Description of document:	**US Army (and other) records re: Cluster of Infant Botulism Cases at Fort George G. Meade, Maryland in 2006**
Requested date:	05-October-2007
Released date:	10-March-2008
Posted date:	21-March-2008
Source of document:	Department of the Army US Army Claims Service Office of the Judge Advocate General Fort George G Meade, Maryland

DEPARTMENT OF THE ARMY
US ARMY CLAIMS SERVICE
OFFICE OF THE JUDGE ADVOCATE GENERAL
4411 LLEWELLYN AVENUE
FORT GEORGE G MEADE MARYLAND 20755-5360

March 10, 2008

REPLY TO
ATTENTION OF:

Executive

This letter is in response to your Freedom of Information Act (FOIA) request which was received in this office on October 5, 2007. You requested a copy of "all correspondence, letters and emails and ANY other type of communication, with CHHPM and anyone involved in the investigation on Fort George G. Meade, Maryland in October 2006 and December 2006." The enclosed compact discs provide the information requested. I apologize for the delay.

The documents contain personal information and that information has been redacted. Generally, the redacted information consists of the names, social security numbers, home addresses, home and work telephone numbers, medical information and personal information of private individuals and DoD employees. Release of this information would constitute an unwarranted invasion of privacy (FOIA Exemption 6).

The partial denial of your request for materials which are not being released is made on behalf of Major General Scott C. Black, The Judge Advocate General of the Army. You may appeal this determination by writing to the Commander, U.S. Army Claims Service, 4411 Llewellyn Avenue, Fort George G. Meade, MD 70755-5360 within 60 calendar days of your receipt of this letter. Both the letter and the envelope should be clearly marked, "Freedom of Information Act/Privacy Act Appeal." I will then forward your appeal to the General Counsel, Department of the Army, who will notify you directly of his decision.

Sincerely,

Kathleen Kelly

Kathleen Kelly
Major, US Army
Executive Officer

Office in Baltimore
Office 410-767-6685 Cell: [redacted]

ALCON:

Dr. Blythe called me at home at about 1800 hours Friday, 5 Jan 07, about the Botulism cases at Fort Meade. I advised him that the [redacted] He indicated that there is keen interest in following up on these two cases by the State of Maryland, CDC, and the research facility in California doing work on Infant Botulism .

Dr. Blythe also indicated that he had been doing some work that day on developing an investigation strategy to include a questionnaire etc. While the current Public Health position on Infant Botulism is that it is not a person to person spread, the people working with research are not so sure (might be fecal oral) [redacted]

[redacted]

I advised Dr. Blythe that while both of these cases lived close to each other (one or two buildings away on the same street) that there was no indication from Mom or Dad of the child now in the hospital when I interviewed them both that they knew of another case of Botulism on post. This was also the impression that the I.D. Resident had when he interviewed the parents as well.

Dr. Blythe's concern was "access" to Fort Meade to do the study. I indicated that this should be no problem, and that his point of contact was [redacted]. Copies of all reports submitted to the State of Maryland, have been faxed to Ms. [redacted], APHN, Fort Meade, and I discussed the cases with [redacted] later in the afternoon before COB Friday as well. Dr Blythe indicated in our conversation that he would be calling [redacted] first thing Monday a.m.

I gave Dr. Blythe, [redacted] 24/7 number [redacted], advising him as the Medical POC for this or any other Public Health Issue at WRAMC. Dr. Blythe indicated that he did not feel it was necessary for him to contact [redacted] that evening. He did indicate that there was an urgency to this investigation because we have two neighbors with cases and there might be other children infected, so getting to the bottom of any connection between these cases is vital, and it is also important for the Medical Community serving Fort Meade, to be aware of this possibility, without causing panic in the community. Because there are so few cases a year (100 nation wide) they don't have an incubation period for this disease.

My sense on this "investigation" is that the State of Maryland working in conjunction with "Public" Health: CDC, and the research facility in CA will take the lead, but that there is an Army "Public" Health counterpart assigned to each of the Maryland team member functions, so that the investigation, with papers published, etc., reveals that this was a team effort between Army and Public Health, and how well the synergistic effort went!

Mother of the child who is now in the hospital, is [redacted] at the [redacted]. Dad is a [redacted] works as the [redacted] at [redacted], both strictly in office positions. The family has no other children.

I just now faxed a copy of the records of the child from Fort Meade who had the infant botulism in October. (0730 8 Jan 07)

Subject: Infant hospitalized in OCTOBER.

EXSUM

January 9, 2007
For Official Use ONLY
Do NOT RELEASE

Response to Query:

The [redacted] family told Fort Meade officials late yesterday that their infant son was hospitalized in October for "Botulism." The family says the child has since recovered.

The Preventative Medicine Office at Kimbrough and Fort Meade Officials are investigating the situation.

Response to Query about the second case:

We are not aware of any additional cases at this time. But we are always concerned about all service members and their families' health issues.

Background Not For Release. For Internal use only:

[redacted]

Centers for Disease Control (CDC) called [redacted] and informed her that a 2nd case has been confirmed on Fort Meade today.

Major [redacted] was the Pediatrics doctor.

The family said the CDC investigator implied that a debris pile located on the corner of Clark Road may be the source of the airborne Botulism.

[redacted] confirmed that there were complaints of a dust cloud in the Area and Picerne Military Housing agreed to water the area down. The debris pile consists of crushed concrete.

Potential issues are yet to be investigated:

We have a meeting with the commander at 8:00 in the morning in his office.
Will keep everyone notified.

(CBS- Channel 9 WUSA may pick up the story. Fort Meade PAO was notified by DINFOS PAO that the wife of the family wanted to have them at her house last night. But Fort Meade PAO informed the family that all media coming to the installation must be escorted by our office.)

[redacted]

Thanks--will look for the revised fact sheet. There have been no media queries here (and likely will not be unless Fort Meade refers someone to me). Should I get a query, I will refer anything about Kimbrough to the Fort Meade office.

I'm preparing short responses on what an epicon is, what the composition of this one is, what its methods will be. Main message is usually that CHPPM supplements expertise at the medical facility. When I get a draft, I will forward it to you for review/approval, as well as our DEDS.

Had contacted [redacted] (whom I've met) and someone called [redacted] via email, and have now left voice mail for [redacted]

[redacted],

Just got off the phone w/ [redacted] (CDR Kimbrough ACC) and her staff regarding the two cases of infant botulism from the Ft Meade community.

They're requesting our assistance to address the issue and have requested an

EPICON.

A big concern is the risk of infection from exposure to contaminated soil. There's construction near the housing area where the two cases reside that's created a large debris pile of soil, concrete, etc. Local residents and the Ft Meade Garrison Command are very concerned that this may be the cause of the two infections.

There's been interest from outside medical organizations to help respond to this.

The POC at KACC is the Chief of PM, [redacted] (email above, [redacted]). Please ensure all communication is routed thru her so that we have a single message.

[redacted] They're sending up a draft press release (attached) and botulism fact sheet that need to be reviewed NLT 1700 today. They're also looking for assistance drafting an article for the Ft Meade newspaper to help inform the community. This will require RISKCOM support. Coordinate w/DEDS [redacted]'s in the office today.)

Please copy the USACHPPM-EOC w/all emails.

DEDS should prepare a daily consolidated exsum for the CG until this matter is over.

All,

We are working on [redacted]s questions and will have to you soon. Current status is [redacted] and [redacted] will travel to FT Meade and meet with Chief PM at Meade at 1600 today to discuss questionnaire and plan for tomorrow's launch of EPICON(-). [redacted] will provide list of needed resources after that meeting.
Minimum going out tomorrow from CHPPM will be [redacted] and myself. At 1000 hours tomorrow we will meet at Fort Meade PM office Maryland PH representative (possible state epidemiologist Dr. David Blythe), Meade staff [redacted] to interview parents of cases. Based on common exposures from those interviews [redacted] will direct further actions (food, environment, Child development center...).
Fort Meade possible support arranged includes: Veterinary support ([redacted] PHN [redacted] and CHPPM-North [redacted]
Should environmental sampling be required technical reachback includes: CHPPM lab support arrangement [redacted], CDC labs (partnership with DR. [redacted]) and Maryland Public health labs.
We are currently arranging a teleconference with CDC and other environmental exposure intestinal botulism experts, developing a questionnaire, reviewing risk communication/pao products and preparing to launch.

That is a short update from my vantage point.

I have about 10 questions that I forwarded to [redacted] on epicon details that would likely be asked by inquiring media reps. They are attached. Need ops to provide accurate answers to all those that don't refer to the fact sheet, today if possible.

I've had no inquiries so far. Mr. [redacted] told me he let Kimbrough know that we could respond to query if needed.

I have contacted the Fort Meade public affairs office requesting a copy of the final news release and letting them know that people from here will be supplementing Kimbrough for purposes of epidemiological investigation.

[redacted]

If you have a question, please check with the EOC first.
This way we prevent emails going to 15 people and 15 people responding and another 15 email messages and so on. Our leadership does not need to see every message string for simple staffing questions (that is why we have the EOC).
This process also prevents those that are supporting the mission to rely on the EOC to disseminate the information (not PAO stuff), situation reports, etc..
All info flows through the EOC, so we have the latest versions. The great folks in Risk Communication always keep OPS in the loop.

Thanks,

[redacted]

[redacted]
Just got off the phone w/ [redacted] and her staff regarding the two cases of infant botulism from the Ft Meade community.

They're requesting our assistance to address the issue and have requested an EPICON.

A big concern is the risk of infection from exposure to contaminated soil. There's construction near the housing area where the two cases reside that's created a large debris pile of soil, concrete, etc. Local residents and the Ft Meade Garrison Command are very concerned that this may be the cause of the two infections.

There's been interest from outside medical organizations to help respond to this.

The POC at KACC is the [redacted] (email above, [redacted]). Please ensure all communication is routed thru her so that we have a single message.

[redacted] They're sending up a draft press release (attached) and botulism fact sheet that need to be reviewed NLT 1700 today. They're also looking for assistance drafting an

article for the Ft Meade newspaper to help inform the community. This will require RISKCOM support. Coordinate w/DEDS [redacted] in the office today.)

Please copy the USACHPPM-EOC w/all emails.

DEDS should prepare a daily consolidated exsum for the CG until this matter is over.

EXECUTIVE SUMMARY

11 JAN 07

(U) FORT MEADE INFANT BOTULISM EPICON. (U) USACHPPM EPICON team will deploy to Fort Meade 12 Jan 07 to investigate 2 reported cases on infant botulism. Some team members met at Fort Meade 11 Jan. and conducted teleconference with CDC botulism specialists, Maryland and local public health officials, and the WRAMC physician who treated both cases. Clinical and environmental components of the investigation were discussed. EPICON team will meet with MTF commander tomorrow morning. Then 2 or 3 members will interview parents of both infants. PREPARE MEMO_____.

EXSUM
January 12, 2007
Friday

Stories appeared last night and this morning on/in:
WBAL TV 11 -NBC (Baltimore)
WUSA TV 9 - CBS (Washington)
WJZ TV 13 - CBS (Baltimore)
CNN
WBFF TV 5 - Fox
Capitol Gazette
AP
Various local metro radio stations.

UPDATE of Today's Events:

Media interest in the Botulism story continued today. Mrs. [redacted] continued to contact the media and be interviewed and says she won't rest until she gets some answers.

We were able to counter her barbs today when the commander went on air with WUSA9, Washington CBS affiliate and informed the reporter that the investigators were on site today. Our talking points included the fact that the investigators told him that botulism is a naturally occurring bacterium that can be found anywhere. They emphasized we may not ever know what caused these children to get sick. But the installation was doing all they could to ensure the safety of our community.

Two town hall meetings are scheduled for next week.

An invitation went out tonight to the residents of Amber Court to come to a private town hall meeting at 7pm on Tuesday January 16, 2007. We will have a physician from the US Army Center for Health Promotion and Preventive Medicine (USACHPPM) who is a member of the epidemiological consult (EPICON) team assisting in the investigation.

A second follow-up town hall meeting for all Fort Meade residents will be January 23 at Potomac Place at 6:00. Again the investigators for USACHPPM will be there to answer any questions.

We also had WJLA TV 7, ABC Affiliate cover the event on the installation.
There was a problem with the news crew showed up without contacting the Installation PAO office. They showed their House of Representatives Press Badge to the Contract Guard who thought they were a political leader and let them on the installation. They arrived at the [redacted] home (where they had been invited by the [redacted] and got there just as the investigators were arriving. So there was no PAO escort. But LTC [redacted] and [redacted], the Director, Epidemiology and Disease Surveillance, (U.S. Army Center for Health Promotion and Preventive Medicine, Aberdeen Proving Ground, Maryland) answered their questions successfully. And the media left. We later caught up with the media and explained the rules of escorting of media on post and explained they risk the pulling of their credentials on Fort Meade if they ever do that again.
We believe they now understand.

We also met with the Investigating Team today. The told us the following information.

They will not be doing environmental sampling in the house or outside or in the area. Our goal will be to explain this so folks don't think we are not doing anything. But sampling at this point is a waste of time. Botulism is everywhere.

The team will attempt to determine whether the two infant botulism cases reported in the Fort Meade area are related and attempt to identify any possible, common links or sources.

If one or more sources are identified, control measures may be recommended to guard against further transmission. Communication will be important throughout the process, and the team will share information regarding the illness and control measures with the affected community.

These cases are linked by proximity. Walter Reed Army Hospital has sent specimens from the babies to be tested at Maryland Labs. It will be several weeks before we have any answers. But the odds are against us finding an underling source because it is everywhere in the soil. It is not an inhalation problem but a toxic ingestion problem.

Reviewing results of tests that were ordered on the affected children during their illness, as well more specific testing that is in progress using samples from these patients. These more specific, bacteria subtype tests are being processed at public health laboratories. The team will review additional clinical information from healthcare providers.

They conducted interviews with both sets of infants' parents to determine food history and possible environmental exposures. They have follow-up questions with the one set of parents and will go back tonight.

Team members will also try to determine if the Fort Meade community or the civilian sector is experiencing other cases, by looking at surveillance data and disease reports. They are going tonight to introduce themselves to two other neighbors who have infants and live in the neighborhood.

They expect these meetings to extend through next week.

We have no plans to come in this weekend for coverage over the weekend. I believe the media is through until we can get some results. [redacted](my new media relations director) is on post and will be on call if anyone needs her. Her number is [redacted]

Have a great weekend.

I am concerned about the Story in the Saturday, January 13 2007 Maryland Gazette paper by Joshua Stewart. He says he talked to Lola Russell, spokesman for the CDC who is putting out information. Can we please get in contact with this person. "

Here is what she said that I have a problem with: "When there is a cluster that occurs, there is a soil in that area which has a higher than average content that was likely form some activity like construction."

To me here statement is confirming what Mrs. [redacted] was putting out that the construction ground was to blame. I would just like it if we could all agree on what to say. Do any of you have a contact number for LOLA?

About Botulism – Thoughts from the Commander

One of my fundamental responsibilities is the health and welfare of every member of this community. There are many threats to the safety of the folks who live, work, and play on Fort Meade. Last week I addressed the threat posed by motor vehicle accidents, for example. Even as I wrote that column, however, another safety issue loomed for our community, one much more difficult to take on. I learned late Tuesday afternoon that two cases of Infant Botulism had been diagnosed on Fort Meade and that both occurred on the same street, although separated in time by almost 3 month.

I've learned a great deal about botulism since the first call came in. Botulism is an extremely common bacteria that is found in soil. The most common form of the disease can usually be traced to tainted food arising from improperly canned or bottled food. Infant Botulism is rarer. It generally strikes babies under six months of age. Somehow the child ingests the bacteria and their young systems are unable to kill it in their stomachs. The bacteria grows and multiplies and begins to release the botulism toxin into their little systems. The toxins then attack the muscles throughout the body. If untreated, the disease can result in death.

We were fortunate. The doctors at Walter Reed diagnosed the illness in time to save both children's lives and each is now home. The questions that we are left with are from where did this particular strain of the bacteria come, how did the babies ingest it, and what can we do to minimize the risk of other infants becoming sick? To answer these questions, the Preventive Health department at Kimbrough is leading a team made up of epidemiologists and health care professionals from the Army's Center for Health Promotion and Preventive Medicine and the Anne Arundel County Health Department. They are drawing on the expertise of Maryland's Department of Health, the Center for Disease Control, and medical researchers around the country who have tried to understand this disease.

It is unlikely, these professionals tell me, that we will be able to trace the botulism bacteria that struck these babies to a particular source: it is simply too commonplace in the environment. Similarly, there are many ways that the bacteria could have been introduced into the children's systems. The investigative team will nevertheless try to establish some commonality between the two cases.

I have responsibility to take actions to reduce risks of further transmissions as these are identified to me. Since the botulism bacteria occurs naturally in the soil, I am working with Picerne to cover exposed soil near housing areas to limit the possibility of airborne transmission through dust. That is why we reseeded the construction staging site on Clark Road; and that is why we will relocate this site before we initiate planned construction in the spring. I have also worked to distribute a flyer to all residents describing the symptoms of this disease and some common actions parents and caregivers may take to reduce risks of transmitting the disease to infants. These include boiling water used in formula, cleaning toys frequently in a weak bleach solution, and washing

hands constantly with hot water and soap. None of these actions is a guarantee that the disease won't be transmitted, but they do reduce risk.

We held a meeting for all residents of Oliver Court on 16 January to discuss their specific concerns and answer questions they might have. I will conduct another community meeting on 23 January at Potomac Place at 1800 hours. This meeting will be open to all residents and any one else on the installation who has questions or concerns.

The good news is that this disease is treatable. Both babies are healthy and happy. The bad news is that it does not lend itself to definitive prevention measures: there is nothing to "clean-up," there is no trail showing where it came from and how it got to the baby. This can be frustrating for people who want answers now, who want to assign blame. This is our community and a strong community comes together when faced with adversity. We all must be vigilant of symptoms, more careful than ever of good sanitation actions, and not contribute to rumors or speculation. If you have questions, ask them. If you hear rumors, give us an opportunity to respond to them.

I have prayed a prayer of thanksgiving that both children are fine; I pray that no other families will suffer. Perhaps that is the most powerful response I can offer. Please continue to care for each other and reach out to those in need.

VOL. 04 NO. 04 May/June 1998

MSMR

Medical Surveillance Monthly Report

Table of Contents

Army Medical Surveillance Activity (AMSA)

Current and past issues of the MSMR can be viewed online at the following internet address: *amsa.army.mil*

Data in the MSMR is provisional, based on reports and other sources of data available to the Medical Surveillance Activity. Notifiable conditions are reported by date of onset (or date of notification when date of onset is absent). Only cases submitted as confirmed are included.

Surveillance Trends

Completeness and Timeliness of Reporting of Notifiable Diseases/ Conditions, US Army, July 1997 - December 1997

The Army Medical Surveillance Activity (AMSA) periodically assesses the completeness and timeliness of reporting of notifiable diseases/conditions. The methodology of the assessment has been described in previous MSMRs.[1,2] In brief, for defined periods, records of hospitalizations of active duty soldiers were searched to identify those with principal discharge diagnostic codes indicative of reportable diseases/conditions. These records were then compared to reports received through the Army's automated notifiable diseases reporting system (MSS). Completeness of reporting was estimated as the percent of hospitalized cases that were reported through the MSS; among hospitalized cases reported through the MSS, timeliness of reporting was estimated based on the distribution of times from hospital admissions to corresponding MSS reports.

Completeness: During the period July through December 1997, there were 273 hospitalizations of active duty soldiers for diseases/conditions presumed to be reportable. Of these, 120 (44.0%) were reported through the MSS. Completeness of reporting during the most recent assessment period markedly exceeded that during earlier periods (figure 1).

During the period, nearly two-thirds (75 of 118, 63.6%) of reportable infectious disease cases but less than one third (45 of 155, 29.0%) of other reportable conditions (i.e., heat stroke, heat exertion, rhabdomyolysis, carbon monoxide intoxication, chemical agent exposure, Guillain-Barre syndrome) were reported through the MSS. Completeness of reporting of infectious cases significantly increased in the most recent compared to previous periods. In contrast, proportions of non-infectious cases reported through MSS have remained relatively stable (figure 1).

Two reporting sites, Forts Eustis and Drum, had 100% reporting completeness (albeit each had only 1 or 2 reportable hospitalized cases). Reporting sites at Fort Campbell, Tripler Army Medical Center (Hawaii), and Korea reported more than 70% of larger numbers of reportable hospitalized cases.

Timeliness: Of hospitalized cases reported through the MSS, more than 58% were reported within one week, and more than 80% within three weeks, of admission (table 1). The estimated timeliness during the latter half of 1997 was comparable to that during earlier periods (figure 2).

Editorial Comment: This report summarizes findings of the third semiannual assessment of completeness and timeliness of notifiable disease reporting in the Army. The results suggest that during the most

recent assessment period there was an increase in reporting of notifiable diseases/conditions Armywide without a degradation (or improvement) of timeliness of reporting.

The methodology used for assessing reporting performance has inherent weaknesses that should be considered when interpreting the results. For example, "gold standard" cases for routine Armywide assessments are identified based on International Classification of Diseases, 9th revision (ICD-9) coded hospital discharge diagnoses. However, over the course of thousands of hospitalizations, some nonreportable conditions are inevitably miscoded with reportable case codes (resulting in "false" reportable cases). Unfortunately, for assessment purposes, such cases are inappropriately counted as missed reportable cases. Also, there is not a one-to-one correspondence between ICD-9 codes and reportable diseases/conditions; thus, some hospitalizations are properly annotated with reportable case codes and also properly not reported through the MSS. Such cases may be improperly counted, however, as "missed" reportable cases in routine periodic completeness and timeliness assessments. Both circumstances result in underestimation of actual reporting completeness. Since the same methodology is used consistently in periodic assessments of reporting completeness, estimates of trends should be relatively unaffected by these potential biases.

It is noteworthy that reportable infectious disease cases were reported much more completely than noninfectious diseases/conditions. Rhabdomyolysis, a condition that has been relatively poorly reported in the Army, is not included in the new triservice consensus list of reportable diseases/conditions; if for no other reason, overall completeness of reporting in the Army should improve after the new consensus list is implemented. Still, there are several potential explana-

Continued from page 8

tions for the relative underreporting of noninfectious conditions. First, most Army preventive medicine services are required to report specified diseases/conditions to civilian public health authorities (e.g., county/state health departments). Given that most civilian notifiable diseases are infectious in nature, one would expect more complete and accurate reporting of infectious diseases to the extent that the civilian and military requirements overlap. Also, preventive medicine staffs may ascertain reportable infectious disease cases through clinical and/or laboratory channels. In contrast, noninfectious cases are generally ascertainable only through clinical channels, and many clinicians remain relatively unaware of noninfectious disease reporting requirements.

In the past year, preventive medicine representatives of the Army, Navy, Air Force, and Marines developed a triservice consensus list of reportable diseases/conditions. In the course of their work, the group also developed standard case definitions, reporting procedures, and summarization methods for notifiable disease surveillance. Implementation (scheduled for this summer) of the consensus triservice list, case definitions, and procedures will for the first time standardize notifiable disease reporting throughout the DoD.

Case Report

Elevated Blood Lead in a Child with Clinical Signs of Toxicity, Fort Campbell, Kentucky

In March 1998, the three year old daughter of an active duty soldier presented to the primary care clinic at Blanchfield Army Community Hospital, Fort Campbell, Kentucky, with a one day history of nausea, headache, and temperature to 101°F. Physical examination of the child was normal, and a diagnosis of viral upper respiratory infection was made.

Prior to the clinic visit, the child's mother saw a television announcement that led her to realize that her daughter had symptoms of lead poisoning (e.g., chronic constipation, recurrent nausea, developmental delays). In response to the mother's concerns, the careprovider checked the child's blood lead level. An assay revealed a concentration of 35 micrograms per deciliter (mcg/dl). A followup level approximately one month later was 15 mcg/dl.

In April 1998, the child's primary care provider initiated a comprehensive case management plan that included a complete laboratory work-up, evaluation of the child's speech development, and an environmental assessment. Laboratory results revealed that the child was anemic, and she was started on oral iron supplementation.

A community health nurse and an environmental science officer from the local Preventive Medicine Service visited the family at their home. The parents described longstanding concerns regarding the pace and character of the child's development. For example, the child seemed to lag behind her contemporaries in acquiring motor skills, developing language, and following directions. A complete developmental assessment revealed significant speech and language delays and mild to moderate global delays. The child was referred to an on-post developmental preschool program which she is expected to begin in the fall.

For approximately 18 months, the family had lived in 1960s vintage on-post government quarters. Inspection of the quarters revealed generally clean and well-maintained indoor living areas. However, paint on the kitchen door was flaking, and there were areas of the walls at nearly every corner of the residence where the child had chewed on the wallboard (the parents described the child's history of pica which was expressed through chewing rugs, chalk, magazines, books, and walls; picking, peeling, and eating paint; and eating dirt and rocks). Outside the residence, there were two storage areas with peeling and chipping paint. Environmental assessment of the residence included swipes for paint dust, sampling of soil from the backyard play area, and x-ray fluorescence (XRF) readings of walls, doors, and ceramic items. The two outside storage doors were found to have high levels of lead. The family was counseled regarding lead exposure prevention and nutritional aspects of lead poisoning, and the child was referred for a complete nutritional assessment.

During followup, the child's blood lead levels steadily declined (to 10 mcg/dl at the most recent evaluation in late May) probably due, at least in part, to increased parental lead hazard awareness and subsequent closer parental supervision. In addition, in February 1998, the child's mother began working outside the home, and as a result, the child spent most of her time during the day in a lead-free environment.

Management and close followup of the case are ongoing.

Editorial comment: Lead is a naturally occurring element that is continuously released into the environment during mining, smelting, processing, use, recycling, and disposal activities. Lead-based paint (in homes built before 1978) remains the most important source of lead exposure of children. While actions taken by the Environmental Protection Agency (EPA), the Food and Drug Administration

(FDA), and the Occupational Safety and Health Administration (OSHA) have reduced potential exposures from the environment, childhood lead poisoning remains a major preventable health problem in the United States.

In recent years, average blood lead levels have declined dramatically in the United States[1]; still, it is estimated that from 1991 to 1994, there were 890,000 U.S. children aged 1 to 5 years with blood lead levels greater than or equal to 10 mcg/dl (levels that indicate, as a minimum, family education and follow-up testing).[2] Blood lead levels as low as 10-15 mcg/dl are associated with diminished intelligence, slowed neurological development, decreased hearing acuity, and growth deficits. Higher levels can result in severe damage to the renal, hematopoietic, and central nervous systems and even death. Thus, recent Centers for Disease Control and Prevention guidelines for preventing lead poisoning in children remain relevant to many civilian and military communities.[3]

Lead education and awareness programs are needed for both the general public and the health care community. Patients and their family members often ask questions of careproviders during clinic visits. Such situations provide good opportunities for family preventive health counseling. For example, in response to questions regarding child health and safety, providers can suggest ways to reduce environmental lead exposure risks, including 1) ensure that floors, window sills, toys, and other surfaces are clean; 2) provide a healthful, nutritionally balanced diet; 3) prevent children from chewing painted surfaces; and 4) encourage good personal hygiene practices (e.g., washing hands). The *Guide to Clinical Preventive Services (2d edition)* of the US Preventive Services Task Force[4] provides careproviders with questions that may be useful for assessing lead exposure risks, guidelines for interpreting blood lead levels, and appropriate follow-up practices.

Report and editorial comment submitted by Kevin Michaels, MAJ, MC, Chief, Preventive Medicine Service, and Beverly Morgan, CPT, AN, Chief, Community Health Nursing, Fort Campbell, Kentucky.

Case Report

Infant Botulism, Walter Reed Army Medical Center

In May 1998, a 5 week old female presented to the pediatric clinic at Walter Reed Army Medical Center (WRAMC) with a two day history of decreased appetite, irritability, and progressively decreasing activity. The child also had a three day history of constipation. Although there was no history of fever or ill contacts, bacterial sepsis was considered a possible cause of the illness. Physical examination revealed a "floppy" infant with little to no facial expression, a weak cry, and inability to suck. A CT scan of the head was normal, and basic metabolic screening was unremarkable.

After one day in the hospital, the child had decreased spontaneous movements and a diminished gag reflex. Her clinical course seemed to be progressing towards total body paralysis. The possibility of infant botulism was introduced by a resident physician who had heard about the case. The diagnosis was supported by electromyographic (EMG) findings and was confirmed by detection of botulinum toxin, type B, in the patient's stool (performed at the Centers for Disease Control and Prevention, Atlanta, Georgia).

On the third hospital day, the infant received human Botulinum Immune Globulin (BIG) under an FDA-approved investigational new drug (IND) emergency use protocol. From the time of the BIG infusion, there was no further progression of paralysis, and over the next two weeks, there was a return of near normal neuromuscular function. The infant was discharged after a 2 1/2 week hospital stay, and she is currently well with no residual effects of her illness.

Editorial comment: Botulism is the clinical manifestation of poisoning with toxins produced by *Clostridium botulinum*, a spore-forming obligate anaerobic bacterium that is distributed in soil worldwide. There are three forms of botulism: infant, foodborne, and wound. All forms are caused by botulinum toxin and have the same pathophysiology. The forms differ only in relation to the sites and circumstances of toxin production.

There are 50-100 cases of botulism reported each year in the U.S. When spores of *C. botulinum* are ingested by infants (e.g., in honey or dust), they can germinate and multiply in the bowel and, in the process, release botulinum toxin, an extremely potent blocker of nerve conduction. As the bacterial toxin is absorbed from the intestine, it is distributed throughout the body in the bloodstream. When toxin reaches presynaptic termini of peripheral nerves, it irreversibly binds to them, preventing their release of acetylcholine and thereby blocking nerve signals to muscles. The cumulative result is a progressive, symmetric, flaccid descending paralysis. As the disease develops, loss of voluntary and involuntary muscle function produces a "floppy" infant that ultimately requires mechanical ventilation for life support. Infants with botulism generally require prolonged hospitalizations and weeks of intensive care. Antibiotics are not helpful and may be harmful (e.g., antibiotics may have synergistic toxic effects, *C. botulinum* may release toxin when killed).[1,2]

With adequate support, the prognosis for recovery from infant botulism is excellent. Although deaths from infant botulism are rare in the U.S., patients and their parents endure long periods of convalescence. In addition, complications of the illness may be life threatening or chronically disabling. Finally, hospitalization costs are extremely high. A review of cases in California from 1992-1997 found that more than $8 million were required for care of approximately 60 infant botulism patients.

Adults and older children with normal gastrointestinal anatomies and microflora are not susceptible to infant botulism, probably because their fully developed gut bacteria do not permit the growth of *C. botulinum*. Adults may get botulism, however, from ingesting preformed toxin, typically

from eating improperly preserved home-processed foods (e.g., canned fruits and vegetables). Five minutes of boiling is required to destroy *C. botulinum* toxin, and even higher temperatures for longer periods are required to inactivate spores. If *C. botulinum* is allowed to contaminate food during its preparation, packaging, or storage, it can produce toxin in sufficient quantity to cause disease upon its ingestion. Even a single suspected case of foodborne botulism constitutes a public health emergency. Immediate actions are required to prevent further consumption of contaminated food and to identify, evaluate, and treat other potential cases. Finally, wound botulism occurs when *C. botulinum* germinates in "dirty" wounds (e.g., traumatic injuries, intravenous drug use).[1]

For decades, adults stricken with foodborne botulism have been successfully treated with equine botulinum antitoxin. Equine antitoxin is not given to children, however, due to risks of severe allergic reactions and serum sickness. Thus, for its first 15 years, standard treatment of infant botulism was entirely supportive. Recently, however, Stephen Arnon, M.D., Director of the California Infant Botulism Treatment and Prevention Program, has directed studies of the use of human Botulism Immune Globulin (BIG) for treating infant botulism.[3] Preliminary findings of his studies have suggested that early treatment of infant botulism with BIG may produce more rapid recoveries than with standard treatment and, in many cases, may eliminate the need for mechanical ventilatory support. Thus, BIG therapy of infant botulism may result in decreased and less severe complications, shortened inpatient courses, and significant cost savings.[3,4] The product is awaiting FDA approval for a nationwide open-label clinical trial. It was made available for use at WRAMC only through an emergency use clinical research protocol.

Report and editorial comment provided by Jeff Bennett, CPT, MC, USAF, Fellow, Pediatric Infectious Diseases, Walter Reed Army Medical Center, Washington, DC.

Past 24 hrs

- Part of team met at CHPPM-Main to discuss approaches to environmental sampling. It must be emphasized at all levels that environmental sampling is NOT intended to serve as a tool to 'solve the outbreak [cluster]', nor directly predict risk of future cases, nor contribute to immediate preventive interventions. Instead this would be an opportunity to advance understanding of spore prevalence in a geographic area previously uncharacterized with respect to C. botulinum. It does, however, still constitute part of the overall public health assessment (in contrast to generalizable, scientific research) in that the information gained will contribute to nationally collected data on risk density. As an additional benefit it may enhance current health communications to, and information for, the residents and workers of Fort Meade and the surrounding area (though the information must be presented in proper context to avoid the opposite effect, namely, generating either fear or a false sense of ability of garrison to mitigate).

- Per Dr. Arnon's botulism expert (SME) list, contacted Dr. Mike Adler, MRICD Botulism research group director. They do not have the laboratory capabilities to support us on Edgewood. However, he is contacting someone at USAMRIID to explore possible collaboration on lab support for environmental sampling (soil and dust) and will get back to me soon.

Next 24 hrs

- Schedule meeting or phone conference among CHPPM subject experts on environmental sampling and laboratory analysis.
Tentative invitee list:
EPICON Team
MAJ [redacted] (DLS)
[redacted] (DOHS) [redacted] (DEHE)

- Schedule vacuum dust collection at homes of the two affected infants.

- Continue to await results of bacterial subtyping by Maryland State Laboratory.

- Continue disease surveillance.

Bulbar Paralysis, Lamziekte, Limberneck, Loin Disease, Shaker Foal Syndrome, Toxicoinfectious Botulism, Western Duck Sickness

Last Updated: Aug. 16, 2005

Importance

Botulism, caused by a *Clostridium botulinum* neurotoxin, can affect many species of mammals, birds, and fish. Among animals, this disease is seen most often in waterfowl, poultry, mink, cattle, sheep, horses, and some species of fish; an estimated 10 to 50 thousand wild waterfowl are killed annually by botulism. A form of botulism also appears to be responsible for the shaker foal syndrome in horses. In humans, *C. botulinum* can cause descending flaccid paralysis, generally beginning with the cranial nerves and - if left untreated - progressing through the body causing respiratory and limb paralysis. Death due to respiratory failure occurs in approximately 5% of human cases. Botulinum toxins can be used as a bioterrorist weapon spread by aerosol, or contamination of food or drink, therefore all cases should be reported immediately and thoroughly investigated. Naturally caused cases of botulism are rare in domestic mammals in the United States; cases in wildfowl and poultry are more common.

Etiology

Clostridium botulinum is a spore-forming, anaerobic bacterium which produces a potent neurotoxin. Botulism can result from the ingestion of preformed toxin or the growth of *C. botulinum* in anaerobic tissues. Seven types of botulism toxin are known, designated by the letters A through G. Types A, B, E and F cause illness in humans. Type C is the most common cause of botulism in animals. Type D is sometimes seen in cattle and dogs, and type B can occur in horses. Types A and E are found occasionally in mink and birds. Type G rarely causes disease, although a few cases have been seen in humans. All types of botulinum toxin produce the same disease; however, the toxin type is important if antiserum is used for treatment.

Species affected

Many species of mammals and birds, as well as some fish, can be affected by botulism. Clinical disease is seen most often in wildfowl, poultry, mink, cattle, sheep, horses, and some species of fish. Dogs, cats, and pigs are relatively resistant; botulism is seen occasionally in dogs and pigs but has not been reported from cats.

Geographic distribution

C. botulinum is found in the soil worldwide. In ruminants, botulism mainly occurs in areas where phosphorus or protein deficiencies are found. Botulism is seen regularly in cattle in South Africa and sheep in Australia. This disease is rare in ruminants in the United States, although a few cases have been reported in Texas and Montana.

Transmission

Although *C. botulinum* and its spores are widely distributed in soils, the intestinal tracts of fish and mammals, and the gills and viscera of shellfish, the bacteria can only grow under anaerobic conditions. Botulism occurs when animals ingest the preformed toxins in food or *C. botulinum* spores germinate in anaerobic tissues and produce toxins as they grow.

Preformed toxins can be found in a variety of sources, including decaying vegetable matter (grass, hay, grain, spoiled silage) and carcasses. Carnivores usually ingest the toxins in contaminated meat such as chopped raw meat or fish. Ruminants in phosphorus-deficient areas may chew bones and scraps of attached meat; a gram of dried flesh can have enough botulinum toxin to kill a cow. Ruminants may also be fed hay or silage contaminated by the toxin-containing carcasses of birds or mammals. Horses usually ingest the toxin in contaminated forage. Birds can ingest the toxins in maggots that have fed on contaminated carcasses or in dead invertebrates from water with decaying vegetation. Cannibalism and contaminated feed may also result in cases in poultry.

The toxicoinfectious form of botulism occurs when an anaerobic wound is contaminated with *C. botulinum*. Sites predisposed to *C. botulinum* infection can include gastrointestinal ulcers, abscesses in the navel, liver, or lungs, and skin or muscle wounds. This form of botulism appears to be responsible for shaker foal syndrome in horses. Toxicoinfectious botulism is also seen in chickens, when broilers are intensively reared on litter; the cause of this phenomenon is unknown.

Incubation period

The incubation period can be 2 hours to 2 weeks; in most cases, the symptoms appear after 12 to 24 hours. Mink are often found dead within 24 hours of ingesting the toxin.

Clinical signs

Botulism is characterized by progressive motor paralysis. Typical clinical signs may include muscle paralysis, difficulty chewing and swallowing, visual disturbances, and generalized weakness. Death usually results from paralysis of the respiratory or cardiac muscles.

Ruminants

In cattle, the symptoms may include drooling, restlessness, incoordination, urine retention, dysphagia,

and sternal recumbency. Laterally recumbent animals are usually very close to death. In sheep, the symptoms may include drooling, a serous nasal discharge, stiffness, and incoordination. Abdominal respiration may be observed and the tail may switch on the side. As the disease progresses, the limbs may become paralyzed and death may occur.

Horses

The clinical signs in horses are similar to cattle. The symptoms may include restlessness, knuckling, incoordination, paralysis of the tongue, drooling, and sternal recumbency. The muscle paralysis is progressive; it usually begins at the hindquarters and gradually moves to the front limbs, head, and neck.

The shaker foal syndrome is usually seen in animals less than 4 weeks old. The most characteristic signs are a stilted gait, muscle tremors, and the inability to stand for more than 4 to 5 minutes. Other symptoms may include dysphagia, constipation, mydriasis, and frequent urination. In the later stages, foals usually develop tachycardia and dyspnea. Death generally occurs 24 to 72 hours after the initial symptoms and results from respiratory paralysis. Some foals are found dead without other clinical signs.

Pigs

Pigs are relatively resistant to botulism. Reported symptoms include anorexia, refusal to drink, vomiting, pupillary dilation, and muscle paralysis.

Foxes and Mink

During outbreaks of botulism, many animals are typically found dead, while others have various degrees of paralysis and dyspnea. The clinical picture is similar in commercially raised foxes.

Birds

In poultry and wild birds, flaccid paralysis is usually seen in the legs, wings, neck, and eyelids. Wildfowl with paralyzed necks may drown. Broiler chickens with the toxicoinfectious form may also have diarrhea with excess urates.

Post mortem lesions

There are no distinct, diagnostic post mortem lesions. Respiratory paralysis may cause nonspecific signs in the lungs. In the shaker foal syndrome, the most consist lesions are excess pericardial fluid with strands of fibrin, pulmonary edema, and congestion.

Morbidity and Mortality

Botulism is common in wild waterfowl; an estimated 10 to 50 thousand wild birds are killed annually. In some large outbreaks, a million or more birds may die. Ducks appear to be affected most often. Botulism also affects commercially raised poultry. In chickens, the mortality rate varies from a few birds to 40% of the flock. Some affected birds may recover without treatment.

Botulism seems to be relatively uncommon in most domestic mammals; however, in some parts of the world, epidemics with up to 65% morbidity are seen in cattle. The prognosis is poor in large animals

that are recumbent. In cattle, death generally occurs within 6 to 72 hours after sternal recumbency. Most dogs with botulism recover within two weeks.

Diagnosis

Clinical

A presumptive diagnosis of botulism may be made with the clinical signs and history. If possible, the diagnosis should be confirmed with testing (see below).

Differential diagnosis

Other causes of motor paralysis should be ruled out in all species. In poultry, mild infections characterized by leg paralysis should be differentiated from Marek's disease, drug or chemical toxicity, and skeletal abnormalities. In waterfowl, the differential diagnosis includes fowl cholera and chemical toxicity, particularly lead poisoning.

Laboratory Tests

Botulism can be difficult to diagnose, as the toxin is not always found in clinical samples or the feed. Diagnosis is often a matter of excluding other diseases. A definitive diagnosis can be made if botulinum toxin is identified in the feed, stomach or intestinal contents, vomitus or feces. The toxin is occasionally found in the blood in peracute cases. Botulinum toxin can be detected by a variety of techniques, including enzyme-linked immunosorbent assays (ELISAs), electrochemiluminescent (ECL) tests and mouse inoculation or feeding trials. The toxins can be typed with neutralization tests in mice.

In toxicoinfectious botulism, the organism can be cultured from tissues. *C. botulinum* is an anaerobic, Gram positive, spore-forming rod. On egg yolk medium, toxin-producing colonies usually display surface iridescence that extends beyond the colony.

Samples to collect

Serum, feces, gastric fluid, intestinal contents, and food suspected of contamination can be submitted for testing. Cultures may also be taken from infected wounds. Samples should be kept refrigerated.

Recommended actions if botulism is suspected

Notification of authorities

Local, state and federal authorities should be notified of any possible cases of botulism.

Federal Area Veterinarian in Charge (AVIC): http://www.aphis.usda.gov/vs/area_offices.htm

State Veterinarians: http://www.aphis.usda.gov/vs/sregs/official.html

Quarantine and Disinfection

Quarantine is not necessary. Botulism is not communicable by casual contact but, in some cases, tissues from dead animals can be toxic if ingested by other animals.

Botulinum toxins are large, easily denatured proteins. They can be inactivated by exposure to sunlight, chemical disinfection with 0.1% sodium hypochlorite or 0.1 N NaOH, or heating to 80°C for 30 minutes or 100°C for 10 minutes. Chlorine and other disinfectants can destroy the toxins in water. The vegetative cells of *Clostridium botulinum* are susceptible to many disinfectants, including 1% sodium hypochlorite and 70% ethanol. The spores are resistant to environmental conditions but can be destroyed by moist heat (120°C for at least 15 min).

Public health

In humans, botulism is classified into three forms: foodborne, wound, and infant or intestinal botulism. Foodborne botulism is caused by ingestion of neurotoxins when food is not properly handled to control bacterial growth. Inadequate heating during canning or food preparation is the most common cause. Wound botulism is caused by contamination with soil and insufficient cleansing of wounds allowing *C. botulinum* spores to germinate in an anaerobic environment and produce toxin. Injectable drug users have an increased risk of wound botulism. Intestinal botulism generally occurs in children less than a year of age. It is caused by the ingestion of *C. botulinum* spores which germinate in the intestinal tract and produce toxin. Although honey is the most well known source of botulism in infants, many foods can potentially contain spores from the soil. Adults with altered gastrointestinal microflora are also susceptible to this form of botulism.

Foodborne and wound botulism cause a symmetrical, descending, flaccid paralysis. The cranial nerves are generally affected first causing double vision, blurred vision, drooping eyelids, slurred speech, difficulty swallowing, and dry mouth. Constipation or diarrhea, and vomiting may also be seen initially. The signs progress to paralysis of respiratory muscles, arms, and legs. Wound botulism is very similar to foodborne infections; however, gastrointestinal signs are not usually present and patients may have a wound exudate or develop a fever. Infants with botulism show similar signs with lethargy, poor feeding, constipation, drooping eyelids, difficulty swallowing, loss of head control, progressive weakness or paralysis, and respiratory depression or arrest. The onset may be gradual or sudden.

Public education on proper handling of food, refrigeration and home canning techniques helps to prevent cases of foodborne botulism. Early identification and treatment of the disease are important in recovery. In the United States where treatment is readily available, the case fatality rate for this form is 5-10%. Death is usually caused by respiratory failure. Early treatment with botulinum antitoxin may help to prevent progression of paralysis. Recovery can take months to years. The case fatality rate for hospitalized cases of infant botulism is less than 1%. Some suggest botulism may be the cause for up to 5% of sudden infant death syndrome (SIDS) cases.

Subject: RE: Oliver Court mtg questions

Hi ma'am:

Is the fact sheet the one recently posted on the Meade webpage? If not, could you send a copy to us? Otherwise, I can just download the copy from your webpage. Yes, I have contacted both the [redacted] and with the following results:

[redacted] I spoke with Ms. [redacted] on Sat 13 Jan. She was quite harried, and said they were busy all weekend. We did speak for about 5 minutes and, in my opinion, still sounded somewhat agitated/ skeptical that the Army still isn't doing anything to find the cause. I tried my best to reassure her that the Fort Meade team was working with Anne Arundel County, and was consulting with CDC and other experts to make sure we were looking into all possible options and to ensure that our proposed actions were sound. I also tried to persuade her to arrange a time to speak with me at any time/location/ method that was convenient for her (i.e., day/ night/ weekend/ weekday/ her house/ over the phone). In the end, she was very nice, much more calm, and did take my phone numbers, saying she would call me if she was interested. I asked if I could call her back later in the week to see if she might have time, and she said ok. I tried to call again yesterday, but got no answer and there was no answering machine. [redacted] and I agreed that maybe it would be best to leave it, unless you all believe I should continue to try.

: I spoke with Ms. yesterday, and she was very gracious. I believe she was sincere in her responses. She said she had no concerns, and that she thought the Garrison and Kimbrough were doing what they should be doing to look into the issue. She specifically mentioned that [redacted] SGM had been to her house twice, that she'd gotten two flyers, that there had been a meeting with the Oliver Court residents this past week, and that there is another meeting this past week. As far as meeting her needs go, she said, "I'm good." She did not know of anyone else with concerns or with young children. I did give her my phone numbers in case she did come across anyone else I/ we might contact. (Ms. did specifically mention that the meeting with the Oliver Court residents was very helpful in addressing the concerns of the residents in that area, and that this particular meeting was a good idea).

My colleagues also took the name/ phone number of one additional Oliver Court resident at the Tuesday night meeting, and I have followed up with that individual, but have gotten no response.

Ms [redacted],
I certainly understand. The Fact Sheet was written and dispersed to the clinics, pharmacy, waiting areas etc.....but I do appreciate the offer.

Were you able to reach the [redacted] or schedule w/ the Cook's??

Thanks
[redacted]

Ma'am:

My apologies for missing Tuesday night's meeting, but I hear things went well. Based on the notes I see in the attached file that my colleagues so kindly captured, I would like to offer to write up the fact sheet that parents requested at that meeting (reflected in question 4 on the attached file). If you would like me to do that, I would be glad to do so

FACT SHEET ON ANIMAL BOTULISM (for Ft Meade Internet)

Botulism can occur in a wide range of animals, poultry, waterfowl and wildlife. Livestock such as horses, cattle, and sheep can be infected with botulism in association with ingesting contaminated hay or feedstuff.

Botulism cases in domestic animals such as cats or dogs are relatively rare. However, those cases that have occurred have been associated with the consumption of carrion or contaminated food. But again keep in mind that botulism is rare in household pets.

Signs and symptoms of illness that should be reported to your Veterinarian are diarrhea, weakness, loss of appetite and paralysis.

There have not been any increases in the number of abnormal pet deaths reported through the Veterinary Treatment Facility. There has been a heightened awareness and we will continue to monitor and report any abnormal trends.

[redacted], DVM, DABVP

[redacted] DVM

Note: There is no central repository that would track pet deaths on Fort Meade. When owners report their deaths to Veterinarian Clinic in order to have records removed from clinic this is usually the only means of awareness.

MESSAGE FROM THE INSTALLATION COMMANDER

INFANT BOTULISM FACT SHEET

Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center. The infants, both under the age of 6 months at the time of diagnosis, were treated at Walter Reed Army Medical Center. The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade. LTC Sharon Cole-Wainwright, Chief of Preventive Medicine at Kimbrough Ambulatory Care Center said, "while the name of the disease can be frightening, infant botulism is a treatable condition associated with swallowing the botulinum bacteria found naturally in soils and in some contaminated food products. It is premature to speculate about a particular source until the investigation is complete." Cases of Infant Botulism are rare and usually occur among infants less than 6 months of age.

What are the symptoms of Infant Botulism?

Any or all of the following:

- ☐ constipation
- ☐ poor feeding and a weak suck
- ☐ weak cry
- ☐ loss of head control
- ☐ difficulty swallowing
- ☐ excessive drooling
- ☐ floppy appearance or "floppy baby"
- ☐ generalized weakness
- ☐ breathing difficulties

What do you do if your infant is experiencing these symptoms?

Call (301) 677-8606 or go to the nearest Emergency Room

- Howard County General Hospital 5755 Cedar Lane, Columbia, Maryland (410) 740-7890 or 7990
- Laurel Regional Hospital 7300 Van Dusen Road, Laurel, Maryland (301) 725-4300 or (410) 792-2270
- Baltimore Washington Medical Center, 301 Hospital Drive, Glen Burnie, Maryland (410) 787-4000

How is Infant Botulism treated?

Prompt diagnosis is essential. Medication is available to treat the condition.

How can I reduce the risk of contracting Infant Botulism?

- ☐ Wash hands frequently
- ☐ Avoid giving honey to infants less than 1 year of age
- ☐ Routine and frequent cleaning of toys-- particularly items that babies place in their mouths and those toys which have fallen on the ground or floor
- ☐ Through proper preparation of foods (boiling and cooking)
- ☐ Avoid cans of food/formula with dents or that are bulging or rusting
- ☐ Avoid locations with excessive dust and debris

For further information about the disease, contact Kimbrough Ambulatory Care Clinic, Preventive Medicine Services (301) 677-8661. If you have other questions or are contacted by the media please refer them to the Fort Meade Public Affairs Office at (301) 677-1436 or 1486.

INFANT BOTULISM FACT SHEET

Infant botulism is a treatable condition associated with swallowing the botulinum bacteria found naturally in soils and in some contaminated food products. Infant botulism is not contagious, and person-to-person transmission is not known to occur. An infant must eat the bacterial spores that then multiply and produce the toxin in the digestive tract. Cases of Infant Botulism are rare and usually occur among infants less than 6 months of age.

What are the symptoms of Infant Botulism?

Any or all of the following:

- ☐ constipation
- ☐ poor feeding and a weak suck
- ☐ weak cry
- ☐ loss of head control
- ☐ difficulty swallowing
- ☐ excessive drooling
- ☐ floppy appearance or "floppy baby"
- ☐ generalized weakness
- ☐ breathing difficulties

What do you do if your infant is experiencing these symptoms?

Call (301) 677-8606 or go to the nearest Emergency Room

- Howard County General Hospital 5755 Cedar Lane, Columbia, Maryland (410) 740-7890 or 7990
- Laurel Regional Hospital 7300 Van Dusen Road, Laurel, Maryland (301) 725-4300 or (410) 792-2270
- Baltimore Washington Medical Center, 301 Hospital Drive, Glen Burnie, Maryland (410) 787-4000

How is Infant Botulism treated?

Prompt diagnosis is essential. Medication is available to treat the condition.

How can I reduce the risk of contracting Infant Botulism?

- ☐ Wash hands frequently

Maam:

It wasn't linked.

However, in the week that the first case was reported, CDC sent out an alert with EPI_X about botulism associated with carrot juice (foodborne botulism). When we saw the case in the RMES report we contacted Ms. [redacted] at WRAMC to see if there was a link and what the cause was of the infants botulism.

Good day [redacted]:

As we all discussed at last week's town hall meeting, below is a short weekly update of the EPICON team actions to date. I know we discussed you speaking personally with just the 3-5 families with the highest level of interest (which is certainly the most effective way to discuss concerns of thos particular families). However, I strongly encourage that this information be widely publicized beyond just that group to preempt potential media focus (which is possible and potentially likely based on past community interest and history of actions). I'll be out of the office beginning this afternoon until Monday morning, but can still read email via my Blackberry. Please let me know what else I can provide to you.

++

[redacted]

expected. The Maryland DHMH Laboratory has contacted the Center for Disease Control and Prevention (CDC in Atlanta, GA) to see if they are willing to do the subtyping and expect a CDC response by the end of the week.

The EPICON team is continuing discussions with the Maryland Department of Health and Mental Hygiene (DHMH), the CDC, the laboratory in California, Fort Meade medical authorities and other experts in this field to determine next steps in the investigation.

The Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases for 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at:

Subject: RE: Ft Meade EPICON update

I'll let Dr. Blythe comment on the false sense of direct and active CDC collaboration; but the [redacted] should know that we did not "take CDC off the case" per se. CDC neither invited itself to directly investigate nor showed any interest in conducting laboratory testing initially.

On the point about time it takes to get results, the [redacted] would need to be specific what test they're talking about. The initial toxin analysis, for example, was resulted way back. Culturing could take much less time as well, but is not as simple and reliable (actually, not as sensitive if stool is absent organisms or low inoculum / low count) as some would have the [redacted] believe. More importantly than any of this, however, is that it is of NO IMPACT OR IMPORTANCE WHATSOEVER to the clinical care of these babies or our ability to predict a third case. Neither is environmental testing. While they are not altogether irrelevant to the individual or family risks in that community, they are irrelevant from the standpoint of prediction or mitigation---which is all that any parent would have practical cause to publicize via the media. It is a non-issue, and I would challenge any world expert to tell the [redacted] otherwise with good evidence to back up their opinion.

Thanks for making the communication. I am happy to 'augment' as needed.

ALCON,
As per our conversation I did return [redacted] call to give him an update as to the results of the state testing and the fact that we were awaiting a response from CDC as to whether they are willing to perform the subtyping and from this we would determine our next COA. He was comfortable with the response but had several concerns and questions:

-Was he not to contact the state since I was returning his call - I assured him that he was certainly able to contact the state and reminded him that Dr Russo had in fact given them her card so that they could contact her if they needed to do so. Reinforced that we were working together as a team i.e.. EPICON Team, State and Fort Meade

-Why has it taken the state so long to get this answer? He had spoken with several microbiologist experts (one from Finland) and was told that results could have been received within 2-3 days, and it had taken until now to get lab results....

-Someone (not sure of name, he would call me back with that name) from the CDC had notified him that they (CDC) had been taken off of the case so why were we waiting to hear from the CDC on conducting further testing? Why couldn't the specimen be sent to another lab for testing (he stated he had researched and spoke to several different labs who could and were willing to do the testing)

-Why are we not testing the soil? He was told by the CDC that soil testing would be performed before they were taken off of the case.....

[redacted] a further wrinkle! We asked one of our psychologists for help responding to the [redacted] issues and he felt strongly that he is having serious mental health issues and that we have a responsibility to inform his superior officer. He felt the combination of anger, paranoid ideation, loss of contact with reality and obsession with this issue could lead to trouble and referred to him "doing something" in which case a lawsuit might be a welcome direction for his energies.
We have no idea who his superior officer might be but again think its really important someone Army be involved with talking to him and in view of this maybe it should be someone with a mental health background.

<<bal-te.ar.botulism03feb03,0,5400604.htm>>

Vexing infant botulism provokes threat of suit By Bradley Olson Sun Reporter Originally published February 3, 2007 It's one of the rarest infectious diseases, affecting an average of only 100 babies a year in the United States, but infant botulism infected two babies living on the same street at Fort Meade in recent months - puzzling researchers.

Clusters of the illness are not unprecedented, experts say, and the ubiquity of the bacterial spores that cause infant botulism makes isolating one source almost impossible.

That is especially true in this case, where the military base also happens to be an Environmental Protection Agency Superfund site.

Both children survived the illness, but one family confirmed yesterday that it has hired a lawyer who will likely sue the Army, claiming that military officials have been negligent in seeking the cause of the outbreak. The parents of the other child say they do not blame the military and do not plan to join a lawsuit.

On Thursday, base officials confirmed that both cases, the first diagnosed in October and the second in December, came from the same strain of Clostridium botulinum bacteria.

"I would be hesitant to reassure everyone by saying this is a freak thing and this is over," said Col. Bruno Petruccelli, a physician and director of epidemiology and disease surveillance at the U.S. Army Center for Health Promotion and Preventive Medicine in Aberdeen. "Maybe there will be a third case and a fourth case. We can't say there won't be another one."

Army doctors involved in the investigation say they have followed medical protocol, conducting an investigation with help from experts at the Centers for Disease Control and Prevention in Atlanta, Walter Reed Army Medical Center, Maryland Public Health Administration and Anne Arundel County Department of Public Health.

Infant botulism develops in newborns - usually those between 3 weeks and 6 months of age - when they ingest bacteria that produce a toxin inside the large intestine. The toxin attaches to nerves in the body and paralyzes them. Although the condition is treatable and most babies eventually recover, it causes several frightening symptoms, including paralysis and respiratory problems.

Such was the case with [redacted] whose family lives on the Anne Arundel County military base.

On Oct. 2, [redacted] noticed that the baby became fussy and was not feeding well. Thinking he was teething, she put him to bed. The next morning, he made an odd, grunting sound, and when she picked him up, his head flopped.

She took him to Bethesda Naval Hospital, where doctors, thinking [redacted] was dehydrated, gave him fluids intravenously. When his eyes began to gloss over, Cook recalled, Jonathan was rushed to Walter Reed Army Hospital, where a young physician noticed symptoms of infant botulism she had seen in a case during her residency.

She went home to research the condition and in the meantime, doctors tested him for meningitis. When that came back negative, they sent him to get a CT scan to rule out a neurological disorder. During the scan, [redacted] vital signs plunged, and a gaggle of doctors and nurses rushed into the room, reviving him and putting him on oxygen.

Once infant botulism was definitively diagnosed, they treated him with a drug called "Baby-BIG," which slightly relieves symptoms and doesn't allow the toxin to paralyze any other nerves.

"My son was so sick, he couldn't even open his eyes," [redacted] said. "He had over 50 needle marks in him because his veins kept busting. To watch that, it was absolutely the most terrifying, horrible experience I've had to go through as a mother, and I've got four kids. I don't want any other families to have to go through that."

[redacted] has been fine since his recovery, but his mother became angry when, on Jan. 9, a Walter Reed doctor called her to say another child on her street had been diagnosed with infant botulism. At that point, she became convinced that the military was not committed to finding a cause.

Michael Archuleta, a Texas-based lawyer who is also a physician and is representing the [redacted] family, said he believes a pile of debris, about a block from the street where both families live, is the source of the toxin, and will file a negligence claim with the Army.

"We have two cases of infant botulism occurring in the same time frame, very close to one another, that is epidemiologically very improbable unless it came from an external or environmental source," he said.

A base spokeswoman confirmed that there was a debris pile and said it was removed and the site was covered with hay on Jan. 7.

The mother of the second child, who asked not to be identified when contacted by The Sun, said that her daughter is no longer sick and that she does not wish to join any potential lawsuit.

In interviews with both families, investigators have determined that the source was not food such as honey, which has proved to be a source of infant botulism.

Fort Meade and Army officials, as well as several leading independent epidemiologists and infectious disease experts, insist that testing soil in infant botulism cases would be fruitless because the bacterial spores that cause it are common and naturally occurring.

Dr. John Bartlett, a professor of medicine at the Johns Hopkins University who specializes in infectious diseases but is not involved in these cases, said that testing soil is "pointless."

"That kind of activity just doesn't pay off," he said. "You don't look for it in dirt, and even looking for it in a food source is going to be a long shot. I mean, two cases in the same geographic area are unusual, but I wouldn't know quite how to go about finding a source. Usually, we don't try because we don't find it."

Archuleta and the [redacted] believe that DNA testing could establish an exact match between the two cases and the dirt pile or other soils, and they intend to use that evidence in any litigation.

The toxin is too ubiquitous, Petrucelli, the Army epidemiologist, said, and the DNA-testing process too inconclusive. That Fort Meade was built on a landfill and is currently monitored by the Environmental Protection Agency would not have any impact, because those sites focus on chemical agents and other toxic substances, not naturally occurring substances, he said.

Dr. James Campbell, a pediatric infectious disease specialist at the University of Maryland School of Medicine, who is not involved in the case, said unlike food-borne botulism, which generally infects adults and which investigators almost always link to a food source, there is often no identified source for the infant variety.

Per our conversation, here is the media request that I got from the Baltimore Sun:

Reporter: Brad Olson
Baltimore Sun
Phone: (410) 332-6100
E-mail: bradley.olson@baltsun.com

Request:

Mrs. [redacted] called the Baltimore Sun claiming that the installation is not doing enough to find out what caused the isolated cases of infant botulism at FGGM. Is the post going to be testing the environment, specifically the soil? If not, why was that decision made? Mr. Olson also had questions about how the investigation is going. I sent him a copy of the most up-to-date news release, which is attached in this e-mail. The deadline for this story is 4 p.m. on 2 Feb.

We are requesting that USACHPPM provide a subject matter expert who can comment on the investigation to the reporter and explain why the installation is not doing environmental testing.

We also wanted to inform you that [redacted] in our office was misquoted in the Washington Post yesterday. Travis was trying to explain that botulism is everywhere in the soil.

Then he said in an answer that we the installation would do whatever needed to be done to investigate the cause.

The reporter made the lead connection incorrectly that we would be doing environmental testing and were just waiting for the results. We will do a retraction with the Post.

Call me if you have a question. My staff is doing an excellent job trying to keep this from making another story. But we may need your help.

Feb. 1, 2007 **Release # 070201**

FOR IMMEDIATE RELEASE

Infant botulism investigation update

FORT GEORGE G. MEADE, MD., -- Maryland health officials have confirmed the presence of Type B Clostridium botulinum bacteria from both cases of infant botulism recently diagnosed at Fort Meade. This confirmation was expected as this type of botulism strain is typically found on the East Coast.

The first case of infant botulism was diagnosed in October 2006 and the second in December 2006. Both children have since been treated and are recovering. The children live on Oliver Court at Fort Meade.

The Maryland Department of Health and Mental Hygiene (DHMH) have contacted the Center for Disease Control and Prevention in Atlanta, Ga., to determine if they are willing to do subtyping of the bacteria.

Investigators continue to discuss and coordinate with DHMH, CDC, Fort Meade medical authorities and other experts as they work towards completing the investigation.

In addition, the Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases from 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at http://amsa.army.mil/AMSA/amsa_home.htm.

SENSITIVE

NOT FOR RELEASE

Subject: Botulism UPDATE

EXSUM

February 2, 2007

Botulism UPDATE

FGGM PAO had requests for information about the cases of infant botulism from media outlets including:

1. The Baltimore Sun

2. Fox 5, D.C. (query complete)

3. WJLA Channel 7, D.C. (a crew came to the Reece Road gate for a live shot around 1800)

4. Washington Post – Clarification from yesterday.

BACKGROUND as I know it:

The [redacted] created another media day around the botulism situation on Fort Meade. Mr. [redacted] told his commander at DINFOS he feels it is his duty to expose the installation because he feels we are covering something up. Their concern is based on the fact the inspectors are not doing any environmental testing in his neighborhood. They have hired an environmental lawyer in Austin to sue the installation. And they are contacting the media to ensure their voices are heard. (Just so you know we did not know about the law suit before the interview. The reporter used it as one of the opening questions when they arrived back at the installation.)

