DEPARTMENT OF THE NAVY
OFFICE OF THE CHIEF OF NAVAL OPERATIONS
2000 NAVY PENTAGON
WASHINGTON DC 20350-2000

IN REPLY REFER TO.

12 March 2010

SUBJECT: YOUR FREEDOM OF INFORMATION CASE DON 2010F0294

This responds to your Freedom of Information Act (FOIA) request dated 16 November 2009. You requested each report produced for Congress by the Department of the Navy during the past three years, and which are not posted on the Navy public internet websites. Your request letter was received 3 December 2009 by the Navy FOIA office and was assigned Case File Number DON 2010F0294. Your request was received by this office, via email 25 February 2010.

A search of our records produced the enclosed CD-ROM which is responsive to your request. It is released to you in its entirety. The fee for processing your request is \$30. You will be contacted by the Department of the Navy Freedom of Information Act Policy Branch via separate correspondence to arrange payment.

If you have any questions concerning this matter, please do not hesitate to contact Lieutenant Commander Terry McNamara at (703)695-5753.

Sincerely,

A handwritten signature in cursive script, appearing to read "S. Gonzales", is written over the typed name.

S. GONZALES
Director, Department of the Navy
Program Information Center

Enclosure:

1 CD-ROM containing Navy reports to Congress 2007-2009

2007

THE ASSISTANT SECRETARY OF THE NAVY
(Research, Development and Acquisition)
WASHINGTON DC 20350-1000

JUL 10 2006

The Honorable John Warner
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

The Fiscal Year 2007 House Armed Services Committee Report 109-452 directed that the Secretary of the Navy revalidate the cost estimates for the CVN 21, for the ships currently programmed in the LHA Replacement program, and for the eight ships of the SAN ANTONIO Class that follow the lead ship. The committee further directed that the revalidated cost estimates be submitted for review and approval by the Under Secretary of Defense for Acquisition, Technology, & Logistics (USD (AT&L)). Finally the committee directed that no later than July 1, 2006, the Secretary of the Navy submit a report to the congressional defense committees containing the revalidated cost estimates for these ship classes including certification by the Secretary that all known and anticipated major elements of cost have been included in the estimate. I am responding for Secretary Winter.

In February 2004, the Navy issued a policy that directed the inclusion of realistic pricing for shipbuilding inflation. In prior years, shipbuilding estimates utilized OSD/OMB indices for projecting inflation costs. Use of the OSD/OMB indices had the effect of under-predicting the inflation costs experienced in our shipbuilding programs. This shift in policy was subsequently reflected in the Fiscal Year 2006 President's Budget.

The Navy has also implemented a policy on program change orders that allows Program Managers the authority to approve engineering and non-engineering change proposals that reduce or do not impact contract cost, but reserves shipbuilding program funds for only those change orders required for safety, contractual defects, unavailable contractor furnished equipment, documented testing and trial deficiencies, and statutory/regulatory changes. Further, in recognition of the need to manage requirement changes/growth, the Navy has instituted capabilities and requirements review processes. The Naval Capabilities Board and Resources and Requirements Review Boards are chaired at the highest levels of Navy Leadership with the objective to minimize requirements changes to shipbuilding programs. This will provide a stable requirements baseline upon which credible estimates can be developed and maintained.

Specific to the CVN 21 program, the revised cost estimate as reflected in the Fiscal Year 2006 President's Budget reflected the above change in inflation prediction policy. The CVN 21 cost estimate that supported the Milestone B (MS B) decision in April 2004

included realistic inflation predictions. These predictions were based on historical data, shipbuilder forward pricing projections, and projections of inflation in the shipbuilding industry for material. Additionally, this estimate was based on a detailed review of the ship design covering all factors affecting the price of the ship (i.e., inflation, labor and overhead projections, material, government furnished equipment, shipyard workload, ship design maturity, etc.). In accordance with the CVN 21 MS B Acquisition Decision Memorandum, the Navy is subject to follow-on Defense Acquisition Board (DAB) reviews prior to award of the construction contract.

The LHA Replacement (LHA(R)) program completed both a Navy and OSD Cost Analysis and Improvement Group cost review as part of the January 2006 MS B review. The MS B Acquisition Decision Memorandum directed the Navy to fund to the Service cost position for the LHA 6, adjusted to include additional funding for material escalation and other changes as reflected in the Fiscal Year 2007 President's Budget request.

The Fiscal Year 2007 President's Budget request for the LPD program consists of LPD 18-21 under a Cost Plus Incentive Fee contract and the recently awarded Fixed Price Incentive Fee contract for LPD 22-25. The Fiscal Year 2007 President's Budget request included additional funding over the Fiscal Year 2006 President's Budget request for the LPD 19, 20, and 23 as a result of incorporating lead ship lessons learned and to offset the increased costs of these ships due to a reduction from 12 to nine in the total number of LPD Class ships to be constructed. Finally, as the LPD program is currently the only Navy program building ships at the Northrop Grumman Ship Systems Avondale Facility, there is risk in the Navy's ability to predict future overheads and rates associated with work at that facility. Imposing cost caps without recognition of the potential need for additional funds to address these items is not an effective method of controlling costs and may in fact result in further construction delays and additional costs.

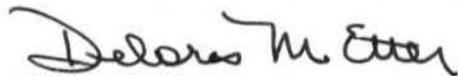

The Navy and USD AT&L have revalidated the FY 2007 President's Budget request cost estimates for the LPD 18-25, LHA 6, and CVN 78. The OSD CAIG has not yet conducted formal cost reviews for the CVN 21 Class follow ships.

<i>SM</i>	<i>PB07 End Cost</i>	<i>Known Hurricane Katrina Impact</i>	<i>Post Delivery & Outfitting</i>	<i>Total</i>
LPD 18	\$1,111.3	\$145.0	\$51.3	\$1,307.6
LPD 19	\$1,138.2	\$156.0	\$79.3	\$1,373.5
LPD 20	\$1,004.6	\$165.0	\$48.1	\$1,217.7
LPD 21	\$1,137.3	\$151.0	\$48.4	\$1,336.7
LPD 22	\$1,246.7	\$157.0	\$51.3	\$1,455.0
LPD 23	\$1,191.2	\$171.0	\$56.1	\$1,418.3
LPD 24	\$1,333.0	\$153.0	\$60.0	\$1,546.0
LPD 25	\$1,804.8	\$0.0	\$61.7	\$1,866.5
CVN 78	\$10,461.1	\$0.0	\$212.1	\$10,673.2
CVN 79	\$9,583.0	\$0.0	\$231.4	\$9,814.4
CVN 80	\$10,807.0	\$0.0	\$270.9	\$11,077.9
LHA 6	\$2,813.6	\$97.0	\$82.3	\$2,992.9

Based upon the above positions, the Navy assesses that all known and anticipated major elements of cost such as contract values, current projected forward price rate agreements, labor and material inflation, and workload projections, as well as the lessons learned impact from the lead ship have been included in the Navy's cost estimates for these ships as reflected in the Fiscal Year 2007 President's Budget request. The Navy and Northrop Grumman Corporation continue to work through the impacts of Hurricane Katrina. Given the uncertainties associated with the final impact of Hurricane Katrina on the Shipbuilding industry, it could take several years to realize the complete impact.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Hunter, Stevens, and Young.

Sincerely,

A handwritten signature in cursive script that reads "Delores M. Etter".

**REPORT ON
NAVY'S FLEET RESPONSE PLAN**

**2000 Navy Pentagon
Code: N430D
Washington, DC 20350-2000**

December 2006

REPORT ON NAVY'S FLEET RESPONSE PLAN IN COMPLIANCE WITH SECTION 341 OF FISCAL YEAR 2007 NATIONAL DEFENSE AUTHORIZATION ACT

Requirement:

Not later than December 1, 2006, the Secretary of the Navy shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the program of the Navy referred to as the Fleet Response Plan. The report shall include the following:

- (1) A directive that provides guidance for the conduct of the Plan and standardizes terms and definitions.
- (2) Performance measures for evaluation of the Plan.
- (3) Costs and resources needed to achieve objectives of the Plan, including any incremental effect on the Navy Operation and Maintenance budget.
- (4) Operational tests, exercises, war games, experiments, and deployments used to test performance.
- (5) A collection and synthesis of lessons learned from the implementation of the Plan as of the date on which the report is submitted.
- (6) Evaluation of each of the following with respect to each ship participating in the Plan:
 - (A) Combat readiness, including training requirements.
 - (B) Ship material condition, including trending data for mission degrading casualty reports rated as C3 or C4.
 - (C) Professional development training requirements accomplished during a deployment and at home station.
 - (D) Crew retention statistics.
- (7) Any proposed changes to the Surface Force Training Manual.
- (8) The amount of funding required to effectively implement the operation and maintenance requirements of the Plan by ship class.

(9) Any recommendations of the Secretary of the Navy with respect to expanding the Plan to include Expeditionary Strike Groups.

In addition, the Secretary of the Navy may not expand the implementation of the Fleet Response Plan beyond the Carrier Strike Groups until the date that is six months after the date on which the Secretary of the Navy submits the report to Congress.

Executive Summary:

The Fleet Response Plan is the operational framework for Carrier Strike Groups that capitalizes on the Navy's investments in its readiness accounts. It leverages its force provider capabilities to meet Combatant Commander force requirements for traditional roles, such as forward presence, while providing an available surge capability for emerging missions. It is a deliberate process that ensures continuous availability of trained, ready Navy forces. It does not change training requirements, operational capabilities, or amount of maintenance, nor has it impacted training accomplishment or reenlistment rates; overall, its implementation has been cost-neutral to the Operations and Maintenance Budget.

Expanding the Fleet Response Plan beyond Carrier Strike Groups to all deployable Navy Forces will enable the Navy to provide a more agile, flexible, and scalable surge capability, enabling quicker response to unexpected threats, humanitarian disasters, and contingency operations.

Discussion:

The responses to the questions found in the Fiscal Year (FY) 2007 National Defense Authorization Act, Section 341, are provided below.

1. Fleet Response Plan directive.

The Navy's existing directive that sets policy and establishes responsibility for the execution of the Fleet Response Plan, Chief of Naval Operations (OPNAV) Instruction 3000.15, dated August 31, 2006, is included as enclosure 1. This instruction states that the Fleet Response Plan is applicable to all active and reserve deployable units. As required by Section 341, the Secretary of the Navy will not expand implementation of Fleet Response Plan beyond Carrier Strike Groups (CSGs) until six months after the submission of this report.

2. Performance measures for evaluation of the Fleet Response Plan.

The Navy is currently using two measures of performance for the Fleet Response Plan and is continuing to develop and refine additional ways to fully measure the effects of the Fleet Response Plan's impacts. These measures of performance include: a. the ability to meet the adjudicated Combatant Commanders' requests for forces; b. the availability of surge ready forces to meet Operational Plan requirements while meeting Personnel Tempo of Operations (PERSTEMPO) limits specified by the CNO.

a. **Combatant Commander's Request for Forces.** The Navy is meeting an increasing and more complex demand for forces. From the late 1990's through 2003, the Navy provided Carrier Strike Groups to Combatant Commanders allocated on a yearly average presence level in accordance with the Secretary of Defense's 1998 Global Naval Forces Presence Policy. In 2005, the demand for Carrier Strike Groups increased above the traditional steady-state average. The requirement also grew in complexity, with more stringently defined times, durations and force

levels. Having the Fleet Response Plan construct in place has allowed the Navy to meet this complex demand signal.

b. **Surge Force Availability.** Since the implementation of the Fleet Response Plan, the availability of Carrier Strike Groups ready to deploy (as referred to under the Fleet Response Plan definitions as “Major Combat Operations (MCO) Surge Ready” and “MCO Ready”) has nearly doubled. Moreover, the readiness of all Carrier Strike Groups is closely tracked, with their readiness ratings reported weekly to the Chief of Naval Operations (CNO).

c. The PERSTEMPO Program is a deliberate process to balance support of national objectives with reasonable operating conditions for our Sailors. The PERSTEMPO Program requires all units to report current and projected operational employments to both the Type and Fleet Commanders, and has several limitations on how often a unit can be away from its home port. If a unit is projected to exceed these limits, a report to the CNO is required to be made, and the CNO must authorize the unit(s) to exceed the limitations.

3. Costs and resources needed to achieve objectives of the Fleet Response Plan.

Implementation and execution of the Fleet Response Plan has been cost neutral to the Navy’s Operation and Maintenance budget due to offsetting impacts to ships’ operations and maintenance budgets. When the Fleet Response Plan was implemented, the Navy increased the nominal deployment cycle 24 months to 27 months. As a result, over a ship’s service life, there will be fewer major maintenance availabilities. To maintain ships’ material condition without extending the resulting maintenance availabilities, more funding was invested in continuous maintenance, where shipyard personnel perform maintenance without the ship’s physical presence in a shipyard. The net result of rebalancing the maintenance requirements between maintenance availabilities and continuous maintenance yielded a neutral impact to the Operations and Maintenance budget. It should be noted that the FRP provides surge capability. Should that capability be called for through actual surging of forces, there would be increased operations and maintenance costs beyond what was programmed due to increased steaming and flying operations and the associated increase in maintenance requirements resulting from increased operations.

4. Operational tests, exercises, war games, experiments, and deployments used to test performance.

The Navy has used, and will continue to use a variety of events, to include deployments and war games, to evaluate the effectiveness of the Fleet Response Plan. This past year, we maintained the Fleet Response Plan’s readiness to consistently deliver forward-deployed or ready-to-surge Carrier Strike Groups almost immediately (within 30 days), plus additional Carrier Strike Groups in 90 days or less. The Fleet Response Plan allows us to surge 50 percent more combat power on short notice to deal with future global contingencies than in the past. For example, the Navy was able to maintain the JOHN C STENNIS Carrier Strike Group in a “ready for war” state for 418 of the 509 days of its most recent readiness cycle, which included deployed operations.

The Navy demonstrated the Fleet Response Plan's capability in a surge exercise, SUMMER PULSE '04, deploying seven Carrier Strike Groups across five theaters for three months. The Navy also surged USS BATAAN, BOXER, and KEARSARGE to enable Marine Corps deployments to support ongoing operations in Iraq. This surge capability is maintained across the Fleet 365 days per year. To support this level of operational availability, the Navy has been evaluating and improving our maintenance processes and organizations

5. Lessons learned from implementation of the Fleet Response Plan.

The Navy collects and maintains lessons learned in the Navy Lessons Learned (NLL) data base at the Naval Warfare Development Center and utilizes relevant lessons to incrementally improve the training that occurs in each of the Fleet Response Plan phases. Individual units report lessons learned through the NLL system based on assigned missions (e.g., Maritime Security, Global War on Terror, Anti-piracy). Post-deployment briefings are also used to convey relevant operational issues encountered during the execution of various missions; changes to the training process often occur from these exchanges.

One particular lesson learned was determined after initial indications of successfully generating greater CSG readiness for no increase in cost; it was to match the planned Aircraft Carrier maintenance cycle to the actual realized cycle time. This notional increase resulted in several more months of planned surge capability and made individual cycle start and stop dates more predictable.

As an additional lesson learned, a need exists to update the current PERSTEMPO instruction and associated measure of performance. The current PERSTEMPO instruction was developed in 1985 in the context of the Cold War. But the security environment has changed since then. Since its initial response to the events of 9/11, the Navy has compiled a number of lessons learned in this area and is working to apply it to its deploying forces. Under the current PERSTEMPO program, the Navy has had to either extend or deploy earlier its forces to meet more complex demand requirements. As an example, in 2005 the Navy executed a 26% increase in deployed force presence to meet the needs of the Combatant Commanders. These changes were often made on short notice and created instability in Sailors' lives. In an effort to increase operational availability of naval forces and meet increasingly complex Combatant Commanders' demand for forces, unit deployability and employability has been reviewed with significant consideration placed upon how employment affects Sailors and their families. The effort focused on balancing the operational availability of units while preserving operational readiness and Sailor's quality of life. As a result of the review, updated deployment policies, revised applicable definitions, and codified deployment metrics are being staffed. The Navy will brief the Congress on the new PERSTEMPO instruction when it has completed staffing.

6. Evaluation of ship performance participating in the Fleet Response Plan.

There have been two Carrier Strike Groups to date that have completed the entire Fleet Response Plan cycle. For the purpose of this report, data and analysis reported below were derived from these Carrier Strike Groups.

- a. Combat readiness, including training requirements.

Fleet Response Plan implementation has not changed training requirements; rather, it provides for a graduated readiness capability, achieving higher readiness earlier in the cycle. Each ship operating under the Fleet Response Plan has completed all scheduled training and certification exercises, achieving the level of combat readiness designed into each Fleet Response Plan phase.

- b. Ship material condition, including trending data for mission degrading casualty reports rated as C3 or C4.

There was no statistically significant impact to each ship's material condition as a result of Fleet Response Plan implementation. Detailed graphical averages, trending and analysis are included in appendix A.

- c. Professional development training requirements accomplished during a deployment and at home station.

For all Navy Type Commanders (Air, Surface and Sub-Surface), there has been no decrease in the percentage of required training accomplished through formal home station schools. Two Type Commanders have reported increasing trends in home station school accomplishment rates. An example for Commander, Naval Air Forces units is included in appendix B. Moreover, the Navy has accelerated Distance Support and afloat Integrated Learning Environment capabilities to each ship to enable its Sea Warrior initiative, supplementing traditional deployed education opportunities such as basic skills improvement classes, Program for Afloat College Education (PACE) courses, and in-rate training.

- d. Crew retention.

To date, there are no statistically significant indications that the Fleet Response Plan negatively affects retention. Detailed statistical graphs are included in appendix C.

7. Proposed changes to the Surface Force Training Manual.

There are no proposed changes to the Surface Force Training Manual related to implementation of the Fleet Response Plan. Training requirements have not changed; only the phases in which they are to be completed have changed. The same training events are still required for accomplishment to the same level of competence as they were prior to Fleet Response Plan implementation. Moreover, sustainment of capabilities through training has been factored into the Fleet Response Plan to maintain unit and group proficiency.

8. Funding required to effectively implement the operation and maintenance requirements of the Fleet Response Plan by ship class.

Current Navy operation and maintenance requirements are sufficient to effectively implement the Fleet Response Plan due to its ~~cost-neutral~~ nature as described earlier. Actually surging

forces will lead to increased operations and maintenance costs to the extent that surge operations cause an increase in overall steaming operations. The average operations and maintenance costs per Fiscal Year for each ship class (in constant year FY-07 dollars) are as follows:

CVN: \$104.4 M per ship per year.
SSN: \$ 26.7 M per ship per year.
CG: \$ 19.7 M per ship per year.
DDG: \$ 12.7 M per ship per year.
FFG: \$ 7.5 M per ship per year.

Note: These figures constitute normal investment levels, not differential costs associated with the Fleet Response Plan.

9. Recommendations.

The Navy desires to expand the Fleet Response Plan, to include Expeditionary Strike Groups, as well as all other deployable Navy assets that use a time-phased readiness approach to develop operational capabilities. Experience to date indicates the Fleet Response Plan approach is a viable and appropriate response to meeting global Navy force demands. Accordingly, the Navy is making plans to expand the Fleet Response Plan beyond Carrier Strike Groups and will inform the Congress appropriately as these plans are finalized.

Conclusion:

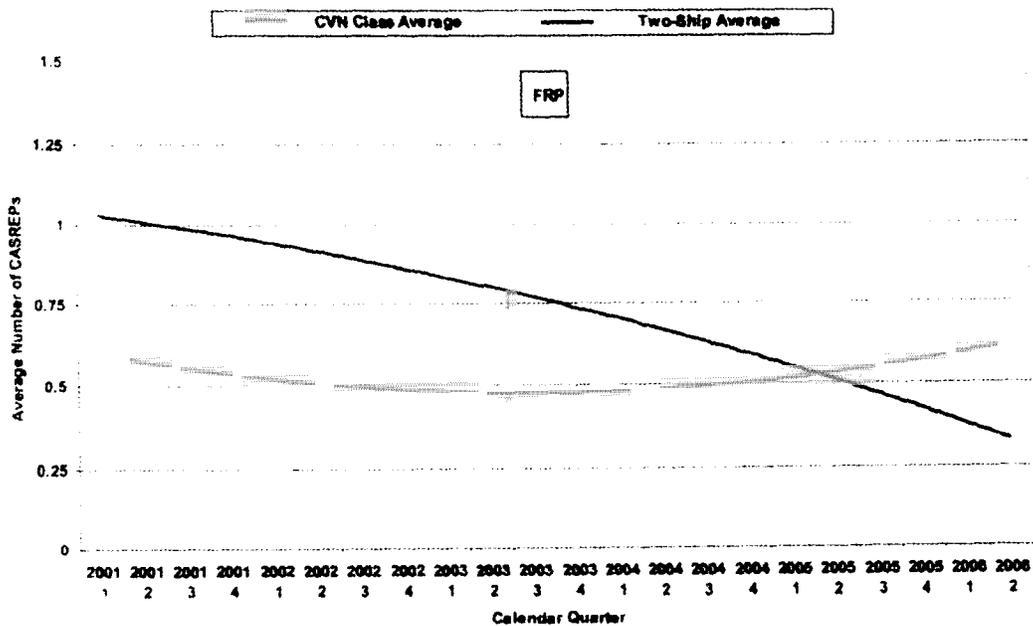

The current security environment has created new demands for Navy forces, from individual units to strike groups, requiring a more agile and flexible capability to respond to Combatant Commander's requirements. The Fleet Response Plan delivers the desired surge capability that supports the Navy's ability to respond to unexpected threats, humanitarian disasters, and contingency operations while supporting the needs of the Combatant Commanders to maintain a global forward presence. It is a cost-neutral solution to providing increased availability of deployable Carrier Strike Groups. Based on the results to date, the Navy is formulating plans to expand the Fleet Response Plan beyond Carrier Strike Groups, and will inform the Congress as these plans are finalized.

APPENDIX A

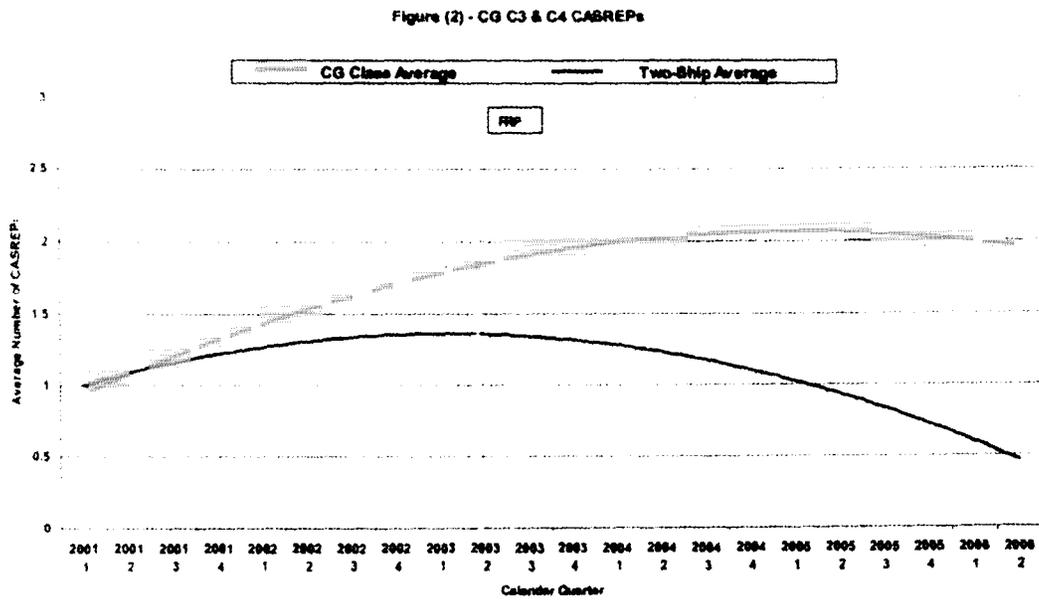

CASREP DATA FOR CSGS COMPLETING FRP CYCLE

NIMITZ Class Aircraft Carriers (CVNs). Figure (1) depicts the average number of active C3 and C4 Casualty Reports (CASREPs) from January 01 – July 06 for the CVN 68 Class of ships as compared to the combined average number of active C3 and C4 CASREPs for the USS NIMITZ (CVN 68) and USS HARRY S. TRUMAN (CVN 75). Relative to the class average, the two ships experienced higher numbers of CASREPs before May 2003, and lower numbers of CASREPs after May 2003. This data supports the hypothesis of no adverse impact to ship material condition.

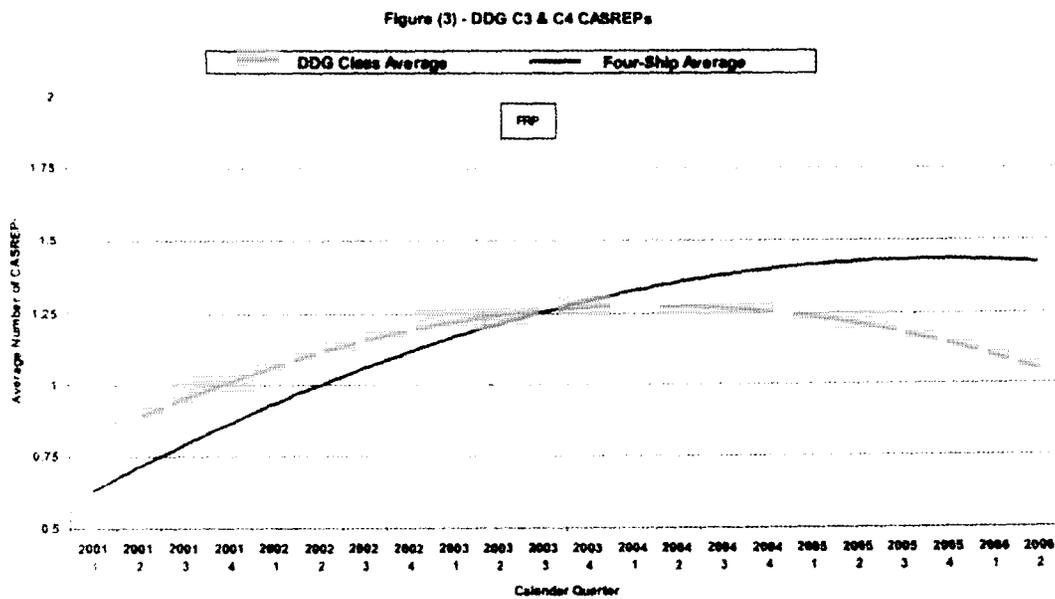

Figure (1) - CVN C3 & C4 CASREPs

TICONDEROGA Class Cruisers (GGs). Figure (2) depicts the average number of active C3 and C4 Casualty Reports (CASREPs) from January 01 – July 06 for the TICONDEROGA Class of ships as compared to the combined average number of active C3 and C4 CASREPs for the two CGs, USS PRINCETON (CG 59) and USS MONTEREY (CG 61), assigned to the two CSGs of interest. Relative to the class average, the two ships experienced fewer numbers of CASREPs before May 2003, and even fewer numbers of CASREPs after May 2003. This data supports the hypothesis of no adverse impact to ship material condition.

ARLEIGH BURKE Class Guided Missile Destroyers (DDGs). Figure (3) depicts the average number of active C3 and C4 Casualty Reports (CASREPs) from January 01 – July 06 for the ARLEIGH BURKE Class of ships as compared to the combined average number of active C3 and C4 CASREPs for the four DDGs, USS BARRY (DDG 52), USS HIGGINS (DDG 76), USS MASON (DDG 87), and USS CHAFEE (DDG 90), assigned to the two CSGs of interest. While the CASREP data depicted by the fitted curves shows a higher average number of CASREPs for the four ships when compared to the average DDG class curve, the trend was occurring well before May 2003, and shows no significant change after May 2003. In addition, the data shows a trend that is approaching the class average both before May 2003 and after May 2003. This data supports the hypothesis of no adverse impact to ship material condition.

APPENDIX B

FORMAL SCHOOL TRAINING COMPLETION DATA FOR NAVY AIR FORCES UNITS

Below is data from a report on "A Statistical Analysis of Formal School Requirements" initiated by Commander, Naval Air Forces Staff. It does not extend back before the implementation of FRP, but it does show a significant increasing trend in the percentage of personnel in aviation units, including those in Carrier Air Wings, that have completed formal shore based schools for the billets they occupy.

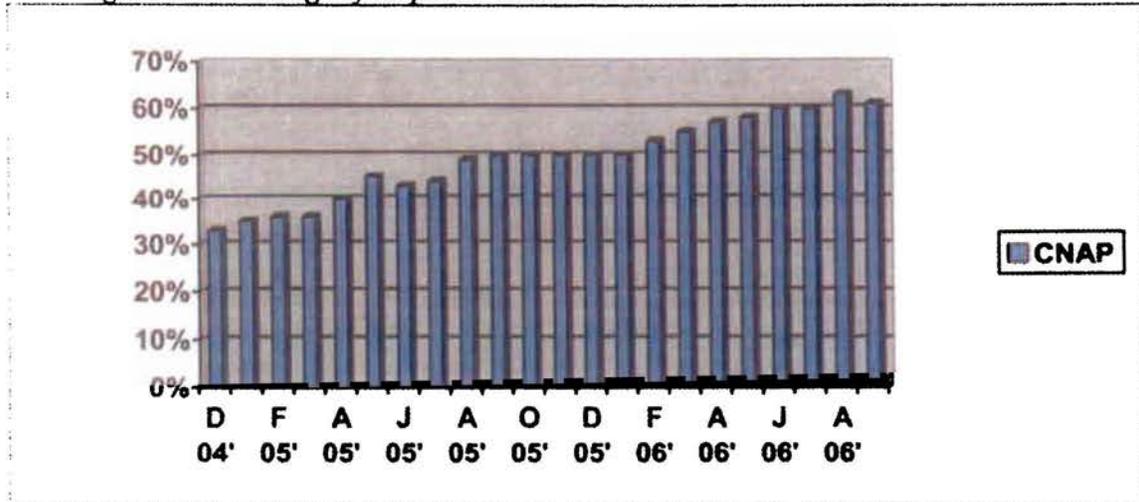

Fleet Response Plan (FRP) Training Impact: A Statistical Analysis of Formal School Requirements

The following *Figures* are populated with the NTMPS Formal Schools Requirements completion percentages for all units used in this analysis. The graphical interpretation of this data provides the basis all conclusions and inferences made in the analysis.

NTMPS Graduates Onboard Data

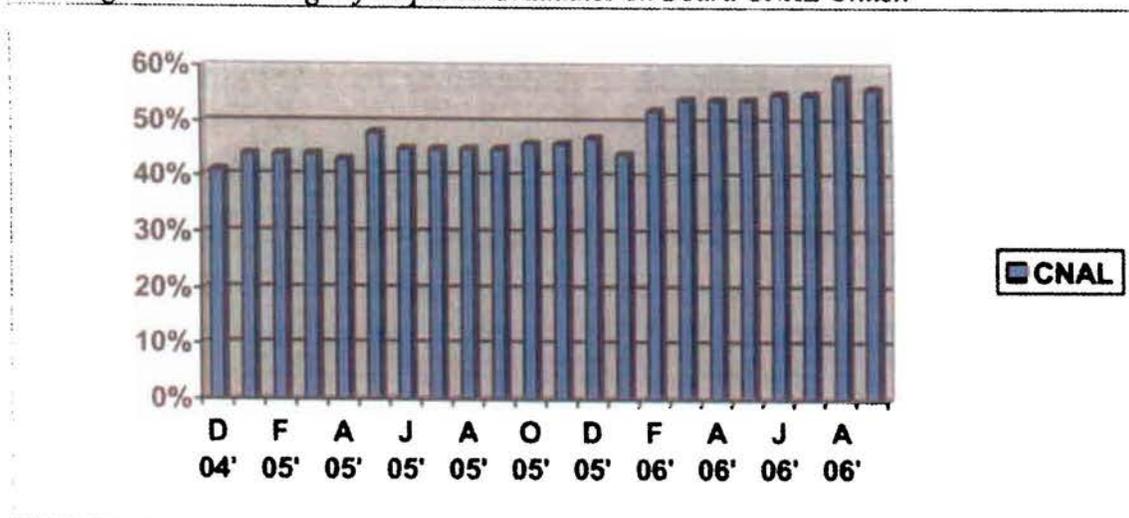

For the 184 units under Commander, Naval Air Forces, the total monthly percentages of *Graduates Onboard* was obtained from the NTMPS database. See *Figures 1 and 2* below.

Figure 1. Percentage of Required Graduates on Board CNAP Units.

Source: NTMPS December 2004 - September 2006

Figure 2. Percentage of Required Graduates on Board CNAL Units..

Source: NTMPS December 2004 - September 2006

Graphical Interpretation of the Data

As Figures 1 and 2 clearly demonstrate, formal school completions, as measured by *Graduates Onboard*, were apparently not impacted by FRP. In fact, the analysis strongly suggests that training accomplishments have actually increased steadily over the analysis time period.

The impact of FRP on training accomplishment cannot be affirmatively determined due to pre-FRP data paucity. Training accomplishment rates have been increasing since 2004.

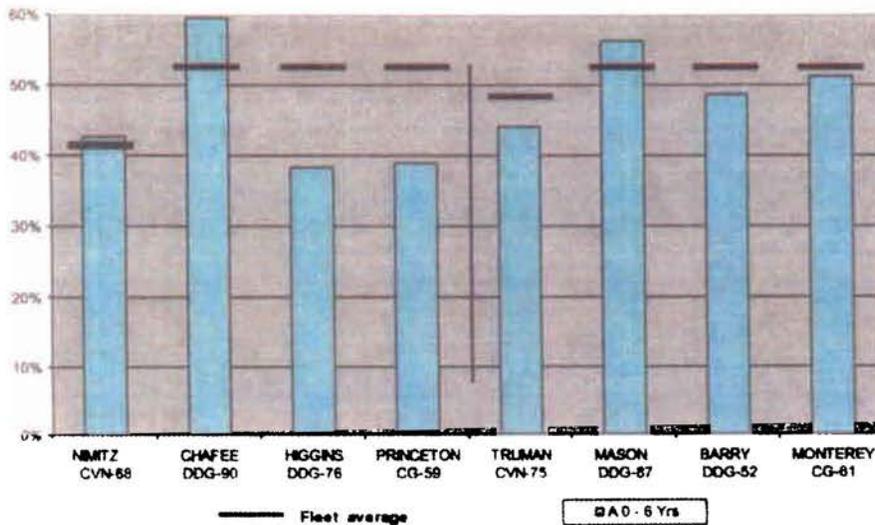

APPENDIX C

RETENTION STATISTICS FROM UNITS COMPLETING AN ENTIRE FRP CYCLE

This section contains overall retention averages for the surface units of those CSGs that finished a complete FRP cycle ending in FY-06. Figures 1 -- 3 show the reenlistment rates by zone averaged over the FRP cycle and compares them to their respective fleet average for that type ship. Figures 4 -- 9 provide a more detailed view of CVN retention, since their manpower (and therefore retention) is more significant in number than other units of a CSG. As indicated in the graphs (and the explanatory note below), there are no statistically significant indications that the Fleet Response Plan negatively affects retention.

Figure 1. Zone A reenlistment rates for FRP cycle for designated units.

ZONE A REENLISTMENT

Note: Both USS HIGGINS and USS PRINCETON averages for Zone A reenlistments were below their respective Fleet averages. Analysis for USS HIGGINS found that it started the FRP cycle near its Fleet average, declined significantly during the period, and then finished the cycle back near its Fleet average. The USS PRINCETON started the FRP cycle significantly below its Fleet average then increased and stabilized at a level above its depicted average for the last half of the FRP cycle.

ZONE B REENLISTMENT

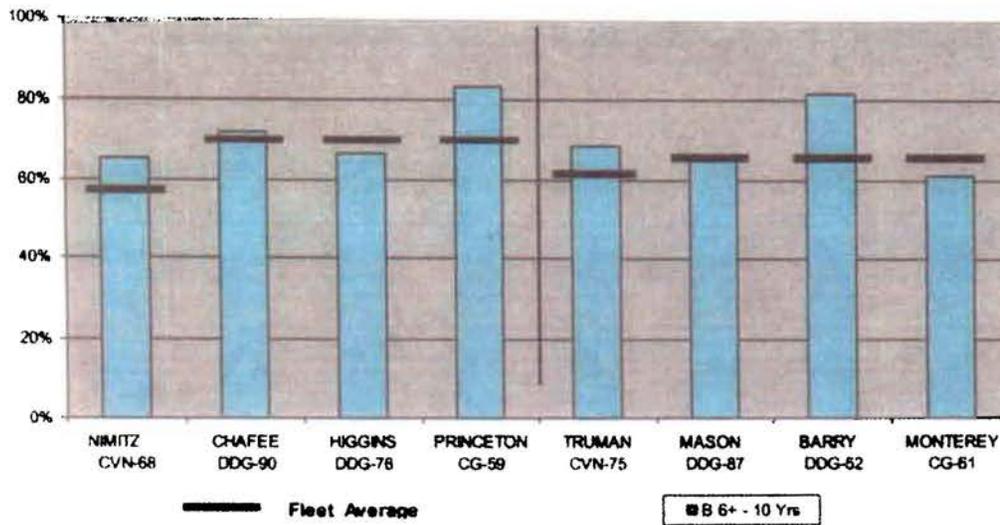

Figure 2. Zone B reenlistment rates for FRP cycle for designated units.

ZONE C REENLISTMENT

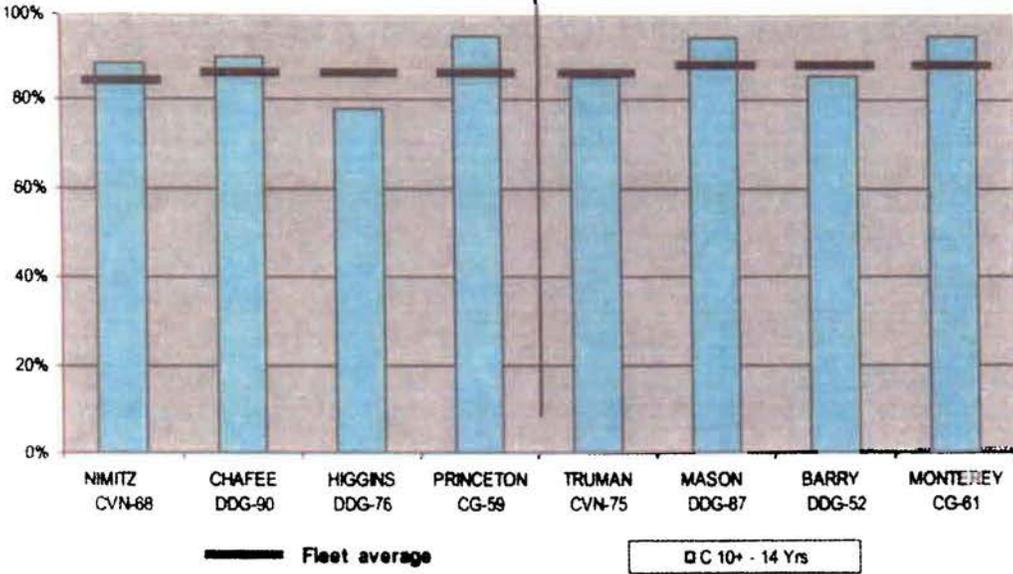

Figure 3. Zone C reenlistment rates for FRP cycle for designated units.

