, were you aware of the new reqnirements as they were being developed?**

Since becoming Acting Chairman on December 1, 2013, I have received regular briefings from our Compliance staff. Shortly before a public announcement regarding the new form, I learned of the desire by CPSC staff to update our online "CPSC Monthly Progress Report for Recalls" to include the existence of, and importance of, electronic media and retailers.

8) **What authority does the commission have to reqnire companies to monitor sites where products they no longer own or control are being resold?**

As I understand it, when a firm enters into a voluntary agreement to conduct a recall in cooperation with the CPSC, the agency has always requested that firms work with the third-party sellers of their product to ensure that the recall is effective. This could include both "brick and mortar" retailers as well as online sellers of products. Regardless of whether an individual Corrective Action Plan includes an agreement for a recalling firm to monitor sites where their product is sold, the CPSC has always encouraged recalling firms to do so. The updated "CPSC Monthly Progress Report for Recalls" simply provides an easier way for firms to document what they have found, if they have found anything.

9) **Will companies be required to monitor third-party websites where products they no longer own or control are being resold even if such activity is not included in a corrective action plan?**

As I understand it, the Commission has always encouraged firms to monitor the sales of their products wherever they are sold.

10) **Isn't the commission responsible for ensuring that resale and auctions sites are not selling the affected product?**

Once a voluntary recall has been conducted with a firm, CPSC staff will monitor the marketplace for the sale, or resale, of any recalled product – acts that constitute a violation of the Consumer Product Safety Act. When we find such sales, or resales, we work to address the issue. Currently CPSC is monitoring more than 400 previous recalls. With jurisdiction over as many as 15,000 different product categories, in the interest of consumer safety, the Commission has also looked to its partners in the consumer product community, particularly industry, to assist in monitoring the sale, or resale, of products they have voluntarily recalled.

11) **How practically are thousands of companies, particularly smaller businesses, to undertake monitoring of third-party website where products such companies no longer own or control are being resold and what are such companies supposed to do if they find a product that has been recalled is being resold?**

Given the Commission's extremely limited resources, we certainly understand the challenges facing small businesses in monitoring the marketplace. Businesses often do so for reasons of competitiveness, patent protection, and brand loyalty. I hope that a company discovering the sale of its recalled products would notify both those engaged in such illegal and dangerous behavior and the staff of the Consumer Product Safety Commission.

12) **Will companies engaged in voluntary recall be liable for the actions of third-party websites?**

It is difficult to answer categorically questions that may be very fact specific and involve issues of contract agreements, legal interpretation, and enforcement discretion, but, generally speaking, recalling firms are not likely to be held liable for the actions of third-party websites over whom they have no legal or other relationship. That said, in the interest of consumer

safety, the Commission has always looked to its partners in the consumer product community to assist in monitoring the sale, or resale, of products they have voluntarily recalled.

13) Is it your view that a recalling company is legally responsible for the actions of third parties?

It is difficult to answer categorically questions that may be very fact specific and involve issues of contract agreements, legal interpretation, and enforcement discretion, but, generally speaking, recalling firms are not likely to be held legally responsible for the actions of third parties over whom they have no legal or other relationship. That said, in the interest of consumer safety, the Commission has always looked to its partners in the consumer product community to assist in monitoring the sale, or resale, of products they have voluntarily recalled.

14) Is it the intent of the CPSC to require companies engaged in a voluntary recall to monitor third-party websites?

It is my understanding that the CPSC, in the interest of consumer safety, has always encouraged recalling firms to monitor the potential sales, or resale, of products they have voluntarily recalled, regardless of where the sale, or resale, may occur. In 2014, a large percentage of consumer sales of all products, including many non-consumer products, take place online. The Commission has always looked to its partners in the consumer product community to assist in monitoring the sale, or resale, of products they have voluntarily recalled, and is likely to continue to do so.

15) Why was this new requirement for companies undertaking voluntary recalls to mouitor resale or auction sites not part of your proposed voluntary corrective action rule?

The Commission's request, in the interest of consumer safety, for recalling firms to monitor the sale, or resale, of its products wherever that sale, or resale, may take place is not new and is not a requirement for all firms. When a firm enters into a voluntary agreement to conduct a recall in cooperation with the CPSC, the agency has always requested that firms work with all third-party sellers of their product to ensure that the recall is effective. This could include both "brick and mortar" retailers as well as online sellers of produets. Regardless of whether an individual Corrective Action Plan includes an agreement for a recalling firm to monitor sites where their product is sold, the CPSC has always encouraged recalling firms to do so. The updated "CPSC Monthly Progress Report for Recalls" simply provides an easier way for firms to document what they have found, if they have found anything.

That said, I again note that this is a proposed rule. I am carefully reviewing all comments from all stakeholders and retain an open mind as to what the final version of the rule might look like.

16) The CPSC recently proposed a rule that would expand staff's role on voluntary standards setting bodies. Among the proposed changes, CPSC staff could participate as voting members of a voluntary standard developmeut group. As a commissioner, how do you view the agency's role in the voluntary standards setting process?