The problem is this is wrong. We are not involved in a cover up of any kind. In fact the command has been very proactive about the whole thing.

So we are doing the best we can to counter their attacks by having the experts at United States Army Center for Health Promotion and Preventive Medicine (CHPPM) available for the reporters to talk to. Today the Baltimore Sun reporter Brad Olsen talked to [redacted] at CHPPM via phone. The reporter had questions for the installation as well.

Our basic message was that until the investigations are complete any comments on causes would be speculative. Ft. Meade continues to cooperate fully with US Army, Anne Arundel County, Maryland and Centers for Disease Control investigators. [redacted] has been

proactive in notifying the community and addressing their concerns.

When asked about the debris pile near the home we said; "Concrete construction debris was temporarily stored at the site in preparation for crushing and re-use on other projects. Crushing occurred on Oct. 31, Nov. 1-3 and Nov. 7. The crushed concrete was moved from the site and it used as road fill. The area in question was hydro-seeded on Jan 7 and hay was laid over the seed to allow it to germinate.

Colonel [redacted] went on camera this afternoon on channel 7 WJLA in Washington (ABC). She stuck to the same messages we had put out before. The Clostridium botulinum bacteria is a naturally occurring bacteria that is found anywhere in the environment. Therefore we don't plan to do any soil sampling or air quality sampling because it exists everywhere in Maryland. We don't have any answers right now because the investigation is not complete. But we are working together with Anne Arundel County, Maryland and Centers for Disease Control investigators. She also emphasis that very likely we would not ever be able to point to an exact cause.

The first newscast at 6:00 was very short. It basically said the [redacted]ere suing the Army. They did not use any of the footage from [redacted]. They filmed an intro around 7pm and said the real story would be on the 10:00 news tonight.

We will continue to monitor the situation and send reports up as we have them.

She took him to Bethesda Naval Hospital, where doctors, thinking [redacted] was dehydrated, gave him fluids intravenously. When his eyes began to gloss over, [redacted] recalled, [redacted] was rushed to Walter Reed Army Hospital, where a young physician noticed symptoms of infant botulism she had seen in a case during her residency.

She went home to research the condition and in the meantime, doctors tested him for meningitis. When that came back negative, they sent him to get a CT scan to rule out a neurological disorder. During the scan, [redacted] vital signs plunged, and a gaggle of doctors and nurses rushed into the room, reviving him and putting him on oxygen.

Once infant botulism was definitively diagnosed, they treated him with a drug called "Baby-BIG," which slightly relieves symptoms and doesn't allow the toxin to paralyze any other nerves.

"My son was so sick, he couldn't even open his eyes," [redacted] said. "He had over 50 needle marks in him because his veins kept busting. To watch that, it was absolutely the most terrifying, horrible experience I've had to go through as a mother, and I've got four kids. I don't want any other families to have to go through that."

[redacted] has been fine since his recovery, but his mother became angry when, on Jan. 9, a Walter Reed doctor called her to say another child on her street had been diagnosed with infant botulism. At that point, she became convinced that the military was not committed to finding a cause.

Michael Archuleta, a Texas-based lawyer who is also a physician and is representing the [redacted] family, said he believes a pile of debris, about a block from the street where both families live, is the source of the toxin, and will file a negligence claim with the Army.

"We have two cases of infant botulism occurring in the same time frame, very close to one another, that is epidemiologically very improbable unless it came from an external or environmental source," he said.

A base spokeswoman confirmed that there was a debris pile and said it was removed and the site was covered with hay on Jan. 7.

The mother of the second child, who asked not to be identified when contacted by The Sun, said that her daughter is no longer sick and that she does not wish to join any potential lawsuit.

In interviews with both families, investigators have determined that the source was not food such as honey, which has proved to be a source of infant botulism.

Fort Meade and Army officials, as well as several leading independent epidemiologists and infectious disease experts, insist that testing soil in infant botulism cases would be fruitless because the bacterial spores that cause it are common and naturally occurring.

Dr. John Bartlett, a professor of medicine at the Johns Hopkins University who specializes in infectious diseases but is not involved in these cases, said that testing soil is "pointless."

"That kind of activity just doesn't pay off," he said. "You don't look for it in dirt, and even looking for it in a food source is going to be a long shot. I mean, two cases in the same geographic area are unusual, but I wouldn't know quite how to go about finding a source. Usually, we don't try because we don't find it."

Archuleta and the [redacted] believe that DNA testing could establish an exact match between the two cases and the dirt pile or other soils, and they intend to use that evidence in any litigation.

The toxin is too ubiquitous, Petrucelli, the Army epidemiologist, said, and the DNA-testing process too inconclusive. That Fort Meade was built on a landfill and is currently monitored by the Environmental Protection Agency would not have any impact, because those sites focus on chemical agents and other toxic substances, not naturally occurring substances, he said.

Dr. James Campbell, a pediatric infectious disease specialist at the University of Maryland School of Medicine, who is not involved in the case, said unlike food-borne botulism, which generally infects adults and which investigators almost always link to a food source, there is often no identified source for the infant variety.

Vexing infant botulism provokes threat of suit

BY BRADLEY OLSON
SUN REPORTER

ORIGINALLY PUBLISHED FEBRUARY 3, 2007

It's one of the rarest infectious diseases, affecting an average of only 100 babies a year in the United States, but infant botulism infected two babies living on the same street at Fort Meade in recent months - puzzling researchers.

Clusters of the illness are not unprecedented, experts say, and the ubiquity of the bacterial spores that cause infant botulism makes isolating one source almost impossible.

That is especially true in this case, where the military base also happens to be an Environmental Protection Agency Superfund site.

Both children survived the illness, but one family confirmed yesterday that it has hired a lawyer who will likely sue the Army, claiming that military officials have been negligent in seeking the cause of the outbreak. The parents of the other child say they do not blame the military and do not plan to join a lawsuit.

On Thursday, base officials confirmed that both cases, the first diagnosed in October and the second in December, came from the same strain of Clostridium botulinum bacteria.

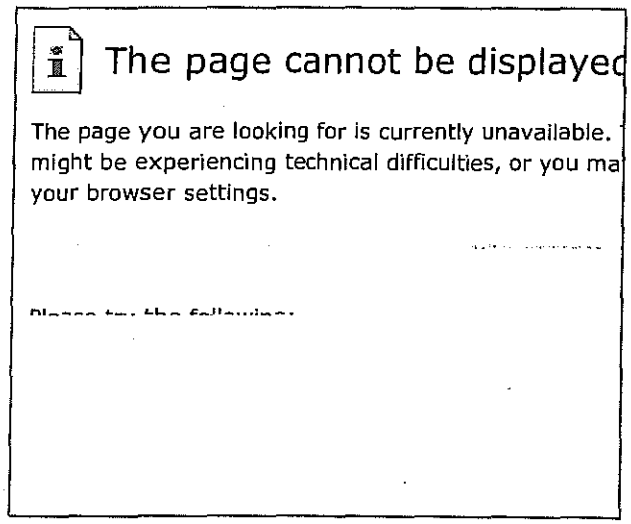
"I would be hesitant to reassure everyone by saying this is a freak thing and this is over," said Col. Bruno Petruccelli, a physician and director of epidemiology and disease surveillance at the U.S. Army Center for Health Promotion and Preventive Medicine in Aberdeen. "Maybe there will be a third case and a fourth case. We can't say there won't be another one."



Army doctors involved in the investigation say they have followed medical protocol, conducting an investigation with help from experts at the Centers for Disease Control and Prevention in Atlanta, Walter Reed Army Medical Center, Maryland Public Health Administration and Anne Arundel County Department of Public Health.

Infant botulism develops in newborns - usually those between 3 weeks and 6 months of age - when they ingest bacteria that produce a toxin inside the large intestine. The toxin attaches to nerves in the body and paralyzes them. Although the condition is treatable and most babies eventually recover, it causes several frightening symptoms, including paralysis and respiratory problems.

Such was the case with [redacted] now [redacted] whose family lives on the Anne Arundel County military base.

On Oct. 2, [redacted]oticed that the baby became fussy and was not feeding well. Thinking he was teething, she put him to bed. The next morning, he made an odd, grunting sound, and when she picked him up, his head flopped.

She took him to Bethesda Naval Hospital, where doctors, thinking [redacted]as dehydrated, gave him fluids intravenously. When his eyes began to gloss over, [redacted] recalled, [redacted]was rushed to Walter Reed Army Hospital, where a young physician noticed symptoms of infant botulism she had seen in a case during her residency.

She went home to research the condition and in the meantime, doctors tested him for meningitis. When that came back negative, they sent him to get a CT scan to rule out a neurological disorder. During the scan, [redacted]vital signs plunged, and a gaggle of doctors and nurses rushed into the room, reviving him and putting him on oxygen.

Once infant botulism was definitively diagnosed, they treated him with a drug called "Baby-BIG," which slightly relieves symptoms and doesn't allow the toxin to paralyze any other nerves.

"My son was so sick, he couldn't even open his eyes," [redacted]said. "He had over 50 needle marks in him because his veins kept busting. To watch that, it was absolutely the most terrifying, horrible experience I've had to go through as a mother, and I've got four kids. I don't want any other families to have to go through that."

[redacted] has been fine since his recovery, but his mother became angry when, on Jan. 9, a Walter Reed doctor called her to say another child on her street had been diagnosed with infant botulism. At that point, she became convinced that the military was not committed to finding a cause.

Michael Archuleta, a Texas-based lawyer who is also a physician and is representing the Cook family, said he believes a pile of debris, about a block from the street where both families live, is the source of the toxin, and will file a negligence claim with the Army.

"We have two cases of infant botulism occurring in the same time frame, very close to one another, that is epidemiologically very improbable unless it came from an external or environmental source," he said.

A base spokeswoman confirmed that there was a debris pile and said it was removed and the site was covered with hay on Jan. 7.

The mother of the second child, who asked not to be identified when contacted by The Sun, said that her daughter is no longer sick and that she does not wish to join any potential lawsuit.

In interviews with both families, investigators have determined that the source was not food such as honey, which has proved to be a source of infant botulism.

Fort Meade and Army officials, as well as several leading independent epidemiologists and infectious disease experts, insist that testing soil in infant botulism cases would be fruitless because the bacterial spores that cause it are common and naturally occurring.

February 2, 2007

Botulism UPDATE

FGGM PAO had requests for information about the cases of infant botulism from media outlets including:

1. The Baltimore Sun

2. Fox 5, D.C. (query complete)

3. WJLA Channel 7, D.C. (a crew came to the Reece Road gate for a live shot around 1800)

4. Washington Post – Clarification from yesterday.

BACKGROUND as I know it:

The [redacted] created another media day around the botulism situation on Fort Meade. Mr. [redacted] told his commander at DINFOS he feels it is his duty to expose the installation because he feels we are covering something up. Their concern is based on the fact the inspectors are not doing any environmental testing in his neighborhood. They have hired an environmental lawyer in Austin to sue the installation. And they are contacting the media to ensure their voices are heard. (Just so you know we did not know about the law suit before the interview. The reporter used it as one of the opening questions when they arrived back at the installation.)

The problem is this is wrong. We are not involved in a cover up of any kind. In fact the command has been very proactive about the whole thing.

So we are doing the best we can to counter their attacks by having the experts at United States Army Center for Health Promotion and Preventive Medicine (CHPPM) available for the reporters to talk to. Today the Baltimore Sun reporter Brad Olsen talked to [redacted] PPM via Phone. The reporter had questions for the installation as well.

Our basic message was that until the investigations are complete any comments on causes would be speculative. Ft. Meade continues to cooperate fully with US Army, Anne Arundel County, Maryland and Centers for Disease Control investigators. Col. McCreedy has been proactive in notifying the community and addressing their concerns.

When asked about the debris pile near the home we said; "Concrete construction debris was temporarily stored at the site in preparation for crushing and re-use on other projects. Crushing occurred on Oct. 31, Nov. 1-3 and Nov. 7. The crushed concrete was moved from the site and it used as road fill. The area in question was hydro-seeded on Jan 7 and hay was laid over the seed to allow it to germinate.

[redacted] went on camera this afternoon on channel 7 WJLA in Washington (ABC). She stuck to the same messages we had put out before. The Clostridium botulinum bacteria is a naturally occurring bacteria that is found anywhere in the environment. Therefore we don't plan to do any soil sampling or air quality sampling because it exists everywhere in Maryland. We don't have any answers right now because the investigation is not complete. But we are working together with Anne Arundel County, Maryland and Centers for Disease Control investigators. She also emphasis that very likely we would not ever be able to point to an exact cause.

The first newscast at 6:00 was very short. It basically said the [redacted] were suing the Army. They did not use any of the footage from [redacted] They filmed an intro around 7pm and said the real story would be on the 10:00 news tonight.

We will continue to monitor the situation and send reports up as we have them.

Melanie

Subject: SJA advice re media/public inquiry on botulism case

Sirs,

I've checked with both the Center for Health Promotion and Preventive Medicine SJA and the U.S. Army Medical Command SJA (via the public affairs supervisor at MEDCOM HQ); their advice regarding public comment on our investigation into the cases of infant botulism is consistent: we should not respond to media/public inquiries given what the Fort Meade installation PAO has told us--that one of the Fort Meade families has decided to litigate.

The MEDCOM advice is specifically that we refrain from speaking on "any issue related to the botulism cases and the ongoing investigation into how the children contracted the disease."

The advice is not inconsistent with my experience at other commands; on the basis of it, I've declined an interview request from the installation paper, and will decline further requests for interviews from commercial media as advised.

V/R,

Subject: Ft Meade EPICON update (UNCLASSIFIED)

Importance: High

Dear [redacted]

As promised, here is what will likely be the last weekly update re the EPICON team. I've tried to draft it in a way that your public affairs staff could use in updating the residents of Fort Meade:

[We] Epidemiologists from the Army Center for Health Promotion and Preventive Medicine advised the Preventive Medicine Staff of the Walter Reed Health Care System and the Kimbrough Ambulatory Care Center to adopt strategies to ensure increased vigilance in diagnosing infant botulism. Two infants residing on Fort Meade were diagnosed and treated for the disease at Walter Reed Army Medical Center. The first case of infant botulism was diagnosed in October 2006 and the second in December 2006. [redacted] who live on Oliver Court, [redacted]

The Epidemiological Consultation team has completed its assessment and is planning to deliver a written report for the Fort Meade garrison commander in about three weeks. The team will work closely with the Army Medical Surveillance Activity to monitor incidence of cases within DOD.

COL McCreedy, your staff may wish to approach the Maryland Department of Health and Mental Hygiene to see if they would be willing to include this information about their efforts--it should be attributed to DHMH rather than CHPPM:

"The Maryland Department of Health and Mental Hygiene and the U.S. Centers for Disease Control and Prevention's laboratory specializing in botulism are considering special testing to determine specific bacterial subtypes using samples from the two infants. While subtyping would not help to predict or prevent future cases, it could contribute to a general scientific understanding of the bacteria."

Since the assessment itself is complete and we're underway with the report itself, we do not plan to continue sending weekly updates. However, if there's anything else we can provide, please don't hesitate to contact me/ us.

Info Paper on Infant Botulism ...

Sir,
You probably saw this. Am sharing with others as appropriate, since TSG should have seen by now. Mainly a way to summarize.
VR
[redacted]

INFORMATION PAPER

DASG-PPM-NC
8 February 2007

SUBJECT: Infant botulism cases at Ft. Meade

1. Purpose. To provide information on infant botulism at Ft. Meade, MD

2. Facts.

a Two infants living on the same street approximately 400 feet apart, at Ft. Meade contracted infant botulism in Oct 06 and Jan 07, respectively. Subsequent investigation did not reveal a common source. A local newspaper reported that one of the families plans to sue the Army, claiming that they were negligent in seeking the cause of the two cases. They reportedly believe that dirt from a construction site one block away from the street where both families live is the source of the spores, that soil testing should have been undertaken, and that the Army is intentionally avoiding such sampling because Ft. Meade is a Superfund site. The fact that *Clostridium* spores are everywhere in soil and dust, makes isolating any one putative source impossible, and experts agree that testing the soil in infant botulism cases is fruitless.

b. Infant botulism, also known as intestinal botulism, is a rare but serious paralytic illness caused by a nerve toxin produced by a spore-forming bacterium, *Clostridium botulinum*. *Clostridium* spores are ubiquitous worldwide, in soil and dust; most cases of intestinal botulism are likely to derive from ingestion of spores from common, airborne dust. After spores are ingested, they germinate in the intestines and produce bacteria which manufacture and release botulinum toxin. Intestinal botulism typically affects children younger than a year and rarely affects adults, because most adults and older children have natural defenses that prevent growth of the bacteria and elaboration of toxin. Other than avoiding feeding infants honey and corn syrup which are well known to present a risk of having spores, there is no known way to prevent the disease. Each year in the US, two cases are reported for about every 100,000 live births; this translates to about 5 cases per month throughout the country

c. The MEDDAC Commander at Ft. Meade requested assistance to investigate, and USACHPPM formed an Epidemiologic Consultation (EPICON) Team, which also consulted subject matter experts from the Centers for Disease Control and Prevention (CDC), the California Department of Health Services (CDHS), the Maryland Department of Health and Mental Hygiene, and the Anne Arundel County Health Departments. CDHS was consulted because of their nationally renowned expertise in infant botulism. The Team interviewed the affected infants' parents using the CDC's infant botulism questionnaire, modified for military beneficiaries. Stool specimens had been collected by local physicians and tested by the Maryland Department of Health and Mental Hygiene, and offered to the CDC for sub-typing. Investigators and Ft. Meade officials conducted town hall meetings to address community concerns and provided information sheets to local residents. Investigators also provided press releases and conducted media interviews.

[redacted] revealed no common exposures that may have been a likely source of the outbreak, and no possible food sources. The risk communication effort was intensified due to the high level of community concern regarding transmission and environmental factors discussed in the interviews, such as nearby construction. This quelled the fears of most Ft. Meade residents; however, some still wonder why environmental sampling and testing is not being done.

e. The Maryland Department of Health and Mental Hygiene is requesting determination of specific bacterial sub-types from the CDC. The CDHS is considering a research project that would attempt to isolate *C. botulinum* from soil or house dust samples that could be obtained from Ft. Meade. However, any results that may derive from the laboratory work of either the CDC or the CDHS in regard to this two-case cluster would contribute nothing toward identifying the source, predicting the emergence of additional cases, or mitigating future infections. In fact there are no known, specific, public health interventions to prevent non-foodborne, infant (intestinal) botulism because *C. botulinum*—when isolated from environmental samples—are traceable to multiple locations and not limited to any narrowly identified source. Instead, any Ft. Meade-associated research activities would occur strictly to advance the body of scientific knowledge about these bacteria and their ecology in Maryland.

f. EPICON Team recommendations include: (1) Military Health System providers throughout the National Capital Region (NCR) be made aware of the two cases, to reinforce the need to consider botulism in the differential when evaluating infants with paralytic signs or significant constipation; (2) NCR clinic staff receive a message reinforcing the need to communicate reportable medical events to both civilian and military public health authorities; (3) NCR beneficiaries who are parents of newborns and infants be informed about intestinal botulism as part of child health education; (4) Army epidemiologists enhance surveillance for botulism cases.

The Colorado Independent Newsweekly reports that top Army commanders received applause and criticism as the Pentagon's Task Force on Mental Health swept through Fort Carson, amid lingering questions about whether returning combat troops get the psychological care they need. Army Surgeon General Kevin Kiley and Maj. Gen. Robert Mixon acknowledged last week to media that commanders should be better trained to identify mental-health problems. According to one Washington, D.C.-based advocacy group, that's an important step. Kiley was at Fort Carson as part of a military-wide study to recommend improvements to military mental-health services, particularly for troops with post-traumatic stress disorder, or

PTSD. (We have learned some lessons)

The San Antonio Express News reports on local concerns that the pace of BRAC spending will negatively impact the area. San Antonio is slated to get $2 billion in new construction and a net gain of 3,000 medical-related jobs from the Pentagon's 2005 Defense Base Realignment and Closure Commission recommendations. Yet local leaders worry that the federal government might not spend the money needed to meet the BRAC goals — a decision that could delay work for local construction contractors, engineers and architects. (Pace of BRAC)

The Baltimore Sun continues its reporting on the children's botulism cases at Fort Meade. While both children survived the illness, one family has hired a lawyer who will likely sue the Army, claiming that military officials have been negligent in seeking the cause of the outbreak. The parents of the other child say they do not blame the military and do not plan to join a lawsuit. "I would be hesitant to reassure everyone by saying this is a freak thing and this is over," said Col. Bruno Petruccelli, a physician and director of epidemiology and disease surveillance at the U.S. Army Center for Health Promotion and Preventive Medicine in Aberdeen. "Maybe there will be a third case and a fourth case. We can't say there won't be another one." (Suit Possible)

Stars & Stripes reports that while more than 37,000 patients from the wars in Iraq and Afghanistan have been treated at Landstuhl RMC, only about 20 percent of those were seen for combat-related wounds, officials say. Troops and civilians from the combat zones, including Americans and patients from 41 other nations, have sought treatment at the U.S. Army hospital for ailments including heart problems, back injuries, kidney stones, respiratory illnesses, gynecological issues and dermatological complications, officials said. "When you've got more than 140,000 people in any one place, you have to expect diseases and injuries that have to be evaluated and treated," said Dr. Randolph Modlin, an Army colonel and chief of cardiology at Landstuhl. (Noncombat Injuries)

KING 5 TV News (Seattle, Wash) picked up an Associate Press news summary on a former civilian employee at Madigan Army Medical Center charged Friday in U.S. District Court in Tacoma with theft of honest services and accepting a bribe to aid in the commission of a fraud on the United States. 43-year-old Luis Cruz was employed as a tool and parts attendant at the U.S. Army's Madigan Medical Center. He was fired in April 2005 for drug use. After Cruz's dismissal, an investigation revealed that Cruz had been using his government-issued credit card to pay for services never ordered or received by the military. According to charging papers, Cruz and a co-conspirator who processed the charges pocketed more than $50,000 in cash for which they had falsely billed the government.

Potomac News features a heart-warming story of a little boy whose wish to go to Walt Disney World is being made possible by the Make-A-Wish Foundation. In a couple of weeks Shawn Aberl II will be able to see Mickey Mouse and all his pals while experiencing all the amusement park has to offer. The son of Staff Sgt. Jennifer and Sgt. 1st Class Shawn Aberl of Fort Belvoir, was born with popliteal pterygium, a disease that caused his fingers, toes and right leg to be webbed. Webbing was also present in Shawn's mouth and esophagus when he born. "It's very, very rare," Jennifer said as she watched her son and husband play with a pile of action figures in their Dogue Creek home on Saturday. "One in a million live births have this. They've never seen it here at Walter Reed Army Medical Center." Staff Sgt. Aberl is assigned to DeWitt Army Community Hospital, Fort Belvoir. (Belvoir Boy Gets His Wish)

Independentmail (Anderson, S. Carolina) reports on the story behind the more than 8,000 so-called "comfort quilts" hand-made to patients at Walter Reed Army Medical Center. What began as a humble way to keep warm in harsh mountain winters has become a comfort to members of the United States military who are recovering from war. About 50 of the colorful patchwork representations of a grateful nation arrive at the center each week. Each one is carefully opened, befitting the care with which it was made and shipped, by Chaplain John L. Kallerson, an Army major who believes each is a blessing. (Crafting Comfort)

KNEWS.com resurfaces the story of former Army Captain Jullian Philip Goodrum and his battles with the Army and PTSD. Goodrum was quoted in a United Press International article about appalling conditions at Fort Knox, Ky., for the soldiers in "medical hold" there. That article sparked congressional investigations of the treatment of injured

soldiers at two bases. In his interview with the television reporter, Goodrum is quoted as saying, "Per G.I. Joe, 'knowing is half the battle," he said. "Obtain medical knowledge and become familiar with symptoms of PTSD. Seek out qualified medical providers for medical support or readjustment support in your area that specializes in PTSD. PTSD is a risk of injury during service in a combat theater of operations. Have in place a course of action to implement if you begin to experience symptoms of PTSD or (have) readjustment concerns." And, he's sad to say, don't depend on the military to take care of it. Goodrum is full of stories of military personnel who tried - and failed - to get mental-health services through the Army. Vexing Infant Botulism Provokes Threat Of Suit

By Bradley Olson, Sun Reporter

It's one of the rarest infectious diseases, affecting an average of only 100 babies a year in the United States, but infant botulism infected two babies living on the same street at Fort Meade in recent months - puzzling researchers.

Clusters of the illness are not unprecedented, experts say, and the ubiquity of the bacterial spores that cause infant botulism makes isolating one source almost impossible.

That is especially true in this case, where the military base also happens to be an Environmental Protection Agency Superfund site.

Both children survived the illness, but one family confirmed yesterday that it has hired a lawyer who will likely sue the Army, claiming that military officials have been negligent in seeking the cause of the outbreak. The parents of the other child say they do not blame the military and do not plan to join a lawsuit.

On Thursday, base officials confirmed that both cases, the first diagnosed in October and the second in December, came from the same strain of Clostridium botulinum bacteria.

"I would be hesitant to reassure everyone by saying this is a freak thing and this is over," said Col. Bruno Petruccelli, a physician and director of epidemiology and disease surveillance at the U.S. Army Center for Health Promotion and Preventive Medicine in Aberdeen. "Maybe there will be a third case and a fourth case. We can't say there won't be another one."

Army doctors involved in the investigation say they have followed medical protocol, conducting an investigation with help from experts at the Centers for Disease Control and Prevention in Atlanta, Walter Reed Army Medical Center, Maryland Public Health Administration and Anne Arundel County Department of Public Health.

Infant botulism develops in newborns – usually those between 3 weeks and 6 months of age - when they ingest bacteria that produce a toxin inside the large intestine. The toxin attaches to nerves in the body and paralyzes them. Although the condition is treatable and most babies eventually recover, it causes several frightening symptoms, including paralysis and respiratory problems.

Such was the case with [redacted] whose family lives on the Anne Arundel County military base.

On Oct. 2, [redacted] noticed that the baby became fussy and was not feeding well. Thinking he was teething, she put him to bed. The next morning, he made an odd, grunting sound, and when she picked him up, his head flopped.

She took him to Bethesda Naval Hospital, where doctors, thinking [redacted] was dehydrated, gave him fluids intravenously. When his eyes began to gloss over, [redacted] recalled, [redacted] was rushed to Walter Reed Army Hospital, where a young physician noticed symptoms of infant botulism she had seen in a case during her residency.

She went home to research the condition and in the meantime, doctors tested him for meningitis. When that came back negative, they sent him to get a CT scan to rule out a neurological disorder. During the scan, Jonathan's vital signs plunged, and a gaggle of doctors and nurses rushed into the room, reviving him and putting him on oxygen.

Once infant botulism was definitively diagnosed, they treated him with a drug called "Baby-BIG," which slightly relieves symptoms and doesn't allow the toxin to paralyze any other nerves.

"My son was so sick, he couldn't even open his eyes," [redacted] said. "He had over 50 needle marks in him because his veins kept busting. To watch that, it was absolutely the most terrifying, horrible experience I've had to go through as a mother, and I've got four kids. I don't want any other families to have to go through that."

Jonathan has been fine since his recovery, but his mother became angry when, on Jan. 9, a Walter Reed doctor called her to say another child on her street had been diagnosed with infant botulism. At that point, she became convinced that the military was not committed to finding a cause.

Michael Archuleta, a Texas-based lawyer who is also a physician and is representing the [redacted] family, said he believes a pile of debris, about a block from the street where both families live, is the source of the toxin, and will file a negligence claim with the Army.

"We have two cases of infant botulism occurring in the same time frame, very close to one another, that is epidemiologically very improbable unless it came from an external or environmental source," he said.

A base spokeswoman confirmed that there was a debris pile and said it was removed and the site was covered with hay on Jan. 7.

The mother of the second child, who asked not to be identified when contacted by The Sun, said that her daughter is no longer sick and that she does not wish to join any potential lawsuit.

In interviews with both families, investigators have determined that the source was not food such as honey, which has proved to be a source of infant botulism.

Fort Meade and Army officials, as well as several leading independent epidemiologists and infectious disease experts, insist that testing soil in infant botulism cases would be fruitless because the bacterial spores that cause it are common and naturally occurring.

Dr. John Bartlett, a professor of medicine at the Johns Hopkins University who specializes in infectious diseases but is not involved in these cases, said that testing soil is "pointless."

"That kind of activity just doesn't pay off," he said. "You don't look for it in dirt, and even looking for it in a food source is going to be a long shot. I mean, two cases in the same geographic area are unusual, but I wouldn't know quite how to go about finding a source. Usually, we don't try because we don't find it."

Archuleta and the [redacted] believe that DNA testing could establish an exact match between the two cases and the dirt pile or other soils, and they intend to use that evidence in any litigation.

The toxin is too ubiquitous, Petrucelli, the Army epidemiologist, said, and the DNA-testing process too inconclusive. That Fort Meade was built on a landfill and is currently monitored by the Environmental Protection Agency would not have any impact, because those sites focus on chemical agents and other toxic substances, not naturally occurring substances, he said.

Dr. James Campbell, a pediatric infectious disease specialist at the University of Maryland School of Medicine, who is not involved in the case, said unlike food-borne botulism, which generally infects adults and which investigators almost always link to a food source, there is often no identified source for the infant variety.

Respectfully submitted. Hard copy will be mailed to [redacted] on Monday. I apologize for delaying this electronic delivery today. Scanned copy was ready for me to send earlier in the day but on final read-through I found a few formatting glitches (outline numbering, spacing, pagination). I did not want to wait any longer for type / re-scan, so am passing this on as we head into the weekend. At first I included [redacted] in distro but I hesitated as CHPPM's got its name stamped on a less-than-perfect tech report.. We'll make the corrections for hard copy.

After you and the Garrison Cdr have had a chance to read it, I would request your clearance to share with our colleagues at Maryland and Anne Arundel health depts.

Thank you for consulting us during these difficult circumstances, and we remain prepared to continue assisting in any way we can.

VR,

EPIDEMIOLOGICAL CONSULATION NO. 13-HG-06TU-07
INVESTIGATION OF A CLUSTER OF *CLOSTRIDIUM BOTULINUM* IN INFANTS AT FORT MEADE, MARYLAND
JANUARY 2007

1. REFERENCES. Appendix A contains the references used in this report.

2. PURPOSE. The purpose of this epidemiological consultation (EPICON) was to investigate a cluster of *Clostridium botulinum* (*C. botulinum*) in infants at Fort Meade, Maryland.

3. AUTHORITY. The U.S. Army Medical Department Activity (MEDDAC) Commander at Fort Meade requested assistance from the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) after two infants living on the same street, approximately 116 meters apart, contracted intestinal botulism in October 2006 and December 2006, respectively. In response to this request, the USACHPPM formed an EPICON team to perform an investigation.

4. BACKGROUND.

a. *Clostridium botulinum* is an anaerobic spore-forming, rod-shaped bacterium that produces botulinum neurotoxin, the causative agent of botulism (reference 1). *C. botulinum* is known to produce seven distinct toxins including A, B, C1, D, E, F, and G. Release of these toxins at pre-synaptic nerve terminals causes paralysis (reference 2).

b. Specific toxin types of *C. botulinum* are usually associated with specific geographic regions within the United States (U.S.). While both type A and B cases are seen in the western U.S., type A predominates west of the Rocky Mountains (reference 3). Type B has been isolated more frequently in cases in the Eastern U.S., specifically Pennsylvania and New York. Toxin types C, D, and F are less defined to a specific region, but are typically isolated from animals rather than humans, and all three of these types are poorly absorbed by the human intestine, which is essential for inducing neurological symptoms associated with botulism. Fresh water and fish ingestion have been associated with outbreaks of botulism type E. These outbreaks have historically been limited to the Baltic, Alaskan, and the Great Lakes areas (reference 3).

c. There are three major types of botulism found in humans: foodborne, wound, and gastrointestinal colonization (otherwise known as infant) botulism.

TABLE OF CONTENTS

5. RECOMMENDATIONS. The EPICON team recommends that—

a. Military Health System providers throughout the National Capital Region (NCR) be made aware of the two cases at Fort Meade in order to reinforce the need to seriously consider botulism in the differential diagnosis when evaluating infants with paralytic signs or significant constipation and when Sudden Infant Death Syndrome cases are encountered.

b. Army epidemiologists enhance surveillance for botulism cases.

c. The NCR clinic staff receive a message reinforcing the need to communicate reportable medical events to both civilian and military public health authorities.

d. The NCR beneficiaries who are parents of newborns and infants be informed about intestinal botulism as part of child health education.

e. Risk communication efforts continue on a scaled-down basis, that media coverage continues to be monitored, and that the installation remains ready to respond to community rumors, misunderstandings and misperceptions in a timely manner.

4. CONCLUSIONS.

a. Interviews with each family revealed no common exposures that may have been a likely source of the outbreak, and no possible food sources. The risk communication effort was intensified due to the high level of community concern regarding transmission and environmental factors discussed in the interviews, such as nearby construction. This quelled the fears of most Fort Meade residents; however, a local newspaper reported that the parents of one of the affected infants plans to sue the Army, claiming there was negligence in seeking the cause of the two cases. They reportedly believe that dirt from a construction site one block away from the street where both families live is the source of the spores, that soil testing should have been undertaken, and that the Army is intentionally avoiding such sampling because Fort Meade is a Superfund site.

b. Proving or disproving a link with the environment is a dubious task given the lack of previous research in the area. It is widely believed that botulism type B is endemic to the soil in the area and over the entire east coast of the U.S. Numerous discussions were held with leading *C. botulinum* experts, CDC representatives, and Maryland and Anne Arundel County public health officials about proceeding with environmental testing. The consensus of this group was that environmental testing would not prove or disprove a link between the cases and the environment. In addition, there are no known public health prevention strategies for non-foodborne *C. botulinum.* Despite not testing the environment for possible connections, research was performed regarding prior land use. The Agency for Toxic Substances and Disease Registry does list Fort Meade on the National Priorities List, but their report indicates that the waste sites are far from the current location of the cases. Moreover, while prior dumping sites for waste and dead carcasses are theorized to be a viable source for *C. botulinum,* there has been no evidence to support this.

c. After review of all the research and data, it is clear that there are numerous modes of ingestion of *C. botulinum* by infants that are not well described in the literature. At the present time, the EPICON team cannot find a link between the two cases at Fort Meade. Moreover, each of the infections was probably due to a number of factors including limited normal bacteria flora growth in the intestine and may in fact include some cofactor or another infection that increases the susceptibility of an infant. Much needs to be learned about the epidemiology of infant botulism and this EPICON team reached out to the leading scientists in this field. Collaborations were offered for both environmental and laboratory researchers to provide isolates and samples to aid long-term research projects that will better elucidate the etiology of *C. botulinum.* However, it is important to state that EPICON team members do not feel these results will assist in the current investigation or provide immediate public health interventions for the Fort Meade population.

EXECUTIVE SUMMARY
EPIDEMIOLOGICAL CONSULATION NO. 13-HG-06TU-07
INVESTIGATION OF A CLUSTER OF *CLOSTRIDIUM BOTULINUM* IN INFANTS AT FORT MEADE, MARYLAND
JANUARY 2007

[redacted]

1. PURPOSE. The purpose of this epidemiological consultation (EPICON) was to investigate a cluster of *Clostridium botulinum* (*C. botulinum*) in infants at Fort Meade, Maryland. The U.S. Army Medical Department Activity Commander at Fort Meade requested assistance from the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) after two infants living on the same street, approximately 116 meters apart, contracted intestinal botulism in October 2006 and December 2006, respectively.

2. BACKGROUND. Intestinal botulism, also known as infant botulism, is a rare but serious paralytic illness that can occur in children under 1 year of age. It is caused by a nerve toxin produced by *C. botulinum* bacteria, the spores of which are ubiquitous worldwide in soil and dust. Most cases of infant botulism are probably caused by ingestion of spores from common, airborne dust. After spores are ingested, they germinate in the intestines and produce bacteria which manufacture and release botulinum toxin. Stool specimens collected from both of the Fort Meade infants tested positive for *C. botulinum* toxin type B, which is prevalent in the Eastern United States (U.S.).

3. METHODS. The USACHPPM formed an EPICON team for this investigation. The team consulted subject matter experts from the Centers for Disease Control and Prevention (CDC), the California Department of Health Services (CDHS), the Maryland Department of Health and Mental Hygiene (DHMH), and the Anne Arundel County Department of Health. The CDHS was consulted because of their nationally renowned expertise in infant botulism. The team interviewed the affected infants' parents using the CDC's infant botulism questionnaire, modified for military beneficiaries. Stool specimens had been collected by local physicians and tested by the Maryland DHMH. *Clostridium botulinum* has been isolated from both samples and isolates will be sent to the CDC for subtyping. The EPICON personnel conducted town hall meetings with the Fort Meade Garrison Commander to address community concerns. Investigators also provided information sheets to local residents, provided press releases, and conducted media interviews.

<Editor's Note: Add whatever copies furnished you deem necessary.>

(1) Foodborne botulism is typically caused by ingesting preformed toxin from improperly preserved food items. Wound botulism, similar to other wound infections, is caused by the bacteria embedding under subcutaneous skin or deep inside an open area on the body, where they then produce the toxin. Intestinal botulism, which was first reported in 1976 (reference 4), occurs almost exclusively in infants, with the range of affected ages being 1 to 63 weeks. The majority of all cases occur in infants under 6 months of age, with the average age of reported cases being 13 weeks (reference 5). Cases are thought to be caused by ingestion of *C. botulinum* spores that subsequently colonize the large intestine and produce botulinum neurotoxin (references 4 and 6).

(2) While *C. botulinum* cases occur throughout the world, the diagnosis of infant botulism is relatively uncommon in less developed countries (reference 7). There are numerous reasons for this trend, but perhaps the biggest is the amount of resources and testing required for a definitive diagnosis of infant botulism. *Clostridium botulinum* in infants is the most commonly diagnosed type of botulinum intoxication in the U.S. (reference 6); despite this, less than 2 infant botulism cases occur annually for every 100,000 live U.S. births (references 8 through 13). The case fatality rate for infant botulism in the U.S. is about 1.3 percent and less than 1 percent for hospitalized infants (reference 8). However, studies suggest that some cases of Sudden Infant Death Syndrome (SIDS), which affects more than 4,500 infants in the U.S. each year or approximately 50 infants per 100,000 live births, may be due to infant botulism ((reference 9). Although the actual rate of fatal botulism falsely attributed to SIDS is unknown, studies analyzing infants who died from SIDS in the U.S. found botulism bacteria or toxin in up to 5 percent of examined SIDS cases (references 8, 9, 10, and 13). Some European studies have found higher rates (references 11 and 12).

d. Since infants cannot communicate symptoms, parental and provider awareness are keys to early diagnosis and treatment. Signs of infant botulism include: constipation, weakness (affecting gag, cry, sucking and swallow functioning), flaccid paralysis or "floppy baby syndrome," poor feeding, lethargy and hypotonia (reference 6). Prompt laboratory diagnosis is necessary to rule out other degenerative neuromuscular diseases. A test for toxin in the infant's stool specimen is conducted to identify and type the toxin. A confirmatory test is conducted by culturing the fecal specimen to isolate *C. botulinum*. However, typical infant botulism laboratory analysis stops at this step. Laboratory subtyping from clinical isolates are not usually done and are part of broader research in the few laboratories equipped to do such testing.

e. Historically, there has not been a treatment protocol for infant botulism with the exception of treating specific symptoms. However, in 2003, the Food and Drug Administration approved Botulism Immune Globulin Intravenous (Human) (BabyBIG) for treatment of infant botulism cases with toxin A or B. This treatment consists of botulism antitoxin antibodies that are derived from humans (reference 14).

f. Commonly known vectors such as honey or syrup have been shown to be the source of several infant botulism cases. However, these risk factors can only be demonstrated in 10 percent of all infant botulism cases (reference 15). Recent research suggests that the toxin forming agent spores may be introduced by ingesting environmental materials such as dust or soil. Given *C. botulinum* is ubiquitous in soils around the world, ingested dust and soil are thought to be likely culprits of infant botulism (reference 15).

g. In late 2006, two cases of infant botulism type B were identified among Department of Defense (DOD) beneficiaries hospitalized at the Walter Reed Army Medical Center (WRAMC). The cases occurred approximately 3 months apart and the infants involved lived in the same residential area in Fort Meade, Maryland, approximately 116 meters apart. The proximity of the cases increased community concern and sparked the investigation summarized in this EPICON.

h. While the incidence of *C. botulinum* infection among infants is rare, it is not unprecedented to have clustering of cases. A review of literature reveals numerous infant botulism clusters that have been investigated (references 16 through 18). More recently, a new unpublished report indicated a cluster of infant botulism types A and B at Vandenberg Air Force Base in California. Like the cases presented in this report, there were two cases of confirmed infant botulism within 3 months of onset. Foodborne illness for both cases was ruled out. Thus, environmental concerns were investigated.

5. METHODS.

a. EPICON Team. Principal team members from the USACHPPM included two preventive medicine physicians, three epidemiologists (including one with environmental health expertise), and three risk communication specialists. This team worked with preventive medicine personnel at Fort Meade, medical epidemiologists from the Anne Arundel County Department of Health and the Maryland Department of Health and Mental Hygiene (DHMH), and public affairs professionals from these various organizations. The EPICON personnel and their civilian public health partners also conducted telephonic conferencing with a team of *C. botulinum* experts from the Centers for Disease Control and Prevention (CDC) and the California Department of Health Services (CDHS). Additionally, military medical and laboratory surveillance agencies for all service branches were consulted to identify and confirm additional cases. These agencies included the Army Medical Surveillance Activity (AMSA), the Navy Environmental Health Center (NEHC), and the Air Force Institute of Operational Health (AFIOH).

b. Case Interviews.

(1) A modified investigation form (appendix B) was developed using the CDC's standard infant botulism form (A Guide to Investigation of Infant Botulism, CDC 52.73 REV. 9-87) and the New York City Department of Health's investigation form. The form was designed to be

more specific for military families regarding factors such as residence, potential exposures in the military, and housing. Information collected included demographics, onset dates, clinical presentation, food history, travel history, and exposures to known or suspected botulism sources.

(2) A team of four conducted the interviews with the parents of each case. Questions were asked by one person to remove question bias from the interview. Questions were asked in the same order for each case, and responses were recorded by all four team members. Each interview lasted for approximately 1 hour. After the interviews, responses to each question were typed by one member of the team and reviewed by the other three members for accuracy. Afterwards, the entire EPICON team reviewed the responses for commonalities between the two cases and possible exposure links.

c. Surveillance.

(1) The AMSA's Defense Medical Surveillance System (DMSS), its integrated Reportable Medical Events System (RMES), and the Military Health System Mart (M2) were queried to identify infant botulism diagnosed among active-duty military beneficiaries from calendar year (CY) 2002 through CY 2006. The inpatient queries were structured to identify any hospital admissions of infants under 1 year of age who were diagnosed with a primary or secondary diagnosis of infant botulism. Data from civilian facilities were only available if the claim was processed through TRICARE, the military health insurer. All data were consolidated into one case file which was then limited to unique cases. For each probable case identified through record review, AMSA, NEHC, and AFIOH were consulted to determine if the cases had confirmatory laboratory results. Because laboratory records are not readily accessible confirmation was only available for cases reported through the RMES reports. The Defense Enrollment Eligibility Reporting System (DEERS) was then queried to determine live births among DOD active-duty service members' beneficiaries for CY 2003 through CY 2006.

(2) Based on the documented association between SIDS and infant botulism, the EPICON team also consulted with the Office of the Armed Forces Medical Examiner (OAFME), a component of the Armed Forces Institute of Pathology (AFIP); the Baltimore Medical Examiner's Office; and the Maryland DHMH to gather information regarding fatalities classified as either SIDS or infant botulism.

d. Environmental Analysis. Sampling of environmental sources for *C. botulinum* type B was strongly considered by all parties involved in the investigation. After consulting with experts in the field, it was determined that environmental sampling would not add to this investigation and thus it was not conducted. However, collaboration with, and submission of environmental samples to, the Infant Botulism Treatment and Prevention Program in California was offered as part of long-term research and may occur in the future. In addition, a layout of the immediate construction sites and the case's residence was developed using a measuring wheel for distances.

Distances were measured and marked for the residences, playground, football field, and possible construction site. Figure 1 shows this layout. Prior land use was also thoroughly researched for any possible botulinum contamination or biological use that may induce growth of *C. botulinum.*

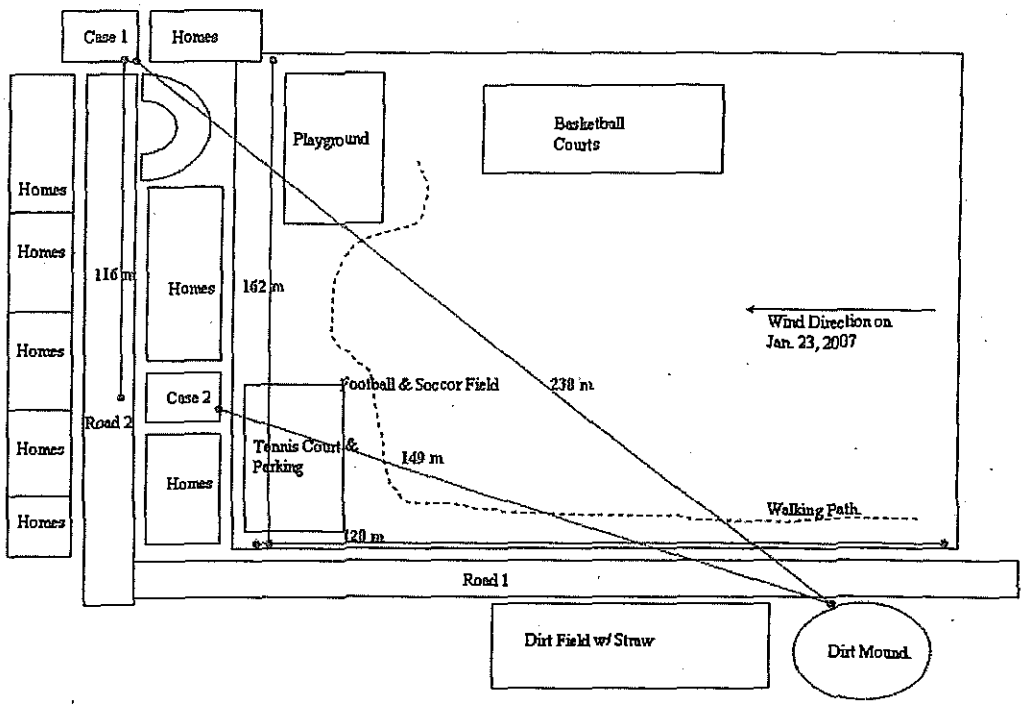

Figure 1. Layout of Possible *C. Botulinum* Exposures and Cases' Residences

e. Provider Education. Military Health System (MHS) providers throughout the National Capital Region (NCR) were made aware of the two cases from Fort Meade as a means of reinforcing the need to seriously consider botulism when evaluating infants being seen because of paralytic signs or significant constipation, and when SIDS cases are encountered. Providers and clinic staff also received a reinforcing message about the need to communicate reportable medical events to both civilian and military public health authorities.

f. Risk Communication.

(1) From the beginning, Fort Meade's response focused on educating healthcare providers and the local community about the issue and on direct interaction with the affected families and other Fort Meade residents where the two affected infants lived. Kimbrough Ambulatory Care Center (KACC) notified all military healthcare providers in the NCR of the existence of the two cases and symptoms commonly associated with the disease. The Fort Meade Garrison Commander and KACC staff also immediately teamed up to personally visit both infants' families to identify unmet needs and to hand deliver risk communication products to the remaining residents. Risk communication products were also distributed to onpost child development centers, the media, and eventually to in-home childcare providers when that gap was identified. Risk communication products and media releases are in appendix C.

(2) Risk communication efforts regarding this issue incorporated several key risk communication principles—

(a) Discussing the bad news first and in a timely manner.

(b) Contacting the affected families and area residents in person.

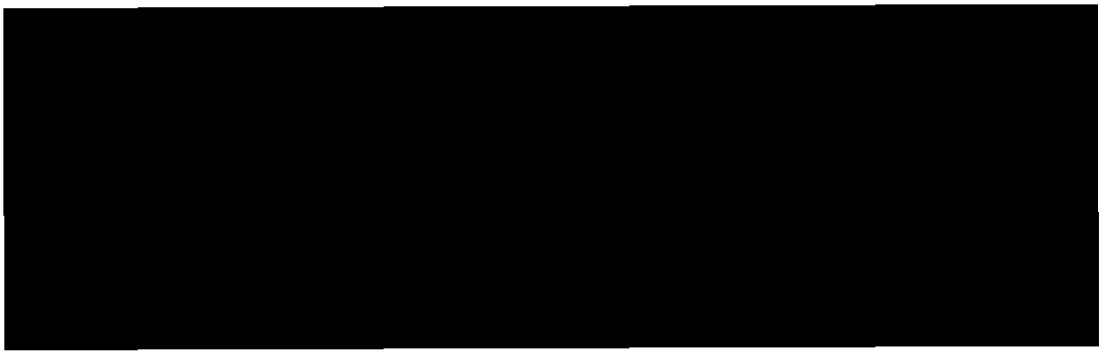
(c) Identifying and using consistent spokespersons.

(d) Aligning response efforts with nonmilitary experts on infant botulism (that is, county and state health departments, the CDC, and the State of California where most infant botulism cases in the U.S. have occurred) to ensure that actions taken and/or proposed were scientifically valid.

6. FINDINGS/RESULTS.

a. Interviews and Clinical Case Summaries.

(1) Case 1.



[redacted]

[redacted]

property. However, there are numerous construction sites throughout the post, which the family may have passed by on occasion. Another construction site of possible exposure may be a "dirt pile" about 150 meters from the house or the playground which the father states he took the child to once prior to onset. The child stays at home with the mother and is not exposed to any childcare facilities outside of the home. The mother stated that she does dust and vacuum their house at least once per week. While both parents stated that no construction or gardening has been performed at the residence, both mentioned that sewage backup does occur during periods of ample rain.

(2) Case 2.

[redacted]

street, thus both are exposed to the same construction sites located elsewhere onpost. Case 2 has been exposed to the Child Development Center II (CDC II). No other children with similar illnesses have presented from this CDC II facility.

(c) Both families shop for groceries at the same locations. Feeding patterns are on the same schedule, but case 2 typically feeds with supplement, whereas case 1 feeds on breast milk. Case 2 does access the local children's center (CDC II), while case 1 has never utilized the facility. The children did not share any other known commonalities such as people, churches, gathering centers, etc. All four parents of the children had different occupations and were at different localities for their respective positions.

b. Epidemiology.

(1) Fewer than 100 cases of laboratory-confirmed infant botulism have been identified each year within the U.S., which equates to a rate of about 2 cases per 100,000 live births (reference 19). Review of published public health reports revealed that a total of 16 laboratory-confirmed cases of infant botulism (primarily type B) were reported in the State of Maryland from 1976 through 1996 (reference 5). The Anne Arundel County Department of Health was consulted to identify additional cases reported in the state of Maryland since 1996; they had documented 30 laboratory-confirmed cases during this time frame, bringing the cumulative 30-year total to 46 cases. Case reports were sporadic, ranging from 0 to 6 cases reported per year.

The 2005 incidence rate was 6.7 cases per 100,000 live births (reference 20). Table 1 shows U.S., Maryland, and Anne Arundel County case reports from calendar years 2002 through 2006.

Table 1. Laboratory-Confirmed Infant Botulism Cases, CY 2002–CY 2006

Case Reports	2002	2003	2004	2005	2006
National[1]	69	76	87	85	88
Maryland[2]	0	1	5	5	6
Ann Arundel County[2]	0	1	1	0	2

[2]Maryland and Anne Arundel County figures provided by the Anne Arundel County Department of Health.

(2) Table 2 provides information regarding cases of infant botulism diagnosed among DOD active-duty beneficiaries from 2002 through 2006. During the 5 calendar years evaluated, approximately 85,000 to 105,000 live births were documented annually among DOD active-duty service members. Among this cohort, a total of 16 unique cases of infant botulism were identified during this period. Of the 16 cases identified, only 6 were laboratory-confirmed. A total of 2 probable cases were diagnosed in 2002, 3 occurred in 2003, 2 in 2004, 1 in 2005, and 8 in 2006, representing annual rates of 3.5 cases, 3 cases, 1 case, and 8.6 cases per 100,000 live births, respectively. Denominator data were not available for CY 2002 from M2 due to limitations with the M2 interface used to query the DEERS; therefore, rates could not be generated prior to CY2003. All cases were under 6 months of age, and there was not a male or female predominance. The majority (71 percent) of cases were from the west coast or the Great Plains region. These findings are consistent with the literature (references 1, 6, 16, and 22).

(3) In the process of reviewing case medical records, a similar clustering of cases as that observed at Fort Meade was detected in 2006 at Vandenberg Air Force Base in southern California. Two infants living in the same housing base were diagnosed within 3 months of each other, the first case being diagnosed in March 2006 and the second in May 2006. Case 1 was determined to be botulinum type B and the second was type A. Preventive medicine personnel questioned stated that the cases resided within 2 miles of each other. They were able to rule out the possibility of the cases being foodborne, but could not identify any epidemiologic links between the two cases. They consulted with the CDHS and concluded that the cases were probably acquired by ingestion of spores which occurred naturally in the environment, and noted nearby construction at a service station.

Table 2. Infant Botulism among DOD Active-Duty Beneficiaries, CY 2002–CY 2006

2nd	0	0	0	0	4
3rd	1	3	1	0	1
4th	0	0	1	1	2

*Probable cases are cases with clinical presentation, lacking confirmatory laboratory tests; cases were identified through International Classification of Diseases, Ninth Revision (ICD-9) diagnosis codes entered into the patient's electronic medical record during hospitalization (reference 23).

(4) Further review of public documents regarding infant mortality revealed that within the State of Maryland approximately 50 SIDS cases are reported each year while mortality due to infant botulism has not been documented in the state (reference 24). The Baltimore Medical Examiner's Office further stated that because SIDS is considered a cause of death, the Medical Examiner does not test victims for potential underlying causes such as infant botulism. Interviews with the OAFME revealed that the organization has no visibility on continental U.S. (CONUS) dependent fatalities due to DOD casualty operations policy.

c. Risk Communication. Because of the high level of community concern associated with this issue, risk communication efforts by Fort Meade and the investigators were critical in the overall response. Target audiences included the Fort Meade residential and childcare

communities because of their heightened concerns and local military and civilian healthcare providers to ensure increased vigilance.

(1) Risk communication efforts involved education through information sheets, weekly updates, links to nonmilitary resources, video/audio files of media interviews, personal outreach by the Fort Meade MEDDAC Commander and KACC, and town hall meetings to answer questions and discuss lingering concerns. Collaboration with nonmilitary experts likely assisted in addressing community concerns due to their neutrality about the proposed investigative approach. Media interest was intense and extended well beyond the local area.

(2) Several media interviews were conducted by the Fort Meade Garrison Commander, the EPICON team leader, and the KACC Chief of Preventive Medicine, to include those with NPR, The Baltimore Sun , and the Washington D.C. affiliates of ABC and CBS television networks. Given that public interest in the issue is less than it was initially, it would be easy to assume that concerns have been adequately addressed.

d. Laboratory Testing. Initial laboratory testing for both cases was performed by the Maryland DHMH Public Health Laboratory. Stool samples from both cases cultured positive for *C. botulinum*. In addition, a mouse bioassay was performed in which botulinum neurotoxin type B was detected. Genetic subtyping for each organism is currently pending with the CDC.

e. Mapping. Mapping of the area demonstrated that the residences of case 1 and case 2 were approximately 116 meters apart. Case 1 was slightly downhill of the playground, which in turn was slightly uphill of the dirt mound. The dirt mound was about 238 meters from case 1. Case 2 was much closer to this dirt mound (~150 meters) and was slightly uphill from it. (See figure 1).

f. Environmental Testing. Due to parental concern expressed to the media in reference to hazardous waste "Superfund" sites on Fort Meade, the EPICON team explored historical records regarding land use at Fort Meade. Fort Meade was listed on the Environmental Protection Agency's National Priorities List of hazardous waste sites on 22 July 1998 (reference 25). Due to this, the EPICON team researched the history of the site near residences where the cases occurred to identify any possible prior use, such as use for relocation/management of waste. The 1999 Agency for Toxic Substances and Disease Registry (ATSDR) public health assessment on Fort Meade (reference 25) and the 1989 U.S. Army Environmental Hygiene Agency's evaluation of solid waste management on Fort Meade (reference 26) listed numerous waste sites, including chemical containments and landfill sites (references 25 and 26). No waste sites were identified in the immediate area of residence for the cases.

7. DISCUSSION/CONCLUSIONS.

a. Investigation.

(1) The epidemiology of infant botulism is not well understood. Due to its rare occurrence and emerging etiologic understanding, numerous limitations are present when trying to prove or disprove links between cases. Although risk factors for infant botulism have been well studied, investigations are often inconclusive, and specific biological physiologies for developing infections are less well described. Spika et al identified several possible risk factors for infant botulism, including living in a rural area, breast-feeding infants over 2 months of age, less than one bowel movement per day for at least 2 months, and ingestion of corn syrup (references 1, 22, and 27). Other studies suggest hospitalized infant botulism cases tend to have higher birth weights and to be born to mothers that tend to be white, older and better educated (reference 5). Breast-feeding is more common in cases (references 17 and 28) and is associated with later onset in type B cases (reference 28). The rarity of infant botulism further complicates diagnosis, treatment, and prevention efforts for clinicians, microbiologists and epidemiologists.

(2) Upon initial review, there was concern that the two cases were linked in some way and that other infants in the community could be at risk. Thus, a thorough consultation was conducted to investigate all known risk factors for infant botulism. Both families shopped for groceries at the same commissary, as do most other families who live on Fort Meade. Still, foodborne agents were quickly ruled out due to the fact that the affected infants did not consume any food from a common source. In fact, case 1 was breast-fed almost exclusively, while case 2 was fed supplement. Known food risk factors such as honey and corn syrup were never used by either case. After ruling out common food agents, the investigation then looked for common exposures such as public gatherings, churches, day care facilities, and parents' occupational exposures. Each of the parents work in a different setting, and none of the four came into contact with each other during the course of their work. Furthermore, neither of the families shared the same church or public places. The families had no known contact with each other prior to onset of the cases. Thus, transmission is unlikely to have occurred in a child care setting or any other public location. In addition, the cases were three months apart and the families were not known associates, thus person-to-person transmission is highly unlikely, especially given that person-to-person transmission has never been documented.

(3) The investigation then turned to environmental exposures. Proving or disproving a link with the environment is a dubious task given the lack of previous research in the area. It is widely believed that botulism type B is endemic to the soil in the area and over the entire east coast of the U.S. Numerous discussions were held with leading *C. botulinum* experts, CDC representatives, and Maryland and Anne Arundel County public health officials about proceeding with environmental testing. The consensus of this group was that environmental testing would not prove or disprove a link between the cases and the environment. In addition, there are no known public health prevention strategies for non-foodborne *C. botulinum*. Reasons for this decision were: little is known about the diversity of the organism (that is, no library to compare with), the ability of laboratory methods to discriminate among *C. botulinum* subtypes

(reference 29) is limited; laboratory capacity is limited; and finally, due to the ubiquitous and dispersed nature of the organism, the probability of collecting the exact soil sample containing the causal agent is miniscule. It is interesting to note that one group of researchers in this field found an apparent "cluster" of *C. Botulinum* strains that were identified by Pulsed-Field Gel Electrophoresis (PFGE) approach as being more than 90 percent similar. However, the isolates were from different types of materials from two different continents and were collected over an extended period of time (reference 29). These results highlight the limitations to current laboratory methods in linking cases in a suspected cluster.

(4) Despite not testing the environment for possible connections, research was performed regarding prior land use. The ASTDR does list Fort Meade on the National Priorities List, but their report indicates that the waste sites are far from the current location of the cases. Moreover, while prior dumping sites for waste and dead carcasses are theorized to be viable sources for *C. botulinum*, there has been no evidence to support this.

(5) Several studies have indicated that *C. botulinum* is endemic to many, if not all, parts of the world and ultimately resides in the soil (references 1, 7, 15, 16, and 22). Current efforts are underway in California to develop a *C. botulinum* library of genetic material that may one day be utilized for PFGE or Amplified Fragment Length Polymorphism in matching human-linked strains of the organism with environmental samples. However, this library is not yet complete, thus genetic subtyping of the organism would not result in a confirmation of positive or negative results. Therefore, the only results of environmental testing would be to inform us that *C. botulinum*, if isolated, is present in the environment. Given the possible outcomes of environmental sampling, it was decided that there was no public health benefit. As Istre et al indicated, there are probably several environmental factors that aid in the ingestion of *C. botulinum*; however, until the technology and knowledge advances, we cannot determine what those factors may be (reference 16).

(6) After review of all the research and data, it is clear that there are numerous modes of ingestion of *C. botulinum* by infants that are not well described in the literature. At the present time, the EPICON team cannot find a link between the two cases at Fort Meade. Moreover, each of their infections was probably due to a number of factors including limited normal bacteria flora growth in the intestine and may in fact include some cofactor or another infection that increases the susceptibility of an infant. Much needs to be learned about the epidemiology of infant botulism, and the EPICON team reached out to the leading scientists in this field. Collaborations were offered for both environmental and laboratory researchers to provide isolates and samples to aid long-term research projects that will better elucidate the etiology of *C. botulinum*. However, it is important to state that EPICON team members do not feel these results will assist in the current investigation or provide immediate public health interventions for the Fort Meade population.

b. Risk Communication.

(1) According to the National Research Council, risk communication is defined as "an interactive process of exchange of information and opinion among individuals, groups, and institutions" (reference 30). The interactive element of risk communication, along with clear messages, is necessary in order for both experts and nonexperts to develop a mutual understanding of interests, values and concerns that go far beyond one-way information sharing.

(2) While treatable, infant botulism can cause significant anxiety and panic not only for the affected families but also within the local population because it—

(a) Afflicts only very young helpless children (typically less than 1-year-old).

(b) Occurs in an apparently random fashion without a means to predict or prevent exposure.

(c) Has no discernible cause due to its ubiquitous nature in the environment.

(d) Elicits dread and fear just by its very name, "botulism."

(3) When community concerns and media interest are high, risk communication efforts are critical in the overall response. Aggressive health information efforts (that is, fact sheets, press releases, etc.) are needed to increase awareness of the disease, its symptoms, and response actions. At the same time, technical knowledge is not always the dominant influence when concerns are high (and trust is low or unknown). Dialogue opportunities with experts and healthcare providers are important to answer questions and discuss lingering concerns.

8. LIMITATIONS.

a. The consultation is limited by several factors. The first is that there was a very small number of cases (n=2). Thus, neither a case-control study nor a cohort study was feasible. Secondly, *C. botulinum* is a class A agent which limits laboratory options. In addition, several laboratories were contacted about conducting subtyping for the two specimens and, after much internal discussion, the botulism laboratory at CDC agreed to take the samples but with the stipulation that the results would only benefit future knowledge of the organism and would not be valid for this investigation.

b. The lack of a central source for identifying and tracking mortality among dependents of active-duty service members within the DOD is also problematic. Although establishment of centralized databases to monitor unexplained child deaths was formally recommended by the American Academy of Pediatrics in 1999, actions have not been undertaken within the DOD to

allow this capability. Creation of a mortality registry for dependents would allow determination of baseline mortality risk from all causes, thereby enabling the study of epidemiological patterns of these deaths and focused prevention strategies to reduce the incidence of death in the spouses and children of service members. The OAFME/AFIP has submitted a proposal for funding this type of surveillance (appendix D). However, this remains an unmet need since the proposal did not receive funding.

c. Additionally, the lack of access to laboratory data for confirmation of probable or clinically diagnosed cases is problematic. This confirmation was not available for the majority of infant botulism cases identified among DOD beneficiaries, making it difficult to directly compare incidence estimates with state and national estimates which are based solely on lab-confirmed cases. Therefore, it is not possible to determine if rates among DOD beneficiaries are elevated as compared to national rates.