Nimitz Zone A vs All PACFLT CVs

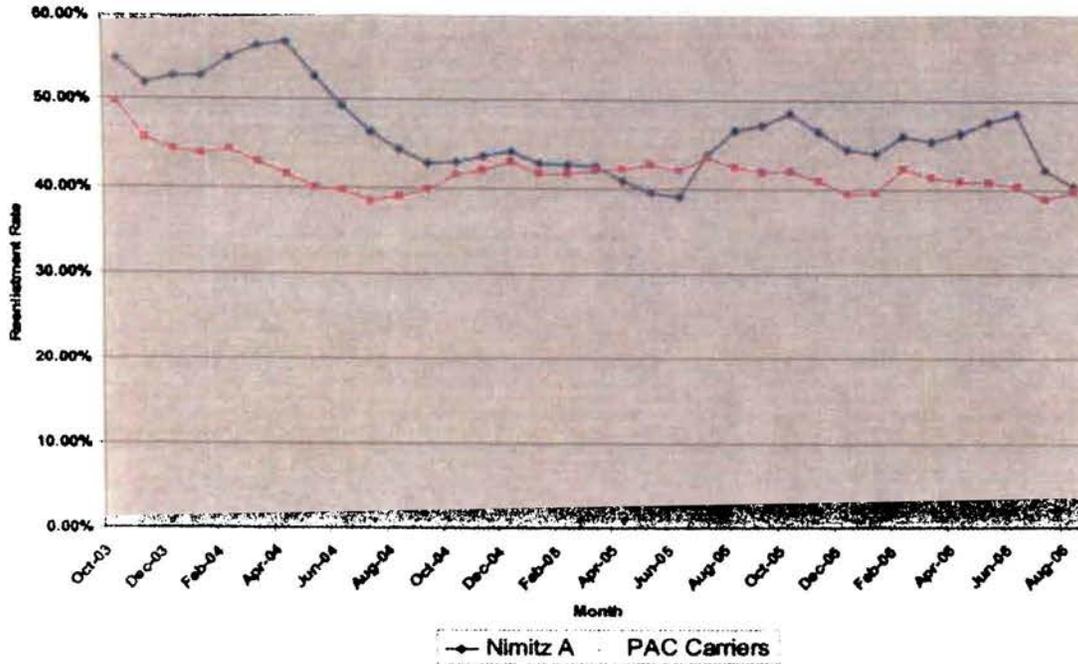

Figure 4. Zone A reenlistment rates for USS Nimitz vs. CVN average.

Truman Zone A vs All LANTFLT CVs

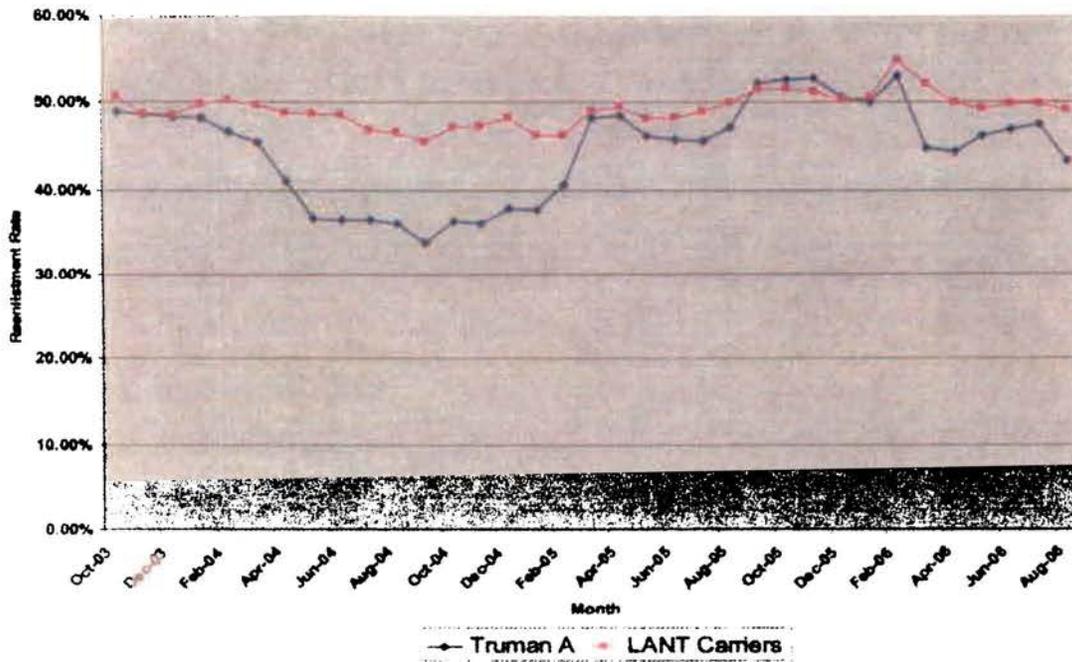

Figure 5. Zone A reenlistment rates for USS Truman vs. CVN average.

Nimitz Zone B vs All PACFLT CVs

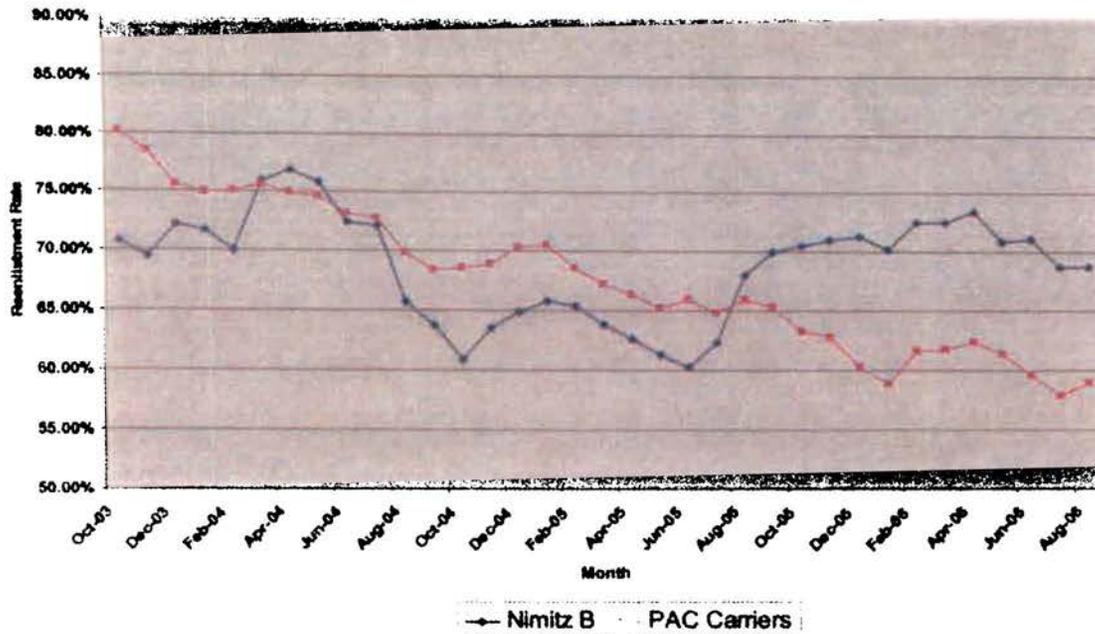

Figure 6. Zone B reenlistment rates for USS Nimitz vs. CVN average.

Truman Zone B vs All LANTFLT CVs

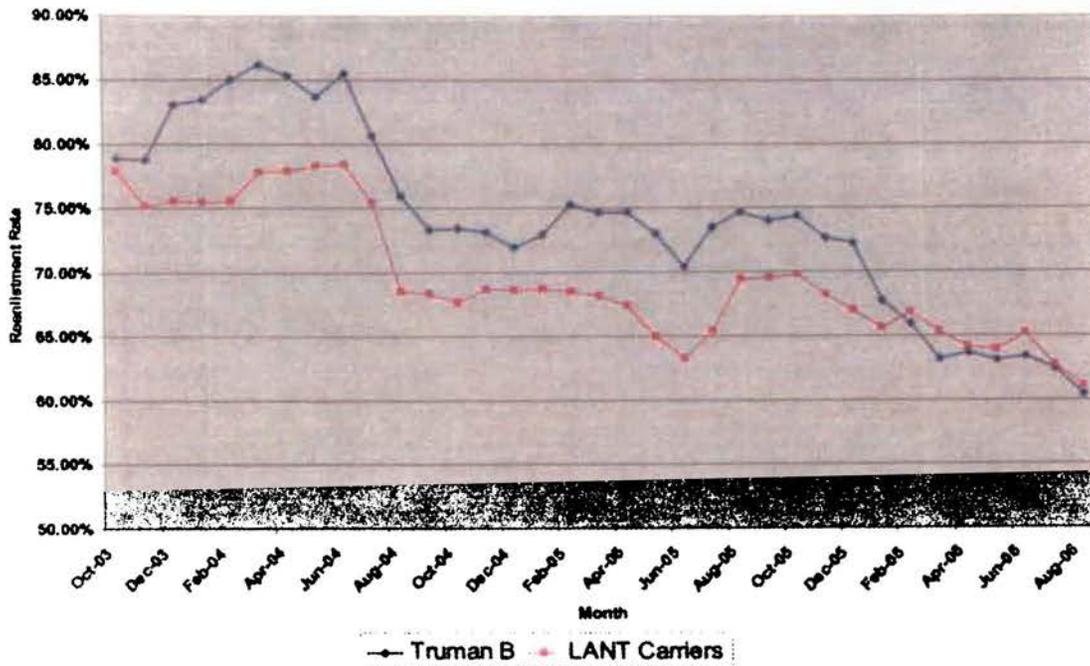

Figure 7. Zone B reenlistment rates for USS Truman vs. CVN average.

Nimitz Zone C vs All PACTFLT CVs

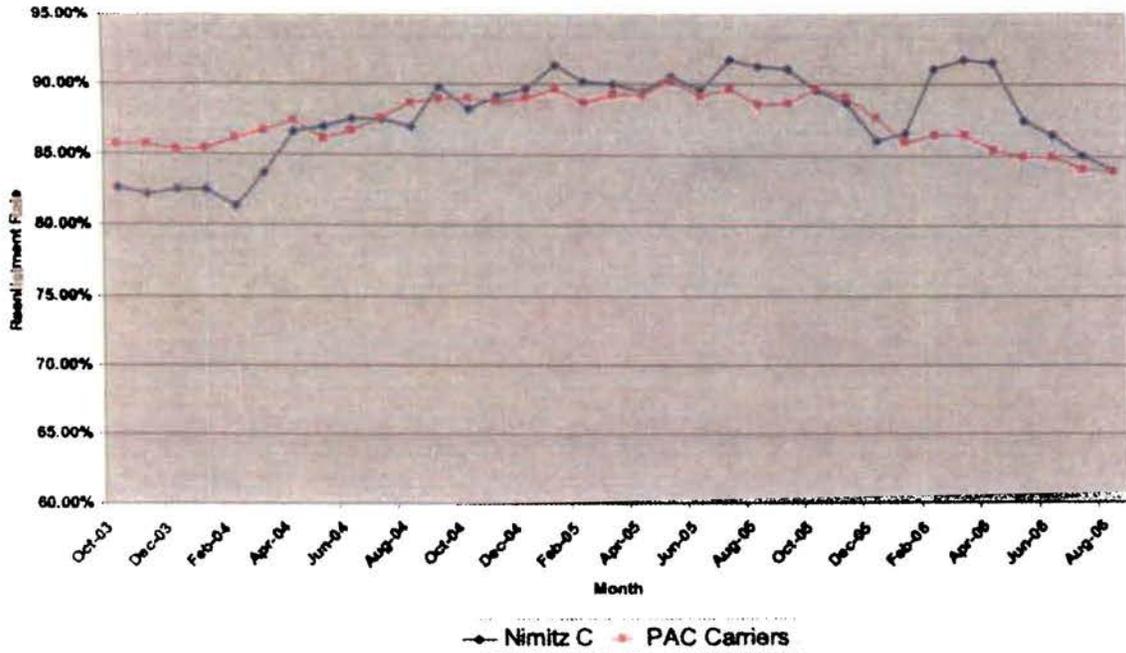

Figure 8. Zone C reenlistment rates for USS Nimitz vs. CVN average.

Truman Zone C vs All LANTFLT CVs

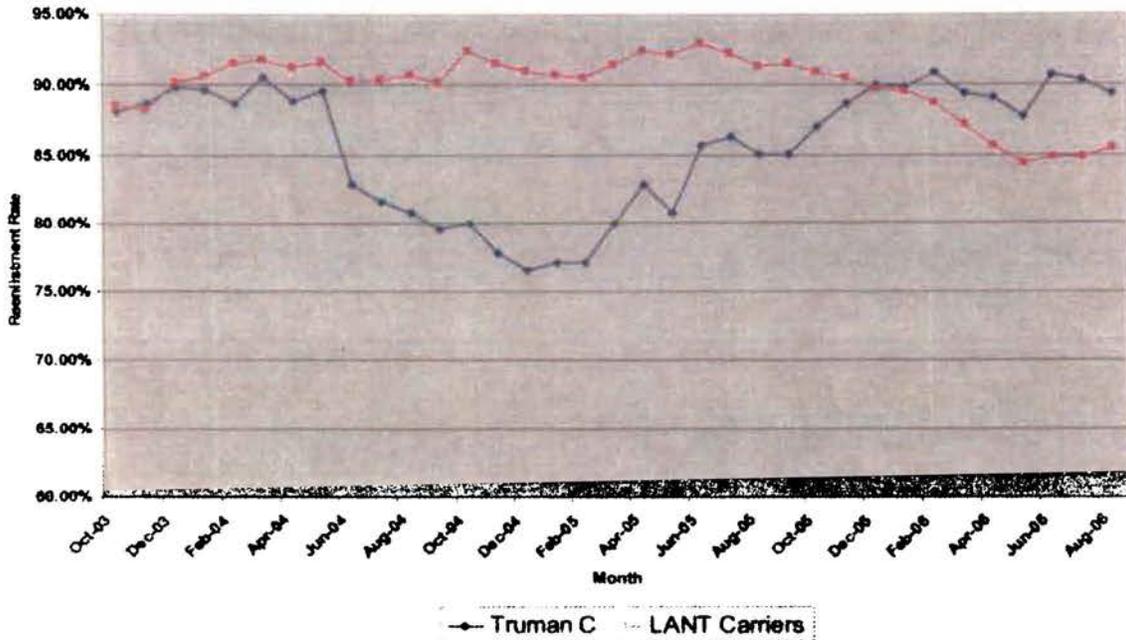

Figure 9. Zone C reenlistment rates for USS Truman vs. CVN average.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

November 29, 2006

The Honorable John Warner
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

Section 341 of the FY 2007 National Defense Authorization Act, Public Law 109-364, directed the Secretary of the Navy to provide a report addressing the Navy's Fleet Response Plan.

Enclosed is the requested information on the U.S. Navy's Fleet Response Plan that is used to govern the readiness cycle of Navy units. Also enclosed is a copy of the Navy Instruction that defines the phases of a readiness cycle.

A similar letter has been sent to Chairman Hunter. As always, if I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in cursive script, appearing to read "D. Winter", is positioned below the word "Sincerely,".

Donald C. Winter

Enclosure: (1) Report on Navy's Fleet Response Plan
(2) OPNAVINST 3000.15

The Honorable Carl Levin

THE ASSISTANT SECRETARY OF THE NAVY
(Research, Development and Acquisition)
WASHINGTON DC 20350-1000

JAN 31 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

Section 1015 of the FY 2007 Defense Authorization Act, Public Law 109-364, requested the Secretary of the Navy submit a report describing the options available for future lease arrangement with respect to the Guam Shipyard in Santa Rita, Guam.

The report requested several important and detailed matters be addressed, including: an evaluation of the performance of the lessee and operators of the Guam Shipyard; an evaluation of options with respect to the Guam Shipyard lease; options for new use arrangements; input from at least three contractors on the viability of operations based on the projected workload for FYs 2008 through 2013; and the Secretary's recommendations with respect to continuation of the existing Guam Shipyard lease and which option the Secretary recommends for FY 2008.

On December 12, 2006 I provided you a letter indicating that we were still collecting the contractor data. The data has now been collected and incorporated into the enclosed report.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairman Skelton.

Sincerely,

A handwritten signature in black ink that reads "Delores M. Etter".

Delores M. Etter

REPORT TO CONGRESS
ON
OPTIONS FOR FUTURE LEASE ARRANGEMENT
FOR GUAM SHIPYARD

Prepared by:

Ships/Submarine Readiness Branch (N431)
Office of the Chief of Naval Operations
2000 Navy Pentagon
Washington, DC 20350-2000

January 2007

REQUIREMENT

Section 1015 of the Fiscal Year 2007 Defense Authorization Act directed the Secretary of the Navy to submit a report describing the options available with respect to the Guam Shipyard in Santa Rita, Guam. The required report shall include the following:

1. An evaluation of the performance of the entities that, as of the date of the enactment of this Act, are the lessee and operators of the Guam Shipyard under the terms of the lease in effect on the date of the enactment of this Act.

2. An evaluation of each of the following options with respect to the Guam Shipyard lease:

(a) Terminating the remaining term of the lease and issuing a new 25 year lease with the same entity.

(b) Terminating the remaining term of the lease with respect to the approximately 73 acres within the Guam Shipyard that are required for mission requirements and leaving the remaining term of the lease in effect with respect to the approximately 27 acres within the facility that are not required for mission requirements.

(c) Terminating the remaining term of the lease and negotiating a new use arrangement with a different lessee or operator. The new use arrangement options shall include:

- Government-owned and government-operated facility.
- Government-owned and contractor-operated facility
- Government-leased property for contractor-owned and contractor-operated facility.

3. In evaluating the options, the Secretary of the Navy shall include an evaluation of each of the following:

(a) The anticipated future military vessel repair and workload on Guam in relation to the 2006 Quadrennial Defense Review, issued on February 6, 2006, pursuant to Section 118 of Title 10, United States Code.

(b) The anticipated military vessel repair and workload attributable to vessels comprising the Maritime Prepositioning Ship Squadron Three.

(c) The anticipated military vessel repair and workload due to a change in Section 7310 of Title 10, United States Code that would designate Guam as a United States homeport facility.

(d) The expected workload if the submarine tender, USS FRANK CABLE (AS 40), is decommissioned.

(e) The estimated reacquisition costs of transferred Government property.

(f) Costs to improve floating dry dock mooring certification and required nuclear certification for the floating dry dock designated as AFDB-8 to conduct the following maintenance:

- Dry docking selected restricted availabilities and mid-term availability for attack submarines.

- Dry docking phased maintenance availabilities for amphibious vessels, including amphibious assault ships, dock landing ships, and amphibious transport dock ships.
- Dry docking phased maintenance availabilities for surface combatants including cruisers, destroyers and frigates.

(g) Commercial opportunities for development to expand commercial ship repair and general industrial services, given anti-terrorism force protection requirements at the current facility.

(h) Estimates from three contractors for the maintenance and repair costs associated with executing a multiship, multioption contract that would generate a minimum 60,000 manday commitment for the Department of the Navy and Military Sealift Command vessels.

(i) A projection of the maintenance and repair costs associated with executing a minimum 60,000 mandays for the Department of the Navy and Military Sealift Command vessels as a Government-owned and Government-operated Navy ship repair facility.

4. In evaluating the options, the Secretary of the Navy shall seek input from at least three contractors on the viability of operations based on the projected workload Fiscal Years 2008 through 2013.

5. The Secretary of the Navy shall include in the report recommendations with respect to continuation of the existing Guam Shipyard lease based on evaluations conducted and the option that the Secretary recommends for Fiscal Year 2008.

EXECUTIVE SUMMARY

The 1995 Defense Base Closure and Realignment Commission Report recommended the closure of the Naval Ship Repair Facility Guam as a fully functional ship repair facility. The Report recommended that if Military Sealift Command (MSC) ships remain in Guam, that a private sector ship repair capability should be developed. To assist in developing a private sector ship repair capability the Department of the Navy leased the property of the former Ship Repair Facility, Guam to the Guam Economic Development and Commerce Authority (GEDCA) (formerly Guam Economic Development Authority) which subsequently subleased the property to Guam Shipyard Inc. (GSY) for use in operating a ship repair facility and related industrial services. The majority of the work conducted by GSY is maintenance on MSC ships. The work has been awarded to GSY on a non-competitive basis since 1998.

Although the U.S. Navy continues to value the presence of a selective ship depot maintenance capability on Guam, it is our preference such capability be supported through the competitive acquisition of Navy ship maintenance work by GSY.

1. Evaluation of Guam Shipyard Performance

There are two performance aspects that require evaluation, lease contract performance and ship maintenance contract performance. Lease performance by GEDCA has been substandard, requiring the Navy to serve several notices of breach of performance. In general, GSY ship maintenance performance has been of comparable quality to other U.S. based shipyards.

a. Lease Performance

Under the Defense Base Closure and Realignment Act of 1990, P.L. 101-510, the Ship Repair Facility (SRF), Guam was closed on September 30, 1997. The Secretary of the Navy, pursuant to 10 U.S.C. § 2667 (f) (1), determined that a lease agreement between the United States of America and GEDCA would “facilitate State and local economic development efforts pending final disposition of the real and personal property and ... pursuant to 10 U.S.C. § 2667 (f) (2), has determined that a public interest will be served as a result of this lease.”¹

Comprised of a portion of the former SRF Guam consisting of approximately 100 acres, certain U.S. owned related personal property remaining on the leased premises, and certain U.S. owned utility systems within the leased premises were transferred to GEDCA.

The term of the current lease is for a period of ten years, beginning on October 1, 1997. If for any reason the U.S. is unable to dispose of all or portions of the leased premises by conveyance of fee title prior to the ten-year anniversary of the term beginning date, the GEDCA will have the option to extend the lease for an additional five years for those portions of the leased premises for which fee title has not been conveyed. The GEDCA must provide written notice at least ninety days prior to the expiration of the original term.

In lieu of rent, GEDCA is to provide all security and safety protection and maintenance/repair services for the leased premises as specified in Sections 3 and 13 of the lease agreement. GEDCA is also required to apply all revenue received from subleasing the leased premises first to reimburse the U.S. for the caretaker site office costs incurred by the U.S. in connection with the administration of the lease and afterwards to reimburse itself for the costs of marketing of the leased premises, property management, facilities maintenance and repair, and Navy approved improvements to the property.

Overall the Navy judges the lease performance by GEDCA and sub-lessee GSY as sub-standard for the reasons outlined below:

¹ Interim Lease Agreement between Department of the Navy and Guam Economic Development Authority at the Former Ship Repair Facility, Guam, Navy Identification No. N627429yRP00090

While the Navy has not pursued a default or other claim of damages against either GEDCA or GSY, GEDCA, as the party in privity with the U.S., was officially notified by Naval Facilities Engineering Command, Pacific Division of three breaches of performance in 2004 and four breaches of performance in 2006. Issues of noncompliance with lease terms that have been raised with GEDCA include:

- In 2004, GEDCA was notified of possible breaches for failure to obtain Navy approval for certain subleases (§4) of the property. GEDCA leased a portion of the property to TYCO, LTD which encumbered the typhoon mooring system on Wharf Q, an important strategic asset used to secure military vessels and GSY dry docks during a typhoon. GEDCA leased a building to Marine World, Inc., a commercial venture in Tumon, for use as a marine life support facility.
- GEDCA and GSY have been notified on seven occasions of breach of performance due to a failure to maintain the property, specifically the dumping and open storage of debris and rubbish materials that present a potential hazard to adjacent Navy facilities and personnel during severe weather or typhoon conditions. The open dumping of trash and debris also presents unknown environmental hazards. To date, GEDCA and GSY have failed to cure this breach and have declined to remove and manage the debris in accordance with the Navy's direction.

Additionally, visual inspection indicates that many of the facilities are in a substandard and deteriorated condition. Further, concerns have been raised regarding whether revenues GEDCA has received from subleasing the property have been expended in accordance with lease requirements. The Navy has received a final audit report dated January 18, 2007, from the Defense Contract Audit Agency audit of GEDCA's revenues and expenditures. This audit report is being reviewed by the Navy and further action is pending completion of that review.

Finally, GEDCA's sublease with GSY has also been substandard. GEDCA presented GSY a Notice of Default Under Sublease Agreement on February 4, 2005 for failure to comply with the following requirements: submission of audited financial statements for Fiscal Years 2001, 2002, 2003, and 2004; proof of insurance; payment for utility services provided by U.S. Navy Public Works Center; and relocation of the floating drydock AFDM-8. GEDCA terminated the sublease agreement with GSY on February 18, 2005 (the sublease was reinstated on February 16, 2006).

b. Maintenance Contract Performance

The two primary Navy customers acquiring services from GSY are MSC and Commander, Submarine Forces Pacific (SUBPAC). Since FY 1998, MSC, in support of PACFLT, has issued Class Justification and Approvals (J&As) for other than full and open competition to authorize award of non-competitive contracts for ship repair to GSY. The initial two year Class J&A was issued for three reasons:

- Take action consistent with the 1995 BRAC recommendations.
- Provide start-up work to allow GSY to become a viable shipyard.
- Recognize the strategic value of sustaining some degree of ship depot maintenance capability in this Western Pacific U.S. territory.

It was Navy's intention that the sole sourcing of work to GSY would be an interim measure for the period necessary for GSY to develop a commercial base for depot repair work in Guam. Given the fact GSY has operated under this sole-source approach for eight years, it is the Navy's assessment that sufficient time has expired to allow GSY to develop a commercial repair base. Although no such base has materialized to date, Section 1014 of the Fiscal Year 2007 Defense Authorization Act redefined Navy ship homeporting and has therefore created an expanded opportunity for GSY to competitively bid for more Navy ship repair work. Given this change, Navy considers the sole sourcing of work to GSY no longer necessary nor appropriate. GSY should now have the experience and capability to competitively bid for ship maintenance work, and in doing so, sustain sufficient capability to meet the Navy's desire for a facility capable of selective ship depot maintenance in Guam (primarily hull, mechanical, electrical and weight handling equipment repair).

GSY retains expertise in Hull, Mechanical and Electrical (HM&E) work. Execution of this type of work by GSY is adequate and of comparable quality to other U.S. based shipyards. As a result of the nature of the legacy equipment and design of the current MSC ships operating out of Guam (T-AFS & T-AE), MSC is able to tailor the contracted repair packages to match the skills resident at GSY. These older ships are very HM&E intensive. Within the next five years, the current ships operating out of Guam will be replaced with T-AKEs. T-AKEs are built to commercial standards and are more technologically advanced than current MSC ships. These ships are all metric, have an advanced degaussing system and high voltage electric system throughout the ship. GSY has discussed with MSC the technical expertise required to maintain this new T-AKE ship class.

The T-AKE requires drydocking once every five years vice the requirement of twice every five years for the current ships. This lengthened docking interval is expected to result in a commensurate reduction in MSC depot maintenance workload in Guam as these ships are introduced.

SUBPAC utilized GSY to conduct 65% of the USS FRANK CABLE (AS 40) FY 2004 Docking Planned Maintenance Availability (DPMA). The quality of the completed work by GSY was excellent. During 2005, GSY provided docking, undocking and shore

services to USS SAN FRANCISCO (SSN 711) after her grounding to enable Pearl Harbor Naval Shipyard and Intermediate Maintenance Facility personnel to accomplish necessary repairs to allow safe transit to the Continental United States (CONUS).

2. Evaluation of Guam Shipyard Lease Options

a. Terminate remaining term of lease and issuance of new 25 year lease with same entity.

NOT RECOMMENDED. Issuance of a 25 year lease is not judged to be in the best interest of the U.S. Navy at this time. A clear picture of the future force structure requirements in Guam has not yet been finalized.

The relocation of USMC Expeditionary Force components and headquarters to Guam and expansion of waterfront capabilities and shore side facilities is anticipated, but not yet finalized. Issuance of a new 25 year lease with the same footprint would restrict the U.S. Navy from the most efficient utilization of scarce real estate on the island.

b. Termination of remaining term of the lease with respect to approximately 73 acres within the Guam Shipyard that are required for mission requirements and leaving the remaining terms of the lease in effect with respect to the approximately 27 acres within the Facility that are not required for mission requirements.

RECOMMENDED WITH COMMENT. A reduced footprint would be beneficial to the U.S. Navy to allow longer lead time to plan potential expansion of waterfront capabilities and facilities to support embarkation operations and accommodation of additional transient ships. Negotiations with GEDCA would be required to reduce the current footprint.

c. Termination of the remaining term of the lease and negotiating a new use arrangement with a different lessee or operator.

NOT RECOMMENDED. For the reasons previously stated, it would be premature to negotiate a new use arrangement with a different lessee or operator until the future site utilization requirement for Guam is finalized. Having said that, the following initial assessment of the alternatives outlined are provided:

- Government-owned and government-operated facility: In the Defense Base Closure and Realignment Commission 1995 Report to the President, the Secretary of Defense recommended closure of SRF Guam on the basis that sufficient capacity existed in DoD's remaining organic ship depot maintenance facilities to meet Navy needs for such facilities. That assessment remains valid.

- Government-owned and contractor-operated facility: Negotiating a new use arrangement with a different lessee or operator is not judged to be in the best interest of the U.S. Navy at this time. A clear picture of the future force structure requirements in Guam has not yet been finalized. Negotiation of a new use arrangement prior to final

determination of force structure requirements would restrict the U.S. Navy from the most efficient utilization of scarce real estate on the island.

- Government-leased property for contractor-owned and contractor-operated facility: Due to the physical location of the former SRF, disposal of the land and physical property that comprised SRF is not in the best interest of the U.S. Government as it would essentially “carve out” a section of an integrated waterfront, therefore restricting the Navy from the most efficient utilization of that waterfront as future requirements dictate.

3. Evaluation of Workload.

a. Anticipated future military vessel repair and workload on Guam in relation to the 2006 Quadrennial Defense Review (QDR).

The QDR Report states that “the Fleet will have a greater presence in the Pacific Ocean, consistent with the global shift of trade and transport. Accordingly, the Navy plans to adjust its force posture and basing to provide at least six operationally available and sustainable carriers and 60% of its submarines in the Pacific to support engagement, presence and deterrence”².

Assignments of depot availabilities are made in accordance with the following Navy Availability Assignment Business Rules:

- Schedule maintenance in ship’s homeport when possible (PERSTEMPO/Quality of Life). OPNAVINST 4700.7K requires any availability assigned to the private sector that is less than six months in duration be executed in the ship’s homeport provided adequate competition, capacity and capability exists;
- Optimize critical skill usage; and
- Load public shipyards first to efficiently use organic capacity.

Increased naval presence in the Pacific will result in additional U.S. Navy port visits to Guam. However, per the Naval Supervisory Activity list, no additional vessels are currently scheduled to be homeported in Guam; therefore, no additional scheduled depot workload is likely to be programmed for Guam. The additional port visits may increase the amount of voyage repairs conducted in Guam; however, the majority of such voyage repair workload would be expected to be within the capability and capacity of the USS FRANK CABLE (AS 40) Repair Department.

² Quadrennial Defense Review Report, February 6, 2006

b. Anticipated military vessel repair and workload attributable to vessels comprising Maritime Prepositioning Ship Squadron Three.

There is no anticipated repair or depot workload attributable to vessels comprising the Maritime Prepositioning Ship Squadron Three (MPS 3) planned to be accomplished in Guam. The ships assigned to MPS 3 will continue to conduct periodic overhaul or repair availabilities in CONUS which are scheduled to coincide with routine periodic downloads and maintenance of their cargo, also done CONUS.

c. Anticipated military vessel repair and workload due to a change in Section 7310 of Title 10, United States Code that would designate Guam as a United States homeport facility.

Designating Guam as a U.S. homeport facility is not anticipated to change the vessel repair workload associated with U.S. Navy ships. No additional ships beyond the current submarines and tender are scheduled for a homeport change to Guam. Potential voyage repairs are addressed in paragraph 3a above.

MSC ships are also subject to this statute. The Navy does not designate homeports for MSC vessels. As a matter of policy, these ships are considered “homeported in the U.S.” for purposes of Section 7310 of Title 10 U.S.C. unless the ship will remain deployed overseas for a period exceeding two years. The five MSC ships operating out of Guam currently utilize GSY for planned and unplanned maintenance. No change in MSC force structure is anticipated in this area. Therefore, no increase in MSC ship repair workload in Guam is anticipated due to the change in Section 7310 of Title 10, United States Code.

d. The expected workload if the submarine tender, USS FRANK CABLE (AS 40), is decommissioned.

The overall impact of decommissioning USS FRANK CABLE (AS 40) would be a net reduction of workload for GSY. FRANK CABLE is scheduled for a pier-side availability every 30 months. Approximately 65% of the work in these availabilities has been non-competitively assigned to GSY for accomplishment. If FRANK CABLE is decommissioned, this work would be lost to GSY.

e. The estimated reacquisition costs of transferred Government property.

The Navy has no interest in reacquiring Class 3 and 4 properties (e.g., worker’s tools) currently in use by GSY due to equipment obsolescence. The only pieces of property that fall into Class 1 or 2 that was not retained by the Government are the floating drydocks (AFDB-8, AFDM-8). GSY currently holds the title to these drydocks. They were declared excess by the Navy and that condition has not changed.

f. Cost to improve floating dry dock mooring certification and required nuclear certification for the floating dry dock designated as AFDB-8 to conduct the following maintenance:

Dry docking selected restricted availabilities and mid term availability for attack submarines.

Dry docking phased maintenance availabilities for amphibious vessels, including amphibious assault ships, dock landing ships, and amphibious transport dock ships.

Dry docking phased maintenance availabilities for surface combatants including cruisers, destroyers and frigates.

The Navy certifies drydocks to dock U.S. Navy ships in accordance with MIL-STD-1625(C). AFDB-8 is not certified to drydock U.S. Navy ships. The drydock meets all requirements to obtain Navy certification except for the mooring system. The mooring system design must be adequate to withstand the most severe weather that the facility is likely to encounter with a maximum ship in dock. GSY's rough order of magnitude estimated cost to upgrade the mooring system for AFDB-8 to comply with MIL-STD-1625(C) is between \$8M and \$10M.

Nuclear maintenance beyond the capability or capacity of ships force shall be assigned only to nuclear capable shipyards or nuclear capable intermediate maintenance activities and performed following the requirements established by the Director of Naval Nuclear Propulsion Program. U.S. Navy nuclear powered warships should only be routinely drydocked in facilities owned and operated by either the U.S. Navy or an activity authorized to perform nuclear work. GSY is not certified to perform nuclear work nor is this capability anticipated to be required from GSY. Adequate capacity currently exists to perform nuclear work within the existing four naval shipyards and two nuclear capable private shipyards

Submarine certification for unrestricted operations is maintained by accomplishment of prescribed and required maintenance of the submarine safety (SUBSAFE) material condition. Activities authorized to perform SUBSAFE work are designated in NAVSEA NOTICE 5000. GSY is not certified to perform SUBSAFE work nor is this capability anticipated to be required from GSY as discussed in paragraph 3d above.

Drydocking phased maintenance availability assignments are made in accordance with the criteria outlined in paragraph 3a above. No additional vessels are scheduled to be homeported in Guam, therefore, no additional scheduled depot workload is programmed nor anticipated for Guam.

g. Commercial opportunities for development to expand commercial ship repair and general industrial services.

Opportunity for commercial ship repair and general industrial services is addressed in the lease agreement between Navy and GEDCA. The Navy is not in a position to comment further on the commercial opportunities for development.

h. Contractor Estimates for the maintenance and repair costs associated with executing a multiship, multioption contract that would generate a minimum 60,000 manday commitment for the Department of the Navy and Military Sealift Command vessels.

A Sources Sought Announcement was issued seeking potential sources that would be interested in performing maintenance and repair work onboard both Military Sealift Command and U.S. Navy ships in Guam. Interested sources were requested to submit a rough estimate of the costs associated with executing a multiship, multioption contract that would generate a minimum 60,000 manday commitment per year, for fiscal years 2008 through 2013. Results of the Sources Sought Announcement are summarized in paragraph 4 below.

Since 1998, with the exception of 2004 and the FRANK CABLE Drydocking Phased Maintenance Availability, the average depot mandays executed by GSY are 34,000.

For Fiscal Year 2008, using an average manday rate from the potential sources, the estimated maintenance and repair cost associated with executing 60,000 mandays is \$23.6M.

i. A projection of the maintenance and repair costs associated with executing a minimum 60,000 mandays for the Department of the Navy and Military Sealift Command vessels as a Government owned and Government operated Navy ship repair facility.

Although the Navy does not currently operate a non-nuclear ship depot maintenance facility, the costs of such a facility can be approximated by using comparable commercial sector manday rates. On that basis, the projected maintenance and repair costs associated with executing 60,000 mandays by a Government owned and Government operated Navy ship repair facility is approximately \$26.3M per year.

4. Contractor Input

As noted above in paragraph 3h, a Sources Sought Notice was issued seeking potential sources who would be interested in performing maintenance and repair work onboard both Military Sealift Command and U.S. Navy ships in Guam.

Sixteen (16) responses were received. Responses were received from both large and small businesses; the incumbent, one Native American Corporation, companies with extensive ship repair experience, and those with limited ship repair experience, major shipyards, smaller shipyards, and holders of Naval Sea Systems Command (NAVSEA) issued Master Ship Repair Agreements and Agreements for Boat Repair.

Using the data from the Sources Sought Announcement for Fiscal Year 2008, the estimated annual cost ranged from a low of \$10.8M to a high of \$42.1M. Based on an average manday rate from the potential sources, the estimated maintenance and repair cost associated with executing 60,000 mandays is \$23.6M.

Therefore, compared to the estimated cost for a Government owned and Government operated Navy ship repair facility of \$26.3M per year, it is reasonable to assume that a negotiated contract would be more cost effective.

5. Recommendation for the continuance of existing Guam Shipyard lease

Lease alternatives were assessed in paragraph 2 above. The Navy's recommendation is to allow the current ten year lease term to run to expiration on October 1, 2007 and to open negotiations with GEDCA to terminate the five year term renewal option on the lease or alternatively to allow the five year option to run but negotiate a reduction in the current footprint to 23 acres. If negotiations are unsuccessful, the current lease should be allowed to run to expiration or be terminated for cause if grounds for such exist in accordance with the current lease provisions.

CONCLUSION

Although the U.S. Navy continues to value the presence of a facility capable of accomplishing selective ship depot maintenance (primarily hull, mechanical, electrical and weight handling equipment repair) on Guam, such capability should be supported through the competitive acquisition of Navy ship maintenance work by GSY. The current lease should be allowed to expire as scheduled unless terminated earlier for cause if grounds for such exist pursuant to the terms of the lease.

THE ASSISTANT SECRETARY OF THE NAVY

Research Development and Acquisition

1000 Navy Pentagon

Washington DC 20350-1000

DEC 19 2006

The Honorable Duncan L. Hunter
Chairman, Committee on
Armed Services
House of Representatives
Washington, DC 20515-6035

Dear Mr. Chairman:

Section 1015 of the FY 2007 Defense Authorization Act, Public Law 109-364, requested the Secretary of the Navy submit a report describing the options available for future lease arrangement with respect to the Guam Shipyard in Santa Rita, Guam.

The report requested several important and complex matters be addressed, including: an evaluation of the performance of the lessee and operators of the Guam Shipyard; an evaluation of options with respect to the Guam Shipyard lease; options for new use arrangements; input from at least three contractors on the viability of operations based on the projected workload for FYs 2008 through 2013; and the Secretary's recommendations with respect to continuation of the existing Guam Shipyard lease and which option the Secretary recommends for FY 2008.