The rule to which you refer grew out of a report from May 2012 by the U.S. Government Accounting Office (GAO), "Consumer Product Safety Commission: A More Active Role in Voluntary Standards Development Should be Considered." (See http://www.gao.gov/assets/600/590990.pdf.)

The GAO Report recommended that the Commission review its policy for staff participation in voluntary standards development activities and determine the feasibility of the agency's staff assuming a more active role in developing voluntary standards. Specifically, the GAO Report recommended that CPSC staff be allowed – not required – in appropriate cases to vote on balloted provisions of voluntary standards. The Report also suggested that staff be allowed to hold leadership positions at various levels of standards development organizations, including task groups, subcommittees, or committees. GAO concluded that changing the CPSC's regulations to allow staff to participate more actively in voluntary standards activities could result in stronger voluntary standards without compromising the CPSC's or the voluntary standards groups' independence.

As a result of this GAO Report, Commission staff proposed conforming amendments to 16 CFR 1031, the Commission's regulation on participation in voluntary standards activities. These amendments followed GAO's recommendations to allow staff, on an optional basis, to vote on voluntary standard's or take a leadership role on voluntary standards group committees.

The proposed rule noted that such activity might result in a more effective voluntary standards process and accelerate standards development and implementation. Further, such participation could gain CPSC staff greater access to and familiarity with the latest technologies, and would provide an opportunity for staff to help establish standards to advance CPSC's safety goals. In addition, "full" federal government participation in standards development increases the likelihood that the standards can meet both public and private sector needs. 141 Cong. Rec. H14334 (daily ed. Decemher 12, 1995) (Statement of Rep. Morella). A single standard that satisfies both industry and the CPSC would benefit both by simplifying applicable requirements – only a single set of standards would apply.

Finally, optional staff participation in voluntary standards development groups by voting and taking leadership roles would be consistent with the guidance reflected in OMB Circular A-119 Revised, "Federal Participation in the Development and Use of Voluntary Consensus Standards and in Conformity Assessment Activities" (February 10, 1998). Among other things, OMB Circular A-119 encourages agency representatives serving as members of voluntary consensus standards bodies to "participate actively and on an equal basis with other members," and to "vote . . . at each stage of the standards development process unless prohibited from doing so by law of their agencies."

The role voluntary standards play in the safety of American consumers, and the ability of the CPSC to do its job cannot be overemphasized. I have long believed that we must work in concert with the voluntary standards organizations to help those organizations create the best standards they can. This is why I am so delighted by the progress I have seen in the

voluntary standards community over the past forty years. Groups such as ASTM, ANSI, and UL have dramatically improved their technical skills, their efficiency in drafting standards, their openness and transparency, and their outreach to all stakeholders. I'm pleased to see CPSC work so closely with these groups, and I have little doubt that our partnership with them will only grow and deepen in the years to come in the interest of better standards for consumers and product manufacturers alike. That said, it is only a proposed rule and I am still reviewing all comments from all stakeholders and retain an open mind as to what the final version of the rule might look like.

17) The statute is very clear in stressing the importance of relying on industry-developed volnntary standards. How do we ensnre that the Commission wonld not tnrn the standards development process into a de facto mandatory rulemaking by demanding standards tbat might not he fully supported by the industry?

I see no indication that the proposed rule would turn the voluntary standards development process into de facto mandatory rulemaking. I believe that CPSC involvement, especially by highly skilled and knowledgeable technical staff, often helps improve the quality of voluntary standards. Additionally, CPSC staff participation in the standards process does not automatically mean that the standards body will adopt CPSC staff's view or that the Commission will adopt the resulting voluntary standard. I appreciate your concern and will be sure to pay particular attention to this issue when the final rule is presented to the Commission. I continue to review all the comments from all stakeholders of the proposed rule and retain an open mind as to what the final version of the rule might look like.

18) If CPSC staff takes a leadership role, or even simply votes in support of a voluntary standards, isn't that an endorsement standard?

Because of the disclaimers required of Commission staff in the proposed rule, including that CPSC staff participation in the standards process does not automatically mean that the Commission will adopt the resulting voluntary standard, I see no indication that the proposed rule's approach to staff involvement would suggest the Commission has officially endorsed a particular standard. The law is fairly clear regarding CPSC's approach to voluntary standards. If the Commission, in the course developing a mandatory standard determines that an existing voluntary standard adequately addresses a risk of injury and is substantially complied with, the Commission must stop its work and defer to the voluntary standard. Nothing in this proposed rule changes that.

I appreciate your concern and will be sure to pay particular attention to this issue when the final rule is presented to the Commission. I continue to review all the comments from all stakeholders of the proposed rule and retain an open mind as to what the final version of the rule might look like

19) The Consumer Product Safety Commission sits at the intersection of science and consumer protection. It has come to the Committee's attention that there is an important distinction between scientific reviews conducted in other countries, such as the E.U., versus the scientific standards that we apply in the United States. As you

know, U.S. agencies apply the "reasonable risk" assessment that the CPSC must apply based on the legal standards, criteria and guidelines under the Federal Hazardous Advisory Act (FHSA) for conducting risk assessments and determining what factors to consider in those evaluations.