9. RECOMMENDATIONS.

a. The EPICON team recommends that—

(1) Military Health System providers throughout the NCR be made aware of the two cases at Fort Meade in order to reinforce the need to seriously consider botulism in the differential diagnosis when evaluating infants with paralytic signs or significant constipation and when SIDS cases are encountered.

(2) The NCR providers and clinic staff receive a message reinforcing the need to communicate reportable medical events to both civilian and military public health authorities.

(3) The NCR beneficiaries who are parents of newborns and infants be informed about intestinal botulism as part of child health education.

(4) Army epidemiologists enhance surveillance for botulism cases.

(5) The policy makers at DOD take the AFIP proposal (appendix D) into consideration.

(6) Access to laboratory results by centralized data management agencies, such as the DMSS, be improved to enhance ongoing surveillance activities.

b. Although public interest is not as elevated as it was initially, some questions do linger within the community. Therefore, risk communication efforts should continue on a scaled-down basis. Monitoring of media coverage should continue, and the garrison should remain prepared to respond to community rumors, misunderstandings and misperceptions in a timely manner.

c. Because new information regarding infant botulism and this investigation is limited, it is recommended that the results of the EPICON team investigation be released in order to meet community expectations. While education of the community was a key component of the risk communication process, particularly during the initial response phase, this interactive component of risk communication is still crucial and should be continued to—

(1) Gauge how widespread concerns may be.

(2) Obtain empirical data from the community regarding how they view the command's response.

(3) Identify any lingering misperceptions/misunderstandings about this issue and verify that risk communication education efforts were effective.

(4) Identify the most preferred communication venues.

(5) Identify the most trusted sources of information on this issue.

(6) Further demonstrate the command's commitment to community well-being

APPENDIX B

CLOSTRIDIUM BOTULINUM QUESTIONNAIRE USED FOR INVESTIGATION

Hypothesis Generating Questionnaire (Infant Botulism)

(Modified January 2007 from a New York City Department of Health Questionnaire and CDC Form 52.73, Guide to Investigation of Infant Botulism)

Initials of interviewer _____

Date form completed: ___/___/___

DEMOGRAPHIC INFORMATION OF THE CASE

Parent's last name: _____ Parent's first name: _____

Infant's last name: _____ Infant's first name: _____

Home address: _____

_____

_____

Phone: ( ) - _____

Sex: □ Male □ Female

Race/Ethnicity: □ White, not Hispanic □ Black, not Hispanic
□ Hispanic □ Asian or Pacific Islander
□ American Indian or Alaska native
□ Unknown

Mother's Age: Father's Age:

Mother's Occupation: Father's Occupation:

Number of Pregnancies:

Number of Live Births:

Type of Delivery (cases only): □ Vaginal □ C-Section

Complications: □ Yes □ No If yes, please explain: _____

Was infant premature? □ Yes □ No □ Unknown If yes, gestational age (weeks) _____

What was infant's birth weight _____

1. Where was your child born? ❑ Hospital ❑ Other _____

   Hospital Name: _____

   Age at discharge from hospitals? _____

Was your child premature? ❑ Yes ❑ No ❑ DK

2. Where do you usually take your child for medical problems or for well baby visits?
   ❑ Pediatrician ❑ Family/gen practitioner ❑ Nurse practitioner or PA
   ❑ ER ❑ Other (Please specify_____)

3. Before your child's illness from botulism began, did he/she see a physician for any other medical problems (not including well-child visits or visits for immunizations)? ❑ Yes ❑ No❑ DK

4. Did your child receive antibiotics in the month prior to illness onset? ❑ Yes ❑ No❑ DK

5. What was your infant's usual bowel movement pattern during the following months of life?

	≥ 1 BM/day	1 > BM ≤ 3/day	< 1/3 days	unknown
1st month	___	___	___	___
2nd month	___	___	___	___
3rd month	___	___	___	___
4th month	___	___	___	___

When we first interviewed you about your child's illness, you reported that he/she first appeared sick on ____/____/____ *(onset date)*. Is this the correct date? ❑ Yes ❑ No ❑ DK

I. Food/Liquid Exposures

6. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being breast-fed? ❑ Yes ❑ No ❑ DK
   If yes, how many times per day do you breast feed? _____

Formatted: Bullets and Numbering

7. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being bottle fed? ❑ Yes ❑ No ❑ DK
   Do you use expressed breast milk to bottle feed? ❑ Yes ❑ No ❑ DK
   Do you use formula to bottle feed? ❑ Yes ❑ No ❑ DK
   Which formula did you primarily use? _____
   Please specify other brands of formula that you used. (List all brands used)
   _____
   _____
   _____

Formatted: Bullets and Numbering

What type of formula do you usually use? Did you use...
   a. Liquid (ready to serve) ❑ Yes ❑ No ❑ DK

b. Liquid (conc. add water) ❑ Yes ❑ No ❑ DK

c. Powdered ❑ Yes ❑ No ❑ DK

Who usually prepared the formula?

Name: _____

Relationship to the child: _____

If water was used, what was the source of the water? _____

If tap water, was it boiled or filtered? ❑ Yes ❑ No ❑ DK

How many bottle feedings per day? _____

8. Prior to your child's illness, did he/she eat any baby cereal? ❑ Yes ❑ No ❑ DK

Please specify type and brand (rice, oatmeal, etc.). _____

9. Did your child eat jars, bottles, or cans of baby food? ❑ Yes ❑ No ❑ DK

Please specify type and brand _____

10. Did your child eat any baby food that was prepared at home? ❑ Yes ❑ No ❑ DK

Please specify how it was prepared _____

11. Did your child eat any home-canned foods? ❑ Yes ❑ No ❑ DK

12. Did anyone in your family eat any home-canned foods? ❑ Yes ❑ No ❑ DK

13. Did your child drink any regular cow's milk (pasteurized)? ❑ Yes ❑ No ❑ DK

14. Did your child drink any unpasteurized milk? ❑ Yes ❑ No ❑ DK

15. Did your child eat or drink any honey? ❑ Yes ❑ No ❑ DK

16. Did your child eat any corn syrup? ❑ Yes ❑ No ❑ DK

17. Did your child drink any sugar/water? ❑ Yes ❑ No ❑ DK

18. Did your child drink any fruit juices? ❑ Yes ❑ No ❑ DK

19. Did your child drink any unpasteurized fruit juices? ❑ Yes ❑ No ❑ DK

Formatted: Bullets and Numbering

20. Did your child eat any meats? ❑ Yes ❑ No ❑ DK

21. Did your child eat any fish? ❑ Yes ❑ No ❑ DK

22. Did your child drink tea? ❑ Yes ❑ No ❑ DK
    Was it sweetened? ❑ Yes ❑ No ❑ DK

23. Did your child receive any supplemental vitamins in the month before the illness began?
    ❑ Yes ❑ No ❑ DK
    If yes, please specify_____
    Did they contain iron? ❑ Yes ❑ No ❑ DK

24. Did your child eat any fresh produce (fruits or vegetables) that were organically grown?
    ❑ Yes ❑ No ❑ DK
    If yes, please specify which fruits and vegetables were organically grown_____
    _____

25. Does anyone in your family eat any fresh produce (fruits or vegetables) that is organically grown?
    ❑ Yes ❑ No ❑ DK
    If yes, please specify which fruits and vegetables were organically grown_____

26. Do you shop at any Farmer's Markets? ❑ Yes ❑ No ❑ DK
    If yes, please specify._____

27. Where do you shop for groceries? _____

28. Where do you shop for baby food and other baby items? _____

II. Environmental exposures

29. Was there any of the following during the month before your child's onset near your home:
    ❑ construction (e.g. new home or other building)
    ❑ excessive dust (e.g. sewers, new foundations)
    ❑ excavation
    ❑ new road construction
    ❑ plowing of fields

❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

30. Was there any of the following during the month before your child's onset at other sites where your child has been:

❑ construction (e.g. new home or other building)

❑ excessive dust (e.g. sewers, new foundations)

❑ excavation

❑ new road construction

❑ plowing of fields

❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

31. Did your child or anyone else in your family play in a sandbox prior to illness?

❑ Yes ❑ No ❑ DK

If so, where? (list)

32. How often is the furniture in your house dusted?

❑ more than once per week

❑ once a week

❑ less than once per week but at least every two weeks

❑ less than every two weeks

❑ other (please specify_____)

❑ unknown/refused

33. Do you have any carpets or area rugs covering the floor in your house? ❑ Yes ❑ No❑ DK

If yes, are they

❑ wall to wall carpets

❑ area rugs

❑ both wall to wall and area rugs

What is the pile of wall to wall carpeting, (low, med, or shag)?_____

34. How often are your floors and carpets vacuumed?

❑ more than once per week

❑ once a week

❑ less than once per week but at least every two weeks

❑ less than every two weeks

❑ other (please specify_____)
❑ unknown/refused

35. What type of heating system do you have in your home?
❑ forced air (e.g. gas, oil, electric)
❑ steam heat (radiators)
❑ circulating hot water (e.g. solar, oil, gas)
❑ electric
❑ other (please specify_____)

36. Does your home have air conditioning? ❑ Yes ❑ No ❑ DK
If yes, please specify if individual room unit or central air conditioning_____

37. Do you have any electric air cleaner in your home? ❑ Yes ❑ No ❑ DK
If yes, please specify if central or portable_____

38. Were you or anyone in your household or family involved in gardening or yard work prior to your child's illness onset?
❑ Yes ❑ No ❑ DK
If yes, please specify flower or vegetable.
How often do you or household/family member garden?_____

Which months of the year do you garden?_____

39. Do you have any plants inside your house?
If yes, are they (check all that apply)
❑ located on or within 1 foot of the floor
❑ located on tables
❑ hanging from the ceiling
Are there any plants in the baby's room? ❑ Yes ❑ No ❑ DK

40. Do you take your child for walks outside? ❑ Yes ❑ No ❑ DK
Where do you usually go for walks?_____
Do you go to any nearby parks? ❑ Yes ❑ No ❑ DK
If yes, please specify_____

41. Does your child play or lie on the ground outside? ❑ Yes ❑ No ❑ DK
Please specify in backyard, park, etc._____
_____

42. Are you a member of any social or religious organizations? ❑ Yes ❑ No ❑ DK
If yes, please specify_____
Did you take your child to any events? ❑ Yes ❑ No ❑ DK
Was your child at an associated daycare during any of these events?
If yes, where/when?_____

43. Is your child in school/daycare or does he/she participate in any other group activities?
❑ Yes ❑ No ❑ DK
If yes, please provide names and locations _____
Describe "other group activities"_____

44. Did your child travel outside of Ft. Meade at all prior to his/her illness? ❑ Yes ❑ No❑ DK
If yes, please specify where?_____

45. Did your child travel outside of Maryland prior to his/her illness? ❑ Yes ❑ No❑ DK
If yes, please specify location, length of stay, and nature of visit_____

46. Did you visit a live poultry or meat market? ❑ Yes ❑ No ❑ DK
If yes, did you purchase any poultry or meat?
Specify type of meat purchased: _____
Name of market: _____
Address of market: _____
Did you take your child to the live market? ❑ Yes ❑ No ❑ DK

47. Did you take your child to any large gatherings prior to illness (wedding reception, parties, festivals, fairs, religious gatherings, etc.) ❑ Yes ❑ No ❑ DK
If yes, please specify_____

48. Did your child swim/wade/splash in an ocean, lake, river, pool, or recreational water park in the before his/her illness onset? ❑ Yes ❑ No ❑ DK
If yes, please specify_____

49. Did your child come into contact with any animals in the prior to illness? ❑ Yes ❑ No ❑ DK

If yes, what kind of animals? _____

When? _____ Where? _____

50. Where did you buy/obtain your baby's crib?_____

Was the crib used or new? ❑ Yes ❑ No ❑ DK

Was the mattress used or new? ❑ Yes ❑ No ❑ DK

51. Does your child share toys with anyone? ❑ Yes ❑ No ❑ DK

If yes, please specify_____

52. How often do you sterilize bottles before using them? ❑ Always ❑ Sometimes ❑ Never

53. How often do you sterilize nipples before using them? ❑ Always ❑ Sometimes ❑ Never

54. Does your child use a pacifier? ❑ Yes ❑ No ❑ DK

Where were pacifiers purchased?

How often do you clean the pacifier?_____

If the pacifier falls on the floor:

How often do you clean with water? ❑ Always ❑ Sometimes ❑ Never

How often do you clean with soap? ❑ Always ❑ Sometimes ❑ Never

How often do you sterilize? ❑ Always ❑ Sometimes ❑ Never

55. Who is your child's pediatrician?

Pediatrician's name:_____

Clinic name: _____

Address: _____

Phone number:( ) _____-_____

56. Do you know anyone other infants who have had a similar illness as your child's?

❑ Yes ❑ No ❑ DK

If yes, please specify_____

_____

Additional comments_____

_____

Thank you very much for you time.

FORT MEADE, MD 20755
www.ftmeade.army.mil

Jan. 10, 2006 **Release # 070110**

FOR IMMEDIATE RELEASE

Infant Botulism Found in Two Children at Fort Meade

FORT GEORGE G. MEADE, Md., - Since October 2006, Walter Reed Army Medical Center (WRAMC) has identified two cases of infant botulism involving residents of Fort Meade. One infant has recovered while the other infant is being treated by doctors at WRAMC. Both children were under six months of age at the time of diagnosis.

The cause is currently under investigation by the Preventive Medicine Services on Kimbrough Ambulatory Care Center (KACC).

"Infant botulism is a treatable condition associated with the ingestion of clostridium botulinum bacteria found naturally in soils and in some contaminated food products. It would be premature to speculate about a particular source because we are still trying to conduct our investigation," said Chief of Preventative Medicine at KACC, Lt. Col. Sharon Cole-Wainwright.

Infant Botulism is rare and usually affects infants under six of age.

Symptoms may include constipation, listlessness, difficulty swallowing, a weak cry and a loss of appetite. If parents are concerned, they should contact their health care provider.

Health care professionals recommend that parents of infants wash their hands frequently, clean toys and pacifiers in a weak bleach solution, and thoroughly boil water used to prepare baby formula. These are not foolproof measures for preventing botulism infection, but they afford some protection against the most common avenues of transmission.

(more)

"Our primary concern is always the health and welfare of the members of our community. We will work closely with health officials and will keep the community informed of any new information as it comes available. The Army is committed to providing the safest living and working environment for its people," said Col. Kenneth McCreedy, installation commander.

MESSAGE FROM THE INSTALLATION COMMANDER

INFANT BOTULISM FACT SHEET

Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center. The infants, both under the age of 6 months at the time of diagnosis, were treated at Walter Reed Army Medical Center. The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade. LTC Sharon Cole-Wainwright, Chief of Preventive Medicine at Kimbrough Ambulatory Care Center said, "while the name of the disease can be frightening, infant botulism is a treatable condition associated with swallowing the botulinum bacteria found naturally in soils and in some contaminated food products. It is premature to speculate about a particular source until the investigation is complete." Cases of Infant Botulism are rare and usually occur among infants less than 6 months of age.

What are the symptoms of Infant Botulism?

Any or all of the following:

- constipation
- poor feeding and a weak suck
- weak cry
- loss of head control
- difficulty swallowing
- excessive drooling
- floppy appearance or "floppy baby"
- generalized weakness
- breathing difficulties

What do you do if your infant is experiencing these symptoms?

Call (301) 677-8606 or go to the nearest Emergency Room

- Howard County General Hospital 5755 Cedar Lane, Columbia, Maryland (410) 740-7890 or 7990
- Laurel Regional Hospital 7300 Van Dusen Road, Laurel, Maryland (301) 725-4300 or (410) 792-2270
- Baltimore Washington Medical Center, 301 Hospital Drive, Glen Burnie, Maryland (410) 787-4000

How is Infant Botulism treated?

Prompt diagnosis is essential. Medication is available to treat the condition.

How can I reduce the risk of contracting Infant Botulism?

- Wash hands frequently
- Avoid giving honey to infants less than 1 year of age
- Routine and frequent cleaning of toys-- particularly items that babies place in their mouths and those toys which have fallen on the ground or floor
- Through proper preparation of foods (boiling and cooking)
- Avoid cans of food/formula with dents or that are bulging or rusting
- Avoid locations with excessive dust and debris

For further information about the disease, contact Kimbrough Ambulatory Care Clinic, Preventive Medicine Services (301) 677-8661. If you have other questions or are contacted by the media please refer them to the Fort Meade Public Affairs Office at (301) 677-1436 or 1486.

EPIDEMIOLOGICAL CONSULTATION TEAM AND ITS MISSION AT FORT MEADE
16 Jan 07

BACKGROUND:
In response to lingering concerns about the two cases of infant botulism at Fort Meade, an epidemiological consultation (EPICON) team was requested to assist the medical community here at Fort Meade in its investigation. The EPICON team arrived at Fort Meade on Friday January 12th to begin its mission to investigate the occurrence of these cases. This fact sheet provides some background information about the team and its mission.

What is an EPICON team?
Epidemiology is the science devoted to investigating how population factors and the environment influence the occurrence of diseases or injuries. The team then applies this science to find possible causes, risk factors and opportunities for prevention.

Who is on the EPICON team? Where are they from? What are their specialties?
The EPICON team members are from the U.S. Army Center for Health Promotion and Preventive Medicine, part of the Army's Medical Command, who specializes in preventive medicine, environmental health, epidemiology, and communication about health matters when public concerns are high. In conducting this study the team is collaborating with a physician-epidemiologist from Anne Arundel County's public health department, the Kimbrough preventive medicine staff, the Centers for Disease Control and Prevention (CDC) and the California state health department.

Why is the EPICON team here?
The team was called by the Kimbrough Ambulatory Acute Care Hospital and Garrison Commanders because they believed someone from outside Fort Meade was needed to review the situation and provide advice while allowing Kimbrough to continue their important clinical and preventive medicine mission without disruption.

What methods is the team using to try and find answers?

The team is working to determine if there is any connection between the two cases of infant botulism. The team has interviewed the affected families to identify products used, places visited, possible common exposure, etc. They are reviewing clinical test results on the affected children during their illness, and will review more detailed analysis currently being done at a Maryland state laboratory which will identify the specific subtype of botulism bacteria. Team members are also looking at disease surveillance reports and other data to see if the Fort Meade community or Anne Arundel County has experienced similar cases.

Will environmental sampling be done?
It's certainly understandable why finding the cause is so important to families with young children. Focused environmental sampling in specific areas may be conducted for purely scientific reasons, such as to determine where the bacteria might be present. But random sampling throughout a wide area is unlikely to provide a definite link to the two Fort Meade

cases or help direct future preventive measures, or provide a definite link to one or a few specific areas of contaminated objects or soil. This is because the botulism-causing bacteria are widely distributed in many environments around the world.

How long will the team's investigation take?
The results of the subtyping of the bacteria from the affected infants are expected to be completed on or about January 20th. This information is critical in answering the question, "Are the two cases connected?" However, the team's mission will not end there. The EPICON team will continue to conduct a thorough review of the local surveillance data and existing scientific literature; and continue to collaborate with the Fort Meade medical authorities, the Fort Meade garrison, as well as with Anne Arundel County and CDC partners before finalizing its report. The team anticipates delivering a report to the Garrison Commander by the end of February.

Feb. 1, 2007 **Release # 070201**

FOR IMMEDIATE RELEASE

Infant botulism investigation update

FORT GEORGE G. MEADE, MD., -- Maryland health officials have confirmed the presence of Type B Clostridium botulinum bacteria from both cases of infant botulism recently diagnosed at Fort Meade. This confirmation was expected as this type of botulism strain is typically found on the East Coast.

The first case of infant botulism was diagnosed in October 2006 and the second in December 2006. Both children have since been treated and are recovering. The children live on Oliver Court at Fort Meade.

The Maryland Department of Health and Mental Hygiene (DHMH) have contacted the Center for Disease Control and Prevention in Atlanta, Ga., to determine if they are willing to do subtyping of the bacteria.

Investigators continue to discuss and coordinate with DHMH, CDC, Fort Meade medical authorities and other experts as they work towards completing the investigation.

In addition, the Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases from 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at http://amsa.army.mil/AMSA/amsa_home.htm.

APPENDIX D

ARMED FORCES INSTITUTE OF PATHOLOGY (AFIP) PROPOSAL TO FUND DEVELOPMENT OF A DEPENDENT MORTALITY BASE

Dependent Mortality Database

Proposed: The goal of this paper is to explore the feasibility of establishing a registry of dependent fatalities, to include exploration of methodologies.

Background: Currently, there is no central source for identifying and tracking mortality amongst the dependents of active duty servicemembers. It is widely believed that domestic abuse is more prevalent in military families than in their civilian counterparts, and numerous programs have been established to mitigate the perceived increased risk of domestic violence in servicemember's families. Establishing a registry of deaths in dependents will allow for the determination of baseline mortality risk from all causes, to include more accurate tracking of domestic violence related deaths. Other potential research areas that could be explored using this registry include reviews of specific types of accidents, SIDS, cancer and infectious disease mortality. By studying the epidemiological patterns of these deaths, focused prevention strategies can be developed to reduce the incidence of death in the spouses and children of servicemembers. Furthermore, establishment of centralized databases to monitor unexplained child deaths was formally recommended by the American Academy of Pediatrics in 1999{Kairys SW, Alexander RC, Block RW, et al. American Academy of Pediatrics. Committee on Child Abuse and Neglect and Committee on Community Health Services. Investigation and review of unexpected infant and child deaths. Pediatrics 1999; 104:1158-60}.

Data Sources and Methodology: The existing DoD-Medical Mortality Registry is an active surveillance system designed to provide real-time outbreak information to decision-makers{Gardner JW, Cozzini CB, Kelley PW, et al. The Department of Defense Medical Mortality Registry. *Mil Med.* Jul 2000;165(7 Suppl 2):57-61.}. An investigation is triggered by receiving current information from each of the Service-Specific Casualty Offices. There would be value in actively monitoring child deaths for infectious agents, as children are often sentinels for outbreaks. An example occurred last year during the influenza outbreak that was particularly noted for causing child fatalities. However, because the Casualty Offices only track and report dependent deaths that occur overseas, real time surveillance of dependent fatalities is not achievable at this time. An alternative approach is to establish a Registry consisting primarily of death certificate data, obtained from National Death Index (NDI) searches. For the purposes of monitoring homicides, this basic level data would provide demographics and a basis for comparison with civilian homicide rates. It would also provide an estimate for the completeness of capture of the established Fatality Review Boards. The two major limitations of this approach are lag time, which averages approximately three years, and incomplete information.

Budget: The costs of establishing a Death Certificate based registry as part of the Armed Forces Medical System are approximately 350K per year, which would support an epidemiologist to collect and analyze the data, and the direct costs of the NDI searches. If real time investigative surveillance is desired, a mechanism for rapidly identifying dependent fatalities would have to be established. Costs from the Armed Forces Medical Examiner System would increase to approximately 450K per year.

<<Botulism final report.doc>>

Here's my quick attempt at a Botulism wrap-up article. Need to know what you think about closing the loop from a PAO, medical and a legal standpoint (I recently received a rather incoherent fax from Mrs. [redacted] indicating she may be doing independent soil testing. She also stated: "if there are no developments in the case of my baby's illness, I will have no other choice but to go to the media again."). I have a copy of her letter and a copy of the report.

[redacted]

The final report of the special team gathered to investigate two cases of infant botulism at Fort Meade in October and December 2006 has been completed. An Epidemiological Team headed by the U.S. Army Center for Health Promotion and Preventive Medicine reported finding "no common exposures that may have been a likely source of the outbreak, and no possible food sources." Further, after consulting with *C. botulinum* experts, CDC representatives, and Maryland and Anne Arundel County public health officials, the team concluded that "environmental testing would not prove or disprove a link between the cases and the environment." As a result, the report contained no call for environmental testing. The report makes the following recommendations:

1. Make Military Health System providers throughout the National Capital Region (NCR) aware of the two cases at Fort Meade in order to reinforce the need to seriously consider botulism in the differential diagnosis when evaluating infants with paralytic signs or significant constipation and when Sudden Infant Death syndrome cases are encountered.
2. Reinforce the need for NCR clinic staff to communicate reportable medical events to both civilian and military public health authorities.
3. Encourage referral centers like Walter Reed Army Medical Center (WRAMC) to engage preventive medicine personnel (both its own and those of pertinent installations) early in the course of such events.
4. Enhance Army epidemiologic surveillance for botulism cases.
5. Establish a DOD registry of dependent fatalities.
6. Improve centralized access to military clinical laboratory data.
7. Inform NCR beneficiary parents of newborns and infants about intestinal botulism as part of child health education.
8. Ensure construction contracts serving Fort Meade and other installations require control measures to minimize dispersion of fugitive dust.
9. Continue risk communication efforts on a scaled-down basis, monitor media coverage, and remain ready to respond to community rumors, misunderstandings and misperceptions in a timely manner.

In response to this report, the Installation Commander will implement the recommendations that fall under his control (recommendations 8 and 9). While current construction contracts already require developers to dampen soil to minimize dust, this requirement will be further emphasized in future contracts. Colonel McCreedy stated: "We realized that the nature of the botulism bacteria made it unlikely that we would find a specific source if a food-borne source could not be identified. We are relieved that no further incidents have occurred and are most happy to report that both of the affected babies are doing fine. We remind the community to be aware of the symptoms of this disease and to act quickly if their infants manifest any of them."

Relist the symptoms.

Sir,
Here is the message I want to send to the group.

([redacted] Mr USACHPPM; [redacted] Ms USACHPPM; [redacted] LTC WRAIR-Wash DC; [redacted] MAJ USACHPPM-Wash DC; [redacted] LTC KACC-Ft Meade; [redacted] Ms USACHPPM; [redacted] (Maryland) (CDC dhmh.state.md.us), [redacted] COL KACC-Ft Meade).

Appreciate your thoughts before sending.

VR,
[redacted]

All,

As many of you know COL (DR) [redacted] is retiring very soon. He is currently clearing and will no longer be working this EPICON. He has asked [redacted] to stand in as the PM physician as we move forward (with MAJ [redacted] support if available).

Recent events include:
1) This week [redacted] has contacted Ms. [redacted] (CHPPM Risk Communications) and Dr. Russo (AA County Public Health) reference our investigation. He has expressed great concern with our investigation (see message below).
2) CDC lab results are expected with the next two weeks.
3) Fort Meade SJA has been in contact with me. [redacted], Fort Meade Installation Commander, wants to publish an article on our investigation in the post newspaper. He is asking if we have any objections to publishing the information summarized in the draft EPICON report.

In my conversation with [redacted] he has emphasized we focus on certain things as we move forward:

1) Be open and forthright but we should not tailor our EPICON or responses to a single individual and instead should focus on the entire FT Meade community.

2) Risk Communication, PAO and SJA (legal) must be involved in all communications.
3) We must speak with a common voice and through a common source. We feel possible sources could be either Dr. Russo in the local public health district or Dr. Blythe at the State (might be advisable due to the [redacted] concerns of an "Army cover-up"). Source could be Fort Meade Preventive Medicine, or USACHPPM as well. Whoever it is, this source should communicate directly to the Fort Meade command to avoid confusion.
4) We should have legal and PAO advise before we communicate our results to the public.
5) CDC laboratory results are expected shortly and they will be reported to Dr. David Blythe and the Maryland Public Health Lab first.
6) We support lab results be included in the EPICON report but they must be explained by an expert.
7) We support (with SJA, PAO and Risk Communication review) the inclusion of a summary of the EPICON report in the local FT Meade newspaper to keep the public informed.

Appreciate your professional opinions on these issues.

VR,
[redacted]

Sir,

[redacted] just called me reference the Ft Meade inf botulism EPICON. SGT [redacted] (parent of one Ft Meade infant bot case) called her this morning and they had a lengthy conversation reference his concerns. [redacted] wants to discuss the next steps in responding to him.

Apparently SGT [redacted] found internet articles on: His housing being built on a land fill; School across the street from his quarters had been used as a psychiatric ward; Clostridium stored on Fort Meade and possible experiments with German POW's in WWII? He claims whoever he is speaking with at CDC is telling him they do not have any samples and his contact is also telling him the Army and state of MD made a decision not to send any samples to CDC (must be confusing clinical with environmental samples).

His specific questions are:
1)Who is doing DNA subtyping and the status?
2)What is the answer on testing the soil? If answer in no what is scientific rationale behind the decision?

[redacted] wonders whether a conversation with Dr. Maslanka would help to quell concerns. My continued contact with the CDC labs (see message below) show as of 25 APR 07 the results are not available. Appreciate your guidance on next steps.

Vr,
[redacted]

Hi [redacted]

This is the best upate we can provide. Still awaiting lab restuls.

On another note, I'd mentioned briefly to COL McCreedy about possibly doing some kind of evaluation within the local community about how the disease response was conducted. I would still like for you all to consider that, if you're willing. We can develop the community response mechanism in several forms (e.g., interviews, focus groups, online anonymous survey, etc.). But doing that kind of thing would be very helpful to us at CHPPM in improving future responses, and could provide you with data re: how the local Command responded. Just something to think about.

[redacted],
The best answer I can provide is quote from CDC's Dr. Maslanka below.
It may seem unusual for length of time required, but with very specific and rarely applied diagnostics that also require QC and verification, etc., this is not really unusual from the CDC or any high-level reference lab.
Thanks.
BP

Classification: UNCLASSIFIED
Caveats: NONE

Colleagues,
As some of you know I am in the process of retiring from active duty. I am currently clearing / outprocessing, and will no longer be working this EPICON in the same, official capacity as previously. From CHPPM end, MAJ [redacted] is the lead epidemiologist. I have asked Drs. Cersovsky and Tobler to provide PM physician coverage on various ongoing projects for which they were not already in the lead, and this would fall into that arena.

MAJ [redacted] and COL [redacted] nicely summarize recent events as follows, and I liberally plagiarize from their respective emails:
1) This week [redacted] contacted Ms. [redacted] (CHPPM Risk Communications) and Dr. Russo (AA County Public Health) reference our investigation, about which he expressed great concern.
2) Complete CDC lab results are expected with the next two weeks. It is not looking as though the two clinical case isolates will be linkable by subtyping (i.e., same type neither ruled in nor ruled out), which may have implications for any possible plan to pursue environmental sampling. This statement is not final so please do not transmit further.
3) Fort Meade legal (SJA) has been in contact with [redacted] and [redacted], Fort Meade Installation Commander, sent an e-mail message this past weekend requesting support in terms of a review of the message he will send to the public (and place on the Ft Meade website). He would like to use the recommendations from the EPICON report [para 9a(1)-(9)] as the basis for his message; and he wanted to update the community on the status of the recommendations.
4) [redacted] wants to publish an article on our investigation in the post newspaper. He is asking if we have any objections to publishing the information summarized in the draft EPICON report. [redacted] recommends:

Assuming the report is releaseable (i.e., assuming [redacted] has decided it is), it can be posted to the post website if so desired--and the article can reference it. In the article, all questions should be referred to Meade PAO--who can sort out the ones that are for the installation and refer the ones specifically about the EPICON to CHPPM PAO (NOT directly to our subject-matter experts).

In addition [redacted] and I recommend we focus on certain things as we move forward:

1) Be open and forthright but not tailor our EPICON or responses to a single individual and instead should focus on the entire FT Meade community.
2) Risk Communication, PAO and--as necessary--SJA should be involved in all communications.
3) It may be wise to have both legal and PAO review of any specific laboratory results before they are communicated to the public.
4) CDC laboratory results will be reported to Dr. David Blythe and the Maryland Public Health Lab first.
5) We support lab results being an addendum to the EPICON report but they must be explained by an expert.----
6) We must speak with a common voice and through a common source. In this regard COL [redacted] recommends:

For any requests for information (RFIs) from anyone with respect to installation (FT Meade) information, the RFI should be answered by an installation staff member. Anything medically-related to the bot tox case (or any medical information) should be managed by Kimbrough primary POC [redacted] who, in turn if she needs assistance from CHPPM, AA County or WRAMC PM, can contact the appropriate POC and be the conduit to respond to the RFI. Additionally, [redacted] should be the conduit to communicate medical information to COL McCreedy or whomever he designates.

Appreciate your attention.

Respectfully,
[redacted]

Sir,

Left a voice mail but wanted to follow up. Our team leader, COL [redacted] is retiring and will no longer be involved in the EPICON. He has designated me to take over his role in responding to future inquiries. COL [redacted] directed we would include our SJA (Mr. [redacted], PAO [redacted] and risk communication specialist (Ms. [redacted] in all public communications and I have cc'ed them on this message. I do not have any issues with the content of the attached final report but feel it should be reviewed by our staff and be part of an ongoing broad public communication effort.

We have discussed public communication of this investigation internally, with the Fort Meade Medical Treatment Facility (MTF) Commander, as well as with local and state public health officials over the past few weeks. We feel this investigation is approaching closure but it is important to realize parents of one of the affected infants still have high levels of concern on this issue. One parent has directly contacted our risk communications specialist as well as Dr. Kelly Russo of the local county public health district within the past few weeks and is eagerly awaiting laboratory results.

In recent conversations with the CDC and Maryland Public Health officials we learned the CDC laboratory sub-typing results (clinical, not environmental samples) for these cases will be released in the near future (perhaps as early as this week). These results will likely trigger increased media and community interest in this investigation. We feel it is very important all communication be technically accurate and comes from a single source. We feel that source of information for your population should be through Kimbrough Preventive Medicine (LTC [redacted]) with the State of Maryland (Dr. David Blythe) addressing CDC results since the request came through their office. We would serve as technical advisor and be available to support as needed (i.e. document review, town halls...). Please feel free to contact me reference any other questions.

MAJ [redacted],

I am the SJA for Ft Meade, MD. The Ft Meade Installation Commander, [redacted] wants to publish an article in our post newspaper to close the loop on the two intestinal botulism cases reported here late last year.

In the attached draft article, he refers to information from CHPPM Epidemiological Consultation No. 13-HG-06TU-07. The cover memo for the report, dated 5 Mar 07, directs inquiries regarding the report to you.

Specifically, we ask whether CHPPM has any objections to publishing the information summarized in the draft article.

Thanks in advance for your help. Please contact me via email or at (301) [redacted] if I can assist you in any way.

VR,

Classification: UNCLASSIFIED
Caveats: NONE

Fort Meade, MD—The final report of the special Epidemiological Consultation Team gathered to investigate two cases of infant (intestinal) botulism at Fort Meade has been released. Results indicate that no common exposures or food sources caused two cases of infant (intestinal) botulism here. The Army Center for Health Promotion and Preventive Medicine (CHPPM) led the team, in consultation with several non-military experts.

"These investigations are difficult for at least two reasons," said [redacted] CHPPM epidemiologist and team leader. "First, neither baby was fed honey—known to be a prime source of the disease in babies—or any of the same foods. That eliminated the most common cause of intestinal botulism, tainted foods."

Once food had been eliminated as a potential cause, team epidemiologists consulted with experts outside of the Department of Defense to determine whether environmental testing could assist in finding a cause for the two cases.

"This is because *Clostridium botulinum* spores, which can cause intestinal botulism, are found in soils and dust worldwide," White said. "Our team reached out to state and local public health organizations as well as national infant botulism experts to ensure we did not overlook a common source that could cause other Fort Meade infants to become ill."

Non-military experts consulted included medical and epidemiological experts from the state of California (recognized as a world leader in infant botulism treatment and research); the Maryland and Anne Arundel County public health officials; and the Centers for Disease Control and Prevention (CDC). All agreed that it was unlikely environmental testing would find a link between the cases and the environment, according to the report.

The team provided these findings in a written report to COL [redacted] Fort Meade garrison commander, on March 5th, 2006.

Comment [dw1]: May want address why held (awaiting CDC results). Ft. Meade's call.

The state of Maryland Department of Public Health has also asked the CDC's botulism laboratory to conduct subtype testing (analysis) of stool specimens from both infants to try to identify the specific bacteria that can cause infant botulism. The garrison is currently awaiting these results which will be provided by the state of Maryland. CHPPM epidemiologists do not believe that these test results will affect their investigation.

The two infant botulism cases occurred in October and December, 2006 and both infants made a full recovery. No additional cases have been detected.

There are no known prevention strategies for non-foodborne intestinal botulism, so the report recommendations focus on increasing awareness of this illness and its symptoms within the local medical community; continuing to monitor the number of cases within DOD; educating families about the illness; and, on a local level, ensuring that construction companies working on Fort Meade take steps to minimize dust.

Lt. Col. [redacted] Preventive Medicine at Kimbrough Ambulatory Care Center on Fort Meade, credits the infants' speedy recovery to the parents, who detected changes in their babies' behavior and sought medical care promptly.

"Noticing changes in their babies' behavior and seeking medical care resulted in rapid treatment that may have saved their lives," [redacted] said.

The CHPPM report is downloadable on the Fort Meade Web site at {direct URL}. Information on the causes and prevention of infant botulism is available on the same site at http://www.ftmeade.army.mil/botulism.html

Comment [dw2]: Will the entire report be available or just the executive summary? Also ensure link is correct.

Fort Meade, MD—The final report of the special Epidemiological Consultation Team gathered to investigate two cases of infant (intestinal) botulism at Fort Meade has been released. Results indicate that no common exposures or food sources caused two cases of infant (intestinal) botulism here. The Army Center for Health Promotion and Preventive Medicine (CHPPM) led the team, in consultation with several non-military experts.

"These investigations are difficult for at least two reasons," said Maj [redacted] CHPPM epidemiologist and team leader. "First, neither baby was fed honey—known to be a prime source of the disease in babies—or any of the same foods. That eliminated the most common cause of intestinal botulism, tainted foods."

Once food had been eliminated as a potential cause, team epidemiologists consulted with experts outside of the Department of Defense to determine whether environmental testing could assist in finding a cause for the two cases.

"This is because *Clostridium botulinum* spores, which can cause intestinal botulism, are found in soils and dust worldwide," White said. "Our team reached out to state and local public health organizations as well as national infant botulism experts to ensure we did not overlook a common source that could cause other Fort Meade infants to become ill."

Non-military experts consulted included medical and epidemiological experts from the state of California (recognized as a world leader in infant botulism treatment and research); Maryland and Anne Arundel County public health officials; and the Centers for Disease Control and Prevention (CDC). All agreed that it was unlikely environmental testing would find a link between the cases and the environment, according to the report.

The state of Maryland Department of Public Health has also asked the CDC's botulism laboratory to conduct subtype testing (analysis) of stool specimens from both infants to try to identify the specific bacteria that can cause infant botulism. The garrison is currently awaiting these results which will be provided by the state of Maryland.

The team provided its findings in a written report to Colonel [redacted] Fort Meade garrison commander, on March 5th, 2006. At the request of CHPPM, the report's release was delayed in the hopes that the sub-type test results could be included. When no specific date could be established for release of this information, the command determined not to wait any longer to publish the report. CHPPM epidemiologists have stated that these test results will not affect their investigation or conclusions.

The two infant botulism cases occurred in October and December, 2006 and both infants made a full recovery. No additional cases have been detected.

There are no known prevention strategies for non-foodborne intestinal botulism, so the report recommendations focus on increasing awareness of this illness and its symptoms within the local medical community; continuing to monitor the number of cases within DOD; educating families about the illness; and, on a local level, ensuring that construction companies working on Fort Meade take steps to minimize dust.

Lt. Col. [redacted] Preventive Medicine at Kimbrough Ambulatory Care Center on Fort Meade, credits the infants' speedy recovery to the parents, who detected changes in their babies' behavior and sought medical care promptly.

"Noticing changes in their babies' behavior and seeking medical care resulted in rapid treatment that may have saved their lives," [redacted] said.

Deleted: the

Comment [dw1]: May want address why held (awaiting CDC results). Ft Meade's call.

Deleted: The team provided these findings in a written report to COL Kenneth McCreedy, Fort Meade garrison commander, on March 5th, 2006.

Formatted: Indent: First line: 0.5"

Deleted: do not believe

The CHPPM report is downloadable on the Fort Meade Web site at {direct URL]. Information on the causes and prevention of infant botulism is available on the same site at http://www.ftmeade.army.mil/botulism.html

Comment [dw2]: Will the entire report be available or just the executive summary? Also ensure link is correct.

Subject: Botulism EPICON

Importance: High

Ma'am,

As a result of COL [redacted] retirement, I've taken over many of the 60C duties in DEDS, including the remnants of the botulism EPICON from several months ago. I tried to call you earlier today (Tues) and left a message with your secretary, but bottom line is that I've been contacted by [redacted] father of one of the cases, who is seeking to supply me with "conclusive evidence" for soil testing. I did not speak with him -- he left two voicemail messages.

I discussed with [redacted] who provided me with the background on this parent's activism, and with [redacted] at CHPPM. We all agreed that it would be beyond our role as technical consultants to communicate directly with this parent, and that the matter should be first referred to you and the garrison commander.

I'd like to discuss how best to handle further communication with [redacted] when you get the chance. My office phone is [redacted] cell is [redacted]

Thanks much, and I hope all's going well with your command,

Subject: INFANT BOTULISM MEDIA REQUEST

Ms. [redacted] and Ms. [redacted],

I wanted to inform you that Fort Meade PAO received a media query from Melissa Carlson of WBAL - TV. She was interested in obtaining more information about the infant botulism investigation.

Fort Meade PAO ran an article in our installation paper last week about some of the findings and also provided a Web address for the executive summary.

Our news release was prepared for query - only requests. I sent the release to Ms. Carlson (which is the same exact verbiage from the Sound Off article.)

[redacted] our main PAO, wanted me to keep you in the loop about what is going on. If you need to speak with someone here please contact myself or [redacted] at [redacted]

Thanks!

v/r,

Subject: RE: Yr release on Kimbrough botulism cases

Thanks for the release. Please call me [redacted]

No inquiries here on our support to the investigation of the cases at Kimbrough. We have not yet dispatched our people to supplement the Kimbrough staff.

I left Walter Reed and came to the Center for Health Promotion & Preventive Medicine in May. Very different responsibilities, and no staff (I am the only PAO). I love it here.

Of the nine people who worked with me at Walter Reed PAO, three are left. There have been two retirements and four who left for new jobs.
The latest decision I've heard regarding employment after the realignment of Walter Reed and National Naval Medical Center is that Walter Reed employees will have to compete for available positions (there are already PAOs and a newspaper staff at National Naval, but the staff will be beefed up some) and that the new Walter Reed National Military Medical Center will be under Navy command and control, so civilian employees there will convert from Army to Navy personnel management. We did not know this when you interviewed.

Hope you're happy as Fort Meade PAO--if Walter Reed was the other choice, you made a fortunate decision.

That said, there is no trauma center or rehabilitative medical staff in the country that could do what the Walter Reed Medical staff has done for the wounded from our current wars. There sustained excellence is amazing, and those of us who supported their efforts were privileged.

INFORMATION PAPER

DASG-PPM-NC
24 July 2007

SUBJECT: Botulism and recall of Castleberry canned meat products

1. Purpose. To provide information to healthcare providers on botulism and the FDA food recall of Castleberry's canned meat products, which may contain botulinum toxin.

2. Facts.

a. The FDA issued a recall of various Castleberry brands of canned foods. As of 21 July 2007, four cases of botulism have been reported to Centers for Disease Control and Prevention (CDC) from Indiana (2 cases) and Texas (2 cases). Onset dates range from 29 June to 9 July 2007. All four persons were reported to have consumed Castleberry's brand Hot Dog Chili Sauce Original. Botulinum toxin was identified in leftover chili sauce from an unlabeled, sealable bag collected from a patient's refrigerator. This product has been identified as being available through Defense Commissary Agency stores as well as other commercial outlets.

b. Healthcare providers should have a heightened awareness of the potential for cases of botulism and familiarity with presenting symptoms.

c. *Clostridium botulinum*, a spore-forming obligate anaerobic bacillus, produces toxins which cause botulism, a serious, but relatively rare intoxication. These rod-shaped organisms grow best in low oxygen conditions, such as in canned goods. The bacteria form spores which allow them to survive in a dormant state until exposed to conditions that can support their growth. There are seven types of botulism toxin designated by the letters A through G; only types A, B, E and F cause illness in humans. The spores are ubiquitous in soil, worldwide. There are three forms of naturally occurring botulism: foodborne, wound, and intestinal (infant and adult).

d. Classic symptoms of botulism include: double vision, blurred vision, drooping eyelids, slurred speech, difficulty swallowing, dry mouth, and muscle weakness. Infants with botulism appear lethargic, feed poorly, are constipated, and have a weak cry and poor muscle tone. If untreated, these symptoms may progress to cause paralysis of the arms, legs, trunk and respiratory muscles which can result in death. In foodborne botulism, symptoms generally begin 18 to 36 hours after eating a contaminated food, but they can occur as early as 6 hours or as late as 10 days. In the U.S., the case fatality rate is 5-10%.

e. On average, 110 cases of botulism are reported each year the United States. Of these, approximately 25% are foodborne, 72% are intestinal botulism, and the rest are wound botulism.

f. Defense Supply Center- Philadelphia (DSCP) issued an ALFOODACT 022-2007 (19 July 07) and expanded ALFOODACT 023-2007 (22 July 07) to all Army, Navy, Air Force, Marine Corps, Coast Guard or other activities as appropriate. Castleberry's

Food Company initiated a voluntarily recall. "FDA is expanding its July 18 warning to people not to eat the contents of certain cans of chili sauce due to the risk of botulism." Additional information can be found at the FDA website, http://www.fda.gov/oc/opacom/hottopics/castleberry.html, and at the CDC website, http://www.cdc.gov/botulism/botulism.htm.

g. As of 23 July 2007, products have been identified and removed at nine DoD locations. Castleberry is cooperating with the FDA, CDC, USDA, and the affected states' active investigation into the cause of the contamination.

Hey dude: as always, GREAT to talk with you. Wordsmith as needed. According to [redacted], we're on 'standown' for now, but it would be good to have something ready, just in case.

Some words to get us started in response to "The reporter said that in the report it said that Children at Military Installations are more susceptive to infant botulism and would we like to comment on that:"

No, we do not believe that children on military installations are more susceptible. There are several reasons why we say this:

1) The 2 cases at Fort Meade were rare events, and sometimes rare events happen close to one other. We do know that children in certain age groups are more susceptible to infant botulism, and that children on military installations are just as susceptible as other children of the same age.
2) In our report, we included all cases: Those that were confirmed by lab analysis, and unconfirmed dr's diagnoses because we wanted to be as transparent as possible and exclude nothing.
3) Differences in U.S., state, and military rates oculd be attributed to many factors, such as differences in doctor's diagnoses, surveillance capabilities, and abilities to access pertinent data systems.

EXECUTIVE SUMMARY
EPIDEMIOLOGICAL CONSULTATION NO. 13-HG-06TU-07
INVESTIGATION OF TWO INTESTINAL BOTULISM CASES
AT FORT MEADE, MARYLAND
OCTOBER - DECEMBER 2006

1. PURPOSE. The purpose of this epidemiological consultation (EPICON) was to investigate a cluster of *Clostridium botulinum* (*C. botulinum*) in infants at Fort Meade, Maryland. The Kimbrough Ambulatory Care Center Commander at Fort Meade requested assistance from the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) after two infants living on the same street, approximately 116 meters apart, contracted intestinal botulism in October 2006 and December 2006, respectively.

2. BACKGROUND. Intestinal botulism, also known as infant botulism, is a rare but serious paralytic illness that almost always occurs in children under 1 year of age. On very rare occasions it can occur in older children and adults after bowel surgery, when people are affected with inflammatory bowel disease, or after antimicrobial therapy (Redbook 2006). Botulism is caused by a nerve toxin released by the bacterium *C. botulinum*, which can be found in soil and dust worldwide. Most cases of botulism affecting children older than 1 year of age and adults occur when spores germinate in improperly prepared foods, producing toxin that affects humans when the contaminated food is eaten. In contrast, cases of intestinal botulism are believed to occur when spores are ingested and are able to germinate within the intestines and produce toxin. It is believed that a permissive environment within the intestines in infants allows the bacteria to grow and produce toxin. In most intestinal botulism cases a source for the ingestion is never identified. In cases of intestinal botulism, toxin and bacteria may be found in stool specimens. Stool specimens collected from both of the Fort Meade infants tested positive for *C. botulinum* toxin type B. Type B toxin-producing *C. botulinum* is prevalent in the eastern United States (U.S.).

3. METHODS. The USACHPPM formed an EPICON team for this investigation. The team consulted subject matter experts from the Centers for Disease Control and Prevention (CDC), the California Department of Health Services (CDHS), the Maryland Department of Health and Mental Hygiene (DHMH), and the Anne Arundel County Department of Health. The CDHS was consulted because of its nationally renowned expertise in infant botulism. The team interviewed the affected infants' parents using a modified version of the CDC's infant botulism questionnaire. Stool specimens had been collected by the inpatient pediatric team at the Walter Reed Army Medical Center (WRAMC) and tested by the Maryland DHMH. *C. botulinum* has been isolated from both samples, and isolates will be sent to the CDC for sub typing.

The EPICON personnel conducted town hall meetings with the Fort Meade Garrison Commander to address community concerns. Investigators also provided information sheets to local residents, provided press releases, and conducted media interviews.

4. CONCLUSIONS.

a. Interviews with each family revealed no common exposures that may have been a likely source of the outbreak, and no possible food sources. The risk communication effort was intensified due to the high level of community concern regarding transmission and environmental factors discussed in the interviews, such as nearby construction. This quelled the fears of most Fort Meade residents; however, a local newspaper reported that the parents of one of the affected infants plans to sue the Army, claiming there was negligence in seeking the cause of the two cases. They reportedly believe that dirt from a construction site one block away from the street where both families live is the source of the spores, that soil testing should have been undertaken, and that the Army is intentionally avoiding such sampling because Fort Meade is a Superfund site.

b. Proving or disproving a link with the environment is a dubious task given the lack of previous research in the area. It is widely believed that botulism type B is endemic to the soil in the area and over the entire East Coast of the U.S. Numerous discussions were held with leading *C. botulinum* experts, CDC representatives, and Maryland and Anne Arundel County public health officials about proceeding with environmental testing. The consensus of this group was that environmental testing would not prove or disprove a link between the cases and the environment. In addition, there are no known public health prevention strategies for non-foodborne *C. botulinum.* The Agency for Toxic Substances and Disease Registry does list Fort Meade on the National Priorities List, but their report indicates that the waste sites are far from the current location of the cases. Moreover, while prior dumping sites for waste and dead carcasses are theorized to be a viable source for *C. botulinum,* there has been no evidence to support this.

c. The scientific literature suggests numerous possible modes of ingestion of *C. botulinum* by infants which could be relevant to this investigation, but none of which are proven. The EPICON team could not find a link between the two cases at Fort Meade, other than the residential proximity itself. Much needs to be learned about the epidemiology of infant botulism and the EPICON team reached out to the leading scientists in this field. Possible collaborations for long-term environmental and laboratory research projects were discussed, as each discovered cluster of infections affords a possible opportunity to better elucidate non-foodborne modes of *C. botulinum* transmission.

5. RECOMMENDATIONS.

a. Make Military Health System (MHS) providers throughout the National Capital Region (NCR) aware of the two cases at Fort Meade in order to reinforce the need to seriously consider botulism in the differential diagnosis when evaluating infants with paralytic signs or significant constipation and when Sudden Infant Death Syndrome cases are encountered.

b. Reinforce the need for NCR clinic staff to communicate reportable medical events to both civilian and military public health authorities.

c. Encourage referral centers like WRAMC to engage preventive medicine personnel (both its own and those of pertinent installations) early in the course of such events.

d. Enhance Army epidemiologic surveillance for botulism cases.

e. Establish a DOD registry of dependent fatalities.

f. Improve centralized access to military clinical laboratory data.

g. Inform NCR beneficiary parents of newborns and infants about intestinal botulism as part of child health education.

h. Ensure construction contracts serving Fort Meade and other installations require control measures to minimize dispersion of fugitive dust.

i. Continue risk communication efforts on a scaled-down basis, monitor media coverage, and remain ready to respond to community rumors, misunderstandings and misperceptions in a timely manner.

Injury Prevention Report No. 12-HF-04DJ-06, Aug -5 – May 06

TABLE OF CONTENTS

EPIDEMIOLOGICAL CONSULTATION NO. 13-HG-06TU-07
INVESTIGATION OF TWO INTESTINAL BOTULISM CASES
AT FORT MEADE, MARYLAND
OCTOBER - DECEMBER 2006

1. REFERENCES. Appendix A contains the references used in this report.

2. PURPOSE. The purpose of this epidemiological consultation (EPICON) was to investigate *Clostridium botulinum* (*C. botulinum*) infection of two infants on Fort Meade, Maryland.

3. AUTHORITY. The U.S. Army Medical Department Activity (MEDDAC) Commander at Fort Meade requested assistance from the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) after two infants living on the same street, approximately 116 meters apart, contracted intestinal botulism in October 2006 and December 2006, respectively. In response to this request, the USACHPPM formed an EPICON team to perform an investigation.

4. BACKGROUND.

a. *C. botulinum* is an anaerobic spore-forming, rod-shaped bacterium that produces botulinum neurotoxin, the causative agent of botulism (reference 1). *C. botulinum* is known to produce seven distinct toxins including A, B, C1, D, E, F, and G. Release of these toxins at pre-synaptic nerve terminals causes paralysis (reference 2).

b. Specific toxin types of *C. botulinum* are usually associated with specific geographic regions within the United States (U.S.). While both type A and B cases are seen in the western U.S., type A predominates west of the Rocky Mountains (reference 3). Type B has been isolated more frequently in cases in the eastern U.S., specifically Pennsylvania and New York. Toxin types C, D, and F are less defined to a specific region, but are typically isolated from animals rather than humans, and all three of these types are poorly absorbed by the human intestine, which is essential for inducing neurological symptoms associated with botulism. Fresh water and fish ingestion have been associated with outbreaks of botulism type E. These outbreaks have historically been limited to the Baltic, Alaskan, and the Great Lakes areas (reference 3).

c. There are three major types of botulism found in humans: foodborne, wound, and intestinal (otherwise known as infant) botulism.

(1) Foodborne botulism is typically caused by ingesting preformed toxin from improperly preserved food items. Wound botulism, similar to other wound infections, is caused by the bacteria embedding under subcutaneous skin or deep inside an open area on the body, where they then produce the toxin. Intestinal botulism, which was first reported in 1976 (reference 4), occurs almost exclusively in infants, with the range of affected ages being 1 to 63 weeks. The majority of all cases occur in infants under 6 months of age, with the average age of reported cases being 13 weeks (reference 5). Cases are thought to be caused by ingestion of *C. botulinum* spores that subsequently colonize the large intestine and produce botulinum neurotoxin (references 4 and 6).

(2) While botulism cases occur throughout the world, the diagnosis of infant botulism is relatively uncommon in less developed countries (reference 7). There are numerous reasons for this trend, but perhaps the biggest is the amount of resources and testing required for a definitive diagnosis of infant botulism. *C. botulinum* in infants is the most commonly diagnosed type of botulinum intoxication in the U.S. (reference 6); despite this, only about 2 infant botulism cases are known to occur annually for every 100,000 live U.S. births (references 8 through 13). The case fatality rate for infant botulism in the U.S. is about 1.3 percent and less than 1 percent for hospitalized infants (reference 8). However, studies suggest that some cases of Sudden Infant Death Syndrome (SIDS), which affects more than 4,500 infants in the U.S. each year or approximately 50 infants per 100,000 live births, may be due to infant botulism (reference 9). Although the actual rate of fatal botulism falsely attributed to SIDS is unknown, studies analyzing infants who died from SIDS in the U.S. found botulism bacteria or toxin in up to 5 percent of examined SIDS cases (references 8, 9, 10, and 13). Some European studies have found higher rates (references 11 and 12).

d. Since infants cannot communicate symptoms, parental and provider awareness are keys to early diagnosis and treatment. Signs of infant botulism include: constipation, weakness (affecting gag, cry, sucking and swallow functioning), flaccid paralysis or "floppy baby syndrome," poor feeding, lethargy and hypotonia (reference 6). Prompt laboratory diagnosis is necessary to rule out other degenerative neuromuscular diseases. A test for toxin in the infant's stool specimen is conducted to identify and type the toxin. A confirmatory test is conducted by culturing the fecal specimen to isolate *C. botulinum*. However, typical infant botulism laboratory analysis stops at this step. Laboratory subtyping from clinical isolates are not usually done, butare part of broader research in the few laboratories equipped to do such testing.

e. Historically, there has not been a treatment protocol for infant botulism with the exception of treating specific symptoms. However, in 2003, the Food and Drug Administration approved Botulism Immune Globulin Intravenous (Human) (BabyBIG) for treatment of infant botulism cases with toxin A or B. This treatment consists of botulism antitoxin antibodies that are derived from humans (reference 14).

f. Commonly known vectors such as honey or syrup have been shown to be the source of several infant botulism cases. However, these risk factors can only be demonstrated in 10 percent of all infant botulism cases (reference 15). Recent research suggests that spores of the toxin-forming agent may be introduced by ingesting environmental materials such as dust or soil. Given that *C. botulinum* is ubiquitous in soils around the world, ingested dust and soil are thought to be likely culprits of infant botulism (reference 15).

g. In late 2006, two cases of infant botulism type B were identified among Department of Defense (DOD) beneficiaries hospitalized at the Walter Reed Army Medical Center (WRAMC). The cases occurred approximately 3 months apart and the infants involved lived in the same residential area in Fort Meade, Maryland, approximately 116 meters apart. The proximity of the cases increased community concern and sparked the investigation summarized in this EPICON.

h. While the incidence of *C. botulinum* infection among infants is rare, it is not unprecedented to have clustering of cases. A review of literature reveals numerous infant botulism clusters that have been investigated (references 16 through 18). More recently, a new unpublished report indicated a cluster of infant botulism types A and B at Vandenberg Air Force Base in southern California. Like the cases presented in this report, there were two cases of confirmed infant botulism among base residents within 3 months of onset. Foodborne transmission for both cases was ruled out, and investigators concluded that the disease was contracted through ingestion of soil or dust which may naturally contain spores.

5. METHODS.

a. EPICON Team. Principal team members from the USACHPPM included two preventive medicine physicians, three epidemiologists (including one with environmental health expertise), and one risk communication specialist. This team worked with preventive medicine personnel at Fort Meade, medical epidemiologists from the Anne Arundel County Department of Health and the Maryland Department of Health and Mental Hygiene (DHMH), and public affairs professionals from these various organizations. The EPICON personnel and their civilian public health partners also conducted telephonic conferencing with a team of *C. botulinum* experts from the Centers for Disease Control and Prevention (CDC) and the California Department of Health Services (CDHS). Additionally, military medical and laboratory surveillance agencies for all service branches were consulted to identify and confirm additional cases. These agencies included the Army Medical Surveillance Activity (AMSA), the Navy Environmental Health Center (NEHC), the Air Force Institute of Operational Health (AFIOH), and the Armed Forces Medical Examiner.

b. Case Interviews.

(1) A modified investigation form (appendix B) was developed using the CDC's standard infant botulism form (A Guide to Investigation of Infant Botulism, CDC 52.73 REV. 9-87) and a standardized questionnaire from the New York City Department of Health and Mental Hygiene. The form was designed to be more specific for military families regarding factors such as residence, potential exposures in the military, and housing. Information collected included demographics, onset dates, clinical presentation, food history, travel history, and exposures to known or suspected botulism sources.

(2) A team of four conducted the interviews with the parents of each case. Questions were asked by one person to remove question bias from the interview. Questions were asked in the same order for each case, and responses were recorded by all four team members. Each interview lasted for approximately 1 hour. After the interviews, responses to each question were typed by one member of the team and reviewed by the other three members for accuracy. Afterwards, the entire EPICON team reviewed the responses for commonalities between the two cases and possible exposure links.

c. Case Finding and Surveillance.

(1) The Army Medical Suveillance Activity operates a longitudinal epidemiological database called the Defense Medical Surveillance System (DMSS), which contains healthcare encounter data and demographics of all US military personnel and other beneficiaries, and which is also the central repository for DOD Reportable Medical Events (RMES) . The MHS Mart (M2) also contains healthcare encounter and demographic data. Both DMSS and M2 were queried to identify infant botulism cases diagnosed among military health system beneficiaries from calendar year (CY) 2002 through CY 2006. The inpatient queries were structured to identify any hospital admissions of infants under 1 year of age who were diagnosed with a primary or secondary diagnosis of infant botulism or which were reported through the RMES. If beneficiaries sought care at civilian facilities, these encounters were captured only if a billing claim was processed through TRICARE, the military health insurer. All data were consolidated into one case file which was then limited to unique cases. For each probable case identified through record review, AMSA, NEHC, and AFIOH were consulted to determine if the cases had confirmatory laboratory results. Because DOD laboratory records are not readily accessible prior to July 2006 and testing may also occur outside the DOD, confirmation was only available for cases reported through the RMES reports. The Defense Enrollment Eligibility Reporting System (DEERS) was then queried to determine live births among DOD active duty beneficiaries for CY 2003 through CY 2006; CY 2002 DEERS data were not available within M2.

e. Provider Education. MHS providers throughout the NCR were made aware of the two cases from Fort Meade as a means of reinforcing the need to seriously consider botulism when evaluating infants being seen because of paralytic signs or significant constipation, and when SIDS cases are encountered. Providers and clinic staff also received a reinforcing message about the need to communicate reportable medical events to both civilian and military public health authorities.

f. Risk Communication.

(1) From the beginning, Fort Meade's response focused on educating healthcare providers and the local community about the issue and on direct interaction with the affected families and other Fort Meade residents where the two affected infants lived. Kimbrough Ambulatory Care Center (KACC) notified all military healthcare providers in the NCR of the existence of the two cases and symptoms commonly associated with the disease. The Fort Meade Garrison Commander and KACC staff also immediately teamed up to personally visit both infants' families to identify unmet needs and to hand deliver risk communication products to the remaining residents. Risk communication products were also distributed to on-post child development centers, the media, and eventually to in-home childcare providers when that gap was identified. Risk communication products and media releases are in appendix C.

(2) Risk communication efforts regarding this issue incorporated several key risk communication principles—

(a) Discussing the bad news first and in a timely manner.

(b) Contacting the affected families and area residents in person.

(c) Identifying and using consistent spokespersons.

(d) Aligning response efforts with nonmilitary experts on infant botulism (that is, county and state health departments, the CDC, and the State of California where most infant botulism cases in the U.S. have occurred) to ensure that actions taken or proposed were scientifically valid.

(2) The Maryland DHMH was also consulted to identify cases reported in the state of Maryland and also specifically within Anne Arundel County, where Fort Meade is located.

(3) The EPICON team also consulted with the Office of the Armed Forces Medical Examiner (OAFME), the Baltimore Medical Examiner's Office, and the Maryland DHMH to gather information regarding fatalities classified as either SIDS or infant botulism.

d. Environmental Analysis. Sampling of environmental sources for *C. botulinum* type B was strongly considered by all parties involved in the investigation. After consulting with experts in the field, it was determined that environmental sampling would not add to this investigation and thus it was not conducted. However, collaboration with, and submission of environmental samples to, the Infant Botulism Treatment and Prevention Program in California was offered as part of long-term research and may occur in the future. In addition, a layout of the immediate construction sites and the cases' residences was developed using a measuring wheel for distances. Distances were measured and marked for the residences, playground, football field, and possible construction site. Figure 1 shows this layout. Prior land use was also thoroughly researched for any possible botulinum contamination or biological use that may induce growth of *C. botulinum.*

b. Epidemiology.