In order to seek input from at least three contractors, the Military Sealift Command (MSC) issued a Sources Sought Announcement to gather information on potential sources who would be interested in performing maintenance and repair work onboard both MSC and U.S. Navy ships in Guam. The closing response date for this market survey is December 21, 2006. The contractor's information is needed to be able to provide a recommendation based on all the facts. Therefore, the Navy will submit the complete report by January 31, 2007.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairman Warner.

Sincerely,

A handwritten signature in black ink that reads "Delores M. Etter".

REPORT TO CONGRESS
ON
NAVY STRATEGY FOR DDG 1000
FOLLOW SHIP PROCUREMENT

PREPARED BY
PROGRAM EXECUTIVE OFFICE, SHIPS
WASHINGTON, DC 20350

JANUARY 2007

FOR OFFICIAL USE ONLY

1.0 REQUIREMENT

The FY 2007 Senate Armed Services Committee Report 109-254 directed the Secretary of the Navy to submit to the congressional defense committees, not later than 30 days prior to lead ship contract(s) award, a report on the competition plan for DDG 1000 follow ship procurement. The report is to include the range of possible outcomes for awarding follow ships, the Navy's estimated cost for the respective ships, the estimated cost benefit provided by competition, the basis for determining contract award, and the type of contract planned for the award. The report shall also address potential impact of follow ship awards on the lead ship costs or schedules, including an assessment of workload impacts at the respective shipyards.

2.0 EXECUTIVE SUMMARY

In response to the Congressional requirement, this report provides a status of the DDG 1000 follow ship procurement strategy. The Navy established a senior working group in early 2006 to review the strategy. This ongoing effort is considering several complex and critical contractual, financial and programmatic issues – all highly interdependent. This working group solicited and received input from the shipbuilders on various options in May/June 2006.

While the Navy remains sensitive to the importance of maintaining the unique skills and knowledge at the surface combatant shipyards to ensure both (Bath Iron Works, Bath ME and Northrop Grumman Ship Systems, Ingalls Division, Pascagoula, MS) remain viable, a competitive acquisition strategy can be used to procure the DDG 1000 follow ships and the future surface combatant ships (i.e. CG(X)) in the desired quantities without a “winner take all” competition option. It is important for the Navy to have acquisition options for these future surface combatants in order to solicit competitive bids for best market prices, utilize innovative approaches and gain the benefit of other ideas resulting from both collaborative design and competitive production environments. The dual shipyard acquisition strategy provides significant benefits to both the Navy and the industrial base and is critical to maintaining long term surface combatant program affordability.

3.0 BACKGROUND

The DDG 1000 is the center piece of the Navy's surface combatant acquisition program to support the 21st century warfighting requirements. The multi-mission DDG 1000 Destroyer (ZUMWALT Class) is currently a seven-ship program with two split-funded ships budgeted in FY 2007/08 and one ship budgeted in each year between FY 2009-2013 (see Table 1).

Congress approved the President's Budget request of \$2,568M for FY 2007. The FY 2007 Budget is in addition to \$1,010M of previous years Advance Procurement funding (FY 2005 – FY 2006). To complete construction of the two FY 2007 DDG 1000 Class ships, subsequent year funding is required in FY 2008 and will be addressed during the FY 2008 President's Budget development process.

Table 1: PB07 Ship Build Plan

Program	Dual (Lead) Ships	Follow Ships					
	2007	2008	2009	2010	2011	2012	2013
DDG 1000	2	0	1	1	1	1	1

The DDG 1000 dual lead ship acquisition strategy was approved via a Milestone B decision on November 23, 2005 by the DAE, Under Secretary of Defense, Acquisition Technology & Logistics (USD (AT&L)), allowing the program to enter the System Development and Demonstration Phase. The Milestone B Acquisition Decision Memorandum allowed the Navy to award detail design contracts, and directed the program to return for a program review with the DAE prior to exercising contract options for ship construction. ASN (RD&A) approved a Class Justification and Approval for this acquisition on February 16, 2006 pursuant to the authority of 10 U.S.C. 2304(c)(3), which provided for other than full and open competition when necessary to award a contract to a particular source to achieve industrial mobilization. The program awarded the detail design contracts to Northrop Grumman Ship Systems and General Dynamics Bath Iron Works in August 2006. The detail design contracts are structured in accordance with the acquisition plan and program schedule as supported by the FY 2007 President's Budget request. The involvement of both shipbuilders in the detail design process will increase their understanding of the basic design, enabling significant producibility improvements and a more stable design.

In accordance with the Milestone B decision, the DDG 1000 Program completed a review by the Defense Acquisition Board (DAB) on October 4, 2006, and received approval to continue with contract negotiations for construction of the two lead ships of the ZUMWALT Class. The Navy intends to award the ship construction contracts during the second quarter of FY 2007. Start of major fabrication at the two shipyards is planned to begin in summer 2008. This synchronizes the start of fabrication, providing the Navy an opportunity to establish a basis for competition for the follow ships currently budgeted in FY 2009 and out. The Navy is confident this strategy will promote cooperative and collaborative completion of detail design, and will give the Navy information and options for future acquisition strategy decisions.

4.0 COMPETITION PLAN FOR DDG 1000 FOLLOW SHIP PROCUREMENT

The Navy is committed to a dual lead ship acquisition strategy and recognizes the importance of sustaining two surface combatant shipbuilders. The dual lead ship acquisition strategy is designed to maintain competitive surface combatant shipbuilding industrial base that will provide affordable ships that meet the current and future needs of the Navy. These two shipbuilders (Northrop Grumman Ship Systems (NGSS) and General Dynamics Bath Iron Works (BIW)) are both highly qualified, highly capable shipyards. They have exhibited the financial strength, resources (plant facilities and manpower), capacity, experience, skills, and the overall viability to successfully construct

DDG 1000 ships. Maintaining the unique shipbuilding skills and knowledge at the surface combatant shipyards provides a means of ensuring the best value to the Navy in current and future procurements.

The Navy is committed to seeing that both shipbuilders remain viable to ensure that a competitive acquisition strategy can be used to procure the FY 2009-2013 DDG 1000 follow ships and future surface combatant ships (i.e., CG(X)) in the desired quantities. It is important for the Navy to have choices for these future surface combatants in order to solicit competitive bids, execute innovative production approaches and gain the benefit of other ideas resulting from a competitive environment. The dual shipyard acquisition strategy provides significant benefits to both the Navy and the industrial base and is the primary rationale for maintaining program affordability.

4.1 Range of Possible Outcomes:

The Navy established a senior-level working group in early 2006 to review the follow ships acquisition strategy to address contractual, financial and programmatic concerns. The objective is to provide for a stable, competitive industrial base to support future shipbuilding and Mission Systems Equipment (MSE) procurements. This working group solicited and received input from the shipbuilders in May/June 2006.

The ongoing review takes into consideration several factors including the current and future workload at each surface combatant shipyard and how such workload impacts the industrial base. The lead ship construction workshare agreements currently being negotiated will impact the overall shipyard workloads. It is the Navy's desire to minimize shipyard workforce fluctuations and maintain stability at each shipyard by providing a firm business base. The timely award of DDG 1000 lead ships and subsequent follow ships is instrumental in providing sufficient industrial base workload stability.

Before establishing a contracting strategy for follow ships, the Navy is assessing and analyzing recent shipyard cost and schedule performance for ships currently under construction at both shipyards. The Navy will assess shipbuilder progress towards major milestones, cost and schedule variances and assess impacts of new producibility initiatives on performance. As a result of Hurricane Katrina, uncertainty remains concerning how NGSS will distribute the future workload between Avondale and Ingalls. Additional time is required for the Navy to adequately assess these workload impacts.

As an ACAT 1D Program, the DDG 1000 acquisition strategy needs to be approved through the DAE. At the recent DAE review (October 2006), the Navy presented the following potential alternatives for follow ship procurement:

- two ship competition in FY 2009; three ship competition in FY 2011
- three ship competition in FY 2009; two ship competition in FY 2012
- single solicitation for a four ship Profit Related to Offers (PRO) with option for FY 2013 ship.

While the selection of a specific acquisition strategy may not be limited to these alternatives, they are representative of the most likely scenarios. All three alternatives could be executed as annual plus option contract awards in FY 2009. Subsequent contract awards would be candidates for Multi-year procurements (MYPs). All three alternatives could be implemented using a dual source limited competition strategy, or a PRO contracting strategy, to maintain competitive pricing pressure without resorting to a "winner take all" strategy. In the dual source limited competition strategy, each shipyard receives at least one ship, with the competition to establish who receives the larger share of workload. In the PRO strategy, the contractors compete for their target profit based upon their offers. These approaches are discussed in more detail in Section 4.4.

4.2 Navy's Estimated Cost for the Respective Ships:

Respective ship cost estimates will be updated with submission of the FY 2008 President's Budget request. The Navy is committed to meet the Congressional cost goal established for the dual lead ships (\$6.582B) and the cost cap (\$2.3B) for the 5th ship. The Navy intends to incorporate the GAO recommendations identified in their report "Improved Practices Could Help Minimize Cost Growth in Navy Shipbuilding Programs" to ensure realistic prices for ship construction contracts and early recognition of cost issues are achieved. In particular, the Navy will ensure that:

- pricing for construction of the lead ship is negotiated separately from the pricing of detail design
- pricing of follow ships is separate from pricing of lead ships
- shipbuilders are required to submit monthly cost performance reports
- shipbuilders are required to prepare variance analysis reports that identify root causes of reported variances, associated mitigation efforts, and future cost impacts.

Historically, new classes of ships (i.e., DDG 1000 Class) that incorporate new designs and new technologies create uncertainties in the cost. Therefore, the Navy has separated the negotiation of the lead ships from the follow ships. The Navy will also have initial return cost performance from the lead ships before negotiations begin on the follow ships. The Navy will make use of knowledge gained during detail design and construction to negotiate prices for follow ships.

Innovative strategies have been created to reduce overall acquisition costs to achieve the dual lead ships cost goal and the 5th ship cost cap. The Navy and the DDG 1000 industry team are using a thorough design-to-cost process to pursue every opportunity to reduce cost on DDG 1000 without reducing critical mission performance. The DDG 1000 Design/Build Strategy process integrates the efforts early in the design process of all stakeholders to minimize work content, simplify design and standardize material and manufacturing processes. A key enabler of this strategy is the program's use of a Collaboration Center which maximizes design cooperation, communication and partnership by co-locating the Navy with the program's five prime contractors. The Design/Build Strategy also leverages the use of the CATIA V5 Computer-Aided Design tool, which provides three dimensional visibility early in the design process. The DDG

1000 Program's use of a single integrated data environment used by all designers further facilitates design integration by providing an authoritative central repository for all program data.

The Design/Build Strategy has developed several products and manufacturing processes which will result in a producible and more efficient design. Through a Parts Standardization initiative, the DDG 1000 Program has reduced by 25 percent the use of general material items and catalogued them in a Common Parts Catalog saving the program millions of dollars by reducing the number of parts. The program employs a single buyer approach for the procurement of all Class Common Equipment ensuring a common design and reduced costs through larger lot buys. Both shipbuilders have collaboratively developed Craft Memoranda of Understanding to design, share and document common manufacturing preferences and agree to standardize manufacturing practices in 89 different areas covering all shipbuilding trades. By integrating craftsmen early in the design process, both of these initiatives will reduce manufacturing costs and optimize product quality. Finally, the Mission System Integrator is incrementally delivering mission systems design information to the shipbuilders.

In order to prove out the Design/Build Strategy, each shipbuilder is accelerating the design and manufacture of a main machinery block. This unique initiative will also validate that each shipbuilder can manufacture using the other shipbuilder's design. Each shipbuilder will manufacture a machinery block to the extent that it demonstrates detail design processes, material procurement manufacturing processes, and craft labor costs and quality. The Navy will closely manage each shipbuilder's cost, schedule and quality performance throughout this initiative and aggressively apply "lessons learned" to the overall Design/Build process.

There are numerous examples of producibility initiatives that have been incorporated into the DDG 1000 design. Increased deck heights allow for straighter pipe runs and increased access for shipyard craftsmen to pull cable and install pipe and ventilation ducting. The design features the use of multiple modular system-level components such as Electronic Modular Enclosures, Advanced Gun System magazines, Equipment "rafts" and a modular Anchor and Steering system. This approach provides for off-ship construction and test and "turn-key" integration within the ship construction process resulting in reduced costs and increased quality. The DDG 1000 design replaces miles of tin ventilation ducting with a flexible, lighter-weight fabric design that reduces weight and cost but also greatly improves shipboard quality-of-life. Weld joint designs and welding procedures have been optimized for high productivity and enhanced survivability for manufacturing large marine structures like the Peripheral Vertical Launch System. The composite deckhouse is joined with the rest of the steel ship by a producible and cost-effective adhesive bond which projects to significantly reduce both manufacturing cost and ship weight.

The Navy has been successful in removing significant costs from the DDG 1000 dual lead ships and follow ships without reducing critical mission performance. These initiatives (described in this section: "Navy's Estimated Cost for the Respective Ships")

will help the DDG 1000 Program meet the cost goal established for the dual lead ships and the Congressional cost cap associated with the 5th ship.

4.3 Estimated Cost Benefit Provided By Competition:

Competition fosters an atmosphere of creativity and innovation, and encourages the development of new processes to improve performance, reduce costs, and construct ships in a more effective manner. Both shipyards that construct surface combatants have invested significantly to upgrade facilities. BIW constructed a Land Level Transfer Facility (LLTF) and NGSS modernized their panel line and other facilities to improve productivity and remain competitive. These investments, in each shipyard's respective facility, have had a positive effect in reducing the labor-hours and ultimately the cost required to construct ships.

The Navy will prepare cost comparisons for each of the competition options that are ultimately considered. These cost comparisons will in part be based on the results of the dual lead ships negotiations and awards. However, the DDG 51 Program offers an analogy for the successful use of PRO. The DDG 51 Program office used competition between shipyards, executing multiple acquisition strategies to control cost over the course of the shipbuilding program. The FY 1985-1993 ships were awarded in a traditional "compete for work" strategy. In FY 1994, the Navy solicited pricing from both shipbuilders to construct two of the three ships appropriated for that year. However, the Navy concluded the prices bid by each shipyard would lead to unprofitable contracts for the shipbuilders. After numerous alternatives were considered, the Navy opted to combine the procurement of the three FY 1994 DDG 51s with the three FY 1995 DDG 51s and equally allocate three DDG 51s to each shipbuilder at negotiated prices. The downward pressure on cost to the Government due to competition was lost under this "negotiated allocation" strategy. A study sponsored by ASN(RD&A) on DDG 51 Program Acquisition recommended that the Navy explore contracting strategies that reduced the price to the government and retained the benefits of competitive forces on FY 1996/1997 ships. The PRO acquisition strategy was determined to be the approach to meet these challenges.

The PRO concept is a competitive allocation procurement strategy tailored to a dual source production program. Under PRO, contractors compete for a target profit based on their offer. The lowest cost bidder is awarded a contract at its proposed target cost and receives a higher target profit percentage (this profit percentage is specified in the Request for Proposal (RFP)). The losing bidder is awarded a contract at its proposed target cost, but the loser's target profit is set to a lower percentage than the winner's. The losing profit percentage is a function of the difference between the losing bid and the winning bid; the bigger the difference between the bids, the lower the loser's target profit. The formula for deriving the loser's target profit is specified in the RFP. With the PRO concept used to award the FY 1996 and FY 1997 ships, the DDG 51 Program realized a savings of approximately \$264M across all six ships.

Two shipyards provide the Navy with increased procurement flexibility by offering greater choice, particularly with respect to future ships. There have been numerous studies that have demonstrated that the cost of initiating competitive sourcing is more

than offset by lower bids and savings from competition inspired improvements in technology, manufacturing processes, procurement, and business practices.

4.4 Basis for Determining Contract Award:

The basis for award for the ultimately selected acquisition strategy, including for the three representative options discussed in Section 4.1 of this report, will be best value to the Navy. The two most likely competitive strategies for contract award for follow ship acquisition are a dual source limited competition strategy and a PRO strategy. Other strategies may also be considered during acquisition strategy deliberations.

Under the dual source limited competition strategy, each shipyard receives at least one ship. A competition is held to establish the winner who will receive a larger share of the workload. Dual source limited competition strategy has had the drawback of forcing the winning shipyard to submit a lower bid. This results in the "winning" yard receiving a minimal return, while the "losing" yard might receive a better return by submitting higher bids. This strategy provides low cost to the Navy but with lower costs come an increased risk of loss contracts. As a result, the Navy has concerns that this strategy may curtail contractors' capital expenditures as a result of small profit percentages (especially at the winning yard) impacting future productivity improvements. In addition, this competitive approach may not provide sufficient consideration to workload at the surface combatant shipyards.

The second strategy is a competitive, dual source allocation of work. Each shipbuilder receives one half of the total requirement of ships. Competitive pressure is maintained through a PRO procurement strategy. PRO is a competitive allocation procurement strategy tailored to a dual source production program. Under the PRO concept, the contractors compete for a target profit based on their offer. The winner (lowest bid) receives greater profit percentage than the loser (highest bid). This strategy has been successfully implemented on other surface combatant programs. PRO has resulted in higher prices to the Navy than traditional compete for work acquisition strategies, but has enabled the shipbuilders to bid reasonable costs, to earn a profit, and be guaranteed workshare that provides industrial base stability.

4.5 Type of Contract Planned for the Award:

Regardless of acquisition strategy, it is the Navy's current desire to award the DDG 1000 Class follow ships via a Fixed Price Incentive contract with shareline provisions. These contracts will have a cost ceiling and the primary cost incentive to the shipbuilder to execute within established contract cost parameters is the shareline provision. The shareline provision has historically been a very strong cost incentive for the shipbuilders and provides equitable risk between the government/contractor. The Navy will investigate the use of award fees as incentive in follow contracts as well. The purpose of the award fee is to provide additional incentive to the shipbuilder to achieve performance that benefits the Navy. The award fee provision provides timely and material feedback and is intended to focus the shipbuilder on technical and management performance and reward them for performance above acceptable levels. The Navy will also ensure that the contracts contain milestone based incentives to ensure financial returns are tied to

measurable progress consistent with commitments agreed to in production plans. The terms and conditions used in the follow ship contracts will have the primary and overriding objective to establish cost control, maintain schedule integrity, and provide sufficient workload to maintain the industrial base.

4.6 Potential Impact of Follow Ship Awards on the Lead Ship Costs or Schedules

A consistent and steady procurement rate in a competitive environment allows the industry to size itself in the most cost-effective manner. Fluctuation in workload impacts the ability of shipyards to build ships at their optimum efficiency. Without the workload associated with the follow ships, the surface combatant shipyards fixed overhead would be spread over a reduced number of ships. This would drive up overhead rates and the costs of all ships under construction (including the DDG 1000 dual lead ships). The shipyards would also attempt to stretch out DDG 1000 lead ship production schedules to bridge the gap until CG(X) construction begins (this would exacerbate the overhead issue and further drive up lead ship costs). This effort would be undertaken to avoid the costly process of laying off employees in the short term and rehiring as future work becomes available. This instability in the workforce creates inefficiencies and is likely to happen if the follow ships are not awarded. It is not feasible to assume that the shipyards would be able to bridge the construction gap between the DDG 1000 lead ships and the CG(X) Program.

5.0 SUMMARY

The DDG 1000 Program is committed to maintaining two shipbuilders and to ensure competition, thereby maximizing long-term cost reductions by incentivizing shipbuilders to invest in capital improvements, while maintaining quality and schedule. Competition will be the primary instrument used by the Navy to meet the Congressional goals and cost caps established on DDG 1000 Class ships. Further study and analyses must be conducted before the basis for determining contract award and the type of contract to be used can be finalized. Upon completion of a thorough review, the Navy will determine the best, most cost effective contract strategy to implement on the DDG 1000 Class follow ships. The goal of the contract strategy will be to maintain the industrial base; provide workload stability; retain competitive pressures; achieve realistic profits for the shipbuilders; and aggressively pursue cost reduction initiatives to ensure cost caps are met.

FOR OFFICIAL USE ONLY

THE ASSISTANT SECRETARY OF THE NAVY
Research Development and Acquisition
1000 Navy Pentagon
Washington DC 20350-1000

JAN 04 2007

The Honorable John P. Murtha
Chairman, Subcommittee on Defense
Committee on Appropriations
House of Representatives
Washington, DC 20515-6018

Dear Mr. Chairman:

The FY 2007 Senate Armed Services Committee Report 109-254 requested the Secretary of the Navy submit to the Congressional Defense Committees, not later than 30 days prior to lead ship contract(s) award, a report on the competition plan for DDG 1000 follow ship procurement.

The Navy remains sensitive to the importance of maintaining the unique skills, knowledge, and capabilities at both of the shipyards producing the DDG 1000 Class – General Dynamics Bath Iron Works in Bath, Maine, and Northrop Grumman Ship Systems in Pascagoula, Mississippi. The Navy also believes it is highly desirable and possible to employ a competitive acquisition strategy for the DDG 1000 follow ships without resorting to a “winner take all” competition. Competition maintains pressure to achieve best market prices, encourages industry capital investment, and fosters innovation. The enclosed report describes potential competitive strategies under consideration.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Inouye, Skelton, and Levin.

Sincerely,

A handwritten signature in black ink, reading "Delores M. Etter".

Dear Mr. Chairman:

The FY 2007 Senate Armed Services Committee Report 109-254 requested the Secretary of the Navy submit to the Congressional Defense Committees a report outlining the acquisition strategy for the Littoral Combat Ship (LCS) program.

In my letter of January 30, 2007, I advised that the Navy intended to submit this report no later than May 4, 2007. On March 15, the Navy announced its recommended way ahead for the LCS program. With the approval of the Office of the Secretary of Defense (OSD) and of the Congress, the Navy is recommending deferral of procurement in FY 2007 and use of those funds to complete the construction of LCS 1, 2, and 4, and a reduced procurement of existing designs in FY 2008 and 2009. The Navy intends to down select to a single sea frame design in FY 2009 following developmental and operational testing of the two lead ships and consideration of other relevant factors. The Navy intends to conduct a full and open competition for production of the Navy design in FY 2010.

The Navy will require approval of its revised acquisition strategy from OSD prior to Milestone B, which is tentatively planned for the fourth quarter of FY 2007. Solicitation for FY 2008 procurement will occur after Milestone B approval. As such, the Navy intends to submit this report prior to seeking Milestone B approval.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Inouye, Skelton, and Murtha.

Sincerely,

Dear Mr. Chairman:

The FY 2007 Senate Armed Services Committee Report 109-254 requested the Secretary of the Navy submit to the Congressional Defense Committees a report outlining the acquisition strategy for the Littoral Combat Ship (LCS) program.

The report is to identify several very important and detailed matters, including the competition plan, the flight strategy, and the cost containment strategy for the program; a clear representation of all research and development and procurement costs for the total program; and an assessment of added life cycle costs associated with operation and support for two dissimilar Flight 0 LCS designs.

In my letter of November 16, 2006, I advised that the Navy intended to submit this report in conjunction with the FY 2008 President's Budget request. Subsequently, the Navy has determined that there are significant cost overruns on the LCS 1 contract with Lockheed Martin (LM). On January 12, 2007, the Navy issued a 90-day stop-work order on LM's second LCS ship (LCS 3) while examining the root causes of the cost growth and determining an appropriate course of action. This review will include examination of acquisition strategy options for the FY 2007 and follow ships. As such, the Navy now intends to submit this report no later than May 4, 2007.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Inouye, Skelton, and Murtha.

The report identifies several very important and detailed matters to be addressed by the Navy, including the competition plan, the flight strategy, and the cost containment strategy for the program; a clear representation of all research and development and procurement costs for the total program; and an assessment of added life cycle costs associated with operation and support for two dissimilar Flight 0 LCS designs.

The Navy is continuing the detailed analysis required to complete this report, and will not be able to submit the report by December 1, 2006. The Navy intends to submit this report in conjunction with the FY 2008 President's Budget request on February 5, 2007.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Warner, Hunter, and Young.

Sincerely,

A handwritten signature in cursive script that reads "Delores M. Etter".

NOV 16 2006

The Honorable C. W. Bill Young
Chairman, Subcommittee on Defense
Committee on Appropriations
House of Representatives
Washington, DC 20515-6018

Dear Mr. Chairman:

The FY 2007 Senate Armed Services Committee Report 109-254 requested the Secretary of the Navy submit to the Congressional Defense Committees no later than December 1, 2006 a report outlining the acquisition strategy for the Littoral Combat Ship (LCS) program.

The report identifies several very important and detailed matters to be addressed by the Navy, including the competition plan, the flight strategy, and the cost containment strategy for the program; a clear representation of all research and development and procurement costs for the total program; and an assessment of added life cycle costs associated with operation and support for two dissimilar Flight 0 LCS designs.

The Navy is continuing the detailed analysis required to complete this report, and will not be able to submit the report by December 1, 2006. The Navy intends to submit this report in conjunction with the FY 2008 President's Budget request on February 5, 2007.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Stevens, Hunter, and Warner.

Sincerely,

A handwritten signature in cursive script that reads "Delores M. Etter".

February 2, 2007

The Honorable Daniel K. Inouye
Chairman, Subcommittee on Defense
Committee on Appropriations
United States Senate
Washington, DC 20510-6028

Dear Mr. Chairman:

Under Section 231 of Title 10, United States Code, the Secretary of Defense is required to submit with the Defense Budget an annual long-range plan for the construction of Naval vessels and certification that both the budget for that fiscal year and the Future Years Defense Program provide for funding the Navy's long-range construction plan. The enclosed long-range plan provides a detailed program for the construction of combatant and support vessels over the next 30 fiscal years.

In the FY 2008 Annual Long-Range Shipbuilding Report, there has been no change in FY 2008 procurement plans since the FY 2007 report was submitted. The changes made within the Future Years Defense Program have been minimal and focused on fact-of-life requirements. This report reflects the Navy's continuing effort to improve the overall affordability and feasibility of its shipbuilding plan.

There is an ongoing investigation regarding cost overruns in the Littoral Combat Ship (LCS) program. At this time, I do not believe that the status of the LCS program necessarily will have a material impact on the ability to sustain the naval vessel force structure specified in the FY 2008 annual plan. I expect to have more insight into LCS within the next two months.

A similar letter has been sent to Chairmen Levin, Skelton, and Murtha. As always, if I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in cursive script, appearing to read "Donald C. Winter".

**Report to Congress on
Annual Long-Range Plan for Construction of
Naval Vessels for FY 2008**

Prepared by:
Director, Warfare Integration (OPNAV N8F)
Office of the Chief of Naval Operations
2000 Navy Pentagon
Washington, DC 20350-2000

February 2007

Annual Long-Range Plan for Construction of Naval Vessels for FY 2008

I. Reporting Requirement

This report is submitted in accordance with Chapter 9, Section 231 of Title 10 United States Code, which requires the Secretary of Defense to submit with the Defense Budget, an annual long-range plan for the construction of naval vessels that includes the following:

(a) ANNUAL NAVAL VESSEL CONSTRUCTION PLAN AND CERTIFICATION – The Secretary of Defense shall include with the defense budget materials for a fiscal year:

(1) A plan for the construction of combatant and support vessels for the Navy developed in accordance with this section; and

(2) A certification by the Secretary that both the budget for that fiscal year and the future-years defense program provide for funding of the construction of naval vessels at a level that is sufficient for the procurement of the vessels provided for in the plan.

(b) ANNUAL NAVAL VESSEL CONSTRUCTION PLAN – Each such naval vessel construction plan shall contain the following:

(1) A detailed program for the construction of combatant and support vessels for the Navy over the next 30 fiscal years.

(2) A description of the necessary naval vessel force structure to meet the requirements of the national security strategy of the United States or the most recent Quadrennial Defense Review (*QDR*).

(3) The estimated levels of annual funding necessary to carry out the program, together with a discussion of the procurement strategies on which such estimated levels of annual funding are based.

(c) ASSESSMENT WHEN VESSEL CONSTRUCTION BUDGET IS INSUFFICIENT TO MEET APPLICABLE REQUIREMENTS – If the budget for a fiscal year provides for funding of the construction of naval vessels at a level that is not sufficient to sustain the naval vessel force structure specified in the naval vessel construction plan for that fiscal year under subsection (a), the Secretary shall include an assessment that describes and discusses the risks associated with the reduced force structure of naval vessels that will result from funding naval vessel construction at such a level.

II. Submission of the Report

In the FY 2007 report, the Chief of Naval Operations presented the Navy's requirements for a force of about 313 ships and indicated that the submission of this report for the FY 2008 President's Budget would include a more complete assessment of the long-range shipbuilding plan necessary to support this effort. In the current report, the Navy has laid out a plan that fully addresses the long-term build rates, fiscal constraints, industrial base capacity, Global War on Terrorism (GWOT) and other evolving requirements that impact the plan and have provided an executable "way ahead" to achieve the long-term goals of this structure. The 313-ship force is designed to field the necessary capabilities to meet a FY 2020 threat.

The Chief of Naval Operations has focused on both the stability and affordability of the Navy's long-range shipbuilding plan. The Navy's commitment to provide a stable shipbuilding profile is reflected in the commitment to the individual ship build rates and specific classes included in the near-term of the FY 2007 plan. Consequently, there have been no changes in the Navy's force structure requirements in this FY 2008 report. As stated in last year's plan, the Navy has looked very hard at the out-year requirements with a view toward providing industry with an executable plan upon which they can rely in making their plans for modernizing their facilities and improving their production processes. Therefore, slight adjustments have been made in long-range procurement plans to balance requirements with affordability and industrial base stability. The Navy's FY 2008 report reflects the rigorous analysis of the challenges the nation faces, the sets of capabilities needed to meet them, and the risk that can be reasonably assumed.

III. Background

Because of the complex configuration and size of naval vessels, design time can range from two to seven or more years; similarly, construction time can also span several years; and acquisition costs can be substantial. Given the capital investment required, principal naval vessels are procured at relatively low rates and a naval vessel's expected service life is comparatively long: 25 years for smaller ships and up to 40-50 years for ballistic missile submarines and nuclear-powered aircraft carriers. As a result, 30-40 years are required to make a substantial change in the Navy's force structure. With this in mind, the Navy uses a planning approach that incorporates three specific phases reflecting the appropriate focus for each time period. These phases are:

Near-Term: This period includes the current budget year and future years defense plan (FYDP). During this phase, the Navy endeavors to minimize adjustments to the plan to balance the mix of ships, unit cost, and resources available in the budget, while addressing industrial and vendor base concerns. Given known requirements and quantities, the cost estimates are reasonably accurate. No changes have been made for FY 2008 procurements since submission of the FY 2007 report.

Mid-Term: This period is beyond the FYDP out to approximately 10 to 15 years. Requirements are based on Defense-wide planning scenarios and incorporate intelligence assessments of future threats and operating environments. Cost estimates are representative based on delivering ship classes started in the near-term.

Far-Term: This period begins 15 or more years in the future. Because the requirements are not clear, the number and type of ships are estimated based on Joint and internal Navy analytical efforts. Cost estimates in this period are notional due to uncertainties in operational requirements, quantities, business conditions, and other uncertainties associated with the shipbuilding industry.

This comprehensive long-range shipbuilding plan seeks to ensure the Navy's force structure meets its operational requirements in terms of capability and capacity. The plan also addresses overall force affordability and industrial base stability. The three aspects of the Navy's plan - requirements, cost, and stability are key and provide the demand signal to industry. The Navy is attempting to address all three elements in providing a reliable and executable long-range plan for the nation's shipbuilding industrial base.

IV. Force Structure Requirement

A. Quadrennial Defense Review

The *FY 2006 Quadrennial Defense Review (QDR 06)* developed operational guidance for the national defense and national military strategies and for shaping the future force to improve capabilities and expand capacity to address four priorities:

- Defeat Terrorist Extremists
- Defending the Homeland in Depth
- Shaping the Choices of Countries at Strategic Crossroads
- Preventing Hostile State and Non-state Actors from Acquiring or Using Weapons of Mass Destruction (WMD)

QDR 06 sets a twenty-year course for the Department of Defense and provides an opportunity to continue to reshape the U.S. armed forces to meet current and emerging security challenges. The *QDR 06* construct places continued emphasis on the unique operational demands associated with homeland defense and the GWOT. It shifts the focus from optimizing for conflicts in two particular regions to building a joint portfolio of capabilities with global reach and serves as a bridge from today's threat-based force to a future capabilities-based transformational force. It is important to note that while the *QDR 06* directs a transition of force posture from global or major regional conflicts to those of the more diverse GWOT missions, it also reflects the necessity to maintain the ability to counter major regional conflicts. With this in mind, the Navy's FY 2008 shipbuilding plan continues to pursue the major investments necessary to sustain its aircraft carriers, submarines and surface combatants required for this level of conflict, while also introducing a long-term strategy for LCS, JHSV and MPF(F) shipping assets that are more suited to the long-war the Nation is currently prosecuting.

B. Force Structure

The future Navy will enhance its seaborne capability with global speed and persistence provided by forward deployed forces supplemented by rapidly deployable forces through the Fleet Response Plan (FRP). To maximize return on investment, the Navy that fights the GWOT and executes Maritime Security Operations will be complementary to the Navy required to fight and win in any Major Combat Operation (MCO). This capabilities-based, threat-oriented Navy can be disaggregated and distributed world wide to support Combatant Commander GWOT demands. The resulting distributed and netted force, working in conjunction with our joint and maritime partners, will provide both actionable intelligence through persistent Maritime Domain Awareness, and the ability to take action where and when a threat is identified. The same force can rapidly aggregate to provide the strength needed to defeat any potential adversary in an MCO. The ships contained in this 30-year shipbuilding plan will sustain operations in forward areas longer, be able to respond more quickly to emerging contingencies, and generate more sorties and simultaneous attacks against greater numbers of multiple targets and with greater affect than the current fleet.

Force structure requirements were developed and validated through detailed joint campaign and mission level analysis, then optimized through innovative sourcing initiatives (e.g., FRP, multi-crewing, and a global maritime posture that effectively increases presence capacity and decreases response time). The Navy's ship force requirement of 313 naval vessels as reflected in Table 1 represents a target level of

capability and capacity necessary to meet the projected warfighting requirements for the FY 2020 time period and is compliant with the *QDR 06* and *Strategic Planning Guidance*.

Table 1. Future Naval Force Structure

Type/Class	Required
Aircraft Carriers	11
Surface Combatants	88
Littoral Combat Ships	55
Attack Submarines	48
Cruise Missile Submarines	4
Ballistic Missile Submarines	14
Expeditionary Warfare Ships	31
Combat Logistics Force	30
Maritime Prepositioning Force (Future)	12
Support Vessels	20
Total Naval Force	313

Note:

Future combat operations may require us to revisit many of the decisions reflected in this report, including those associated with amphibious lift. As the Navy embarks on production of the Maritime Prepositioning Force in this FYDP, the Navy will continue to analyze the utility of these ships in terms of their contribution to, and ability to substitute for, the assault echelon forces in the Navy's future battle-force inventory. The current force represents the best balance between these forces available today. However, changing world events and resulting operational risk associated with the various force structure elements that make up these two components of overall lift will be analyzed to ensure the Navy is not taking excessive risk in lift capability and capacity. While there needs to be a balance between expeditionary and prepositioning ships for meeting the overall lift requirement, future reports may adjust the level of support in one or both of these solutions. Any adjustments made in these capabilities will have to be accommodated in light of the resources available and could require the Navy to commit additional funding to this effort in order to support the overall balance of our shipbuilding program.

V. Naval Vessel Construction Plan

The near-term plan as shown in Table 2 displays the Department of the Navy (DoN) new ship construction procurement and funding plans for FY 2008 and the future years defense plan (FYDP) as reflected in the FY 2008 President's Budget submission.

Table 2. FY 2008-2013 Shipbuilding Budget

Ship Type	Near Term FY 2008 Plan and FYDP						Total	
	TY \$M Qty						FY (08-13)	
	FY08 Qty	FY09 Qty	FY10 Qty	FY11 Qty	FY12 Qty	FY13 Qty	\$ M	Qty

JHSV ⁷		175 1	174 1	182 1			531	3
Total New Construction	12,522 7	14,011 11	12,303 12	15,368 13	15,747 12	17,524 12	87,475	67

Notes:

- Navy assumes split funding for large capital ships (aircraft carriers and amphibious ships), and a one-time authority for DDG 1000 dual lead ships (FY07/FY08). FY 2008 CVN 21 funding represents 1st increment of split funding for FY 2008 carrier. FY 2008 DDG 1000 funding represents 2nd increment of split funding for the FY 2007 ships. FY 2008 LHA(R) funding represents 2nd increment of split funding for FY 2007 ship.
- Increase in funding in FY 2009 - FY 2011 is due to start of Multi-Year Procurement/Economic Order Quantity buy in FY 2009 that includes 2 SSNs per year in FY 2012 and FY 2013 supporting advance procurement.
- Last year of DDG 51 funding in FY 2008 and LPD 17 funding in FY 2009 represent respective program closeout costs.
- Does not include LCS mission modules, which are funded in Other Procurement, Navy (OPN).
- Funded in National Defense Sealift Fund (NDSF).
- FY 2011 funding represents 2nd increment of split funding for the FY 2010 ship. FY 2013 funding represents 1st increment of split funding for the FY 2014 ship; remaining funds will be budgeted in FY 2014.
- The JHSV Program is a joint program procuring 5 Army (lead ship in FY 2008) and 3 Navy ships in FY 2009-2011.

VI. Long-Range Naval Vessel Construction Plan

The long-range naval vessel construction plan shown in Table 3 displays the projected procurements over the next 30 years. The ship procurements shown are planned to achieve the force capability outlined earlier in this report. Minor adjustments have been made from the FY 2007 long-range procurement plans in the interest of balancing capability requirements with affordability.

Table 3. FY 2008-2037 Long-Range Naval Vessel Construction Plan

	Near Term					Mid Term							Far Term																	
	FY08	FY09	FY10	FY11	FY12	FY13	FY14	FY15	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26	FY27	FY28	FY29	FY30	FY31	FY32	FY33	FY34	FY35	FY36	FY37
Aircraft Carrier	1				1				1					1				1				1								
Surface Combatant		1	1	2	1	2	1	2	2	2	2	2	2	2	2	1	2	3	3	3	3	3	3	3	3	3	3	3	3	3
Littoral Combat Ships	3	6	6	6	6	5	6	6	5													1	2	3	4	6	6	6	6	
Attack Submarines	1	1	1	1	2	2	2	2	2	2	2	2	2	2	2	2	2	2	2	2	2	1	2	1	2	1	2	1	2	1
Ballistic Missile Submarines											1			1		1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Expeditionary Warfare Ships	1									1	1		1	1	1	2	1	1	2	1	1	2	1	1	1				1	
Combat Logistics Force	1										1		2	2	2	2	2	2	2											
Maritime Prepositioning Force (Future)		2	3	3	1	2																								
Support Vessels		1	1	1	1	1	1	2	1	1			2		2	3	2	1				1	1	1						
Total New Construction Plan	7	11	12	13	12	12	10	12	11	6	6	5	9	8	10	10	10	11	10	7	7	9	9	9	10	9	13	12	11	10

With this FY 2008 report, the Navy continues to move toward steady rate production for each of its ship classes. Stable production rates are reflected in the procurement plans for aircraft carriers, attack submarines, ballistic missile submarines and large-deck amphibious ships. Others, such as guided missile destroyers, will achieve a steady rate of production as legacy platforms are retired in the far-term. Plans for the recapitalization of the OHIO Class submarines that have been converted to SSGN have been deferred until the ships are fully operational and their war fighting utility has been tested.