Specifically, the FHSA identifies safety factors, and mandates their application, in order to meet the 'banned hazardous substance' criteria. This is done by calculating the "acceptable daily intake" from the No Observed Adverse Effect Level (NOAEL) and the Low Observed Adverse Effect Level (LOAEL) to determine acceptable risk for developmental/reproductive toxicants. The U.S. standard provides a higher degree of safety than the current European regulatory system, which is skewed to implement a precautionary approach towards regulation that focuses primarily on a potential hazard and does not apply the same degree of risk assessment criteria in considering the actual use of the chemical.

How will you ensure that the CPSC strictly follows U.S. safety standards as defined by the FHSA and is not influenced by standards, such as the precautionary approach, outside the jurisdiction of the CPSC and the U.S. regulatory system?

My duty is to uphold and enforce the laws and regulations that apply to the CPSC, and if re-confirmed, I look forward to doing so.

20) Would you support greater use of stakeholder working groups and requests for information as the CPSC examines ways to improve the effectiveness of its programs?

Yes, with a caveat. One must keep in mind that stakeholder groups can easily fall within the provisions of the Federal Advisory Committee Act, 5 U.S.C. App. 2, §§ 1-16, which brings an array of procedural requirements and high costs for agencies. Many years ago, Congress abolished the three advisory committees administered by the CPSC because of the enormous costs they imposed on our resource-strapped agency.

That said, I have always been a strong advocate for the involvement of all CPSC stakeholders from large manufacturers and retailers to small businesses and inventors, to consumer advocates and individual members of the public. Since becoming a Commissioner, I have had an open door policy to all stakeholders and have sought to honor every request to meet with me. Further, I have always believed in reading every comment that is submitted to the agency on an issue that will come before me as a Commissioner. If re-confirmed, I look forward to finding more ways to improve the effectiveness of our feedback mechanisms with all of our stakeholder groups.

21) The digital age provides new opportunities for more direct contact to consumers for distributing important information and education. How important are public/private partnerships in the strategies for outreach to consumers?

Very important. The CPSC is a small agency with a very large safety mandate. In order to inform and educate the public, the CPSC often relies on our non-governmental partners in the

private sector and the not-for-profit sector to help us amplify our outreach. Whether through the use of social media, media interviews, or in-store messaging, CPSC has a rich history of collaborating with associations and companies on campaigns such as safe sleep for babies, drowning prevention, poison prevention, and window blind safety, to name only a few. A number of companies and organizations have effectively used social media platforms to inform their customers and constituents of product hazards. Because of the significant positive results for consumers that often come from these relationships, it is my hope that CPSC will continue to explore opportunities to work with industry and other groups on information and education campaigns.

22) How can the CPSC engage and ntilize the private sector in fnrthering its mission?

It is my hope that CPSC can continue to explore opportunities to conduct social media dialogues such as Twitter chats, participate in webinars, speak and exhibit at industry conferences, produce videos, and use the Neighborhood Safety Network to build on our progress in collaborating with the private sector to save lives, prevent injuries, and advance the cause of product safety.

In addition, almost every voluntary standards committee in which the Commission participates is made up, in part, of members from the private sector. The role voluntary standards play in the safety of American consumers, and the ability of the CPSC to do its job cannot he emphasized enough. I have long believed that we must work in concert with the voluntary standards organizations to help those organizations create the best standards they can. This is why I am so delighted by the tremendous progress I have seen in the voluntary standards community over the past forty years. Groups such as ASTM, ANSI, and UL have dramatically improved their technical skills, their efficiency in drafting standards, their openness and transparency, and their outreach to all stakeholders – especially consumers – affected by their work. I'm pleased to see CPSC work so closely with these groups, and I have little doubt that our partnership with them will only grow and deepen in the years to come in the interest of hetter standards for consumers and product manufacturers alike.

23) How would you handle situations when consumers are heing injured by using prodncts incorrectly or contrary to lahel instructions, and what role would the CPSC play in such situations?

At the outset, let me say that every accident involves three factors: the product, the consumer, and the surrounding environment. Depending on the circumstances, it is often hard to pin down precisely what role each factor plays in an accident. That is why the Commission employs an extensive epidemiological and human factors staff to assist us in our approach to protecting consumers. I find it hard to generalize about the cause of some injuries by pointing to consumers' ignoring label instructions if the labels warn of hazards that consumers should not expect to exist. For example, the Commission entered into a civil penalty agreement with a manufacturer of infant flotation seats that failed without warning, plunging young children into water over their heads. The manufacturer had a warning label that parents should not leave children unattended in pools with the flotation device. That,

however, did not address the fact that the seats were defective and failed without warning, placing infants in life-threatening situations.

That said, the Commission has a group of talented technical experts who often provide advice and guidance to outside groups regarding the efficacy of their warning labels. I believe that the market is a better informed, safer arena because of CPSC staff's technical input, and, if reconfirmed, I will continue to support their efforts.