(1) Fewer than 100 cases of laboratory-confirmed infant botulism have been identified each year within the U.S., which equates to a rate of about 2 cases per 100,000 live births (reference 19). Review of public health reports revealed that a total of 16 laboratory-confirmed cases of infant botulism (primarily type B) were reported in the State of Maryland from 1976 through 1996 (reference 5). The Anne Arundel County Department of Health, whose district includes Fort Meade, was consulted to identify additional cases reported in the state of Maryland since 1996. They had documented 30 laboratory-confirmed cases during this time frame, bringing the cumulative 30-year total to 46 cases. Case reports were sporadic, ranging from 0 to 6 cases reported per year. The 2005 incidence rate was 6.7 cases per 100,000 live births (reference 20). Table 1 shows U.S., Maryland, and Anne Arundel County case reports from calendar years 2002 through 2006.

Table 1. Laboratory-Confirmed Infant Botulism Cases, CY 2002–CY 2006

Case Reports	CY 2002	CY 2003	CY 2004	CY 2005	CY 2006
National[1]	69	76	87	85	88
Maryland[2]	0	1	5	5	6
Anne Arundel County[2]	0	1	1	0	2

[2]Maryland and Anne Arundel County figures provided by the Anne Arundel County Department of Health.

(2) Table 2 provides information regarding cases of infant botulism diagnosed among MHS beneficiaries from 2002 through 2006. During the 5 calendar year period evaluated, approximately 85,000 to 105,000 live births were documented annually among DOD active duty beneficiaries. A total of 16 unique cases of infant botulism were identified during this period. A total of 2 probable cases were diagnosed in 2002, 3 occurred in 2003, 2 in 2004, 1 in 2005, and 8 in 2006, representing 2003 through 2006 annual rates of 3.5 cases, 3 cases, 1 case, and 8.6 cases per 100,000 live births, respectively. (Denominator data were not available for CY 2002 from M2 due to limitations with the M2 interface used to query the DEERS system; therefore, rates could not be generated prior to CY2003.) All cases were under 6 months of age, and there

was not a male or female predominance. The majority (71 percent) of cases were from the West Coast or the Great Plains region. These findings are consistent with the literature (references 1, 6, 16, and 22). Of the 16 cases identified, only 6 were laboratory-confirmed based on RME reports.

Table 2. Infant Botulism Among DOD Active-Duty Beneficiaries, CY 2002–CY 2006

Cases	CY 2002	CY 2003	CY 2004	CY 2005	CY 2006
Probable cases*	2	2	1	1	4

3rd	1	3	1	0	1
4th	0	0	1	1	2

*Probable cases are cases with clinical presentation, lacking confirmatory laboratory tests; cases were identified through International Classification of Diseases, Ninth Revision (ICD-9) diagnosis codes entered into the patient's electronic medical record during hospitalization (reference 23).

(3) In the process of reviewing case medical records, a similar clustering of cases as that observed at Fort Meade was detected in 2006 at Vandenberg Air Force Base in southern California. Two infants living in military housing on the same base were diagnosed within 3 months of each other, the first case being diagnosed in March 2006 and the second in May 2006. Case 1 was determined to be botulinum type B and the second was type A. Preventive medicine personnel questioned stated that the cases resided within 2 miles of each other. They were able to rule out the possibility of the cases being foodborne, but could not identify any epidemiologic links between the two cases. They consulted with the CDHS and concluded that the cases were probably acquired by ingestion of spores which occurred naturally in the environment, and noted nearby construction at a service station.

(4) Further review of public documents regarding infant mortality revealed that within the State of Maryland approximately 50 SIDS cases are reported each year while mortality due to infant botulism has not been documented in the state (reference 24). The Baltimore Medical Examiner's Office further stated that because SIDS is considered a cause of death, the Medical Examiner does not test victims for potential underlying causes such as infant botulism. Interviews with the OAFME revealed that the organization has no visibility in regard to continental U.S. (CONUS) dependent fatalities due to DOD casualty operations policy. Furthermore, because the State of Maryland annual reports do not distinguish between deaths among military members versus civilians it was not possible to determine if any SIDS cases were among military beneficiaries.

c. Risk Communication. Because of the high level of community concern associated with this issue, risk communication efforts by Fort Meade and the investigators were critical in the overall response. Target audiences included the Fort Meade residential and childcare communities because of their heightened concerns and local military and civilian healthcare providers to ensure increased vigilance.

(1) Risk communication efforts involved education through information sheets, weekly updates, links to non-military resources, video/audio files of media interviews, personal outreach by the Fort Meade MEDDAC Commander and KACC, and town hall meetings to answer questions and discuss lingering concerns. Collaboration with nonmilitary experts likely assisted in addressing community concerns due to their neutrality about the proposed investigative approach. Media interest was intense and extended well beyond the local area.

(2) Several media interviews were conducted by the Fort Meade Garrison Commander, the EPICON team leader, and the KACC Chief of Preventive Medicine, to include those with National Public Radio (NPR), The Baltimore Sun , and the Washington D.C. affiliates of ABC and CBS television networks.

d. Laboratory Testing. Initial laboratory testing for both cases was performed by the Maryland DHMH Public Health Laboratory. [redacted]

e. Mapping. Mapping of the area demonstrated that the residences of case 1 and case 2 were approximately 116 meters apart. Case 1 was slightly downhill of the playground, which in turn was slightly uphill of the dirt mound. The dirt mound was about 238 meters from case 1. Case 2 was much closer to this dirt mound (~150 meters) and was slightly uphill from it. (See figure 1).

f. Environmental Testing. Due to parental concern expressed to the media in reference to hazardous waste "Superfund" sites on Fort Meade, the EPICON team explored historical records regarding land use at Fort Meade. Fort Meade was listed on the Environmental Protection Agency's National Priorities List of hazardous waste sites on 22 July 1998 (reference 25). Due to this, the EPICON team researched the history of the site near residences where the cases occurred to identify any possible prior use, such as use for relocation/management of waste. The 1999 Agency for Toxic Substances and Disease Registry (ATSDR) public health assessment on Fort Meade (reference 25) and the 1989 U.S. Army Environmental Hygiene Agency's evaluation of solid waste management on Fort Meade (reference 26) listed numerous waste sites, including chemical containments and landfill sites (references 25 and 26). No waste sites were identified in the immediate area of residence for the cases.

7. DISCUSSION/CONCLUSIONS.

a. Investigation.

(1) The epidemiology of infant botulism is not well understood. Its rare occurrence, and the inability of epidemiologists to identify the source of causative bacterial spores in non-foodborne cases, significantly limits any effort to prove or disprove links among cases. Although risk factors for infant botulism have been well studied, investigations are often inconclusive, and specific biological physiologies for developing infections are less well described. Spika et al identified several possible risk factors for infant botulism, including living in a rural area, breast-feeding infants over 2 months of age, less than one bowel movement per day for at least 2 months, and ingestion of corn syrup (references 1, 22, and 27). Other studies suggest hospitalized infant botulism cases tend to have higher birth weights and to be born to mothers that tend to be white, older and better educated (reference 5). Breast-feeding is more common in cases (references 17 and 28) and is associated with later onset in type B cases (reference 28). The rarity of infant botulism further complicates diagnosis, treatment, and prevention efforts for clinicians, microbiologists and epidemiologists.

(2) Upon initial review, there was concern that the two cases were linked in some way and that other infants in the community could be at risk. Thus, a thorough consultation was conducted to investigate all known risk factors for infant botulism. Both families shopped for groceries at the same commissary, as do most other families who live on Fort Meade. Still, foodborne agents were quickly ruled out due to the fact that the affected infants did not consume any food from a common source. In fact, case 1 was breast-fed almost exclusively, while case 2 was fed supplement. Known food risk factors such as honey and corn syrup were never used in either case. After ruling out common food agents, the investigation then looked for common exposures such as public gatherings, churches, day care facilities, and parents' occupational exposures. Each of the parents work in a different setting, and none of the four came into contact with each other during the course of their work. Furthermore, neither of the families shared the same church or public places. The families had no known contact with each other prior to onset of the cases. Thus, transmission is unlikely to have occurred in a child care setting or any other public location. In addition, the cases emerged three months apart and the families were not known associates, thus person-to-person transmission is highly unlikely, especially given that person-to-person transmission has never been documented.

(3) The investigation then turned to environmental exposures. Proving or disproving a link with the environment is a dubious task given the lack of previous research in the area. Several studies have indicated that *C. botulinum* is endemic to many parts of the world and ultimately resides in the soil (references 1, 7, 15, 16, and 22). In particular, it is widely believed that botulism type B is endemic to the soil in the area and over the entire East Coast of the U.S. Numerous discussions were held with leading *C. botulinum* experts, CDC representatives, and Maryland and Anne Arundel County public health officials about proceeding with environmental testing. The consensus of this group was that environmental testing would not prove or disprove a link between the cases and the environment. In addition, there are no known public health prevention strategies for non-foodborne *C. botulinum.* Reasons for this decision were: little is known about the diversity of the organism (that is, no library to compare with), the ability of laboratory methods to discriminate among *C. botulinum* subtypes (reference 29) is limited; laboratory capacity is limited; and finally, due to the ubiquitous and dispersed nature of the organism, the probability of collecting the exact soil sample containing the causal agent is miniscule.

(4) It is interesting to note that one group of researchers in this field found an apparent "cluster" of *C. botulinum* strains that were identified by Pulsed-Field Gel Electrophoresis (PFGE) approach as being more than 90 percent similar. However, the isolates were from different types of materials from two different continents and were collected over an extended period of time (reference 29). These results highlight the limitations to current laboratory methods in linking cases in a suspected cluster. Current efforts are underway in California to develop a *C. botulinum* library of genetic material that may one day be utilized for PFGE or

Amplified Fragment Length Polymorphism in matching human-linked strains of the organism with environmental samples. However, this library is not yet complete. Therefore, the only results of environmental testing would be to confirm that *C. botulinum*, if isolated, is present in the environment. As Istre et al. indicated, there are probably several environmental factors that aid in the ingestion of *C. botulinum*; however, until the technology and knowledge advances, we cannot determine what those factors may be (reference 16).

(5) The ASTDR does list Fort Meade on the National Priorities List, but their report indicates that the waste sites are far from the current location of the cases. Moreover, while prior dumping sites for waste and dead carcasses are theorized to be viable sources for *C. botulinum*, there has been no evidence to support this.

(6) After review of all the research and data, it is clear that there are numerous modes of ingestion of *C. botulinum* by infants that are not well demonstrated in the literature. The EPICON team cannot find a link between the two cases at Fort Meade other than geographic proximity. The most likely source of infection was airborne dust particles that directly entered, or were carried into, the mouths of these infants. Based on prior work by experts investigating pairs or clusters of intestinal botulism cases, there is no sampling technique that has proven useful for narrowing down reservoirs of soil where the specific, infecting spores originate. Much needs to be learned about the epidemiology of infant botulism, and the EPICON team reached out to the leading scientists in this field. Possible collaborations for long-term environmental and laboratory research projects were discussed, as each discovered cluster of infections affords a possible opportunity to better elucidate non-foodborne modes of *C. botulinum* transmission.

b. Risk Communication.

(1) According to the National Research Council, risk communication is defined as "an interactive process of exchange of information and opinion among individuals, groups, and institutions" (reference 30). The interactive element of risk communication, along with clear messages, is necessary in order for both experts and nonexperts to develop a mutual understanding of interests, values and concerns that go far beyond one-way information sharing.

(2) While treatable, infant botulism can cause significant anxiety and panic not only for the affected families but also within the local population because it—

(a) Afflicts only very young helpless children (typically less than 1 year old).

(b) Occurs in an apparently random fashion without a means to predict or prevent exposure.

(c) Has no discernible cause due to its ubiquitous nature in the environment.

(d) Elicits dread and fear just by its very name, "botulism."

(3) When community concerns and media interest are high, risk communication efforts are critical in the overall response. Aggressive health information efforts (that is, fact sheets, press releases, etc.) are needed to increase awareness of the disease, its symptoms, and response actions. At the same time, technical knowledge is not always the dominant influence when concerns are high (and trust is low or unknown). Dialogue opportunities with experts and healthcare providers are important to answer questions and discuss lingering concerns.

8. LIMITATIONS.

a. The consultation is limited by several factors. The first is that there was a very small number of cases (n=2). Thus, neither a case-control study nor a cohort study was feasible. Secondly, the classification of *C. botulinum* as a select agent limits laboratory options due to special facility requirements and handling restrictions. In addition, several laboratories were contacted about conducting subtyping for the two specimens and, after much internal discussion, the botulism laboratory at CDC agreed to take the samples but with the stipulation that the results would only benefit future knowledge of the organism and would not be valid for this investigation.

b. The lack of a central source for identifying and tracking mortality among dependents of active-duty service members within the DOD is also problematic. Although establishment of centralized databases to monitor unexplained child deaths was formally recommended by the American Academy of Pediatrics in 1999, actions have not been undertaken within the DOD to allow this capability. Creation of a mortality registry for dependents would allow determination of baseline mortality risk from all causes, thereby enabling the study of epidemiological patterns of these deaths and focused prevention strategies to reduce the incidence of death in the spouses and children of service members. The OAFME/AFIP submitted a proposal for this type of surveillance (appendix D), but it has not received funding.

c. By including all hospitalizations and outpatient encounters, DOD surveillance systems have the potential to permit calculating incidence more completely than reportable disease mechanisms, since some underreporting is typical of passive surveillance in both civilian and military sectors. Currently, however, the results codes vary across laboratories—and many botulism-related tests, in particular, are outsourced—making analysis complex and unreliable. Therefore, comparison of rates among DOD beneficiaries to national rates may either underestimate or overestimate actual differences..

9. RECOMMENDATIONS.

a. The EPICON team recommends that—

(1) Military Health System providers throughout the NCR continue to be made aware of the two cases at Fort Meade in order to reinforce the need to seriously consider botulism in the differential diagnosis when evaluating infants with paralytic signs or significant constipation, and when SIDS cases are encountered.

(2) The NCR providers and clinic staff receive a message reinforcing the need to communicate reportable medical events to both civilian public health and military preventive medicine authorities. ,

(3) The NCR beneficiaries who are parents of newborns and infants be informed about intestinal botulism as part of child health education.

(4) Referral centers like WRAMC be encouraged to engage preventive medicine personnel (both its own and those of pertinent installations) early in the course of such events.

(4) Army epidemiologists enhance surveillance for botulism cases and other RMEs.

(5) DOD establish a registry of dependent fatalities through the OAFME (appendix D).

(6) Access to laboratory results by AMSA (future Armed Forces Health Surveillance Center) be improved to enhance ongoing surveillance activities.

(7) NCR beneficiary parents of newborns and infants be informed about intestinal botulism as part of child health education.

(8) Construction contracts serving Fort Meade and other installations require control measures to minimize dispersion of fugitive dust (reference 31).

b. Although public interest is not as elevated as it was initially, some questions do linger within the community. Therefore, risk communication efforts should continue on a scaled-down basis. Monitoring of media coverage should continue, and the installation commander should remain prepared to respond to community rumors, misunderstandings and misperceptions in a timely manner.

c. Because new information regarding infant botulism and this investigation is limited, it is recommended that the conclusions of the EPICON be released in order to meet community expectations. While education of the community was a key component of the risk

communication process, particularly during the initial response phase, this interactive component of risk communication is still crucial and should be continued to—

(1) Gauge how widespread concerns may be.

(2) Obtain empirical data from the community regarding how they view the command's response.

(3) Identify any lingering misperceptions or misunderstandings about this issue and verify that risk communication education efforts were effective.

(4) Identify the most preferred communication venues.

(5) Identify the most trusted sources of information on this issue.

(6) Further demonstrate the command's commitment to community well-being.

EPICON No. 13-HG-06TU-07, Fort Meade MD, Jan 06

Hypothesis Generating Questionnaire (Infant Botulism)

(Modified January 2007 from a questionnaire from the New York City Department of Health and Mental Hygiene and CDC Form 52.73, Guide to Investigation of Infant Botulism)

Initials of interviewer _____

Date form completed: ___/___/___

DEMOGRAPHIC INFORMATION OF THE CASE

Parent's last name: _____ Parent's first name:_____

Infant's last name: _____ Infant's first name: _____

Home address: _____

_____

_____

Phone: ( ) -_____

Sex: □ Male □ Female

Race/Ethnicity: □ White, not Hispanic □ Black, not Hispanic
□ Hispanic □ Asian or Pacific Islander
□ American Indian or Alaska native
□ Unknown

Mother's Age: Father's Age:

Mother's Occupation: Father's Occupation:

Number of Pregnancies:

Number of Live Births:

Type of Delivery (cases only): □ Vaginal □ C-Section

Complications: □ Yes □ No If yes, please explain: _____

Was infant premature? □ Yes □ No □ Unknown If yes, gestational age (weeks) _____

What was infant's birth weight _____

1. Where was your child born? ❑ Hospital ❑ Other _____
   Hospital Name:_____
   Age at discharge from hospitals? _____
   Was your child premature? ❑ Yes ❑ No ❑ DK

2. Where do you usually take your child for medical problems or for well baby visits?
   ❑ Pediatrician ❑ Family/gen practitioner ❑ Nurse practitioner or PA
   ❑ ER ❑ Other (Please specify_____)

3. Before your child's illness from botulism began, did he/she see a physician for any other medical problems (not including well-child visits or visits for immunizations)? ❑ Yes ❑ No ❑ DK

4. Did your child receive antibiotics in the month prior to illness onset? ❑ Yes ❑ No ❑ DK

5. What was your infant's usual bowel movement pattern during the following months of life?

	≥ 1 BM/day	1 > BM ≤ 3/day	< 1/3 days	unknown
1st month	___	___	___	___
2nd month	___	___	___	___
3rd month	___	___	___	___
4th month	___	___	___	___

When we first interviewed you about your child's illness, you reported that he/she first appeared sick on ____/____/____ *(onset date)*. Is this the correct date? ❑ Yes ❑ No ❑ DK

I. Food/Liquid Exposures

6. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being breast-fed?
❑ Yes ❑ No ❑ DK
If yes, how many times per day do you breast feed? _____

7. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being bottle fed?
❑ Yes ❑ No ❑ DK
Do you use expressed breast milk to bottle feed? ❑ Yes ❑ No ❑ DK
Do you use formula to bottle feed? ❑ Yes ❑ No ❑ DK
Which formula did you primarily use? _____
Please specify other brands of formula that you used. (List all brands used)
_____
_____
_____

What type of formula do you usually use? Did you use...
a. Liquid (ready to serve) ❑ Yes ❑ No ❑ DK
b. Liquid (conc. add water) ❑ Yes ❑ No ❑ DK
c. Powdered ❑ Yes ❑ No ❑ DK
Who usually prepared the formula?
Name: _____

Relationship to the child: _____

If water was used, what was the source of the water? _____

If tap water, was it boiled or filtered? ❑ Yes ❑ No ❑ DK

How many bottle feedings per day? _____

8. Prior to your child's illness, did he/she eat any baby cereal? ❑ Yes ❑ No ❑ DK
   Please specify type and brand (rice, oatmeal, etc.)._____

9. Did your child eat jars, bottles, or cans of baby food? ❑ Yes ❑ No ❑ DK
   Please specify type and brand_____

10. Did your child eat any baby food that was prepared at home? ❑ Yes ❑ No ❑ DK
    Please specify how it was prepared_____

11. Did your child eat any home-canned foods? ❑ Yes ❑ No ❑ DK

12. Did anyone in your family eat any home-canned foods? ❑ Yes ❑ No ❑ DK

13. Did your child drink any regular cow's milk (pasteurized)? ❑ Yes ❑ No ❑ DK

14. Did your child drink any unpasteurized milk? ❑ Yes ❑ No ❑ DK

15. Did your child eat or drink any honey? ❑ Yes ❑ No ❑ DK

16. Did your child eat any corn syrup? ❑ Yes ❑ No ❑ DK

17. Did your child drink any sugar/water? ❑ Yes ❑ No ❑ DK

18. Did your child drink any fruit juices? ❑ Yes ❑ No ❑ DK

19. Did your child drink any unpasteurized fruit juices? ❑ Yes ❑ No ❑ DK

20. Did your child eat any meats? ❑ Yes ❑ No ❑ DK

21. Did your child eat any fish? ❑ Yes ❑ No ❑ DK

22. Did your child drink tea? ❑ Yes ❑ No ❑ DK

Was it sweetened? ❑ Yes ❑ No ❑ DK

23. Did your child receive any supplemental vitamins in the month before the illness began?
❑ Yes ❑ No ❑ DK
If yes, please specify_____
Did they contain iron? ❑ Yes ❑ No ❑ DK

24. Did your child eat any fresh produce (fruits or vegetables) that were organically grown?
❑ Yes ❑ No ❑ DK
If yes, please specify which fruits and vegetables were organically grown_____
_____

25. Does anyone in your family eat any fresh produce (fruits or vegetables) that is organically grown?
❑ Yes ❑ No ❑ DK
If yes, please specify which fruits and vegetables were organically grown_____

26. Do you shop at any Farmer's Markets? ❑ Yes ❑ No ❑ DK
If yes, please specify._____

27. Where do you shop for groceries? _____

28. Where do you shop for baby food and other baby items? _____

II. Environmental exposures

29. Was there any of the following during the month before your child's onset near your home:
❑ construction (e.g. new home or other building)
❑ excessive dust (e.g. sewers, new foundations)
❑ excavation
❑ new road construction
❑ plowing of fields

❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

30. Was there any of the following during the month before your child's onset at other sites where your child has been:

❑ construction (e.g. new home or other building)

❑ excessive dust (e.g. sewers, new foundations)

❑ excavation

❑ new road construction

❑ plowing of fields

❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

31. Did your child or anyone else in your family play in a sandbox prior to illness?

❑ Yes ❑ No ❑ DK

If so, where? (list)

32. How often is the furniture in your house dusted?

❑ more than once per week

❑ once a week

❑ less than once per week but at least every two weeks

❑ less than every two weeks

❑ other (please specify_____)

❑ unknown/refused

33. Do you have any carpets or area rugs covering the floor in your house? ❑ Yes ❑ No❑ DK

If yes, are they

❑ wall to wall carpets

❑ area rugs

❑ both wall to wall and area rugs

What is the pile of wall to wall carpeting, (low, med, or shag)?_____

34. How often are your floors and carpets vacuumed?

❑ more than once per week

❑ once a week

❑ less than once per week but at least every two weeks

❑ less than every two weeks

❑ other (please specify_____)
❑ unknown/refused

35. What type of heating system do you have in your home?
❑ forced air (e.g. gas, oil, electric)
❑ steam heat (radiators)
❑ circulating hot water (e.g. solar, oil, gas)
❑ electric
❑ other (please specify_____)

36. Does your home have air conditioning? ❑ Yes ❑ No ❑ DK
If yes, please specify if individual room unit or central air conditioning_____

37. Do you have any electric air cleaner in your home? ❑ Yes ❑ No ❑ DK
If yes, please specify if central or portable_____

38. Were you or anyone in your household or family involved in gardening or yard work prior to your child's illness onset?
❑ Yes ❑ No ❑ DK
If yes, please specify flower or vegetable.
How often do you or household/family member garden?_____

Which months of the year do you garden?_____

39. Do you have any plants inside your house?
If yes, are they (check all that apply)
❑ located on or within 1 foot of the floor
❑ located on tables
❑ hanging from the ceiling
Are there any plants in the baby's room? ❑ Yes ❑ No ❑ DK

40. Do you take your child for walks outside? ❑ Yes ❑ No ❑ DK
Where do you usually go for walks?_____
Do you go to any nearby parks? ❑ Yes ❑ No ❑ DK
If yes, please specify_____

41. Does your child play or lie on the ground outside? ❑ Yes ❑ No ❑ DK
Please specify in backyard, park, etc._____
_____

42. Are you a member of any social or religious organizations? ❑ Yes ❑ No ❑ DK
If yes, please specify_____
Did you take your child to any events? ❑ Yes ❑ No ❑ DK
Was your child at an associated daycare during any of these events?
If yes, where/when?_____

43. Is your child in school/daycare or does he/she participate in any other group activities?
❑ Yes ❑ No ❑ DK
If yes, please provide names and locations _____
Describe "other group activities"_____

44. Did your child travel outside of Ft. Meade at all prior to his/her illness? ❑ Yes ❑ No ❑ DK
If yes, please specify where?_____

45. Did your child travel outside of Maryland prior to his/her illness? ❑ Yes ❑ No ❑ DK
If yes, please specify location, length of stay, and nature of visit_____

46. Did you visit a live poultry or meat market? ❑ Yes ❑ No ❑ DK
If yes, did you purchase any poultry or meat?
Specify type of meat purchased: _____
Name of market: _____
Address of market: _____
Did you take your child to the live market? ❑ Yes ❑ No ❑ DK

47. Did you take your child to any large gatherings prior to illness (wedding reception, parties, festivals, fairs, religious gatherings, etc.) ❑ Yes ❑ No ❑ DK
If yes, please specify_____

48. Did your child swim/wade/splash in an ocean, lake, river, pool, or recreational water park in the before his/her illness onset? ❑ Yes ❑ No ❑ DK
If yes, please specify_____

49. Did your child come into contact with any animals in the prior to illness? ❑ Yes ❑ No ❑ DK

If yes, what kind of animals? _____

When? _____ Where? _____

50. Where did you buy/obtain your baby's crib?_____

Was the crib used or new? ❑ Yes ❑ No ❑ DK

Was the mattress used or new? ❑ Yes ❑ No ❑ DK

51. Does your child share toys with anyone? ❑ Yes ❑ No ❑ DK

If yes, please specify_____

52. How often do you sterilize bottles before using them? ❑ Always ❑ Sometimes ❑ Never

53. How often do you sterilize nipples before using them? ❑ Always ❑ Sometimes ❑ Never

54. Does your child use a pacifier? ❑ Yes ❑ No ❑ DK

Where were pacifiers purchased?

How often do you clean the pacifier?_____

If the pacifier falls on the floor:

How often do you clean with water? ❑ Always ❑ Sometimes ❑ Never

How often do you clean with soap? ❑ Always ❑ Sometimes ❑ Never

How often do you sterilize? ❑ Always ❑ Sometimes ❑ Never

55. Who is your child's pediatrician?

Pediatrician's name:_____

Clinic name: _____

Address: _____

Phone number:( ) _____-_____

56. Do you know anyone other infants who have had a similar illness as your child's?

❑ Yes ❑ No ❑ DK

If yes, please specify_____

_____

Additional comments_____

_____

Thank you very much for you time.

RISK COMMUNICATION PRODUCTS AND MEDIA RELEASES FOR BOTULISM INVESTIGATION

EPICON No. 13-HG-06TU-07, Fort Meade MD, Jan 06

FORT GEORGE G. MEADE
NEWS RELEASE
PUBLIC AFFAIRS OFFICE
4550 PARADE FIELD LANE
FORT MEADE, MD 20755
www.ftmeade.army.mil

Jan. 10, 2006 **Release # 070110**

FOR IMMEDIATE RELEASE

Infant Botulism Found in Two Children at Fort Meade

FORT GEORGE G. MEADE, Md., - Since October 2006, Walter Reed Army Medical Center (WRAMC) has identified two cases of infant botulism involving residents of Fort Meade. One infant has recovered while the other infant is being treated by doctors at WRAMC. Both children were under six months of age at the time of diagnosis.

The cause is currently under investigation by the Preventive Medicine Services on Kimbrough Ambulatory Care Center (KACC).

"Infant botulism is a treatable condition associated with the ingestion of clostridium botulinum bacteria found naturally in soils and in some contaminated food products. It would be premature to speculate about a particular source because we are still trying to conduct our investigation," said Chief of Preventative Medicine at KACC, Lt. Col. Sharon Cole-Wainwright.

Infant Botulism is rare and usually affects infants under six of age.

Symptoms may include constipation, listlessness, difficulty swallowing, a weak cry and a loss of appetite. If parents are concerned, they should contact their health care provider.

Health care professionals recommend that parents of infants wash their hands frequently, clean toys and pacifiers in a weak bleach solution, and thoroughly boil water used to prepare baby formula. These are not foolproof measures for preventing botulism infection, but they afford some protection against the most common avenues of transmission.

(more)

"Our primary concern is always the health and welfare of the members of our community. We will work closely with health officials and will keep the community informed of any new information as it comes available. The Army is committed to providing the safest living and working environment for its people," said Col. Kenneth McCreedy, installation commander.

EDITOR'S NOTE: For more information contact
at (301) or , at (301)

MESSAGE FROM THE INSTALLATION COMMANDER
INFANT BOTULISM FACT SHEET

Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center. The infants, both under the age of 6 months at the time of diagnosis, were treated at Walter Reed Army Medical Center. The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade. LTC Sharon Cole-Wainwright, Chief of Preventive Medicine at Kimbrough Ambulatory Care Center said, "while the name of the disease can be frightening, infant botulism is a treatable condition associated with swallowing the botulinum bacteria found naturally in soils and in some contaminated food products. It is premature to speculate about a particular source until the investigation is complete." Cases of Infant Botulism are rare and usually occur among infants less than 6 months of age.

What are the symptoms of Infant Botulism?

Any or all of the following:

- constipation
- poor feeding and a weak suck
- weak cry
- loss of head control
- difficulty swallowing
- excessive drooling
- floppy appearance or "floppy baby"
- generalized weakness
- breathing difficulties

What do you do if your infant is experiencing these symptoms?

Call (301) 677-8606 or go to the nearest Emergency Room

- Howard County General Hospital 5755 Cedar Lane, Columbia, Maryland (410) 740-7890 or 7990
- Laurel Regional Hospital 7300 Van Dusen Road, Laurel, Maryland (301) 725-4300 or (410) 792-2270
- Baltimore Washington Medical Center, 301 Hospital Drive, Glen Burnie, Maryland (410) 787-4000

How is Infant Botulism treated?

Prompt diagnosis is essential. Medication is available to treat the condition.

How can I reduce the risk of contracting Infant Botulism?

- Wash hands frequently
- Avoid giving honey to infants less than 1 year of age
- Routine and frequent cleaning of toys-- particularly items that babies place in their mouths and those toys which have fallen on the ground or floor
- Through proper preparation of foods (boiling and cooking)
- Avoid cans of food/formula with dents or that are bulging or rusting
- Avoid locations with excessive dust and debris

For further information about the disease, contact Kimbrough Ambulatory Care Clinic, Preventive Medicine Services (301) 677-8661. If you have other questions or are contacted by the media please refer them to the Fort Meade Public Affairs Office at (301) 677-1436 or 1486.

EPIDEMIOLOGICAL CONSULTATION TEAM AND ITS MISSION AT FORT MEADE
16 Jan 07

BACKGROUND:
In response to lingering concerns about the two cases of infant botulism at Fort Meade, an epidemiological consultation (EPICON) team was requested to assist the medical community here at Fort Meade in its investigation. The EPICON team arrived at Fort Meade on Friday January 12th to begin its mission to investigate the occurrence of these cases. This fact sheet provides some background information about the team and its mission.

What is an EPICON team?
Epidemiology is the science devoted to investigating how population factors and the environment influence the occurrence of diseases or injuries. The team then applies this science to find possible causes, risk factors and opportunities for prevention.

Who is on the EPICON team? Where are they from? What are their specialties?
The EPICON team members are from the U.S. Army Center for Health Promotion and Preventive Medicine, part of the Army's Medical Command, who specializes in preventive medicine, environmental health, epidemiology, and communication about health matters when public concerns are high. In conducting this study the team is collaborating with a physician-epidemiologist from Anne Arundel County's public health department, the Kimbrough preventive medicine staff, the Centers for Disease Control and Prevention (CDC) and the California state health department.

Why is the EPICON team here?
The team was called by the Kimbrough Ambulatory Acute Care Hospital and Garrison Commanders because they believed someone from outside Fort Meade was needed to review the situation and provide advice while allowing Kimbrough to continue their important clinical and preventive medicine mission without disruption.

What methods is the team using to try and find answers?

The team is working to determine if there is any connection between the two cases of infant botulism. The team has interviewed the affected families to identify products used, places visited, possible common exposure, etc. They are reviewing clinical test results on the affected children during their illness, and will review more detailed analysis currently being done at a Maryland state laboratory which will identify the specific subtype of botulism bacteria. Team members are also looking at disease surveillance reports and other data to see if the Fort Meade community or Anne Arundel County has experienced similar cases.

Will environmental sampling be done?
It's certainly understandable why finding the cause is so important to families with young children. Focused environmental sampling in specific areas may be conducted for purely scientific reasons, such as to determine where the bacteria might be present. But random sampling throughout a wide area is unlikely to provide a definite link to the two Fort Meade

cases or help direct future preventive measures, or provide a definite link to one or a few specific areas of contaminated objects or soil. This is because the botulism-causing bacteria are widely distributed in many environments around the world.

How long will the team's investigation take?

The results of the subtyping of the bacteria from the affected infants are expected to be completed on or about January 20th. This information is critical in answering the question, "Are the two cases connected?" However, the team's mission will not end there. The EPICON team will continue to conduct a thorough review of the local surveillance data and existing scientific literature; and continue to collaborate with the Fort Meade medical authorities, the Fort Meade garrison, as well as with Anne Arundel County and CDC partners before finalizing its report. The team anticipates delivering a report to the Garrison Commander by the end of February.

EPICON No. 13-HG-06TU-07, Fort Meade MD, Jan 06

EPIDEMIOLOGICAL CONSULTATION TEAM AND ITS MISSION AT FORT MEADE
23 Jan 07

BACKGROUND:
In response to lingering concerns about the two cases of infant botulism at Fort Meade, an epidemiological consultation (EPICON) team was requested to assist the medical community here at Fort Meade in its investigation. The EPICON team arrived at Fort Meade on Friday January 12th to begin its mission to investigate the occurrence of these cases. This fact sheet provides some background information about the team and its mission.

What is an EPICON team?
Epidemiology is the science devoted to investigating how population factors and the environment influence the occurrence of diseases or injuries. The team then applies this science to find possible causes, risk factors and opportunities for prevention.

Who is on the EPICON team? Where are they from? What are their specialties?
The EPICON team members are from the U.S. Army Center for Health Promotion and Preventive Medicine, part of the Army's Medical Command, who specializes in preventive medicine, environmental health, epidemiology, and communication about health matters when public concerns are high. In conducting this study the team is collaborating with a physician-epidemiologist from Anne Arundel County's public health department, the Kimbrough preventive medicine staff, the Centers for Disease Control and Prevention (CDC) and the California state health department.

Why is the EPICON team here?
The team was called by the Kimbrough Ambulatory Acute Care Hospital and Garrison Commanders because they believed someone from outside Fort Meade was needed to review the situation and provide advice while allowing Kimbrough to continue their important clinical and preventive medicine mission without disruption.

What methods is the team using to try and find answers?

The team is working to determine if there is any connection between the two cases of infant botulism. The team has interviewed the affected families to identify products used, places visited, possible common exposure, etc. They are reviewing clinical test results on the affected children during their illness, and will review more detailed analysis currently being done at a Maryland state laboratory which will identify the specific subtype of botulism bacteria. Team members are also looking at disease surveillance reports and other data to see if the Fort Meade community or Anne Arundel County has experienced similar cases.

Will environmental sampling be done?
It's certainly understandable why finding the cause is so important to families with young children. Focused environmental sampling in specific areas may be conducted for purely scientific reasons, such as to determine where the bacteria might be present. But random sampling throughout a wide area is unlikely to provide a definite link to the two Fort Meade

cases or help direct future preventive measures, or provide a definite link to one or a few specific areas of contaminated objects or soil. This is because the botulism-causing bacteria are widely distributed in many environments around the world.

How long will the team's investigation take?
The results of the subtyping of the bacteria from the affected infants are expected to be completed on or about January 20th. This information is critical in answering the question, "Are the two cases connected?" However, the team's mission will not end there. The EPICON team will continue to conduct a thorough review of the local surveillance data and existing scientific literature; and continue to collaborate with the Fort Meade medical authorities, the Fort Meade garrison, as well as with Anne Arundel County and CDC partners before finalizing its report. The team anticipates delivering a report to the Garrison Commander by the end of February.

Feb. 1, 2007 **Release # 070201**

FOR IMMEDIATE RELEASE

Infant botulism investigation update

FORT GEORGE G. MEADE, MD., -- Maryland health officials have confirmed the presence of Type B Clostridium botulinum bacteria from both cases of infant botulism recently diagnosed at Fort Meade. This confirmation was expected as this type of botulism strain is typically found on the East Coast.

The first case of infant botulism was diagnosed in October 2006 and the second in December 2006. Both children have since been treated and are recovering. The children live on Oliver Court at Fort Meade.

The Maryland Department of Health and Mental Hygiene (DHMH) have contacted the Center for Disease Control and Prevention in Atlanta, Ga., to determine if they are willing to do subtyping of the bacteria.

Investigators continue to discuss and coordinate with DHMH, CDC, Fort Meade medical authorities and other experts as they work towards completing the investigation.

In addition, the Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases from 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at http://amsa.army.mil/AMSA/amsa_home.htm.

APPENDIX D

ARMED FORCES INSTITUTE OF PATHOLOGY (AFIP) PROPOSAL TO FUND DEVELOPMENT OF A DEPENDENT MORTALITY DATABASE

EPICON No. 13-HG-06TU-07, Fort Meade MD, Jan 06

Dependent Mortality Database

Proposed: The goal of this paper is to explore the feasibility of establishing a registry of dependent fatalities, to include exploration of methodologies.

Background: Currently, there is no central source for identifying and tracking mortality amongst the dependents of active duty servicemembers. It is widely believed that domestic abuse is more prevalent in military families than in their civilian counterparts, and numerous programs have been established to mitigate the perceived increased risk of domestic violence in servicemember's families. Establishing a registry of deaths in dependents will allow for the determination of baseline mortality risk from all causes, to include more accurate tracking of domestic violence related deaths. Other potential research areas that could be explored using this registry include reviews of specific types of accidents, SIDS, cancer and infectious disease mortality. By studying the epidemiological patterns of these deaths, focused prevention strategies can be developed to reduce the incidence of death in the spouses and children of servicemembers. Furthermore, establishment of centralized databases to monitor unexplained child deaths was formally recommended by the American Academy of Pediatrics in 1999{Kairys SW, Alexander RC, Block RW, et al. American Academy of Pediatrics. Committee on Child Abuse and Neglect and Committee on Community Health Services. Investigation and review of unexpected infant and child deaths. Pediatrics 1999; 104:1158-60}.

Data Sources and Methodology: The existing DOD-Medical Mortality Registry is an active surveillance system designed to provide real-time outbreak information to decision-makers{Gardner JW, Cozzini CB, Kelley PW, et al. The Department of Defense Medical Mortality Registry. *Mil Med.* Jul 2000;165(7 Suppl 2):57-61.}. An investigation is triggered by receiving current information from each of the Service-Specific Casualty Offices. There would be value in actively monitoring child deaths for infectious agents, as children are often sentinels for outbreaks. An example occurred last year during the influenza outbreak that was particularly noted for causing child fatalities. However, because the Casualty Offices only track and report dependent deaths that occur overseas, real time surveillance of dependent fatalities is not achievable at this time. An alternative approach is to establish a Registry consisting primarily of death certificate data, obtained from National Death Index (NDI) searches. For the purposes of monitoring homicides, this basic level data would provide demographics and a basis for comparison with civilian homicide rates. It would also provide an estimate for the completeness of capture of the established Fatality Review Boards. The two major limitations of this approach are lag time, which averages approximately three years, and incomplete information.

Budget: The costs of establishing a Death Certificate based registry as part of the Armed Forces Medical System are approximately 350K per year, which would support an epidemiologist to collect and analyze the data, and the direct costs of the NDI searches. If real time investigative surveillance is desired, a mechanism for rapidly identifying dependent fatalities would have to be established. Costs from the Armed Forces Medical Examiner System would increase to approximately 450K per year.

High Rate of Infant Botulism On Ft. Meade Fort Meade, Md. - Tuesday August 14, 2007 4:48 pm

An investigation into Infant Botulism at Fort Meade found children on military bases are more susceptible to the toxin.

(Reporter Stephen Tschida said,)" The study found on average, 8.6 babies contracted the illness per 100,000 births to active military personnel.
That's four times higher than the national average. The report also stated that some cases of Sudden Infant Death Syndrome, also known as SIDS, may be due to Infant Botulism.

[redacted] almost lost her son [redacted] to the rare paralysis-inducing illness last October. Around the same time, another baby in the same Fort Meade neighborhood also contracted the disease.

[redacted] says she doesn't feel safe living on the base nor does she think any other parent should. [redacted] wants the military to dig up all the chemical and other hazardous waste dumps on the bases before building new houses on them.

"The base even admitted that there were numerous, I'm quoting the report, numerous chemical waste dumps." [redacted] said.

[redacted] says the Army promised to determine whether the Botulism that infected her son was naturally occurring or engineered in a lab. She says she has never received a response.

ABC 7/Newschannel 8 made repeated calls to the people who conducted the study but also did not get a response.

[redacted]

There is nothing in the report that I have found that would lead to this conclusion. I am not certain what [redacted] at CHPPM can do as I have re-read the report and don't know how to draw the conclusion that military infants are more susceptible. Isn't that an appropriate response?

Please advise.

EXSUM

We received a phone call from Steve at channel 7, WJLA-TV, the ABC station in Washington.

Mrs. [redacted] gave them the complete copy of the Infant Botulism report.

The reporter said that in the report it said that Children at Military Installations are more susceptive to infant botulism and would we like to comment on that.

I explained that I had read the executive summary and I had not read that in the report.

I referred him to [redacted] at CHPPM to talk about the report. (She is out. So basically I am just buying time until I can get some answers.)

I referred him to the executive report we have posted on the web site at www.ftmeade.army.mil <http://www.ftmeade.army.mil>

Talking Points-Infant Botulism

I believe this latest story is out of the Fort Meade localized area now. And is headed to the national area.

We didn't write the report and we can't comment about what it says. We didn't release the report to the family. And as you can see below there is litigation now. I believe OCPA or IMCOM will need to answer any further queries on this as it relates to other installations.

I can't comment on any other bases. Only what is happening here.

These were the first 2 cases ever reported here.

And there are 6 cases in the state of Maryland over 5 years.

Looking forward to your recommendations.

WJLA, channel 7, local ABC affiliate ran a piece at 1730 today regarding the final report on the two cases of Infant Botulism detected on Ft. Meade last winter. The story was also posted to the website and is pasted below.

It was said that [redacted] had the full report and either quoted from or alluded to it several times during the piece. Although the report was not actually shown on camera, hands were seen paging through a seemingly lengthy document. (According to [redacted] Center for Health Promotion and Preventive Medicine, PAO, the full report has limited distribution to US government agencies and their contractors. The logical question is how the family obtained the report).

The interview appeared to have been conducted in the [redacted] home on the installation.

The reporter interviewed one local resident, [redacted], who said, "I'm sure the government knows all about this but isn't doing anything."

[redacted] said "I don't feel safe living on base any more."

Sir:

This is FYI. No action on your part is required.

On 30 Jul 07, the US Army Claims Service (USARCS) received three claims, each asserting $1 million, filed on behalf of [redacted] (infant), [redacted] (mother) and [redacted] (father). USARCS forwarded the claims to our Claims Office for processing. The [redacted] are represented by a law firm from Austin, Texas. They allege the government was negligent in the placement of a debris pile and environmental contamination which caused Master [redacted] to become sick with infant botulism.

We are processing these claims and have coordinated with environmental services [redacted] and the MEDDAC (Risk Manager). Colonel [redacted] is aware of these claims. We will keep USARCS promptly informed of the claims' status.

I am available to address your questions and concerns regarding this matter.

V/R,

LTC [redacted]

Normally, the installation would not comment on pending litigation, but it might be appropriate to reiterate the command messages that were put out at the time of the initial reports on the two cases of botulism. Talking points are pasted here:

<<Talking Points-Infant Botulism.doc>>

Fort Meade Garrison Public Affairs Office

<mailto: my.mil>

Talking Points – Infant Botulism

- Fort Meade is working with the U.S. Army Center for Health Promotion and Preventive Medicine to ensure a thorough and efficient investigation is conducted.

- Being good stewards of the environment is a major commitment for the Army. Fort Meade shares the environment with everyone who lives, works and plays on the installation. We are committed to ensuring the necessary precautions to prevent any adverse affects on the people who use the installation.

- While Fort Meade is a superfund site designated by the Environmental Protection Agency, the Clostridium botulinum bacteria is a naturally occurring bacteria that is found anywhere in the environment. None of the superfund sites are remotely related to the bacterium that causes infant botulism.

- It is also important to note that infant botulism can be caused by other factors such as improperly prepared food and giving honey to infants less than one year of age. It is important that parents of infant children take precautions to reduce any possible risks.

- The health and well-being of the people who live, work and play on Fort Meade are very important to us. The Army tries to maintain high standards for the environment that we live in. Because locations with excess dust and debris have been shown to increase the risk of contracting infant botulism, future work sites will be positioned further away from housing areas as a preventative measure to keep dust down. All construction work on FGGM uses water to reduce the amount of dust.

- Initial response to the information that dirt creates dust that could create the bacteria, FGGM proceeded to put down hay as a preventive measure. The bacterium currently has not been linked to any dirt specifically on post.

I just talked with Colonel [redacted] and I advised him that this is not our report and we should not be the ones talking about what it says.

I can talk about what happens on the installation. But if someone else puts out a report. Then they should be the ones discussing it. It is outside of our lane.

[redacted]

Below is the collected wisdom of our epidemiologists and risk communicator re response to queries about whether military infants get IB at rates greater than other infants. Please disregard the earlier version I sent you.

We understand that and agree with COL McCreedy's preference and yours to keep comment on the cases coming from Fort Meade. We're happy to support with additional info any follow-on queries you might get to tonight's Channel 7 story on the [redacted] and/or the belief that there is a higher incidence of IB among military infants. Per discussion, please let us know if there is some pending claim or legal action that would preclude you or us from commenting--I wasn't clear on that when I spoke with [redacted] earlier.

Thanks to all for pulling this together.

[redacted]
U.S. Army Center for Health Promotion
& Preventive Medicine
[redacted]

The epidemiological report did not say, and we do not believe, that infants on military installations are more susceptible to botulism than other infants.

1. Military infants do not get infant botulism more frequently than other U.S. infants of the same age. Rates among military infants are comparable to U.S. infant rates.

2. Infant botulism occurs rarely. There were a total of two cases at Fort Meade. Sometimes rare events happen close to one other. It's not possible to say that the two cases were not due to random variation (chance).

§ In the IB report, CHPPM epidemiologists included laboratory-confirmed AND probable cases because we wanted to be as transparent as possible and exclude nothing.
§ The CDC rates in the report reflect ONLY lab-confirmed cases.
§ Only six military IB cases in 2002-06 were laboratory confirmed, according to reportable-medical-event reports.

Here's the statistical background from MAJ [redacted]

The CDC 2/100,000 rates are based on lab-confirmed cases only. Looking only at Reportable Medical Event cases with lab confirmation (from Table 2 in the tech report) the overall rate of infant botulism among DoD Active-Duty beneficiaries from CY03-CY06 is 1.56/100,000 and is comparable to national rates.

[redacted]

	CY03	CY04		CY05	CY06	Average
lab confirmed cases	1	1	0	4	6	
Total live births	85583	101522		104356	92551	384012
Lab Confirmed Rate/100,000 live births	1.17	0.99	0.00	4.32	1.56

I just talked to [redacted] from OCPA. She agrees with me. The installation shouldn't be respondoing to a report put out by CHPPM. She said they should take our time and get the right language. And get the right person to respond to ABC.

She is going to get with [redacted] and [redacted] in the morning. They will talk with CHPPM in the morning. Then get back with me.

But right now it is at a national level.

They may take it from here.

I willl keep you posted.

Good Morning,

As many of you know, last evening a story ran on a Washington ABC affiliate, WJLA, channel 7, regarding the unsafe living environment here on Ft Meade and made reference to a higher than normal infant botulism rate on all military installations. This information was given to the media by an on-post resident, [redacted] whose son became ill with infant botulism. (If you recall, we had 2 cases of infantile botulism on Ft Meade at the end of 2006: 1 in Oct 06 and the other in Dec 06). CHPPM conducted an EPICON and published a final report on the two cases of Infant Botulism. There was no conclusive evidence that

the 2 cases were related or the cause determined.
[redacted] obtained a copy of this report (not too sure how) and focused on epi data reported on page 9 whereby CHPPM reports infantile botulism cases (known and suspected) in the U.S. A misinterpretation of the epidemiological information led to the inappropriate conclusion that military bases have a higher than normal rate of infantile botulism. Mrs. [redacted] had the full report and either quoted from or alluded to it several times during the news piece. Although the report was not actually shown on camera, hands were seen paging through a seemingly lengthy document (it was the CHPPM report).

Additionally, the reporter interviewed one local resident, [redacted] who said, "I'm sure the government knows all about this but isn't doing anything." [redacted] said "I don't feel safe living on base any more." A link to this report is shown below.

Our PAO here at Ft Meade, [redacted] believes that this story has national attention since the reporter indicates a higher rate on military installations (not just Ft Meade.) Ms Moore informed Ms Rebecca Wriggle, OCPA and IMCOM PAO personnel. The Ft Meade PAO and garrison commander feel that they shouldn't be responding to a report put out by CHPPM particularly one where there are conclusions draw that reference all military installations. Additionally, the [redacted] family has filed lawsuits and our legal advisers here on Ft Meade have asked that we try an minimize communication on this issue without their involvement.

I am not sure where this is going but wanted you all to have situational awareness from the FT Meade perspective. We have developed media talking points to respond to RFIs as it pertains to Ft Meade.

Just saw the news report on Channel 7, ABC .

You can find it on the ABC 7 web site
http://www.wjla.com/news/stories/0807/447447.html

High Rate of Infant Botulism On Ft. Meade Fort Meade, Md. - Tuesday August 14, 2007 4:48 pm

An investigation into Infant Botulism at Fort Meade found children on military bases are more susceptible to the toxin.

(Reporter Stephen Tschida said,)" The study found on average, 8.6 babies contracted the illness per 100,000 births to active military personnel.
That's four times higher than the national average. The report also stated that some cases

of Sudden Infant Death Syndrome, also known as SIDS, may be due to Infant Botulism.

[redacted] almost lost her son [redacted] to the rare paralysis-inducing illness last October. Around the same time, another baby in the same Fort Meade neighborhood also contracted the disease.

[redacted] says she doesn't feel safe living on the base nor does she think any other parent should. [redacted] wants the military to dig up all the chemical and other hazardous waste dumps on the bases before building new houses on them.

"The base even admitted that there were numerous, I'm quoting the report, 'numerous chemical waste dumps." [redacted] said.

[redacted] says the Army promised to determine whether the Botulism that infected her son was naturally occurring or engineered in a lab. She says she has never received a response.

CPT [redacted]
I strongly recommend you get approval from the Garrison Commander and PAO before giving this presentation. In understand you presented this at a military Conference last week in Louisville, KY. I am not in your supervisory chain nor can I speak for the garrison staff, but I would not approve this presentation as written if I were due to the increased sensitivity with this issue and the potential questions it would raise in a population of untrained personnel and the release of the electronic file outside the military community.

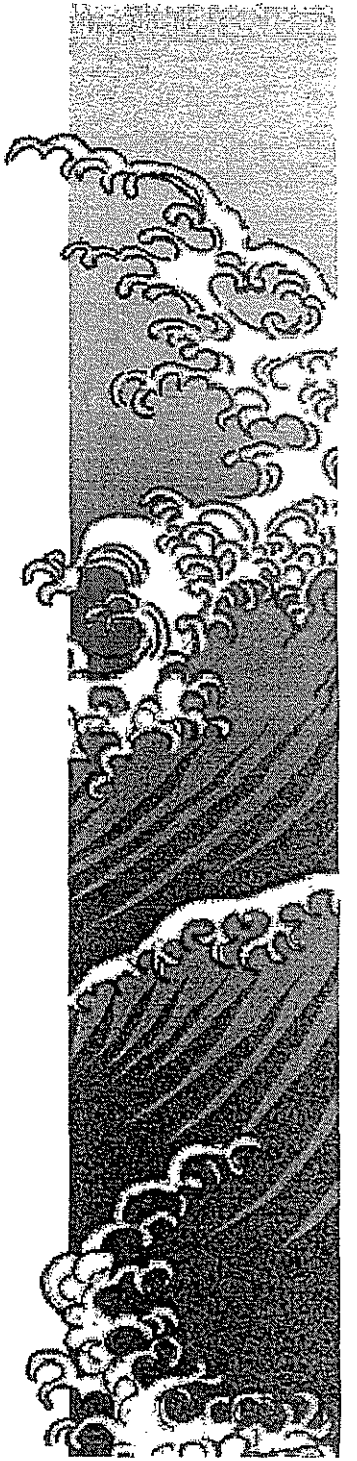
Two Cases of Infant Botulism on the Installation (Ft. Meade)

- The investigation: the role of the vet and the importance of coordination
- Botulism, comparative medicine
- What ifs: agroterrorism and foreign animal diseases

Call from PM Chief

- Goal: to get together PM, epidemiology, environmental health, and vet services, and conference call with others to include members of the CDC. Share the case details and discuss the situation and how to proceed with planning and executing an epidemiological investigation.



Case 1, October 2006

- [redacted]
- 4 children in the family, stay-at-home mom, no daycare
- [redacted]

http://news.bbc.co.uk/2/low/uk_news/england/hampshire/4346687.stm

Case 2, January 2007

- [redacted]
- Only child, did go to daycare
- [redacted]

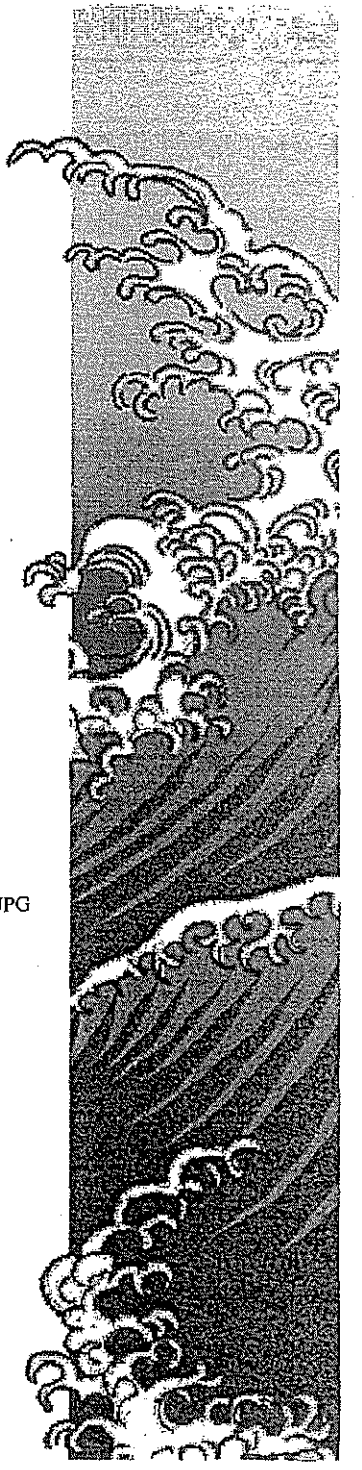
http://www.wholesaleramp.com/WholesaleRAMP/images/7007457831.jpg

http://www.photonics.com/images/spectra/applications/2006/November/Honey.jpg

The Location:

- The two cases occurred in two town houses found in the same block of six and separated by only one home.
- The neighborhood was undergoing construction with significant soil disruption 400 yards upwind of the two homes over an approximately football field-sized area. Whether this construction was already underway before the first case is not clear.

http://k43.pbase.com/u44/hoangt/upload/36064942.Townhouses.JPG



Conference Call: The Players

- Director of Epidemiology and Disease Surveillance at CHPPM
- Army Medical Surveillance, also with CHPPM
- Chief of Preventative Medicine
- Chief of Environmental Health
- MD State Epidemiology, the Disease Control Program
- County Health Department
- CDC
- VCO

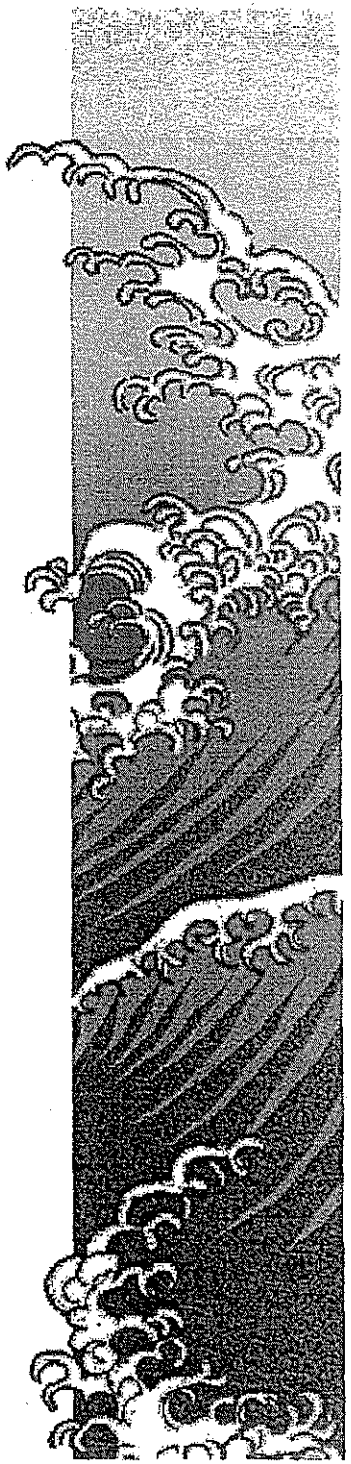
The Agenda

- Create an EpiCon Team
  - Headed by CHPPM Epi, probably consist of a Risk Communicator and 2 or 3 Epidemiologists and be a collaboration between MD State Epi and the military
- Collaborate on a questionnaire for the families
- Discuss a lab sampling plan
  - Caution from the State lab: do not overload our testing capabilities and do not sample w/o testing
- Plan a way to proactively handle media relations

Have rule out then test to confirm

VCO role

- *Could have been* to mobilize our food inspectors to respond to a recall for a food borne illness outbreak in baby formula
- *Turned out to be* answering questions such as:
  - What would symptoms of botulism in my pet be?
  - Have a bunch of dead animals ever been buried in that area?
  - Have bird die-offs occurred on ponds on base?
  - I've seen dented cans: what is Vet Services doing to protect us from botulism in the Commissary?



Clostridium Botulinum

A gram+, anaerobic, spore-forming bacterium

http://www.healthofchildren.com/B/Botulism.html

Botulism

Disease of acute, progressive, flaccid paralysis caused by neurotoxin produced by C. botulinum

Brief Timeline of Botulism Facts

- **1793**: Wildbad, Germany experienced a large outbreak of food poisoning from blood sausages. The cause of the illness and was called "Wurstgift" by German physician and poet Justinius Kerner

- **1895**: Professor Emile Pierre van Ermengem, of Ellezelles, Belgium identified the botulinum bacterium as the causative agent for botulism poisoning. During an outbreak of contaminated preserved ham, he used Koch's postulates to determine the cause of disease.

- **1928**: Dr. Herman Sommer at UCSF isolated botulinum neurotoxin

Timeline Continued

1943: WWII foreign intelligence reports indicated that Japan was developing biowarfare programs using agents like anthrax and botulinum toxin. In response, the U.S. National Academy of Sciences and Fred Ira Baldwin, chairman of the bacteriology department of the University of Wisconsin, set up laboratories at Fort Detrick, Maryland for offensive and defensive biowarfare research.

http://www.detrick.army.mil/cutting_edge/index.cfm?chapter=chapter4

1946: Dr. Edward Schantz, an army officer stationed at Fort Detrick, purifies botulinum neurotoxin in great quantities for use in government and educational institutions.

JAMA Vol. 285, No. 21, June 6, 2001. Letter to the Editor: A historical incident illustrates a number of features of botulinum toxin not discussed in the review of bioweaponry

During World War II, the US Office of Strategic Services (OSS) developed a plan for Chinese prostitutes to assassinate high-ranking Japanese officers with whom they sometimes consorted in occupied Chinese cities. Concealing traditional weapons on the women at the appropriate time would obviously be difficult. Therefore, under the direction of Stanley Lovell, the OSS prepared gelatin capsules "less than the size of the head of a common pin" containing a lethal dose of botulinum toxin. Wetted, a capsule could be stuck behind the ear or in scalp hair, later to be detached and slipped into the officer's food or drink. The OSS recognized that the normal background of botulism cases would deflect suspicion from the women.

The capsules were shipped to Chunking, China. The Navy detachment there, taking nothing for granted, tested the capsules on stray donkeys. The donkeys lived. Lovell was informed that the capsules were faulty, and the project was abandoned.

(R. H. Whitlock, DVM, PhD, written communication, April 27, 2001).

http://www.medem.com/medem/images/aao/AAO_Eye_Children_Lev20_Strabismus_01.gif

Botox: A Side Story

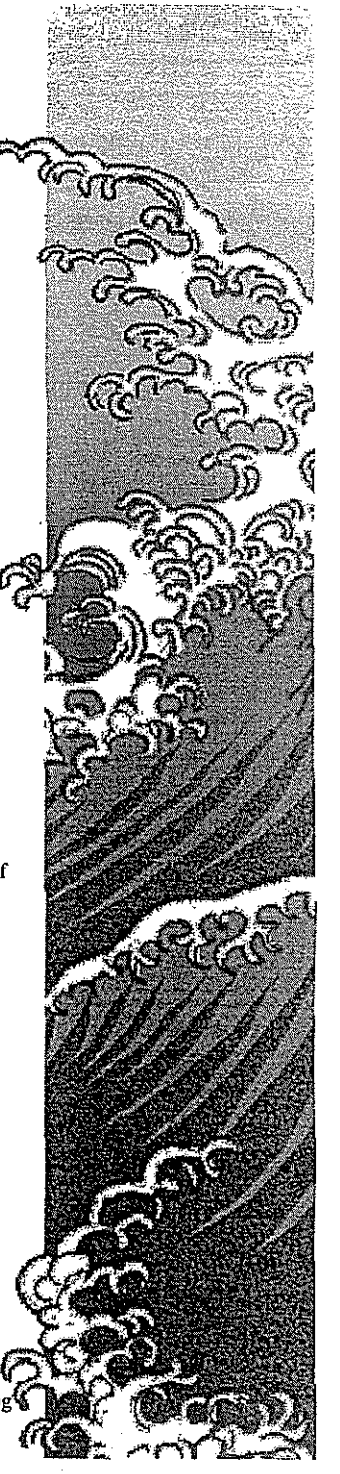
Edward Schantz later collaborated with Alan B. Scott, M.D., who used the toxin to relieve strabismus in monkeys.

Over the course of 20 years they developed a version of the toxin that was approved by the FDA for testing on humans. They sold it to the pharmaceutical company Allergan, which branded the drug Botox.

In 1989, the FDA approved it for the treatment of strabismus, blepharospasm and hemifacial spasm in patients over 12 years old.