VII. 30-Year Naval Force Size

The 30-year shipbuilding construction plan presented above results in the ship inventory shown in Table 4 below. The 313-ship force represents a target level of capability and capacity based on a FY 2020 threat assessment. The total inventory of battle force ships and numbers of each type of ship will vary from year to year above and below the 313-ship force target as a result of the complex interaction between retirements, recapitalization, capability, affordability, design and construction time, and industrial base capacity. The Navy continuously evaluates the threat and evolving security environment to determine the necessary forces to meet the challenge.

Table 4. FY 2008-2037 Naval Battle Force Inventory

	Near Term					Mid Term							Far Term																		
	FY08	FY09	FY10	FY11	FY12	FY13	FY14	FY15	FY16	FY17	FY18	FY19	FY20	FY21	FY22	FY23	FY24	FY25	FY26	FY27	FY28	FY29	FY30	FY31	FY32	FY33	FY34	FY35	FY36	FY37

Notes:

1. Aircraft carrier force structure will temporarily decrease to 10 in FY 2013 upon decommissioning of CVN 65 after 52 years of service.
2. Assumes transfer of 1 active fleet LHD from the expeditionary warfare ships to the MPF(F) squadron.

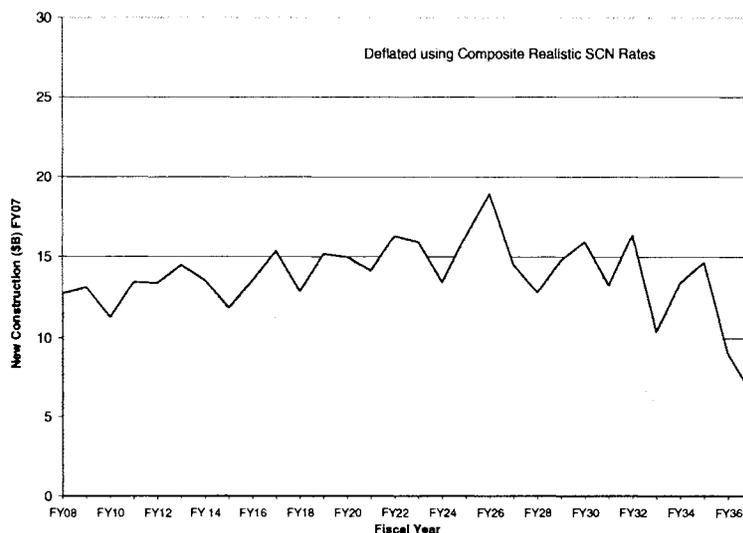

The Navy requirement for aircraft carriers remains a minimum of 11 operational vessels. However, the decision to move CVN 78, the first ship of the CVN 21 program, from FY 2007 to FY 2008 (made incident to the FY 2006 President’s Budget) in conjunction with the scheduled retirement of CVN 65, will result in the carrier force level falling to 10 operational carriers in FY 2013 and FY 2014. While this is not desirable, the Navy has looked into several options to avoid this drop, which is inevitable given the current condition of CVN 65. This will result in significant stress on the force since the anticipated demand for operational carriers will not fall commensurately over this period. The Navy is looking at several strategies associated with the Navy’s Fleet Response Plan deployment cycles and remaining ship maintenance schedules that will mitigate the impact of this drop in carrier structure and there appear to be several options that will function – over the short-term (up to 2 years) – to provide the coverage necessary for support of the Combatant Commanders without unduly burdening the remaining 10 carriers. Return to at least 11 operational carriers in FY 2016 is necessary to alleviate this short period where the structure is below the minimum.

In contrast, the necessity to maintain the nuclear industrial base for carrier production will provide the Navy with greater out-year flexibility as the inventory of carriers recovers beyond FY 2015. By carefully managing the NIMITZ Class service life in the period between FY 2019 and FY 2037, the Navy will have the ability to address ship-aging issues while still maintaining the force structure articulated in this plan. Should end-of-life issues require the Navy to retire a given carrier 1 or 2 years before it reaches its full 50-year expected life; this approach permits that decision without resulting in a reduction to 10 carriers again at some point in the future. This flexibility is reflected in the “12 carrier” inventory over this period that is an artifact of both the overlap in those years where delivery of a new carrier in a given year occurs in the concomitant year of the corresponding carrier retirement and the need to support the industrial base at a reasonable level for cost control and workforce stability.

VIII. Estimated Levels of Annual Funding Required for the Long-Range Shipbuilding Program

Figure 1 provides the estimated annual new construction funding in FY 2005 dollars required to execute the Long-Range Naval Vessel Construction Plan. This profile reflects various procurement strategies the Department is currently pursuing in its FY 2008 budget submittal including multi-year procurement contracts. In FY 2007, Congress provided Authorization to spread CVN procurement funding over a four-year period. The Navy will evaluate feasibility of four-year funding in future budgets.

Figure 1. Annual Funding Required for Navy Long-Range Shipbuilding (FY 2008-2037)

The annual funding required to achieve and sustain the 313-ship force structure described herein is about 13.4 billion dollars per year in FY 2005 dollars (14.4 billion dollars in FY 2007 dollars). The 13.4 billion dollars per year does not include funding for CVN Refueling Complex Overhauls, SSBN/SSN Engineered Refueling Overhauls, other conversions, Service Life Extension Programs, small craft, or other costs associated with the New Shipbuilding Construction account. Achieving the 313-ship force structure within the average annual investment of about 13.4 billion dollars will require the Navy to stabilize and control requirements growth. Controlling shipbuilding costs will also require increased industry commitment to process improvement, capital investment, and workforce shaping. To facilitate this commitment from industry, the Navy is committed to a stable out-year procurement plan for both ship types and numbers of ships. Providing a stable shipbuilding plan that industry can use to determine their expected workloads will enable industry to commit resources to facilities and operating efficiencies that should help bring down the end-cost of the ships the Navy plans on procuring.

The Navy also needs procedures in place within the Department that are aimed at controlling requirements, maturing detailed designs prior to construction, and putting proper incentives in contracts to ensure the Navy gets the best value. To that end, the Navy has made significant efforts to establish and maintain control of requirements growth and ship costs and to improve affordability of its future force that include:

- Senior level review boards have been instituted and have added increased discipline to control platform cost and requirements growth in Navy shipbuilding programs.
- The Navy is emphasizing the number of repeat builds of ships within the same class to reduce new construction shipbuilding costs provided the required warfighting capabilities can be retained. This will permit longer production runs and resultant cost reductions associated with production improvements and economies of scale.
- The Navy's long-range vision reduces the types and models of ships, maximizes the reuse of ship designs and components, implements open architecture for software and hardware systems, and introduces systems modularity.
- The Navy plans that make greater use of contract incentives, such as steep share lines combined with performance incentives, multi-year procurements, fixed price contracts (when and where appropriate), are expected to contribute to real cost containment in future shipbuilding plans.

While these current efforts contribute to near- and mid-term cost reductions, the Navy realizes that balancing far term warfighting requirements and costs may be fiscally challenging, and that these efforts alone may not be enough. As more accurate cost estimates are determined in future ship development (for ships such as CG(X), SSBN(X), etc.), the Navy may need to adjust the average annual investment objective or revisit warfighting requirements as appropriate.

The first of the fourteen remaining operational Trident SSBNs is planned to be retired beginning in 2029. As a result of further study during FY 2006/2007, the Navy has accelerated the date to begin procurement of the next generation SSBN. The Navy plans on pursuing this effort beginning in FY2019. Embarking on their replacements at this point will provide support for the nuclear design industrial base and reduce the engineering design concurrency associated with other nuclear submarine development programs. In addition, this timeline provides reduced acquisition risk for this important strategic asset. As these vessels represent the most survivable leg of the nation's nuclear triad, it is imperative that the Nation commit to their timely recapitalization. Given the strategic nature of these vessels and the national mission which they support, the Department believes these ships will require the same level of national commitment to their replacement as existed in the construction of the original OHIO Class submarines. The Navy will

continue to work with Congress to identify the funding source for these vessels at the point when commitment to funding their design is approached. While the Navy is committed to this program, recapitalization of ships with similar dimensions and capacity as the OHIO Class from within existing resources could have a very serious negative impact on the remaining ship procurement programs. Based on this, the Navy will, once again, seek strategic program support funding for these national assets as the Navy enters into their design and recapitalization.

IX. Naval Vessel Construction Risk

Funding for the Navy's near-term shipbuilding requirement meets the needs of the Department and fully funds those ships included in the FY 2008 President's Budget and the future year defense plan (FYDP). Therefore, funding is adequate for the planned force structure in the near-term. It will be the Navy's challenge to maintain control of these costs to ensure the overall force structure required by the 313 ship force remains affordable in the long term.

X. Summary

While the Navy continues to analyze operational requirements, ship designs and costs, acquisition plans and tools, and industrial base capacity to further improve its shipbuilding plans, The Navy's shipbuilding requirement has remained stable. The 313-ship fleet reflects a force that has the ability to meet a broad array of future challenges and anticipated threats for the FY 2020 time period. The key to realizing the vision of the 313-ship fleet is the stability of the shipbuilding plan. This requires close cooperation between this Department, Congress, and industry, all three of which are tightly linked. Achieving this stability in the shipbuilding plan will require discipline from these major stakeholders. Full funding and support of this plan is crucial to transforming the Navy's fleet to a naval force attuned to the 21st Century and its evolving requirements.

THE ASSISTANT SECRETARY OF THE NAVY
(Research, Development and Acquisition)
WASHINGTON DC 20350-1000

FEB 21 2007

The Honorable Ike Skelton
Chairman, Committee on
Armed Services
House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

Section 124 (e) of the Fiscal Year 2006 Defense Authorization Act, Public Law 109-163, directed the Secretary of the Navy to provide an annual report that provides current information regarding the content of any element of the Littoral Combat Ship (LCS) Class of vessels that is designated as a "mission package", the estimated cost of any such element, and the total number of such elements anticipated.

The enclosed annual report provides current information regarding Mission Package content, estimated cost, and discusses changes from the last report submitted March 28, 2006.

Please let me know if I can be of further assistance. A copy of the Navy report is also being provided to Chairmen Levin, Inouye, and Murtha.

Sincerely,

Dear Mr. Chairman:

As directed by the Fiscal Year 2007 House Armed Services Committee Report 109-452, the enclosed report provides measures that can be taken to manage the capacity of the shipbuilding/ship repair industrial base in a manner that would make Navy shipbuilding more affordable.

A stable shipbuilding industrial base is required to ensure minimum sustaining employment levels and retention of critical skills to maintain the U.S. shipbuilding and ship repair industrial base to meet the requirements of the Department of Navy for an affordable and capable force structure. The Navy is addressing overall force affordability and industrial base stability through management of three key aspects related to the 313 shipbuilding plan - requirements, cost, and program stability which provides a key demand signal to industry.

The Navy continues to analyze operational requirements, ship designs and costs, acquisition plans and tools, and industrial base capacity to further improve its shipbuilding plans. The Navy recently completed a business plan for the maintenance of our fleet. This plan discusses how maintenance activities will be divided between the public and private sectors.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Skelton, Levin, and Murtha.

Sincerely,

A handwritten signature in cursive script that reads "Delores M. Etter".

REPORT TO CONGRESS

on

**Shipbuilding/Ship Repair
Industrial Base Capacity**

PREPARED BY

**Deputy Assistant Secretary of the Navy
For Shipbuilding Programs
Office of the Assistant Secretary of the Navy
Research, Development, and Acquisition
1000 Navy Pentagon
Washington, D.C. 20350**

February 2007

BACKGROUND

The Fiscal Year 2007 House Armed Services Committee Report 109-452 directs the Secretary of the Navy to submit a report to the Congressional Defense Committees on measures that can be taken to manage the capacity of the shipbuilding/ship repair industrial base in a manner that would make Navy shipbuilding more affordable.

EXECUTIVE SUMMARY

The U.S. has six major private shipyards, which constitute the first tier of naval construction, and four public yards which repair naval vessels. Two defense contractors, Northrop Grumman Corporation and General Dynamics Corporation, own the six shipyards capable of producing the U.S. Navy's most advanced warships and submarines.

The U.S. Navy operates four public yards for depot level repair of fleet vessels. They are Portsmouth Naval Shipyard located in Kittery, ME, Norfolk Naval Shipyard located in Portsmouth, VA, Puget Sound Naval Shipyard and Intermediate Maintenance Facility, in Bremerton, WA, and Pearl Harbor Naval Shipyard and Intermediate Maintenance Facility in Pearl Harbor, HI.

The industry's second tier shipyards include facilities such as Bollinger Shipyards in Lockport, LA, Marinette Marine Corporation in Marinette, WI, Textron Marine and Land Systems in New Orleans, LA, VT Halter Marine Shipyard in Pascagoula, MS, and Austal USA in Mobile, AL. These yards construct smaller naval and commercial vessels such as assault landing craft, foreign military sales, coastal patrol craft, ocean going tugboats, special mission ships, ferries, barges, and U.S. Navy Littoral Combat Ship (LCS).

New Construction

A stable shipbuilding industrial base is required to ensure minimum sustaining employment levels and retention of critical skills to maintain the U.S. shipbuilding industrial base to meet the requirements of the Department of Navy (DoN) for an affordable and capable force structure. The DoN requires an industrial base which is reliable, cost-effective and adequate to meet the Nation's strategic objectives. A stable, robust, funding profile is the primary factor necessary to sustain those industrial capabilities which support Navy shipbuilding. Such funding focuses market demand across a broad spectrum of industry segments to meet emerging and projected DoN requirements.

The Navy's long-range shipbuilding plan seeks to align the Navy's force structure to meet its operational requirements in terms of both capability and capacity. The long range plan also addresses overall force affordability and industrial base stability. The three key aspects of the Navy's plan - requirements, cost, and stability are key and provide the demand signal to industry. The Navy is addressing all three elements by developing a reliable and executable long-range shipbuilding plan for the nation's shipbuilding industrial base.

Navy's ship Program Executive Officers (PEO'S) and program managers, in concert with their industry partners, have generated significant productivity improvements during a sustained period of low rate production. However, we still face significant challenges as we design and construct the Navy of the future. As we construct the force of the future we are mindful of the Navy's 313 ship force structure requirement and long-range shipbuilding plan and we are striving to maintain stability within our shipbuilding industrial base. In managing the industrial base there are three primary factors that drive the health of the shipbuilding industrial base they are capacity, capability, and competition.

The Navy is committed to developing a stable shipbuilding plan which will allow industry to project future workload requirements, ensure the availability of a skilled workforce with requisite skills mix to perform the work, and to make the necessary capital investment in plant and equipment to affordably build and repair the ships of the future.

Ship Repair

The four public sector Naval Shipyards (Portsmouth, Norfolk, Puget Sound, and Pearl Harbor) are wholly-owned subsidiaries of the Navy enterprise, and are vital for Fleet operational availability and mission success. The shipyards provide the essential organic capability to perform ship depot maintenance and emergency repair work, primarily for nuclear-powered aircraft carriers and submarines, and complement the private sector's capability for conventional surface ships. Along with the private sector, the Naval Shipyards provide operational and combat ready ships and weapon systems required by Combatant Commanders and the Joint Chiefs of Staff contingency scenarios.

The Naval Shipyard fundamental business objectives include sustaining the core skills, process, and infrastructure capability and capacity for future workload, and continuously improving processes and systems to provide increased value and operational availability to the Fleet.

Overall recommendations for managing the capacity of the shipbuilding/shipbuilding repair industrial base require a partnership between the Navy, Industry, and Congress.

Navy can help to stabilize the industrial base by:

- Promoting acquisition strategies that enhance cost reduction such as multi-year procurement, block-buy, teaming for flexibility, open architecture and commonality;
- Encouraging modernization through steady workload and a variety of contract incentives;
- Maintaining a level workload to provide the best opportunity for increasing efficiency and effectiveness;

- Matching the most experienced people to shipbuilding programs with highest risk; and
- Continuing to assess and execute the Naval Shipyard Business Plan.

Shipbuilders should:

- Benchmark off of the best of European, U.S. and Asian shipbuilding practices and adopt the best strategies to increase efficiency;
- Buy common components wherever possible;
- Reinvest profit towards shipbuilding advancements and new technology;
- Ensure ship reporting metrics are correctly reported;
- Apply lessons learned across shipbuilding programs; and
- Investigate bulk purchases of commodities such as steel and copper.

The Congress can help with:

- Providing multi-year procurement authority;
- Allowing flexibility of funding for cross-class component purchases; and
- Encouraging and creating incentives for commercial work at U.S. shipbuilders.

DISCUSSION

The near-term construction workload is reflected in the FY 2008 President's Budget request which calls for construction of seven ships: one VIRGINIA Class submarine; one SAN ANTONIO Class Amphibious Transport Dock ship (LPD 17); one LEWIS & CLARK Class Auxiliary Cargo & Ammunition ship (T-AKE); and three Littoral Combat Ships (LCS); and the first ship of the Future Carrier Program, CVN 78. In addition, we have requested full funding for the tenth hull and advance procurement of the eleventh and twelfth VIRGINIA Class submarines, completion of full funding for the two lead DDG 1000 ships, advance procurement for the CVN 71 Refueling Complex Overhaul (RCOH) funding, development design and advanced procurement for CVN 79, the second ship in the Future Carrier Program, second increment for the first Amphibious Assault Ship Replacement (LHA(R)), Engineered Refueling Overhaul (ERO) of a Ballistic Missile Submarine, Nuclear (SSBN), and the service life extension for five Landing Craft Air Cushion craft. The Navy will procure one Joint High Speed Vessel (JHSV) for the Army in FY 2008. This shipbuilding plan provides a stable demand signal to our industry partners. The Navy closely monitors the overall industrial base as well as individual sector industrial bases.

Destroyer Industrial Base:

Eleven DDG 51s are currently under contract and being constructed at Northrop Grumman Ship Systems (NGSS) and Bath Iron Works (BIW) with construction completion in 2010. There are five DDG 1000 ships in the FY 2008 President's Budget request across the six years of the Future Years Defense Program (FYDP), which is unchanged from the FY 2007 President's Budget request. The DDG 1000 profile is a result of the Navy's dual lead ship acquisition strategy; two split-funded ships in FY 2007

and in FY 2008. NGSS and BIW each began detail design of the respective lead ships in FY 2006. The dual lead ship acquisition strategy preserves the opportunity for some form of competition for the FY 2009 and follow ships. DDG 1000 is critical to the continued sustainment of the destroyer industrial base.

BIW's workforce will decrease once the seven (7) DDG 51s currently under construction is completed. Workforce reductions, loss of learning, loss of skills, and higher unit costs are areas of concern during BIW's transition from the end of the DDG 51 construction to production of DDG 1000.

NGSS operations were severely impacted by Hurricane Katrina in late August 2005. The Pascagoula, Gulfport, and Avondale facilities sustained damage and the workforce was displaced. An intensive effort to retain and hire skilled tradesmen is underway, and delivery dates are continuously being evaluated for ships currently under construction. Rebuilding continues, with the workload expected to be above the pre-Katrina projections for the same timeframe.

Carrier Industrial Base:

The carrier industrial base is generally helped by the concurrent work occurring on nuclear submarines. The carrier work is mainly in three areas, new ship construction, design and engineering and Refueling Complex Overhaul (RCOH). Production workload will be increasing slightly in the 2007/2008 timeframe, with a reduction forecasted in 2009, followed by the need to quickly ramp up in later years. Engineering workload is stable through the end of 2010, with slight reductions forecasted in the 2011/2012 timeframe. The production workforce will need to ramp up in 2010/2011, increasing hiring which will require more training and supervision. Significant Northrop Grumman Newport News (NGNN) and Navy management attention is being applied to minimize costs during this period. As part of development of the 313 shipbuilding plan, the Navy determined that a carrier build rate of one carrier start every four years (2008, 2012, 2016) with one year pause for technology insertion followed by one carrier every four years (2021, 2025, 2029) and so on, would be the most economical profile and best stabilizer of the carrier industrial base while still meeting the necessary force structure requirement of 11 carriers.

Submarine Industrial Base:

The effects of procuring only eleven submarines in the past fifteen years, coupled with the continued low build rate of one submarine per year, have forced many vendors to exit this specialized business or incur increased costs. The combination of a long ship construction cycle and a low shipbuilding rate provides a challenge to the shipyards to ensure the continued training and retention of specialized workers. Two submarines per year will distribute overhead costs, and would increase learning efficiencies. Navy is working to reduce the cost of VA Class submarines to \$2B (FY05\$) per unit starting in 2012 when procurements ramp to two/year.

Amphibious and Auxiliary Industrial Base:

The Amphibious and Auxiliary shipyards include National Steel and Shipbuilding Company (NASSCO) and NGSS (both Ingalls and Avondale operations). At NASSCO, the current production workforce is stable through 2008. The workforce level decreases thereafter because of the quantity of T-AKE's per year in production. However, a new venture with DAEWOO Shipbuilding, as well as competitive opportunities with respect to the Maritime Prepositioning Force Future (MPF(F)) Mobile Landing Platform and Large Medium Speed Roll-On/Roll-Off, may provide additional workload for NASSCO.

At NGSS's Avondale facility, the workforce is relatively stable through mid-2010 when the LPD Program concludes in 2011. At NGSS's Ingalls facility, the workload is expected to rise through 2009 with LPD and LHA 6 workload and then will decline to a relatively stable workforce with MPF(F) LHA and DDG 1000 in 2012. Today, NGSS mitigates some workload peaks and valleys through workshare opportunities between their Pascagoula and Avondale operations.

Second Tier Industrial Base:

Second tier shipyards are being used to meet the unique requirements for high speed and shallow draft ship capabilities. The second tier shipyards provide a robust skill mix of capabilities because of their link with the overall commercial sector. Austal and Marinette Marine are currently subcontractors for LCS. The workload at these yards is stable due to a robust backlog of commercial and other government work. This workforce will be spread across the yards mentioned above. Additional facilitization may be required at one or more of these yards to support future production of LCS.

VT Halter Marine, Inc. is also currently working detail design and construction of the Missile Range Instrumentation Ship T-AGM(R) Cobra Judy Replacement. The Fiscal Year 2007 Department of Defense Appropriations Act, Public Law 109-289, also included funding for construction of a T-AGS Oceanographic Survey Ship and will likely be accomplished at a second tier yard. Additional competitive opportunities will be provided with the start of the Navy and Army Joint High Speed Vessel program with procurement of the lead hull funded by the Army in 2008.

Ship Repair Industrial Base

The Fleet Response Plan is reshaping the way the Navy responds to the Nation's needs. To maintain a deployed and surge ready Carrier Strike Group readiness posture, our maintenance system must support both current and future readiness. The focus is on a reinvention of the ship maintenance process using a corporate enterprise approach, which produces a fleet of ships ready to deploy when called upon.

SHIPMAIN is a "best business" practice that is changing the culture of getting surface ship repair work completed in a one-step process. SHIPMAIN provides the maximum benefit per maintenance dollar through the implementation of a refined process

that eliminates time lags, prioritizes ship jobs, and empowers surface ship sailors in the maintenance decisions impacting their ships. It is a continuous maintenance system planned and coordinated through new procedures and processes. To track the overall success of SHIPMAIN, the Navy has established metrics to measure key aspects of ship maintenance processes, including modernization, work identification, planning, contracting, and execution of work.

The six new Regional Maintenance Centers (RMCs), located in Norfolk, VA, Mayport, FL, Ingleside, TX, San Diego, CA, Bremerton, WA, and Pearl Harbor, HI, have implemented the SHIPMAIN process. RMCs plan and execute maintenance per fleet policy and guidance, as well as assure process compliance. This collaborative effort establishes a single pier side Navy maintenance activity to support sailors and their ships in their homeports.

Multi-Ship Multi-Option (MSMO) contracts target efficient and effective maintenance practices. They allow the executing agency the ability to better plan its work and take advantage of best repair capabilities. They will provide long-term vendor relationships throughout ships' training, deployment, maintenance and modernization cycles, in order to reduce costs through, level loading of work, and increased contractor participation in work package development and planning. The future of class maintenance contracting lies with MSMO contracting.

In 2001 the Naval Sea Systems Command introduced the "One Shipyard" concept of the Industrial Base Workload and Resource Enterprise to achieve the most efficient ship maintenance for the Fleet under a Surge, Sustain and Reconstitute operational construct, as outlined in the CNO Guidance. One Shipyard focuses on cost, schedule, and quality through standardizing processes, sharing resources among public yards, and partnering with private yards. Other vital elements are a corporate approach to material support and resolving critical skill shortages. One Shipyard is a descriptor for this distributed complex. The size and demographics of the public and private industrial base workforce and careful balancing of total workforce capacity with programmed workload creates geographic critical skills shortfalls, particularly when the actual workload varies from programmed workload in a surge scenario. To mitigate these skill imbalances, skilled workers are loaned and borrowed rather than having each shipyard hire, train and employ capacity to execute peak workload that would be underutilized and costly to maintain during off-peak times. The industrial base today has adequate worker capacity, but the workers must be carefully managed and moved to where the work is geographically. This facet of ship repair is unique in the depot industry—all other depot repairs are conducted by moving the units to be repaired to where the workers are employed.

To maintain an effective, efficient, ready Naval Shipyard workforce, the employee resources must be stabilized and revitalized at a sufficient level to provide a work-skills balance to meet the critical work with adequate margin for surge to meet unplanned requirements. U.S. Code Title 10 contains several requirements for organic (i.e., U.S. Navy owned and operated) depot maintenance capabilities and capacity. These

statutes are the foundation for building a bottom-up “zero-based” definition of Naval Shipyard capacity and baseline workload requirements.

- 10 USC 2464 requires a core logistics capability (i.e., skills, processes, and infrastructure) that is government-owned and government-operated, to ensure a ready and controlled source of technical competence and resources necessary to ensure effective and timely response for all weapons systems.
- 10 USC 2466 limits the amount of depot maintenance funds that can be contracted out to the private sector to less than or equal to 50%.
- 10 USC 2472 requires public depot civilian employment to be managed solely on the basis of workload and the funds available for such depot maintenance. It prohibits management by “end strength.”

The workload distribution as outlined in the Navy’s Business Plan is accomplished using the availability assignment criteria approved by the Secretary of the Navy. The governing principles of these criteria aim to strike a balance between ship’s crew quality of life, cost, operational availability, and ability to execute work in accordance with cost and schedule goals.

- Schedule maintenance in ship’s homeport when possible
- Optimize critical skill usage (One Shipyard concept)
- Load public shipyards first to efficiently use organic capacity
- When there is more than one option for availability assignment, the following factors, as applicable, will always be taken into account: a) Crew impact, b) Cost impact, c) Operational impact, d) Shipyard executability, e) Class Maintenance Plan impact, f) Schedule impact, and g) Modernization impact.

The Navy’s Business Plan concludes that the size of the Naval Shipyard enterprise workload and workforce is based on the most efficient and effective use of the four shipyards in operation today with a minimum workload required to meet the core and 50/50 requirements is, on average, approximately 3.6 million man-days per year.

WAY AHEAD

Our nation’s shipbuilding industrial base has experienced a 40 percent reduction in workload since the end of the Cold War and industry adjusted its workforce to meet the Navy’s shipbuilding requirements. Both industry and the Navy are concerned with fluctuations in the shipbuilding workload. A stable shipbuilding program is required to ensure minimum sustaining employment levels and retention of critical skills. This is essential if we are to retain a viable U.S. shipbuilding industrial base to meet the Navy’s requirements for an affordable and capable force structure.

The Navy continually assesses the shipbuilding industrial base to determine applicable best practices that could be implemented across shipbuilding programs. During the development of the FY 2008 Annual Long-Range Plan for the Construction of Naval Vessels, the Navy reviewed the impact to the industrial base and believes that the current industrial base is sufficient for its needs. The long-range shipbuilding strategy

provides a foundation for stability across the shipbuilding industry by balancing the risk between capabilities required to meet the threats of the future, the affordability of Navy platforms and the stability of our industrial base. A future fleet of about 313 ships will deliver the capacity and capability required by the joint force as expressed in the Quadrennial Defense Review and in Defense Planning Guidance.

The Navy is sponsoring policies to align the industrial base for long-term force development through split funding, advanced procurement, and cost savings incentives. The acquisition team performs periodic program reviews with a focus on greater efficiency, effectiveness, and reduced cycle time and maintaining costs and production schedules within contractual limits. The Navy also views industry as a trusted partner while we provide a stable baseline upon which to plan.

Additionally, the Navy will continue to work with the private sector and the Naval Shipyards to provide operational and combat ready ships and weapon systems required by Combatant Commanders and the Joint Chiefs of Staff contingency scenarios and enhance ship operational availability (Ao). The Naval Shipyard will sustain the core skills, process, and infrastructure capability and capacity for future workload and will continuously improve processes and systems to provide increased value and operational availability. The steps that the Navy is taking includes, driving culture change and improvements in direct work productivity with Lean Six Sigma implementation. Revitalizing and shaping the workforce through careful management of overtime, hiring, the apprentice program, and attrition and investing in the Naval Shipyards' physical plant infrastructure and information technology systems to ensure future mission capability and Fleet readiness.

CONCLUSIONS

The Navy believes that the number one issue facing the American military shipbuilder today is the uncertainty in future orders for ship construction. The year to year fluctuation in the projected naval order book adds uncertainty for the shipbuilder wanting to invest in capital and labor improvement, and adds cost to the vessels actually being built and delivered. This fluctuation limits procurement of vessels that have been programs of record, programs that the shipbuilders have used to make labor and capital investment decisions.

The fundamental basics of managing the capacity of the industrial base and reducing Navy shipbuilding costs begin with a stable build program. The Navy's 313-ship goal and the Annual Long-Range Plan for the Construction of Naval Vessels which lays out the path to that force capability and capacity provides this basis. Building on this foundation, the Navy can further stabilize the industrial base by:

- Promoting acquisition strategies that enhance cost reduction such as multi-year procurement, block-buy, teaming for flexibility, open architecture and commonality;

- Encouraging modernization through steady workload and a variety of contract incentives;
- Maintaining a level workload to provide the best opportunity for increasing efficiency and effectiveness;
- Matching the most experienced people to shipbuilding programs with highest risk; and
- Continuing to assess and execute the Naval Shipyard Business Plan.

Shipbuilders should:

- Benchmark off of the best of European, U.S. and Asian shipbuilding practices and adopt the best strategies to increase efficiency;
- Buy common components wherever possible;
- Reinvest profit towards shipbuilding advancements and new technology;
- Ensure ship reporting metrics are correctly reported;
- Apply lessons learned across shipbuilding programs; and
- Investigate bulk purchases of commodities such as steel and copper.

The Congress can help with:

- Providing multi-year procurement authority;
- Allowing flexibility of funding for cross-class component purchases; and
- Encouraging and creating incentives for commercial work at U.S. shipbuilders.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

March 12, 2007

The Honorable Daniel K. Inouye
Chairman, Subcommittee on
Defense
Committee on Appropriations
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

The Fiscal Year 2007 Senate Armed Services Committee Report 109-254 directed that the enclosed report on the Maritime Prepositioning Force (Future) be submitted with the Fiscal Year 2008 President's Budget request. Additionally, and as a follow-on to the Maritime Prepositioning Force (Future) Report submitted to Congress in June 2005, this new report is designed to provide a greater level of understanding.

Maritime Prepositioning Force (Future) will constitute a component of our Nation's Global Prepositioning Materiel Capabilities. The squadron will contribute a brigade's worth of Prepositioned War Reserve Materiel Afloat lift, replacing one of the three existing Maritime Prepositioning Ship Squadrons. Maritime Prepositioning Force (Future) is designed to enable freedom of action, operating from over the horizon and employing forces through and over anti-access environments.

The Department of the Navy's plan for Maritime Prepositioning Force (Future), as reflected in the Department's 30-Year Shipbuilding Plan, will provide this capability in a timely and cost effective manner while supporting industrial base stability, as well as providing opportunities for competition.

A similar letter has been sent to Chairmen Levin, Skelton, and Murtha. If I can be of any further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

THE ASSISTANT SECRETARY OF THE NAVY
(Research, Development and Acquisition)
WASHINGTON, DC 20350-1000

FEB 21 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As directed by the Fiscal Year 2007 Senate Armed Services Committee Report 109-254, the Navy has reviewed economic order quantity and long lead time material procurement for the CVN 21 Program advance procurement. This report summarizes the Navy's review.

The Navy's Long-Range Plan for Construction of Naval Vessels for Fiscal Year (FY) 2008 includes the plan to procure the first three ships of the CVN 21 Program at 4-year intervals with provisions for advance material procurement. While engaged in the FY 2008 Budget Development process, the Navy assessed a number of options to ensure the budget request fully funds our current and projected mission requirements while considering our Nation's critical industrial base. The FY 2008 President's Budget procurement plan and the Navy's Long-Range Plan for Construction of Naval Vessels represents the best option for use of Shipbuilding and Conversion, Navy funding on the CVN 21 Program.

Limited options exist for economic order quantity (EOQ) offsets on the first three ships of the CVN 78 Class. The addition of \$50 million in FY 2007 funds for the purpose of EOQ is no longer an executable option based upon timing of the funds. The Navy evaluated the EOQ question and determined that \$100 – 200 million would be needed in FY 2008 to realize a savings of \$25 – 50 million between FY 2010 and 2015. The Navy did not view this as an attractive business case and did not include EOQ in our FY 2008 budget submission.

Please let me know if I can be of further assistance. I will be happy to brief you on how Navy reached this conclusion if you desire. A copy of this letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink that reads "Delores M. Etter". The signature is written in a cursive style.

REPORT TO CONGRESS

on

Ship Systems Commonality

PREPARED BY

**Deputy Assistant Secretary of the Navy
For Shipbuilding Programs
Office of the Assistant Secretary of the Navy
Research, Development, and Acquisition
1000 Navy Pentagon
Washington, D.C. 20350**

February 2007

BACKGROUND

The Fiscal Year 2007 Senate Armed Services Committee Report 109-254 directed the Secretary of the Navy to submit a report to the congressional defense committees, with the Fiscal Year 2008 President's Budget request, on the analysis of the costs and benefits of implementing a plan to maximize the commonality in the design, integration, and installation of systems into new ships and existing ships. Specifically, the committee believes there are common capabilities in communications, surveillance, self-defense, damage control, combat systems, weapon deployment, propulsion, computing capability, and electrical power generation and distribution. By incorporating a family of ships concepts, which applies to investments made on one ship class to other ship classes, the Navy could avoid redundant research and development while reducing supply and training pipelines. Similarly for new ships, the committee believes a modular and open architecture approach to designing and integrating subsystems could reduce costs for Navy ships.

The Navy agrees with the Senate Armed Services Committee's view of the benefits of commonality, namely in avoiding redundant research and development while reducing supply and training pipelines. For over 30 years, the Navy has been researching, developing, and implementing a range of commonality and modularity approaches. Today, this area continues to be a priority.

SUMMARY OF NAVY ACTIONS

1. Consider commonality in Hull, Mechanical, and Electrical (HM&E) Equipment systems and Mission Systems across multiple ship classes in a cost effective manner through use of competition and innovative contracting to achieve "best value" systems.
2. Consider Type/Model/Series in the Analysis of Alternatives (AoA) guidance and output.
3. Consider reducing the number of hull types in the Navy After Next.
4. Implement Open Architecture across the Navy Enterprise to facilitate common system solutions for both the in-service and new construction ship classes.
5. Update the 30 year shipbuilding plan as necessary to incorporate commonality initiatives.

DISCUSSION OF KEY FINDINGS

Commonality can be addressed in several ways: at the ship level, at the system level, at the material level, and in our processes. All of these applications have potential to add value to the current Navy, the next Navy, or the Navy After Next. A cross-program approach, analogous to that of a financial portfolio manager, may be the best approach to building a total commonality strategy. This will facilitate implementation of commonality initiatives because the cost advantages are tracked at a global level, rather than distributed to programs. In addition, commonality must be addressed in future AoA

studies and requirements documents, namely in the beginning stage, if the Navy expects to see overarching benefits.

Current Navy

The Navy is currently using several approaches in shipbuilding and modernization programs to foster increased ship system and component commonality between current and future ship classes. These efforts include modernization plans for in-service ships, as well as improved acquisition approaches for future ships.

Specifications and standards play a key role in achieving commonality goals. New common systems and equipment will be designed using specifications and standards. Government standards will be used or developed when appropriate to control interfacing and to ensure commonality.

Ship level

To enhance commonality, the Navy is executing Multi-Ship / Multi-Option Contracts for ship repair to address total ship class maintenance and modernization requirements. One tenet of these contracts is to encourage standardization of components at the repair or replacement level by leveraging existing technologies that are common and exportable to other ship classes. Some examples of these initiatives are: Night Vision Equipment, Programmable Logic Controllers, Environmental and Pollution Abatement Systems, fire detection equipment, Remote Tank Level Indicators, and quality of life equipment such as galley, laundry, and crew entertainment systems. This common equipment facilitates a situation where the repair activity can learn the repair once and become proficient, saving time and money on future repairs.

System level

Within the ship community, commonality in HM&E is generally the norm, not the exception. Most ship specifications are developed from the previous class. Therefore, when a component is changed from class to class, it is a planned change to address a design deficiency, an increase in capability, or a discrete requirements difference. For example, parts commonality was a major initiative during design development of VIRGINIA Class, resulting in an order of magnitude reduction in the parts list used for ship construction. An example is the Acoustic Rapid Commercial-Off-The-Shelf Insertion (ARCI) Program. ARCI allowed new-technology sonar systems designed for the VIRGINIA Class to be installed in the other four submarine classes. The use of COTS in ARCI results in 5:1 development; 6:1 production; and 8:1 unit-level consumption cost savings with significantly improved capabilities.

In addition to ARCI, the Navy is currently implementing several initiatives to increase ship system commonality for in-service surface ships. The goal in this approach is to minimize component variance within the systems to reduce cost, schedule, and risk.

Some examples include:

- The CG 47 Class Integrated Ship Controls system leverages the design of GIG-E network switches, Computer Work Stations, HYDRA and Zonal Uninterrupted Power Supply (UPS) from other Navy ship classes.
- The CG Modernization Program leverages Digital Video Surveillance and Enhanced Training Capabilities from DDG 51 Class ships.
- The Navy will use common processing and display systems for all modernization efforts. Specific efforts where commonality has been incorporated are processing servers, processors, the operating system, GIG-E network architecture, display graphics engine, Human Machine Interface implementation, and Mission Critical Enclosures.
- The LSD 41/49 Class Mid-Life Program incorporated Programmable Logic Controllers (PLC) technology to replace existing obsolete Machinery Control Systems with a supportable, more reliable and less costly PLCs. These PLCs are installed in MCM Class ships and ARS Class ships for Machinery Control Systems and in Aircraft Carriers for Damage Control, List Control, consolidated alarms, automated firemain control, and JP-5 Fuel Management.
- The LSD Mid-Life Program installed an "All Electric" alteration that removes hotel services and auxiliary steam systems and replaces them with electric ones. This effort is in alignment with the overall Navy effort to remove auxiliary steam systems from in-service ships and build New Construction ships with "All Electric" auxiliary systems.
- The Diesel Readiness System (DRS) is a collection of initiatives (in fluids, performance, operations and maintenance) developed to improve reliability, maintainability, and operational availability of U.S. Navy diesel engines. DRS was initially prototyped and implemented on LSD 41/49 Class ships, but it is easily adaptable to most diesel engines including those in FFG, LPD, LCC, MCM, PC and LCS Class ships. The aircraft carrier and submarine community have both expressed interest in DRS for their emergency diesel generators.
- The "best athlete" solution is used on aircraft carriers modernization to reduce life cycle costs by reducing ILS requirements to a single common design. This was applied on machinery control and voice systems.
- The CVN 68 Class Carrier Construction Program, In Service Carrier Modernization Program, and CVN 68 Class Refueling Complex Overhaul Programs have all adopted a standard approach to defining, integrating, and procuring Ship Self Defense, C4ISR, Air Traffic Control, and Mission/Strike Planning systems relying on NAVSEA/PEO IWS, SPAWAR/PEO C4I, and NAVAIR/PEO(W)/PEO(T) to provide common solutions across all aircraft carriers as well as other air capable ship platforms.

The Navy has also targeted commonality in ship combat systems. All new combat systems designs are required to be more modular and to incorporate Open Architecture (OA) principles in both their design and acquisition. Modular open systems allow for the isolation of hardware from software so that one can be modified without affecting the other. This facilitates incremental introduction, certification, and testing of the affected modules and reduces the time and costs of certification and Test & Evaluation.

The goal of OA is to procure and maintain combat systems in the most efficient manner possible, while maximizing reuse of software, commonality of hardware, and eliminating redundant capability development. As part of the Warfare Systems “product-line reduction” strategy, the Navy is using a warfighting capability based approach rather than platform-centric approach. This means that Navy develops specific capability and functionality for use Enterprise-wide vice expending additional resources developing multiple systems that provide the same capability but are targeted to one class of ships only.

The Navy has established a library of combat system software and related assets for developing improvements to warfare systems. This approach is expected to result in greater capability through reuse and commonality among the Navy family of systems. Strategic software reuse will also enable programs to decrease development time, decrease development cost, and reduce risk. An area where software sharing has resulted in significant cost avoidance is the Anti-Submarine Warfare mission area. Building on the success of the ARCI Program, common acoustic software is being implemented in existing CGs and DDGs through COTS/OA upgrades to the AN/SQQ-89 system. These systems are also being incorporated into the designs of DDG 1000 and LCS.

Material Level

The Navy is exploring maritime HM&E equipment standardization. A study is underway that has defined potential strategic approaches for achieving maximum cost savings in the material support area. These strategic approaches are comprised of inserting standardization mechanisms and incentives into the acquisition process; minimizing non-standard equipment introduction during maintenance and modernization; and establishing long-term commodity-based contracts and “best value” tools for selecting standard alternatives to be used by all HM&E equipment procurement organizations.

By using common system/equipment across multiple ship platforms and awarding long-term commodity contracts for use by all HM&E procuring activities, the Navy may be able to leverage industry and achieve significant cost savings through bulk procurements and reduced life cycle costs for equipment, material, tools and associated technical documentation. The first of several commodities contracts is expected to be awarded in early FY 2008. Significant value may be gained if the Navy takes advantage of these standardization opportunities. Use of HM&E equipment/material commonality may significantly reduce the acquisition and life-cycle cost of the ship.

Processes

The Navy implemented a common modernization process in 2002, termed the SHIPMAIN Entitled Process. This process employs a disciplined decision making model to prevent investment in modernization programs with limited value. This common process also manages the critical installation planning milestones for each ship to reduce production churn on the waterfront and minimize payment of premiums to the installing activity.

Next Navy

The Navy currently has plans to increase the ship and ship system commonality. They include both the planned future activities as part of the 30 Year Shipbuilding Plan and a conceptual alternative (Navy After Next) that details a reasonable stretch goal.

Ship level

When addressing commonality at the ship level, the Navy has begun to reduce the number of ship types. The 2007 fleet has 29 hull types. By 2020, this number is reduced to 27 hull types if the 30 Year Shipbuilding Plan is followed. A reduction in the number of hull types will result in fewer unique components to be maintained and a reduced training and supply pipeline. It should be noted that Aircraft Carriers are in the middle of this reduction process. The Navy is currently reducing from five types of carriers (Forrestal, Kitty Hawk, CV 67, CVN 65, and CVN 68 Classes) to two types (CVN 68 and CVN 78 Classes) by the year 2015. Additionally, the CVN 78 Class uses the same hull form as the CVN 68 Class, as another means to reduce design and production costs and increase commonality. An Affordable Future Fleet Study discussed later in this report is examining further reductions in the number of hull types throughout the Fleet.

System level

The Navy plans to use innovative approaches to incorporate ship system commonality in new shipbuilding programs. The DDG 1000 destroyer has achieved commonality by utilizing existing Navy systems to the maximum extent possible. For example, 67 percent of the total DDG 1000 software is reused from existing Navy systems. Hardware reuse has also been emphasized to ensure logistics interoperability with the Fleet and a reduced shore support infrastructure footprint. Where existing Navy systems do not satisfy unique DDG 1000 warfighting requirements, new systems have been developed that will be common among the future ship classes or potentially backfit on the in-service fleet. For instance, the DDG 1000 Total Ship Computing Environment Infrastructure incorporates a modular, open systems architecture that is planned for reuse in the Ship Self Defense System (SSDS) in LPD 17, CVN 68, and LHA 6 Classes. Similarly, the Dual Band Radar, consisting of the S-band Volume Search Radar and an X-Band Multi-Function Radar, will also be installed on CVN 21.

Similarly, the CVN 21 Future Carrier Program has achieved commonality to existing Navy systems that are utilized in the CVN 68 Class Construction, Refueling Complex Overhaul, and In Service Modernization Programs. CVN 21 relies on common providers for a number of their systems, which are managed by Program Acquisition Resource Managers (PARMs). The CVN 21 Program is also developing a flexible ship infrastructure in areas of the ship that are heavily influenced by the evolutionary nature of computers, displays, and communication technology. This adaptive infrastructure, primarily located in the command center areas of the ship, is designed to allow commercial based computer, display, and communication device technology to evolve without a physical impact to the ship, through the use of standard ship interfaces on the deck, bulkheads, and overhead. This adaptive infrastructure also promotes commonality

with future systems, as equipment can easily be exchanged for new common systems as they become available.

Similarly, the Next Generation Integrated Power System (NGIPS) effort will leverage commercial technology to increase commonality. In the next 30 years, NGIPS will be used to increase commonality on the future ship and submarine designs; plus potential back fit of specific high return-on-investment components in other classes.

Open architected systems and modular designs are two enablers to achieve ship and warfare system consolidation. The business and technical aspects of Open Architecture are being implemented in most new Navy combat systems; however, due to the scope of the modernization effort required across the surface enterprise, it could be 2025 before a full transition to open systems is realized. To accelerate this timeline, within available funding constraints, the Navy is actively studying alternatives that will completely field common open architected systems across the surface enterprise within the next decade.

In terms of modularity, LCS has incorporated a modular design in the Mission Packages. The mechanical, electrical, and data information interfaces between the Mission Modules and the ship are defined by an Interface Control Document (ICD). All future Mission Packages must be designed to conform to the ICD. Within the Mission Packages, there is Mission Package equipment that is common; all three missions use a common Mission Package Computing Environment (MPCE), an H-60 derivative helicopter, and Unmanned Surface Vehicles.

Additionally, the Architectures, Interfaces, and Modular Systems (AIMS) Program has several system and sub-system architectures that are modular. For instance, the FlexTech System, which consists of a track and bracket system with standard interfaces for quick installation and removal of equipment, has shown acquisition and life-cycle savings. This type of system is especially applicable in CIC-type spaces where technology changes rapidly and the cost to remove and install equipment can be prohibitive.

Materials level

Because modularity and common ship components can impact the materials, commonality has also been explored in this area. To take advantage of this commonality, the Navy has explored the option of purchasing materials on a “portfolio” basis, rather than separately for each program. Potential savings come in the form of economic order quantity purchases, regional savings, and commercial leverage. This could allow the Navy to reduce the shipbuilding costs associated with material, which account for approximately 57% of the total shipbuilding costs. This reduction in material costs may also offset the increase in materials costs from increasing the ship modularity.

Another material initiative is used by the DDG 1000 Program. This program has implemented a Class Common Equipment (CCE) standardization effort that includes 119 CCE items that each shipbuilder will use. Through a Parts Standardization Initiative, the program has reduced the use of general material items by 25 percent and has catalogued them in a Common Parts Catalog, which contributes to a highly producible and more

efficient design. The VIRGINIA Class, LCS, and CVN 21 Programs have similar initiatives in place to ensure common components.

Processes

There are commonality-based opportunities for increased effectiveness and efficiency in the naval ship design process. One process change is the Navy Product Data Initiative (NPDI). Under the NPDI project, the shipbuilders, the system vendors, and the Navy are working together to create a common specification for an integrated product data environment (IPDE) that would be invoked in future Navy contracts. The principal goals are to eliminate duplication of IT systems and enable economical handling of changes that are an intrinsic part of design, construction, or life cycle support.

Navy After Next

As mentioned above, the Navy is currently considering future concepts that could enhance commonality. Although these are not currently part of the Navy's plans, these concepts could provide future guidance. They are considered stretch goals.

Ship level

Entities across the Navy are examining future ways to reduce types and models of ships while improving the standardization of components. A study conducted by Naval Sea Systems Command, called the Affordable Future Fleet Study, evaluated reducing the number of overall hull types beyond current shipbuilding plans. For instance, a potential strategy for surface combatants is to derive CG(X) from DDG 1000 or a DDG 51 replacement from LCS. Another option is to reduce the types of amphibious ships to one type versus three. Using these types of strategies, the NAVSEA study team found that the Navy can potentially reduce hull types to the following:

1. Aircraft carriers: CVN 78
2. Amphibious ships: L(X)
3. CLF: T-AKE
4. T-AO(X) variant
5. SSN/SSBN: Common sub
6. Surface combatants: DDG 1000
7. Surface combatants: DDG 1000 AAW
8. Surface combatants: CG(X) variant
9. Surface combatants: new small focused AAW ship

Hull information:

Ship	Full Load Displacement (t)	Light Ship Displacement (t)	Overall Length (m)	Overall Beam (m)
CVN 78	101,000	82,400	333	40.9
L(X)	35,700	26,600	229	32.3
T-AKE	41,593	24,935	210	32.2
T-AO(X)	42,800	10,200	198	32.2
Common Sub	14,560 submerged		135	12.8
	12,931 surfaced			
DDG-1000	14,800	12,900	186	24.4
DDG-1000 AAW	15,200	13,300	186	24.4
CG(X) Variant	15,200	13,300	186	24.4
Small Focused	4,450	3,660	142	15.4

This analysis is conceptual and would have to be revisited with the requirements team to examine a feasible timeline for implementation and the correct mix of capabilities; however this study does provide a commonality option. By reducing the overall number of hull types, there may be potential for vast reductions in the number of HM&E varieties in the Fleet, which could reduce life cycle logistics costs including the procurement of technical data, training, and supply support associated with the procurement of new equipment. Similarly, there is the potential to reduce procurement cost as compared to the current long range plan because non-recurring costs by reuse of already approved designs. Test and Evaluation savings could also be realized, if common products were tested once vice on every platform. The Navy has devised an Enterprise Test and Evaluation strategy to eliminate redundant testing of common systems, which is being implemented. In order to achieve this commonality, the Navy would have to lead a forum on common components, revised specifications, and revised standards.

System level

At the system level, the Navy plans to reduce the number of combat systems baselines from sixteen to five by 2025. This would be achieved in two ways; through decommissioning or open architecture. By decommissioning surface combatants (FFG 7 Class), conventionally powered aircraft carriers, and amphibious assault ships, the combat systems baselines will be reduced by three. Further reduction will be achieved through the installation of open architecture compliant systems in the existing fleet and in all new construction ships. The resulting ship system would be characterized by common components, revised specifications, and open standards to ensure commonality. Critical to achieving this objective will be delivering a standard warfare systems architecture as part of the system design process. The Navy is engaged in activities designed to migrate warfare system of systems to meet interoperability and openness objectives.

Another alternative concept for systems is to expand the Navy's use of modular systems. Modularity has been pursued for decades, but it is more comprehensively implemented in foreign navies than in the United States. Foreign navies are reported to have achieved acquisition cost reductions without reduction in performance. In the U.S. Navy, the full potential of modularity has not been realized. The stumbling block is that, with the exception of construction modularity (already in place), the cost benefits have been

difficult to quantify. In contrast, it has been easy to eliminate modularity features based on their adverse impact on material cost and weight. Modular systems offer benefits in mission flexibility, while ensuring commonality. Three possible levels of modularity implementation have been identified:

1. Component (minimal) – A continuation of existing design practices. Standard components are used throughout a given ship and an open architecture is maintained for computer systems. A modularity technical warrant holder would be established to maintain standard interfaces for modular elements.
2. Ship/System (medium) – Expands on the component level and uses standard systems and interchangeable payloads. Examples: Danish Stanflex and German Meko ships. Substantial commonality exists within ship classes, and limited commonality may exist across the fleet as well.
3. Fleet (full) – Modularity applied to the fleet as a whole, which would be designed to take advantage of hull commonality, warfare systems supersets, and other opportunities.

Although modularity has been explored at a program level, the Navy could fully evaluate the cost advantages of modularity by considering the entire Navy program plan. Modularity usually adds material cost and weight, so it has historically been a target for short-term cost-cutting. A cross-program approach, considering ship life, technical refresh, and the flexibility to quickly respond to future threats, could establish the business case for modularity.

Materials level

Because modularity and common ship components can impact the materials, commonality has also been explored at the material level. Moving to a reduced number of hull types and awarding long-term commodity-based contracts may not only reduce life cycle costs through the use of common materials, but may also have a positive impact on fleet readiness through increased availability of common materials across ship platforms.

Processes

The Affordable Future Fleet Study also identified four areas of the ship design process where commonality and interoperability are recommended:

- Product data interoperability.
- Concept and feasibility design tools.
- Technical Warrant Holder tools for certification of designs.
- Design community tools coordination.

Future work will examine modifications to these processes to enhance commonality.

CONCLUSIONS DERIVED FROM THE STUDY

Ship system and component commonality has the potential to bring great benefits, in terms of reduced procurement costs, reduced testing and evaluation, reduced training costs, reduced supply costs, shorter delivery schedules, and improved industrial

efficiencies and workload balancing. The Navy has a number of initiatives and processes in place to capture commonality benefits for the Current Navy and the Next Navy. For the Navy After Next, we are working on addressing commonality in several ways. At the highest level, reducing the number of ship hull types will reduce the number of unique systems in the fleet. Regardless of the number of ship hull types, however, open systems architecture and modularity can also support commonality of ship systems. Finally, a portfolio strategy for purchasing materials can ensure cost savings and commonality of materials in the fleet. In order to implement any of the solutions outlined in this report, the Navy needs to examine a corporate strategy and develop a uniform approach for ship system commonality, which may include AoAs, determining requirements document inputs and corporate cost savings tracking through captured metrics. The intent of this report is not to eliminate competitive opportunities, at the system level through sole source arrangements, but to show the potential benefits of ship systems commonality through reducing ship hull types, and awarding common equipment commodity contracts.

Dear Mr. Chairman:

As directed by the FY 2007 Senate Armed Services Committee Report 109-254, the enclosed provides an analysis of the costs and benefits of implementing a plan to maximize commonality in the design, integration, and installation of systems into new ships and existing ships.

Ship system commonality has the potential to bring great benefits, in terms of reduced procurement costs, reduced testing and evaluation, reduced training costs, reduced supply costs, shorter delivery schedules, and improved industrial efficiencies and workload balancing. It can be addressed in several ways. At the highest level, reducing the number of ship hull types will reduce the number of unique systems in the fleet. Regardless of the number of ship hull types, however, open systems architecture and modularity can also support commonality of ship systems. Finally, a portfolio strategy for purchasing materials can ensure cost savings and commonality of materials in the fleet. In order to implement commonality, the Navy needs to examine a corporate strategy and develop a uniform approach, which may include Analysis of Alternatives, determining requirements document inputs, and corporate cost savings tracking through captured metrics.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

REQUIREMENT:

The Senate Armed Services Committee Report 109-254 directed the Secretary of the Navy to submit with the FY 2008 President's Budget request a detailed plan for developing cost reduction measures with defined goals and benchmarks for the VIRGINIA Class production program.

EXECUTIVE SUMMARY

In the report of the 2006 Quadrennial Defense Review (QDR), the Department of Defense committed to "Return to a steady-state production rate of two attack submarines per year not later than 2012, while achieving an average per-hull procurement cost objective of \$2.0 billion." Lowering the per-hull cost from \$2.4 billion to \$2.0 billion (FY05) is essential for sustaining the procurement rate needed to preserve the nuclear submarine force structure, while minimizing the impact on the Navy's other platform recapitalization programs. The VIRGINIA Class nuclear submarine cost reduction program consists of three primary elements: 1) design changes for cost reduction, 2) construction improvements for cost reduction, and 3) increasing the procurement rate under a multi-year procurement (MYP) contract with economic order quantity (EOQ) authority. This report describes these elements and provides program goals and the benchmarks the Navy will use to track progress to ensure that cost reduction goals are being achieved.

Design changes for cost reduction: The Navy is working to a goal of \$100 million (FY05) in per-hull savings by the FY 2012 ships through changes to the VIRGINIA Class design that lower cost without impacting the ship's capabilities. These changes include simplifying systems, using lower cost components, and implementing the use of technologies to improve construction techniques. The design change effort has begun with a detailed study to identify the aspects of the VIRGINIA Class design that drive cost. The Navy and the shipbuilders are using actual cost data from building the first three ships to determine where changes to the design can reap the greatest cost savings. Guided by the study results, the Navy, the shipbuilders and the major component vendors develop candidate design change proposals for lowering cost. The Navy evaluates each proposal and selects for insertion those shown, through a business case analysis (BCA), to yield a good return on investment with manageable risk to the pace of construction performance improvement. The positive trend of construction performance is another critical aspect of the cost reduction effort. The Navy will insert selected design changes to ships under contract and group others into bundles for insertion in the next block of ships to be procured.

Construction improvements for cost reduction: The Navy has set a per-hull savings goal of \$100 million (FY05) by the FY 2012 ships through construction process improvements. The Navy and the shipbuilders are working to accelerate workforce learning by capturing experience gained from VIRGINIA Class ships under construction and using it to produce an optimized construction sequence that minimizes labor hours and cost. The shipbuilders are taking advantage of the Capital Expenditure (CAPEX) incentive of the FY 2004-2008 MYP contract to improve their production infrastructure to enhance construction efficiency. Also, the Navy and the shipbuilders are developing technology-based solutions to address construction challenges and innovative approaches for the installation of complex systems. In combination, these actions target a reduction of the construction period from 84 to 60 months. The Navy will monitor

ES- 1

WARNING: Export restricted by the Arms Export Control Act.

For Official Use Only

progress by assessing actual schedule performance relative to the shipbuilder's 60 month plan, which provides target completion dates for each hull section and assembly stage.

Increasing the procurement rate under a multi-year contract: By ordering two VIRGINIA hulls in FY 2012 and beyond under an MYP contract with EOQ authority, the Navy will realize per-hull cost savings of \$200 million (FY05). Increasing the procurement rate under an MYP contract with EOQ authority is essential for achieving a \$2.0 billion (FY05) VIRGINIA Class submarine. The higher production rate enables the shipbuilders to operate more efficiently, accelerate improvements in workforce proficiency, lower per-hull overhead and support costs, and purchase items and commodities from vendors at lower cost.

Cost reduction status: The Navy's investment of \$42.8 million in FY 2006 and \$68.3 million in FY 2007 has funded the cost driver analysis, the detailed study of the construction process as well as the evaluation and implementation of numerous design change proposals, most of which are still in progress. Savings yielded by completed design changes and process improvements implemented thus far are shown in Figure 1. Savings will continue to accumulate as design change evaluations complete and construction process improvements are implemented.

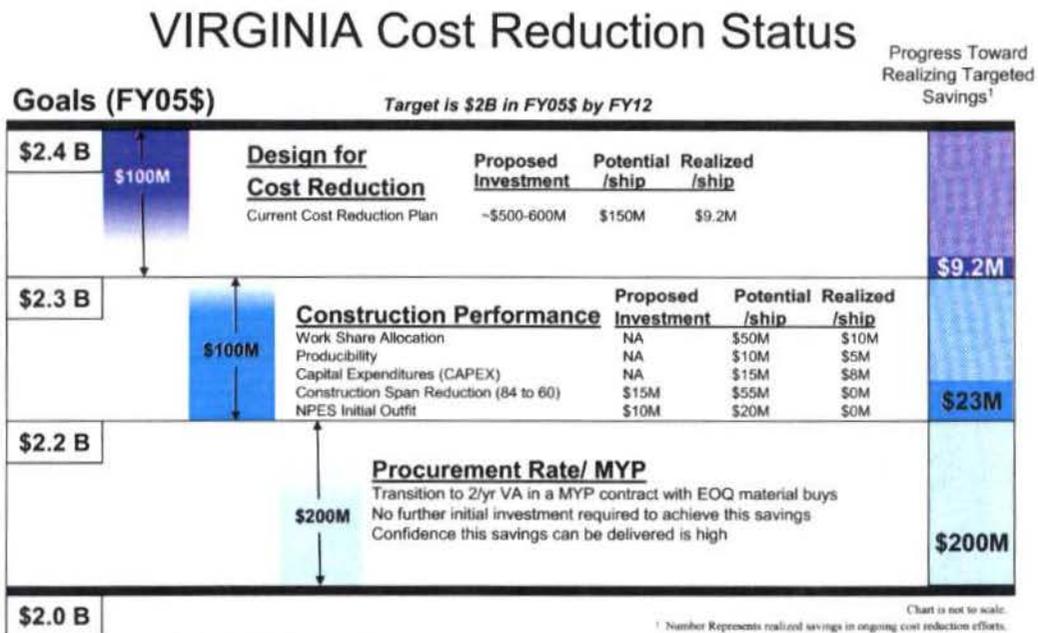

Figure 1. VIRGINIA Class Cost Reduction Status as of December 2006

The VIRGINIA cost reduction program merges the efforts of the government, the shipbuilders and the major component vendors to lower production risk for the VIRGINIA Class submarine in advance of contract award for the next block of ships. Lowering production risk is essential for instilling confidence in the government and the shipbuilders that VIRGINIA Class submarines can be built for the \$2.0 billion (FY05) target price. Best results will be achieved by executing the design change and construction improvement efforts as rapidly as resources allow.

1.0 Introduction

The Navy established the VIRGINIA Class submarine cost reduction program to guide the plan of actions for lowering VIRGINIA production cost from \$2.4 billion to \$2.0 billion (FY05) by the FY 2012 ships. The program targets per-hull savings of:

- \$100 million (FY05) through changes to the design that will lower cost without impacting capability;
- \$100 million (FY05) through construction process improvements; and
- \$200 million (FY05) through a stable two-per-year procurement rate under a MYP contract with EOQ authority.

This report describes each aspect of the cost reduction program, including the goals and benchmarks that the Navy is using to ensure that cost reduction goals are being met.

2.0 Design Changes for Cost Reduction

The Navy has set a goal of achieving total per-hull savings of \$100 million (FY05) by the FY 2012 ships through changes to the VIRGINIA Class design that will lower cost without impacting the ship's capabilities. The types of changes under consideration include simplifying systems, using lower cost or commercial-off-the-shelf components that meet Navy requirements, and implementing the use of technologies that improve construction techniques.

2.1 Design Change Process

Using the actual construction costs of the first three VIRGINIA Class submarines, the Navy, in coordination with the shipbuilders, is conducting a detailed analysis of the VIRGINIA Class cost drivers. The cost driver analysis guides the formulation of cost reduction proposals submitted by the government, shipbuilders, and major component vendors. The Navy screens each idea on the basis of its potential to deliver savings and the associated technical, schedule, and programmatic risks. Ideas that pass the initial screening are subjected to a Navy-funded evaluation to validate the initial estimate of savings and fully explore the risks. This phase produces an insertion plan and a BCA which incorporate all factors, including the research, development, test and evaluation investment, the complexity of the change and the potential savings. The Navy carefully considers the effect that each design change proposal will have on workforce learning, defined as the trend of improvement that results over time as the workforce gains experience in building the ship. Maintaining the pace of learning is critical for achieving the overall cost targets. To help understand and manage the potential impact of design changes on learning, the Navy has enlisted the support of industry experts using proven models and methods that have been successfully applied to other complex military procurement programs. Complex changes can cause a short-term decrement in learning en route to significant long-term savings, so where feasible, the Navy will accelerate the development and insertion of such changes in order to maximize savings across the class, minimize the effect on learning and lower construction risk for the next planned MYP contract. The Navy will either insert changes on a by-hull basis as

For Official Use Only

Distribution limited to U.S. Government Agencies and their contractors.

WARNING: Export restricted by the Arms Export Control Act.

For Official Use Only

contract modifications or incorporate them into a future block design. The Navy will also develop improved design tools to minimize the cost of design changes and future configuration management.

As illustrated in Figure 2, efforts are organized in three areas:

- Program Development – FY 2006 and FY 2007 efforts to identify cost drivers and savings opportunities and develop the program plan;
- FY 2009 Ship Affordability Improvements – Design changes that will mature and be executable in time for the FY 2009-2011 group of ships; and
- FY 2012 Ship Affordability Improvements – Design changes that will not be ready for insertion until the FY 2012 ships. While these changes are currently targeted for the FY 2012 ships, the Navy is making every effort to insert them into the FY 2011 ship, or earlier, to minimize the impact on learning and achieve cost savings sooner.

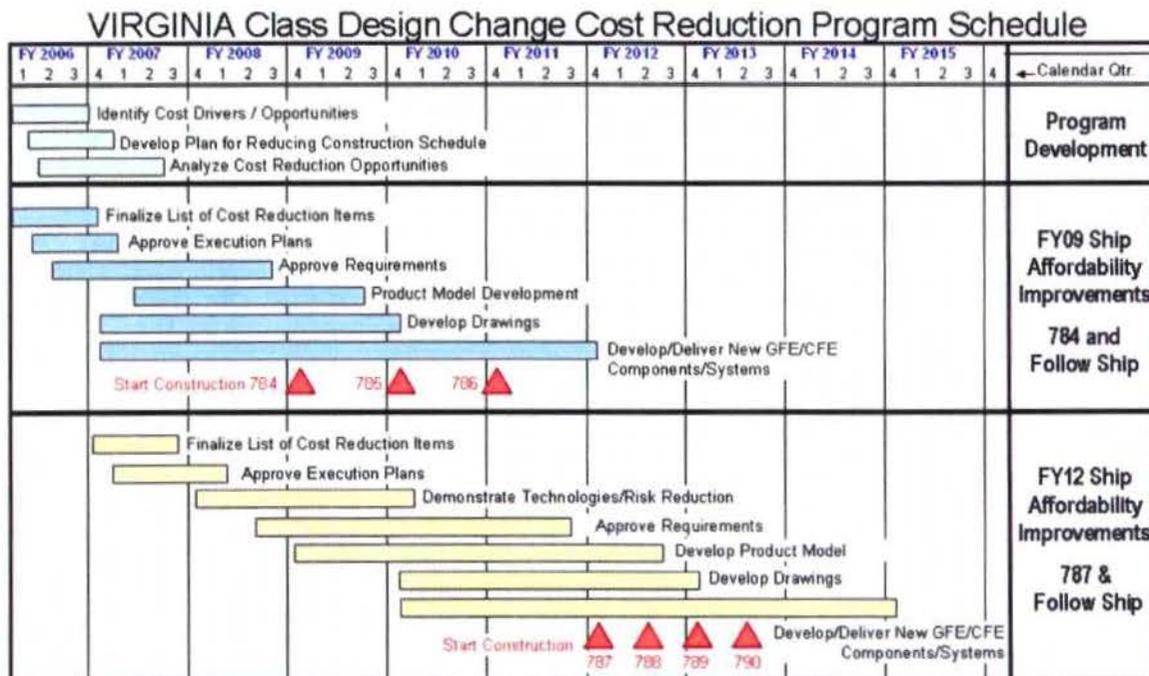

Figure 2. VIRGINIA Class Design Change Cost Reduction Schedule

2.2 Design Change Investments

In FY 2006 the Navy invested \$42.8 million for the detailed studies needed to guide the design change process and to begin evaluating design change proposals. Proposals include electrifying the weapons stowage and handling system (WSHS), simplifying several propulsion plant

For Official Use Only

systems, incorporating a new reverse osmosis (pure water) unit, and changing the specifications for paints and coatings to lower cost. The Navy also completed preliminary design of the Large Aperture Bow (LAB) array, a lower cost alternative to the current spherical sonar array.

In FY 2007 the Navy will spend \$68.3 million to continue the initiatives started in FY 2006 and also fund new investigations of potential cost savings proposals such as a reduced cost weapon system air turbine ejection pump, additional items in the propulsion plant and an alternate bow arrangement concept described below.

The alternative bow arrangement concept features the LAB array and a Payload Interface Module (PIM), a payload bay opening in the bow into which Flexible Payload Modules (FPM) with launchers would be fitted to provide the vertical launch capability. This approach eliminates a costly and labor-intensive process from the construction sequence by replacing the Vertical Launch System (VLS) with a system providing equivalent capability that is easier and less costly to build. With VLS, the complex arrangement of hydraulic and air piping, control valves and mechanical components that provide vertical launch capability are integral to the ship. The payload bay and FPM approach transfers the launcher system components to the FPM, which can be built separate from the ship in a facility optimized for this purpose. This modular approach also creates the potential to develop a less complex way of providing vertical launch capability and the potential to carry a wider array of payloads such as unmanned undersea vehicles, unmanned aerial vehicles and other strike weapons. The PIM approach is illustrated in Figure 3.

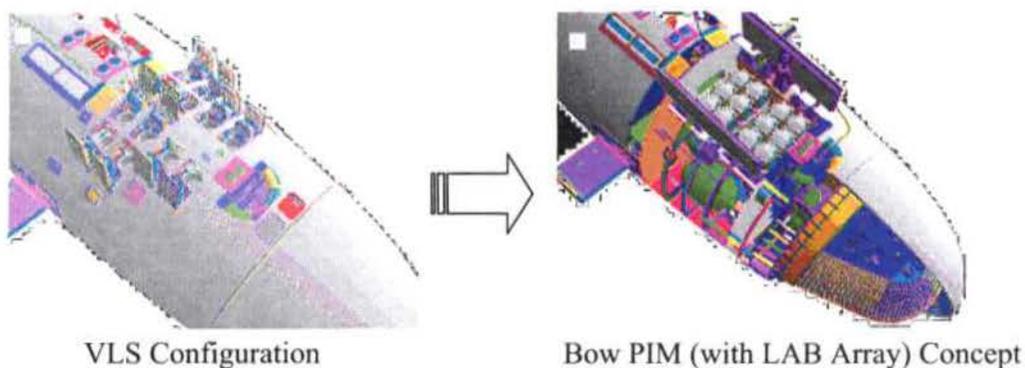

Figure 3. Alternate Bow Arrangement to Lower VIRGINIA Class Procurement Cost

Electric actuation of the torpedo room WSHS would provide capability equivalent to the current electro-hydraulic controls, but at dramatically lower cost through elimination of over a half mile of hydraulic piping, 20 hydraulic motors, numerous electro-hydraulic control valves, approximately 2,000 controlled welds and almost 1,000 controlled piping bends. It would also contribute to a shorter construction period by enabling the shipbuilder to complete a greater share of pre-testing earlier, during the module outfit phase of construction. These and other major design change proposals being considered are shown in Figure 4 on the next page.

For Official Use Only

Design Changes for Cost Reduction

Weapons Module Electrification	Universal Modular Mast Radar
Direct Seawater Feed and Brine Discharge	Total Ship Monitoring System – Wireless Modification
Vendor Reverse Osmosis Pure Water Unit	Shaft Seal Cooling Water System Modification
Propulsion Lube Oil Simplification	Large Aperture Bow Array
Main Machinery Cost Reduction	VIRGINIA Bow Payload Bay
Damping Material Reductions	Tomahawk Flexible Payload Module
Reduced Cost Weapons System Air Turbine Pump	Light Weight Wide Aperture Array (WAA) Digital Switch
Air Compressor Interstage Membrane Dehydrator	Conformal Acoustic Velocity Sensor (CAVES) WAA
Lower Cost Integrated Low Pressure Electrolyzer	Propulsion Plant Design Changes

Figure 4. Major Design Change Initiatives

2.3 Design Change Benchmarks

The Navy will track progress in cost reduction from design changes as the sum of projected savings from all approved design change proposals. The projection of savings for each proposal will be as determined by the completed BCA. The savings are considered to be achieved when the change has been fully costed by cost engineers and the expected savings are agreed to by the government and the shipbuilder on an item-by-item basis. This is the best available measure and benchmark of savings short of a signed construction contract that prices all design changes and their interacting effects. The negotiated price is the final measure of savings achieved.

3.0 Construction Improvements for Cost Reduction

The Navy has set a per-hull savings goal of \$100 million (FY05) by the FY 2012 ships through construction process improvements, which collectively, will shorten the construction sequence from 84 to 60 months. Shortening the construction period to 60 months is an essential element for achieving the \$100 million (FY05) goal. Cost savings result from reducing the number of labor hours required to build the ship and lowering the shipbuilder's overhead and support costs.

3.1 Acceleration of Workforce Learning

The Navy and the shipbuilders are working to accelerate the savings that result from workforce learning by capturing experience gained from VIRGINIA Class ships under construction and using it to produce an optimized construction sequence that minimizes labor hours and cost. The effort involves a detailed analysis of the fabrication of each major hull section and each aspect of the outfitting phase. It focuses initially on the highest labor cost drivers, those processes shown by actual data to expend the greatest number of man-hours and which have been shown to impose construction delays. Major tasks are broken down into individual work paths so that delays and inefficiencies can be identified and addressed in a more efficient sequence. In some cases, tasks that presently control the schedule can be moved to an earlier, less limiting phase of

For Official Use Only

construction or from the waterfront back to the manufacturing environment where open hull sections provide easier access and greater labor efficiency.

3.2 Capital Expenditure

The shipbuilders are taking advantage of the CAPEX incentive of the FY 2004 - 2008 MYP contract to make improvements to their production infrastructure that will enhance construction efficiency and lower cost. A CAPEX project for a Sheet Metal Light Fabrication Facility has been completed and has yielded favorable results. A module transportation project will lower construction cost by facilitating the transport of larger hull sections between Quonset Point RI, Newport News, VA and Groton, CT. Building fewer, larger hull sections enables a higher level of completion for individual modules in the manufacturing environment where labor efficiency is greater. Approved CAPEX projects are shown in Figure 5. As shown in Figure 1, the CAPEX projects will save approximately \$8 million (FY05) per hull starting with HAWAII, the third ship of the class. The Navy is continuing to evaluate additional CAPEX project proposals.

Project Description
Sheet Metal Light Fabrication Facility Project
Module Transportation Project
Northrop Grumman Newport News Module Outfitting Facility Upgrade
Quonset Point Coating Facility Project
Horizontal Machining Center Upgrade

Figure 5. Approved CAPEX Projects

3.3 Improving Manufacturing Techniques

The Navy is also introducing technology-based solutions for lowering construction cost through improved labor efficiency and more efficient manufacturing and construction techniques. Below are a few examples.

- The VIRGINIA Class design uses fiber optic cabling throughout the ship. Mating fiber optic cables using standard connectors is labor intensive and sensitive to the industrial environment. Failure of fiber optic connectors adds labor hours and cost. The Navy has adopted the simpler and more effective fusion splicing technique to reduce the time to mate connectors and reduce the incidence of failure and rework.
- The Manufacturing Technology (MANTECH) Program, managed and funded by the Office of Naval Research (ONR), develops technology-based solutions for practical challenges in the construction process. MANTECH projects are pursuing the expanded use of composite materials to lower the cost and weight of VIRGINIA components such as the main seawater

For Official Use Only

pump impeller and the sail cusp (the leading edge fairing at the base of the sail). MANTECH projects also target improvements in construction efficiency. Figure 6 illustrates two projects:

- Optimization of the construction sequence at Northrop Grumman Newport News' (NGNN) modular outfitting facility (left and center); and
- Product-Centric Facility Design – an effort to lower labor cost while improving welding performance by maximizing use of the Precision Automated Welding System (PAWS) for fabrication of major structural units (right).

Figure 6. ONR MANTECH Projects Contribute to Cost Reduction by Developing Technology-Based Solutions for Construction Challenges

MANTECH is also developing improved techniques for joining and fitting thin wall piping, a critical aspect of submarine construction. Figure 7, on the next page, presents a list of current MANTECH projects in execution or under development.

For Official Use Only

MANTECH Projects in Execution

Product Centric Facility Design - Steel Fabrication	Weld Distortion Prediction
Ultralight Gas Metal Arc Welding	Propulsor Affordability Initiative
Computed Radiography	

MANTECH Projects under Development

Improve the Efficiency of the Outfitting Process	Alternative Damping Material Application
Develop and Implement a World Class Design for Production Process for Submarines	Reduced Cost Application of Special Hull Treatment/Mold-in-Place Coating
Material Storage, Flow, Tracking and Space Utilization Process Optimization	Integrated Time Domain Multiplexing Switching, Laser and Laser Modulation Assembly
Alternative Pipe Fittings	Integrated Optical Blocking - Multi-Pole Optical Switch
Welding and Joining of Inconel 625 Piping	Low Cost, Highly reliable Fiber Optic Accelerometers
Automated Welding Technique	Time Division Multiplexed Telemetry
Small Weldment Fabrication Process Improvements	Improved Blast and Paint Processes
Virtual Reality Training for Welders	Low Cost Composite Sail Cusp
Laser Image Projection	Composite Main Ballast Tank Flood Grates
Optimized Cladding Cell Development and Implementation	Composite Control Surfaces
Fiber Optic CAVES	Cast-in-Place Bow Dome Boot
CAVES Materials	Composite Air Turbine Pump Impeller
Pultruded Towed Array Fairings	Low Cost Composite Air Turbine Pump Muffler
Chin Array Fairing Cover	Composite Propulsor
Integrated Testing Development	Part Marking and Labeling

Figure 7. Current MANTECH Projects in Execution or Under Development

- The shipbuilders are pursuing new rapid-curing paints and improved painting techniques to reduce paint-related work delays from days to hours. These and other producibility improvements will yield savings of \$5 million (FY05) per hull. The shipbuilders and the Navy are also investigating paint systems that will improve life cycle performance.
- The Navy is using funding added to the budget by Congress to investigate reduced cost manufacturing techniques for the composite bow sonar dome.
- In addition to the General Dynamics Electric Boat and NGNN CAPEX and ONR MANTECH efforts, the Navy is investigating a variety of other construction process improvement initiatives for achieving the goal of shortening the construction sequence.

Figure 8, on the next page, lists some of these projects.

For Official Use Only

Construction Improvements for Cost Reduction

84-to-60 Month Schedule Reduction Planning	Paint and Coating Process Improvement
Material Systems Supply Chain Reengineering	Poly Shielding Implementation
Critical Work Centers Reengineering	Enterprise Analysis and Improvement Task
Improved Material Procurement Process	Electronic Sign-off of Line Items
Early Identification and Action for Repair Parts	Implement an Atmospheric Database
Mold-in-Place Vendor & Resource Capacity Assessment	Enhanced Laser Marking
Contractor Furnished Equipment Vendor Assessment	Improved Sheet Metal Product Fabrication
Producibility Improvements	Hatch Improvement Program
Fusion Splicing of Fiber Optic Cables	Engineering Support Services Cost Reduction
Eliminate Post Bravo Sea Trials Dry Dock Period	

Figure 8. Ongoing Construction Process Improvement Projects

3.4 Applying Lean Concepts to VIRGINIA Class Production

The Navy is applying Lean Six Sigma principles to achieve construction savings by improving a wide array of processes associated with VIRGINIA Class production. Lean complements parallel efforts by the shipbuilders to shorten the construction sequence. Processes targeted for improvement range from relatively small but recurrent functions, such as improving supervisor access to technical information in order to minimize time away from the job site, to major tasks such as improving the success of hull section assembly. The Navy is also applying Lean principles to all aspects of the government-shipbuilder interface to identify and eliminate any potential inefficiency. The Lean initiatives supporting VIRGINIA Class cost reduction are a high Navy priority. They are among a select group of Lean functions for which progress is routinely reported to the Secretary of the Navy.