In 2002, the FDA approved it for brow line wrinkle treatment

http://www.themedicalspas.com/medspa_images/img_botox.gif



http://microbes.historique.net/images/botox.jpg

blepharospasm

Company Accused Of Selling Knockoff Botox That Paralyzed Four

Agents Say Company Shipped Unapproved Toxin-Based Drugs

December 10, 2004

TUSCON, Ariz. -- Federal investigators say there may be a link between an Arizona company and anti-wrinkle injections that paralyzed four people in Florida. Federal prosecutors and Food and Drug Administration officials searched the offices of Toxin Research International Inc., in Tuscon, Ariz., Saturday. They reportedly seized computer equipment and other items to track down records about the sale, purchase, storage, shipment and marketing of Clostridium botulinum.

FDA investigators said they believed TRI illegally shipped an unapproved botulism-based drug "into interstate commerce with the intent to defraud or mislead" clients to believe it was the approved drug Botox.

FDA special agent Susan Leeds also alleged that TRI lied to the FDA by claiming it hadn't sold the substance to doctors using products on humans, or to those not involved in research.

The FDA has approved the drug Botulinum Toxin Type A made by Allergan for some neck pain, eye movement spasms and wrinkle removal, under the names Botox and Botox Cosmetic.

TRI claims its drug is for research purposes only; its Web site carries the disclaimer: "Not for Human Use."

The investigation started after four people received anti-wrinkle injections at the Advanced Integrated Medical Center in Oakland Park.

The Centers for Disease Control and Prevention notified the FDA that a married couple was admitted Nov. 26 to a Palm Beach medical center after showing symptoms of botulism.

Eric and Bonnie Kaplan had received anti-wrinkle injections two days earlier at a Fort Lauderdale clinic from a man identified as Bach McComb -- a doctor of osteopathy whose medical license was suspended for allegedly prescribing "excessive amounts of controlled substances," according to the couple's doctor.

McComb himself also became sick after he and his girlfriend received injections. They were both hospitalized in Bayonne, N.J., the same day as the Kaplans.

DR. ERIC KAPLAN RECOUNTS STORY OF HOW HE AND HIS WIFE NEARLY DIED FROM 'BAD BOTOX'

PALM BEACH, Florida - *Just before Thanksgiving 2004, Dr. Eric Kaplan and his wife Bonnie did what millions of Americans do every year: they visited a doctor so they could be injected with Botox. The Kaplans thought this was a perfectly safe procedure that would make them look ten years younger, but they were very nearly dead wrong. The "Botox" they received was counterfeit and they were poisoned with a counterfeit substance – raw Botulinum Toxin, an extremely dangerous and extremely poisonous toxin. Within days, both had developed severe botulism and were fighting for their lives in a South Florida hospital. Dr. Kaplan is sharing their story in a forthcoming book,*

Dying to Be Young: From Botox to Botulism.

Dying to Be Young (Nightengale Press, ISBN: 1-933449-40-3) is scheduled for release in February 2007.
Part survivor story, part powerful warning, Dying to be Young is a harrowing chronicle of the Kaplans' ordeal – complete paralysis, total life support, six weeks in a Florida hospital, a lengthy stay in a rehabilitation center in Georgia, and beyond. Dying to Be Young is far more than a tell-all about the dangers associated with Botox; Dying to be Young is

a gripping chronicle of triumph over tragedy, inspiration, spirit and love.

Resplendent with moving truths and insights, Dying to be Young is the journal of a man fighting for life, a story of awakening, and a remarkable testament to the triumph of the human spirit. Dr. Kaplan's hope for the book is two-fold: first, he hopes to raise the level of consciousness about the dangers associated with Botox and second, he hopes to share the lessons he learned during the ordeal.

"My goal in sharing our story is to underscore that the power of mind, spirit and soul is far stronger than any muscle in our body. It is my heartfelt desire that this book inspires readers to see beyond the mundane and be thankful for the little things in life – the ability to blink, to breathe, to move, to laugh, to cry, to love and be loved."

C. botulinum and Botulism

- C. botulinum likes warm, moist, oxygen-free environments.
- Forms spores if environment is not conducive to growth. Spores are hardy and infectious, found in the environment.
- Toxin is produced when spores encounter an ideal environment, germinate, and grow.
- The toxin can cause food-borne, infant, and wound botulism.

And indeterminate CDC

Photo courtesy of the CDC

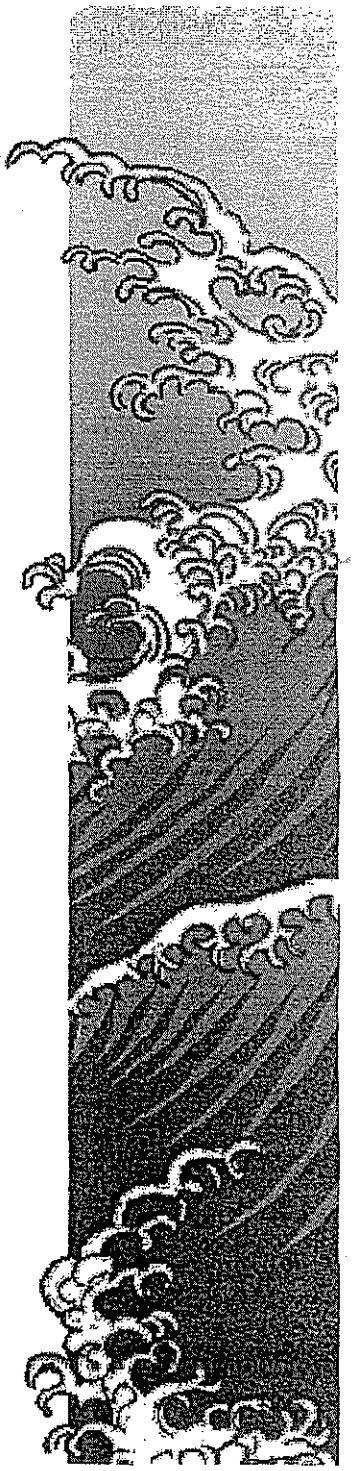
Food-Borne Botulism

Spores not killed by correct canning germinate in anaerobic environments and produce toxin.

The toxin is absorbed by the upper GI tract and passes into the blood stream by which it reaches the peripheral neuromuscular synapses.

Clinical symptoms of botulism begin 18-36 hours after toxin ingestion with weakness, dizziness and dryness of the mouth.

Nausea and vomiting may occur. Neurologic signs include blurred vision, inability to swallow, difficulty in speech, weakness of skeletal muscles and respiratory paralysis.



http://www.evilwarpingkitty.com/picture_library/food/food13.jpg

Home canning is often the culprit in food-born botulism cases

Infant Botulism

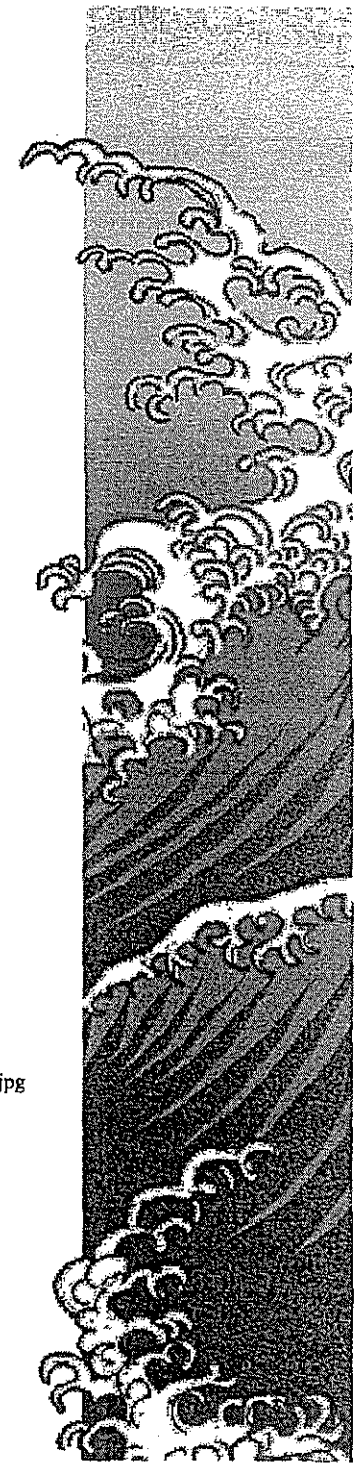
- Infant botulism may be due to **infection** caused by C. botulinum, which may colonize the GI tract before normal flora has a chance to grow.
- The disease occurs in infants that have been exposed to spores.
- Toxin produces the symptoms, characterized initially by constipation, poor nursing, and generalized weakness.
- Infant botulism may be a cause of sudden infant death syndrome (SIDS) C. botulinum, its toxin, or both have been found in the bowel contents of several infants who have died suddenly and unexpectedly.

http://chip.med.nyu.edu/file.php/14/botulism_images/infant.jpg

Wound-associated Botulism

Rarest form of human botulism

Drug users, especially black tar heroin IM



http://www.smw.ch/docs/images/coupoeil/129-40-117-01.jpg

http://www.ebasedprevention.org/uploaded Images/mexican_blck_tar.jpg

http://www.wichitagov.org/NR/rdonlyres/BEFF96BA-179D-41B6-B5D1-735C7561C91D/19698/_38111943_drug_syringe_150.jpg

Toxin Types

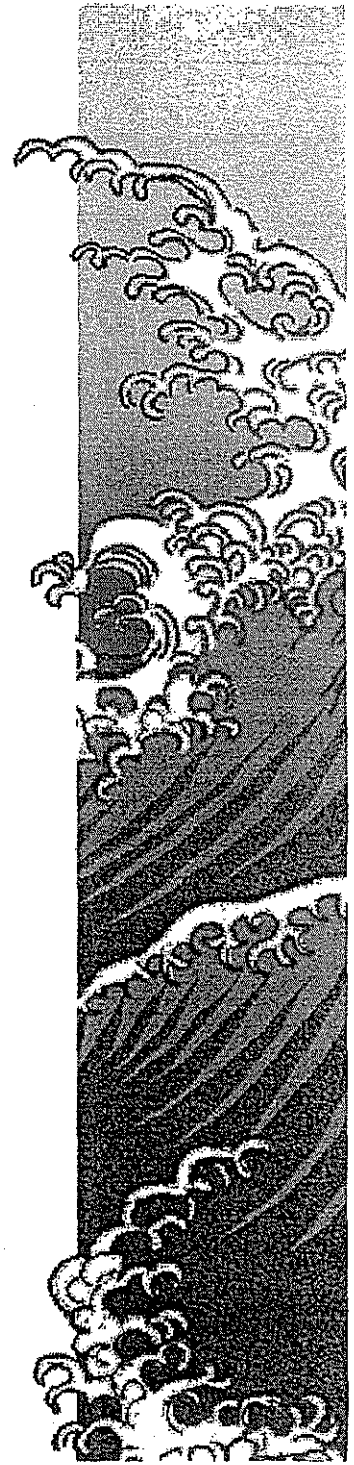
- 7 toxigenic types of the organism exist, each producing an immunologically distinct form of botulinum toxin: **A, B, C, D, E, F, and G**
- In the U.S. **Type A** is the most significant cause of human botulism cases
- Infants seem to get **Type A or B** botulinum toxin; the Fort Meade cases were both **Type B** toxin
- **A and B** are common in soil while the rest are frequently found in wet environments
- *Note: Clinical disease is the same but treatment with antiserum depends on toxin type*

Remember, botulinum is in soil, water sediments, animal GI tracts, animal tissues

Botulism in Animals

(they NEVER read the USDA Complete Guide to Home Canning)

- Often similar to food-borne illness
- Wound botulism
- Limberneck, Western Duck Sickness
- Shaker Foal Syndrome (similar to infant botulism)
- Loin Disease, Lamziekte
- Cats, dogs, pigs fairly resistant (never reported in a cat)



Ruminant Botulism

- Botulinum toxin Type B
- Often secondary to protein or phosphorus deficiency resulting in pica
- Ingestion of toxin while eating bones, contaminated silage, poultry litter
- Signs: drooling, restlessness, recumbency (r/o rabies!)

http://mark.asci.ncsu.edu/Nutrition/NutritionSlides/48.jpg

http://www.isrvma.org/images/56_3_42.jpg

Shaker Foal Syndrome

- Similar to infant botulism
- Type B Toxin
- Foals <4 weeks old
- Stilted gait, muscle weakness, tremors, dysphagia, constipation, respiratory paralysis

http://www.vlac.net/Pictures/Neonatal%20ICU.jpg

Contaminated forage, Types B and C

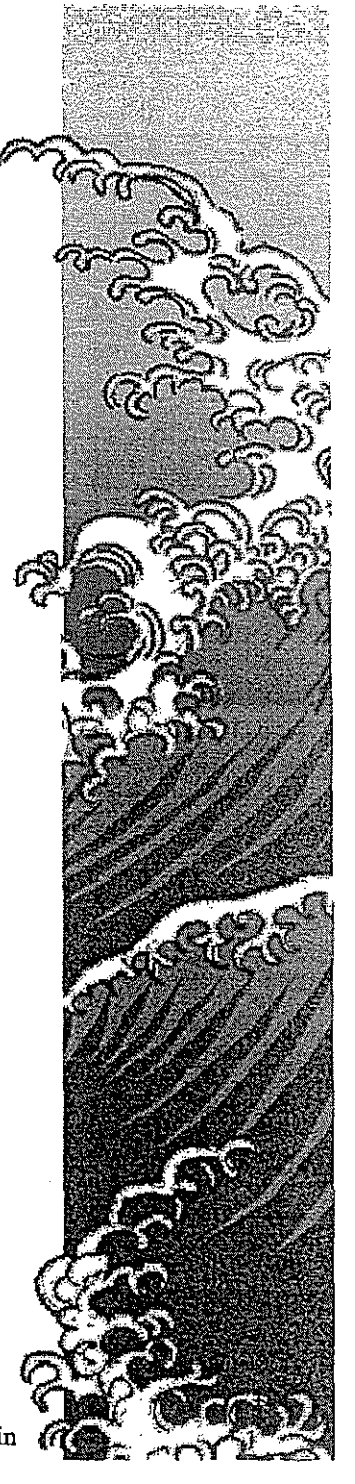
Waterfowl Botulism

- Usually Type C Toxin, occasionally E
- Mass die-offs possible
- Birds frequently drown
- Rotting vegetation implicated

http://wildlife1.usask.ca/wildlife_health_topics/images/neck_paralysis.jpg

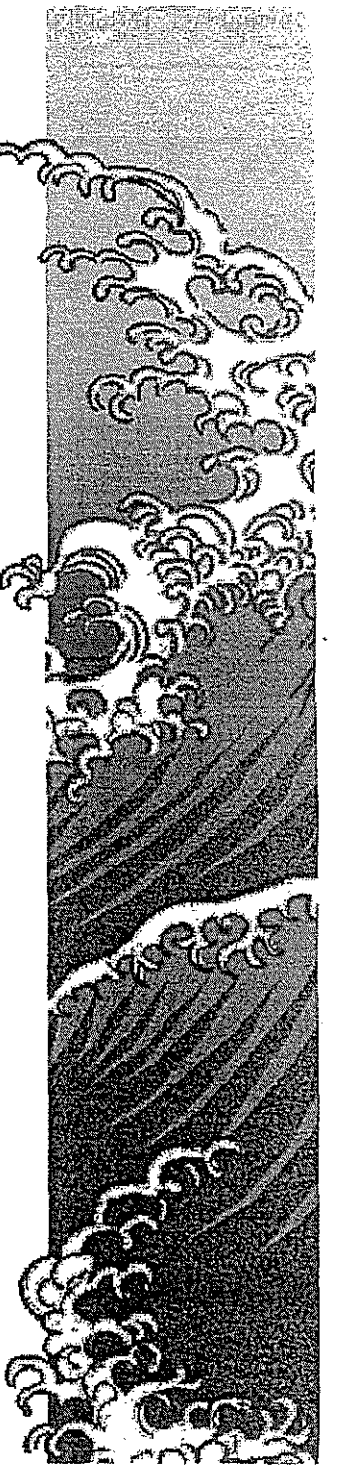
http://wildlife1.usask.ca/wildlife_health_topics/botulism/botulismc.php

- Blowfly larvae absorb Type C toxin but are apparently not harmed by it
- Five maggots may contain enough Type C botulinum toxin to kill a duck



Vultures, antitoxin

One dead bird can easily turn into many



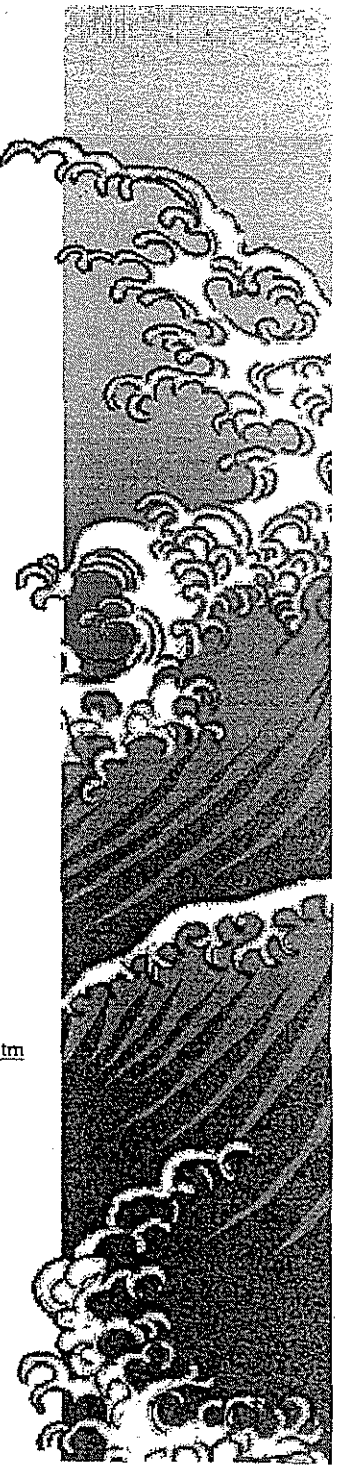
www.flutrackers.com/forum/showthread.php?t=14093

Now imagine, what if a massive bird die off occurred on the installation?

What if it looked like Avian Influenza?

- VCO training, SMART-V
- Foreign Animal Disease
  - FADP short course, Animal and Plant Health Inspection Service of the United States Department of Agriculture
  - FADD at Plum Island
- Call your State Vet, FADD will head up investigation, sampling, etc according to the National Animal Health Emergency Management System

http://www.ars.usda.gov/main/site_main.htm?modecode=19400000



Attending the FADP course were two FBI agents: WMD coordinators

- FBI lead investigative agency for law enforcement ops in terrorist situations
  - Preparedness, countermeasures, investigation and operations, intelligence and analysis
- Looking at Foreign Animal Disease outbreaks as potentially intentional uses of biological Weapons of Mass Destruction
- Conduct criminal investigations of WMD events
- Came to learn how we do the epidemiological investigation

Multi-Agency Joint Agro-Criminal Epidemiological Investigation Training Workshop

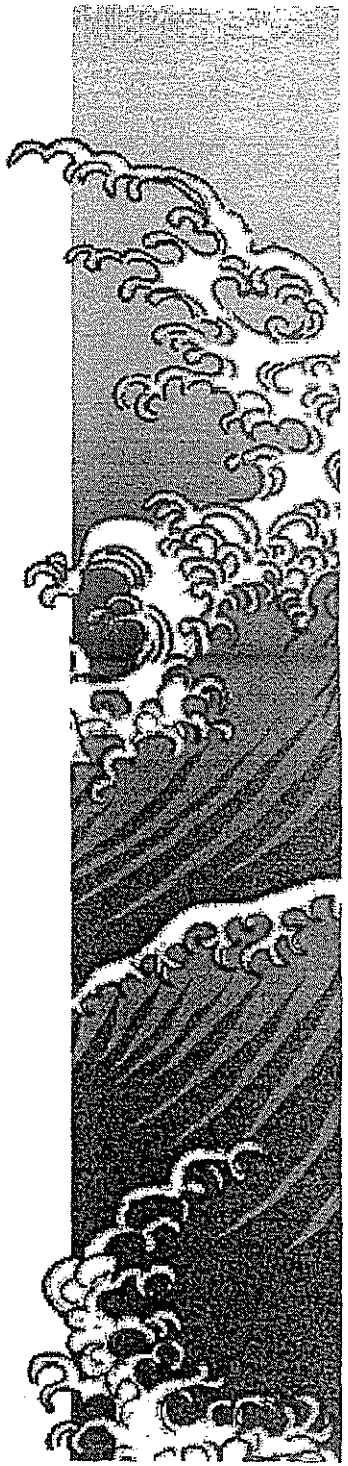
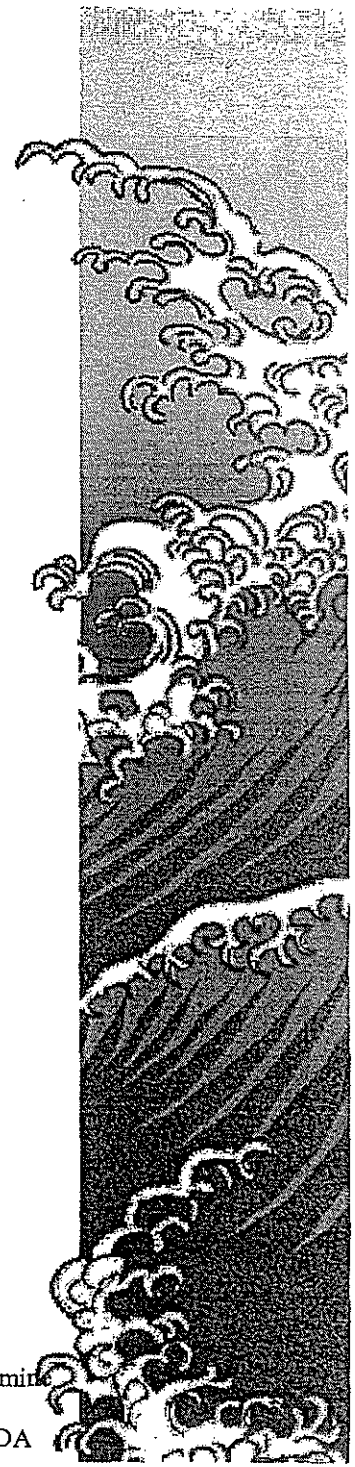
George Hughes, Senior Special Agent, FDA OCI

- Tampering with an FDA approved product is a federal felony
  - Counterfeit and unapproved drugs
  - Product substitution
  - Tampering
  - Fraudulent health treatments
  - New drug application fraud
  - Clinical investigation fraud
  - Illicit prescription drug diversion from normal distribution



Infant Formula Story

- Infant formula delivered to WIC (Special Supplemental Nutrition Program for Women, Infants and Children) program mothers
- Mothers exchanged it at the local store for less than the case is worth
- Store prints new boxes, resells it at full value
- Left-over returned to warehouse
- Codes removed with nail polish remover and altered so expired product could be resold

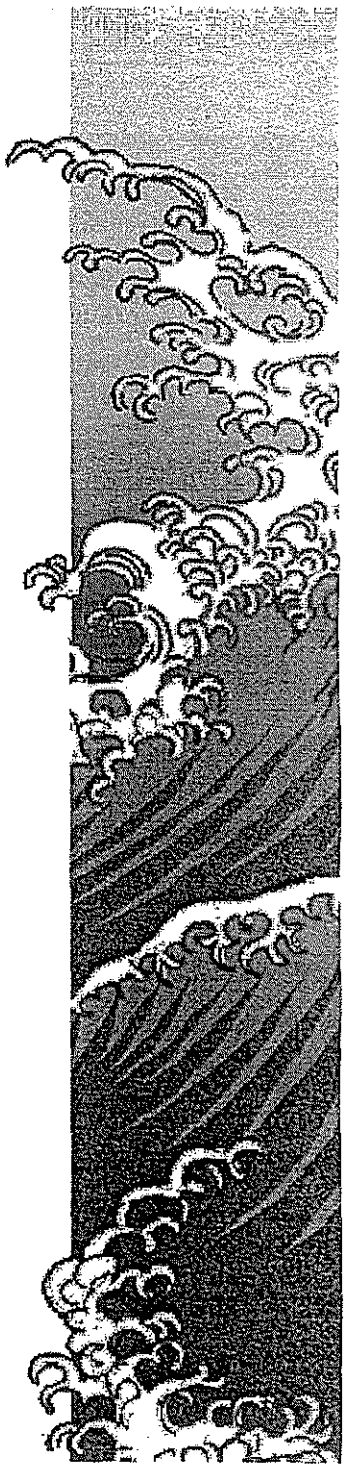


Melamine

USDA

The more direct connection between bioterrorism and 2 cases of infant botulism on the installation…

- The United States Centers for Disease Control and Prevention (CDC) has categorized bioterrorism threat agents based on their transmissibility, mortality, public health impact and requirements for containment and response.
- Agents in the highest priority category are easily transmitted from person-to-person, have high mortality rates and have the potential to cause major public health impact.
- The agents and diseases in Category A are **Anthrax, Botulism, Plague, Smallpox, Tularemia,** and **Viral hemorrhagic fevers**. The viral hemorrhagic fevers include Ebola and Marburg.



Goals in Summary

- Review botulism
- Importance of inter-agency coordination and collaboration in an investigation
- Think big: One Health in the context of a globalized world and the reality of terrorism

For your information. I am trying to get answers on this. I would like to correct the statement she made to the reporter by tomorrow if I can get some answers. . My commander will look like we were hiding the report. And we were not.

I can't find it. But I know that there was a cover on the executive summary that we saw that showed that the document could not be released. It was for official use only. Not releasable. There is the Hippa Act too. The report had personal information that could not be releasable to the public.

So why is CHPPM PAO saying my commander had release authority for the report. Instead of saying we could not release the report due to the HIPPA act.

I don't think it is right to say that the commander of Fort Meade is the release authority for this document. I read the cover. It said this document could not be released. It said for Official use only.
I remember it because we had problems even putting the executive summary on the web site because of the cover sheet.

So now, [redacted] telling the Baltimore Sun, my commander had release authority.

Now we look like the bad guys.

I really need some clarification on this. The cover said the report wasn't releasable to the public.

Of course we can't find that cover sheet. And I still don't have a copy of this CHPPM report. Why would my commander be the release authority for a report we didn't write?

BALTIMORE SUN QUERIES RE CHPPM INFANT BOTULISM REPORT--Bradley Olson, who covered last winter's story of 2 cases of infant botulism at Fort Meade, MD, requested information about the epidemiological report of the investigation into those cases. CHPPM physician-epidemiologist who was part of the EPICON team discussed report conclusion, issue of soil testing (this was not done; Army, CDC, Maryland and California departments of public health all concurred that it would not establish cause and effect), other tests for the disease, why full report was not released to the public (report was made to the Fort Meade garrison commander, who is the release authority). Outlook: balanced; story scheduled for Wednesday but may be held over until Thursday.

Sir,
No news yet but MD Department of Health and Mental Hygiene Lab has requested CDC lab release the report to them ASAP. Typing was done at the MD state public health laboratory and sub-typing was done at the CDC.
Again, want to caution this subtyping was recommended to build a library of Type B C. botulinum isolates on the East Coast for future comparison, was not part of our investigation, and will not change our conclusions.
I will call Dr. Blythe again today to follow up.
VR,
[redacted]

I wish I could say otherwise, but we still don't have a definitive date from CDC. The most recent date suggested has already passed. I'll speak again tomorrow to Dr. Kiehlbauch from our lab and to Dr. Jack DeBoy, the Director of the entire state lab, to see what else we can do. Will follow up with you as soon as I know more.

Thanks much for your call and all info Mr. [redacted] Sorry to hear about your condition.

As far as the 2 cases of botulism at Fort Meade reported yesterday at the Epi Chiefs' meeting, I understand there are no common foodstuff exposures identified to-date, such as honey-containing food items, no tap water or other suspicious items. They have been exposed, however, to Similac with Iron canned formulations, which have been set aside for bot toxin testing. In addition, there is evidence of reconstruction of houses within 1 mile (but not inmediately next to) and possible contamination with earth which many of us feel is probably not an important factor.

Regarding the four cases in the community surrounding Fort Meade, MD, I understand the history is less clear. You have been called and interacted with the Anne Arundel Co Health Dept and have spoken to Mr. John Sweitzer at the State Health Dept in Baltimore, MD, for possible testing of the Similac cans and are awaiting his response. We would be very interested in a follow-up on such testing, if you can arrange for it.

Thanks for input and let me know of any further developments, Toti

Dr. [redacted] I understand through C. Carneiro that you would like the info on the two Infant Botulism cases. I a work for LTC [redacted] here in P.M. And will be very happy to provide the info for us. Anything I cannot do [redacted] is available. Think you know we did not have an MD C, PM, since COL [redacted] left in 2004 and [redacted] arrived in October 2006.

[redacted] is a contractor with Inf Control in the Hospital hired to do Acinetobacter related issues, however she has a rich Public Health Backgrouond, and during a staffing crunch here in P.M. really helped the WRAMC Prev Med program, and worked the first case of Infant Botulism back in October. [redacted] arrived in mid October, and I returned to work 30 October 2006 after a 5 month Absence (left leg amputated for Sarcoma), am retired Army CHN. Was C, PM Bremerhaven for 3 years, and C, P.M. for about a year up at Kirk, APG during the 15-6 mess with Ric Davilla in the late 1980's while they were recruiting a DAC. (Dr. [redacted] just retired about a year ago)

I have both case files here please call me and I will send you what I have done, including my contacts with the MD state Hlth Dept., etc., etc.
If you dial my office number [redacted] and I am not at my desk, my phone calls route to my cell phone. LTC [redacted] has decided that he will be the 24/7 on call for P.M., ao during business hours you reach him at [redacted] otherwise on his cell/blackberrry [redacted]

We just received a call from a [redacted] reporting that two months ago he had taken his [redacted] to Walter Reed. [redacted] He received a call from CDC today to get information from him. The caller indicated there had been another Ft. Meade infant that had been diagnosed with botulism. Can you check on this for me and let me know if we have any public health issues we should address? As I understand it, infant botulism (the majority of all reported cases) results primarily from feeding the child honey or corn syrup or other sweetener before age 1. The Marine is [redacted] cell 410-733-3714.

EXSUM

January 9, 2007
For Official Use ONLY
Do NOT RELEASE

Response to Query:

The [redacted] family told Fort Meade officials late yesterday that their infant son was hospitalized in October for "Botulism." The family says the child has since recovered.

The Preventative Medicine Office at Kimbrough and Fort Meade Officials are investigating the situation.

Response to Query about the second case:

We are not aware of any additional cases at this time. But we are always concerned about all service members and their families' health issues.

Background Not For Release. For Internal use only:

[redacted]

Centers for Disease Control (CDC) called [redacted] and informed her that a 2nd case has been confirmed on Fort Meade today.

[redacted] was the Pediatrics doctor.

The family said the CDC investigator implied that a debris pile located on the corner of Clark Road may be the source of the airborne Botulism.

[redacted] confirmed that there were complaints of a dust cloud in the Area and Picerne Military Housing agreed to water the area down. The debris pile consists of crushed concrete.

Potential issues are yet to be investigated:

We have a meeting with the commander at 8:00 in the morning in his office.
Will keep everyone notified.

(CBS- Channel 9 WUSA may pick up the story. Fort Meade PAO was notified by DINFOS PAO that the wife of the family wanted to have them at her house last night. But Fort Meade PAO informed the family that all media coming to the installation must be escorted by our office.)

FORT GEORGE G. MEADE

NEWS RELEASE

PUBLIC AFFAIRS OFFICE

4550 PARADE FIELD LANE

FORT MEADE, MD 20755

www.ftmeade.army.mil

Jan. 10, 2006
Release # 070110

FOR IMMEDIATE RELEASE

Infant Botulism Found in Two Children at Fort Meade

FORT GEORGE G. MEADE, Md., - Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center.

The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade.

LTC Sharon Cole-Wainwright, Chief of Preventive Medicine at Kimbrough Ambulatory Care Center said, " Infant botulism is a treatable condition associated with the ingestion of Clostridium botulinum bacteria found naturally in soils and in some contaminated food products. It would be premature to speculate about a particular source because we are still trying to conduct our investigation."

There are approximately 100 cases of infant botulism reported annually in the U.S. This normally affects children under the age of 6 months of age, boys and girls equally. Symptoms may include constipation, listlessness, difficulty swallowing a weak cry, and a loss of appetite (not sucking well). If parents are concerned, they should contact their health care provider at (301) 677-8606.

Col. Kenneth McCreedy, Installation Commander. "We are always concerned about all service members and their families' health issues. It is great that all agencies are working together to ensure our community remains a safe environment for everyone concerned."

Botulism Press Release--Ft Mea... [redacted]

Just got off the phone w/ [redacted] (") and her staff regarding the two cases of infant botulism from the Ft Meade community.

They're requesting our assistance to address the issue and have requested an EPICON.

A big concern is the risk of infection from exposure to contaminated soil. There's construction near the housing area where the two cases reside that's created a large debris pile of soil, concrete, etc. Local residents and the Ft Meade Garrison Command are very concerned that this may be the cause of the two infections.

There's been interest from outside medical organizations to help respond to this.

The POC at KACC is the Chief of PM, [redacted], (email above, [redacted]. Please ensure all communication is routed thru her so that we have a single message.

[redacted] - They're sending up a draft press release (attached) and botulism fact sheet that need to be reviewed NLT 1700 today. They're also looking for assistance drafting an article for the Ft Meade newspaper to help inform the community. This will require RISKCOM support. Coordinate w/DEDS [redacted] in the office today.)

Please copy the USACHPPM-EOC w/all emails.

DEDS should prepare a daily consolidated exsum for the CG until this matter is over.

FORT GEORGE G. MEADE

NEWS RELEASE

PUBLIC AFFAIRS OFFICE

4550 PARADE FIELD LANE

FORT MEADE, MD 20755

www.ftmeade.army.mil

Jan. 10, 2006
Release # 070110

FOR IMMEDIATE RELEASE

Infant Botulism Found in Two Children at Fort Meade

FORT GEORGE G. MEADE, Md., - Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center. THE INFANTS, BOTH UNDER THE AGE OF 6 MONTHS??, WERE DIAGNOSED AND TREATED AT WALTER REED BECAUSE RESIDENTS AT FORT MEADE RECEIVE FULL MEDICAL TREATMENT THERE. (SOME WHO READ THIS WILL LIKELY WONDER WHY THEY WEREN'T TREATED AT FORT MEADE)

The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade. IN ADDITION, MEDICAL STAFF AT BOTH KIMBROUGH AND WALTER REED ARE RECEIVING/ HAVE RECEIVED(?) ADDITIONAL TRAINING ON THIS DISEASE TO INCREASE AWARENESS?????

[redacted] Preventive Medicine at Kimbrough Ambulatory Care Center said, "WHILE THE NAME OF THE DISEASE CAN BE FRIGHTENING, infant botulism is a treatable condition associated with SWALLOWING OR EATING the botulinum bacteria found naturally in soils and in some contaminated food products. It IS premature to speculate about a particular source UNTIL THE investigation IS COMPLETE."

THE DISEASE IS RARE; there are approximately 100 cases of infant botulism reported annually in the U.S. This normally affects children under the age of 6 months of age, boys and girls equally. ACCORDING TO THE NATIONAL INSTITUTES OF HEALTH, symptoms may include constipation, listlessness, difficulty swallowing a weak cry, and a loss of appetite (not sucking well). If parents are concerned, they should contact their health care provider at (301) [redacted]

[redacted] Installation Commander. "We are COMMITTED TO PROTECTING THE HEALTH OF all service members and families AT FORT MEADE. It is great that all agencies are working together to ensure our community remains a safe environment for everyone."

FOR MORE INFORMATION, PLEASE CONTACT WHO???? (THIS PART IS CRITICAL -- READERS NEED TO KNOW WHO THEY CAN CALL IF THEY WANT TO TALK ABOUT THIS IN MORE DETAIL)

Here is the information sheet that we got this morning. Believe I need you to OK it as well. Thanks.

INFANT BOTULISM FACT SHEET

There are approximately 100 cases of botulism reported annually in the U.S. Approximatley 75% of these are infant botulism. It normally affects infants less than 6 months of age. It affects boys and girls equally.

The bacteria (Clostridium botulinum) that causes Infant botulism is transmitted by spores which germate and produce toxins in the intestines of the infant. It is not spread from person to person. The risk factors and vehicles of transmission can either be environmental or through ingestion. However, the transmission remains unclear in most cases. The most common routes of transmissions to infants are food and dust. Honey is also a source and should not be fed to infants less than 1 year of age.

What are the symptoms of Infant Botulism?

* constipation

* poor feeding and weak suck
* weak cry
* loss of head control
* difficulty swalling and pooling of secretions
* loss of head control
* floppy appearance or "floppy baby"
* generalized weakness
* breathing difficulties

How is Infant Botulism diagnosed?

stool spiecemen and testing of possible found source.

How is Infant Botulism treated?

Prompt diagnosis and treatment is key!

FDA approved - BabyBIG it binds to any free toxin in the body and prevents further damage. Only available through the California Health Department at a cost of $45,000 a treatment. Low cost compared to hospitalization of infant for months and expect full recovery slowly.

How can I prevent Infant Botulism?

* No honey to infants less than 1 year of age
* strict handwashing
* toy cleaning and particularly items that infants place in their mouths
* proper preparation of foods (boiling and cooking) spores are destroyed by boiling
* proper preparation of canned foods (foods preserved or canned at home)
* avoid cans of food/formula with dents, bulging or rusting
* avoid construction sites and high dust areas

For further information contact Kimbrough Ambulatory Care Clinic Preventive Medicine Services (301) 677-8661.

Sir,
Just got the tasker so I'll send this anyway.

Here is what we currently have as background:

During my conversation with Mr. [redacted] (infection control WRAMC) he stated that as of last Friday the Maryland State Epidemiologist Dr. Blythe reported a total of 3 Maryland infant botulism cases (excluding 2 FT Meade cases). Maryland 2006 cases were in Silver Springs, Belair and Northeast. Dr Blythe is interested in coming to FT Meade to

investigate with local PM chief (CHPPM too?) due to the fact that the cases lived within a few houses of each other on base and concerns reference a construction site in the housing area. First case was 9 month old (don't know if was in on post child care or not) and second case was 2 months old (was in on post child care center).

In the United States an average of 110 cases of botulism are reported each year. Of these, approximately 25% are foodborne, 72% are infant botulism, and the rest are wound botulism. In 2004 the CDC reported Maryland had 5 cases of infant botulism, (0 foodborne or wound cases in 2004).

[redacted]search of M2 inpatient records found 3 cases among infants under 1 yoa admitted to an MTF with 14 cases admitted to non-MHS facilities.
We did find one case in OCT 06 at WRAMC (*** below):
Here are the case summaries from M2 from 2002 to November 06:

Calendar year	2002	2003	2004	2005	2006
Cases	3	3	3	1	7*

*not counting WRAMC 31 DEC Case

3 inpatient cases within MHS facilities (SIDR file)

Case 1: Admission Date 12/11/2005; Discharged 12/28/2005; ~4 month old WM; dependent of AD Army; Admitted to Madigan AMC, Ft. Lewis Case 2: Admission Date 04/02/2006; Discharged 04/10/2006; ~5 month old WF; dependent of AD Army; Admitted to Madigan AMC, Ft. Lewis
***Case 3: Admission Date 10/03/2006; Discharged 10/20/2006; ~7 month old WM; dependent of AD Marine; Admitted to Walter Reed

14 cases seen outside MHS facilities (catchment area name provided from Purchased Care - I file)

[redacted]

We are standing by for further instruction on this.

Subject: FW: Infant Botulism (UNCLASSIFIED)

All,

Note two attachments. One confirmed case 31 DEC 06 and possible "media" case in OCT 06. CPT [redacted] is running a query for intestinal botulism (formerly classified as infant botulism) cases from inpatient data using discharge diagnosis (ICD-9 005.1). This is also a reportable event and, other than the 31 DEC case, he says none have been seen for years (he'll provide a list of cases w/in 24 hours).

[redacted]

Try to run a quick query to look at overall rates in DoD focusing on all inpatient botulism cases. Also, during the EPI chiefs meeting there was a discussion of two possible additional off-base (Fort Meade area) cases so let's see if we can find anything on those as well (check EPI-X and any other sources you can get).

[redacted]

Prepare a short information paper for our risk communicators on infant botulism and look up national incidence rates from CDC for the past few years as well as any recent cases in the U.S. and especially in the DC/ Fort Meade area.

POC for our confirmed case is [redacted] at WRAMC and I have a call in with him for any additional details.

Thanks,
[redacted]

NEWS RELEASE

PUBLIC AFFAIRS OFFICE

4550 PARADE FIELD LANE

FORT MEADE, MD 20755

www.ftmeade.army.mil

Jan. 10, 2006
Release # 070110

FOR IMMEDIATE RELEASE

Infant Botulism Found in Two Children at Fort Meade

FORT GEORGE G. MEADE, Md., - Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center.

The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade.

LTC [redacted], [redacted] Preventive Medicine at Kimbrough Ambulatory Care Center said, " Infant botulism is a treatable condition associated with the ingestion of Clostridium botulinum bacteria found naturally in soils and in some contaminated food products. It would be premature to speculate about a particular source because we are still trying to conduct our investigation."

There are approximately 100 cases of infant botulism reported annually in the U.S. This normally affects children under the age of 6 months of age, boys and girls equally. Symptoms may include constipation, listlessness, difficulty swallowing a weak cry, and a loss of appetite (not sucking well).
If parents are concerned, they should contact their health care provider at (301) 677-8606.

Col. [redacted] Installation Commander. "We are always concerned about all service members and their families' health issues. It is great that all agencies are working together to ensure our community remains a safe environment for everyone concerned."

Sent: Wednesday, January 10, 2007 6:26 PM
To: [redacted] Mr USACHPPM; [redacted] Mr USACHPPM
Subject: Request for EPICON Support to USAMEDDAC Ft Meade

Good Afternoon:

Request support from CHPPM to conduct an epidemiological investigation into the occurrence of two cases of infant botulism in two young residents (each less than 6 mos old) who reside on Ft Meade. Though the first case occurred in October 06 and the second case occurred in December 06, the fact that these two families reside in the same neighborhood and 5 houses apart leads me to believe there may be a relationship between these two cases and my public health professionals here require some assistance with the investigation.

One of the outcomes to the epidemiological investigation should include recommendations from CHPPM to the garrison commander and me concerning actions we need to take to minimize the risk of exposure to clostridium bacteria (particularly in our infant population) here on Ft Meade. We are in the midst of construction at many locations on the installation and most in close proximity to residential areas.

Additionally, I request that, as preliminary information is determined through the course of the investigation and you and your staff have requirements to inform the senior leadership of the MEDCOM/OTSG, that you "cc" me and keep me informed as you prepare EXSUMs and official communications concerning interim findings to your higher HQ. I will do the same.

My primary POC here is LTC [redacted] (shown as [redacted] only in global outlook). As always, thank you for your timely support to us and this great community. I look forward to working with you all!

Warm regards,

COL [redacted]

INFANT_BOTULISM_FACT_SHEET2 (2...

Sir,

Per our phone conversation, here are my changes (copy with my changes accepted as text below since you are on the blackberry) to the fact sheet.
Main concerns are:
1) Intestinal (formerly Infant) botulismcan occur in infants older than 6 months
2) ingestion of dust and other soil contaminated foods (not just honey) are concerns.

VR,
MAJ [redacted]

INFANT BOTULISM FACT SHEET
10 Jan 2007
Kimbrough Ambulatory Care Clinic Preventive Medicine Services
(301) [redacted]

Infant botulism (also known as intestinal botulism) is a rare and serious but treatable disease where Clostridium botulinum bacteria grow within a baby's digestive system. Contact is made through eating or swallowing bacterial spores found naturally in soils and in some contaminated food products. Most cases (94 percent) occur in babies 6 months-old and younger. Infant botulism affects boys and girls equally. There are approximately 100 cases of infant botulism reported annually in the United States.

Infant botulism is not spread from person to person. Children older than one year typically do not contract infant botulism because the Clostridium bacteria do not grow well in their intestines.

Contaminated honey is one possible food source and should not be fed to infants less than 1 year of age. Other possible sources include contaminated foods and dust.

What are the symptoms of Infant Botulism?
Any or all of the following:

- constipation
- poor feeding and a weak suck
- weak cry
- loss of head control
- difficulty swallowing
- excessive drooling
- floppy appearance or "floppy baby"
- generalized weakness
- breathing difficulties

How is Infant Botulism diagnosed?
A visit to your health care providers who will collect a stool specimen.

How is Infant Botulism treated?

Prompt diagnosis and treatment is key! Treatment is available through FDA-approved medicine. Expect complete recovery although the recovery is gradual -- usually weeks to 2 months with treatment and several months without treatment.

How can I prevent Infant Botulism?

- Wash hands frequently
- Avoid giving honey to infants less than 1 year of age
- Routine and frequent cleaning of toys-- particularly items that babies place in their mouths and those toys which have fallen on the ground or floor
- Through proper preparation of foods (boiling and cooking)
- Avoid cans of food/formula with dents or that are bulging or rusting
- Avoid locations with excessive dust and debris

Where can I get more information?

EXECUTIVE SUMMARY

10 January 2007

(U) Command Critical Information Requirement, Kimbrough Ambulatory Care Center (KACC), FT MEADE, MD (EXSUM).

(U) Two cases of infant botulism have been confirmed at Ft Meade. The first case [redacted] reside in the same neighborhood on Ft Meade, 5 houses apart. Their residential area is in close proximity to a construction site. Epidemiological investigation will primarily include public health and preventive medicine personnel from Ft Meade MEDDAC, WRAMC, and CHPPM with open lines of communication to Anne Arundel County and Maryland State Health Departments. KACC personnel have worked with Ft Meade PAO to prepare a press release, a fact sheet, and will participate in a town hall meeting during the week of 15 Jan 07. Health care providers at KACC and Walter Reed have been alerted to these cases to increase heightened awareness of symptoms.

BG Cates,

FYI - We've been asked by Kimbrough ACC to assist them w/assessing and responding to two cases of Infant Botulism that were diagnosed in children who live w/in Family Housing at Ft Meade. Additional details are summarized in the POPM EXSUM below.

There's been growing concern w/in the local Ft Meade community that these infections may be caused by ingestion of contaminated soils from a construction debris pile adjacent to the family housing area.

RISKCOM has provided a review of a press release and fact sheet already. DEDS is preparing an EPICON to respond as required. DOHS, DEHE and CHPPM-North have been informed to be prepared to assist if required.

[redacted]

Just got off the phone w[redacted](CDR Kimbrough ACC) and her staff regarding the

two cases of infant botulism from the Ft Meade community.

They're requesting our assistance to address the issue and have requested an EPICON.

A big concern is the risk of infection from exposure to contaminated soil. There's construction near the housing area where the two cases reside that's created a large debris pile of soil, concrete, etc. Local residents and the Ft Meade Garrison Command are very concerned that this may be the cause of the two infections.

There's been interest from outside medical organizations to help respond to this.

The POC at KACC is the Chief of PM, LTC [redacted] (email above, [redacted]). Please ensure all communication is routed thru her so that we have a single message.

[redacted]- They're sending up a draft press release (attached) and botulism fact sheet that need to be reviewed NLT 1700 today. They're also looking for assistance drafting an article for the Ft Meade newspaper to help inform the community. This will require RISKCOM support. Coordinate w/DEDS ([redacted]s in the office today.)

Please copy the USACHPPM-EOC w/all emails.

DEDS should prepare a daily consolidated exsum for the CG until this matter is over.

(301) 677-8661

Infant botulism (also known as intestinal botulism) is a rare and serious but treatable disease where Clostridium botulinum bacteria grow within a baby's digestive system. Contact is made through eating or swallowing bacterial spores found naturally in soils and in some contaminated food products. Most cases (94 percent) occur in babies 6 months-old and younger. Infant botulism affects boys and girls equally. There are approximately 100 cases of infant botulism reported annually in the United States.

Infant botulism is not spread from person to person. Children older than one year typically do not contract infant botulism because the Clostridium bacteria do not grow well in their intestines.

Contaminated honey is one possible food source and should not be fed to infants less than 1 year of age. Other possible sources include contaminated foods and dust.

What are the symptoms of Infant Botulism?
Any or all of the following:

- constipation
- poor feeding and a weak suck
- weak cry
- loss of head control
- difficulty swallowing
- excessive drooling
- floppy appearance or "floppy baby"
- generalized weakness
- breathing difficulties

How is Infant Botulism diagnosed?
A visit to your health care providers who will collect a stool specimen.

How is Infant Botulism treated?
Prompt diagnosis and treatment is key! Treatment is available through FDA-approved medicine. Expect complete recovery although the recovery is gradual -- usually weeks to 2 months with treatment and several months without treatment.

How can I prevent Infant Botulism?

- Wash hands frequently
- Avoid giving honey to infants less than 1 year of age
- Routine and frequent cleaning of toys-- particularly items that babies place in their mouths and those toys which have fallen on the ground or floor
- Through proper preparation of foods (boiling and cooking)
- Avoid cans of food/formula with dents or that are bulging or rusting
- Avoid locations with excessive dust and debris

Where can I get more information?

Sent: Thursday, January 11, 2007 2:36 PM
To: [redacted] KACC-Ft Meade
Subject: OCTOBER CASE OF BOTULISM

[redacted]

This is a copy of a telephone consult I will enter. I have no idea of how mother got my office number, and I think I made it clear that you were her primary point of contact. If I do get any more calls from her I will keep you advised.

[redacted]

11 Jan 2007- 1100 hrs. Received telephone call from mother, [redacted] Her first question was, "Are you part of the cover up" ? When undersigned APHN asked "what coverup" she replied that the Garrison Commander, Fort Meade had been to her house yesterday, regarding the fact that her child had had infant Botulism in October 2006, and now one of her nearby neighbors child has it too. The Garrison Commander had asked her not to go to the media, and mother indicated that she was intending to do so.

Mother went on to say that there was an open field very near her house with a lot of dirt, and since yesterday the area had been covered with a green substance. Mother further indicated that she had done some research and found that there were only about 100 cases of infant botulism in the USA a year, and now there are two cases very near each other, why are there not Public Health people actively working on this issue at this minute. Undersigned APHN then discussed issues related to Infant Botulism with mother. The fact that there are so few cases each year, for example, Maryland has had three cases (before the Fort Meade 2 cases), since April 2006. One Silver Spring, MD, one in Bel Air, MD, and one in the town of Northeast, MD (Near the Delaware state line). That while certain food products (i.e. honey) have been implicated, and the bacteria does live in the soil, so transmission through dust is a possibility. However, because there are so few cases, usually single cases, so that finding a means of transmission for baby botulism has not been done. This APHN indicated to mother that the Chief, Preventive Medicine, Fort Mead, LTC [redacted], was in the process of assembling a team of Public Health Officials (Maryland State, CDC, as well as Army) to study the cases at Fort Meade in depth. Mother then said, "Well, they will do their study, send the results to the Garrison Commander, and he will re-write it any way he wants" Undersigned APHN assured Mother that this Study would be an open Public Study, that the Garrison Commander would get a report, but the same report and findings would be directly available to anyone who is interested.

Mother asked why the "study group" had not arrived yet. Undersigned APHN suggested that she call LTC [redacted] and ask for details about the proposed study, and ask to be kept in the loop as the study goes along. Undersigned APHN suggested that she even offer to be a lay member of the study group, but that might not be possible because of HIPAA or other restrictions that would keep a lay person from being on the study group. Mother was satisfied with "being kept in the loop" although she thought it would be nice to be part of the study group.

Undersigned APHN then went on to inquire on how her baby was now, that he had read the notes from the Peds Clinic Visit 24 October 2006 after baby had been discharged from the hospital, and at that time was doing well. Mother indicated that she appreciated APHN's comment because that reminded her that he is due for some baby shots. APHN gave mother telephone no. for LTC [redacted] and his office and home numbers. The conversation ended on a very positive note.

11Jan07 1130 hours Telephone Call to LTC-[redacted] to review above note.

EXECUTIVE SUMMARY

11 January 2007

(U) Command Critical Information Requirement, Kimbrough Ambulatory Care Center (KACC), FT MEADE, MD (EXSUM).

(U) This is a follow-up to the CCIR sent on 10 Jan 07. KACC has begun assembling a team of epidemiological investigators from Ft Meade MEDDAC, CHPPM, WRAMC and Anne Arundel County Health Department. Investigation into the cause of the 2 cases of infant botulism at Ft Meade has begun. The media, an NBC affiliate out of Baltimore—WBAL Channel 11 (local), met with the family of the child with the first case of infant botulism. Family believes the source disease is soil and debris pile adjacent to the family housing area. WBAL personnel interviewed the garrison commander and the Ft Meade MEDDAC Chief of Preventive Medicine, LTC [redacted] to ask questions about the cause of infant botulism, the mode of transmission of the disease, the occurrence of this disease on the installation, whether or not the installation would be investigating the cause of the disease, and any preliminary information available as to the cause of the disease in the two infants. The medical talking points consisted of 1) the health of the two infants is of primary concern and a full recovery is expected; 2) an investigation is ongoing with no preliminary information available at this time; epidemiological investigation involves collaboration with Army, local and state public health personnel. The news segment is to air at 1730 hrs this evening.

Subject: RE: Infant Botulism (UNCLASSIFIED)-EPICON REQUESTED

All,

We are working on [redacted] questions and will have to you soon. Current status is COL [redacted] and MA[redacted] will travel to FT Meade and meet with Chief PM at Meade at 1600 today to discuss questionnaire and plan for tomorrow's launch of EPICON(-). COL P will provide list of needed resources after that meeting.
Minimum going out tomorrow from CHPPM will be COL [redacted], [redacted] Lori [redacted] and myself. At 1000 hours tomorrow we will meet at Fort Meade PM office Maryland PH representative (possible state epidemiologist Dr. David Blythe), Meade staff (LTC [redacted]) to interview parents of cases. Based on common exposures from those interviews COL [redacted] will direct further actions (food, environment, Child development center...).
Fort Meade possible support arranged includes: Veterinary support [redacted] cell-[redacted], PHN (LTC [redacted] and CHPPM-North [redacted].
Should environmental sampling be required technical reachback includes: CHPPM lab support arrangement (LTC [redacted], CDC labs (partnership with DR. Steven Arnon) and Maryland Public health labs.
We are currently arranging a teleconference with CDC and other environmental exposure intestinal botulism experts, developing a questionnaire, reviewing risk communication/pao products and preparing to launch.

That is a short update from my vantage point.

I have about 10 questions that I forwarded to [redacted] on epicon details that would likely be asked by inquiring media reps. They are attached. Need ops to provide accurate answers to all those that don't refer to the fact sheet, today if possible.

I've had no inquiries so far. Mr. [redacted] told me he let Kimbrough know that we could respond to query if needed.

I have contacted the Fort Meade public affairs office requesting a copy of the final news release and letting them know that people from here will be supplementing Kimbrough for purposes of epidemiological investigation.

[redacted]

If you have a question, please check with the EOC first.
This way we prevent emails going to 15 people and 15 people responding and another 15 email messages and so on. Our leadership does not need to see every message string for simple staffing questions (that is why we have the EOC).
This process also prevents those that are supporting the mission to rely on the EOC to disseminate the information (not PAO stuff), situation reports, etc..
All info flows through the EOC, so we have the latest versions. The great folks in Risk Communication always keep OPS in the loop.

Thanks,
[redacted]

Hypothesis Generating Questionnaire (Infant Botulism)

(modified January 2007 from New York City Department of Health Questionnaire)

Initials of interviewer _____

Date form completed: ___/___/___

DEMOGRAPHIC INFORMATION OF THE CASE

Parent's last name: _____ Parent's first name:_____

Infant's last name: _____ Infant's first name:

Home address:

1. Where was your child born? ❑ Hospital ❑ Other _____
   Hospital Name:
   Age at discharge from hospitals? _____
   Was your child premature? ❑ Yes ❑ No ❑ DK

2. Where do you usually take your child for medical problems or for well baby visits?
   ❑ Pediatrician ❑ Family/gen practitioner ❑ Nurse practitioner or PA
   ❑ ER ❑ Other (Please specify_____)

3. Before your child's illness from botulism began, did he/she see a physician for any other medical problems (not including well-child visits or visits for immunizations)? ❑ Yes ❑ No ❑ DK

4. Did your child receive antibiotics in the month prior to illness onset? ❑ Yes ❑ No ❑ DK

5. What was your infant's usual bowel movement pattern during the following months of life?

	≥ 1 BM/day	1 > BM ≤ 3/day	< 1/3 days	unknown
1st month	___	___	___	___
2nd month	___	___	___	___
3rd month	___	___	___	___
4th month	___	___	___	___

When we first interviewed you about your child's illness, you reported that he/she first appeared sick on ____/____/____ *(onset date)*. Is this the correct date? ❑ Yes ❑ No ❑ DK

I. Food/Liquid Exposures

6. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being breast-fed?
   ❑ Yes ❑ No ❑ DK
   If yes, how many times per day do you breast feed? _____
7. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being bottle fed?
   ❑ Yes ❑ No ❑ DK
   Do you use expressed breast milk to bottle feed? ❑ Yes ❑ No ❑ DK
   Do you use formula to bottle feed? ❑ Yes ❑ No ❑ DK
   Which formula did you primarily use? _____
   Please specify other brands of formula that you used. (List all brands used)
   _____
   _____
   _____

What type of formula do you usually use? Did you use...
   a. Liquid (ready to serve) ❑ Yes ❑ No ❑ DK
   b. Liquid (conc. add water) ❑ Yes ❑ No ❑ DK
   c. Powdered ❑ Yes ❑ No ❑ DK
   Who usually prepared the formula?
   Name: _____
   Relationship to the child: _____
If water was used, what was the source of the water? _____
   If tap water, was it boiled or filtered? ❑ Yes ❑ No ❑ DK
How many bottle feedings per day? _____

8. Prior to your child's illness, did he/she eat any baby cereal? ❑ Yes ❑ No ❑ DK
   Please specify type and brand (rice, oatmeal, etc.)._____
9. Did your child eat jars, bottles, or cans of baby food? ❑ Yes ❑ No ❑ DK
   Please specify type and brand_____
10. Did your child eat any baby food that was prepared at home? ❑ Yes ❑ No ❑ DK
    Please specify how it was prepared_____
11. Did your child eat any home-canned foods? ❑ Yes ❑ No ❑ DK
12. Did anyone in your family eat any home-canned foods? ❑ Yes ❑ No ❑ DK

13. Did your child drink any regular cow's milk (pasteurized)? ❑ Yes ❑ No ❑ DK

14. Did your child drink any unpasteurized milk? ❑ Yes ❑ No ❑ DK

15. Did your child eat or drink any honey? ❑ Yes ❑ No ❑ DK

16. Did your child eat any corn syrup? ❑ Yes ❑ No ❑ DK

17. Did your child drink any sugar/water? ❑ Yes ❑ No ❑ DK

18. Did your child drink any fruit juices? ❑ Yes ❑ No ❑ DK

19. Did your child drink any unpasteurized fruit juices? ❑ Yes ❑ No ❑ DK

20. Did your child eat any meats? ❑ Yes ❑ No ❑ DK

21. Did your child eat any fish? ❑ Yes ❑ No ❑ DK

22. Did your child drink tea? ❑ Yes ❑ No ❑ DK
Was it sweetened? ❑ Yes ❑ No ❑ DK

23. Did your child receive any supplemental vitamins in the month before the illness began?
❑ Yes ❑ No ❑ DK
If yes, please specify_____
Did they contain iron? ❑ Yes ❑ No ❑ DK

24. Did your child eat any fresh produce (fruits or vegetables) that were organically grown?
❑ Yes ❑ No ❑ DK
If yes, please specify which fruits and vegetables were organically grown_____
_____

25. Does anyone in your family eat any fresh produce (fruits or vegetables) that is organically grown?
❑ Yes ❑ No ❑ DK
If yes, please specify which fruits and vegetables were organically grown_____

26. Do you shop at any Farmer's Markets? ❑ Yes ❑ No ❑ DK

If yes, please specify._____

27. Where do you shop for groceries?

_____

28. Where do you shop for baby food and other baby items?

_____

_____

II. Environmental exposures

29. Was there any of the following during the month before your child's onset near your home:

- ❑ construction (e.g. new home or other building)
- ❑ excessive dust (e.g. sewers, new foundations)
- ❑ excavation
- ❑ new road construction
- ❑ plowing of fields
- ❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

30. Was there any of the following during the month before your child's onset at other sites where your child has been:

- ❑ construction (e.g. new home or other building)
- ❑ excessive dust (e.g. sewers, new foundations)
- ❑ excavation
- ❑ new road construction
- ❑ plowing of fields
- ❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

31. Did your child or anyone else in your family play in a sandbox prior to illness?

❑ Yes ❑ No ❑ DK

If so, where? (list)

32. How often is the furniture in your house dusted?

- ❑ more than once per week
- ❑ once a week
- ❑ less than once per week but at least every two weeks
- ❑ less than every two weeks
- ❑ other (please specify_____)
- ❑ unknown/refused

33. Do you have any carpets or area rugs covering the floor in your house? ❑ Yes ❑ No ❑ DK

If yes, are they

❑ wall to wall carpets

❑ area rugs

❑ both wall to wall and area rugs

What is the pile of wall to wall carpeting, (low, med, or shag)?_____

34. How often are your floors and carpets vacuumed?

❑ more than once per week

❑ once a week

❑ less than once per week but at least every two weeks

❑ less than every two weeks

❑ other (please specify_____)

❑ unknown/refused

35. What type of heating system do you have in your home?

❑ forced air (e.g. gas, oil, electric)

❑ steam heat (radiators)

❑ circulating hot water (e.g. solar, oil, gas)

❑ electric

❑ other (please specify_____)

36. Does your home have air conditioning? ❑ Yes ❑ No ❑ DK

If yes, please specify if individual room unit or central air conditioning_____

37. Do you have any electric air cleaner in your home? ❑ Yes ❑ No ❑ DK

If yes, please specify if central or portable_____

38. Were you or anyone in your household or family involved in gardening or yard work prior to your child's illness onset?

❑ Yes ❑ No ❑ DK

If yes, please specify flower or vegetable.

How often do you or household/family member garden?_____

_____

Which months of the year do you garden?_____

39. Do you have any plants inside your house?

If yes, are they (check all that apply)

❑ located on or within 1 foot of the floor

❑ located on tables

❑ hanging from the ceiling

Are there any plants in the baby's room? ❑ Yes ❑ No ❑ DK

40. Do you take your child for walks outside? ❑ Yes ❑ No ❑ DK

Where do you usually go for walks?_____

Do you go to any nearby parks? ❑ Yes ❑ No ❑ DK

If yes, please specify_____

41. Does your child play or lie on the ground outside? ❑ Yes ❑ No ❑ DK

Please specify in backyard, park, etc._____

_____

Burba Park _____

42. Are you a member of any social or religious organizations? ❑ Yes ❑ No ❑ DK

If yes, please specify_____

Did you take your child to any events? ❑ Yes ❑ No ❑ DK

Patriot Ridge Community Center _____

Was your child at an associated daycare during any of these events?

If yes, where/when?_____

CDC 1_____

CDC 2_____

CDC 3_____

FCC _____

43. Is your child in school/daycare or does he/she participate in any other group activities?

❑ Yes ❑ No ❑ DK

If yes, please provide names and locations _____

Describe "other group activities"_____

44. Did your child travel outside of Ft. Meade at all prior to his/her illness? ❑ Yes ❑ No ❑ DK

If yes, please specify where?_____

45. Did your child travel outside of Maryland prior to his/her illness? ❑ Yes ❑ No ❑ DK

If yes, please specify location, length of stay, and nature of visit._____

46. Did you visit a live poultry or meat market? ❑ Yes ❑ No ❑ DK

If yes, did you purchase any poultry or meat?