3.5 Alternate Approach for Combat Systems

The Navy is exploring the potential to lower construction cost and shorten the construction period by changing the way that the submarine is provided its combat capabilities. Under current practice, each VIRGINIA is fitted with a fully capable combat system matching the Fleet configuration that existed at the time of contract award. This approach provides combat capabilities that will not be used during sea trials and which will be outdated upon delivery, creating the need for a costly update to the most current Fleet configuration following delivery of the ship. One alternative under consideration would install a set of combat capabilities during construction sufficient for sea trials, and then upgrade them to the most current configuration following the ship's shakedown period. The initial "sea trials system" would be less expensive to install and test, and could use components recovered from upgrading an earlier ship. As another alternative, the Navy is conducting a Lean Value Stream Analysis to assess delaying installation of the combat systems until closer to sea trials. Doing so would deliver the ship with a newer

For Official Use Only

configuration, thus eliminating the need for an extensive update (as currently required) after delivery.

3.6 Construction Improvement Benchmarks

In combination, the efforts being pursued to improve construction performance will shorten the construction period from 84 to 60 months and yield per-hull savings of \$100 million (FY05) by reducing shipbuilder labor and lowering shipbuilder overhead and support costs. The Navy will monitor progress in achieving the goal by assessing actual schedule performance relative to the shipbuilders' 60 month plan which provides target completion timelines for each major module and assembly stage in months from construction start. A depiction of the plan to reach the 60 month goal is illustrated in Figure 9. As shown in the figure, the improved construction sequence, which produces four major modules of higher completion, began with SSN 778. Construction of prior ships involved as many as ten modules of lesser completion.

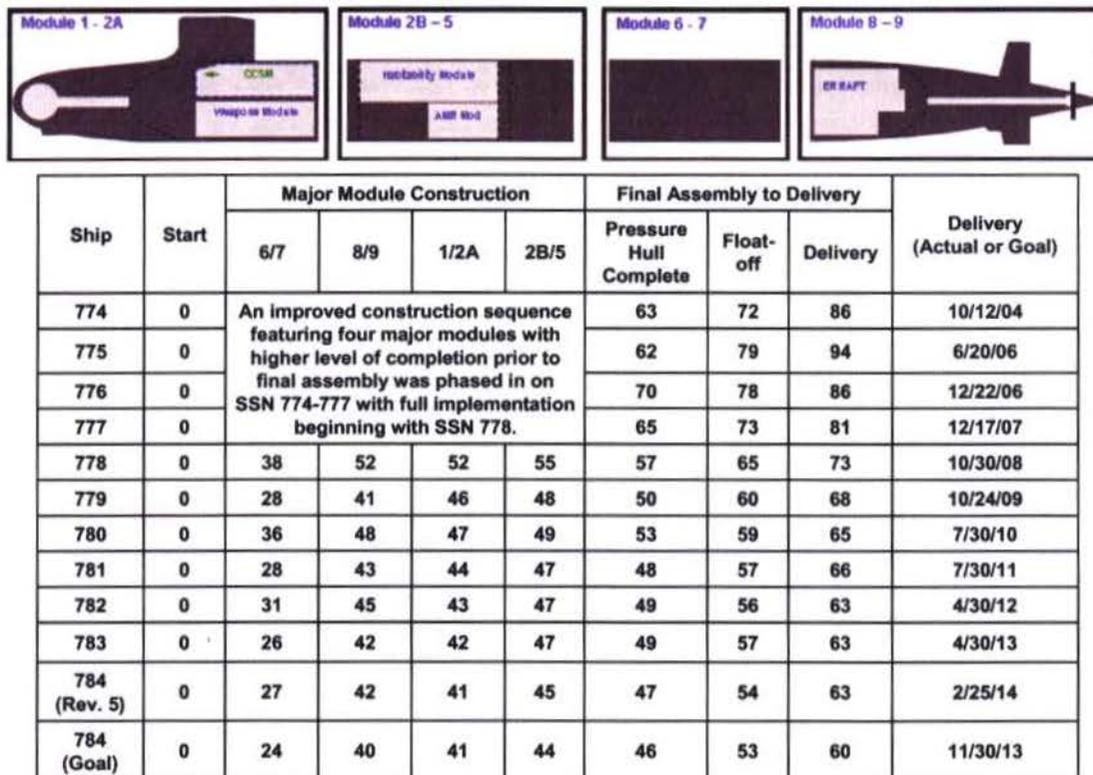

Figure 9. Target Completion Goals - Measured in Months from Construction Start

For Official Use Only

4.0 Increasing the Procurement Rate under a Multi-Year Contract

The greatest per-hull savings will result from increasing the production rate in a MYP contract with EOQ authority. Increasing the VIRGINIA production rate will produce savings in several ways:

- Lower per-hull shipbuilder overhead costs – Fixed overhead cost at construction facilities will be distributed among a greater number of ships, lowering the per-hull cost.
- Lower cost for ship components – Increased demand for major ship components to support a higher build rate will yield additional savings because major component vendors will produce at greater efficiency and will be able to spread their per-unit fixed overhead costs across a greater number of components.
- Accelerated learning at the shipbuilder facilities – A higher production rate will further accelerate workforce learning, improve construction efficiency and lower production cost by decreasing total labor hours.
- Lower cost for raw materials – Shipbuilders will be able to contract for a higher volume of raw material, such as steel and other commodities needed for the construction process, achieving a lower price.
- Potential to increase competition – Along with design changes favoring commercial specifications, the higher procurement rate for components and commodities resulting from a higher VIRGINIA build rate may attract the participation of additional vendors and yield further savings through competition.

The savings that result from a higher build rate under an MYP contract with EOQ material buys will yield per-hull savings of \$200 million (FY05). Increasing the procurement rate in a MYP contract with EOQ authority is a critical aspect of achieving a \$2.0 billion (FY05) VIRGINIA by FY 2012.

5.0 Contract Timeline

As described in this report, the VIRGINIA Class cost reduction effort pursues savings through:

- Changes to the class design to lower cost while maintaining capability;
- Production process improvements to reduce labor hours and shorten the construction period; and
- Increasing the procurement rate in a MYP contract with EOQ authority.

All three of these elements must come together in order to develop confidence that the FY 2012 VIRGINIA Class ships can be built for the target price of \$2.0 billion (FY05). Confidence on the part of the Navy and the shipbuilders is critical for negotiating a contract for the target price.

For Official Use Only

The cost reduction effort is driven by the timeline for negotiating the next block of VIRGINIA Class ships, illustrated in Figure 10 (below). The Navy must finalize the ship design in the request for proposal, scheduled to be released in September 2007. For this reason, it is imperative that the design change and construction process improvement efforts proceed as quickly as funding allows.

VIRGINIA Class Block III Contract Timeline	
Feb 2007	Submit request for MYP approval to Congress
Dec 2006 – Jul 2007	Develop acquisition strategy, plan & approvals
Aug 2007	Obtain sole-source procurement authority from Milestone Decision Authority - USD (AT&L)
Sep 2007	Release Request for Proposal
Jan 2008	Receive shipbuilder proposal
Jan – Apr 2008	Evaluate shipbuilder proposal
Mar – Aug 2008	Negotiate contract
Sep 2008	Secretary of Defense certifies to Congress that the program is fully funded in the Future-Years Defense Program
Oct 2008	Award contract

Figure 10. VIRGINIA Class Block III Contract Timeline

6.0 Conclusion

The VIRGINIA Class cost reduction program is underway and progressing toward the goal of lowering per-hull VIRGINIA construction cost from the current \$2.4 billion (FY05) to the target price of \$2.0 billion (FY05) by the FY 2012 ships. Lowering VIRGINIA cost is critical for achieving and sustaining the higher production level, in FY 2012 and beyond, called for in the Navy's Annual Long-Range Plan for the Construction of Naval Vessels for FY 2008. Success in achieving the cost reduction goal and enabling the higher procurement rate requires that the parallel thrusts of design changes for cost reduction and construction process improvements be pursued as rapidly as funding allows.

THE ASSISTANT SECRETARY OF THE NAVY
(Research, Development and Acquisition)
WASHINGTON DC 20350-1000

FEB 21 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

The Senate Armed Services Committee Report 109-254 requested the Secretary of the Navy submit, with the Fiscal Year 2008 President's Budget request, a detailed plan for developing cost reduction measures with defined goals and benchmarks for the VIRGINIA Class production program.

Lowering the per-hull cost from \$2.4 billion to \$2.0 billion (FY 2005) is essential for sustaining the procurement rate needed to preserve the nuclear submarine force structure, while minimizing the impact on the Navy's other platform recapitalization programs. The VIRGINIA Class nuclear submarine cost reduction program consists of three primary elements: 1) design changes for cost reduction, 2) construction improvements for cost reduction, and 3) increasing the procurement rate under a multi-year procurement (MYP) contract with economic order quantity (EOQ) authority. The enclosed report describes these elements and provides program goals and the benchmarks the Navy will use to track progress to ensure that cost reduction goals are being achieved.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink that reads "Delores M. Etter".

Washington, DC 20510-6050

Dear Mr. Chairman:

The Fiscal Year 2007 House Appropriations Committee Report 109-504 directed that the Navy review the situation regarding currency fluctuation losses that have occurred on the T-AKE main propulsion diesel engine contract and submit a plan for addressing this situation to the congressional defense committees not later than February 1, 2007.

On October 18, 2001, the Navy awarded a fixed price incentive contract to National Steel and Shipbuilding Company (NASSCO) for construction of up to 12 Dry Cargo/Ammunition ships (T-AKE). The contract, priced in U.S. dollars, included priced options for eleven follow ships, and included an Economic Price Adjustments (EPA) clause to protect both the Navy and the contractor from volatility in labor and material markets. The EPA clause consists of Bureau of Labor Statistics (BLS) indices, Iron and Steel, General Purpose Machinery and Electrical Machinery, with a tolerance band of plus or minus five percent. Neither this clause, nor any other provision of NASSCO's contract, provides for a cost adjustment in the event of any currency fluctuation.

NASSCO designed the T-AKE class and commenced construction of the first nine ships with selected equipment from foreign suppliers. The T-AKE main propulsion diesel engine subcontractor, Fairbanks Morse, and other NASSCO subcontractors have alleged losses due to foreign exchange rate differences to the dollar. Fairbanks Morse has reported increased material costs in the amount of \$6.6 million for the first six ship sets. NASSCO maintains that on July 25, 2001, the date that it submitted its best and final offer, the U.S. dollar was equivalent to 1.14093 EUR. However, on October 18, 2001, the date of the award of the lead and first follow ship, the exchange rate declined to one U.S. dollar to 1.10687 EUR, constituting a three percent decline in the exchange rate between the currencies.

NASSCO further contends that as the Navy exercised the options for T-AKEs 3 through 8 over the next four years, the exchange rate between the two currencies experienced a total deterioration of 33 percent as the exchange rate fell to one U.S. dollar to 0.75850 EUR as of March 1, 2005. Although NASSCO assumed the exchange risk on

the behalf of some of the suppliers, other vendors made the business decision to assume the exchange rate risk on their own by pricing the foreign content of their materials in U.S. dollars.

NASSCO has brought these foreign currency exchange rate issues to the attention of the Navy in the form of a contract problem identification report. NASSCO has not submitted a formal claim or a request for equitable adjustment to the contract on the issue of currency fluctuations.

The Navy's contractual obligation to NASSCO is to compensate them for "escalation" that is above the band that is set forth in the EPA clause. As described above, the Navy prime contract with NASSCO does not address currency exchange rate fluctuation issues. As a result, the contract places the risk of currency fluctuation on NASSCO, and it was NASSCO's responsibility to cover such contingency as it best saw fit in pricing its T-AKE contract proposal. One approach that NASSCO or its subcontractors could have pursued to address this risk was purchase of exchange rate hedge contracts. NASSCO and its subcontractors made the business decision not to do so. For these reasons, NASSCO has no entitlement to a cost adjustment to the T-AKE contract due to losses incurred from currency fluctuations.

In conclusion, the Navy will evaluate the potential risk due to foreign exchange fluctuation on future contracts. However, prime contractors are in a better position than the Government to assess the extent of the risk to its planned suppliers and to price any offer it submits to the Navy accordingly.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink that reads "Delores M. Etter". The signature is fluid and cursive, with the first name being the most prominent.

Dear Mr. Chairman:

Section 361 of the John Warner FY 2007 National Defense Authorization Act directs the Secretary of Defense to submit to the congressional defense committees a written certification that the Navy has budgeted and programmed funding to fully meet the requirements in FY 2008 for: (1) ship steaming days per quarter for deployed and non-deployed ship operations; and (2) projected depot maintenance for ships and aircraft. This requirement has been delegated to the Navy.

Accordingly, I certify that the Navy has budgeted and programmed sufficient funding in FY 2008 to meet baseline mission requirements in the areas of ship steaming days per quarter for deployed and non-deployed ship operations, and projected requirements for ships and aircraft depot maintenance.

Section 361 also directs me to submit to the congressional defense committees an annual report that sets forth the progress toward budgeting resources to sustain required readiness levels in support of the national military strategy without significant risk. The report provides assessments for deployed and non-deployed quarterly ship steaming days requirements, and projected ship and air depot maintenance programs. The report also provides documentation supporting the required certification. The FY 2008 annual report is enclosed.

As always, if I can be of further assistance, please let me know. A similar letter has been sent to Chairmen Levin, Inouye and Murtha.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

SEC. 342. REPORT ON NAVY SURFACE SHIP ROTATIONAL CREW PROGRAMS.

(a) **REPORT REQUIRED.**—Not later than April 1, 2007, the Secretary of the Navy shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the ship rotational crew experiment referred to in subsection (c)(1). The report shall include the following:

(1) A comparison between the three destroyers participating in that experiment and destroyers not participating in the experiment that takes into consideration each of the following:

A) Cost-effectiveness, including a comparison of travel and per diem expenses, maintenance costs, and other costs.

(B) Maintenance procedures, impacts, and deficiencies, including the number and characterization of maintenance deficiencies, the extent of voyage repairs, post-deployment assessments of the material condition of the ships, and the extent to which work levels were maintained.

(C) Mission training requirements.

(D) Professional development requirements and opportunities.

(E) Liberty port of call opportunities.

(F) Movement and transportation of crew.

(G) Inventory and property accountability.

(H) Policies and procedures for assigning billets for rotating crews.

(I) Crew retention statistics.

(J) Readiness and mission capability data.

(2) Results from surveys administered or focus groups held to obtain representative views from commanding officers, officers, and enlisted members on the effects of rotational crew experiments on quality of life, training, professional development, maintenance, mission effectiveness, and other issues.

(3) The extent to which standard policies and procedures were developed and used for participating ships.

(4) Lessons learned from the experiment.

(5) An assessment from the combatant commanders on the crew mission performance when deployed.

(6) An assessment from the commander of the Fleet Forces Command on the material condition, maintenance, and crew training of each participating ship.

(7) Any recommendations of the Secretary of the Navy with respect to the extension of the ship rotational crew experiment or the implementation of the experiment for other surface vessels.

(b) **POSTPONEMENT OF IMPLEMENTATION.**—The Secretary of the Navy may not begin implementation of any new surface ship rotational crew experiment or program during the period beginning on the date of the enactment of this Act and ending on October 1, 2009.

(c) **TREATMENT OF EXISTING EXPERIMENTS.**—

(1) **DESTROYER EXPERIMENT.**—Not later than January 1, 2007, the Secretary of the Navy shall terminate the existing ship rotational crew experiment involving the U.S.S. Gonzalez (DDG-66), the U.S.S. Stout (DDG-55), and the U.S.S. Laboon (DDG-58) that is known as the “sea swap”.

(2) **PATROL COASTAL CLASS SHIP EXPERIMENT.**—The Secretary of the Navy may continue the existing ship rotational crew program that is currently in use by overseas-based Patrol Coastal class ships.

(3) **MINE COUNTERMEASURES SHIPS.**—The Secretary of the Navy may continue the existing ship rotational crew program that is currently in use by MCM and MHC ships.

(4) LITTORAL COMBAT SHIPS.—The Secretary of the Navy may employ a two crew for one ship (commonly referred to as Blue-Gold) rotational crew program for the first two ships of each Littoral combat ship design (LCS 1-4).

(d) COMPTROLLER GENERAL REPORT.—Not later than July 15, 2007, the Comptroller General shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the ship rotational crew experiment referred to in subsection (c)(1). The report shall include the following:

(1) A review of the report submitted by the Secretary of the Navy under subsection (a) and an assessment of the extent to which the Secretary fully addressed costs, quality of life, training, maintenance, and mission effectiveness, and other relevant issues in that report.

(2) An assessment of the extent to which the Secretary established and applied a comprehensive framework for assessing the use of ship rotational crew experiments, including formal objectives, metrics, and methodology for assessing the cost-effectiveness of such experiments.

(3) An assessment of the extent to which the Secretary established effective guidance for the use of ship rotational crew experiments.

(4) Lessons learned from recent ship rotational crew experiments and an assessment of the extent to which the Navy systematically collects and shares lessons learned.

(e) CONGRESSIONAL BUDGET OFFICE REPORT.—Not later than July 15, 2007, the Director of the Congressional Budget Office shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the long-term implications of the use of crew rotation on Navy ships on the degree of forward presence provided by Navy ships. The report shall include the following: *Deadline.*

(1) An analysis of different approaches to crew rotation and the degree of forward presence each approach would provide.

(2) A comparison of the degree of forward presence provided by the fleet under the long-term shipbuilding plan of the Navy with and without the widespread use of crew rotation.

(3) The long-term benefits and costs of using crew rotation on Navy ships.

Report on Navy Surface Ship Rotational Crew Programs in Compliance with Section 342 of Fiscal Year 2007 National Defense Authorization Act

This report provides the Navy's responses to questions about Navy Surface Ship Rotational Crew Programs as directed in section 342 of the Fiscal Year 2007 National Defense Authorization Act (NDAA). The report sections are listed below as written in the NDAA language, followed by a summary of the results for each topic.

Comparison of Ships Participating and Not Participating in the Experiment

Brief Sea Swap Experiment Overview

The Fleet Forces Command (FFC) DDG Sea Swap Initiative (SSI)¹ concept involved six Atlantic Fleet (LANTFLT) ships²: three Experiment Group DDGs, and three similar Control Group DDGs which did not swap crews during the experiment period. USS Gonzalez (DDG 66) deployed to the 5th Fleet Area of Responsibility (AOR) for approximately 18 months (March 2005 – August 2006), and the three Experiment Group DDG crews manned the ship in 6-month increments.

Deployed crew turnovers took place in the 5th Fleet AOR at Jebel Ali, Dubai and Manama, Bahrain. While deployed, Gonzalez supported five Expeditionary Strike Groups (ESGs) as well as performing Maritime Security Operations (MSO) in the 5th Fleet AOR. Gonzalez supported Dutch-led Combined Task Force (CTF) 51, American-led CTF 152, and British-led CTF 58 performing MSO as part of the Global War on Terrorism. All three crews engaged pirates or supported anti-pirate operations off the coast of Somalia. Gonzalez, with final rotating crew onboard, also conducted Non-combatant Evacuation Operations (NEO) under 5th Fleet Operational Control (OPCON) during the Beirut, Lebanon evacuation.

This report addresses each of the topics found in Section 342 of the FY 2007 NDAA. Additional data will be available in the 2nd Quarter of FY 2007 in the maintenance, reenlistment, and survey areas. Analysis results will be updated in the Sea Swap Initiative Final Report, available June 2007.

¹ Although this effort was originally called the DDG Sea Swap Experiment, the name was changed to the DDG Sea Swap Initiative in March 2005.

² Table 1 identifies the ships in the Experiment Group, Control Group, and the Comparison Group (established to provide additional deployed data)

1. "A comparison between the three destroyers participating in that experiment and destroyers not participating in the experiment that takes into consideration each of the following:"

Analysis Approach: Rigorous data collection and analysis were based on comparing data and Measures of Performance (MOPs) between the Sea Swap Experiment Group and Control Group ships and crews (listed in Table 1). A Comparison Group of other DDGs (also listed in Table 1) recently deployed to the 5th Fleet AOR was identified when additional comparison data were needed for some analysis issues. Operations and cost models were developed to assess the primary MOPs: 5th Fleet presence days and operational costs.

Table 1

Experiment Group	USS Gonzalez (DDG 66), USS Laboon (DDG 58), USS Stout (DDG 55)
Control Group	USS Cole (DDG 67), USS Ross (DDG 71), USS The Sullivans (DDG 68)
Comparison Group	USS Oscar Austin (DDG 79), USS Barry (DDG 52), USS Bulkeley (DDG 84), USS Winston S. Churchill (DDG 81), USS Donald Cook (DDG 75), USS Mason (DDG 87), USS McFaul (DDG 74), USS Roosevelt (DDG 80)

Recent real-world 5th Fleet presence has been provided by alternating LANTFLT and Pacific Fleet (PACFLT) ESG and Carrier Strike Group (CSG) deployments (Figure 1). "Traditional" deployment operations and cost models were therefore developed to exhibit how 5th Fleet DDG presence would have been provided had the FFC DDG SSI not taken place. Both SSI and Traditional operations models are discussed in greater detail in Appendix A.

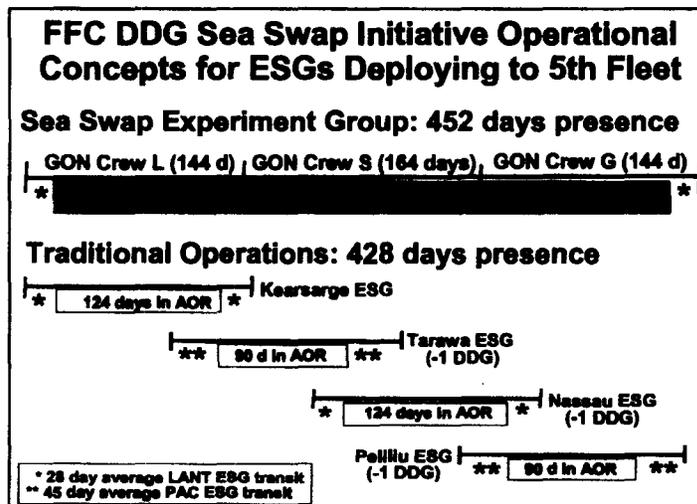

Figure 1. FFC DDG Sea Swap Initiative Operational Concepts (Average Numbers of Days Assuming 180-day Deployments)

1a. "Cost-effectiveness, including a comparison of travel and per diem expenses, maintenance costs, and other costs."

Response: The 3-ship/3-crew FFC DDG SSI analysis summarized here provided the same number of 5th Fleet AOR presence days as 4.2 DDGs using Traditional crewing, at an operational cost savings of \$9.8M. Projected future operational cost savings are estimated to be \$10.6M (using average deployment lengths and current prices for fuel, crew transportation and turnovers, details in Appendix B). Operational cost savings are due primarily to fuel savings of approximately 140,000 barrels. Comparison of maintenance cost data available to date indicates that maintenance spending on Gonzalez and the non-deploying Experiment Group ships is similar to that for other LANTFLT DDGs.

Operations Cost Analysis: 5th Fleet presence days and operational costs were calculated using operations and cost models (discussed in greater detail in Appendix B). Operational cost and performance trade-off analysis results are summarized below:

- The 3-ship/3-crew Experiment Group provided an actual total of 456 5th Fleet presence days, while the average Sea Swap model (assuming all crews deployed for 180 days) would provide a total of 452 5th Fleet presence days. This is equivalent to 4.2 DDGs using the Traditional operations model.
- Two PACFLT and one LANTFLT ESG deployed with one less DDG (because Gonzalez was already in 5th Fleet), providing PACFLT with the operational flexibility of two DDGs for 6 months each for alternate tasking.
- The Experiment Group saved approximately \$9.8M in operations costs compared to the Traditional operations model. This result is largely due to fuel cost savings because Sea Swap required a single LANTFLT round-trip transit, while the Traditional model would require 2.5 LANTFLT and 2.0 PACFLT round-trip transits.

Shipboard Funding/Cost Analysis: Shipboard operating costs (referred to as OPTAR costs) reflect expenditures to support normal operations and maintenance of the crew and hull. OPTAR costs are maintained in two accounts: Other OPTAR (i.e. medical, damage control, personnel safety and general consumables, etc.) and Equipment Maintenance Related Material (EMRM) to support maintenance actions on shipboard equipment.

- Other OPTAR spending (non-maintenance related) was similar for Experiment and Comparison Group crews.
- EMRM spending for Gonzalez was typical of the EMRM spending of the deploying Comparison Group ships except for a 6-month window centered on a spike in January 2006 related to a cluster of SPY-1 RADAR Casualty Reports (CASREPS). A review of CASREPS and EMRM spending for the entire DDG 51 class revealed that one in five ships had experienced a cluster of SPY-1 CASREPS that created a similar spike in EMRM spending, leading to the conclusion that the spike in Gonzalez EMRM spending is not Sea Swap related.

Maintenance Cost Analysis: A Maintenance Cost Model was also developed for this analysis (Appendix C). The Final Report will use this Maintenance Cost Model and the data available from Gonzalez's dry-dock selective restrictive availability (DSRA) as of 15

April 07. Although the final DSRA data will be incomplete until Gonzalez concludes the dry-docking availability in June 2007, it is felt that the DSRA contract award value, CSMP back-log and documented growth work (as of 15 April 07) will provide realistic data to support the Final Report in June 07. Final availability cost data is normally not available until 45 days after completion of the yard period. The current budget for the FY07 Gonzalez availability (approx \$9M) is typical for DDG dry-docking availabilities. It currently appears that total maintenance costs will be similar for Experiment and Control Group ships. However, it should be noted Gonzalez has not completed a DSRA or SRA since her Post Shakedown Availability; a period of almost ten years. Results for deployer and non-deployer maintenance cost analysis are summarized below:

- Gonzalez's maintenance costs over the SSI time period were typical of the Control Group ship Ross (during her June – November 2006 deployment) and other Comparison Group deployers.
- Average monthly voyage repair costs for Gonzalez were higher than those for both Ross and the Comparison Group ships. A majority of the voyage repair spending on Gonzalez occurred in the last twelve months of the deployment. Title 10, U.S. Code defines Voyage Repairs as emergency work necessary to enable a ship to continue its mission and that can be accomplished without a change to the ship's deployment schedule.
- EMRM spending on non-deployers Laboon and Stout was less than that for the Control Group ship The Sullivans, and similar to the All-DDG average.
- For the three non-deploying ships, Laboon, Stout and The Sullivans, the Regional Maintenance Center (RMC) expended less labor dollars on Laboon and more on Stout compared to The Sullivans. However, the dry-docking availability Stout completed during the analysis period accounts for the additional spending.

1b. "Maintenance procedures, impacts, and deficiencies, including the number and characterization of maintenance deficiencies, the extent of voyage repairs, post-deployment assessments of the material condition of the ships, and the extent to which work levels were maintained."

Response: Material condition had no overall impact on Experiment Group ships' operational capability when compared to Control Group ships. However, corrosion control issues were identified prior to Gonzalez departure, and the issues worsened over the course of Gonzalez extended deployment. Maintenance procedures did not vary between Experiment and Control Group ships. In particular, Gonzalez was subject to the same maintenance procedures as other DDGs deployed to 5th Fleet. Post-deployment assessments are not yet complete for Control Group ship Cole, which returned from 5th Fleet deployment in December 2006, consequently the results of Cole's post-deployment data analysis will be included in the Final Report.

Deploying Ship Comparisons: Gonzalez's material condition during her 18-month deployment was not negatively impacted by Sea Swap when compared to six-month deployments for a Comparison Group of DDGs for six material condition measures:

- Gonzalez reported a higher percentage of days C-1 or C-2³ for equipment in the Status of Resources and Training System (SORTS): 93% vs. an average of 84% for the Comparison Group.
- Gonzalez reported fewer mission degrading casualties, being free of C-3 or C-4⁴ CASREPS for more of the time: 82% vs. an average of 76% for the Comparison Group.
- Gonzalez averaged fewer significant work orders (2-Kilos)⁵ each month: 5.8/month vs. 9.8/month for the Comparison Group.
- Gonzalez's monthly average Maintenance Figure Of Merit (MFOM) was lower (better): 21.06 vs. an average of 29.71 for the Comparison Group.
- Critical Systems Assessment (CSA)⁶ results indicate no difference in material condition between Gonzalez and the Control Group ship Ross: the trends in number of deficiencies for each system and average score for each deficiency were similar (Table C1 in Appendix C provides more detailed information). CSA data from the Control Group ship Cole are not yet available and will be included in the Final Report.
- Gonzalez initiated an average of 202 new 2-Kilos per month, while the Comparison Group initiated an average of 275. Gonzalez monthly totals did trend upward through the first 15 months of the deployment, and trended downward during the final three months.
- Gonzalez averaged 69 C-2 CASREPS for each 6 month period, while Comparison Group ships averaged 49 during a standard 6 month deployment.
- Ten voyage repair jobs were conducted on Gonzalez over the course of her 18-month deployment, at a total cost of \$247,439. While part of Gonzalez's costs may be attributed to the extended deployment, conclusions cannot be drawn between Sea Swap and voyage repair costs without further analysis of extended deployment maintenance plans and the final maintenance data from Gonzalez' post-deployment availability.

Non-Deploying Ship Comparisons: No pattern of overall differences was found between the material condition of the non-deploying Experiment Group ships Laboon and Stout and that of the Control Ship The Sullivans. The work levels for non-deploying Experiment Group ships (Laboon and Stout) were lower than those for the non-deploying Control Group ship (The Sullivans). Details are provided in Appendix C.

³ A C-1 rating means no or very minor degradation to the piece of equipment or system, C-2 rating indicates only minor degradation, equipment or system is still operational

⁴ A C-3 rating means major degradation, but problem is solvable with parts or technical assistance, a C-4 rating indicates major degradation requiring depot level or in port repairs.

⁵ A significant 2-Kilo has the following characteristics: work is deemed essential or mandatory, and affected equipment is non-operational or operational in a reduced capacity

⁶ A CSA was conducted by the Board of Inspection and Survey (INSURV) on each of the six ships within 6 months of Gonzalez' deployment date, and again within 6 months of the return to homeport date. In addition, a CSA was conducted on Gonzalez just prior to both turnover dates. During each CSA the same 24 Systems were evaluated.

1c. "Mission training requirements."

Response: Sea Swap impacted the Integrated and Sustainment Phases of training prior to each crew's deployment, but did not impact overall Unit Level Phase training or post-deployment Sustainment Phase training. Regardless, the operational performance of the crews indicates the training was successful.

Comparison of the SSI Experiment Group crews' pre-deployment training to the ESG baseline training completed by Cole (as part of the Iwo Jima ESG) showed the following:

- Unit Level Phase training for the three Experiment Group crews was not noticeably different from that for the Control Group ship Cole.
- The first Experiment Group crew completed typical ESG Integrated and Sustainment Phase training and certifications as a part of the Kearsarge ESG.
- The second and third Experiment Group crews completed atypical ESG Integrated and Sustainment Phase training, and did not receive the typical certifications (Major Combat Operations (MCO) Surge Ready and MCO Ready) before deploying to the 5th Fleet AOR.

The differences in the second and third Experiment Group crews' Integrated and Sustainment Phase training (and lack of related certifications) occurred because these crews were not assigned to a specific CSG or ESG during pre-deployment training. Both crews did participate in a mix of CSG and ESG training as available.

1d. "Professional development requirements and opportunities."

Response: Sea Swap did not impact enlisted or officer individual qualifications or the enlisted advancement exam results.

Statistical testing showed no significant difference between Experiment and Control Group crews in the number of individual qualifications completed monthly for Enlisted Surface Warfare Specialist, Surface Warfare Officer, Officer of the Deck Underway, Officer of the Deck Inport, Engineering Officer of the Watch, Tactical Action Officer, and Combat Systems Officer of the Watch for the time period March 2005 through September 2006.

Statistical testing of the number of enlisted personnel that passed or failed the enlisted advancement exam for each rank indicated no significant difference between Experiment and Control Group crew results.

1e. "Liberty port of call opportunities."

Response: The two-day difference in total deployment port visit days between the Experiment and Comparison Group crews was not significant given the wide variability in port visit opportunities in the 5th Fleet AOR. Note that Experiment Group crews were given a five-day training/liberty port visit in Rota, Spain enroute the 5th Fleet AOR in lieu of the one or two Mediterranean Sea port visits typically scheduled for transiting ships. The average number of days in port for both Groups is shown in Table 2.

Table 2

Experiment Group	10.7	19.3	30.0
Typical LANTFLT DDG	14.6	17.5	32.1

In addition, a "Quick Poll" was designed to gather data for comparing Experiment and Control Group crew morale at several points during the SSI. One question asked about the effect "Amount of time off (e.g., leave, liberty, other)" had on morale. The first three Quick Polls (QPs) showed no significant differences between Experiment and Control Group crew responses. However, the Experiment Group reported that the amount of time off had a significantly more positive effect on morale in the fourth QP, given after Gonzalez returned from deployment.

1f. "Movement and transportation of crew."

Response: Gonzalez was manned by crews from the three Experiment Group ships during her 18-month deployment to the 5th Fleet. Each rotating crew sent an Advance Party of approximately 20 personnel to initiate turnover procedures. The Control Group ships did not rotate crews and were not required to transport personnel between hulls.

Movement and transportation of the Experiment Group crews was coordinated by a designated representative from the Commander, Naval Surface Force U.S. Atlantic Fleet staff (CNSL N41). Costs associated with moving and transporting crews are reflected in the cost models shown in Appendix B. Logistics arrangements included:

- Navy Air Logistics Office (NALO) aircraft were used for the first turnover in Jebel Ali, Dubai in September 2005. Three aircraft were required to transport all personnel and cargo due to aircraft size and availability, resulting in some transportation delays.
- A single wide-body MD-11 commercial aircraft was contracted through U.S. Transportation Command for the second turnover in Manama, Bahrain in February 2006. This approach was more efficient than using multiple Navy aircraft since it allowed the entire crew to travel together and reduced scheduling conflicts.
- Crews were berthed in the Bachelor Officer/Enlisted Quarters in Rota, Spain during training/liberty port visits. Crews stayed in hotels during the turnover period in each turnover city. Bus transportation was provided for movement of personnel between the hotels and Gonzalez. Crews were fed on the pier in a contracted dining facility during the turnover to allow them to secure and clean the galley and complete transferring food service accountability.
- Regional Support Organization (RSO) Norfolk assumed a caretaker role for each non-deploying Sea Swap ship in Norfolk, VA during crew swaps in 5th Fleet. RSO developed detailed check-off lists for both assuming command of the hull and then turning it over to the returning crew. RSO staff personnel, returning Advance Party crew members, and personnel from other ships, manned the hull and provided security during the caretaker period. RSO also coordinated the welcome home events to greet each returning crew.

1g. "Inventory and property accountability."

Response: Transfer of accountability during crew rotations followed normal procedures established for the type of material/operation and the degree of oversight required for each type of material or operation.

Primary guidance is provided by Commander Naval Surface Force Instruction 5440.1 which provides detailed instructions for maintaining accountability during exchanges of command. This instruction recognizes the unique aspects of Sea Swap and Multi-Crewing and incorporates specific requirements to ensure accountability is maintained.

RSO Norfolk established detailed check-off lists for assuming caretaker responsibility of the non-deploying Sea Swap ship to ensure accountability was maintained during the caretaker period. Standard procedures were followed between crews during deployed turnovers.

Two investigations pertaining to inventory and property accountability during the FFC DDG SSI were completed by RSO Norfolk in accordance with Chapter II of the Manual of the Judge Advocate General (JAGMAN) and forwarded to CNSL. Both investigations revealed that the loss of accountability or inventory was due to personnel errors rather than the Sea Swap Initiative.

1h. "Policies and procedures for assigning billets for rotating crews."

Response: Assignment of personnel to the rotating crews of the three Experiment Group ships followed normal procedures and manning criteria. Chief of Navy Personnel (CNP) did not change assignment procedures for Experiment Group crews. A unique Unit Identification Code (UIC) was established for each Experiment Group crew to assist in personnel transfers and billet assignments as well as to track and measure crew-specific data (i.e. reenlistment, training, advancement, etc.) as the crews rotated between hulls. These unique UICs were disestablished December 1, 2006.

1i. "Crew retention [reenlistment] statistics."

Response: Reenlistment data were used for this analysis because the Navy started reporting reenlistment rather than retention rates starting in October 2001. Experiment Group reenlistment trends were mixed compared to the Control Group and a Comparison Group of All LANTFLT DDGs. Analysis results are summarized below:

- Zone A (0-6 years service): Both Control and Experiment Groups had decreasing reenlistment trends compared to an increasing reenlistment trend for LANTFLT DDGs.
- Zone B (6-10 years service): All Groups had a decreasing reenlistment trend.
- Zone C (10-14 years service): The Control Group had an increasing reenlistment trend while the Experimental and LANTFLT DDG groups had a decreasing reenlistment trends (see Appendix D for more detail).

The Experiment Group exhibited a decreasing reenlistment trend in all three Zones during the period of the FFC DDG SSI. A mitigating factor that may have impacted these

results is that the number of crew members at End of Active Obligated Service (EAOS) in Zones B and C for any given 12 month period is small (3-8). It will be difficult to determine if the observed differences between Experiment and Control Groups are attributable to Sea Swap until longer-term data are available.

The four Quick Polls included three questions related to retention intentions, all drawn from the 2005 Navy-wide Personnel Survey. No statistically significant difference in retention intentions was found between Experiment and Control Group crews for any of the four Quick Polls administered during the DDG SSI.

1j. "Readiness and mission capability data."

Response: Gonzalez's overall readiness was significantly higher than that of a Comparison Group of DDGs deploying to the 5th Fleet AOR. Mission tasking and capability were similar for Gonzalez and Comparison Group ships.

Readiness and mission capability data were drawn from operations summaries, 5th Fleet AOR mission tasking, SORTS, and Operational Commander Survey questions. Analysis results indicate:

- Gonzalez's readiness during deployment as measured by overall C-ratings was significantly higher than that of seven Comparison Group DDGs (both ESG and CSG DDGs were included in this analysis).
- Gonzalez's overall tasking in the 5th Fleet AOR was similar to that of Comparison Group ships.
- Gonzalez crews were rated average or above in all areas compared to typical DDGs by Operational Commanders.

Results from Surveys

2. "Results from surveys administered or focus groups held to obtain representative views from commanding officers, officers, and enlisted members on the effects of rotational crew experiments on quality of life, training, professional development, maintenance, mission effectiveness, and other issues."

Analysis Approach: Surveys and group discussions were used to collect data in three major areas: Morale and Quality of Life (QoL), Operational Effectiveness, and Lessons Learned/crew rotation issues.