Specify type of meat purchased: _____

Name of market: _____

Address of market: _____

Did you take your child to the live market? ❑ Yes ❑ No ❑ DK

47. Did you take your child to any large gatherings prior to illness (wedding reception, parties, festivals, fairs, religious gatherings, etc.) ❑ Yes ❑ No ❑ DK

If yes, please specify_____

48. Did your child swim/wade/splash in an ocean, lake, river, pool, or recreational water park in the before his/her illness onset? ❑ Yes ❑ No ❑ DK

If yes, please specify_____

49. Did your child come into contact with any animals in the prior to illness? ❑ Yes ❑ No ❑ DK

If yes, what kind of animals? _____

When? _____ Where? _____

Do you own pets? _____

Buried a pet_____

50. Where did you buy/obtain your baby's crib?_____

Was the crib used or new? ❑ Yes ❑ No ❑ DK

Was the mattress used or new? ❑ Yes ❑ No ❑ DK

51. Does your child share toys with anyone? ❑ Yes ❑ No ❑ DK

If yes, please specify_____

52. How often do you sterilize bottles before using them? ❑ Always ❑ Sometimes ❑ Never

53. How often do you sterilize nipples before using them? ❑ Always ❑ Sometimes ❑ Never

54. Does your child use a pacifier? ❑ Yes ❑ No ❑ DK

Where were pacifiers purchased?

How often do you clean the pacifier?_____

If the pacifier falls on the floor:

How often do you clean with water?	❑ Always	❑ Sometimes	❑ Never
How often do you clean with soap?	❑ Always	❑ Sometimes	❑ Never
How often do you sterilize?	❑ Always	❑ Sometimes	❑ Never

55. Who is your child's pediatrician?

Pediatrician's name:_____

Clinic name: _____

Address:

_____

Phone number:( ) _____-_____

56. Do you know anyone other infants who have had a similar illness as your child's?

❑ Yes ❑ No ❑ DK

If yes, please specify_____

_____

Additional comments_____

_____

_____

_____

Thank you very much for you time.

Subject: CHPPM RTQ on infant botulism (not for release)

The attached is approved by COL [redacted] and MAJ [redacted], who developed most of the answers. It's intended for CHPPM public affairs and CHPPM EPICON participants' use in response to media inquiry.

It is a working document--please let me know if you have comments.

CHPPM has not received any inquiries yet. Interview requests will be routed through/cleared with the Fort Meade public affairs office. I do not have an email for [redacted] but am copying her colleague, [redacted] so that they are informed of planned responses.

I am assuming that I can respond to inquiry on the CHPPM participation in the epidemiological investigation with these approved responses. (I would let Fort Meade PAO know if I have done so, copying COL [redacted]). If that's not correct, please let me know.

[redacted] feels that, were he to find himself in the role of public spokesperson, he would want to engage the participation of the physician currently on-scene from the MD public health department. This is a Dr. Kelly Russo. His is a good idea, in that it shows state and Army collaboration and cooperation. Third-party endorsement (implied or actual) is helpful in this case.

USACHPPM: Saving Lives & Resources--Prevention is the Key.

CHPPM Response to Query

Infant Botulism Epidemiological Consultation (EPICON)

CHPPM public affairs posture: Passive, RTQ only. CHPPM is a support to the Fort Meade public affairs effort and responds only to questions about CHPPM EPICON mission and general questions about EPICONs. Fort Meade infant botulism fact sheet may be used in responses as well.

The contents of this document are for use by CHPPM EPICON spokespersons and CHPPM public affairs in responding to media inquiry. This document is not releasable.

1. What is an epidemiological consultation team?

Epidemiology is the science devoted to investigating how population factors and the environment influence the occurrence of diseases or injuries. The epidemiology consultation team or EPICON team applies this science to find causes, risk factors, opportunities for prevention and treatment, and ways to stop epidemics.

2. What is the team looking for (i.e., what questions is the team trying to answer)?

The team will attempt to determine whether the two infant botulism cases reported in the Fort Meade area are related and attempt to identify any possible, common links or sources.

If one or more sources are identified, control measures may be recommended to guard against further transmission. Communication will be important throughout the process, and the team will share information regarding the illness and control measures with the affected community.

3. What methodologies will the team use to find the answers it seeks?

Reviewing results of tests that were ordered on the affected children during their illness, as well more specific testing that is in progress using samples from these patients. These more specific, bacteria subtype tests are being processed at public health laboratories.

The team will review additional clinical information from healthcare providers and conduct interviews with the infants' parents to determine food history and possible environmental exposures. Team members will also try to determine if the Fort Meade community or the civilian sector is experiencing other cases, by looking at surveillance data and disease reports.

4. How many people are on the team? What are their specialties?

The team will consist of six to eight public health personnel specializing in the fields of preventive medicine, infectious disease epidemiology, environmental science, veterinary medicine and public communication. Army personnel will consult or partner with similar professionals at the Centers for Disease Control and Prevention (CDC) and local public agencies.

5. Why is there concern about the two cases of infant botulism at Kimbrough?

Infant botulism is a relatively rare event. Every year in the United States about 100 cases of infant botulism are reported, and most are isolated cases. The proximity of the two Fort Meade cases warrants further investigation.

6. Why did Kimbrough have to come to the Army Center for Health Promotion & Preventive Medicine for assistance?

CHPPM specializes in preventive medicine, environmental health and public communication about health matters. CHPPM can efficiently assemble an expert team of investigators to interview case contacts, collect and analyze samples, and communicate risks and control measures, when needed, to the public. At the same time the other important, clinical and preventive medicine missions at Kimbrough can continue without disruption.

7. When will the team have answers?

The results of subtyping of the bacteria that were isolated from the affected infants are anticipated within a week—by about Jan. 20.

Interviews of household contacts began on Jan. 12. Information gathered from the interviews may determine common exposures between the affected infants. Should further environmental or clinical sampling be warranted, processing of laboratory samples will require an estimated additional two weeks from the date of sample collection.

8. How will the team report the answers?
The team will report findings to the Fort Meade medical authorities. The decision to make information public is theirs. Information will be released through the Fort Meade public affairs office. The public affairs contact is Melanie Moore, (301) 677-1301.

9. Who will release the answers to the press?
The Fort Meade public affairs office is responsible for sharing information with the affected households as well as the public/press. The public affairs contact is Melanie Moore, (301) 677-1301.

10. What is status of the two cases at Kimbrough?

[redacted]

11. How many cases of infant botulism has the DOD experienced in the last year?
Eight cases have been identified from 2006 through inpatient records: three from California, two from Maryland*, one from Texas, one from Utah, and one from Washington.

* These are the two cases the EPICON is currently participating in investigating.

12. What is botulism?

Botulism is a rare, serious but treatable paralytic illness caused by a nerve toxin that is produced by the bacterium Clostridium botulinum.

From the approved fact sheet: With infant botulism, the Clostridium botulinum bacteria grow within a baby's digestive system. Contact is made by eating or swallowing bacterial spores found naturally in soil and in some contaminated food products. Most cases (94 percent) occur in babies 6 months old and younger. Infant botulism affects girls and boys equally. There are approximately 100 cases of infant botulism reported annually in the United States.

Only if asked; CHPPM backup info: There are three main kinds of botulism. Foodborne botulism is caused by eating foods that contain the botulism toxin. Wound botulism is caused by toxin produced from a wound infected with Clostridium botulinum. Infant (also known as intestinal) botulism is caused by consuming the spores of the botulinum bacteria, which then grow in the intestines and release toxin. All forms of botulism can be fatal and are considered medical emergencies. Foodborne botulism can be especially dangerous because many people can be poisoned by eating a contaminated food.

13. What causes botulism?
Clostridium botulinum is the name of a group of bacteria commonly found in soil. They grow best in low oxygen conditions. The bacteria form spores which allow them to survive in a dormant state until exposed to conditions that can support their growth. There are seven types of botulism toxins designated by the letters A through G; only types A, B, E and F cause illness in humans.

14. How common is botulism?
In the United States an average of 110 cases of botulism are reported each year. Of these, approximately 25 percent are foodborne, 72 percent are infant botulism, and the rest are wound botulism. Outbreaks of foodborne botulism involving two or more persons occur most years and are usually caused by eating contaminated home-canned foods. The number of cases of foodborne and infant botulism has changed little in recent years, but wound botulism has increased because of the use of black-tar heroin, especially in California.

15. What are the symptoms of infant botulism?
From the fact sheet: Any or all of the following are symptoms of infant botulism:

- Constipation
- Poor feeding and a weak suck
- Weak cry
- Loss of head control
- Difficulty swallowing
- Excessive drooling
- Floppy appearance or "floppy baby"
- Generalized weakness
- Breathing difficulties

CHPPM backup info: Infants with botulism appear lethargic, feed poorly, are constipated, and have a weak cry and poor muscle tone.

The classic symptoms of botulism include double vision, blurred vision, drooping eyelids, slurred speech, difficulty swallowing, dry mouth and muscle weakness. These are all symptoms of the muscle paralysis caused by the bacterial toxin. If

untreated, these symptoms may progress to cause paralysis of the arms, legs, trunk and respiratory muscles. In foodborne botulism, symptoms generally begin 18 to 36 hours after eating a contaminated food, but they can occur as early as 6 hours or as late as 10 days.

16. What should one do if symptoms appear?

Seek medical attention immediately.

17. Is it contagious?
Infection is caused by ingestion of contaminated foods or soil or possibly dust. No instance of person-to-person transmission has been proven.

18. Can you die from it?

Less than 1 percent of babies hospitalized with infant botulism die. Infant botulism ranges from mild illness with gradual onset to sudden infant death. Some studies suggest that it may cause an estimated 5 percent of cases of sudden infant death syndrome (SIDS).

CHPPM backup on botulism (all varieties) death: Botulism can result in death due to respiratory failure. However, in the past 50 years, the proportion of patients with botulism who die has fallen from about 50 percent to 8 percent. A patient with severe botulism may require a breathing machine as well as intensive medical and nursing care for several months. Patients who survive an episode of botulism poisoning may have fatigue and shortness of breath for years, and long-term therapy may be needed to aid recovery. Infant botulism ranges from mild illness with gradual onset to sudden infant death. Some studies suggest that it may cause an estimated 5 percent of cases of sudden infant death syndrome (SIDS). Less than 1 percent of hospitalized cases die.

19. How is botulism diagnosed?

From the fact sheet: A visit to a healthcare provider, who will collect a stool specimen.

CHPPM backup info: Growing Clostridium botulinum bacteria from stool cultures is sufficient for making the diagnosis of intestinal botulism in infants.

20. How can infant botulism be treated?
From the fact sheet: Prompt diagnosis and treatment are key. Treatment is available through FDA-approved medicine. Expect a complete recovery, although the recovery is gradual—usually weeks to two months with treatment, and several months without treatment.

CHPPM backup info, general: Good supportive care in a hospital is the mainstay of therapy for all forms of botulism. Currently, antitoxin is not routinely given for treatment of infant botulism.
The respiratory failure and paralysis that occur with severe botulism may require a patient to be on a breathing machine (ventilator) for weeks, plus intensive medical and nursing care. After several weeks, the paralysis slowly improves. If diagnosed early, foodborne and wound botulism can be treated with an antitoxin which blocks the action of toxin circulating in the blood. This can prevent patients from worsening,

but recovery still takes weeks. Physicians may try to remove contaminated food still in the gut by inducing vomiting or by using enemas. Wounds should be treated, usually surgically, to remove the source of the toxin-producing bacteria.

21. How can it be prevented?
From the fact sheet:

- Wash hands frequently
- Avoid giving honey to infants less than 1 year of age
- Routine and frequent cleaning of toys, particularly items that babies place in their mouths and those toys that have fallen to the ground or floor
- Through proper preparation of foods (boiling and cooking)
- Avoid cans of food/formula with dents or that are bulging or rusting
- Avoid locations with excessive dust

CHPPM backup info: Botulism can be prevented. Because honey and corn syrup can contain spores of Clostridium botulinum (and this has been a source of infection for infants), children less than 12 months old should not be fed honey or corn syrup. These are, however, safe in older children.

Foodborne botulism has often been from home-canned foods with low acid content, such as asparagus, green beans, beets and corn. However, outbreaks have occurred that were traceable to sources such as chopped garlic in oil, chili peppers, tomatoes, improperly handled baked potatoes wrapped in aluminum foil, and home-canned or fermented fish. Persons who do home canning should follow strict hygienic procedures to reduce contamination of foods. Oils infused with garlic or herbs should be refrigerated. Potatoes which have been baked while wrapped in aluminum foil should be kept hot until served or refrigerated. Because the botulism toxin is destroyed by high temperatures, persons who eat home-canned foods should consider boiling the food for 10 minutes before eating it to ensure safety. Instructions on safe home canning can be obtained from county extension services or from the U.S. Department of Agriculture.

Wound botulism can be prevented by promptly seeking medical care for infected wounds and by not using injectable street drugs.

EXECUTIVE SUMMARY

12 January 2007

(U) Command Critical Information Requirement, Kimbrough Ambulatory Care Center (KACC), FT MEADE, MD (EXSUM).

(U) This is a follow-up to the CCIR sent on 10 and 11 Jan 07. KACC has assembled a team and began an epidemiological investigation of the two cases of infant botulism on Ft Meade. The team consists of personnel from Ft Meade MEDDAC, CHPPM, WRAMC and the Anne Arundel County Health Department. Team members have completed on-site interviews of the two families .This data will be used to determine any commonality in their living conditions and daily activities to help narrow the focus of the epidemiological Investigation. The team is also investigating prior use of land area near the residential community. One of the families (family of the infant who was ill in Oct 06) strongly believes the source of the disease is a soil and debris pile adjacent to the family housing area. The family has notified many members of the local media. Our medical talking points for the media consist of 1) our primary concern is the health and welfare of this community and the two infants; 2) the investigation is ongoing with no preliminary information available at this time; 3) the investigation involves collaboration between Army, local and state public health personnel. We have had no direct contact with the media today.

Subject: Conf Call in a.m.

I would like to start the day with a conference call at 0900, but may attempt to get some of you on the line between 0800 and 0900. Please reply to let me know you are available and what phone number will be your location at 0900. Top efforts tomorrow and continuing this week:

A. Environment background
   1. Cb prevalence central MD if known
   2. ACE or housing contractor records
      - sewage treatment
      - flood plains, runoff
      - construction projects
      - service call logs, neighborhood of interest
      - recurrent problems
   3. Sched 2nd call w/ Dr. Arnon for new questions, and consult CHPPM DEHE, discussing how--if general envi sampling is considered--locations best decided
   4. Consider meteorological records around back-calc'd exposure date intervals

B. Neighborhood visits
   1. Admin questionnaire to the 2 families w/ unaffected infants.
   2. Home visit to case-family #2 with general observations
   3. Area walk-around for general land observations
   4. Risk comm visits to generate best prep for town hall and info products
   5. Vacuum cleaner aspirate collections

C. Continuing epi background
   1. Case-finding (subclinicals or mis-Dx codes, SIDS or in-hosp fatalities, etc.)
   2. Broader Maryland epi summaries / trends

OLIVER COURT
MMUNITY MEETING

Good morning [redacted]

I hope you had a relaxing weekend and that you did NOT do any work on this issue. Just wondering about 2 things:

Could you please give me a final copy of this flyer for my files?
Could I get the phone number for the [redacted] family so I could followup to possibly schedule a risk communication interview with them?

I did contact the [redacted] family this past Saturday re: a risk communication interview, but [redacted] said they were busy all weekend. I will try to call her again today.

Thank you ma'am, for your help.

DRAFT

OLIVER COURT COMMUNITY MEETING
Tuesday January 16th 2007
7pm

Dear Oliver Court Resident:

Because concerns remain about the infant botulism cases diagnosed within the last few months, a small-group meeting with residents who live in Oliver Court will be held on Tuesday January 16th 2007 at 1900 in Potomac Place. A follow-up town hall meeting for others outside this area will be held the following Tuesday January 23rd at the same time and location.

The purpose of the January 16th meeting will be to provide an intimate discussion forum for the families most closely affected by these events. A physician from the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) who is also a member of the epidemiological consult (EPICON) team assisting in the investigation will be present at this meeting.

I hope you will take advantage of this opportunity. I am also hopeful that others in the community will respect the meeting time reserved for Oliver Court Residents this coming Tuesday, and will take advantage of the town hall meeting on January 23rd.

For more information, please contact LTC [redacted] Preventive Medicine at Kimbrough Ambulatory Care Center at (301) 677-8661.

[redacted]

I was asked to pull info to identify a 2006 birth cohort at Ft. Meade.

I was able to pull identifying information for newbornes in the Ft. Meade zip (20755), which was the same zip for the 2 cases. However, beneficiary residence or address is not available in M2 (DEERS) so this won't be helpful should we need to target a particular subset to survey.

If I were to furnish you with the SSNs for this group would AMSA be able to pull this info?

[redacted],

Just got off the phone w/ [redacted] (CDR Kimbrough ACC) and her staff regarding the two cases of infant botulism from the Ft Meade community.

They're requesting our assistance to address the issue and have requested an EPICON.

A big concern is the risk of infection from exposure to contaminated soil. There's construction near the housing area where the two cases reside that's created a large debris pile of soil, concrete, etc. Local residents and the Ft Meade Garrison Command are very concerned that this may be the cause of the two infections.

There's been interest from outside medical organizations to help respond to this.

The POC at KACC is the Chief of PM, LTC [redacted], (email above, [redacted]). Please ensure all communication is routed thru her so that we have a single message.

[redacted] They're sending up a draft press release (attached) and botulism fact sheet that need to be reviewed NLT 1700 today. They're also looking for assistance drafting an article for the Ft Meade newspaper to help inform the community. This will require RISKCOM support. Coordinate w/DEDS ([redacted] in the office today.)

Please copy the USACHPPM-EOC w/all emails.

DEDS should prepare a daily consolidated exsum for the CG until this matter is over.

Subject: Fwd: Inquiry on MD infant cases

Just so you're aware of what's being said by other agencies - below is a public inquiry CDC received related to the infant botulism situation, and below that, the CDC e-mail response (from Umid Sharapov, the EIS Officer within the Enteric Diseases Epidemiology Branch). Personal identifiers for the individual submitting the inquiry have been removed. Feel free to forward this to whomever you like.

I. E-mail Inquiry to CDC:

Date / Time posted: 1/11/2007 10:25:41 PM
Subject: Infant Botulism Outbreak at Ft Meade
Comments: Sir/Ma'am, I reside on Ft Meade. I have just been made aware of the Infant Botulism cases on Ft Meade. The first case was in October 6th. When did they notify your agency of the illnesses?
II. CDC Response:

CDC is not routinely involved in the investigation of infant botulism cases. CDC is immediately contacted about foodborne botulism cases, because of concern about the possibility of many cases caused by contaminated food. For infant botulism, doctors directly contact the California Infant Botulism Treatment and Prevention Program http://www.dhs.ca.gov/ps/dcdc/InfantBot/ibtindex.htm to request assistance with diagnosis and to obtain the specific antitoxin used to treat infants. State health departments are also notified. Testing of clinical specimens is done either at the state public health laboratory or at CDC (in Maryland, testing is done at the state).

Because of the proximity in time and space of the two illnesses in Ft. Mead, CDC was contacted on January 3. CDC acts primarily to support state health departments and other authorities who are in charge of investigating clusters of disease within a state or in a military jurisdiction, such as these two cases.

To: [redacted] KACC-Ft Meade
Subject: RE: soil and bot

Ma'am,

A cluster in reported cases not concentration in soils. I searched all day and no one; CDC, USDA, US Geological Society, EPA, nor any universities, defined areas of the US as having higher or lower concentrations of C. Botulinum in the soil. I believe the concentration varies depending upon soil conditions (pH), climatic changes, biological events (large animal die-offs), etc.

I will be speaking with the Post Historian tomorrow concerning land use and changes. I already know that cavalry horses were used on Post up until the end of WWI. Since then, Post still maintains horse stables on the other side of HWY 32. All horse activities took place near Tipton Airfield and the current horse stable. There have not been any horse burials or mounted cavalry exercises near the housing areas.

Ma'am,

I just got out of a CBRNE IPR with the Commander. But I have been researching C. Botulinum in the local soils. I have found that there are clusters of Infant Botulism in DC, MD, and DE that are disproportional to the land area these states occupy in comparison to other eastern US states. I can't find any tests that say certain soils have a higher prevalence of C. Botulinum than others.

I'm still looking. However, I did find that produce such as potatoes, carrots, and other vegetables that are non-leafy earth cultivated foods can spread C. Botulinum. I will continue to update you Ma'am on any soil surveys I may find.

UNCLASS

Past 24 hrs

- Produced updated questions-and-answers for direct use in community and for posting, which also addresses EPICON mission. Input from CHPPM PAO Ms. Kukral included.

- Conducted town hall meeting with residents of cases immediate neighborhood. Attended by Anne Arundel County PM physician, USACHPPM epidemiologists, USACHPPM risk communicators, Preventive Medicine Kimbrough Clinic and Fort Meade Garrison Commander.

- Completed teleconference with Maryland State and Anne Arundel county PM physicians, Dr. Arnon (infant botulism expert from California) and EPICON team to discuss strategy for epidemiologic investigation. Discussed possible strategies for environmental sampling.

- Met with garrison commander COL [redacted], Kimbrough commander COL [redacted], and the Fort Meade Publc Affairs Officer for update.

- Identified birth cohort of births to Fort Meade residents for 2006 to identify possible "control" selection .
Next 24 hrs

- Decision on environmental sampling strategy.

- Coordination of laboratory and sample collection/shipping support

- Continue to await results of bacterial subtyping by Maryland State Laboratory

UNCLASS

Past 24 hrs

- inbrief with Kimbrough Commander COL Cummings

- structured epidemiologic interviews of both parents of each of the two infants who have suffered botulism; database creation

- brief on-camera interviews with ABC and CBS local affiliate TV stations from Wash DC, and with Ft Meade local TV

- meeting of entire team with garrison commander COL McCreedy, the installation Sergeant Major, and the Public Affairs Officer

- tour of the implicated housing area and brief meeting of one of two other close neighbors of the affected families who also has an infant child

- telephonic coordination to obtain data on sudden infant death cases in Maryland occurring in military families

- initiation of information gathering on history of pertinent installation land use, housing construction, and sewage treatment

- initial planning of possible, limited case control study

Next 24 hrs

- preliminary analysis of questionnaire data

- contact family #1 to arrange session with risk communicator, to determine additional concerns and ensure any new questions are addressed

- planning for EPICON accompanying of COL [redacted] at Town Hall sessions for installation residents over the next 10 days

- monitor media coverage to gauge need for updates or modification of public messages and educational postings

- continue to await results of bacterial subtyping by Maryland State Laboratory

Personnel and Equipment

All accounted

EXECUTIVE SUMMARY

11 JAN 07

(U) FORT MEADE INFANT BOTULISM EPICON. (U) USACHPPM EPICON team will deploy to Fort Meade 12 Jan 07 to investigate 2 reported cases on infant botulism. Some team members met at Fort Meade 11 Jan. and conducted teleconference with CDC botulism specialists, Maryland and local public health officials, and the WRAMC physician who treated both cases. Clinical and environmental components of the investigation were discussed. EPICON team will meet with MTF commander tomorrow morning. Then 2 or 3 members will interview parents of both infants. PREPARE MEMO_____.

Subject: (U) SITREP Bot. Meade

UNCLASSIFIED

Past 24 hrs

- Part of team met at CHPPM-Main to discuss approaches to environmental sampling. It must be emphasized at all levels that environmental sampling is NOT intended to serve as a tool to 'solve the outbreak [cluster]', nor directly predict risk of future cases, nor contribute to immediate preventive interventions. Instead this would be an opportunity to advance understanding of spore prevalence in a geographic area previously uncharacterized with respect to C. botulinum. It does, however, still constitute part of the overall public health assessment (in contrast to generalizable, scientific research) in that the information gained will contribute to nationally collected data on risk density. As an additional benefit it may enhance current health communications to, and information for, the residents and workers of Fort Meade and the surrounding area (though the information must be presented in proper context to avoid the opposite effect, namely, generating either fear or a false sense of ability of garrison to mitigate).

- Per Dr. Arnon's botulism expert (SME) list, contacted Dr. Mike Adler, MRICD Botulism research group director. They do not have the laboratory capabilities to support us on Edgewood. However, he is contacting someone at USAMRIID to explore possible collaboration on lab support for environmental sampling (soil and dust) and will get back to me soon.

Next 24 hrs

- Schedule meeting or phone conference among CHPPM subject experts on environmental sampling and laboratory analysis.
Tentative invitee list:
EPICON Team
MAJ [redacted] (DLS)
[redacted] (DOHS) [redacted] (DEHE)

- Schedule vacuum dust collection at homes of the two affected infants.

- Continue to await results of bacterial subtyping by Maryland State Laboratory.

- Continue disease surveillance.

Importance: High

Ma'am,

I just spoke with the Picerne Housing Office Manager, [redacted] She said there were no work-orders put in for sewer complaints from the [redacted] housing unit at 3313-6 Oliver Court. However, the [redacted] housing unit at [redacted] liver Court, put in 3 work-order complaints:

1. 16 JAN 2006 - Laundry room floor drain was backed up.
Remedy: maintenance cleaned the drain line.

2. 29 MAR 2006 - Kitchen sink was backed-up
Remedy: maintenance used pluming snake to unclog the line.

3. 9 NOV 2006 - Feces from sewer line coming up through laundry room floor drain.
Remedy: *The notes from maintenance just say "fixed."

OLIVER COURT
MMUNITY MEETING

Ma'am:

My apologies for missing Tuesday night's meeting, but I hear things went well. Based on the notes I see in the attached file that my colleagues so kindly captured, I would like to offer to write up the fact sheet that parents requested at that meeting (reflected in question 4 on the attached file). If you would like me to do that, I would be glad to do so

Ft Meade Public Meeting
January 16, 2007

Questions and significant comments:

1. After reading on the internet that botulism can cause headaches, I wonder if there is a blood test or other type of test that can be run to test for botulism? My daughter is 13 and is having headaches.

Reply: Headache would not generally be the only symptom. Since your child is 13 she could not have contracted infant botulism.

If she could not have contracted infant botulism could the spores in the air have caused her headaches?

2. Why does this affect only infants? What is the difference in botulisms?

3. How does the investigation work?

4. There were two cases of infant botulism on the same street. What would you say to them? (asked by McGreedy)
***During part of the response the parent requested a fact sheet to read as they wait at the clinic for educational purposes. COL Cummings tasked LTC Cole Wainwright to ensure that would happen. She acknowledged that was a good idea to have material for parents to read in the waiting area. She also stated that most of that material was designed for care providers and having material for parents would be a great idea.

5. Could this be transmitted via air-born?

5 a. Will a flyer be made such as those found in the hospital waiting room?

6. Are there other Botulism?

7. How do you determine if the cases are linked?

8. Can it be in the water or passed on from the mother to the child through breast milk?

9. How fast do the symptoms appear?

10. How do the symptoms progress?

11. Should we have a concern for bulging or dented cans in the supermarket?

12. What's the next steps on updates and anything happening?

13. Are pets in danger?

14. Several cats and dogs have dies on (spelling) Moose Forest Street. What do you know about this and could there be a connection to botulism?

NOTE: McGreedy offered to investigate and send them an email on this issue.

Significant comments:

Dr Russo clearly stated that the team members are following the course as the county office follows and all information on botulism and other disease, etc are tracked across the county and state.

PAO - There is a website with updates
She captured the questions as above and they will be posted on the website
There will be updates on the local Ft Meade Newscast TV channel.

You might consider including in your quote or somewhere in the intro of the commander's message that even a thorough, scientific investigation may not resolve the question of cause. (COL [redacted] mentioned to COL [redacted] and me that some previous cases have not enjoyed clear-cut resolution--I don't have specifics on her research.) Fort Meade has brought a lot of expertise, Army and civilian, to bear on the problem; still, it might be advisable to sound a cautionary note so that we don't set up a situation where our expertise comes into question by the community because we didn't pinpoint the cause.

A more minor point: We'd prefer no speculation either before or after the investigation. I would suggest, "It is premature to speculate about a particular source. While we are using the best scientific methods and both Army and Civilian expertise, it is possible that the investigators will not identify the cause of these two babies' illness."

[redacted],

Just got off the phone w/[redacted] (CDR Kimbrough ACC) and her staff regarding the two cases of infant botulism from the Ft Meade community.

They're requesting our assistance to address the issue and have requested an EPICON.

A big concern is the risk of infection from exposure to contaminated soil. There's construction near the housing area where the two cases reside that's created a large debris pile of soil, concrete, etc. Local residents and the Ft Meade Garrison Command are very concerned that this may be the cause of the two infections.

There's been interest from outside medical organizations to help respond to this:

The POC at KACC is the [redacted] PM, [redacted], (email above, [redacted]. Please ensure all communication is routed thru her so that we have a single message.

[redacted] - They're sending up a draft press release (attached) and botulism fact sheet that need to be reviewed NLT 1700 today. They're also looking for assistance drafting an article for the Ft Meade newspaper to help inform the community. This will require RISKCOM support. Coordinate w/DEDS ([redacted] in the office today.)

Please copy the USACHPPM-EOC w/all emails.

DEDS should prepare a daily consolidated exsum for the CG until this matter is over.

[redacted] That sounds like the right approach and we'll work it.

[redacted] I think it would be helpful to have a physician (you or someone you designate) describe botulism and infant botulism--BPT discuss cause of disease (in infants and adults) and how it is transmitted, how it is diagnosed, symptoms, treatment, pace of recovery--the general information that we know. If you are unavailable (I am not sure if the doc from AA County is planning to attend), I will have my DCCS (LT [redacted]) attend. My personal preference is to have the same people from CHPPM at these meetings to maximize our ability to communicate the same messages. I know your TEMPO is high so I understand if this is not possible.

[redacted] I think it would be helpful for you to describe the steps of the investigation, any preliminary findings, timeline for completing the investigation, how the "report" of the investigation will be published--very similarly to how you described this last Tuesday evening at the focused town hall event.

[redacted] I would like you to describe what actions we would like family members to take if they believe their infants are experiencing the symptoms and where they can go (or who they can call) if they have questions. I think we need to be prepared to put out our information desk phone number(who will then refer questions to you or the White Team), the phone number for the White Team, and the phone number for you/LT [redacted] We obviously need to ensure the Information Desk and White Team know how to respond to incoming questions relating to botulism (I am fairly confident that they do). I know that these numbers have been published in the post paper, on the Ft Meade web, on our web, and on our fact sheets and news releases, but we need to put these numbers out at the meeting as well.

Pls let me know if you disagree of have some additional comments/ideas. Thanks all for your continued support! Much appreciated,

The meeting is scheduled for 6:00 p.m., Lori (I hope you're feeling better).

I would like to keep the session informal. We'll introduce our team. I'd like someone from the EPICON first to
1) briefly discuss botulism in general and infant botulism in general
2) talk about what you are doing and the timeline you see

Then perhaps someone from KACC can discuss how they are handling calls requesting information and requests for appointments.

I will then ask [redacted] to describe to the audience where they can go to keep posted on the disease and our activities.

I'll then open the floor for questions and concerns.

How does that sound to everyone?

COL [redacted]

Hi [redacted]

I'm just checking in as a followup to my phone message to you, particularly about the details of the town hall meeting next week (i.e., does it start at 6:30 or 7pm?). I'm guessing we'll also have a dry-run session ahead of time?

You all have been doing a great job of posting updated materials on the Meade webpage, so I'll work with the rest of the EPICON team to get some new information ready for this meeting (and eventually for the web, too). When you get a chance, I'd like to talk with you about your thoughts on meeting agenda, format, etc., based on what you've done in the past, as well as some of the things that have worked well at other sites I've been involved with.

Look forward to hearing from you.

Subject: RE: Oliver Court mtg questions

Hi ma'am:

Is the fact sheet the one recently posted on the Meade webpage? If not, could you send a copy to us? Otherwise, I can just download the copy from your webpage. Yes, I have contacted both the [redacted] and with the following results:

[redacted]: I spoke with Ms. [redacted] on Sat 13 Jan. She was quite harried, and said they were busy all weekend. We did speak for about 5 minutes and, in my opinion, still sounded somewhat agitated/ skeptical that the Army still isn't doing anything to find the cause. I tried my best to reassure her that the Fort Meade team was working with Anne Arundel County, and was consulting with CDC and other experts to make sure we were looking into all possible options and to ensure that our proposed actions were sound. I also tried to persuade her to arrange a time to speak with me at any time/location/ method that was convenient for her (i.e., day/ night/ weekend/ weekday/ her house/ over the phone). In the end, she was very nice, much more calm, and did take my phone numbers, saying she would call me if she was interested. I asked if I could call her back later in the week to see if she might have time, and she said ok. I tried to call again yesterday, but got no answer and there was no answering machine. MAJ [redacted] and I agreed that maybe it would be best to leave it, unless you all believe I should continue to try.

: I spoke with Ms. yesterday, and she was very gracious. I believe she was sincere in her responses. She said she had no concerns, and that she thought the Garrison and Kimbrough were doing what they should be doing to look into the issue. She specifically mentioned that COL [redacted] / SGM had been to her house twice, that she'd gotten two flyers, that there had been a meeting with the Oliver Court residents this past week, and that there is another meeting this past week. As far as meeting her needs go, she said, "I'm good." She did not know of anyone else with concerns or with young children. I did give her my phone numbers in case she did come across anyone else I/ we might contact. (Ms. did specifically mention that the meeting with the Oliver Court residents was very helpful in addressing the concerns of the residents in that area, and that this particular meeting was a good idea).

My colleagues also took the name/ phone number of one additional Oliver Court resident at the Tuesday night meeting, and I have followed up with that individual, but have gotten no response.

Completely agree with [redacted]. I understand that you all did a very good job of getting that point across this past Tuesday night, and it's a point we'll need to continue to drive home as often as possible in order to try and "manage" (if that's possible) community expectations -- hopefully with the help of others (i.e., Dr. Russo? Or others like her). If others are not willing to step out and say it, I've been trying to gather non-military resources that state so. Not finding a cause will take not only repetitive messages to that effect, but would benefit from being repeated in-person in the coming days/ weeks to allow people the chance to discuss the "why" factor (i.e., incorporate into appropriate briefings, volunteer to speak at appropriate community meetings, etc.).

Also, as [redacted] and I (and the rest of the EPICON) have discussed, suggest also including a quote about the fact that Meade/ EPICON are collaborating with local and state experts, as well as the CDC and other national experts. Knowing that "the Army" isn't doing this investigation in a vacuum, so to speak, is not only a true statement, it's a smart decision because it will help make sure the investigation is done as thoroughly and soundly as possible, and we should be talking about it.

Subject: RE: Infant Botulism (UNCLASSIFIED)-EPICON REQUESTED

LTC [redacted]

You might consider including in your quote or somewhere in the intro of the commander's message that even a thorough, scientific investigation may not resolve the question of cause. (COL [redacted] mentioned to COL [redacted] and me that some previous cases have not enjoyed clear-cut resolution--I don't have specifics on her research.) Fort Meade has brought a lot of expertise, Army and civilian, to bear on the problem; still, it might be advisable to sound a cautionary note so that we don't set up a situation where our expertise comes into question by the community because we didn't pinpoint the cause.

A more minor point: We'd prefer no speculation either before or after the investigation. I would suggest, "It is premature to speculate about a particular source. While we are using the best scientific methods and both Army and Civilian expertise, it is possible that the investigators will not identify the cause of these two babies' illness."

Copying [redacted] because I think she's working on some part of this material as well.

[redacted]

Just got off the phone w/ [redacted] (CDR Kimbrough ACC) and her staff regarding the two cases of infant botulism from the Ft Meade community.

They're requesting our assistance to address the issue and have requested an EPICON.

A big concern is the risk of infection from exposure to contaminated soil. There's construction near the housing area where the two cases reside that's created a large debris pile of soil, concrete, etc. Local residents and the Ft Meade Garrison Command are very concerned that this may be the cause of the two infections.

There's been interest from outside medical organizations to help respond to this.

The POC at KACC is the Chief of PM, LTC [redacted], (email above, [redacted]. Please ensure all communication is routed thru her so that we have a single message.

[redacted] They're sending up a draft press release (attached) and botulism fact sheet that need to be reviewed NLT 1700 today. They're also looking for assistance drafting an article for the Ft Meade newspaper to help inform the community. This will require RISKCOM support. Coordinate w/DEDS [redacted] in the office today.)

Please copy the USACHPPM-EOC w/all emails.

DEDS should prepare a daily consolidated exsum for the CG until this matter is over.

Agree with the gist of the topics to be covered, and especially the informal approach. I'm also very hopeful that Dr. Russo will be able and willing to participate. Suggest, however, that we allot ample time for open discussion and respectfully suggest that presentations be kept succinct to allow the audience to "drive" the level of detail the speakers provide. Ideally, would like to see all presentations completed in 20 minutes or less. And as a suggestion, would you consider inviting (in other words, "scheduling") the media ahead of time (maybe 30 minutes or so?) in order for them to get their soundbites without disrupting/ delaying the meeting start time?... And what kinds of handout materials are you looking to use? Depending on the EPICON team discussions, we may develop something (i.e., about completed actions, timeline, etc.)... We'll also bring along some generic CHPPM materials.... I'm guessing, you'll have some kind of pre-meeting Tuesday afternoon....? If I can do anything else to help prepare, just let me know....

[redacted] That sounds like the right approach and we'll work it.

[redacted] I think it would be helpful to have a physician (you or someone you designate) describe botulism and infant botulism--BPT discuss cause of disease (in infants and adults) and how it is transmitted, how it is diagnosed, symptoms, treatment, pace of recovery--the general information that we know. If you are unavailable (I am not sure if the doc from AA County is planning to attend), I will have my DCCS (LTC[redacted]) attend. My personal preference is to have the same people from CHPPM at these meetings to maximize our ability to communicate the same messages. I know your TEMPO is high so I understand if this is not possible.

[redacted]: I think it would be helpful for you to describe the steps of the investigation, any preliminary findings, timeline for completing the investigation, how the "report" of the investigation will be published--very similarly to how you described this last Tuesday evening at the focused town hall event.

Any chance you could let us know the likely source of infection? The cases in the outbreak seem to be linked to intake of a specific brand of carrot juice.

CHPPM was aware of the infant botulism case that was reported in RMES 5 OCT 2006. Actually, there was an EPI-X report about botulism linked to carrot juice (6OCT2006) and I had contacted Ms. [redacted] (infection control nurse at WRAMC) about this (see message below).

Subject: Epi Chiefs transcript and agenda for review/comments

Attached is the transcript from the 26 October Epi-Chiefs Telecon which has the "track changes" turned on so everyone can see the edits made to the original transcript. Also attached is the agenda and a Q Fever document submitted by Dr. Luther Lindler.

This transcript is not an official document, but rather a memory aid. If you have comments or edits to the first draft that you'd like to be incorporated please send them to Dr. [redacted] at [redacted]@na.amedd.army.mil. We will then incorporate those and send out the final draft two to three days prior to the next meeting along with the call-in information.

The next Epi-Chiefs meeting is on 9 November 2006. A reminder email will go out again next week with the transcript and agenda and any changes/comments that are sent to Dr. [redacted]

[redacted] Please mark your calendars accordingly.

Thank you,

PROCEEDINGS

(11:00 a.m.)

1) INTRODUCTION AND MEETING ADMINISTRATIVE ISSUES

[redacted]: Why don't we go ahead and begin. I'm sorry. We joined right at the last minute. We had another meeting that almost ran into this. So, if I could I ask people to identify?

MS. [redacted]: Good morning. This is [redacted] from Walter Reed Army Medical Center.

DR. [redacted]: This is [redacted] calling from Force Health Protection and Readiness Program, DoD.

LCDR [redacted]: You got [redacted] and [redacted] from AFIP.

LtCol [redacted]: This is Lieutenant Colone[redacted] Dr. [redacted] [redacted] and [redacted] from AFIOH.

MR. [redacted], from AFIOH is also on.

MR. [redacted] from Naval Health Research Center.

CAPT [redacted]: Captain [redacted] from NEHC, and joined by Lieutenant Commander [redacted], a Preventive Medicine Resident from USUHS.

LtCol [redacted]: Okay. Let me ask the group here at the GEIS Central Hub to go around the table and introduce themselves.

DR. [redacted]: [redacted]

LT [redacted]: Lieutenant [redacted]

DR. [redacted]: Dr. [redacted].

DR. [redacted]: John [redacted] from AMSARA.

MS. [redacted]: [redacted]

LtCol [redacted]: Okay. And do we have anyone now who has not identified?

(No response.)

LtCol [redacted]: Okay.

2) ANNOUNCEMENTS FROM ANY ATTENDEES

LtCol [redacted]: Are there any announcements from any of the attendees?

(No response.)

LtCol [redacted]: If not, we'll go on to the current topics.

3) CURRENT TOPICS

A) OUTBREAK(S)

LtCol [redacted]: The first topic on the agenda is updates on any outbreaks that have been reported. Do we have anything from any of the attendees?

MR. [redacted]: This is [redacted] in San Diego. I have a couple of things. I see the meningitis case from Parris Island is on the agenda, and we did determine that was serogroup C, and we reported that to Dr. [redacted] and to the MCRD Parris Island folks.

And one other thing I can report in this realm of outbreaks, and I don't know if anyone else is going to comment on this, but we were contacted by CHPPM, who's at Fort Leonard Wood this week, investigation a group A strep outbreak among a unit there, and they're going to ship us some of the isolates this week. They're going to ship them today. We'll begin to test them for M-typing.

Deleted: la

Deleted: Uniformed Services University.

Deleted: -

UNIDENTIFIED MALE SPEAKER: Where was that outbreak?

MR. [redacted] I believe that was Leonard Wood, Fort Leonard Wood.

[redacted] Yesterday [redacted] told us a little bit about that outbreak, but we really don't have any details.

On the line, do we have anyone from CHPPM today that would know something about that, or Dr[redacted]

DR. [redacted]: This is [redacted] There's a team of five individuals who've been at Fort Leonard Wood since the weekend. They're evaluating an outbreak of group A strep disease, mainly focused in one battalion of those basic trainees at Fort Leonard Wood. Over the past month or so, there have been several companies that have had relatively high rates of febrile respiratory illnesses with group A strep throat cultures, and in the past month or so, there have been two individuals who have had necrotizing fasciitis that have required their care in a civilian tertiary care hospital.

So, with relative high rates of group A strep confined pretty much to one unit, or one battalion, with several of those companies not receiving benzathine penicillin at the time that they entered training, and with at least two cases of invasive group A strep disease, it was decided that a thorough investigation of the situation ongoing there was required, and part of that investigation then is to discuss options for intervention, and part of the concern, obviously, is that there at least a temporary hiatus in the supply of benzathine penicillin. So, for the first time, probably in 50 years or so, prevention and response to group A strep outbreak in basic training populations does not provide the option for mass prophylaxis with benzathine penicillin, and the things that are being considered as prophylaxis with oral penicillin and other things.

So, that's ongoing. The investigation has been going on since this week and will continue, I think, through the end of this week and possibly into next and when the team has a chance to summarize their findings and make their recommendations to the folks there at Fort Leonard Wood, I'm sure they'll put it together and disseminate it to the appropriate folks throughout the DoD.

LtCol [redacted] This is [redacted] again. Is there further discussion?

(No response.)

LtCol [redacted] If not, let's go on.

Is there any update on the malaria in Afghanistan returnees from anyone on the line?

(No response.)

And I don't think we had CHPPM on the line besides AMSARA, but do we have any update on pregnancy outcomes in Europe that was mentioned at the previous meeting?

(No response.)

LtCol [redacted] And if not, if we don't have CHPPM on the line, let's put that off until the next meeting and move on.

Is there any update on the infant botulism? WRAMC?

MS. [redacted] Yes, this is [redacted]. I just wanted to report good news. The baby recovered and left on day 17 of hospitalization here at WRAMC; had just a little bit of neurologic sequelae. His head wasn't quite as strong as when he came in, but other than that, he's doing well. So, that's all I have to report.

LtCol [redacted] Thank you, [redacted]

[redacted] The next topic, TB on the USS Ronald Reagan. Is there an update?

[redacted] This is [redacted] from NEHC. There is no update at this point. I think they're just starting their second round of TSTs. So, we'll hear more in the next month or so, I imagine.

LtCol [redacted] Thank you.

Next, the case that was described as a possible encephalitis, do we have an update from AFIP or WRAMC.

LCDR [redacted] This is [redacted]. Was that the death?

LtCol [redacted] The case I'm thinking of, I believe [redacted] described it, and the information was basically awaiting autopsy and other findings.

LCDR [redacted] Right. There was a neuropath consult, and I do not have the results of that. The initial read was just non-specific and we never did find an agent for that. He said it would probably take several months.

Deleted: Right.

LtCol [redacted] Thank you. Yeah, I realize we're sort of pushing the time when we ask questions about that, but don't mean to push.

[redacted] are you still there?

MS. [redacted] Yes, sir, I am.

LtCol [redacted] Could you just briefly describe that case, maybe summarize it in a minute what that case was about and why we were concerned about an infectious cause.

MS. [redacted] If I remember right, we had reported on it earlier. The reason that it was unusual was this is essentially a healthy woman, if this is the case I'm remembering, and just had a sudden onset of seizure and fever and no laboratory specimen of anything that we could find to note any etiology at all, and she ultimately died. I mean, I don't have anything more. I really wasn't prepared to report on her today. I'm sorry.

LtCol [redacted] That's okay. That is the one.

MS. [redacted] Yes.

LtCol [redacted] I just wanted to be sure that [redacted] and the rest of the group were --

MS. [redacted] Yes. We had discussed it I think on one of the meetings where you weren't here, and all the labs have been inconclusive. Even the final ones, I believe, Dr [redacted], you had mentioned, we really have no etiology for this, which is really unusual. So, that's all I have.

LtCol [redacted] Okay. Thank you.

MS [redacted] You're welcome.

B) RECENT MORTALITY

LtCol [redacted] Is there any recent mortalities to discuss [redacted]

LCDR [redacted] Thankfully, no new cases.

LtCol [redacted] Thank you.

C) RESPIRATORY DISEASE

LtCol [redacted] Respiratory diseases, in general? [redacted]?

MR [redacted] Okay, yes, this is [redacted] from San Diego. I have a couple of things.

In terms of FRI rates at recruit camps, it seems like the rate at Great Lakes last week was elevated. That's the week ending the 21st.

Fort Jackson had an elevated rate the week prior to ending the 14th. We don't have their data yet for last week, so, we'll be watching that. The report will come out later today, one that you should all get.

Also, our collaborators here in San Diego, the local county public health labs, referred to us a case of some specimens from someone who had febrile respiratory illness, a civilian, who had recently traveled to the Pacific rim, I can't recall exactly where, but they were concerned about, obviously, a possible influenza or avian influenza. They had ruled it out at their lab with their initial test, but they wanted us to confirm and to do further testing, and we also did rule out influenza and we have a preliminary result of RSV in that patient. We're going to culture that specimen now and, hopefully, it will confirm that it was RSV, but just an example of how we are really starting to work more closely with the local public health lab because they're aware of our capabilities and vice versa, and I think it's been a mutually beneficial arrangement.

LtCol [redacted]: All right. Thank you, [redacted]

Is there discussion from any of the group on respiratory disease as [redacted] reported it or any other respiratory disease topics?

DR. [redacted] this is [redacted] The increased rates in Great Lakes, is that adeno? Do you have any details on that?

MR. [redacted]: Well, the most recent specimens that we have tested from Great Lakes, which would not be from that period, but, you know, Great Lakes is up and down all the time, all we've seen is adeno from there. We haven't seen any influenza yet from Great Lakes, and I should also mention, when I'm talking about FRI rates, that Leonard Wood surprisingly, I guess, doesn't really have anything in terms of their overall FRI numbers. I don't see anything out of the ordinary right now. They had about 60 cases in the past week of FRI, and that's not unusual for a camp of that size.

DR. [redacted]: And the adenovirus that you've seen, is it all adenovirus 4?

MR. [redacted]: Well, that's an interesting discussion in itself. It seems that over the past say six months, we're seeing a much wider variety of sero-types then we had in the past say four or five years. As you know [redacted] it's been almost all type 4s at all camps in that period of time, but again, this data is kind of preliminary and I haven't gotten it all sorted out yet, but there's definitely a wider variety of sero-type seen, including sero-type, if I'm not mistaken, sero-type 14, which we've never seen before, and this is all, of course, right in the midst of us starting being involved with the adenovirus vaccine trials at Great Lakes and Fort Jackson. So, everyone is scrambling around to try to figure this out.

DR. [redacted]: And this is all microneutralization?

MR. [redacted]: No, it's, in fact, it's not micro neutes at all. It's PCR sero-typing, but we've had good success with that, you know, we've been using it for the last couple of years, and it's been all type 4. So, we pretty much, we trust it pretty well our sero-typing, I mean, we do more than one primary and more than one test. So, we're pretty sure that these are accurate results, but we'll get those out, soon, but we're still trying to sort it out a little bit.

Deleted:

Deleted: utes (p

Deleted: h.)?

LtCol [redacted]: If there's no further discussion of respiratory disease, we'll go on to influenza.

D) INFLUENZA

LtCol [redacted]: AFIOH?

MR. [redacted] Sir, this is [redacted] The big news, I guess, since the last meeting here at this end has been samples received from Peru. We received a big batch of specimens from Peru. These were samples collected between June and August '06, the majority of them. The clinical reference lab determined that the majority of these are influenza A. Real time PCR analysis indicates that the majority of them are H1N1 subtype, which is pretty interesting. They have about 120 or so total samples, and 95 of these have been H1N1 subtypes; 15 have been H3N2 subtypes, and the handful, 11 or so, are still pending.

So, it's a pretty significant finding compared to what we saw last year. It may indicate that this is going to be a mixed influenza season.

MR. [redacted] Luke, this is [redacted] any (phone beeps) sequence information on those yet?

MR. [redacted] No, I'm just finishing right now all the subtype work and we're queuing these up for sequence analysis. I'll be very curious to see if they look like your isolates from NHRC or those others that we had talked about at the previous meeting.

MR. [redacted] All right.

MR. [redacted] Outside of the Peru isolates, we have received four isolates from Honduras. All four of those were influenza A, H3N2 subtypes, and we received a handful of isolates from Kenya, and these are all influenza B and those two are in the sequence queue. We've also received another handful of isolates from Hawaii, and interestingly, these too have been influenza A and they've been the H1 subtype showing that H1 is circulating outside of the Peru area, and these were obtained fairly recently, September and October. So, these are recent.

DR. [redacted] Luke, the Peruvian samples, you know, they come from the lab in Peru. Were there other countries involved in those sampling or were they exclusively from Peru itself?

MR. [redacted] Colonel McCall, do you have that RSRH permission?

LtCol [redacted] We don't have that with us, but we'll check on that and get with you.

MR. [redacted] I don't either. I just have Peru written, from what I have right in front of me right it just says Peru, but I do believe that there were two or three different locations that they were funneled in through.

LtCol [redacted] AFIOH, on the Honduras specimen, there was discussion in email and I think only a limited number of people have really seen that between CHPPM-West and people in the flu program. The description was of cases, actually, an outbreak in the Honduran area, I don't know exactly where, but with samples that you had already received, the thought is what they're experiencing is an H3N2 outbreak there. Does that pretty well summarize what you know at this time?

MR. [redacted] Yes. The subtyping information on what we have is that they're all, they've all been H3 subtypes.

DR. [redacted] I talked to [redacted], he was here yesterday, and it appears that these isolates are civilians and they do not include military personnel from Comayagua, from Palmerola Air Base.

LtCol [redacted] Okay. Is there any discussion of influenza from any of the other participants on the line?

MR. [redacted] You're asking about influenza?

LtCol [redacted] Yes.

MR. [redacted] This [redacted] again. I have a couple of things. We did find two new cases from Leonard Wood recently. They were both from mid-September. They were both H3N2 subtypes. They have not been sequenced yet. One of the trainees had been vaccinated prior, and we're following it up. We should have more Leonard Wood results from even more Leonard Wood results from even more recent specimens, hopefully today, and we'll include that in the report if it's available.

I don't think I have anything else. Oh, I reported last time on a small number of cases aboard a ship, the USS Tallulah. Those four cases were from different locations after a port stops in Phuket, Thailand, and in Pearl Harbor. The Pearl Harbor isolates, I believe, were H3N2, while the one isolate that came out of Thailand was H1N1, and those also have not been sequenced yet.

I think that's all I have about influenza.

LtCol [redacted] Any questions or other thoughts about influenza before we move on?

(No response.)

E) Q FEVER

LtCol [redacted] If not, is there any update on Q fever from any of the group?

(No response.)

LtCol [redacted] Here at the Central Hub, [redacted] wrote a short piece and shared it with us on diagnostic testing for Q fever. If he's agreeable and people on this telecon would be interested, we can send that out.

UNIDENTIFIED MALE SPEAKER: Yeah, that's fine.

DR. [redacted] I don't have a problem.

LtCol [redacted] We'll just include it with the minutes and announcements of this meeting then.

DR. O'DONNELL: Yeah, this is [redacted] I'd certainly like to see that. I sat in on a recent briefly from the Institute of Medicine, which (indiscernible) report on infectious diseases during the Gulf War, as well as during OIF and OEF and the subject of Q fever and the recently reported cases came, and afterwards in a discussion with one of the committee members, he allowed us how the whole serology of Q fever can be a slippery slope depending upon how results are interpreted and how the laboratory is doing it, and so, it's somewhat, at least to me, and I'm not a laboratorian, but it's somewhat reminiscent of the problems with things like Lyme Disease serologies. I guess care is necessary when interpreting, and so, if you got some take on Q fever serologies, I'd certainly be interested.

DR. [redacted] Yeah, this is basically a very short, you know, like a one pager or a one and a half pager with a few references on sort of the bottom line from, you know, all I could get or from the literature.

DR. [redacted] That probably will be a lot more informative to me than my own personal reading on the subject. That would be nice to see.

LtCol [redacted] Okay. Thank you. I found it very helpful.

Okay. Let's move on to the roundtable discussion, but first, let me ask anyone who has joined us since we identified to go ahead and identify now.

Col [redacted] This is Colonel [redacted] from CENTAF.

DR. [redacted] This is [redacted] I joined a little while ago. Thank you.

LtCol [redacted] Okay. I'll go ahead and start the roundtable.

4) ROUNDTABLE DISCUSSIONS

LtCo[redacted] I don't think we have the CDC Liaison with us today.

(No response.)

LtCol[redacted]: NHRC.

A) NHRC

MR.[redacted]: No, nothing further, thanks.

LtCol[redacted] Thanks, Tony.

NEHC.

B) NEHC

CAPT[redacted]: Hi, Captain[redacted] here. We had a report of a Sergeant, Marine Sergeant from Camp Lejeune who was admitted to the Naval Hospital there with falciparum malaria. That was 10 days after he got back from a six week assignment in Chad. We're trying to arrange to get the blood specimens sent up to WRAIR to Dr. Milhous and the prophylaxis he was on was doxycycline but he did admit missing a few doses. So, that's about all NEHC has to report.

LtCol[redacted] Thank you. And Dr.[redacted] lab will welcome the specimen, I'm sure. If you have any difficulty getting it there, please let me know. We're trying to encourage the submission of just this kind of specimen, as you know, and I really appreciate your bringing that to the attention of all the other folks on the telecon.

Okay. AFIOH.

C) AFIOH

DR.[redacted] This is[redacted] I wanted to be able to report that we started the QuantiFERON on Gold Mantoux trial. We've been working on that for some time, but it had come up earlier with the SS Ronald Reagan when they were hoping to be able to use that. It is a blood test, obviously, and it's one that we're going to be testing in trial with the TSTs in parallel. It's a ten month trial but we hope to have it completed sooner. They have begun hiring the staff already at Wilford Hall. AFIOH will be running the actual readings of the assay. We'll be doing 2400 BMTs. Just to let you know that it's finally underway.

LtCol[redacted] It's good to hear that. Thank you.

DR.[redacted] This is[redacted] I want to give you an update. We have Lieutenant Colonel[redacted] and[redacted] this week visiting UCOM and CHPPM-Europe to finalize the details on the UCOM Landstuhl medical-influenza surveillance processes. They'll be able to give us more details when they get back next week or the week after.

We additionally were able to get them to Hungary to begin that collaboration in having Dr[redacted] (ph.) had met them yesterday at the airport and they're today to finalize the processes for the influenza surveillance site there.

In addition to that, we got the memorandum finalized for the Kenya sites for influenza surveillance. So, we're making good progress on those.

Furthermore, I'd like to invite any of you who may be in the area from AMSIS to meet with us while you're in the area, if that would be helpful for you. Let us know and we'd be glad to visit with you either at AMSIS or at the site here, if that would be helpful.

That's all I have.

LtCol[redacted] Thanks, Dr.[redacted]

DR.[redacted] I just have a question. This is[redacted] This memo

with [redacted] does this include [redacted], or how is that worked out, if you know?

DR. [redacted]: I don't know. Say that again. What was the --

DR. [redacted]: How is the sharing of specimens and whatnot, if you know, shared between [redacted] and the CDC and USAMRU-K in Nairobi. Is that --

DR. [redacted]: I don't know. I can send you a copy of the memorandum, if that'd be helpful.

DR. [redacted]: Yeah. If you could, I'd appreciate it.

DR. [redacted]: Okay.

DR. [redacted]: Thanks.

LtCol [redacted]: Okay. Are there any questions regarding what's been just reported by AFIOH before I move on?

MR. [redacted] One more thing from AFIOH. I received word from AFRIMS that one of the abstracts that we submitted in collaboration with AFRIMS to the American Society for Tropical Medicine and Hygiene in Atlanta, Georgia, was accepted. So, that will be presented, I believe, next week, and again, there are authors from both AFRIMS and AFIOH on that work. That work is the Nepal outbreak, the H3N2 outbreak in the summer of 2006.

LtCol [redacted] And that was [redacted] speaking?

MR. [redacted] Yes, sir.

LtCol [redacted] Thank you. Okay.

Outside of AMSARA, do we have anyone from CHPPM on the line?

(No response.)

LtCol [redacted] And then from CHPPM-West, I don't think they are on the line as they're traveling.

(No response.)

LtCol [redacted] From Health Affairs?

D) DoD-HEALTH AFFAIRS

DR. [redacted] This is [redacted] I don't think I have anything new to report.

LtCol [redacted] From the GEIS-Central Hub.

E) DoD-GEIS CENTRAL HUB

DR. [redacted] This is [redacted]. I just want to report that we had a meeting with Lieutenant Colonel [redacted] and his staff from the Division of Preventative Medicine. They're involved with setting up and training of epidemiology teams in the Republic of Georgia (indiscernible) region, and they are interested in seeing if we are able to support expansion of seasonal influenza surveillance in that country. The answer from out standpoint is definitely yes. We're going to work that out with NAMRU-3 because that's what the regional laboratory that would take care of that. Those samples, if we can set this up, would not go directly to AFIOH. They would go to NAMRU-3 since they already sample in Azerbaijan, in the neighboring country.

So, I just wanted to report on that and I'll update the group next time on where that stands.

LT [redacted] This is [redacted]. I have in my hands a draft report from our NASA collaborator, Dr. Assaf Anyamba, on predicted global climatic conditions during the next year or so, and I'll send it around to the teleconference group when it's final, but I wanted to note the main point, which is a prediction of a moderate to strong El Nino southern oscillation or the NSO (ph.) event in the later part of 2006 through the early part of 2007, and that would involve heavy rain and flooding in coastal

East Africa, Kenya, and the northern part of South America on the western coast, including Peru and the southwest U.S., and conditions like that in all of those places have been linked with vector borne diseases and rodent borne diseases. So, it could be something to watch for over the next few months.

LtCol [redacted]: Thank you. Anything else from the Central Hub? If not, do we have NORTHCOM on the line today?

(No response.)

LtCol [redacted]: I didn't hear from NORTHCOM or AFMIC.

(No response.)

LtCol [redacted] WRAMC.

F) WRAMC

MS [redacted] Yes, hello, this is [redacted] I just wanted to give a quick update on *Acinetobacter* infections, which is my real job here. The rate of resistance to imipenem 2005 was 23 percent, and to date, in 2006, it's 41 percent of all positive cultures. So, we're seeing an increase in resistance. In August alone, among eight patients with a positive culture for resistant *Acinetobacter*, all eight were resistance to imipenem. So, that's a trend that we predicted and it's still continuing, and I just wanted to report on that, and I'll be reporting on that continuing. Thank you.

LtCol [redacted] Is there discussion from the group?

(No response.)

LtCol [redacted]: Okay. Thank you.

CENTAF.

G) CENTAF

Col [redacted] Nothing significant to report here. Thank you.

LtCol [redacted] Thank you.

Do we have anyone on the line from POPM, MAMC, or SOUTHCOM today?

(No response.)

LtCol [redacted] If not, is there anyone that I've missed?

(No response.)

LtCol [redacted] Okay. Is there any further discussion before we move on to the time of the next meeting?

(No response.)

LtCol [redacted] Proposed date is November 9th. Are there any objections to that?

(No response.)

LtCol [redacted] If not, I'll take that as a yes.

DR [redacted] Yeah, this is [redacted] I'm just going to bring up the fact that that's the week of the TROPMED meeting. Thursday the 9th is the last day of the meeting, so I don't know if many of you will be gone. You might want to delay this until Friday or, I don't know, some other time.

UNIDENTIFIED FEMALE SPEAKER: Friday is a holiday.

DR. [redacted] Okay.

UNIDENTIFIED FEMALE SPEAKER: Isn't it Veterans Day?

MS. [redacted] Yes, the 10th is a holiday. What about moving it to the 16th?

LtCol [redacted] How does the group feel about that? NHRC?

MR. [redacted] Anything would be fine with us.

[redacted]: Let me jump in here. We just checked the dates. Ooops.

(Laughter.)

DR. [redacted] The TROPMED is 12th through the 16th, not the 5th through the 9th as I mentioned before.

UNIDENTIFIED FEMALE SPEAKER: Well, let's keep it to the 9th, I guess.

LtCol [redacted]: Okay. We're hearing keep it to the 9th. Okay.

UNIDENTIFIED FEMALE SPEAKER: Fabulous.

LtCol [redacted] Very good. Well, once again, thank you for joining us. I'm guessing there's nothing else to discuss before we get off, but this is the last chance for anyone.

(No response.)

[redacted] Okay. Once again, thank you.

(Whereupon, at 11:35 a.m. EDT, the foregoing matter was concluded.)

Cc: [redacted] MAJ USACHPPM-Wash DC
Subject: RE: RMES DAILY REPORT (06 October 2006)

Maam:

The 1st case was [redacted] On the report entered into the RMES system, the date of onset was listed as 3 OCT 2006. The report was included in the RMES report sent out on 6 OCT.

Of note was that in the RMES report from 6 OCT is that it stated that AA County had been notified (so according to the report AA County was notified within 48 hours).

I spoke with the infection control nurse at WRAMC on 6 OCT.

I think the idea that Army Public Health didn't react to the first case until the second case is not necessarily true. It seems more correct to state that the second case prompted a more vigorous response.

BTW, for the second case it appeared on the RMES report on Monday 8 January. The EPICON was requested on the 10th of January.

I was wondering, does Ft. Meade/KACC enter its own RMEs or are the reports entered by Walter Reed. Can you tell me if KACC was notified by WRAMC about the cases that occurred and how quickly?