Two well-established Navy survey instruments were used to assess Morale and QoL: A Quick Poll (QP) comprised of questions derived from the Chief of Naval Personnel (CNP) and Navy Personnel Research, Studies and Technology (NPRST) Navy-wide Personnel Survey, and three sections of the Defense Equal Opportunity Management Institute Organizational Climate Survey (DEOCS). These surveys were administered to

all six Experiment and Control Group crews four times, and a fifth post-deployment QP was given to the two Control Group ships (Ross and Cole) in January 2007. The Organizational Climate Survey was given to all six ships in September 2005 and again in October 2006.

Operational Commander Surveys were administered for each deploying crew to staffs in Gonzalez's 5th Fleet operational chain of command. Operational Commanders were asked to compare mission capability and operational effectiveness of Experiment Group crews embarked in Gonzalez with other "typical" deployed DDGs.

Group discussion sessions were held at several levels of command for each Experiment Group crew soon after returning from deployment. These discussions were focused on deriving operational Sea Swap Lessons Learned, but additional questions addressed other crew-rotation areas. Each crew was also given an opportunity to raise their own issues. Similar discussions were held with CNSL and RSO Norfolk staff.

2a. "... effects ... [on] quality of life"

Response: No consistent pattern of statistically significant differences was found between Experiment and Control Group crews for Quick Poll questions in the areas of Navy Workplace Morale, Leadership, Navy Image and Tone, Job Satisfaction, or Workload for any of the four QPs. Organizational Climate Survey analysis showed similar results: no significant differences between Experiment and Control Group crews in Commitment to the Organization, Perceived Work Group Effectiveness or Job Satisfaction.

Some differences were found in the areas of Shipboard Life and Command Leadership, but they were not consistent among crews in each Group, nor were any trends identified across time for either Experiment or Control Group crews.

2b. "... effects ... [on] training"

Response: During group meetings to develop Lessons Learned, several crew members reported the need for additional training for enlisted operators or technicians created by equipment configuration differences between Experiment Group ships. The impact of these differences was reported to be minor, and in each case the crew sought out and completed formal or informal training to resolve the deficiency prior to deployment. Crews did not report any issues concerning Unit Level, Integrated, or Sustainment Phase training.

2c. "... effects ... [on] professional development"

Response: During group meetings to develop Lessons Learned, members of each crew reported that Sea Swap turnover preparations created additional workload that limited a crewmember's time to pursue individual qualifications for professional development. However, statistical analysis of the number of qualifications completed by the Experiment and Control Groups showed no significant difference. In addition, results of a QP question about the average number of hours worked each week did not support the crew member's perception of increased workload.

2d. "... effects ... [on] maintenance"

Response: None of the crews reported a significant Sea Swap impact on any system when asked about material condition. Dissatisfaction was expressed with the availability of some spare parts and supplies during the 18-month deployment.

During Lessons Learned group meetings, crews consistently reported dissatisfaction with the availability of some spare parts and supplies. Comparison of QP responses between Experiment and Control Group crews showed no significant difference on any of the three questions about spare parts and supplies at the beginning of the SSI. However, Experiment Group crews were significantly less satisfied than the Control Group in the second, third and fourth QPs (at about 7-months, 12-months, and after Gonzalez' deployment). Satisfaction with the availability of spare parts and supplies trended downward for Experiment Group crews as the SSI progressed, while Control Group satisfaction did not change over time. Note that none of the Control Group ships was deployed for any of the first four polls. Two Control ships, Cole and Ross, were surveyed again in January 2007, following their 6-month deployment to 5th FLT. Analysis of this data was not available for incorporation in this response, but will be included in the Final Report.

It was noted that factors other than Sea Swap could have caused these differences – for example, the lack of normal logistics hubs to support Gonzalez during operations off the Horn of Africa, or the unavailability of some resupply items in Bahrain (ships can carry only a 6-month supply of items such as Freon, special lube oils and NiCu piping).

2e. "... effects ... [on] mission effectiveness"

Response: Results of the Operational Commander Survey indicated that Gonzalez's mission effectiveness was the same as other "typical" DDGs deployed to 5th Fleet. More detail is provided in the response to Section 5 of this Report.

Group interviews of each Experiment Group crew indicated they felt they were effective even without the usual time to prepare during the transit to the 5th Fleet AOR .

2f. "... effects ... [on] other issues."

Response: During group meetings to develop Lessons Learned, Commanding Officers, crew members and the RSO Norfolk staff indicated that Sea Swap was not "business as usual." All suggested that additional management and oversight is needed to implement and execute Sea Swap effectively and to minimize the impact of crew rotation on Sailors. Crews also agreed that ship "Ownership" was not a Sea Swap issue. Analysis of QP results showed no significant difference between Experiment and Control Group responses in any QoL or Morale-related area.

- "Ownership:" Experiment Group crews were aware that ship Ownership issues often were associated with Sea Swap, and each discussion group initiated a discussion of Ownership issues. All agreed that problems often attributed to Ownership should instead have been attributed to problems in Leadership. They emphasized that in effect, Leadership trumped Ownership.

- **Workload:** Results for the first QP (near the beginning of the SSI) showed that the Experiment Group worked significantly fewer hours, while the other three QPs (at approximately the 7-month, 12-month, and 18-month points) showed no significant differences in hours worked between Experiment and Control Group crews.
- Experiment and Control Group responses compared for 11 questions related to Job Satisfaction and Navy Image and Tone showed no significant differences between groups on any question for any of the four QPs.

Standard Policies and Procedures Development

3. “The extent to which standard policies and procedures were developed and used for participating ships.”

Response: Standard policies were developed at various levels to support the SSI.

Commander Naval Surface Forces Instruction 5440.1 was revised after the West Coast DD/DDG Sea Swap Proof of Concept in order to incorporate Lessons Learned and promulgate procedures required for multi-crewing Change of Commands. RSO Norfolk expanded these checklists and issued the expanded checklists to Sea Swap crews as an RSO Norfolk Notice. In addition, RSO Norfolk developed policies and procedures to guide staff and ship’s force assigned to caretaker duties on Laboon and Stout during crew turnovers.

CNSL developed a Concept of Operations (CONOPS) to guide the staff and other organizations that supported the FFC DDG Sea Swap Initiative.

The Sea Swap crews developed and shared detailed Plan of Actions and Milestones (POAMs) and turnover notebooks to support crew turnover preparation and execution.

Lessons Learned

4. “Lessons Learned from the experiment.”

Response: Fifty comprehensive Lessons Learned were developed using input from the ships, supporting staffs, and the SSI Analysis Team⁷. CNSL submitted 26 of the Lessons Learned that would be useful to future crew rotation efforts to the Navy Lessons Learned System (NLLS).

A key tenet of the data collection and analysis effort was to develop a structured process to capture, disseminate, and archive Lessons Learned. Inputs were captured from individual interviews, group meetings, trip reports, and record message traffic each DDG crew provided to RSO. All message traffic was also provided to each crew and incorporated into a cycle of learning to provide immediate feedback to all crews.

⁷ CNSL hired a contractor to support the SSI data collection, analysis, and Lessons Learned effort.

Lessons Learned were derived and written for three audiences: 1) The next FFC DDG SSI crew preparing for deployment; 2) CNSL, RSO and other staffs revising and developing future CONOPS and policies; and 3) Future users of the NLLS. The results of this process are summarized below:

- Reviewed 111 inputs
- Combined, expanded, and coordinated staff review of inputs to develop 50 comprehensive Lessons Learned
- Submitted 26 formal Lessons Learned to NLLS.

Combatant Commander Assessment

5. “An assessment from the combatant commanders on the crew mission performance when deployed.”

Response: Operational Commanders reported that Gonzalez’s operational performance was similar to other “typical” DDGs deploying to 5th Fleet. Input from ten Operational Commanders that observed Gonzalez’s performance showed that Experiment Group crews were:

- “Average” or above for mission areas observed
- “Better than Average” or above in Strike Group Integration and Good Will/Naval Engagement
- “Better than Average” or above in Surface Warfare.

Operational Commander Surveys were administered after each Gonzalez crew returned from deployment. Surveys covered 14 mission areas, Strike Group Integration performance, and performance as goodwill ambassadors. Commanders rated Gonzalez in each area and were given the opportunity to add comments to amplify each rating.

Fleet Forces Command Assessment

6. “An assessment from the commander of the Fleet Forces Command on the material condition, maintenance, and crew training of each participating ship.”

6a. “... material condition”

Response: Using the Gonzalez post deployment Critical System Assessment (CSA) in October 2006 as a reference point, the material condition of the Experiment and the Control Group ships were similar. However, the full assessment of Gonzalez material condition will include review and assessment of her post deployment maintenance availability scheduled to begin March 2007. These results will be included in the final report.

6b. "... maintenance"

Response: We are awaiting the final assessment and report in June 2007, but would expect the scope of Gonzalez post deployment availability to be greater due to the duration between CNO availabilities.⁸

6c. "... crew training"

Response: Operational Commander Surveys indicated that Sea Swap crews performed as well or better than other DDG crews deployed to 5th Fleet. However, to execute enduring training for Sea Swap we learned that there is an extensive training tail involving shore infrastructure, training facilities, and platform configuration differences that have unanticipated cost associated in dollars and readiness.

Way ahead: No additional Sea Swap Initiatives are currently planned. The FFC DDG Sea Swap Initiative has provided valuable insights into this 3-ship/3-crew multi-crewing alternative. The numerous lessons learned captured during the SSI will be incorporated into future multi-crewing concepts, and will specifically benefit the Littoral Combat Ship (LCS) as it is introduced into the fleet and we use multi-crewing in LCS to derive maximum operational availability, forward presence, and warfighting capability for the investment.

⁸ Gonzalez last CNO availability occurred at her Post Shakedown Availability (PSA) in October 1997. De-scoped Restricted Availabilities (RAV) executed in 1999, 2001, 2003, and 2005.

Secretary of the Navy Recommendations

7. “Any recommendations of the Secretary of the Navy with respect to the extension of the ship rotational crew experiment or the implementation of the experiment for other surface vessels.”

Response: The Navy will complete the data collection and analysis on the FFC DDG Sea Swap Initiative as a component of evaluating the effectiveness of various multi-crewing alternatives. Analysis of multi-crewing alternatives is done with the expectation of fully understanding the implications of these crewing options before adopting any as a permanent component of the ship manning plan. Multi-crewing is not new to the Navy. In addition to the West Coast DD/DDG Sea Swap Proof of Concept and the recently completed FFC DDG Sea Swap Initiative, multi-crewing has been employed on Submarines, High Speed Vessels (HSV), Mine Counter-Measure (MCM) ships and Patrol Coastal (PC) ships for a number of years. Navy’s new Littoral Combat Ship (LCS) will incorporate a Blue/Gold (similar to subs and HSV) multi-crewing manning concept. No additional Sea Swap Initiatives are currently planned. However, the Sea Swap multi-crewing concept is executable and works extremely well for ships with high demand but low numbers and most especially in the case of “sun-setting” a particular class of ships.

As the impact of new technology, ship design and changing missions confront the Department, along with existing capability gaps and the need to close those gaps, Navy will continue to develop transformational ways of manning, training and operating its forces in order to meet Combatant Commander operational mission requirements.

Appendix A

FFC DDG Sea Swap Operations Model

The Traditional model for deploying ESGs to 5th Fleet is shown at the top of Figure A1. LANTFLT and PACFLT typically alternate ESG deployments to 5th Fleet, providing continuous presence. The average transit duration for LANTFLT ESGs is 28 days, including embarking and disembarking Marines and one or two transit port calls in the Mediterranean Sea. The average transit for PACFLT ESGs is 45 days, also including embarking/disembarking Marines and two enroute port calls. Assuming deployment lengths of 180 days, LANTFLT ESGs provide an average of 124 days of 5th Fleet presence, while PACFLT ESGs provide an average of 90 days of 5th Fleet presence. The four-ESG rotation shown in Figure A1 provides an average total of 428 days presence, requiring 4.2 ships/crews.

The FFC DDG Sea Swap Initiative concept is shown in the lower part of Figure A1. Gonzalez with the three Experiment Group crews provided a real-world total of 456 5th Fleet presence days. Crew Lima was deployed for a total of 184 days, Crew Sierra for 171 days, and Crew Golf for 188 days. Typical Sea Swap deployment lengths of 180 days would provide an average total of 452 days of 5th Fleet presence.

Comparing total 5th Fleet presence days for the two models, it would take 4.2 ships and crews using the Traditional concept to equal the average presence provided by three Sea Swap crews deploying on a single ship. If the Traditional model started with a PACFLT ESG deployment rather one from LANTFLT, it would take 4.3 ships (because PACFLT presence is less than LANTFLT presence for each ship).

Note that these results could be slightly different for CSGs because their transits typically are shorter than ESG transits.

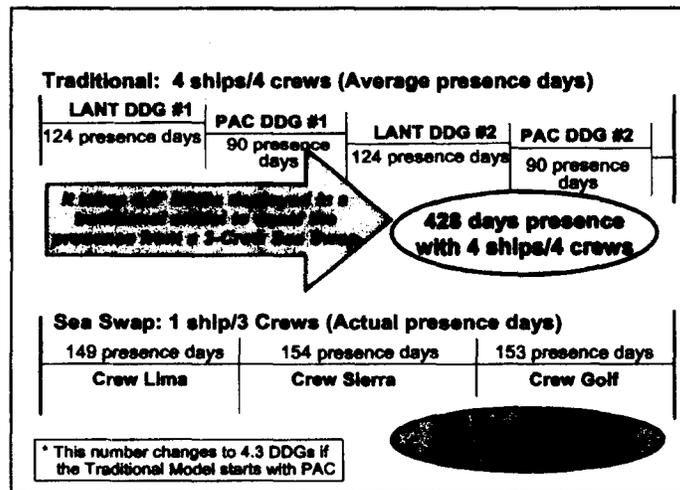

Figure A1. FFC DDG SSI and Traditional Models for ESGs Deploying to the 5th Fleet AOR

Appendix B

Operations Cost Model and Cost Comparison

Figure B1 depicts the basic cost model developed to evaluate the cost-effectiveness of the FFC DDG Sea Swap Initiative. This model was used to analyze three scenarios: actual costs, average costs and projected costs. The cost models discussed here are designed to compare costs for Sea Swap and Traditional crew rotation deployments for supporting ESGs deployed to the 5th Fleet AOR. These models are based on the operations models discussed Appendix A. These models are **marginal** rather than **total** cost models in that they assume that a significant part of the costs of training and deploying forces to the 5th Fleet AOR are the same for both crewing concepts. For example, costs are assumed to be the same for most pre-deployment training events. Therefore, only **difference** training costs for Sea Swap are considered to be part of the cost of Sea Swap for this analysis

The basic operations cost categories that were considered for comparing Sea Swap to Traditional crewing concepts include:

- Transit costs, including fuel, transit port visits, and Suez Canal transit fees
- Difference training costs, which are Unit Level Phase training events required because of configuration differences among the three Experiment Group ships. We are assuming that the general costs for Unit Level, Integrated and Sustainment Phase training are the same for all DDG crews.
- Crew Swap costs (only for Sea Swap), which include:
 - Travel, meals and lodging for crew members traveling to and from Sea Swap City, and meal and hotel costs in Sea Swap City (includes both Advance Party and the remainder of the crew)
 - Ship port costs in Sea Swap City
 - Fuel costs for transiting to and from Sea Swap City.

Traditional Operations Cost Model

$$\text{Cost}_{\text{TRAD}} = \Sigma \text{Fuel}_{\text{Transit}} + \text{Suez Fees} + \text{Port Visits}$$

SSI Ops Cost Model

$$\text{Cost}_{\text{SSI}} = \Sigma \text{Fuel}_{\text{Transit}} + \text{Suez Fees} + \text{Dif Training} + \text{Travel} \\ (\text{AP} + \text{Crew}) + \text{SS City Port Costs}$$

Figure B1. Basic Operations Cost Model

Table B1 provides a cost comparison for the Actual, Average and Projected Cost Models:

Table B1

Cost Category	Actual Cost Model		Average Cost Model		Projected Cost Model ²	
	Gonzalez	Traditional	ESG DDG	Traditional	ESG DDG	Traditional
Transit Fuel	\$2,739 ³	\$14,439	\$2,098	\$14,439	\$2,915	\$16,283
Ship Transit Port Visits	\$198	\$1,040	\$223	\$1,040	\$232	\$1,082
Suez Canal Fee ⁴	\$330	\$660	\$330	\$660	\$343	\$686
Crew Swap Transportation ⁵	\$1,822	\$0	\$2,648 ⁶	\$0	\$2,754	\$0
Crew Swap Transit Port Visit (Rota) ⁷	\$220	\$0	\$106	\$0	\$110	\$0
SSC City Hotel/Meals ⁸	\$675	\$0	\$675	\$0	\$702	\$0
SSC Port Visit Costs ⁹	\$146	\$0	\$146	\$0	\$152	\$0
Turnover Transit Fuel	\$120	\$0	\$107	\$0	\$107	\$0
Difference Training	\$100	\$0	\$100	\$0	\$104	\$0
Totals	\$6,350	\$16,139	\$6,433	\$16,139	\$7,419	\$18,051
Difference (SSI - Traditional)		-\$9,789		-\$9,706		-\$10,632

Transit fuel costs reflect DDGs deploying with ESGs. Costs would most likely differ due to higher transit speeds for DDGs deploying with CSGs.

¹ All cost shown in thousands

² Projected Costs Model is based on Average Ops Model, current fuel price (\$96.18/bbl) and 4% inflation for other costs.

³ Actual fuel consumption is greater than Average due to GON transit back to Lebanon vicinity for real-world NEO Operations after Med port visit enroute to return to homeport

⁴ Costs provided by CNSL N413

⁵ Costs provided by CNSL N41

⁶ Higher cost reflects flying crews via commercial air to/from SSC via liberty/training port visits each way in Rota, Spain (first TOVR used multiple Navy air assets resulting in some scheduling conflicts and delays)

⁷ Costs provided by CNSL N41

⁸ Costs provided by CNSL N41

⁹ Costs obtained from NAVSUP Cost Reporting, Analysis, and Forecasting Tool (CRAFT) Database

Appendix C

Maintenance Data and Cost Model

Material Condition Data

Maintenance data for Gonzalez must be evaluated separately from non-deployer Experiment Group ships Laboon and Stout. Gonzalez extended deployment necessitated comparing Gonzalez maintenance data to that of other recent DDG deployers and Control Group deployers Ross and Cole. However, due to Ross and Cole's return from deployment in November and December 2006, maintenance data analysis was not complete as of this report.

The results of analyzing material condition data for several measures are summarized in Tables C1 through C4.

Table C1

Gonzalez	9	5	10
Control Group (Ross)	9	1	14

Table C2 (Non-Deployers)

Laboon	89.97%
Stout	92.48%
The Sullivans	92.32%

Table C3

Laboon	7.17
Stout	7.13
Control Group	7.44

Table C4 (Non-Deployers)

Laboon	7	11	6
Stout	7	8	9
The Sullivans	10	4	10

¹ Critical System Assessment (CSA): INSURV evaluated 24 shipboard systems and assigned each system an Equipment Operating Condition (EOC) score. The table categorizes the number of systems out of the 24 systems evaluated. This table displays the trend between the initial CSA scores for both Gonzalez and Ross, and their respective post-deployment CSAs.

Non-Deploying Ship Material Condition

The material condition of non-deploying Sea Swap ships (Laboon and Stout) did not differ significantly from that of the non-deployed Control Group ship (The Sullivans). A summary of results for several material condition indicators is shown below. This summary was derived from detailed analysis of data for Stout and Laboon compared to The Sullivans.

- SORTS equipment ratings indicated Laboon's material condition was better than The Sullivans, while Stout's ratings were worse. Laboon reported more days of C-1 or C-2 SORTS ratings for equipment (92% vs. 83% for The Sullivans). It should be noted that Stout had a long-standing SONAR system casualty that existed prior to the start of Sea Swap. This casualty was not corrected until a depot level availability in June 2006. As a result, Stout reported C-1 or C-2 for fewer days than The Sullivans (50% vs. 83%).
- The percent of time free of C-3 and C-4 CASREPS indicated similar material conditions for all three non-deploying ships: Laboon and Stout were free of C-3 and C-4 CASREPS for about the same percent of time as The Sullivans (details are provided in Table C2 in Appendix C).
- The number of significant 2-Kilos indicated that material condition was similar for non-deploying Experiment and Control Group ships: The Sullivans' 2-Kilo data did not appear to be representative, so data for Ross and Cole during non-deployment periods were included in this analysis. The average number of significant 2-Kilos was similar for Experiment Group and Control Group ships during non-deployment periods. (Details are provided in Table C3 in Appendix C.)
- The average monthly Maintenance Figure of Merit (MFOM) indicated that The Sullivans' material condition was better: the average MFOM for Laboon and Stout (27.52) was higher (worse) than that for The Sullivans (24.18).
- CSA results are mixed and do not indicate a better material condition for any ship: Laboon and Stout had fewer improved systems, but also had fewer degraded systems (details are provided in Table C4 in Appendix C).

The maintenance work levels for Laboon and Stout were lower than the work levels for The Sullivans. Both Laboon and Stout had fewer C-2 CASREPS than did The Sullivans (data provided in Table C5). In addition, both Laboon and Stout, on average, opened fewer 2-Kilos each month than did The Sullivans (see Table C6).

Table C5

The Sullivans	184
Stout	138
Laboon	114

Table C6

The Sullivans	306.00
Stout	142.29
Laboon	139.67

Maintenance Cost Model

There are four areas of cost in the maintenance cost model:

1. The money the crew spends on maintenance and repair (EMRM)
2. The money the RMC spends on voyage repairs, Continuous Maintenance, and emergent repairs
3. The money spent in the post-deployment availability (DSRA)
4. The estimated cost to do repairs documented in 2-Kilos still open after the availability (backlog)

The cost model is these costs summed over the analysis time period, as shown in the equation below:

$$\text{Maintenance Cost} = \Sigma(\text{EMRM} + \text{RMC} + (\text{D})\text{SRA} + \text{Backlog});$$

Maintenance cost analysis of the deployed ship will be completed by calculating a maintenance cost for a comparison group of 4 traditional DDG deployers using average DDG costs and comparing that cost to the maintenance cost for Gonzalez.

Appendix D

Reenlistment Data

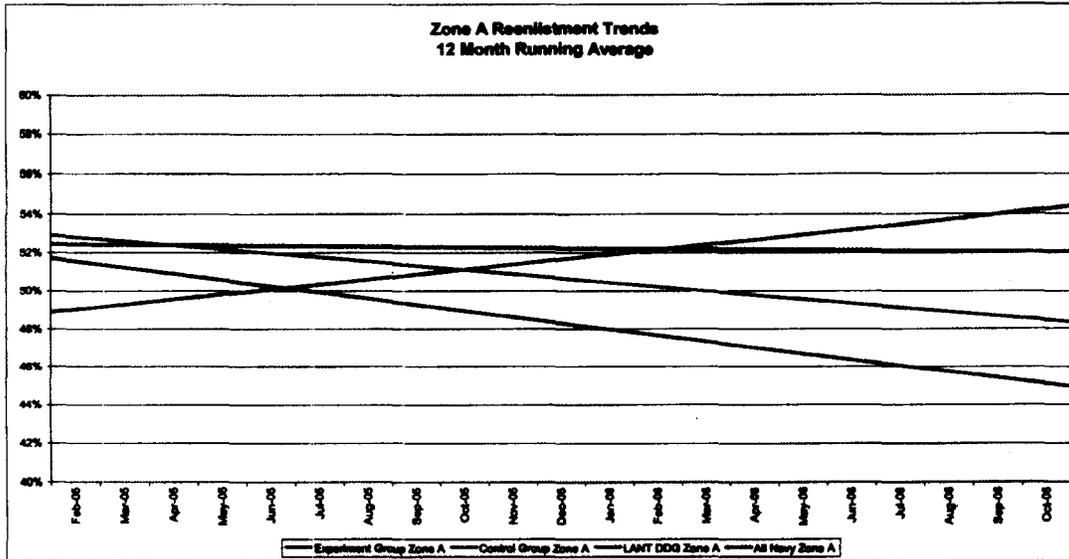

Figure D1. Zone A Reenlistment Trends

Note: Because the trend lines are closely grouped for Zone A in Figure D1, only a portion of the Y-axis scale is shown to make the chart easier to read.

As shown in Figure D1, the Zone A reenlistment rate for the LANT DDG group show a slightly positive trend with the average change equal to 0.26% per month. Both Experiment and Control Group averages show negative trends of -0.32% per month and -0.22% per month respectively. The average change per month is based on the slope of the trend lines.

Since May 2005 the Experiment Group 12-month running average has diverged from the other groups. However, no conclusion can be drawn until the data for the Control Group deployers are collected and analyzed in early 2007.

The trend lines were developed in Excel using the least squares mathematical optimization technique. This method identifies the line which most closely approximates the data ("best fit") by minimizing the sum of the squares of the ordinate (vertical) differences between points generated by the line equation and corresponding points in the data.

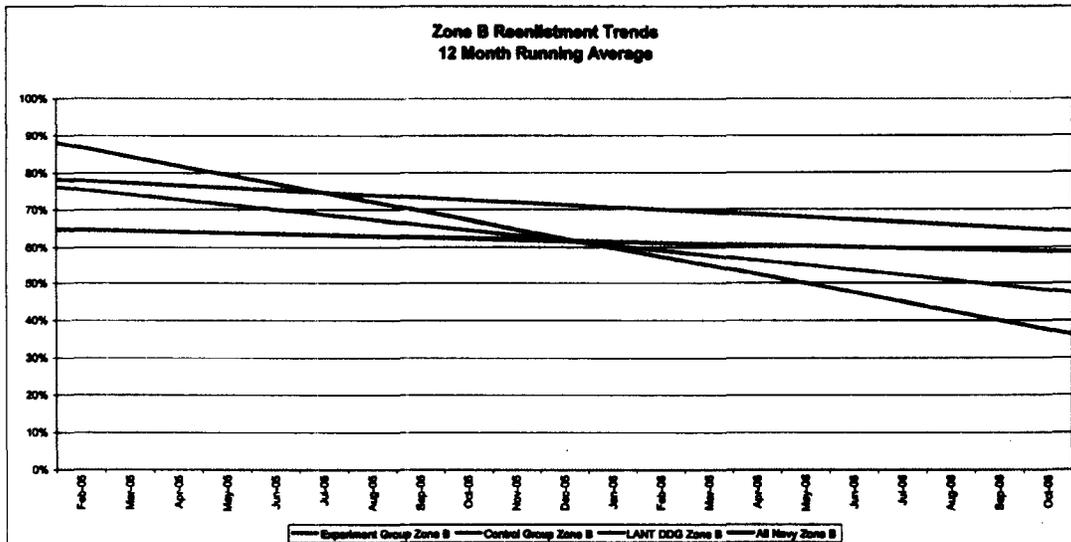

Figure D2. Zone B Reenlistment Trends

Each group in Zone B experienced a downward trend for the FFC DDG SSI time period as illustrated in Figure D2. As in Zone A, the All DDG group follows closely the All Navy group for Zone B.

Note that the Experiment Group started with the highest initial reenlistment rate (89.24%) and declined at a noticeably greater rate than both the LANT DDG and Control Groups.

Given the fact that the number of crew members at EAOS in Zone B for any given 12-month period is small (3-8), it is not clear whether the differences between the Experiment Group and the other groups are attributable to Sea Swap, or if they represent a short-term trend driven by small numbers that will regress to the mean at some later time.

No conclusion can be drawn about how Sea Swap impacts Zone B reenlistment until data for the Control Group deployers Ross and Cole are collected and analyzed.

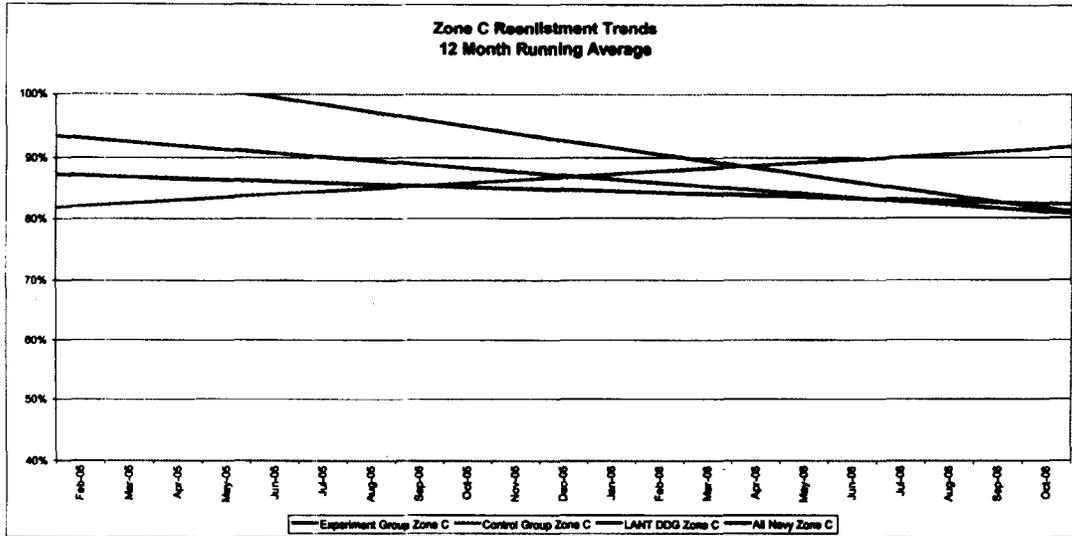

Figure D3. Zone C Reenlistment Trends

Based on the trend lines shown in Figure D3, both the LANT DDG and Experiment Groups experienced a decline in Zone C reenlistment rates with Experiment Group experiencing the greatest decline. Note that the Experiment group started with the highest 12 month running average (100%) and as of August 2006 had the lowest 12-month running average. In comparison, the Control Group experienced a positive trend (0.49% per month), starting below the initial All DDG 12-month running average of 93.07% and ending with the highest 12-month running average. As in zones A and B, the All DDG group closely followed the All Navy Group.

Despite the trend exhibited by the Experiment Group, it is not yet clear if Sea Swap has had an effect on Zone C reenlistment. Given the fact that the number of crew members at EAOS in Zone C for any given 12 month period is small (4-8), it is not clear yet that the differences between the Experiment Group and the other groups are attributable to Sea Swap, or if they represent a short-term trend driven by small numbers that will regress to the mean at some later time.

No conclusion can be drawn about how Sea Swap impacts Zone C reenlistment until data for the control group are collected and analyzed.

THE SECRETARY OF THE NAVY
WASHINGTON, D. C. 20350-1000

February 12, 2007

The Honorable Daniel K. Inouye
Chairman
Subcommittee on Defense
Committee on Appropriations
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

As directed by the conference report accompanying the Fiscal Year 2007 National Defense Authorization Act, the enclosed report provides information on accelerating VIRGINIA-Class submarine production to two ships per year beginning in Fiscal Year 2010.

In 2005, Navy determined that 48 attack submarines were required to meet future projected warfighting requirements. Navy's shipbuilding program of record identified in the Report to Congress on Annual Long-Range Plan for Construction of Naval Vessels for Fiscal Year 2007 (30-Year Shipbuilding Plan) allows the attack submarine force to drop below 48 from 2020-2033, reaching a low of 40 in 2028. Accelerating the VIRGINIA-Class build rate to two ships per year in Fiscal Year 2010, rather than 2012 as planned, would provide the Fleet two additional attack submarines and reduce the time that the Navy has less than 48 attack submarines from fourteen years to nine years. This acceleration would increase Navy ship construction costs by \$5.1 billion, almost ten percent, between Fiscal Years 2008-2011.

Navy's 30-Year Shipbuilding Plan creates the best balance between anticipated requirements and resources. While accelerating the build rate in 2010 would reduce some of the long-term risk associated with having less than 48 attack submarines, it would also create risk by destabilizing the shipbuilding plan. Navy has begun developing a series of mitigation strategies that could be used, if feasible, to reduce the risk to our operational commanders while the force is below 48 attack submarines.

A similar letter has been sent to Chairmen Levin, Skelton, and Murtha. If I can be of any further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Winter".

Report to Congress on
Accelerating VIRGINIA-Class Submarine
Construction

PREPARED BY:
Director, Submarine Warfare
Chief of Naval Operations, N87
2000 Navy Pentagon, Room 5C459
Washington, DC 20350-2000

February 2007

Requirement

The conference report (House Report 109-702) accompanying the John Warner National Defense Authorization Act for Fiscal Year 2007 (Public Law 109-364) contained the following requirement:

"Therefore, the conferees direct the Secretary [of the Navy] to submit a report to the congressional defense committees with the fiscal year 2008 budget request that would identify the necessary planning and programming required to increase *Virginia* class construction to 2 boats per year commencing in fiscal year 2010. The report shall consider program cost, shipyard workload impacts, budget implications, and other significant factors that would weigh in the decision process regarding acceleration of attack submarine construction. The report shall also identify the operational impact associated with delaying the increase in attack submarine construction until 2012 in accordance with the program of record."

This report is submitted to answer this requirement.

Background

In 2005, the Chief of Naval Operations determined that a force of about 313 ships, including 48 attack submarines, was necessary to meet future projected warfighting requirements. These requirements are indexed to the Department of Defense fiscal year 2020 threat assessments and are compliant with the 2006 Quadrennial Defense Review and Strategic Planning Guidance. The Navy's Report to Congress on Annual Long-Range Plan for Construction of Naval Vessels for FY 2007 (hereafter, the "30-Year Shipbuilding Plan") describes a shipbuilding plan that provides the Navy less than 48 attack submarines from 2020 through 2033, reaching a minimum of 40 attack submarines in 2028 and 2029.

The 30-Year Shipbuilding Plan calls for building one VIRGINIA-Class attack submarine per year until fiscal year 2012, when the planned build rate increases to two submarines per year. One method to reduce the duration and magnitude of the planned future attack submarine shortfall would be to increase the build rate (to two submarines per year) sooner than 2012. The earliest the build rate could be increased is fiscal year 2010, since the long-lead (two years) items required to build the additional submarines can be purchased no earlier than fiscal year 2008.

Program Cost

Increasing the VIRGINIA-Class construction rate to two submarines per year in fiscal year 2010 (vice fiscal year 2012 as planned) would require an additional \$5.1 billion be allocated to VIRGINIA-Class submarine construction in fiscal years 2008-2011. The specific adjustments required to the Shipbuilding and Conversion, Navy (SCN) program of record (as submitted in the President's Fiscal Year 2008 Budget request) are provided in the table below.

Programming Required for Accelerated VIRGINIA-Class Procurement
(Dollars in then-year billions, rounded to nearest tenth)

	FY 2008	FY 2009	FY 2010	FY 2011	Total FY 2008-11
VIRGINIA-Class Submarine	1.8	2.2	2.0	2.0	8.0
VIRGINIA-Class Submarine (AP-CY)*	0.7	1.2	1.7	1.7	5.3
Total	2.5	3.4	3.7	3.7	13.3

*Includes funds for advanced procurement of long-lead items and for large-lot procurement of materials and major government-furnished equipment to achieve EOQ savings under a multi-year procurement (MYP) contract.

	FY 2008	FY 2009	FY 2010	FY 2011	Total FY 2008-11
VIRGINIA-Class Submarine	-	-	1.9	1.7	3.6
VIRGINIA-Class Submarine (AP-CY)*	0.4	0.8	0.3	-	1.5
Total	0.4	0.8	2.2	1.7	5.1

	FY 2008	FY 2009	FY 2010	FY 2011	Total FY 2008-11
VIRGINIA-Class Submarine	1.8	2.2	3.9	3.7	11.6
VIRGINIA-Class Submarine (AP-CY)*	1.1	2.0	2.0	1.7	6.8
Total	2.9	4.2	5.9	5.4	18.4

This estimate assumes the submarines are purchased as part of a Multi-Year Procurement (MYP) contract with Economic Order Quantity (EOQ) for fiscal years 2009-2013. The VIRGINIA-Class Submarine Advanced Procurement-Current Year (AP-CY) funding line includes funds for advanced procurement of long-lead items and for large-lot procurement of materials and major government-furnished equipment to achieve EOQ savings under the MYP contract.

The Navy is pursuing cost savings via construction process improvements and design changes to allow two VIRGINIA-Class submarines to be built per year for a total cost of \$4 billion (in fiscal year 2005 dollars) per year in fiscal year 2012 (when the Navy plans to start procuring two submarines per year). (These efforts were described to Congress in the Navy's May 2006 Report on VIRGINIA-Class Submarine Technology Insertion to Lower Cost.) While some of these cost savings will be realized sooner and are factored into the above estimates, the Navy will not fully achieve this goal until fiscal year 2012.

Shipyard Workload Impact

Submarine shipyards can support production of two submarines per year in fiscal year 2010 without adversely impacting planned downstream delivery schedules or maintenance work. The shipyards will be able to leverage the efficiencies of a MYP contract with EOQ to meet the additional labor and facility needs within the funding estimates provided in the table above.

Budget Implications

The additional \$5.1 billion required to increase the VIRGINIA-Class submarine build rate to two submarines per year in fiscal year 2010 represents nearly one-tenth of the total shipbuilding funds the Navy has planned for new construction during fiscal years 2008-2011 (as reflected in the President's Fiscal Year 2008 Budget request). Reprogramming these funds within the President's Budget for accelerated VIRGINIA-Class submarine construction would force the Navy to significantly deviate from the 30-Year Shipbuilding Plan. This would upset the stability that the plan was establishing and result in unacceptable impacts to other Navy shipbuilding programs and their associated industrial facilities.

No changes were made in the President's Fiscal Year 2008 Budget request to the shipbuilding profiles presented in the President's Fiscal Year 2007 Budget. This has created stability

that allows industry to more efficiently project their requirements and reduce overall shipbuilding costs.

Operational Impact

The 30-Year Shipbuilding Plan contains some risk when the force level is less than 48 attack submarines. Accelerating the VIRGINIA-Class submarine build rate to two submarines per year in fiscal year 2010 provides two submarines sooner than planned (before 2020). This would reduce the time the fleet has less than 48 attack submarines from 14 years (2020-2033) to 9 years (2024-2032), and improve the lowest level to 42 attack submarines instead of 40.

The Navy considers the long-term risk contained in the 30-Year Shipbuilding Plan (as a result of having less than 48 attack submarines from 2020-2033) to be manageable as part of a stable shipbuilding plan that is properly balanced within anticipated resources. The Navy is pursuing mitigation strategies to reduce this risk that may be used while the force has less than 48 attack submarines. While accelerating the VIRGINIA-Class submarine build rate to two submarines per year in fiscal year 2010 would also mitigate some of this risk, re-programming the necessary funds would result in an unbalanced naval force. This would increase risk to unacceptable levels elsewhere by changing the capability mix outlined in the 30-Year Shipbuilding Plan.

Conclusion

The 30-Year Shipbuilding Plan is the best balance of anticipated resources to the Navy's force structure requirements. Having less than 48 attack submarines is not ideal, but the long-term risk incurred is manageable as part of a balanced, stable shipbuilding plan. Accelerating the VIRGINIA-Class submarine build rate from that in the 30-Year Shipbuilding Plan requires a sizeable re-programming of the Navy's resources. These resources are best used as recommended in the President's Fiscal Year 2008 Budget request to provide the Nation and the Navy what they need to meet national security requirements with an acceptable level of risk.

THE ASSISTANT SECRETARY OF THE NAVY
(Research, Development and Acquisition)
WASHINGTON, DC 20350-1000
MAR 08 2007

The Honorable Daniel K. Inouye
Chairman, Subcommittee on Defense
Committee on Appropriations
United States Senate
Washington, DC 20510-6028

Dear Mr. Chairman:

As directed by Section 1016 of the National Defense Authorization Act, Public Law 109-364, the enclosed provides the findings of an assessment of the naval vessel construction efficiencies and the effectiveness of special contractor incentives.