What he meant was that because there had been a CDC report on carrot-juice-linked bot, he discussed with the WRAMC epidemiologist so that any pertinent info could be gathered when that first case was still being assessed as to individual exposures (of that infant at that time). As it turned out, the Meade case of Oct was not linked to the other CDC-reported case(s).

Cc: [redacted] OL KACC-Ft Meade
Subject: RE: Ft Meade EPICON update

I'll let Dr. Blythe comment on the false sense of direct and active CDC collaboration; but the [redacted] should know that we did not "take CDC off the case" per se. CDC neither invited itself to directly investigate nor showed any interest in conducting laboratory testing initially.

On the point about time it takes to get results, the [redacted] would need to be specific what test they're talking about. The initial toxin analysis, for example, was resulted way back. Culturing could take much less time as well, but is not as simple and reliable (actually, not as sensitive if stool is absent organisms or low inoculum / low count) as some would have the [redacted] believe. More importantly than any of this, however, is that it is of NO IMPACT OR IMPORTANCE WHATSOEVER to the clinical care of these babies or our ability to predict a third case. Neither is environmental testing. While they are not altogether irrelevant to the individual or family risks in that community, they are irrelevant from the standpoint of prediction or mitigation---which is all that any parent would have practical cause to publicize via the media. It is a non-issue, and I would challenge any world expert to tell the [redacted] otherwise with good evidence to back up their opinion.

Thanks for making the communication. I am happy to 'augment' as needed.

ALCON,
As per our conversation I did return [redacted] call to give him an update as to the results of the state testing and the fact that we were awaiting a response from CDC as to whether they are willing to perform the subtyping and from this we would determine our next COA. He was comfortable with the response but had several concerns and questions:

-Was he not to contact the state since I was returning his call - I assured him that he was certainly able to contact the state and reminded him that Dr Russo had in fact given them her card so that they could contact her if they needed to do so. Reinforced that we were working together as a team i.e.. EPICON Team, State and Fort Meade

-Why has it taken the state so long to get this answer? He had spoken with several microbiologist experts (one from Finland) and was told that results could have been received within 2-3 days, and it had taken until now to get lab results....

-Someone (not sure of name, he would call me back with that name) from the CDC had notified him that they (CDC) had been taken off of the case so why were we waiting to hear from the CDC on conducting further testing? Why couldn't the specimen be sent to another lab for testing (he stated he had researched and spoke to several different labs who could and were willing to do the testing)

-Why are we not testing the soil? He was told by the CDC that soil testing would be performed before they were taken off of the case.....

Good day COL [redacted]

As we all discussed at last week's town hall meeting, below is a short weekly update of the EPICON team actions to date. I know we discussed you speaking personally with just the 3-5 families with the highest level of interest (which is certainly the most effective way to discuss concerns of thos particular families). However, I strongly encourage that this information be widely publicized beyond just that group to preempt potential media focus (which is possible and potentially likely based on past community interest and history of actions). I'll be out of the office beginning this afternoon until Monday morning, but can still read email via my Blackberry. Please let me know what else I can provide to you.

++

[redacted] expected. The Maryland DHMH Laboratory has contacted the Center for Disease Control and Prevention (CDC in Atlanta, GA) to see if they are willing to do the subtyping and expect a CDC response by the end of the week.

The EPICON team is continuing discussions with the Maryland Department of Health and Mental Hygiene (DHMH), the CDC, the laboratory in California, Fort Meade medical authorities and other experts in this field to determine next steps in the investigation.

The Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases for 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at:

All,

COL [redacted] would like to schedule a teleconference tomorrow at 1 p.m. to discuss current status of the investigation and how to address the concerns voiced below.

COL [redacted] priorities are:
1)Risk Communication with the families (addressing concerns, direct contact before the weekend, and determining the best individuals to contact the family)
2)Status of subtyping lab support from the CDC. Perhaps Dr. Blythe can provide current status on the request.
3)Next steps

We will schedule a telephone bridge and will forward that information to you some time tomorrow morning.

Thanks,
MAJ [redacted]

Subject: RE: Ft Meade EPICON update

I'll let Dr. Blythe comment on the false sense of direct and active CDC collaboration; but the [redacted] should know that we did not "take CDC off the case" per se. CDC neither invited itself to directly investigate nor showed any interest in conducting laboratory testing initially.

On the point about time it takes to get results, the [redacted] would need to be specific what test they're talking about. The initial toxin analysis, for example, was resulted way back. Culturing could take much less time as well, but is not as simple and reliable (actually, not as sensitive if stool is absent organisms or low inoculum / low count) as some would have the [redacted] believe. More importantly than any of this, however, is that it is of NO IMPACT OR IMPORTANCE WHATSOEVER to the clinical care of these babies or our ability to predict a third case. Neither is environmental testing. While they are not altogether irrelevant to the individual or family risks in that community, they are irrelevant from the standpoint of prediction or mitigation---which is all that any parent would have practical cause to publicize via the media. It is a non-issue, and I would challenge any world expert to tell the [redacted] otherwise with good evidence to back up their opinion.

Thanks for making the communication. I am happy to 'augment' as needed.

Importance: High

ALCON,
As per our conversation I did return [redacted] call to give him an update as to the results of the state testing and the fact that we were awaiting a response from CDC as to whether they are willing to perform the subtyping and from this we would determine our next COA. He was comfortable with the response but had several concerns and questions:

-Was he not to contact the state since I was returning his call - I assured him that he was certainly able to contact the state and reminded him that Dr Russo had in fact given them her card so that they could contact her if they needed to do so. Reinforced that we were working together as a team i.e.. EPICON Team, State and Fort Meade

-Why has it taken the state so long to get this answer? He had spoken with several microbiologist experts (one from Finland) and was told that results could have been received within 2-3 days, and it had taken until now to get lab results....

-Someone (not sure of name, he would call me back with that name) from the CDC had notified him that they (CDC) had been taken off of the case so why were we waiting to hear from the CDC on conducting further testing? Why couldn't the specimen be sent to another lab for testing (he stated he had researched and spoke to several different labs who could and were willing to do the testing)

-Why are we not testing the soil? He was told by the CDC that soil testing would be performed before they were taken off of the case.....

Subject: RE: Ft Meade EPICON update

I am willing to do by phone. Cannot come down to Meade today for WJLA interview. Key message is that any environmental sampling being discussed by the team is purely in the interest of advancing general knowledge about the ecology of C. botulinum in Maryland. There is NO environmental sampling that will guide an intervention or preventive measure to benefit the community or any individual family, and this can be said generally about NON-foodborne botulism.

Most of the principals in this investigation are meeting telephonically in about an hour. After that meeting I will contact this reporter--we will likely suggest, given that they are willing, that the reporter also speak to the MD public health expert (if he has not done so already), a CDC expert and/or the national expert in California who has been consulting on these cases with us. We want to strongly emphasize the message that this investigation was conducted in accordance with national practice standards and in consultation with nationally recognized experts.

Ms. [redacted]

Per our conversation, here is the media request that I got from the Baltimore Sun:

Reporter: Brad Olson
Baltimore Sun
Phone: (410) 332-6100
E-mail: bradley.olson@baltsun.com

Request:

Mrs. [redacted] called the Baltimore Sun claiming that the installation is not doing enough to find out what caused the isolated cases of infant botulism at FGGM. Is the post going to be testing the environment, specifically the soil? If not, why was that decision made? Mr. Olson also had questions about how the investigation is going. I sent him a copy of the most up-to-date news release, which is attached in this e-mail. The deadline for this story is 4 p.m. on 2 Feb.

We are requesting that USACHPPM provide a subject matter expert who can comment on the investigation to the reporter and explain why the installation is not doing environmental testing.

We also wanted to inform you that [redacted] in our office was misquoted in the Washington Post yesterday. [redacted] was trying to explain that botulism is everywhere in the soil.

Then he said in an answer that we the installation would do whatever needed to be done to investigate the cause.

The reporter made the lead connection incorrectly that we would be doing environmental testing and were just waiting for the results. We will do a retraction with the Post.

Call me if you have a question. My staff is doing an excellent job trying to keep this from making another story. But we may need your help.

<<bal-te.ar.botulism03feb03,0,5400604.htm>>

Vexing infant botulism provokes threat of suit By Bradley Olson Sun Reporter Originally published February 3, 2007 It's one of the rarest infectious diseases, affecting an average of only 100 babies a year in the United States, but infant botulism infected two babies living on the same street at Fort Meade in recent months - puzzling researchers.

Clusters of the illness are not unprecedented, experts say, and the ubiquity of the bacterial spores that cause infant botulism makes isolating one source almost impossible.

That is especially true in this case, where the military base also happens to be an Environmental Protection Agency Superfund site.

Both children survived the illness, but one family confirmed yesterday that it has hired a lawyer who will likely sue the Army, claiming that military officials have been negligent in seeking the cause of the outbreak. The parents of the other child say they do not blame the military and do not plan to join a lawsuit.

On Thursday, base officials confirmed that both cases, the first diagnosed in October and the second in December, came from the same strain of Clostridium botulinum bacteria.

"I would be hesitant to reassure everyone by saying this is a freak thing and this is over," said [redacted] a physician and director of epidemiology and disease surveillance at the U.S. Army Center for Health Promotion and Preventive Medicine in Aberdeen. "Maybe there will be a third case and a fourth case. We can't say there won't be another one."

Army doctors involved in the investigation say they have followed medical protocol, conducting an investigation with help from experts at the Centers for Disease Control and Prevention in Atlanta, Walter Reed Army Medical Center, Maryland Public Health Administration and Anne Arundel County Department of Public Health.

Infant botulism develops in newborns - usually those between 3 weeks and 6 months of age - when they ingest bacteria that produce a toxin inside the large intestine. The toxin attaches to nerves in the body and paralyzes them. Although the condition is treatable and most babies eventually recover, it causes several frightening symptoms, including paralysis and respiratory problems.

Such was the case with [redacted], now 10 months old, whose family lives on the Anne Arundel County military base.

On Oct. 2, [redacted]k noticed that the baby became fussy and was not feeding well. Thinking he was teething, she put him to bed. The next morning, he made an odd, grunting sound, and when she picked him up, his head flopped.

She took him to Bethesda Naval Hospital, where doctors, thinking [redacted] was dehydrated, gave him fluids intravenously. When his eyes began to gloss over, [redacted] recalled, [redacted] was rushed to Walter Reed Army Hospital, where a young physician noticed symptoms of infant botulism she had seen in a case during her residency.

She went home to research the condition and in the meantime, doctors tested him for meningitis. When that came back negative, they sent him to get a CT scan to rule out a neurological disorder. During the scan, [redacted] vital signs plunged, and a gaggle of doctors and nurses rushed into the room, reviving him and putting him on oxygen.

Once infant botulism was definitively diagnosed, they treated him with a drug called "Baby-BIG," which slightly relieves symptoms and doesn't allow the toxin to paralyze any other nerves.

"My son was so sick, he couldn't even open his eyes," [redacted] said. "He had over 50 needle marks in him because his veins kept busting. To watch that, it was absolutely the most terrifying, horrible experience I've had to go through as a mother, and I've got four kids. I don't want any other families to have to go through that."

[redacted] has been fine since his recovery, but his mother became angry when, on Jan. 9, a Walter Reed doctor called her to say another child on her street had been diagnosed with infant botulism. At that point, she became convinced that the military was not committed to finding a cause.

Michael Archuleta, a Texas-based lawyer who is also a physician and is representing the [redacted] family, said he believes a pile of debris, about a block from the street where both families live, is the source of the toxin, and will file a negligence claim with the Army.

"We have two cases of infant botulism occurring in the same time frame, very close to one another, that is epidemiologically very improbable unless it came from an external or environmental source," he said.

A base spokeswoman confirmed that there was a debris pile and said it was removed and the site was covered with hay on Jan. 7.

The mother of the second child, who asked not to be identified when contacted by The Sun, said that her daughter is no longer sick and that she does not wish to join any potential lawsuit.

In interviews with both families, investigators have determined that the source was not food such as honey, which has proved to be a source of infant botulism.

Fort Meade and Army officials, as well as several leading independent epidemiologists and infectious disease experts, insist that testing soil in infant botulism cases would be fruitless because the bacterial spores that cause it are common and naturally occurring.

Dr. John Bartlett, a professor of medicine at the Johns Hopkins University who specializes in infectious diseases but is not involved in these cases, said that testing soil is "pointless."

"That kind of activity just doesn't pay off," he said. "You don't look for it in dirt, and even looking for it in a food source is going to be a long shot. I mean, two cases in the same geographic area are unusual, but I wouldn't know quite how to go about finding a source. Usually, we don't try because we don't find it."

Archuleta and the [redacted] believe that DNA testing could establish an exact match between the two cases and the dirt pile or other soils, and they intend to use that evidence in any litigation.

The toxin is too ubiquitous, Petrucelli, the Army epidemiologist, said, and the DNA-testing process too inconclusive. That Fort Meade was built on a landfill and is currently monitored by the Environmental Protection Agency would not have any impact, because those sites focus on chemical agents and other toxic substances, not naturally occurring substances, he said.

Dr. James Campbell, a pediatric infectious disease specialist at the University of Maryland School of Medicine, who is not involved in the case, said unlike food-borne botulism, which generally infects adults and which investigators almost always link to a food source, there is often no identified source for the infant variety.

[redacted]

The EPICON team is continuing discussions with the Maryland Department of Health and Mental Hygiene (DHMH), the CDC, the laboratory in California, Fort Meade medical authorities and other experts in this field to determine next steps in the investigation.

The Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases for 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at:

http://amsa.army.mil/AMSA/amsa_home.htm

Subject: RE: NARMC Ops

Good Afternoon,
I understood there is some question about the definition of a Superfund Site and the relationship of the sites on Ft Meade to the 2 infant botulism cases. BLUF: there is no relationship.

The parents of the infant who first contracted infant botulism on Ft Meade ([redacted] family) back in October, feel very strongly that the installation is covering up the cause of the infant botulism and have involved as many media outlets as possible to get their story out--that the soil on the installation is making children sick. The most recent allegation by the [redacted] family involves an alleged connection between the "Superfund Sites" here on Ft Meade and the source of the botulinum bacteria which made the two infants ill.

A "Superfund Site" is a phrase coined from the late '70s early 80's which describes locations throughout the country where hazardous materials and wastes were inappropriately buried and where federal funds were set aside and directed (referred to as the Super fund) to clean up these areas...Remember "Love Canal" in 1979? Love Canal was really what prompted the federal government to get involved in the clean-up of extremely hazardous areas (mostly former waste dumps/landfills) and it became one of the first Superfund Sites.

Since there were so many of these hazardous waste disposal sites in the U.S, the federal government (EPA) had to rank-order the sites from most to least contaminated/hazardous. This rank-order listing of these superfund sites is referred to as the National Priorities List. In the early 1990s (1994 I believe) EPA determined that Ft Meade had a couple of locations where hazardous wastes generated decades ago from routine landfill operations, laundry and dry cleaning operations, maintenance activities and DRMO, were disposed of inappropriately. These sites are now listed on the National Priorities List and are eligible for federal funds ("superfunds"). These sites correspond to locations away from the main cantonment area--not near housing areas. The relative risk of human contact with any contaminant associated with these sites is very low. Clean up of these areas is ongoing and will take years to complete. There is environmental monitoring performed on/around these sites to ensure contaminants are not adversely affecting the environment and/or human health.

I hope this provides you an explanation of the superfund sites on Ft Meade and the relationship (or lack there of) to infant botulism.

No. DoD has no oversight on dependent mortalities so there are no data sources I can access.

MAJ [redacted] said you could try contacting Dr. Blythe (410-767-6677) or Dr. Russo (410-222-4114). They may be able to access info for Ann Arundel, but I'm not sure they would be able to determine anything specific to Ft. Meade.

Good luck.

Cc: [redacted] MAJ USACHPPM; [redacted] Mr LMI
Subject: RE: RFI : Birth cohort at fort meade

I had researched this early in the investigation because of the possible association between infant botulism and SIDS and found that the Armed Forces Institute of Pathology (AFIP) has no visibility of CONUS dependent fatalities due to G-1 casualty operations policy.

The pathologist at AFIP recommended that I call the Baltimore Medical Examiner's office.

I did this and found that there had been no recent deaths (CY 2003 - 2006) due to infant botulism and only 15-22 per year due to SIDS in Baltimore city (about 50 SIDS per yr in the state of Maryland). I did not request information regarding children.
Of note, the examiner's office does not test SIDS cases for other probable causes such as infant boutlism.

You can get information from the 2005 vital statistics annual report from the following website. http://www.vsa.state.md.us/doc/05annual.pdf
It breaks the data down by county so you could get the number of infant deaths for Ann Arundel (see page 198 for SIDS cases by county). The report also contains info regarding childhood deaths.
These deaths would include military dependents, but they do not have information regarding what proportion are among military dependents.

Hello,

I was on the telecon with you and others from CDC last week - we have not met in person yet.

We don't have a definite plan yet in terms of which non-cases to interview or a final questionnaire, but wanted to get a comparable group so I searched for any infants residing within the Ft. Meade zip who were born in 2006. I have identified 214.

I'm not sure if we will take a random sample of this group or attempt to identify another neighborhood or neighborhoods within Ft. Meade to target based on the addresses we get back in our search. Basically it's still debatable.
The tentative plan is to create a more generic survey addressing potential environmental exposures so that we can generate hypothesis given that further questioning of the case parents did not yield much. I'm not sure how long it may take to finalize this survey. This will probably be discussed in more detail on the telecon this afternoon.

Are you going to be at the townhall this evening? If so, I could bring you a file with SSNs. Otherwise, I can figure out a secure way to send it to you electronically.

[redacted],

I was asked to pull info to identify a 2006 birth cohort at Ft. Meade.

I was able to pull identifying information for newbornes in the Ft. Meade zip (20755), which was the same zip for the 2 cases. However, beneficiary residence or address is not available in M2 (DEERS) so this won't be helpful should we need to target a particular subset to survey.

If I were to furnish you with the SSNs for this group would AMSA be able to pull this info?

Subject: Ft Meade EPICON update (UNCLASSIFIED)

Importance: High

Dear COL [redacted]

As promised, here is what will likely be the last weekly update re the EPICON team. I've tried to draft it in a way that your public affairs staff could use in updating the residents of Fort Meade:

[We] Epidemiologists from the Army Center for Health Promotion and Preventive Medicine advised the Preventive Medicine Staff of the Walter Reed Health Care System and the Kimbrough Ambulatory Care Center to adopt strategies to ensure increased vigilance in diagnosing infant botulism. Two infants residing on Fort Meade were diagnosed and treated for the disease at Walter Reed Army Medical Center. The first case of infant botulism was diagnosed in October 2006 and the second in December 2006. Both children, who live on Oliver Court, have recovered without complications.

The Epidemiological Consultation team has completed its assessment and is planning to deliver a written report for the Fort Meade garrison commander in about three weeks. The team will work closely with the Army Medical Surveillance Activity to monitor incidence of cases within DOD.

COL [redacted], your staff may wish to approach the Maryland Department of Health and Mental Hygiene to see if they would be willing to include this information about their efforts--it should be attributed to DHMH rather than CHPPM:

"The Maryland Department of Health and Mental Hygiene and the U.S. Centers for Disease Control and Prevention's laboratory specializing in botulism are considering special testing to determine specific bacterial subtypes using samples from the two infants. While subtyping would not help to predict or prevent future cases, it could contribute to a general scientific understanding of the bacteria."

Since the assessment itself is complete and we're underway with the report itself, we do not plan to continue sending weekly updates. However, if there's anything else we can provide, please don't hesitate to contact me/ us.

INFORMATION PAPER

DASG-PPM-NC
8 February 2007

SUBJECT: Infant botulism cases at Ft. Meade

1. Purpose. To provide information on infant botulism at Ft. Meade, MD

2. Facts.

a Two infants living on the same street approximately 400 feet apart, at Ft. Meade contracted infant botulism in Oct 06 and Jan 07, respectively. Subsequent investigation did not reveal a common source. A local newspaper reported that one of the families plans to sue the Army, claiming that they were negligent in seeking the cause of the two cases. They reportedly believe that dirt from a construction site one block away from the street where both families live is the source of the spores, that soil testing should have been undertaken, and that the Army is intentionally avoiding such sampling because Ft. Meade is a Superfund site. The fact that *Clostridium* spores are everywhere in soil and dust, makes isolating any one putative source impossible, and experts agree that testing the soil in infant botulism cases is fruitless.

b. Infant botulism, also known as intestinal botulism, is a rare but serious paralytic illness caused by a nerve toxin produced by a spore-forming bacterium, *Clostridium botulinum*. *Clostridium* spores are ubiquitous worldwide, in soil and dust; most cases of intestinal botulism are likely to derive from ingestion of spores from common, airborne dust. After spores are ingested, they germinate in the intestines and produce bacteria which manufacture and release botulinum toxin. Intestinal botulism typically affects children younger than a year and rarely affects adults, because most adults and older children have natural defenses that prevent growth of the bacteria and elaboration of toxin. Other than avoiding feeding infants honey and corn syrup which are well known to present a risk of having spores, there is no known way to prevent the disease. Each year in the US, two cases are reported for about every 100,000 live births; this translates to about 5 cases per month throughout the country

c. The MEDDAC Commander at Ft. Meade requested assistance to investigate, and USACHPPM formed an Epidemiologic Consultation (EPICON) Team, which also consulted subject matter experts from the Centers for Disease Control and Prevention (CDC), the California Department of Health Services (CDHS), the Maryland Department of Health and Mental Hygiene, and the Anne Arundel County Health Departments. CDHS was consulted because of their nationally renowned expertise in infant botulism. The Team interviewed the affected infants' parents using the CDC's infant botulism questionnaire, modified for military beneficiaries. Stool specimens had been collected by local physicians and tested by the Maryland Department of Health and Mental Hygiene, and offered to the CDC for sub-typing. Investigators and Ft. Meade officials conducted town hall meetings to address community concerns and provided information sheets to local residents. Investigators also provided press releases and conducted media interviews.

d. [redacted] Interviews with each family revealed no common exposures that may have been a likely source of the outbreak, and no possible food sources. The risk communication effort was intensified due to the high level of community concern regarding transmission and environmental factors discussed in the interviews, such as nearby construction. This quelled the fears of most Ft. Meade residents; however, some still wonder why environmental sampling and testing is not being done.

e. The Maryland Department of Health and Mental Hygiene is requesting determination of specific bacterial sub-types from the CDC. The CDHS is considering a research project that would attempt to isolate *C. botulinum* from soil or house dust samples that could be obtained from Ft. Meade. However, any results that may derive from the laboratory work of either the CDC or the CDHS in regard to this two-case cluster would contribute nothing toward identifying the source, predicting the emergence of additional cases, or mitigating future infections. In fact there are no known, specific, public health interventions to prevent non-foodborne, infant (intestinal) botulism because *C. botulinum*—when isolated from environmental samples—are traceable to multiple locations and not limited to any narrowly identified source. Instead, any Ft. Meade-associated research activities would occur strictly to advance the body of scientific knowledge about these bacteria and their ecology in Maryland.

f. EPICON Team recommendations include: (1) Military Health System providers throughout the National Capital Region (NCR) be made aware of the two cases, to reinforce the need to consider botulism in the differential when evaluating infants with paralytic signs or significant constipation; (2) NCR clinic staff receive a message reinforcing the need to communicate reportable medical events to both civilian and military public health authorities; (3) NCR beneficiaries who are parents of newborns and infants be informed about intestinal botulism as part of child health education; (4) Army epidemiologists enhance surveillance for botulism cases.

EPIDEMIOLOGICAL CONSULTATION TEAM AND ITS MISSION AT FORT MEADE
16 Jan 07

BACKGROUND:
In response to lingering concerns about the two cases of infant botulism at Fort Meade, an epidemiological consultation (EPICON) team was requested to assist the medical community here at Fort Meade in its investigation. The EPICON team arrived at Fort Meade on Friday January 12th to begin its mission to investigate the occurrence of these cases. This fact sheet provides some background information about the team and its mission.

What is an EPICON team?
Epidemiology is the science devoted to investigating how population factors and the environment influence the occurrence of diseases or injuries. The team then applies this science to find possible causes, risk factors and opportunities for prevention.

Who is on the EPICON team? Where are they from? What are their specialties?
The EPICON team members are from the U.S. Army Center for Health Promotion and Preventive Medicine, part of the Army's Medical Command, who specializes in preventive medicine, environmental health, epidemiology, and communication about health matters when public concerns are high. In conducting this study the team is collaborating with a physician-epidemiologist from Anne Arundel County's public health department, the Kimbrough preventive medicine staff, the Centers for Disease Control and Prevention (CDC) and the California state health department.

Why is the EPICON team here?
The team was called by the Kimbrough Ambulatory Acute Care Hospital and Garrison Commanders because they believed someone from outside Fort Meade was needed to review the situation and provide advice while allowing Kimbrough to continue their important clinical and preventive medicine mission without disruption.

What methods is the team using to try and find answers?

The team is working to determine if there is any connection between the two cases of infant botulism. The team has interviewed the affected families to identify products used, places visited, possible common exposure, etc. They are reviewing clinical test results on the affected children during their illness, and will review more detailed analysis currently being done at a Maryland state laboratory which will identify the specific subtype of botulism bacteria. Team members are also looking at disease surveillance reports and other data to see if the Fort Meade community or Anne Arundel County has experienced similar cases.

Will environmental sampling be done?
It's certainly understandable why finding the cause is so important to families with young children. Focused environmental sampling in specific areas may be conducted for purely

scientific reasons, such as to determine where the bacteria might be present. But random sampling throughout a wide area is unlikely to provide a definite link to the two Fort Meade cases or help direct future preventive measures, or provide a definite link to one or a few specific areas of contaminated objects or soil. This is because the botulism-causing bacteria are widely distributed in many environments around the world.

How long will the team's investigation take?

The results of the subtyping of the bacteria from the affected infants are expected to be completed on or about January 20th. This information is critical in answering the question, "Are the two cases connected?" However, the team's mission will not end there. The EPICON team will continue to conduct a thorough review of the local surveillance data and existing scientific literature; and continue to collaborate with the Fort Meade medical authorities, the Fort Meade garrison, as well as with Anne Arundel County and CDC partners before finalizing its report. The team anticipates delivering a report to the Garrison Commander by the end of February.

Where can I learn more about infant botulism?

Subject: RE: CDC testing (UNCLASSIFIED)

Classification: UNCLASSIFIED
Caveats: NONE

Good Morning All:
[redacted], I absolutely agree with you in that if there are any requests for information (RFIs) from anyone with respect to installation (FT Meade) information, the RFI should be answered by an installation staff member. Anything medically-related to the bot tox case (or any medical information) should be managed by my primary POC here, LTC [redacted]. If she needs assistance from CHPPM, AA County or WRMAC PM, she will contact the appropriate POC and be the conduit to respond to the RFI. Additionally, I desire LTC [redacted] be the conduit to communicate medical information to COL [redacted] or whomever he designates.

COL [redacted] sent an e-mail message this past weekend requesting support in terms of a review of the message he will send to the public (and place on the Ft Meade website). He would like to use the recommendations from the EPICON report [para 9a(1)-(9)] as the basis for his message. AND he wanted to update the community on the status of the recommendations.

As you know, we implemented recommendations 9a(1) through (4), (8) and (9). My concern was that there were recommendations made in the EPICON report that we (FT Meade) have no control over [i.e. 9a(5)-(7)] so I am not certain how to address those recommendations. Perhaps you can give me and [redacted] an update/some ideas.

Lastly, thank you all again for your support. As you know, the [redacted] family continues to pursue this and claim a cover-up. I doubt we will ever squelch their concerns and if it were my baby, I might feel the same way.
[redacted], I did not know that you were retiring this quickly and certainly hope that retirement brings you some much-needed rest, recreation, and quality time with your family. If there's anything you need, don't hesitate to call.

Thanks for drafting. I want COL Cummings' input first. If your flight beats me tomorrow I'll send over my address and endorse.

[redacted]

Let me know what you think of this. I might specify that you (+/- via your PM shop) be the principal conduit for info flow, but I cannot presume you'll take that

Subject: FW: CDC testing (UNCLASSIFIED)

Classification: UNCLASSIFIED
Caveats: NONE

Sir,
Here is the message I want to send to the group.

([redacted] Mr USACHPPM; [redacted] Ms USACHPPM; [redacted] LTC WRAIR-Wash DC; [redacted] MAJ USACHPPM-Wash DC; [redacted] LTC KACC-Ft Meade; [redacted] Ms USACHPPM; hdruss11@aacounty.org; Blythe, David (Maryland) (CDC dhmh.state.md.us), [redacted] COL KACC-Ft Meade).

Appreciate your thoughts before sending.

VR,
[redacted]

All,

As many of you know COL (DR) [redacted] is retiring very soon. He is currently clearing and will no longer be working this EPICON. He has asked LTC [redacted] to stand in as the PM physician as we move forward (with MAJ [redacted] support if available).

Recent events include:
1) This week [redacted] has contacted Ms. [redacted] (CHPPM Risk Communications) and Dr. Russo (AA County Public Health) reference our investigation. He has expressed great concern with our investigation (see message below).
2) CDC lab results are expected with the next two weeks.
3) Fort Meade SJA has been in contact with me. COL [redacted], Fort Meade Installation Commander, wants to publish an article on our investigation in the post newspaper. He is asking if we have any objections to publishing the information summarized in the draft EPICON report.

In my conversation with COL [redacted] he has emphasized we focus on certain things as we move forward:

1) Be open and forthright but we should not tailor our EPICON or responses to a single individual and instead should focus on the entire FT Meade community.
2) Risk Communication, PAO and SJA (legal) must be involved in all communications.
3) We must speak with a common voice and through a common source. We feel possible sources could be either Dr. Russo in the local public health district or Dr. Blythe at the State (might be advisable due to the [redacted] concerns of an "Army cover-up"). Source could be Fort Meade Preventive Medicine, or USACHPPM as well. Whoever it is, this source should communicate directly to the Fort Meade command to avoid confusion.
4) We should have legal and PAO advise before we communicate our results to the public.
5) CDC laboratory results are expected shortly and they will be reported to Dr. David Blythe and the Maryland Public Health Lab first.
6) We support lab results be included in the EPICON report but they must be explained by an expert.
7) We support (with SJA, PAO and Risk Communication review) the inclusion of a summary of the EPICON report in the local FT Meade newspaper to keep the public informed.

Appreciate your professional opinions on these issues.

VR,
[redacted]

Sir,

[redacted] just called me reference the Ft Meade inf botulism EPICON. [redacted] (parent of one Ft Meade infant bot case) called her this morning and they had a lengthy conversation reference his concerns. [redacted] wants to discuss the next steps in responding to him.

Apparently [redacted] found internet articles on: His housing being built on a land fill; School across the street from his quarters had been used as a psychiatric ward; Clostridium stored on Fort Meade and possible experiments with German POW's in WWII? He claims whoever he is speaking with at CDC is telling him they do not have any samples and his contact is also telling him the Army and state of MD made a decision not to send any samples to CDC (must be confusing clinical with environmental samples).

His specific questions are:
1)Who is doing DNA subtyping and the status?
2)What is the answer on testing the soil? If answer in no what is scientific rationale behind the decision?

[redacted] wonders whether a conversation with [redacted] would help to quell concerns. My continued contact with the CDC labs (see message below) show as of 25 APR 07 the results are not available. Appreciate your guidance on next steps.

Vr,
MAJ [redacted]

[redacted]

We are repeating some PFGE tests. Hope to get them complete in the next week or so and then I will provide a report to MD.

I can tell you so that you might plan your next steps, that I do not think we wil be able to distinguish the 2 case isolates based on our tests (PCR, RAPD, PFGE, and DNA gene sequencing).

Susan

Dr. Maslanka,
Just another follow up on the subtyping for the Fort Meade, MD cases.
Our customer wants an update so just checking to see if you have any results available.
Thanks,
MAJ [redacted]

Hi [redacted]

This is the best upate we can provide. Still awaiting lab restuls.

On another note, I'd mentioned briefly to COL [redacted] about possibly doing some kind of evaluation within the local community about how the disease response was conducted. I would still like for you all to consider that, if you're willing. We can develop the community response mechanism in several forms (e.g., interviews, focus groups, online anonymous survey, etc.). But doing that kind of thing would be very helpful to us at CHPPM in improving future responses, and could provide you with data re: how the local Command responded. Just something to think about.

[redacted],
The best answer I can provide is quote from CDC's Dr. Maslanka below.
It may seem unusual for length of time required, but with very specific and rarely applied diagnostics that also require QC and verification, etc., this is not really unusual from the CDC or any high-level reference lab.
Thanks.
BP

Subject: Meade Bot Update (UNCLASSIFIED)

Classification: UNCLASSIFIED
Caveats: NONE

Colleagues,
As some of you know I am in the process of retiring from active duty. I am currently clearing / outprocessing, and will no longer be working this EPICON in the same, official capacity as previously. From CHPPM end, MAJ [redacted] is the lead epidemiologist. I have asked Drs. [redacted] and [redacted] to provide PM physician coverage on various ongoing projects for which they were not already in the lead, and this would fall into that arena.

MAJ [redacted] and COL [redacted] nicely summarize recent events as follows, and I liberally plagiarize from their respective emails:
1) This week [redacted] contacted [redacted] (CHPPM Risk Communications) and Dr. Russo (AA County Public Health) reference our investigation, about which he expressed great concern.
2) Complete CDC lab results are expected with the next two weeks. It is not looking as though the two clinical case isolates will be linkable by subtyping (i.e., same type neither ruled in nor ruled out), which may have implications for any possible plan to pursue environmental sampling. This statement is not final so please do not transmit further.
3) Fort Meade legal (SJA) has been in contact with MAJ [redacted] and COL [redacted], Fort Meade Installation Commander, sent an e-mail message this past weekend requesting support in terms of a review of the message he will send to the public (and place on the Ft Meade website). He would like to use the recommendations from the EPICON report [para 9a(1)-(9)] as the basis for his message; and he wanted to update the community on the status of the recommendations.
4) COL [redacted] wants to publish an article on our investigation in the post newspaper. He is asking if we have any objections to publishing the information summarized in the draft EPICON report. CHPPM PAO [redacted] recommends:

Assuming the report is releaseable (i.e., assuming COL [redacted] has decided it is), it can be posted to the post website if so desired--and the article can reference it. In the article, all questions should be referred to Meade PAO--who can sort out the ones that are for the installation and refer the ones specifically about the EPICON to CHPPM PAO (NOT directly to our subject-matter experts).

In addition MAJ [redacted] and I recommend we focus on certain things as we move forward:

1) Be open and forthright but not tailor our EPICON or responses to a single individual and instead should focus on the entire FT Meade community.
2) Risk Communication, PAO and--as necessary--SJA should be involved in all communications.
3) It may be wise to have both legal and PAO review of any specific laboratory results before they are communicated to the public.
4) CDC laboratory results will be reported to Dr. David Blythe and the Maryland Public Health Lab first.
5) We support lab results being an addendum to the EPICON report but they must be explained by an expert.----
6) We must speak with a common voice and through a common source. In this regard COL [redacted] recommends:

For any requests for information (RFIs) from anyone with respect to installation (FT Meade) information, the RFI should be answered by an installation staff member. Anything medically-related to the bot tox case (or any medical information) should be managed by Kimbrough primary POC LTC [redacted] who, in turn if she needs assistance from CHPPM, AA County or WRAMC PM, can contact the appropriate POC and be the conduit to respond to the RFI. Additionally, LTC Cole-Wainwright should be the conduit to communicate medical information to COL McCreedy or whomever he designates.

Appreciate your attention.

Respectfully,
COL [redacted]

Ma'am,
Attached is our proposed press release. Appreciate your input on this before we send as final. No final word from the Maryland Department of Health and Mental Hygiene (MDHMH) as to CDC lab results. However, we feel results are coming from a request from the MDHMH to the CDC and will not change our investigation.
Have included Dr. [redacted] as our new PM doc consultant on the project in case you have any questions.
VR,
MAJ [redacted]

Caveats: NONE

Fort Meade, MD—The final report of the special Epidemiological Consultation Team gathered to investigate two cases of infant (intestinal) botulism at Fort Meade has been released. Results indicate that no common exposures or food sources caused two cases of infant (intestinal) botulism here. The Army Center for Health Promotion and Preventive Medicine (CHPPM) led the team, in consultation with several non-military experts.

"These investigations are difficult for at least two reasons," said [redacted], CHPPM epidemiologist and team leader. "First, neither baby was fed honey—known to be a prime source of the disease in babies—or any of the same foods. That eliminated the most common cause of intestinal botulism, tainted foods."

Once food had been eliminated as a potential cause, team epidemiologists consulted with experts outside of the Department of Defense to determine whether environmental testing could assist in finding a cause for the two cases.

"This is because *Clostridium botulinum* spores, which can cause intestinal botulism, are found in soils and dust worldwide," [redacted] said. "Our team reached out to state and local public health organizations as well as national infant botulism experts to ensure we did not overlook a common source that could cause other Fort Meade infants to become ill."

Non-military experts consulted included medical and epidemiological experts from the state of California (recognized as a world leader in infant botulism treatment and research); the Maryland and Anne Arundel County public health officials; and the Centers for Disease Control and Prevention (CDC). All agreed that it was unlikely environmental testing would find a link between the cases and the environment, according to the report.

The team provided these findings in a written report to COL [redacted], Fort Meade garrison commander, on March 5th, 2006.

The state of Maryland Department of Public Health has also asked the CDC's botulism laboratory to conduct subtype testing (analysis) of stool specimens from both infants to try to identify the specific bacteria that can cause infant botulism. The garrison is currently awaiting these results which will be provided by the state of Maryland. CHPPM epidemiologists do not believe that these test results will affect their investigation.

The two infant botulism cases occurred in October and December, 2006 and both infants made a full recovery. No additional cases have been detected.

There are no known prevention strategies for non-foodborne intestinal botulism, so the report recommendations focus on increasing awareness of this illness and its symptoms within the local medical community; continuing to monitor the number of cases within DOD; educating families about the illness; and, on a local level, ensuring that construction companies working on Fort Meade take steps to minimize dust.

Lt. Col. [redacted], Chief, Preventive Medicine at Kimbrough Ambulatory Care Center on Fort Meade, credits the infants' speedy recovery to the parents, who detected changes in their babies' behavior and sought medical care promptly.

"Noticing changes in their babies behavior, and seeking medical care resulted in rapid treatment that may have saved their lives," [redacted] said.

EXECUTIVE SUMMARY
EPIDEMIOLOGICAL CONSULTATION NO. 13-HG-06TU-07
INVESTIGATION OF TWO INTESTINAL BOTULISM CASES
AT FORT MEADE, MARYLAND
OCTOBER - DECEMBER 2006

1. PURPOSE. The purpose of this epidemiological consultation (EPICON) was to investigate a cluster of *Clostridium botulinum* (*C. botulinum*) in infants at Fort Meade, Maryland. The Kimbrough Ambulatory Care Center Commander at Fort Meade requested assistance from the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) after two infants living on the same street, approximately 116 meters apart, contracted intestinal botulism in October 2006 and December 2006, respectively.

2. BACKGROUND. Intestinal botulism, also known as infant botulism, is a rare but serious paralytic illness that almost always occurs in children under 1 year of age. On very rare occasions it can occur in older children and adults after bowel surgery, when people are affected with inflammatory bowel disease, or after antimicrobial therapy (Redbook 2006). Botulism is caused by a nerve toxin released by the bacterium *C. botulinum*, which can be found in soil and dust worldwide. Most cases of botulism affecting children older than 1 year of age and adults occur when spores germinate in improperly prepared foods, producing toxin that affects humans when the contaminated food is eaten. In contrast, cases of intestinal botulism are believed to occur when spores are ingested and are able to germinate within the intestines and produce toxin. It is believed that a permissive environment within the intestines in infants allows the bacteria to grow and produce toxin. In most intestinal botulism cases a source for the ingestion is never identified. In cases of intestinal botulism, toxin and bacteria may be found in stool specimens [redacted]

3. METHODS. The USACHPPM formed an EPICON team for this investigation. The team consulted subject matter experts from the Centers for Disease Control and Prevention (CDC), the California Department of Health Services (CDHS), the Maryland Department of Health and Mental Hygiene (DHMH), and the Anne Arundel County Department of Health. The CDHS was consulted because of its nationally renowned expertise in infant botulism. The team interviewed the affected infants' parents using a modified version of the CDC's infant botulism questionnaire. Stool specimens had been collected by the inpatient pediatric team at the Walter Reed Army Medical Center (WRAMC) and tested by the Maryland DHMH. *C. botulinum* has been isolated from both samples, and isolates will be sent to the CDC for sub typing.

The EPICON personnel conducted town hall meetings with the Fort Meade Garrison Commander to address community concerns. Investigators also provided information sheets to local residents, provided press releases, and conducted media interviews.

4. CONCLUSIONS.

a. Interviews with each family revealed no common exposures that may have been a likely source of the outbreak, and no possible food sources. The risk communication effort was intensified due to the high level of community concern regarding transmission and environmental factors discussed in the interviews, such as nearby construction. This quelled the fears of most Fort Meade residents; however, a local newspaper reported that the parents of one of the affected infants plans to sue the Army, claiming there was negligence in seeking the cause of the two cases. They reportedly believe that dirt from a construction site one block away from the street where both families live is the source of the spores, that soil testing should have been undertaken, and that the Army is intentionally avoiding such sampling because Fort Meade is a Superfund site.

b. Proving or disproving a link with the environment is a dubious task given the lack of previous research in the area. It is widely believed that botulism type B is endemic to the soil in the area and over the entire East Coast of the U.S. Numerous discussions were held with leading *C. botulinum* experts, CDC representatives, and Maryland and Anne Arundel County public health officials about proceeding with environmental testing. The consensus of this group was that environmental testing would not prove or disprove a link between the cases and the environment. In addition, there are no known public health prevention strategies for non-foodborne *C. botulinum.* The Agency for Toxic Substances and Disease Registry does list Fort Meade on the National Priorities List, but their report indicates that the waste sites are far from the current location of the cases. Moreover, while prior dumping sites for waste and dead carcasses are theorized to be a viable source for *C. botulinum,* there has been no evidence to support this.

c. The scientific literature suggests numerous possible modes of ingestion of *C. botulinum* by infants which could be relevant to this investigation, but none of which are proven. The EPICON team could not find a link between the two cases at Fort Meade, other than the residential proximity itself. Much needs to be learned about the epidemiology of infant botulism and the EPICON team reached out to the leading scientists in this field. Possible collaborations for long-term environmental and laboratory research projects were discussed, as each discovered cluster of infections affords a possible opportunity to better elucidate non-foodborne modes of *C. botulinum* transmission.

5. RECOMMENDATIONS.

a. Make Military Health System (MHS) providers throughout the National Capital Region (NCR) aware of the two cases at Fort Meade in order to reinforce the need to seriously consider botulism in the differential diagnosis when evaluating infants with paralytic signs or significant constipation and when Sudden Infant Death Syndrome cases are encountered.

b. Reinforce the need for NCR clinic staff to communicate reportable medical events to both civilian and military public health authorities.

c. Encourage referral centers like WRAMC to engage preventive medicine personnel (both its own and those of pertinent installations) early in the course of such events.

d. Enhance Army epidemiologic surveillance for botulism cases.

e. Establish a DOD registry of dependent fatalities.

f. Improve centralized access to military clinical laboratory data.

g. Inform NCR beneficiary parents of newborns and infants about intestinal botulism as part of child health education.

h. Ensure construction contracts serving Fort Meade and other installations require control measures to minimize dispersion of fugitive dust.

i. Continue risk communication efforts on a scaled-down basis, monitor media coverage, and remain ready to respond to community rumors, misunderstandings and misperceptions in a timely manner.

TABLE OF CONTENTS

EPIDEMIOLOGICAL CONSULTATION NO. 13-HG-06TU-07
INVESTIGATION OF TWO INTESTINAL BOTULISM CASES
AT FORT MEADE, MARYLAND
OCTOBER - DECEMBER 2006

1. REFERENCES. Appendix A contains the references used in this report.

2. PURPOSE. The purpose of this epidemiological consultation (EPICON) was to investigate *Clostridium botulinum* (*C. botulinum*) infection of two infants on Fort Meade, Maryland.

3. AUTHORITY. The U.S. Army Medical Department Activity (MEDDAC) Commander at Fort Meade requested assistance from the U.S. Army Center for Health Promotion and Preventive Medicine (USACHPPM) after two infants living on the same street, approximately 116 meters apart, contracted intestinal botulism in October 2006 and December 2006, respectively. In response to this request, the USACHPPM formed an EPICON team to perform an investigation.

4. BACKGROUND.

a. *C. botulinum* is an anaerobic spore-forming, rod-shaped bacterium that produces botulinum neurotoxin, the causative agent of botulism (reference 1). *C. botulinum* is known to produce seven distinct toxins including A, B, C1, D, E, F, and G. Release of these toxins at pre-synaptic nerve terminals causes paralysis (reference 2).

b. Specific toxin types of *C. botulinum* are usually associated with specific geographic regions within the United States (U.S.). While both type A and B cases are seen in the western U.S., type A predominates west of the Rocky Mountains (reference 3). Type B has been isolated more frequently in cases in the eastern U.S., specifically Pennsylvania and New York. Toxin types C, D, and F are less defined to a specific region, but are typically isolated from animals rather than humans, and all three of these types are poorly absorbed by the human intestine, which is essential for inducing neurological symptoms associated with botulism. Fresh water and fish ingestion have been associated with outbreaks of botulism type E. These outbreaks have historically been limited to the Baltic, Alaskan, and the Great Lakes areas (reference 3).

c. There are three major types of botulism found in humans: foodborne, wound, and intestinal (otherwise known as infant) botulism.

(1) Foodborne botulism is typically caused by ingesting preformed toxin from improperly preserved food items. Wound botulism, similar to other wound infections, is caused by the bacteria embedding under subcutaneous skin or deep inside an open area on the body, where they then produce the toxin. Intestinal botulism, which was first reported in 1976 (reference 4), occurs almost exclusively in infants, with the range of affected ages being 1 to 63 weeks. The majority of all cases occur in infants under 6 months of age, with the average age of reported cases being 13 weeks (reference 5). Cases are thought to be caused by ingestion of *C. botulinum* spores that subsequently colonize the large intestine and produce botulinum neurotoxin (references 4 and 6).

(2) While botulism cases occur throughout the world, the diagnosis of infant botulism is relatively uncommon in less developed countries (reference 7). There are numerous reasons for this trend, but perhaps the biggest is the amount of resources and testing required for a definitive diagnosis of infant botulism. *C. botulinum* in infants is the most commonly diagnosed type of botulinum intoxication in the U.S. (reference 6); despite this, only about 2 infant botulism cases are known to occur annually for every 100,000 live U.S. births (references 8 through 13). The case fatality rate for infant botulism in the U.S. is about 1.3 percent and less than 1 percent for hospitalized infants (reference 8). However, studies suggest that some cases of Sudden Infant Death Syndrome (SIDS), which affects more than 4,500 infants in the U.S. each year or approximately 50 infants per 100,000 live births, may be due to infant botulism (reference 9). Although the actual rate of fatal botulism falsely attributed to SIDS is unknown, studies analyzing infants who died from SIDS in the U.S. found botulism bacteria or toxin in up to 5 percent of examined SIDS cases (references 8, 9, 10, and 13). Some European studies have found higher rates (references 11 and 12).

d. Since infants cannot communicate symptoms, parental and provider awareness are keys to early diagnosis and treatment. Signs of infant botulism include: constipation, weakness (affecting gag, cry, sucking and swallow functioning), flaccid paralysis or "floppy baby syndrome," poor feeding, lethargy and hypotonia (reference 6). Prompt laboratory diagnosis is necessary to rule out other degenerative neuromuscular diseases. A test for toxin in the infant's stool specimen is conducted to identify and type the toxin. A confirmatory test is conducted by culturing the fecal specimen to isolate *C. botulinum*. However, typical infant botulism laboratory analysis stops at this step. Laboratory subtyping from clinical isolates are not usually done, butare part of broader research in the few laboratories equipped to do such testing.

e. Historically, there has not been a treatment protocol for infant botulism with the exception of treating specific symptoms. However, in 2003, the Food and Drug Administration approved Botulism Immune Globulin Intravenous (Human) (BabyBIG) for treatment of infant botulism cases with toxin A or B. This treatment consists of botulism antitoxin antibodies that are derived from humans (reference 14).

f. Commonly known vectors such as honey or syrup have been shown to be the source of several infant botulism cases. However, these risk factors can only be demonstrated in 10 percent of all infant botulism cases (reference 15). Recent research suggests that spores of the toxin-forming agent may be introduced by ingesting environmental materials such as dust or soil. Given that *C. botulinum* is ubiquitous in soils around the world, ingested dust and soil are thought to be likely culprits of infant botulism (reference 15).

g. In late 2006, two cases of infant botulism type B were identified among Department of Defense (DOD) beneficiaries hospitalized at the Walter Reed Army Medical Center (WRAMC). The cases occurred approximately 3 months apart and the infants involved lived in the same residential area in Fort Meade, Maryland, approximately 116 meters apart. The proximity of the cases increased community concern and sparked the investigation summarized in this EPICON.

h. While the incidence of *C. botulinum* infection among infants is rare, it is not unprecedented to have clustering of cases. A review of literature reveals numerous infant botulism clusters that have been investigated (references 16 through 18). More recently, a new unpublished report indicated a cluster of infant botulism types A and B at Vandenberg Air Force Base in southern California. Like the cases presented in this report, there were two cases of confirmed infant botulism among base residents within 3 months of onset. Foodborne transmission for both cases was ruled out, and investigators concluded that the disease was contracted through ingestion of soil or dust which may naturally contain spores.

5. METHODS.

a. EPICON Team. Principal team members from the USACHPPM included two preventive medicine physicians, three epidemiologists (including one with environmental health expertise), and one risk communication specialist. This team worked with preventive medicine personnel at Fort Meade, medical epidemiologists from the Anne Arundel County Department of Health and the Maryland Department of Health and Mental Hygiene (DHMH), and public affairs professionals from these various organizations. The EPICON personnel and their civilian public health partners also conducted telephonic conferencing with a team of *C. botulinum* experts from the Centers for Disease Control and Prevention (CDC) and the California Department of Health Services (CDHS). Additionally, military medical and laboratory surveillance agencies for all service branches were consulted to identify and confirm additional cases. These agencies included the Army Medical Surveillance Activity (AMSA), the Navy Environmental Health Center (NEHC), the Air Force Institute of Operational Health (AFIOH), and the Armed Forces Medical Examiner.

b. Case Interviews.

(1) A modified investigation form (appendix B) was developed using the CDC's standard infant botulism form (A Guide to Investigation of Infant Botulism, CDC 52.73 REV. 9-87) and a standardized questionnaire from the New York City Department of Health and Mental Hygiene. The form was designed to be more specific for military families regarding factors such as residence, potential exposures in the military, and housing. Information collected included demographics, onset dates, clinical presentation, food history, travel history, and exposures to known or suspected botulism sources.

(2) A team of four conducted the interviews with the parents of each case. Questions were asked by one person to remove question bias from the interview. Questions were asked in the same order for each case, and responses were recorded by all four team members. Each interview lasted for approximately 1 hour. After the interviews, responses to each question were typed by one member of the team and reviewed by the other three members for accuracy. Afterwards, the entire EPICON team reviewed the responses for commonalities between the two cases and possible exposure links.

c. Case Finding and Surveillance.

(1) The Army Medical Suveillance Activity operates a longitudinal epidemiological database called the Defense Medical Surveillance System (DMSS), which contains healthcare encounter data and demographics of all US military personnel and other beneficiaries, and which is also the central repository for DOD Reportable Medical Events (RMES) . The MHS Mart (M2) also contains healthcare encounter and demographic data. Both DMSS and M2 were queried to identify infant botulism cases diagnosed among military health system beneficiaries from calendar year (CY) 2002 through CY 2006. The inpatient queries were structured to identify any hospital admissions of infants under 1 year of age who were diagnosed with a primary or secondary diagnosis of infant botulism or which were reported through the RMES. If beneficiaries sought care at civilian facilities, these encounters were captured only if a billing claim was processed through TRICARE, the military health insurer. All data were consolidated into one case file which was then limited to unique cases. For each probable case identified through record review, AMSA, NEHC, and AFIOH were consulted to determine if the cases had confirmatory laboratory results. Because DOD laboratory records are not readily accessible prior to July 2006 and testing may also occur outside the DOD, confirmation was only available for cases reported through the RMES reports. The Defense Enrollment Eligibility Reporting System (DEERS) was then queried to determine live births among DOD active duty beneficiaries for CY 2003 through CY 2006; CY 2002 DEERS data were not available within M2.

(2) The Maryland DHMH was also consulted to identify cases reported in the state of Maryland and also specifically within Anne Arundel County, where Fort Meade is located.

(3) The EPICON team also consulted with the Office of the Armed Forces Medical Examiner (OAFME), the Baltimore Medical Examiner's Office, and the Maryland DHMH to gather information regarding fatalities classified as either SIDS or infant botulism.

d. Environmental Analysis. Sampling of environmental sources for *C. botulinum* type B was strongly considered by all parties involved in the investigation. After consulting with experts in the field, it was determined that environmental sampling would not add to this investigation and thus it was not conducted. However, collaboration with, and submission of environmental samples to, the Infant Botulism Treatment and Prevention Program in California was offered as part of long-term research and may occur in the future. In addition, a layout of the immediate construction sites and the cases' residences was developed using a measuring wheel for distances. Distances were measured and marked for the residences, playground, football field, and possible construction site. Figure 1 shows this layout. Prior land use was also thoroughly researched for any possible botulinum contamination or biological use that may induce growth of *C. botulinum.*

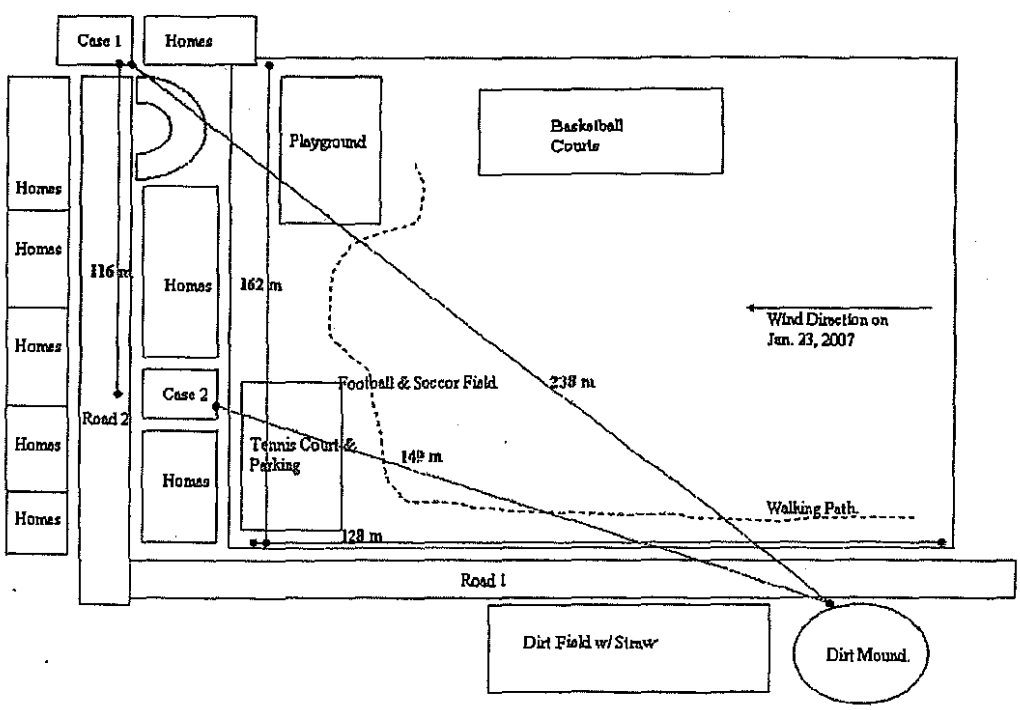

Figure 1. Layout of Case-Patient Residences and Possible Soil or Dust Exposures

e. Provider Education. MHS providers throughout the NCR were made aware of the two cases from Fort Meade as a means of reinforcing the need to seriously consider botulism when evaluating infants being seen because of paralytic signs or significant constipation, and when SIDS cases are encountered. Providers and clinic staff also received a reinforcing message about the need to communicate reportable medical events to both civilian and military public health authorities.

f. Risk Communication.

(1) From the beginning, Fort Meade's response focused on educating healthcare providers and the local community about the issue and on direct interaction with the affected families and other Fort Meade residents where the two affected infants lived. Kimbrough Ambulatory Care Center (KACC) notified all military healthcare providers in the NCR of the existence of the two cases and symptoms commonly associated with the disease. The Fort Meade Garrison Commander and KACC staff also immediately teamed up to personally visit both infants' families to identify unmet needs and to hand deliver risk communication products to the remaining residents. Risk communication products were also distributed to on-post child development centers, the media, and eventually to in-home childcare providers when that gap was identified. Risk communication products and media releases are in appendix C.

(2) Risk communication efforts regarding this issue incorporated several key risk communication principles—

(a) Discussing the bad news first and in a timely manner.

(b) Contacting the affected families and area residents in person.

(c) Identifying and using consistent spokespersons.

(d) Aligning response efforts with nonmilitary experts on infant botulism (that is, county and state health departments, the CDC, and the State of California where most infant botulism cases in the U.S. have occurred) to ensure that actions taken or proposed were scientifically valid.

6. FINDINGS/RESULTS.

b. Epidemiology.

(1) Fewer than 100 cases of laboratory-confirmed infant botulism have been identified each year within the U.S., which equates to a rate of about 2 cases per 100,000 live births (reference 19). Review of public health reports revealed that a total of 16 laboratory-confirmed cases of infant botulism (primarily type B) were reported in the State of Maryland from 1976 through 1996 (reference 5). The Anne Arundel County Department of Health, whose district includes Fort Meade, was consulted to identify additional cases reported in the state of Maryland since 1996. They had documented 30 laboratory-confirmed cases during this time frame, bringing the cumulative 30-year total to 46 cases. Case reports were sporadic, ranging from 0 to 6 cases reported per year. The 2005 incidence rate was 6.7 cases per 100,000 live births (reference 20). Table 1 shows U.S., Maryland, and Anne Arundel County case reports from calendar years 2002 through 2006.

Table 1. Laboratory-Confirmed Infant Botulism Cases, CY 2002–CY 2006

Case Reports	CY 2002	CY 2003	CY 2004	CY 2005	CY 2006
National[1]	69	76	87	85	88
Maryland[2]	0	1	5	5	6
Anne Arundel County[2]	0	1	1	0	2

[2]Maryland and Anne Arundel County figures provided by the Anne Arundel County Department of Health.

(2) Table 2 provides information regarding cases of infant botulism diagnosed among MHS beneficiaries from 2002 through 2006. During the 5 calendar year period evaluated, approximately 85,000 to 105,000 live births were documented annually among DOD active duty beneficiaries. A total of 16 unique cases of infant botulism were identified during this period. A total of 2 probable cases were diagnosed in 2002, 3 occurred in 2003, 2 in 2004, 1 in 2005, and 8 in 2006, representing 2003 through 2006 annual rates of 3.5 cases, 3 cases, 1 case, and 8.6 cases per 100,000 live births, respectively. (Denominator data were not available for CY 2002 from M2 due to limitations with the M2 interface used to query the DEERS system; therefore, rates could not be generated prior to CY2003.) All cases were under 6 months of age, and there

was not a male or female predominance. The majority (71 percent) of cases were from the West Coast or the Great Plains region. These findings are consistent with the literature (references 1, 6, 16, and 22). Of the 16 cases identified, only 6 were laboratory-confirmed based on RME reports.

Table 2. Infant Botulism Among DOD Active-Duty Beneficiaries, CY 2002–CY 2006

*Probable cases are cases with clinical presentation, lacking confirmatory laboratory tests; cases were identified through International Classification of Diseases, Ninth Revision (ICD-9) diagnosis codes entered into the patient's electronic medical record during hospitalization (reference 23).

(3) In the process of reviewing case medical records, a similar clustering of cases as that observed at Fort Meade was detected in 2006 at Vandenberg Air Force Base in southern California. Two infants living in military housing on the same base were diagnosed within 3 months of each other, the first case being diagnosed in March 2006 and the second in May 2006. Case 1 was determined to be botulinum type B and the second was type A. Preventive medicine personnel questioned stated that the cases resided within 2 miles of each other. They were able to rule out the possibility of the cases being foodborne, but could not identify any epidemiologic links between the two cases. They consulted with the CDHS and concluded that the cases were probably acquired by ingestion of spores which occurred naturally in the environment, and noted nearby construction at a service station.

(4) Further review of public documents regarding infant mortality revealed that within the State of Maryland approximately 50 SIDS cases are reported each year while mortality due to infant botulism has not been documented in the state (reference 24). The Baltimore Medical Examiner's Office further stated that because SIDS is considered a cause of death, the Medical Examiner does not test victims for potential underlying causes such as infant botulism. Interviews with the OAFME revealed that the organization has no visibility in regard to continental U.S. (CONUS) dependent fatalities due to DOD casualty operations policy. Furthermore, because the State of Maryland annual reports do not distinguish between deaths among military members versus civilians it was not possible to determine if any SIDS cases were among military beneficiaries.

c. Risk Communication. Because of the high level of community concern associated with this issue, risk communication efforts by Fort Meade and the investigators were critical in the overall response. Target audiences included the Fort Meade residential and childcare communities because of their heightened concerns and local military and civilian healthcare providers to ensure increased vigilance.

(1) Risk communication efforts involved education through information sheets, weekly updates, links to non-military resources, video/audio files of media interviews, personal outreach by the Fort Meade MEDDAC Commander and KACC, and town hall meetings to answer questions and discuss lingering concerns. Collaboration with nonmilitary experts likely assisted in addressing community concerns due to their neutrality about the proposed investigative approach. Media interest was intense and extended well beyond the local area.

(2) Several media interviews were conducted by the Fort Meade Garrison Commander, the EPICON team leader, and the KACC Chief of Preventive Medicine, to include those with National Public Radio (NPR), The Baltimore Sun , and the Washington D.C. affiliates of ABC and CBS television networks.

d. Laboratory Testing. Initial laboratory testing for both cases was performed by the Maryland DHMH Public Health Laboratory. [redacted]

e. Mapping. Mapping of the area demonstrated that the residences of case 1 and case 2 were approximately 116 meters apart. Case 1 was slightly downhill of the playground, which in turn was slightly uphill of the dirt mound. The dirt mound was about 238 meters from case 1. Case 2 was much closer to this dirt mound (~150 meters) and was slightly uphill from it. (See figure 1).

f. Environmental Testing. Due to parental concern expressed to the media in reference to hazardous waste "Superfund" sites on Fort Meade, the EPICON team explored historical records regarding land use at Fort Meade. Fort Meade was listed on the Environmental Protection Agency's National Priorities List of hazardous waste sites on 22 July 1998 (reference 25). Due to this, the EPICON team researched the history of the site near residences where the cases occurred to identify any possible prior use, such as use for relocation/management of waste. The 1999 Agency for Toxic Substances and Disease Registry (ATSDR) public health assessment on Fort Meade (reference 25) and the 1989 U.S. Army Environmental Hygiene Agency's evaluation of solid waste management on Fort Meade (reference 26) listed numerous waste sites, including chemical containments and landfill sites (references 25 and 26). No waste sites were identified in the immediate area of residence for the cases.

7. DISCUSSION/CONCLUSIONS.

a. Investigation.

(1) The epidemiology of infant botulism is not well understood. Its rare occurrence, and the inability of epidemiologists to identify the source of causative bacterial spores in non-foodborne cases, significantly limits any effort to prove or disprove links among cases. Although risk factors for infant botulism have been well studied, investigations are often inconclusive, and specific biological physiologies for developing infections are less well described. Spika et al identified several possible risk factors for infant botulism, including living in a rural area, breast-feeding infants over 2 months of age, less than one bowel movement per day for at least 2 months, and ingestion of corn syrup (references 1, 22, and 27). Other studies suggest hospitalized infant botulism cases tend to have higher birth weights and to be born to mothers that tend to be white, older and better educated (reference 5). Breast-feeding is more common in cases (references 17 and 28) and is associated with later onset in type B cases (reference 28). The rarity of infant botulism further complicates diagnosis, treatment, and prevention efforts for clinicians, microbiologists and epidemiologists.

(2) Upon initial review, there was concern that the two cases were linked in some way and that other infants in the community could be at risk. Thus, a thorough consultation was conducted to investigate all known risk factors for infant botulism. Both families shopped for groceries at the same commissary, as do most other families who live on Fort Meade. Still, foodborne agents were quickly ruled out due to the fact that the affected infants did not consume any food from a common source. In fact, case 1 was breast-fed almost exclusively, while case 2 was fed supplement. Known food risk factors such as honey and corn syrup were never used in either case. After ruling out common food agents, the investigation then looked for common exposures such as public gatherings, churches, day care facilities, and parents' occupational exposures. Each of the parents work in a different setting, and none of the four came into contact with each other during the course of their work. Furthermore, neither of the families shared the same church or public places. The families had no known contact with each other prior to onset of the cases. Thus, transmission is unlikely to have occurred in a child care setting or any other public location. In addition, the cases emerged three months apart and the families were not known associates, thus person-to-person transmission is highly unlikely, especially given that person-to-person transmission has never been documented.

(3) The investigation then turned to environmental exposures. Proving or disproving a link with the environment is a dubious task given the lack of previous research in the area. Several studies have indicated that *C. botulinum* is endemic to many parts of the world and ultimately resides in the soil (references 1, 7, 15, 16, and 22). In particular, it is widely believed that botulism type B is endemic to the soil in the area and over the entire East Coast of the U.S. Numerous discussions were held with leading *C. botulinum* experts, CDC representatives, and Maryland and Anne Arundel County public health officials about proceeding with environmental testing. The consensus of this group was that environmental testing would not prove or disprove a link between the cases and the environment. In addition, there are no known public health prevention strategies for non-foodborne *C. botulinum*. Reasons for this decision were: little is known about the diversity of the organism (that is, no library to compare with), the ability of laboratory methods to discriminate among *C. botulinum* subtypes (reference 29) is limited; laboratory capacity is limited; and finally, due to the ubiquitous and dispersed nature of the organism, the probability of collecting the exact soil sample containing the causal agent is miniscule.

(4) It is interesting to note that one group of researchers in this field found an apparent "cluster" of *C. botulinum* strains that were identified by Pulsed-Field Gel Electrophoresis (PFGE) approach as being more than 90 percent similar. However, the isolates were from different types of materials from two different continents and were collected over an extended period of time (reference 29). These results highlight the limitations to current laboratory methods in linking cases in a suspected cluster. Current efforts are underway in California to develop a *C. botulinum* library of genetic material that may one day be utilized for PFGE or

Amplified Fragment Length Polymorphism in matching human-linked strains of the organism with environmental samples. However, this library is not yet complete. Therefore, the only results of environmental testing would be to confirm that *C. botulinum*, if isolated, is present in the environment. As Istre et al. indicated, there are probably several environmental factors that aid in the ingestion of *C. botulinum*; however, until the technology and knowledge advances, we cannot determine what those factors may be (reference 16).

(5) The ASTDR does list Fort Meade on the National Priorities List, but their report indicates that the waste sites are far from the current location of the cases. Moreover, while prior dumping sites for waste and dead carcasses are theorized to be viable sources for *C. botulinum*, there has been no evidence to support this.

(6) After review of all the research and data, it is clear that there are numerous modes of ingestion of *C. botulinum* by infants that are not well demonstrated in the literature. The EPICON team cannot find a link between the two cases at Fort Meade other than geographic proximity. The most likely source of infection was airborne dust particles that directly entered, or were carried into, the mouths of these infants. Based on prior work by experts investigating pairs or clusters of intestinal botulism cases, there is no sampling technique that has proven useful for narrowing down reservoirs of soil where the specific, infecting spores originate. Much needs to be learned about the epidemiology of infant botulism, and the EPICON team reached out to the leading scientists in this field. Possible collaborations for long-term environmental and laboratory research projects were discussed, as each discovered cluster of infections affords a possible opportunity to better elucidate non-foodborne modes of *C. botulinum* transmission.

b. Risk Communication.

(1) According to the National Research Council, risk communication is defined as "an interactive process of exchange of information and opinion among individuals, groups, and institutions" (reference 30). The interactive element of risk communication, along with clear messages, is necessary in order for both experts and nonexperts to develop a mutual understanding of interests, values and concerns that go far beyond one-way information sharing.

(2) While treatable, infant botulism can cause significant anxiety and panic not only for the affected families but also within the local population because it—

(a) Afflicts only very young helpless children (typically less than 1 year old).

(b) Occurs in an apparently random fashion without a means to predict or prevent exposure.

(c) Has no discernible cause due to its ubiquitous nature in the environment.

(d) Elicits dread and fear just by its very name, "botulism."

(3) When community concerns and media interest are high, risk communication efforts are critical in the overall response. Aggressive health information efforts (that is, fact sheets, press releases, etc.) are needed to increase awareness of the disease, its symptoms, and response actions. At the same time, technical knowledge is not always the dominant influence when concerns are high (and trust is low or unknown). Dialogue opportunities with experts and healthcare providers are important to answer questions and discuss lingering concerns.

8. LIMITATIONS.

a. The consultation is limited by several factors. The first is that there was a very small number of cases (n=2). Thus, neither a case-control study nor a cohort study was feasible. Secondly, the classification of *C. botulinum* as a select agent limits laboratory options due to special facility requirements and handling restrictions. In addition, several laboratories were contacted about conducting subtyping for the two specimens and, after much internal discussion, the botulism laboratory at CDC agreed to take the samples but with the stipulation that the results would only benefit future knowledge of the organism and would not be valid for this investigation.

b. The lack of a central source for identifying and tracking mortality among dependents of active-duty service members within the DOD is also problematic. Although establishment of centralized databases to monitor unexplained child deaths was formally recommended by the American Academy of Pediatrics in 1999, actions have not been undertaken within the DOD to allow this capability. Creation of a mortality registry for dependents would allow determination of baseline mortality risk from all causes, thereby enabling the study of epidemiological patterns of these deaths and focused prevention strategies to reduce the incidence of death in the spouses and children of service members. The OAFME/AFIP submitted a proposal for this type of surveillance (appendix D), but it has not received funding.

c. By including all hospitalizations and outpatient encounters, DOD surveillance systems have the potential to permit calculating incidence more completely than reportable disease mechanisms, since some underreporting is typical of passive surveillance in both civilian and military sectors. Currently, however, the results codes vary across laboratories—and many botulism-related tests, in particular, are outsourced—making analysis complex and unreliable. Therefore, comparison of rates among DOD beneficiaries to national rates may either underestimate or overestimate actual differences..

9. RECOMMENDATIONS.

a. The EPICON team recommends that—

(1) Military Health System providers throughout the NCR continue to be made aware of the two cases at Fort Meade in order to reinforce the need to seriously consider botulism in the differential diagnosis when evaluating infants with paralytic signs or significant constipation, and when SIDS cases are encountered.

(2) The NCR providers and clinic staff receive a message reinforcing the need to communicate reportable medical events to both civilian public health and military preventive medicine authorities. ,

(3) The NCR beneficiaries who are parents of newborns and infants be informed about intestinal botulism as part of child health education.

(4) Referral centers like WRAMC be encouraged to engage preventive medicine personnel (both its own and those of pertinent installations) early in the course of such events.

(4) Army epidemiologists enhance surveillance for botulism cases and other RMEs.

(5) DOD establish a registry of dependent fatalities through the OAFME (appendix D).

(6) Access to laboratory results by AMSA (future Armed Forces Health Surveillance Center) be improved to enhance ongoing surveillance activities.

(7) NCR beneficiary parents of newborns and infants be informed about intestinal botulism as part of child health education.

(8) Construction contracts serving Fort Meade and other installations require control measures to minimize dispersion of fugitive dust (reference 31).

b. Although public interest is not as elevated as it was initially, some questions do linger within the community. Therefore, risk communication efforts should continue on a scaled-down basis. Monitoring of media coverage should continue, and the installation commander should remain prepared to respond to community rumors, misunderstandings and misperceptions in a timely manner.

c. Because new information regarding infant botulism and this investigation is limited, it is recommended that the conclusions of the EPICON be released in order to meet community expectations. While education of the community was a key component of the risk

communication process, particularly during the initial response phase, this interactive component of risk communication is still crucial and should be continued to—

(1) Gauge how widespread concerns may be.

(2) Obtain empirical data from the community regarding how they view the command's response.

(3) Identify any lingering misperceptions or misunderstandings about this issue and verify that risk communication education efforts were effective.

(4) Identify the most preferred communication venues.

(5) Identify the most trusted sources of information on this issue.

(6) Further demonstrate the command's commitment to community well-being.

CLOSTRIDIUM BOTULINUM QUESTIONNAIRE USED FOR INVESTIGATION

EPICON No. 13-HG-06TU-07, Fort Meade MD, Jan 06

Hypothesis Generating Questionnaire (Infant Botulism)

(Modified January 2007 from a questionnaire from the New York City Department of Health and Mental Hygiene and CDC Form 52.73, Guide to Investigation of Infant Botulism)

Initials of interviewer _____

Date form completed: ___/___/___

DEMOGRAPHIC INFORMATION OF THE CASE

Parent's last name: _____ Parent's first name: _____

Infant's last name: _____ Infant's first name: _____

Home address: _____

_____

_____

Phone: ( ) - _____

Sex: □ Male □ Female

Race/Ethnicity: □ White, not Hispanic □ Black, not Hispanic
□ Hispanic □ Asian or Pacific Islander
□ American Indian or Alaska native
□ Unknown

Mother's Age: Father's Age:

Mother's Occupation: Father's Occupation:

Number of Pregnancies:

Number of Live Births:

Type of Delivery (cases only): □ Vaginal □ C-Section

Complications: □ Yes □ No If yes, please explain: _____

Was infant premature? □ Yes □ No □ Unknown If yes, gestational age (weeks) _____

What was infant's birth weight _____

1. Where was your child born? ❑ Hospital ❑ Other _____
   Hospital Name: _____
   Age at discharge from hospitals? _____
   Was your child premature? ❑ Yes ❑ No ❑ DK

2. Where do you usually take your child for medical problems or for well baby visits?
   ❑ Pediatrician ❑ Family/gen practitioner ❑ Nurse practitioner or PA
   ❑ ER ❑ Other (Please specify _____)

3. Before your child's illness from botulism began, did he/she see a physician for any other medical problems (not including well-child visits or visits for immunizations)? ❑ Yes ❑ No ❑ DK

4. Did your child receive antibiotics in the month prior to illness onset? ❑ Yes ❑ No ❑ DK

5. What was your infant's usual bowel movement pattern during the following months of life?

	≥ 1 BM/day	1 > BM ≤ 3/day	< 1/3 days	unknown
1st month	___	___	___	___
2nd month	___	___	___	___
3rd month	___	___	___	___
4th month	___	___	___	___

When we first interviewed you about your child's illness, you reported that he/she first appeared sick on ____/____/____ *(onset date)*. Is this the correct date? ❑ Yes ❑ No ❑ DK

I. Food/Liquid Exposures

6. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being breast-fed?
   ❑ Yes ❑ No ❑ DK
   If yes, how many times per day do you breast feed? _____

7. Prior to your child's illness on ____/____/____ *(onset date)*, was your child being bottle fed?
   ❑ Yes ❑ No ❑ DK
   Do you use expressed breast milk to bottle feed? ❑ Yes ❑ No ❑ DK
   Do you use formula to bottle feed? ❑ Yes ❑ No ❑ DK
   Which formula did you primarily use? _____
   Please specify other brands of formula that you used. (List all brands used)
   _____
   _____
   _____

What type of formula do you usually use? Did you use...
   a. Liquid (ready to serve) ❑ Yes ❑ No ❑ DK
   b. Liquid (conc. add water) ❑ Yes ❑ No ❑ DK
   c. Powdered ❑ Yes ❑ No ❑ DK
   Who usually prepared the formula?
   Name: _____

Relationship to the child: _____

If water was used, what was the source of the water? _____

If tap water, was it boiled or filtered? ❑ Yes ❑ No ❑ DK

How many bottle feedings per day? _____

8. Prior to your child's illness, did he/she eat any baby cereal? ❑ Yes ❑ No ❑ DK
   Please specify type and brand (rice, oatmeal, etc.)._____

9. Did your child eat jars, bottles, or cans of baby food? ❑ Yes ❑ No ❑ DK
   Please specify type and brand_____

10. Did your child eat any baby food that was prepared at home? ❑ Yes ❑ No ❑ DK
    Please specify how it was prepared_____

11. Did your child eat any home-canned foods? ❑ Yes ❑ No ❑ DK

12. Did anyone in your family eat any home-canned foods? ❑ Yes ❑ No ❑ DK

13. Did your child drink any regular cow's milk (pasteurized)? ❑ Yes ❑ No ❑ DK

14. Did your child drink any unpasteurized milk? ❑ Yes ❑ No ❑ DK

15. Did your child eat or drink any honey? ❑ Yes ❑ No ❑ DK

16. Did your child eat any corn syrup? ❑ Yes ❑ No ❑ DK

17. Did your child drink any sugar/water? ❑ Yes ❑ No ❑ DK

18. Did your child drink any fruit juices? ❑ Yes ❑ No ❑ DK

19. Did your child drink any unpasteurized fruit juices? ❑ Yes ❑ No ❑ DK

20. Did your child eat any meats? ❑ Yes ❑ No ❑ DK

21. Did your child eat any fish? ❑ Yes ❑ No ❑ DK

22. Did your child drink tea? ❑ Yes ❑ No ❑ DK

Was it sweetened? ❑ Yes ❑ No ❑ DK

23. Did your child receive any supplemental vitamins in the month before the illness began?
❑ Yes ❑ No ❑ DK
If yes, please specify_____
Did they contain iron? ❑ Yes ❑ No ❑ DK

24. Did your child eat any fresh produce (fruits or vegetables) that were organically grown?
❑ Yes ❑ No ❑ DK
If yes, please specify which fruits and vegetables were organically grown_____
_____

25. Does anyone in your family eat any fresh produce (fruits or vegetables) that is organically grown?
❑ Yes ❑ No ❑ DK
If yes, please specify which fruits and vegetables were organically grown_____

26. Do you shop at any Farmer's Markets? ❑ Yes ❑ No ❑ DK
If yes, please specify._____

27. Where do you shop for groceries? _____

28. Where do you shop for baby food and other baby items? _____

II. Environmental exposures

29. Was there any of the following during the month before your child's onset near your home:
❑ construction (e.g. new home or other building)
❑ excessive dust (e.g. sewers, new foundations)
❑ excavation
❑ new road construction
❑ plowing of fields

❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

30. Was there any of the following during the month before your child's onset at other sites where your child has been:

❑ construction (e.g. new home or other building)

❑ excessive dust (e.g. sewers, new foundations)

❑ excavation

❑ new road construction

❑ plowing of fields

❑ environmental change (e.g. remodeling of your home, landscaping)

If yes, describe_____

31. Did your child or anyone else in your family play in a sandbox prior to illness?

❑ Yes ❑ No ❑ DK

If so, where? (list)

32. How often is the furniture in your house dusted?

❑ more than once per week

❑ once a week

❑ less than once per week but at least every two weeks

❑ less than every two weeks

❑ other (please specify_____)

❑ unknown/refused

33. Do you have any carpets or area rugs covering the floor in your house? ❑ Yes ❑ No❑ DK

If yes, are they

❑ wall to wall carpets

❑ area rugs

❑ both wall to wall and area rugs

What is the pile of wall to wall carpeting, (low, med, or shag)?_____

34. How often are your floors and carpets vacuumed?

❑ more than once per week

❑ once a week

❑ less than once per week but at least every two weeks

❑ less than every two weeks

❑ other (please specify_____)
❑ unknown/refused

35. What type of heating system do you have in your home?
❑ forced air (e.g. gas, oil, electric)
❑ steam heat (radiators)
❑ circulating hot water (e.g. solar, oil, gas)
❑ electric
❑ other (please specify_____)

36. Does your home have air conditioning? ❑ Yes ❑ No ❑ DK
If yes, please specify if individual room unit or central air conditioning_____

37. Do you have any electric air cleaner in your home? ❑ Yes ❑ No ❑ DK
If yes, please specify if central or portable_____

38. Were you or anyone in your household or family involved in gardening or yard work prior to your child's illness onset?
❑ Yes ❑ No ❑ DK
If yes, please specify flower or vegetable.
How often do you or household/family member garden?_____

Which months of the year do you garden?_____

39. Do you have any plants inside your house?
If yes, are they (check all that apply)
❑ located on or within 1 foot of the floor
❑ located on tables
❑ hanging from the ceiling
Are there any plants in the baby's room? ❑ Yes ❑ No ❑ DK

40. Do you take your child for walks outside? ❑ Yes ❑ No ❑ DK
Where do you usually go for walks?_____
Do you go to any nearby parks? ❑ Yes ❑ No ❑ DK
If yes, please specify_____

41. Does your child play or lie on the ground outside? ❑ Yes ❑ No ❑ DK
Please specify in backyard, park, etc._____
_____

42. Are you a member of any social or religious organizations? ❑ Yes ❑ No ❑ DK
If yes, please specify_____
Did you take your child to any events? ❑ Yes ❑ No ❑ DK
Was your child at an associated daycare during any of these events?
If yes, where/when?_____

43. Is your child in school/daycare or does he/she participate in any other group activities?
❑ Yes ❑ No ❑ DK
If yes, please provide names and locations _____
Describe "other group activities"_____

44. Did your child travel outside of Ft. Meade at all prior to his/her illness? ❑ Yes ❑ No❑ DK
If yes, please specify where?_____

45. Did your child travel outside of Maryland prior to his/her illness? ❑ Yes ❑ No❑ DK
If yes, please specify location, length of stay, and nature of visit_____

46. Did you visit a live poultry or meat market? ❑ Yes ❑ No ❑ DK
If yes, did you purchase any poultry or meat?
Specify type of meat purchased: _____
Name of market: _____
Address of market: _____
Did you take your child to the live market? ❑ Yes ❑ No ❑ DK

47. Did you take your child to any large gatherings prior to illness (wedding reception, parties, festivals, fairs, religious gatherings, etc.) ❑ Yes ❑ No ❑ DK
If yes, please specify_____

48. Did your child swim/wade/splash in an ocean, lake, river, pool, or recreational water park in the before his/her illness onset? ❑ Yes ❑ No ❑ DK
If yes, please specify_____

49. Did your child come into contact with any animals in the prior to illness? ❑ Yes ❑ No ❑ DK

If yes, what kind of animals? _____

When? _____ Where? _____

50. Where did you buy/obtain your baby's crib? _____

Was the crib used or new? ❑ Yes ❑ No ❑ DK

Was the mattress used or new? ❑ Yes ❑ No ❑ DK

51. Does your child share toys with anyone? ❑ Yes ❑ No ❑ DK

If yes, please specify _____

52. How often do you sterilize bottles before using them? ❑ Always ❑ Sometimes ❑ Never

53. How often do you sterilize nipples before using them? ❑ Always ❑ Sometimes ❑ Never

54. Does your child use a pacifier? ❑ Yes ❑ No ❑ DK

Where were pacifiers purchased?

How often do you clean the pacifier? _____

If the pacifier falls on the floor:

How often do you clean with water? ❑ Always ❑ Sometimes ❑ Never

How often do you clean with soap? ❑ Always ❑ Sometimes ❑ Never

How often do you sterilize? ❑ Always ❑ Sometimes ❑ Never

55. Who is your child's pediatrician?

Pediatrician's name: _____

Clinic name: _____

Address: _____

Phone number:( ) _____-_____

56. Do you know anyone other infants who have had a similar illness as your child's?

❑ Yes ❑ No ❑ DK

If yes, please specify _____

_____

Additional comments _____

_____

Thank you very much for you time.

Jan. 10, 2006 **Release # 070110**

FOR IMMEDIATE RELEASE

Infant Botulism Found in Two Children at Fort Meade

FORT GEORGE G. MEADE, Md., - Since October 2006, Walter Reed Army Medical Center (WRAMC) has identified two cases of infant botulism involving residents of Fort Meade. One infant has recovered while the other infant is being treated by doctors at WRAMC. Both children were under six months of age at the time of diagnosis.

The cause is currently under investigation by the Preventive Medicine Services on Kimbrough Ambulatory Care Center (KACC).

"Infant botulism is a treatable condition associated with the ingestion of clostridium botulinum bacteria found naturally in soils and in some contaminated food products. It would be premature to speculate about a particular source because we are still trying to conduct our investigation," said [redacted] Preventative Medicine at KACC, Lt. Col. [redacted].

Infant Botulism is rare and usually affects infants under six of age.

Symptoms may include constipation, listlessness, difficulty swallowing, a weak cry and a loss of appetite. If parents are concerned, they should contact their health care provider.

Health care professionals recommend that parents of infants wash their hands frequently, clean toys and pacifiers in a weak bleach solution, and thoroughly boil water used to prepare baby formula. These are not foolproof measures for preventing botulism infection, but they afford some protection against the most common avenues of transmission.

(more)

"Our primary concern is always the health and welfare of the members of our community. We will work closely with health officials and will keep the community informed of any new information as it comes available. The Army is committed to providing the safest living and working environment for its people," said Col. [redacted], installation commander.

EDITOR'S NOTE: For more information contact [redacted]

MESSAGE FROM THE INSTALLATION COMMANDER
INFANT BOTULISM FACT SHEET

Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center. The infants, both under the age of 6 months at the time of diagnosis, were treated at Walter Reed Army Medical Center. The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade. LTC [redacted], [redacted] Preventive Medicine at Kimbrough Ambulatory Care Center said, "while the name of the disease can be frightening, infant botulism is a treatable condition associated with swallowing the botulinum bacteria found naturally in soils and in some contaminated food products. It is premature to speculate about a particular source until the investigation is complete." Cases of Infant Botulism are rare and usually occur among infants less than 6 months of age.

What are the symptoms of Infant Botulism?

Any or all of the following:

- constipation
- poor feeding and a weak suck
- weak cry
- loss of head control
- difficulty swallowing
- excessive drooling
- floppy appearance or "floppy baby"
- generalized weakness
- breathing difficulties

What do you do if your infant is experiencing these symptoms?

Call (301) 677-8606 or go to the nearest Emergency Room

- Howard County General Hospital 5755 Cedar Lane, Columbia, Maryland (410) 740-7890 or 7990
- Laurel Regional Hospital 7300 Van Dusen Road, Laurel, Maryland (301) 725-4300 or (410) 792-2270
- Baltimore Washington Medical Center, 301 Hospital Drive, Glen Burnie, Maryland (410) 787-4000

How is Infant Botulism treated?

Prompt diagnosis is essential. Medication is available to treat the condition.

How can I reduce the risk of contracting Infant Botulism?

- Wash hands frequently
- Avoid giving honey to infants less than 1 year of age
- Routine and frequent cleaning of toys-- particularly items that babies place in their mouths and those toys which have fallen on the ground or floor
- Through proper preparation of foods (boiling and cooking)
- Avoid cans of food/formula with dents or that are bulging or rusting
- Avoid locations with excessive dust and debris

For further information about the disease, contact Kimbrough Ambulatory Care Clinic, Preventive Medicine Services (301) 677-8661. If you have other questions or are contacted by the media please refer them to the Fort Meade Public Affairs Office at (301) 677-1436 or 1486.

EPIDEMIOLOGICAL CONSULTATION TEAM AND ITS MISSION AT FORT MEADE
16 Jan 07

BACKGROUND:
In response to lingering concerns about the two cases of infant botulism at Fort Meade, an epidemiological consultation (EPICON) team was requested to assist the medical community here at Fort Meade in its investigation. The EPICON team arrived at Fort Meade on Friday January 12th to begin its mission to investigate the occurrence of these cases. This fact sheet provides some background information about the team and its mission.

What is an EPICON team?
Epidemiology is the science devoted to investigating how population factors and the environment influence the occurrence of diseases or injuries. The team then applies this science to find possible causes, risk factors and opportunities for prevention.

Who is on the EPICON team? Where are they from? What are their specialties?
The EPICON team members are from the U.S. Army Center for Health Promotion and Preventive Medicine, part of the Army's Medical Command, who specializes in preventive medicine, environmental health, epidemiology, and communication about health matters when public concerns are high. In conducting this study the team is collaborating with a physician-epidemiologist from Anne Arundel County's public health department, the Kimbrough preventive medicine staff, the Centers for Disease Control and Prevention (CDC) and the California state health department.

Why is the EPICON team here?
The team was called by the Kimbrough Ambulatory Acute Care Hospital and Garrison Commanders because they believed someone from outside Fort Meade was needed to review the situation and provide advice while allowing Kimbrough to continue their important clinical and preventive medicine mission without disruption.

What methods is the team using to try and find answers?

The team is working to determine if there is any connection between the two cases of infant botulism. The team has interviewed the affected families to identify products used, places visited, possible common exposure, etc. They are reviewing clinical test results on the affected children during their illness, and will review more detailed analysis currently being done at a Maryland state laboratory which will identify the specific subtype of botulism bacteria. Team members are also looking at disease surveillance reports and other data to see if the Fort Meade community or Anne Arundel County has experienced similar cases.

Will environmental sampling be done?
It's certainly understandable why finding the cause is so important to families with young children. Focused environmental sampling in specific areas may be conducted for purely scientific reasons, such as to determine where the bacteria might be present. But random sampling throughout a wide area is unlikely to provide a definite link to the two Fort Meade

cases or help direct future preventive measures, or provide a definite link to one or a few specific areas of contaminated objects or soil. This is because the botulism-causing bacteria are widely distributed in many environments around the world.

How long will the team's investigation take?

The results of the subtyping of the bacteria from the affected infants are expected to be completed on or about January 20th. This information is critical in answering the question, "Are the two cases connected?" However, the team's mission will not end there. The EPICON team will continue to conduct a thorough review of the local surveillance data and existing scientific literature; and continue to collaborate with the Fort Meade medical authorities, the Fort Meade garrison, as well as with Anne Arundel County and CDC partners before finalizing its report. The team anticipates delivering a report to the Garrison Commander by the end of February.

Where can I learn more about infant botulism?

Feb. 1, 2007 **Release # 070201**

FOR IMMEDIATE RELEASE

Infant botulism investigation update

FORT GEORGE G. MEADE, MD., -- Maryland health officials have confirmed the presence of Type B Clostridium botulinum bacteria from both cases of infant botulism recently diagnosed at Fort Meade. This confirmation was expected as this type of botulism strain is typically found on the East Coast.

The first case of infant botulism was diagnosed in October 2006 and the second in December 2006. Both children have since been treated and are recovering. The children live on Oliver Court at Fort Meade.

The Maryland Department of Health and Mental Hygiene (DHMH) have contacted the Center for Disease Control and Prevention in Atlanta, Ga., to determine if they are willing to do subtyping of the bacteria.

Investigators continue to discuss and coordinate with DHMH, CDC, Fort Meade medical authorities and other experts as they work towards completing the investigation.

In addition, the Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases from 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at http://amsa.army.mil/AMSA/amsa_home.htm.

APPENDIX D

ARMED FORCES INSTITUTE OF PATHOLOGY (AFIP) PROPOSAL TO FUND DEVELOPMENT OF A DEPENDENT MORTALITY DATABASE

EPICON No. 13-HG-06TU-07, Fort Meade MD, Jan 06

Dependent Mortality Database

Proposed: The goal of this paper is to explore the feasibility of establishing a registry of dependent fatalities, to include exploration of methodologies.

Background: Currently, there is no central source for identifying and tracking mortality amongst the dependents of active duty servicemembers. It is widely believed that domestic abuse is more prevalent in military families than in their civilian counterparts, and numerous programs have been established to mitigate the perceived increased risk of domestic violence in servicemember's families. Establishing a registry of deaths in dependents will allow for the determination of baseline mortality risk from all causes, to include more accurate tracking of domestic violence related deaths. Other potential research areas that could be explored using this registry include reviews of specific types of accidents, SIDS, cancer and infectious disease mortality. By studying the epidemiological patterns of these deaths, focused prevention strategies can be developed to reduce the incidence of death in the spouses and children of servicemembers. Furthermore, establishment of centralized databases to monitor unexplained child deaths was formally recommended by the American Academy of Pediatrics in 1999{Kairys SW, Alexander RC, Block RW, et al. American Academy of Pediatrics. Committee on Child Abuse and Neglect and Committee on Community Health Services. Investigation and review of unexpected infant and child deaths. Pediatrics 1999; 104:1158-60}.

Data Sources and Methodology: The existing DOD-Medical Mortality Registry is an active surveillance system designed to provide real-time outbreak information to decision-makers{Gardner JW, Cozzini CB, Kelley PW, et al. The Department of Defense Medical Mortality Registry. *Mil Med.* Jul 2000;165(7 Suppl 2):57-61.}. An investigation is triggered by receiving current information from each of the Service-Specific Casualty Offices. There would be value in actively monitoring child deaths for infectious agents, as children are often sentinels for outbreaks. An example occurred last year during the influenza outbreak that was particularly noted for causing child fatalities. However, because the Casualty Offices only track and report dependent deaths that occur overseas, real time surveillance of dependent fatalities is not achievable at this time. An alternative approach is to establish a Registry consisting primarily of death certificate data, obtained from National Death Index (NDI) searches. For the purposes of monitoring homicides, this basic level data would provide demographics and a basis for comparison with civilian homicide rates. It would also provide an estimate for the completeness of capture of the established Fatality Review Boards. The two major limitations of this approach are lag time, which averages approximately three years, and incomplete information.

Budget: The costs of establishing a Death Certificate based registry as part of the Armed Forces Medical System are approximately 350K per year, which would support an epidemiologist to collect and analyze the data, and the direct costs of the NDI searches. If real time investigative surveillance is desired, a mechanism for rapidly identifying dependent fatalities would have to be established. Costs from the Armed Forces Medical Examiner System would increase to approximately 450K per year.

Response to Query:

The [redacted] family told Fort Meade officials late yesterday that their infant son was hospitalized in October for "Botulism." The family says the child has since recovered.

The Preventative Medicine Office at Kimbrough and Fort Meade Officials are investigating the situation.

Response to Query about the second case:

We are not aware of any additional cases at this time. But we are always concerned about all service members and their families' health issues.

ENCL 4

Background Not For Release. For Internal use only:

[redacted]

Centers for Disease Control (CDC) called [redacted] and informed her that a 2nd case has been confirmed on Fort Meade today.

[redacted] was the Pediatrics doctor.

The family said the CDC investigator implied that a debris pile located on the corner of Clark Road may be the source of the airborne Botulism.

[redacted] confirmed that there were complaints of a dust cloud in the Area and Picerne Military Housing agreed to water the area down. The debris pile consists of crushed concrete.

Potential issues are yet to be investigated:

We have a meeting with the commander at 8:00 in the morning in his office. Will keep everyone notified.

(CBS- Channel 9 WUSA may pick up the story. Fort Meade PAO was notified by DINFOS PAO that the wife of the family wanted to have them at her house last night. But Fort Meade PAO informed the family that all media coming to the installation must be escorted by our office.)

INFANT BOTULISM FACT SHEET

There are approximately 100 cases of botulism reported annually in the United States. Approximately 95% of these cases are infant botulism and occurs in babies 6 month-old and younger. Infant botulism affects boys and girls equally.

The bacteria (Clostridium botulinum) that cause infant botulism are transmitted by spores which germinate and produce toxins in the intestines of the infant. It is not spread from person to person. A toddler cannot contract infant botulism because the Clostridium bacteria does not grow in the intestines of older children.

The risk factors and vehicles of transmission can either be environmental or through ingestion. However, the transmission remains unclear in most cases. The most common routes of transmission to infants are food and dust. Honey is also a source and should not be fed to infants less than 1 year of age.

What are the symptoms of Infant Botulism?

- constipation
- poor feeding and a weak suck
- weak cry
- loss of head control
- difficulty swallowing and pooling of secretions
- floppy appearance or "floppy baby"
- generalized weakness
- breathing difficulties only in about half of the cases

How is Infant Botulism diagnosed?

Stool specimen and testing of possible found source.

How is Infant Botulism treated?

Prompt diagnosis and treatment is key!
FDA approved - BabyBIG - it binds to any free toxin in the body and prevents further damage. Only available through the California Health Department at a cost of approximately $45,000 per treatment. Relative low cost compared to long-term hospitalization of untreated infant; Expect complete recovery although the recovery is gradual -- usually weeks to 2 months with treatment and several months without treatment.

How can I prevent Infant Botulism?

- Handwashing
- No honey to infants less than 1 year of age
- Toy cleaning and particularly items that babies place in their mouths
- Proper preparation of foods (boiling and cooking) spores are destroyed by boiling
- Proper preparation of canned foods (home preserved or canned foods)
- Avoid cans of food/formula with dents, bulging or rusting
- Avoid construction sites with soil and dust

FORT MEADE, MD 20755

www.ftmeade.army.mil

Jan. 10, 2006
Release # 070110

FOR IMMEDIATE RELEASE

Infant Botulism Found in Two Children at Fort Meade

FORT GEORGE G. MEADE, Md., - Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center.

The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade.

Col. [redacted], Commander of Kimbrough Ambulatory Care Center said, "Botulism spores are found naturally in the soil. It is also caused by improperly canned and processed foods. It would be speculative to identify a source because we are still working to determine the specific cause."

There are approximately 100 cases of botulism reported annually in the U.S. Approximately 75% of these are infant botulism. It normally affects infants less than 6 months of age, boys and girls equally. Symptoms may include constipation, listlessness, difficulty swallowing a weak cry, and a loss of appetite (not sucking well). If parents are concerned, they should contact their health care provider.

Health care professionals recommend that parents of infants wash their hands frequently, clean toys and pacifiers in a weak bleach solution, and thoroughly boil water used to prepare baby formula. These are not foolproof measures for preventing botulism infection, they afford some protection against the most common avenues of transmission.

[redacted] Installation Commander. "Our primary concern is always the health

and welfare of the members of our community. We will work closely with health officials to investigate the causes of this outbreak and take all possible preventative measures. I ask the public to remain calm and avoid spreading rumors or gossip. We will keep the community informed of what we learn and the steps they might take to offer a measure of protection against infection."

You might consider weaving the following talking points into your RTQs
[redacted]

INVESTIGATION
The incident is currently under investigation. The Army is committed to providing the safest working environment for its people. The safety of our people and the surrounding communities is our foremost concern. I can assure you we will conduct a thorough investigation in the hope something like this will never happen again.
Any speculation at this point without having all the details is not only unfair to the individual's involved, but could affect the outcome of the investigation.

ALCON,

Attached is the press release that we have developed for QUERY RESPONSE ONLY. Not For Distribution to the media. AGAIN, Please keep in command channels.

If you get a question. Refer any media to my office (301)-677-1436. Then we will handle any questions and provide a copy of the attached press release.

EXSUM Jan. 10, 2007

As of today we have not had any media queries.

Tonight, Jan. 10, an information paper was distributed to the families who live in the same area as the children who became sick. (Installation Commander Colonel [redacted] and [redacted] went to about about 20 houses.)

Tomorrow an information paper (see attached below) will be distributed to all the homes on the installation and at the Child Care Centers. Next week, Colonel [redacted] will address the issue in his command column. (We missed getting in by deadline for this week's paper.) And we will have a story in next weeks paper.

IF you have any questions, give me a call.

This could go national tonight. Will be surprised if it doesn't.

Today NBC news in Baltimore came out to cover the botulism story. Apparently the family of the first incident told the reporter they thought it was a cover up.

We preempted the family by having the reporter talk with Colonel [redacted], LTC [redacted], Preventative Medicine [redacted] Kimbrough Commander and Dr. [redacted], Chief Physician.

The commander assured the reporter that there was no cover-up. In fact he went door to door last night to 20 homes in the neighborhood where the children live. We developed a fact sheet and canvassed the housing area and day cares today. We also have a town hall meeting scheduled for January 23 at Potomac place neighborhood center.

I believe we were able to give a balanced message that infant botulism is rare.

Botulism is in the ground. All around and we don't know the cause of these two cases.

Our community awareness program is underway.

Investigators are coming next week and we are working with local community health care providers.

The reporter just left and is going to talk with the family. I sent 2 of my folks with them. I will let you know how it goes when they return.

All we can hope for is a balanced story. I believe we did all we could do to get that.

Here's our command update FYI

[redacted]

11 January 2007

2 CASES OF INFANT BOTULISM CONFIRMED AT FT MEADE, KIMBROUGH AMBULATORY CARE CENTER (KACC), FT MEADE, MD (U) (MCAT-OP) This is a follow-up to the CCIR sent on 10 Jan 07. KACC has begun assembling a team of epidemiological investigators from Ft Meade MEDDAC, CHPPM, WRAMC and Anne Arundel County Health Department. Investigation into the cause of the 2 cases of infant botulism at Ft Meade has begun. The media, an NBC affiliate out of Baltimore—WBAL Channel 11 (local), met with the family of the child with the first case of infant botulism. Family believes the source disease is soil and debris pile adjacent to the family housing area. WBAL personnel interviewed the garrison commander and the Ft Meade MEDDAC Chief of Preventive Medicine, LTC [redacted], to ask questions about the cause of infant botulism, the mode of transmission of the disease, the occurrence of this disease on the installation, whether or not the installation would be investigating the cause of the disease, and any preliminary information available as to the cause of the disease in the two infants. The medical talking points consisted of 1) the health of the two infants is of primary concern and a full recovery is expected; 2) an investigation is ongoing with no preliminary information available at this time; epidemiological investigation involves collaboration with Army, local and state public health personnel. The news segment is to air at 1730 hrs this evening. POC is COL [redacted] at 301-677-8171.

Stories appeared last night and this morning on/in:
WBAL TV 11 -NBC (Baltimore)
WUSA TV 9 - CBS (Washington)
WJZ TV 13 - CBS (Baltimore)
CNN
WBFF TV 5 - Fox
Capitol Gazette
AP
Various local metro radio stations.

UPDATE of Today's Events:

Media interest in the Botulism story continued today. [redacted] continued to contact the media and be interviewed and says she won't rest until she gets some answers.

We were able to counter her barbs today when the commander went on air with WUSA9, Washington CBS affiliate and informed the reporter that the investigators were on site today. Our talking points included the fact that the investigators told him that botulism is a naturally occurring bacterium that can be found anywhere. They emphasized we may not ever know what caused these children to get sick. But the installation was doing all they could to ensure the safety of our community.

Two town hall meetings are scheduled for next week.

An invitation went out tonight to the residents of Amber Court to come to a private town hall meeting at 7pm on Tuesday January 16, 2007. We will have a physician from the US Army Center for Health Promotion and Preventive Medicine (USACHPPM) who is a member of the epidemiological consult (EPICON) team assisting in the investigation.

A second follow-up town hall meeting for all Fort Meade residents will be January 23 at Potomac Place at 6:00. Again the investigators for USACHPPM will be there to answer any questions.

We also had WJLA TV 7, ABC Affiliate cover the event on the installation.
There was a problem with the news crew showed up without contacting the Installation PAO office. They showed their House of Representatives Press Badge to the Contract Guard who thought they were a political leader and let them on the installation. They arrived at the [redacted] home (where they had been invited by the [redacted] and got there just as the investigators were arriving. So there was no PAO escort. But LTC [redacted] and Colonel [redacted], the Director, Epidemiology and Disease Surveillance, (U.S. Army Center for Health Promotion and Preventive Medicine, Aberdeen Proving Ground, Maryland) answered their questions successfully. And the media left. We later caught up with the media and explained the rules of escorting of media on post and explained they risk the pulling of their credentials on Fort Meade if they ever do that again.
We believe they now understand.

We also met with the Investigating Team today. The told us the following information.

They will not be doing environmental sampling in the house or outside or in the area. Our goal will be to explain this so folks don't think we are not doing anything. But sampling at this point is a waste of time. Botulism is everywhere.

The team will attempt to determine whether the two infant botulism cases reported in the Fort Meade area are related and attempt to identify any possible, common links or sources.

If one or more sources are identified, control measures may be recommended to guard against further transmission. Communication will be important throughout the process, and the team will share information regarding the illness and control measures with the affected community.

These cases are linked by proximity. Walter Reed Army Hospital has sent specimens from the babies to be tested at Maryland Labs. It will be several weeks before we have any answers. But the odds are against us finding an underling source because it is everywhere in the soil. It is not an inhalation problem but a toxic ingestion problem.

Reviewing results of tests that were ordered on the affected children during their illness, as well more specific testing that is in progress using samples from these patients. These more specific, bacteria subtype tests are being processed at public health laboratories. The team will review additional clinical information from healthcare providers.

They conducted interviews with both sets of infants' parents to determine food history and possible environmental exposures. They have follow-up questions with the one set of parents and will go back tonight.

Team members will also try to determine if the Fort Meade community or the civilian sector is experiencing other cases, by looking at surveillance data and disease reports. They are going tonight to introduce themselves to two other neighbors who have infants and live in the neighborhood.

They expect these meetings to extend through next week.

We have no plans to come in this weekend for coverage over the weekend. I believe the media is through until we can get some results. [redacted] is on post and will be on call if anyone needs her. Her number is [redacted]

Have a great weekend.

Subject: Infant botulism--CHPPM EPICON dispatched

[redacted]and all,

CHPPM sent an epidemiological consultation team (EPICON) to Fort Meade today (at request of Kimbrough) to assist in the investigation into the two cases of infant botulism. One occurred in October (recovered) and one this month (under treatment at Walter Reed and expected to recover). The EPICON is working closely with the Maryland public health department.

I have noted coverage on the local TV network affiliates including FOX, NPR, and Baltimore Examiner (an AP short story)--I can't be sure this is an all-inclusive list.

CHPPM (as of 2 pm today) has not received inquiry or request for interview (which we would coordinate through the Fort Meade public affairs office). CHPPM has a draft RTQ that has been approved here and is now being reviewed by the Kimbrough commander.

If you receive any report on this--Fort Meade or North Atlantic Regional Medical Command--I'd appreciate your forwarding it to me for info.

Thanks,

Subject: Re: Town meeting.

2 of 2.

One resident asked about cans at commisary. LTC [redacted] explained we have a person in commissary that checks cans for dents rust and other problems. It is ongoing.

Colonel explained some of the preventative things we are doing.

Keep dust down. Reseed.

We emphasised the team effort. We are working with DOD, State County, etc.

The zinger for the night was the last question.

Are our pets in any danger. They are small and on the ground are there any dangers for them.

One resident said she heard we had 4 animals from Muese Forest had died. Was it because of this bot problem. No one had heard about the problem so we explained we would check on it.

We will do the best we can on addressing the issues on our web site at the frequently asked questions sections.

Al,

[redacted] just called me; she is going to call [redacted] next. She explained to me that the information that she gave to the Gazette reporter was taken directly from the talking points on the CDC Web Site and pertained to a previous infant botulism outbreak, totally unrelated from Fort Meade's cases. I asked her if she considered two cases a cluster and she said no. I informed her that most people who read the Gazette article would think that we had a cluster and that our problem was caused by construction because that is the way the quote from the CDC makes it sound. [redacted] informed me that they are no longer answering any media inquiries but are directing the media to the Fort Meade PAO and the State Department of Health.

[redacted]

The number for the Media Relations Department at the CDC is 404-639-3286. I spoke to a gentleman named Chris. He would not give me Lola Russell's number, and she is not in, so I gave him your name and number and my name and number and asked him to have her call you, or me if she can't get through to you.

Personally, I wouldn't consider two of something to be a cluster.

I am concerned about the Story in the Saturday, January 13 2007 Maryland Gazette paper by Joshua Stewart. He says he talked to Lola Russell, spokesman for the CDC who is putting out information. Can we please get in contact with this person. "

Here is what she said that I have a problem with: "When there is a cluster that occurs, there is a soil in that area which has a higher than average content that was likely form some activity like construction."

To me here statement is confirming what Mrs. [redacted] was putting out that the construction ground was to blame. I would just like it if we could all agree on what to say. Do any of

you have a contact number for LOLA?

MESSAGE FROM THE INSTALLATION COMMANDER

INFANT BOTULISM FACT SHEET

Walter Reed Army Medical Center has identified two cases of infant botulism at Fort Meade since Oct. 2006. One infant has recovered while the other infant is being treated by doctors at Walter Reed Army Medical Center. The infants, both under the age of 6 months at the time of diagnosis, were treated at Walter Reed Army Medical Center. The cause is currently under investigation by the Preventive Medicine Services at Kimbrough Ambulatory Care Center on Fort Meade. [redacted] Preventive Medicine at Kimbrough Ambulatory Care Center said, "while the name of the disease can be frightening, infant botulism is a treatable condition associated with swallowing the botulinum bacteria found naturally in soils and in some contaminated food products. It is premature to speculate about a particular source until the investigation is complete." Cases of Infant Botulism are rare and usually occur among infants less than 6 months of age.

What are the symptoms of Infant Botulism?

Any or all of the following:

- ☐ constipation
- ☐ poor feeding and a weak suck
- ☐ weak cry
- ☐ loss of head control
- ☐ difficulty swallowing
- ☐ excessive drooling
- ☐ floppy appearance or "floppy baby"
- ☐ generalized weakness
- ☐ breathing difficulties

What do you do if your infant is experiencing these symptoms?

Call (301) 677-8606 or go to the nearest Emergency Room

- Howard County General Hospital 5755 Cedar Lane, Columbia, Maryland (410) 740-7890 or 7990
- Laurel Regional Hospital 7300 Van Dusen Road, Laurel, Maryland (301) 725-4300 or (410) 792-2270
- Baltimore Washington Medical Center, 301 Hospital Drive, Glen Burnie, Maryland (410) 787-4000

How is Infant Botulism treated?

Prompt diagnosis is essential. Medication is available to treat the condition.

How can I reduce the risk of contracting Infant Botulism?

- ☐ Wash hands frequently
- ☐ Avoid giving honey to infants less than 1 year of age
- ☐ Routine and frequent cleaning of toys-- particularly items that babies place in their mouths and those toys which have fallen on the ground or floor
- ☐ Through proper preparation of foods (boiling and cooking)
- ☐ Avoid cans of food/formula with dents or that are bulging or rusting
- ☐ Avoid locations with excessive dust and debris

For further information about the disease, contact Kimbrough Ambulatory Care Clinic, Preventive Medicine Services (301) 677-8661. If you have other questions or are contacted by the media please refer them to the Fort Meade Public Affairs Office at (301) 677-1436 or 1486.

COL [redacted]

At about 1400 today, I received a call from the [redacted], informing me of a public affairs emergency that she needed our help with. The [redacted] family invited Channel 7 News to the Visitor Control Center (VCC) so that they could accuse the installation of covering up the investigation of their child's infant botulism case. [redacted] informed me that the installation commander was on his way to the VCC and wanted to have one of our staff there to read a prepared statement supplied by higher headquarters. They felt that the statement would come across better from a medical person. Also, there may be questions that only a medical person could answer. I alerted LTC [redacted] and LTC [redacted]. I couldn't find COL [redacted], who was somewhere else in the facility. I later found [redacted] upstairs with [redacted] and [redacted]. I gave the prepared statement to LTC [redacted] and she departed immediately for the VCC.

At 1440, LTC [redacted] called the DCN's secretary to inform her that there was no one at the VCC. I called the post commander's office and COL [redacted] secretary called him. He stated that there was no one there when he arrived either and he left after a few minutes to go to another meeting. We can only assume that the [redacted] or Channel 7 called off the story and failed to notify COL [redacted] office.

I am willing to do by phone. Cannot come down to Meade today for WJLA interview. Key message is that any environmental sampling being discussed by the team is purely in the interest of advancing general knowledge about the ecology of C. botulinum in Maryland. There is NO environmental sampling that will guide an intervention or preventive measure to benefit the community or any individual family, and this can be said generally about NON-foodborne botulism.

Per our conversation, here is the media request that I got from the Baltimore Sun:

Reporter: Brad Olson
Baltimore Sun
Phone: (410) 332-6100
E-mail: bradley.olson@baltsun.com

Request:

Mrs.[redacted] called the Baltimore Sun claiming that the installation is not doing enough to find out what caused the isolated cases of infant botulism at FGGM. Is the post going to be testing the environment, specifically the soil? If not, why was that decision made? Mr. Olson also had questions about how the investigation is going. I sent him a copy of the most up-to-date news release, which is attached in this e-mail. The deadline for this story is 4 p.m. on 2 Feb.

We are requesting that USACHPPM provide a subject matter expert who can comment on the investigation to the reporter and explain why the installation is not doing environmental testing.

We also wanted to inform you that Travis Edwards in our office was misquoted in the Washington Post yesterday. Travis was trying to explain that botulism is everywhere in the soil.

Then he said in an answer that we the installation would do whatever needed to be done to investigate the cause.

The reporter made the lead connection incorrectly that we would be doing environmental testing and were just waiting for the results. We will do a retraction with the Post.

Call me if you have a question. My staff is doing an excellent job trying to keep this from making another story. But we may need your help.

Good day COL[redacted]

As we all discussed at last week's town hall meeting, below is a short weekly update of the EPICON team actions to date. I know we discussed you speaking personally with just the 3-5 families with the highest level of interest (which is certainly the most effective way to discuss concerns of thos particular families). However, I strongly encourage that this information be widely publicized beyond just that group to preempt potential media focus (which is possible and potentially likely based on past community interest and history of actions). I'll be out of the office beginning this afternoon until Monday morning, but can still read email via my Blackberry. Please let me know what else I can provide to you.

++
++

[redacted]

expected. The Maryland DHMH Laboratory has contacted the Center for Disease Control and Prevention (CDC in Atlanta, GA) to see if they are willing to do the subtyping and expect a CDC response by the end of the week.

The EPICON team is continuing discussions with the Maryland Department of Health and Mental Hygiene (DHMH), the CDC, the laboratory in California, Fort Meade medical authorities and other experts in this field to determine next steps in the investigation.

The Army's Medical Surveillance Activity (AMSA) is also working on a retrospective analysis of botulism cases for 1996-2005 for publication in their Medical Surveillance Monthly Report (MSMR) article. These reports are available online at:

Vexing infant botulism provokes threat of suit By Bradley Olson Sun Reporter Originally published February 3, 2007 It's one of the rarest infectious diseases, affecting an average of only 100 babies a year in the United States, but infant botulism infected two babies living on the same street at Fort Meade in recent months - puzzling researchers.

Clusters of the illness are not unprecedented, experts say, and the ubiquity of the bacterial spores that cause infant botulism makes isolating one source almost impossible.

That is especially true in this case, where the military base also happens to be an Environmental Protection Agency Superfund site.

Both children survived the illness, but one family confirmed yesterday that it has hired a lawyer who will likely sue the Army, claiming that military officials have been negligent in seeking the cause of the outbreak. The parents of the other child say they do not blame the military and do not plan to join a lawsuit.

On Thursday, base officials confirmed that both cases, the first diagnosed in October and the second in December, came from the same strain of Clostridium botulinum bacteria.

"I would be hesitant to reassure everyone by saying this is a freak thing and this is over," said Col. Bruno Petruccelli, a physician and director of epidemiology and disease surveillance at the U.S. Army Center for Health Promotion and Preventive Medicine in Aberdeen. "Maybe there will be a third case and a fourth case. We can't say there won't be another one."

Army doctors involved in the investigation say they have followed medical protocol, conducting an investigation with help from experts at the Centers for Disease Control and Prevention in Atlanta, Walter Reed Army Medical Center, Maryland Public Health Administration and Anne Arundel County Department of Public Health.

Infant botulism develops in newborns - usually those between 3 weeks and 6 months of age - when they ingest bacteria that produce a toxin inside the large intestine. The toxin attaches to nerves in the body and paralyzes them. Although the condition is treatable and most babies eventually recover, it causes several frightening symptoms, including paralysis and respiratory problems.

Such was the case with [redacted] whose family lives on the Anne

Arundel County military base.

On Oct. 2, [redacted] noticed that the baby became fussy and was not feeding well. Thinking he was teething, she put him to bed. The next morning, he made an odd, grunting sound, and when she picked him up, his head flopped.

She took him to Bethesda Naval Hospital, where doctors, thinking [redacted] was dehydrated, gave him fluids intravenously. When his eyes began to gloss over, [redacted] recalled, [redacted] was rushed to Walter Reed Army Hospital, where a young physician noticed symptoms of infant botulism she had seen in a case during her residency.

She went home to research the condition and in the meantime, doctors tested him for meningitis. When that came back negative, they sent him to get a CT scan to rule out a neurological disorder. During the scan, [redacted] vital signs plunged, and a gaggle of doctors and nurses rushed into the room, reviving him and putting him on oxygen.

Once infant botulism was definitively diagnosed, they treated him with a drug called "Baby-BIG," which slightly relieves symptoms and doesn't allow the toxin to paralyze any other nerves.

"My son was so sick, he couldn't even open his eyes," [redacted] said. "He had over 50 needle marks in him because his veins kept busting. To watch that, it was absolutely the most terrifying, horrible experience I've had to go through as a mother, and I've got four kids. I don't want any other families to have to go through that."

[redacted] has been fine since his recovery, but his mother became angry when, on Jan. 9, a Walter Reed doctor called her to say another child on her street had been diagnosed with infant botulism. At that point, she became convinced that the military was not committed to finding a cause.

Michael Archuleta, a Texas-based lawyer who is also a physician and is representing the [redacted] family, said he believes a pile of debris, about a block from the street where both families live, is the source of the toxin, and will file a negligence claim with the Army.

"We have two cases of infant botulism occurring in the same time frame, very close to one another, that is epidemiologically very improbable unless it came from an external or environmental source," he said.

A base spokeswoman confirmed that there was a debris pile and said it was removed and the site was covered with hay on Jan. 7.

The mother of the second child, who asked not to be identified when contacted by The Sun, said that her daughter is no longer sick and that she does not wish to join any potential lawsuit.

In interviews with both families, investigators have determined that the source was not food such as honey, which has proved to be a source of infant botulism.

Fort Meade and Army officials, as well as several leading independent epidemiologists and infectious disease experts, insist that testing soil in infant botulism cases would be fruitless because the bacterial spores that cause it are common and naturally occurring.

Dr. John Bartlett, a professor of medicine at the Johns Hopkins University who specializes in infectious diseases but is not involved in these cases, said that testing soil is "pointless."

"That kind of activity just doesn't pay off," he said. "You don't look for it in dirt, and even looking for it in a food source is going to be a long shot. I mean, two cases in the same geographic area are unusual, but I wouldn't know quite how to go about finding a source. Usually, we don't try because we don't find it."

Archuleta and the [redacted] believe that DNA testing could establish an exact match between the two cases and the dirt pile or other soils, and they intend to use that evidence in any litigation.

The toxin is too ubiquitous, Petrucelli, the Army epidemiologist, said, and the DNA-testing process too inconclusive. That Fort Meade was built on a landfill and is currently

monitored by the Environmental Protection Agency would not have any impact, because those sites focus on chemical agents and other toxic substances, not naturally occurring substances, he said.

Dr. James Campbell, a pediatric infectious disease specialist at the University of Maryland School of Medicine, who is not involved in the case, said unlike food-borne botulism, which generally infects adults and which investigators almost always link to a food source, there is often no identified source for the infant variety.

Vexing infant botulism provokes threat of suit

BY BRADLEY OLSON
SUN REPORTER

ORIGINALLY PUBLISHED FEBRUARY 3, 2007

It's one of the rarest infectious diseases, affecting an average of only 100 babies a year in the United States, but infant botulism infected two babies living on the same street at Fort Meade in recent months - puzzling researchers.

Clusters of the illness are not unprecedented, experts say, and the ubiquity of the bacterial spores that cause infant botulism makes isolating one source almost impossible.

That is especially true in this case, where the military base also happens to be an Environmental Protection Agency Superfund site.

Both children survived the illness, but one family confirmed yesterday that it has hired a lawyer who will likely sue the Army, claiming that military officials have been negligent in seeking the cause of the outbreak. The parents of the other child say they do not blame the military and do not plan to join a lawsuit.

On Thursday, base officials confirmed that both cases, the first diagnosed in October and the second in December, came from the same strain of Clostridium botulinum bacteria.

"I would be hesitant to reassure everyone by saying this is a freak thing and this is over," said Col. Bruno Petruccelli, a physician and director of epidemiology and disease surveillance at the U.S. Army Center for Health Promotion and Preventive Medicine in Aberdeen. "Maybe there will be a third case and a fourth case. We can't say there won't be another one."

Army doctors involved in the investigation say they have followed medical protocol, conducting an investigation with help from experts at the Centers for Disease Control and Prevention in Atlanta, Walter Reed Army Medical Center, Maryland Public Health Administration and Anne Arundel County Department of Public Health.

Infant botulism develops in newborns - usually those between 3 weeks and 6 months of age - when they ingest bacteria that produce a toxin inside the large intestine. The toxin attaches to nerves in the body and paralyzes them. Although the condition is treatable and most babies eventually recover, it causes several frightening symptoms, including paralysis and respiratory problems.

Such was the case with Jonathan Cook, now 10 months old, whose family lives on the Anne Arundel County military base.

On Oct. 2, Christine Cook noticed that the baby became fussy and was not feeding well. Thinking he was teething, she put him to bed. The next morning, he made an odd, grunting sound, and when she picked him up, his head flopped.

She took him to Bethesda Naval Hospital, where doctors, thinking Jonathan was dehydrated, gave him fluids intravenously. When his eyes began to gloss over, Cook recalled, Jonathan was rushed to Walter Reed Army Hospital, where a young physician noticed symptoms of infant botulism she had seen in a case during her residency.

She went home to research the condition and in the meantime, doctors tested him for meningitis. When that came back negative, they sent him to get a CT scan to rule out a neurological disorder. During the scan, Jonathan's vital signs plunged, and a gaggle of doctors and nurses rushed into the room, reviving him and putting him on oxygen.

Once infant botulism was definitively diagnosed, they treated him with a drug called "Baby-BIG," which slightly relieves symptoms and doesn't allow the toxin to paralyze any other nerves.

"My son was so sick, he couldn't even open his eyes," Cook said. "He had over 50 needle marks in him because his veins kept busting. To watch that, it was absolutely the most terrifying, horrible experience I've had to go through as a mother, and I've got four kids. I don't want any other families to have to go through that."

Jonathan has been fine since his recovery, but his mother became angry when, on Jan. 9, a Walter Reed doctor called her to say another child on her street had been diagnosed with infant botulism. At that point, she became convinced that the military was not committed to finding a cause.

Michael Archuleta, a Texas-based lawyer who is also a physician and is representing the Cook family, said he believes a pile of debris, about a block from the street where both families live, is the source of the toxin, and will file a negligence claim with the Army.

"We have two cases of infant botulism occurring in the same time frame, very close to one another, that is epidemiologically very improbable unless it came from an external or environmental source," he said.

A base spokeswoman confirmed that there was a debris pile and said it was removed and the site was covered with hay on Jan. 7.

The mother of the second child, who asked not to be identified when contacted by The Sun, said that her daughter is no longer sick and that she does not wish to join any potential lawsuit.

In interviews with both families, investigators have determined that the source was not food such as honey, which has proved to be a source of infant botulism.

Fort Meade and Army officials, as well as several leading independent epidemiologists and infectious disease experts, insist that testing soil in infant botulism cases would be fruitless because the bacterial spores that cause it are common and naturally occurring.

Dr. John Bartlett, a professor of medicine at the Johns Hopkins University who specializes in infectious diseases but is not involved in these cases, said that testing soil is "pointless."

"That kind of activity just doesn't pay off," he said. "You don't look for it in dirt, and even looking for it in a food source is going to be a long shot. I mean, two cases in the same geographic area are unusual, but I wouldn't know quite how to go about finding a source. Usually, we don't try because we don't find it."

Archuleta and the Cooks believe that DNA testing could establish an exact match between the two cases and the dirt pile or other soils, and they intend to use that evidence in any litigation.

The toxin is too ubiquitous, Petrucelli, the Army epidemiologist, said, and the DNA-testing process too inconclusive. That Fort Meade was built on a landfill and is currently monitored by the Environmental Protection Agency would not have any impact, because those sites focus on chemical agents and other toxic substances, not naturally occurring substances, he said.

Dr. James Campbell, a pediatric infectious disease specialist at the University of Maryland School of Medicine, who is not involved in the case, said unlike food-borne botulism, which generally infects adults and which investigators almost always link to a food source, there is often no identified source for the infant variety.

SENSITIVE

NOT FOR RELEASE

Subject: Botulism UPDATE

EXSUM

February 2, 2007

Botulism UPDATE

FGGM PAO had requests for information about the cases of infant botulism from media outlets including:

1. The Baltimore Sun

2. Fox 5, D.C. (query complete)

3. WJLA Channel 7, D.C. (a crew came to the Reece Road gate for a live shot around 1800)

4. Washington Post – Clarification from yesterday.

BACKGROUND as I know it:

The [redacted] created another media day around the botulism situation on Fort Meade. Mr. [redacted] told his commander at DINFOS he feels it is his duty to expose the installation because he feels we are covering something up. Their concern is based on the fact the inspectors are not doing any environmental testing in his neighborhood. They have hired an environmental lawyer in Austin to sue the installation. And they are contacting the media to ensure their voices are heard. (Just so you know we did not know about the law suit before the interview. The reporter used it as one of the opening questions when they arrived back at the installation.)

The problem is this is wrong. We are not involved in a cover up of any kind. In fact the command has been very proactive about the whole thing.

So we are doing the best we can to counter their attacks by having the experts at United States Army Center for Health Promotion and Preventive Medicine (CHPPM) available for the reporters to talk to. Today the Baltimore Sun reporter Brad Olsen talked to Col [redacted] at CHPPM via phone. The reporter had questions for the installation as well.

Our basic message was that until the investigations are complete any comments on causes would be speculative. Ft. Meade continues to cooperate fully with US Army, Anne Arundel County, Maryland and Centers for Disease Control investigators. Col. [redacted] has been

proactive in notifying the community and addressing their concerns.

When asked about the debris pile near the home we said; "Concrete construction debris was temporarily stored at the site in preparation for crushing and re-use on other projects. Crushing occurred on Oct. 31, Nov. 1-3 and Nov. 7. The crushed concrete was moved from the site and it used as road fill. The area in question was hydro-seeded on Jan 7 and hay was laid over the seed to allow it to germinate.

Colonel [redacted] went on camera this afternoon on channel 7 WJLA in Washington (ABC). She stuck to the same messages we had put out before. The Clostridium botulinum bacteria is a naturally occurring bacteria that is found anywhere in the environment. Therefore we don't plan to do any soil sampling or air quality sampling because it exists everywhere in Maryland. We don't have any answers right now because the investigation is not complete. But we are working together with Anne Arundel County, Maryland and Centers for Disease Control investigators. She also emphasis that very likely we would not ever be able to point to an exact cause.

The first newscast at 6:00 was very short. It basically said the [redacted] were suing the Army. They did not use any of the footage from Colonel [redacted]. They filmed an intro around 7pm and said the real story would be on the 10:00 news tonight.

We will continue to monitor the situation and send reports up as we have them.