The Navy has made aggressive strides to improve the efficiencies of shipbuilding in recent years. These improvements are in the areas of design changes, production initiatives, and materials. In addition to the changes made to date, the Navy also has strategies for continuing to enhance efficiencies in the future through modularity, open architecture, Lean Six Sigma, and corporate purchasing initiatives. In order to foster these types of changes, the Navy has utilized both performance specifications and contracting incentives.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Levin, Skelton, and Murtha.

Sincerely,

A handwritten signature in black ink that reads "Delores M. Etter".

Delores M. Etter

REPORT TO CONGRESS

on

Assessments of Naval Vessel Construction Efficiencies and of
Effectiveness of Special Contractor Incentives

PREPARED BY

Deputy Assistant Secretary of the Navy
For Shipbuilding Programs
Office of the Assistant Secretary of the Navy
Research, Development, and Acquisition
1000 Navy Pentagon
Washington, D.C. 20350

March 2007

BACKGROUND

Section 1016 of the Fiscal Year 2007 National Defense Authorization Act, Public Law 109-364, directed the Secretary to submit a report to the congressional defense committees on the findings of naval vessel construction efficiencies and the effectiveness of special contractor incentives assessments. Specifically, the Senate requires the Secretary to identify construction inefficiencies; identify innovative design and production technologies, processes, and performance incentives that can reduce those inefficiencies; and detail actions to implement those processes and incentives. In addition, the Secretary is tasked with assessing the effectiveness of special incentives for investment by the contractor in facilities and process improvements. This assessment should include a description of the use of these incentives, the evaluation process for selecting projects, the progress made, and recommendations for legislation to enhance contract incentives.

SUMMARY OF NAVY ACTIONS

1. Continue Lean Six Sigma efforts, in the area of shipbuilding, to reduce construction inefficiencies
2. Continue the use of performance specifications to allow contractors to reduce design inefficiencies and costs
3. Implement Capital Expenditure (CAPEX) type incentives into future Navy shipbuilding contracts, as appropriate

DISCUSSION OF KEY FINDINGS

Construction Inefficiencies

In April 2006, the Navy released a Report to Congress addressing the "Assessment of the Efficiency of Naval Shipbuilding". That report addressed findings from an independent study on the cost effectiveness of the ship construction program. Because of the recency of that study, the Navy has not commissioned another independent study of shipbuilding efficiencies. However, when examining last year's conclusions, some of the same problems still exist. For instance, the Navy is still experiencing issues with the design for production and manpower inflexibility.

The Navy continues to face issues with densely packed ships. By densely packing the ship, the designers make it more difficult to produce the design, as more equipment and infrastructure must be sequenced for installation in the same limited space. This increases the production costs. Unfortunately, this lack of design for producibility is a challenge associated with our older designs, some of which are still in production (e.g., DDG 51). However, the Navy has recognized this problem and has moved towards incorporating producibility concerns into the newer designs. For instance, the DDG 1000 has a less dense design and is anticipated to show clear benefits in its producibility. This should eliminate some of the construction inefficiencies.

In terms of manpower inflexibility, the shipbuilders currently face union contracts that often do not allow multi-disciplinary teams or cross-training of employees. Because of these restrictions, additional manpower and training is often required on shipbuilding programs. Many of our shipbuilders also face issues associated with inexperienced labor or high turnover, which increases training costs and reduces productivity. Unfortunately, these issues are out of the direct control of the Navy.

Another construction inefficiency that was not covered in the last report, but has emerged on some of the more recent ships is out of sequence work. By performing work out of sequence, the shipbuilders' production time and cost are increased, as well as potentially causing rework. For instance, the Littoral Combat Ship (LCS) program has experienced cost overruns on LCS 1, partially due to an issue with incorrectly manufactured reduction gears. Because of a 27 week delay in receiving the corrected gears, the schedule and sequence of work on the remainder of the ship had to be altered. In another example, subsequent to Hurricane Katrina, the LHD 8 program experienced a significant loss of pre-manufactured materials and production facility capabilities, which introduced delays in replacing needed materials. Available materials were used to sustain production efforts, but in many cases, caused work to be performed out of sequence. This out of sequence work caused downstream delays and cost increases due to rework.

Design and Production Solutions to Reduce Inefficiencies

The Navy has implemented a number of design and production solutions to reduce the inefficiencies in our shipbuilding programs. In terms of materials and logistics, the Navy began a program to investigate improvement opportunities for contractor furnished equipment/government furnished equipment (CFE/GFE). The program was designed to eliminate duplicate inspection processes, reduce cycle times, and reduce rework. Similarly, a common parts catalog has been established, which will improve inventory control and reduce the number of unique items. Program Executive Office (PEO) (Ships) used a Lean Six Sigma processes to reduce the materials used in the fleet introduction process and streamline their outfitting inventory management.

There are a number of design solutions that have been implemented to reduce inefficiencies. All PEOs use an Integrated Data Environment (IDE) as a repository for all ship drawings. This facilitates common designs, common parts, and configuration management. Similarly, a streamlined change control process has been instituted across ships programs to reduce the cycle time for essential changes. Also, the design teams have implemented Lean designs on ships. For instance, the Navy has reduced redundant structural brackets through efforts with the American Bureau of Shipping. They have also been able to replace hydraulic motors with cheaper and simpler magnet motors on weapon stowage and handling systems.

Production activities have also been targeted for cost reductions. A number of Lean Six Sigma events were carried out to reduce the time and manpower needs for production tasks. In terms of large production activities, many of the shipyards continue to improve their modular construction capabilities and to construct items as "Mega" or "Super" units.

These improvements allow more efficient construction and outfitting of the units prior to assembly.

Several Navy programs have utilized Lean Six Sigma events to reduce cycle times, improve productivity, and reduce costs. Some examples include: 1) Pipe fabrication investments to improve quality and productivity; 2) Changing the Grandblocking strategy to reduce assembly and outfitting times; 3) Eliminating unnecessary steps in hydrostatic testing; and 4) Switching to reduced-cure-time paints. As an example of a certification improvement, the VIRGINIA Class Submarine program used Lean Six Sigma to develop a new certification process for the Fly-By-Wire Ship Control System, which eliminates variation and waste from the process. All of these activities reduce costs and time associated with production and modernization.

Actions to Implement – Performance Specifications

There are two major ways that the Navy has been trying to foster design efficiencies. The first is through performance specifications and the other is through contracting strategies. The Navy has moved away from standards to design specifications. This allows the contractor to meet requirements with increased “trade space”, enabling continuous competition and exploitation of commercial techniques, materials, and designs.

The Navy is also exploring a common specification for future ships. Common specifications and common parts catalogues must be used in the earliest stages of ship design. Though the greatest opportunities for invoking standard specifications are in future Navy ship designs, more near term economies are achievable through the implementation of common GFE ordering systems across shipyards. Contracting methods currently exist to group material orders across contracts, though in many cases the use of uncommon parts impedes the greatest economies.

With more than three-dozen new construction ships under contract, the potential also exists to reduce material procurement costs within and across shipyards. For instance, Northrop Grumman has begun to consolidate steel purchases across projects. Across shipyards, the use of cross-corporate purchasing procedures is possible and would not prevent the corporations from complying with the requirement of the Truth in Negotiations Act. Rather, one could allow specified exclusions from the certificate, and then require another certificate at the time of agreement on price for the corporate buys. In other words, the price would still be certified as accurate, current, and complete, except for those items specifically excluded, and then later certified for the remaining costs associated with the bulk buy.

Actions to Implement – Special Contract Incentives for Investment

The second area of emphasis is contracting strategies. As mentioned in last year’s report, one of the major areas that American shipyards lag behind International yards is in the disciplines addressed through capital investments into improved processes and

infrastructure. Although this is not typically an area that invites significant government involvement, the Navy has found a means to motivate the shipbuilders to enhance their facilities. This deficiency is addressed through contract incentives.

There are two main contracting incentive vehicles that the Navy has used recently to improve the infrastructure of the shipbuilders. The first is the specialized case related to Hurricane Katrina, in which the Navy has special authority to pay for infrastructure improvements in Gulf Coast Shipyards. The second, more traditional, means of motivating shipbuilders is through specific contract incentives.

The Katrina related improvements are authorized via Public Law 109-234. This law provides not less than \$140 Million for improvements to the Gulf Coast shipyards that have existing Navy shipbuilding contracts and were damaged by Hurricane Katrina. While these funds were, in part, designated to expedite the repair of damaged facilities, they were also designated for improvements to the facilities which would result in future cost savings. To execute this funding, NAVSEA requested proposals which were evaluated by a review team for the business case, measurable return on investment, technical merit, and strategic fit. The Navy has selected eight of the proposed projects to be awarded.

Since the Navy requires special regulatory relief to directly fund shipbuilding capitalization projects, contract incentives are more typically used as a means to motivate contractors to make improvements in processes and facilities. NAVSEA has recently implemented a number of different shipbuilding facilities investment incentives. For instance, the VIRGINIA Class Capital Expenditure (CAPEX) program is a 1.5 percent special incentive that is included in the VIRGINIA Class Block II multi-year ship construction contract. This program allows a portion of the overall contract profit to be diverted to fund a series of incentives. To earn the incentive, the shipbuilder has to present a Business Case Analysis that shows the cost/benefit analysis of the improvement. The shipbuilder is funded up to 50 percent of the incentive at the start of the improvement, with the remaining 50 percent available upon successful completion. The Navy also has the option to recover all funds used in the project if the project is unsuccessful, thus additionally motivating the shipbuilder to complete projects in an effective and timely manner. The Navy has up to \$91 Million available to fund this program over the life of the contract (until 2008). At this time, the shipbuilder has spent \$35.6 Million, for a return of \$320 Million in future cost avoidance.

Similarly, the DDG 51 Class program has proposed a CAPEX-type infrastructure improvement project called the "Ultra Hall". Using primarily contract withholdings and incentives, Bath Iron Works (BIW) has proposed to build two larger outfitting bays and purchase additional equipment. This plan allows the shipbuilder to reduce staffing, reduce costs, improve quality, and enhance the modular construction of surface combatants as BIW is able to do a larger portion of the construction in a more modern covered facility. These savings will be realized on future DDG 51 ships, as well as future shipbuilding programs.

Another case of contracting incentives proving successful is the CVN 78 Cost Target Incentives. These incentives are in place to motivate Northrop Grumman to design the ship to meet cost targets established in the Annual Long Range Plan for Construction of Naval Vessels for FY 2008. Coupled with incentives for technical performance in the design contract, the cost target incentive provides a balanced approach to cost, schedule, and performance control. Similar to the CAPEX incentive, a fee recovery provision exists to recover a significant portion of the fee if the contractor deviates from previously provided cost estimates during construction contract proposal submission.

The Navy plans to continue the use of CAPEX-type incentives in shipbuilding contract awards. These incentives ensure the Navy is able to motivate shipbuilders to improve their facilities and processes, resulting in long-term savings to the government. Clearly, incentives have been quite successful on existing contracts, with an approximate 900 percent return on investment for the VIRGINIA Class submarine program. The Ultra Hall project is also expected to result in substantial cost avoidance.

Legislative Recommendations

The Navy has no recommendations for legislative proposals at this time.

CONCLUSIONS DERIVED FROM THE STUDY

The Navy has made aggressive strides to improve the efficiencies of shipbuilding. These improvements are in the areas of design changes, production initiatives, and materials. In order to foster these types of changes, the Navy has utilized both performance specifications and contracting incentives. The CAPEX-type of incentive has proven to be an extremely successful example of how special contracting incentives can improve shipbuilding infrastructure and efficiencies which can result in shipbuilding program cost savings. The Navy also plans to continue encouraging our workforce and our shipbuilding contractors to use Lean Six Sigma techniques to improve our processes.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

April 23, 2007

The Honorable Daniel K. Inouye
Chairman, Subcommittee on Defense
Committee on Appropriations
United States Senate
Washington, DC 20510-6028

Dear Mr. Chairman:

Section 324(a) of the FY 2007 National Defense Authorization Act, Public Law 109-364, specified that the Secretary of the Navy may not deploy the Marine Corps Total Force System (MCTFS) to the Navy until the Chairman of the Defense Business Systems Management Committee has provided written determination that the deployment of MCTFS to the Navy is in the best interests of the Department of Defense. In addition, Section 324(b) directed the Secretary of the Navy to provide a report to the Congressional Defense Committees and the Comptroller General on MCTFS.

As directed by Section 324(b), the enclosed Navy report provides an analysis of alternatives comparing the Defense Integrated Military Human Resources Systems (DIMHRS) and MCTFS via a business case analysis, and an analysis of compatibility with the enterprise architecture of the Department of Defense. The decision for Navy to use MCTFS unifies the Department of the Navy under one integrated personnel and pay system. This interim step is a cost effective integration of Navy and Marine Corps systems, until such time that the Department transitions to DIMHRS. The Department of the Navy remains committed to a transition to DIMHRS following the successful incorporations by Army and Air Force.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Levin, Skelton, Murtha and the Comptroller General.

Sincerely,

**DEPARTMENT OF THE NAVY**OFFICE OF THE SECRETARY
1000 NAVY PENTAGON
WASHINGTON, D.C. 20350-1000

JAN 12 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United State Senate
Washington, DC 20510

Dear Mr. Chairman:

The Fiscal Year 2004 National Defense Authorization Act stated, "...SECNAV shall carry out a demonstration project in which three Naval Aviation Depots are given the flexibility to promote by one grade level workers who are certified at the journey level as able to perform multiple trades." It also required a status report due to Congress NLT 15 January 2007. (PL 108-136 Sec. 338.)

The Naval Air Systems Command (NAVAIR) initiated the Multi-Trade proposal based on Business Process Review and LEAN initiatives. The intent was to combine a small number of highly specialized Federal Wage System trades where business processes provide opportunities to improve the timeliness of repairing aircraft.

PL 108-136 Sec. 338 required implementation using procedures established under 5 USC 4703, which would require the Department of Defense (DoD) concurrence and sponsorship of the initiative as a personnel demonstration project. When presented to DoD, the Department believed that flexibilities under the National Security Personnel System (NSPS) would achieve the same outcome as the proposed project in roughly the same timeframe. As we now know, NSPS implementation was delayed by the strategic pause and other events and coverage of FWS employees is now scheduled to begin no earlier than October 2007.

The Multi-Trade proposal, however, has been implemented, albeit in a modified format. Due to the slippage of NSPS, the Navy proceeded with the Multi-Trade program using awards equivalent to the amounts of one grade promotions. The Multi-Trade employee, after certification in two journey-level trades at the same grade level, receives an award of \$2500, and every subsequent year thereafter based on certification from management that the employee spends a minimum of 25% of the time in each journey-level trade.

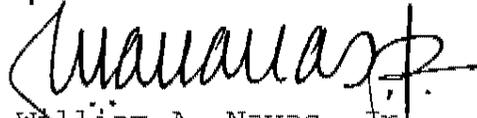

The Department of Defense is actively engaged in planning to extend NSPS to include FWS employees. The plan will incorporate a Multi-Trade approach. A key ingredient of the plan is to build a mechanism to provide compensation incentives for employees to qualify for, and perform, multi-trade work. Under NSPS, this compensation could take a number of forms, including payment of a differential in addition to the employee's salary, setting the employee's salary at a higher rate within the pay band, or assigning the employee's position to a higher pay band. The Department is in the process of identifying the scope and nature of multi-trade work that would warrant additional compensation in recognition of the broader skills and competencies required by such work. The final approach will be determined as the system design progresses through management reviews and discussions with labor unions during continuing collaboration.

While the multi-trade proposal has not been implemented as originally intended, it has been established and is being used in a viable fashion while the final NSPS integration is settled.

Please let me know if I can be of further assistance.

Sincerely,

W.A.

William A. Navas, Jr.
Assistant Secretary of the Navy
(Manpower and Reserve Affairs)

Washington, DC 20515

Dear Mr. Chairman:

The Fiscal Year 2004 National Defense Authorization Act stated, "...SECNAV shall carry out a demonstration project in which three Naval Aviation Depots are given the flexibility to promote by one grade level workers who are certified at the journey level as able to perform multiple trades." It also required a status report due to Congress NLT 15 January 2007. (PL 108-136 Sec. 338.)

The Naval Air Systems Command (NAVAIR) initiated the Multi-Trade proposal based on Business Process Review and LEAN initiatives. The intent was to combine a small number of highly specialized Federal Wage System trades where business processes provide opportunities to improve the timeliness of repairing aircraft.

PL 108-136 Sec. 338 required implementation using procedures established under 5 USC 4703, which would require the Department of Defense (DoD) concurrence and sponsorship of the initiative as a personnel demonstration project. When presented to DoD, the Department believed that flexibilities under the National Security Personnel System (NSPS) would achieve the same outcome as the proposed project in roughly the same timeframe. As we now know, NSPS implementation was delayed by the strategic pause and other events and coverage of FWS employees is now scheduled to begin no earlier than October 2007.

The Multi-Trade proposal, however, has been implemented, albeit in a modified format. Due to the slippage of NSPS, the Navy proceeded with the Multi-Trade program using awards equivalent to the amounts of one grade promotions. The Multi-Trade employee, after certification in two journey-level trades at the same grade level, receives an award of \$2500, and every subsequent year thereafter based on certification from management that the employee spends a minimum of 25% of the time in each journey-level trade.

The Department of Defense is actively engaged in planning to extend NSPS to include FWS employees. The plan will incorporate a Multi-Trade approach. A key ingredient of the plan is to build a mechanism to provide compensation incentives for employees to qualify for, and perform, multi-trade work. Under NSPS, this compensation could take a number of forms, including payment of a differential in addition to the employee's salary, setting the employee's salary at a higher rate within the pay band, or assigning the employee's position to a higher pay band. The Department is in the process of identifying the scope and nature of multi-trade work that would warrant additional compensation in recognition of the broader skills and competencies required by such work. The final approach will be determined as the system design progresses through management reviews and discussions with labor unions during continuing collaboration.

While the multi-trade proposal has not been implemented as originally intended, it has been established and is being used in a viable fashion while the final NSPS integration is settled.

Please let me know if I can be of further assistance.

Sincerely,

WL,

William A. Navas, Jr.
Assistant Secretary of the Navy
(Manpower and Reserve Affairs)

JAN 19 2007

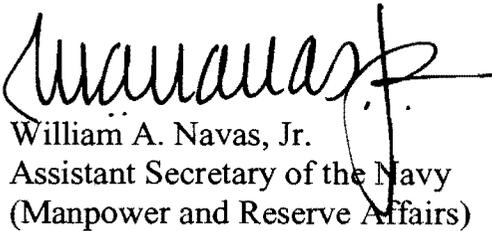

The Honorable David M. Walker
Comptroller General of the United States
Government Accountability Office
441 G Street NW
Washington, DC 20548

Dear Mr. Walker:

The Fiscal Year 2004 National Defense Authorization Act required the Department of the Navy to carry out a demonstration project under which three Naval Aviation Depots were to be given the flexibility to promote, by one grade, level workers who are certified at the journey level as able to perform multiple trades. (PL 108-136 Sec. 338)

Section 338 requires a status report on the project and a Government Accountability Office evaluation of the report to be provided to Congress. I've attached copies of the report for your review that were previously provided to Chairmen of the House and Senate Armed Services Committees.

Sincerely,

William A. Navas, Jr.
Assistant Secretary of the Navy
(Manpower and Reserve Affairs)

Dear Mr. Chairman:

As directed by Senate Appropriations Committee Report 109-292, this letter serves as a report to the congressional defense committees regarding the challenges faced in filling psychology post-doctoral training positions.

The post-doctoral training program at Tripler Army Medical Center (TAMC) is currently the only active Health Psychology training program within the Department of Defense. This program has been extremely successful in generating health psychologists who provide critical services to service members and military beneficiaries. For the first time, the Navy has two psychologists in the current class of 6 fellows.

In the past, Navy Medicine has either recruited licensed health psychologists or sent psychologists to civilian programs for training. Our intent is to continue sending Navy psychologists to the program at TAMC.

We are committed to continuing training, but face some significant challenges within the program. While the positions provide excellent opportunities for program participants, a number of factors, such as the high operational tempo during wartime, military-civilian pay disparities, and the training desires of individual psychologists, prevent us from fully utilizing all available training positions.

We continue to face challenges in the recruiting and retention of psychologists. Some of the initiatives we are examining to increase success in these areas include a loan repayment program for recruiting licensed providers, utilizing Navy-trained psychologists as recruiters at medical conventions, and specialty pay bonus options. Meanwhile, we continue to place as many psychologists in post-doctoral fellowships as manning levels allow.

Please let me know if I can be of any further assistance.

Sincerely,

Dear Mr. Chairman:

As directed by the National Defense Authorization Act for Fiscal Year 2006, Public Law 109-163, enclosed is the Navy "Report to Congress on Rationale and Plans of the Navy to Provide Enlisted Members an Opportunity to Obtain Graduate Degrees." I am responding on behalf of the Secretary of the Navy.

The report confirms Navy's need for a flexible approach to development of 21st century leaders who are adaptable to new circumstances and have the requisite knowledge and skills to succeed in an ever-changing, multi-mission environment. The Navy plans to initiate a number of Navy relevant graduate degree opportunities to enlisted members, the majority of which are through off-duty study, pending identification of additional educational needs. These new and future education requirements will be systematically assessed as part of our evolving personnel strategies.

As always, if I can be of further assistance, please let me know. A similar response has been sent to Chairman Skelton.

REPORT TO CONGRESS

ON

RATIONALE AND PLANS OF THE NAVY TO PROVIDE ENLISTED

MEMBERS AN OPPORTUNITY TO OBTAIN GRADUATE DEGREES

Prepared by:

Deputy Chief of Naval Operations for
Manpower, Personnel, Training and Education
Washington, DC

March 2007

Report Requirement

Subsection 526(c) of the National Defense Authorization Act for Fiscal Year 2006, Public Law 109-163, directed the following:

“The Secretary of the Navy shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the plans, if any, of the Secretary, and the rationale for those plans, for a program to provide enlisted members of the Navy with opportunities to pursue graduate degree programs either through Navy schools or paid for by the Navy in return for an additional service obligation.” Appendix A provides the full text of the report requirement, including specific focus areas to be addressed.

Subsection 543(d) of the John Warner National Defense Authorization Act for Fiscal Year 2007, Public Law 109-364, directed the following:

“The report required by subsection(c) of 526 of the National Defense Authorization Act for Fiscal Year 2006 (Public Law 109-163: 119 Stat. 3246), relating to the rationale and plans of the Navy to provide enlisted members an opportunity to obtain graduate degrees, shall be submitted, in accordance with that subsection, not later than March 30, 2007.”

Background

The Navy is constantly adapting its forces and capabilities to respond to a full range of strategic challenges. We are tackling new mission sets needed to confront and influence the highly dynamic security environment of the 21st century while maintaining traditional naval capabilities integral to the conduct of conventional campaigns. A combination of changing mission sets, the changing nature of work done by enlisted Sailors, the pace of change itself, and the attraction of better educated individuals into the enlisted force requires flexibility in the development of enlisted Sailors.

Consistent with efforts to eliminate barriers that preclude the capability and flexibility to develop adaptable forces, the Navy had sought discretionary statutory authority for use of existing programs at Naval Postgraduate School (NPS) for instruction of enlisted Sailors as requirements dictate. As part of this process, Navy projected the types of NPS degree and non-degree programs that could be relevant to the development of enlisted Sailors, but noted the absence of any specific requirements at that time.

We value the capability we now have to use NPS for education of enlisted Sailors even though current requirements for enlisted graduate level education from any source are few and general in nature. As part of its overall personnel strategy, the Navy will continue to evaluate education needs. We plan to continue to provide a small number of

general graduate level opportunities for selected senior enlisted Sailors pending identification of more specific needs.

Philosophy and Objectives

The underlying philosophy and objectives of providing degree and non-degree graduate level opportunities for enlisted Sailors are part of a larger evolving strategy to broaden the professional and intellectual horizons of Sailors throughout their careers to better prepare them to operate tomorrow's fleet, and assume key naval and joint leadership roles.

Integration of Graduate Degrees Into Enlisted Career Development

Degree and non-degree graduate level education for enlisted Sailors is part of a career-long continuum of education opportunities for officer and enlisted Sailors. The Navy introduced its Professional Military Education (PME) Continuum in November 2004 to provide a comprehensive approach to integration of Advanced Education (post-secondary education), Navy-specific PME, Joint PME, and leadership development. The continuum is evolving to enable targeted learning opportunities sequenced to meet growing and changing roles throughout a career with emphasis on a solid technical and operational foundation early in a career, and management and executive level skills later in the career.

Within the PME continuum, graduate level opportunities for selected senior enlisted Sailors are expected to center on applying advanced concepts in technical fields, building critical and strategic thinking skills, understanding best business and management practices, and fostering cultural understanding and regional knowledge. The academic foundation for such opportunities would primarily come from Navy facilitation of academic credit for military training and experience, and Navy sponsored off-duty education programs.

Requirements for Associate and Baccalaureate Degree Programs

Education conveys general bodies of knowledge; enhances basic skills; and fosters breadth of view, diverse perspectives, critical analysis and thinking, abstract reasoning, innovation and comfort with ambiguity – all of which are fundamental in the development of 21st century leaders. We are reviewing policy established in August 2005, that would require an associates degree for advancement to E-8 starting with the Fiscal Year 2011 Advancement Selection Board. While there are no specific requirements for baccalaureate degrees, we value the effects of education in development of leaders. Therefore, we have facilitated and encouraged education attainment through several programs:

- The Navy College Program, NCP, provides easy access to academic counseling and information, tuition assistance, academic testing programs, and education programs regardless of a Sailor's duty station. NCP Distance Learning Partnerships with civilian academic institutions provide paths for rating relevant degrees that capitalize on academic credit for existing military training and experience. The NCP for Afloat College Education (NCPACE) provides college courses tuition-free to Sailors onboard ships and in remote locations.
- The Advanced Education Voucher (AEV) Program provides selected senior enlisted Sailors financial assistance to complete Navy relevant baccalaureate degrees during off-duty hours. Degree programs are provided by civilian institutions in traditional classroom settings or through distance learning. Twenty Sailors are currently pursuing baccalaureate degrees through this program. A selection board sponsored by the Master Chief Petty Officer of the Navy will convene in March 2007 to consider up to 25 additional candidates for baccalaureate degree completion in select areas of study including: selected strategic foreign languages, systems engineering and analysis, civil engineering, engineering propulsion systems, leadership and management, information technology and electrical engineering technology.

Meeting Academic Prerequisite for Graduate Level Opportunities

Approximately 10,400 enlisted Sailors have baccalaureate degrees documented in their personnel records. This number continues to trend upward as we emphasize the importance of education in career development. This significant number, in combination with the focused nature of NCP Distance Learning Partnerships and AEV program areas of study, enables a sufficient pool of academically qualified candidates to participate in current graduate level opportunities.

Enlisted Career Fields Requiring Graduate Degrees

The Navy has not yet identified any specific enlisted career fields requiring a graduate degree. The focus has been on identification of competencies required by senior enlisted leaders related to the knowledge, skills and abilities necessary for a broad range of responsibilities as well as those needed for specific functional responsibilities. We envision education opportunities would be directed at enhancing performance in selected assignments.

Education Execution Concept

The Navy's current approach to graduate degrees for enlisted Sailors is focused on enhancing knowledge of advanced concepts in technical fields, building critical and

strategic thinking skills, understanding best business and management practices, and fostering cultural understanding and regional knowledge. Current graduate degree opportunities are as follows:

- The aforementioned AEV Program not only provides financial assistance for baccalaureate degree completion, but also for completion of Navy relevant masters' degrees. Selected senior enlisted Sailors pursue masters' degrees provided by civilian institutions in traditional classroom settings or through distance learning during off-duty hours. Eleven senior enlisted Sailors are currently pursuing masters' degrees through this program. A selection board sponsored by the Master Chief Petty Officer of the Navy will convene in March 2007 to consider additional candidates in select areas of study including: Emergency and Disaster Management, Human Resources, Project Management, Engineering and Technology, Homeland Defense and Security, Business Administration, and Leadership and Management.
- The Master Chief Petty Officer of the Navy may select up to four academically qualified Command Master Chiefs per year for enrollment in the Naval War College (NWC) resident senior level course. While the purpose of the program is development of skilled joint leaders and strategically minded thinkers, it also results in award of a Master of Arts Degree in National Security and Strategic Studies. Selected Command Master Chiefs may also participate in NWC non-resident programs through which graduates may earn 12 or 21 semester hours of graduate credit depending upon the specific program.
- NPS offers several master's degree programs through distance learning. While Navy officers have priority, academically qualified enlisted Sailors may participate on a space available basis. Two enlisted Sailors are currently enrolled in NPS distance learning master's degree programs.
- Enlisted Sailors assigned to the permanent staff at NPS or nearby commands may participate in NPS masters' degree programs as duties allow. We have no Sailors enrolled in graduate degree programs under this provision.
- NCP provides access to civilian off-duty education opportunities including graduate programs.

Additional graduate education opportunities will be requirements driven. Requirements will guide the discipline, type (i.e. degree, certificate, seminar, etc.), source (NPS, Air Force Institute of Technology (AFIT), or civilian institutions) and delivery format (resident, distance learning or a combination thereof). As is currently done with AEV and NWC opportunities, we would expect to use a selection board process to identify best qualified education candidates.

Utilization of Enlisted Sailors Upon Award of a Graduate Degree

With the exception of NCP, enlisted Sailors participating in Navy-sponsored graduate degree programs must agree to remain on active duty for a prescribed period. The general nature of current limited opportunities provides executive level skills with broad applicability to a variety of assignments. Our emphasis on requirements-driven education and implementation should improve linkage to specific types of assignments in the future.

APPENDIX A

Subsection 526(c), National Defense Authorization Act for Fiscal Year 2006, Public Law 109-163

Report on Rationale and Plans of the Navy to Provide Enlisted Members an Opportunity to Obtain Graduate Degrees- The Secretary of the Navy shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the plans, if any, of the Secretary, and the rationale for those plans, for a program to provide enlisted members of the Navy with opportunities to pursue graduate degree programs either through Navy schools or paid for by the Navy in return for an additional service obligation. The report shall include the following:

(1) The underlying philosophy and objectives supporting a decision to provide opportunities for graduate degrees to enlisted members of the Navy.

(2) An overall description of how the award of a graduate degree to an enlisted member would fit in an integrated, progressive, coordinated, and systematic way into the goals and requirements of the Navy for enlisted career development and for professional education, together with a discussion of a wider requirement, if any, for programs for the award of associate and baccalaureate degrees to enlisted members, particularly in the career fields under consideration for the pilot program referred to in subsection (d)¹.

(3) A discussion of the scope and details of the plan to ensure that Navy enlisted members have the requisite academic baccalaureate degrees as a prerequisite for undertaking graduate-level work.

(4) Identification of the specific enlisted career fields for which the Secretary has determined that a graduate degree should be a requirement, as well as the rationale for that determination.

(5) A description of the concept of the Secretary for the process and mechanism of providing graduate degrees to enlisted members, including, at a minimum, the Secretary's plan for whether the degree programs would be provided through civilian or military degree-granting institutions and whether through in-resident or distance learning or some combination thereof.

(6) A description of the plan to ensure proper and effective utilization of enlisted members following the award of a graduate degree.

¹ Subsection 543(e) of the John Warner National Defense Authorization Act for Fiscal Year 2007, Public Law 109-364, repealed the requirement for a report on a pilot program referred to in subsection 526(d) of the National Defense Authorization Act for Fiscal Year 2006, Public Law 109-163.

- NCP provides access to civilian off-duty education opportunities including graduate programs.

Additional graduate education opportunities will be requirements driven. Requirements will guide the discipline, type (i.e. degree, certificate, seminar, etc.), source (NPS, Air Force Institute of Technology (AFIT), or civilian institutions) and delivery format (resident, distance learning or a combination thereof). As is currently done with AEV and NWC opportunities, we would expect to use a selection board process to identify best qualified education candidates.

Utilization of Enlisted Sailors Upon Award of a Graduate Degree

With the exception of NCP, enlisted Sailors participating in Navy-sponsored graduate degree programs must agree to remain on active duty for a prescribed period. The general nature of current limited opportunities provides executive level skills with broad applicability to a variety of assignments. Our emphasis on requirements-driven education and implementation should improve linkage to specific types of assignments in the future.

APPENDIX A

Subsection 526(c), National Defense Authorization Act for Fiscal Year 2006, Public Law 109-163

Report on Rationale and Plans of the Navy to Provide Enlisted Members an Opportunity to Obtain Graduate Degrees- The Secretary of the Navy shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the plans, if any, of the Secretary, and the rationale for those plans, for a program to provide enlisted members of the Navy with opportunities to pursue graduate degree programs either through Navy schools or paid for by the Navy in return for an additional service obligation. The report shall include the following:

(1) The underlying philosophy and objectives supporting a decision to provide opportunities for graduate degrees to enlisted members of the Navy.

(2) An overall description of how the award of a graduate degree to an enlisted member would fit in an integrated, progressive, coordinated, and systematic way into the goals and requirements of the Navy for enlisted career development and for professional education, together with a discussion of a wider requirement, if any, for programs for the award of associate and baccalaureate degrees to enlisted members, particularly in the career fields under consideration for the pilot program referred to in subsection (d)¹.

(3) A discussion of the scope and details of the plan to ensure that Navy enlisted members have the requisite academic baccalaureate degrees as a prerequisite for undertaking graduate-level work.

(4) Identification of the specific enlisted career fields for which the Secretary has determined that a graduate degree should be a requirement, as well as the rationale for that determination.

(5) A description of the concept of the Secretary for the process and mechanism of providing graduate degrees to enlisted members, including, at a minimum, the Secretary's plan for whether the degree programs would be provided through civilian or military degree-granting institutions and whether through in-resident or distance learning or some combination thereof.

(6) A description of the plan to ensure proper and effective utilization of enlisted members following the award of a graduate degree.

¹ Subsection 543(e) of the John Warner National Defense Authorization Act for Fiscal Year 2007, Public Law 109-364, repealed the requirement for a report on a pilot program referred to in subsection 526(d) of the National Defense Authorization Act for Fiscal Year 2006, Public Law 109-163.

JOINT REPORT TO CONGRESS
ON
USE OF THE NAVAL POSTGRADUATE SCHOOL
AND THE AIR FORCE INSTITUTE OF TECHNOLOGY
TO MEET REQUIREMENTS FOR ENLISTED GRADUATE DEGREES

Jointly prepared by:

United States Navy
Deputy Chief of Naval Operations for
Manpower, Personnel, Training and Education
Washington, DC

United States Marine Corps
Deputy Commandant for Manpower and Reserve Affairs
Washington, DC

United States Air Force
Deputy Chief of Staff for Manpower and Personnel
Washington, DC

March 2007

Report Requirement

Subsection 543(f) of the John Warner National Defense Authorization Act for Fiscal Year 2007, Public Law 109-364, directed the following:

"Report on Use of NPS and AFIT- Not later than March 30, 2007, the Secretary of the Navy and the Secretary of the Air Force shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a joint report on the manner by which each Secretary intends to use the Naval Postgraduate School and the Air Force Institute of Technology during fiscal years 2008 through 2013 to meet the overall requirements of the Navy and Marine Corps and of the Air Force for enlisted members with graduate degrees. The report shall include the following:

- (1) The numbers and occupational specialities of enlisted members that each Secretary plans to enroll as candidates for graduate degrees each year in each of the two schools.
- (2) A description of the graduate degrees that those enlisted members will pursue at those schools.
- (3) Other matters that the two Secretaries jointly consider to be useful for the committees to better understand the future role that the two schools will each have in meeting service requirements for enlisted members with graduate degrees."

NAVY

Currently, the Navy has no enlisted billets that require the incumbent to have a graduate degree. Consistent with our strategic imperatives, the Navy has no plans to send enlisted members to the Naval Postgraduate School or the Air Force Institute of Technology for graduate degrees until specific requirements are identified and validated. We are in the midst of important work to define the Navy workforce of the future through linking specific knowledge, skills and abilities to capabilities. This work is fundamental to enabling us to determine the types and levels of education required to develop competencies needed to deliver capabilities in a cost efficient manner.

As part of a larger evolving strategy to develop strategically-minded, critical thinkers who are better prepared to operate tomorrow's Fleet, and assume key naval and joint leadership roles, the Navy does provide some education opportunities for senior enlisted members. At the graduate level, five senior enlisted members per year are selected to complete masters' degrees through funded off-duty education at civilian academic institutions. Available areas of study in FY07 included: Disaster Management, Human Performance Improvement, Engineering and Technology, Systems Engineering and Analysis, Homeland Defense and Security, Leadership and Management, and Business Administration. Additionally, we select up to four academically qualified Command Master Chiefs per year for enrollment in the Naval War College (NWC) resident senior level course. The purpose of the program is development of skilled joint leaders and strategically-minded thinkers, but it also results in award of a Master of Arts Degree in National Security and Strategic Studies.

As part of our overall personnel strategy, the Navy will continue to evaluate and support education needed to develop the competencies, professional knowledge and critical thinking skills needed by 21st century leaders to meet the demands of fast-paced, multi-mission environments.

Marine Corps

Currently, the Marine Corps has no enlisted billets that require the incumbent to have a graduate degree. The requirement does exist for certain billets to be staffed with enlisted Marines who possess an undergraduate degree. These billets are filled through the Staff Noncommissioned Officer Degree Completion Program. The related disciplines are: Safety, Education, Psychology, Music and Accounting.

Although there are no current requirements for graduate degrees, there are some Occupational Fields that would benefit from additional education. Those fields include, but are not limited to Intelligence (PMOS 02xx), Signals Intelligence (PMOS 26xx), and Ground Electronics (28xx). Graduate degrees may also be beneficial to those assigned to high-level staffs such as Occupation Field sponsors. Marine Corps needs would dictate the support of any graduate degree opportunities.

In recent years, the Marine Corps has sent enlisted Marines with the Primary Military Occupational Specialty of Information

Assurance Technician (PMOS 0689) to the Air Force Institute of Technology (AFIT) for graduate degrees in Information Assurance. The assignment of these Marines to AFIT has been not designed to fulfill requirements of a specific billet. Rather, the intent has been to bolster the Information Assurance community within the Marine Corps through exposure to broadened instruction at AFIT. Upon graduation, these Marines have been assigned based upon existing occupational needs.

Air Force

The Air Force process to select enlisted personnel to obtain graduate degrees and then assign graduates to jobs that put their newly acquired education to work has developed since its inception in 2002 to a very effective one. Enlisted personnel are nominated through command channels and selected by a committee of Career Field Managers (CFMs). The CFM's selection puts the heaviest weight on the identification of a short list of appropriate post-graduation assignments. Firm assignments are finalized later. All personnel participating in this program must agree to an Active Duty Service Commitment of three years beyond graduation.

Forty-seven enlisted personnel have participated in this program. Nine are still early in their studies with projected graduation in March 2008. Ten will graduate in March 2007 and twenty-five are working for the Air Force. Three program graduates, all from the initial group in 2002, have left the Air Force. Twenty-four of the forty-seven participants represent the Communications-Computer Systems Operations, Communications-Electronics System Maintenance, and Aircraft Maintenance career fields.

Thirty-eight of the forty-seven participants are enrolled in four degree programs: Logistics Management, Computer Science, Information Systems Management, and Information Resource Management. Graduates' assignments include Senior Enemy Integrated Air Defense Systems Analyst; Functional Manager, Aircraft and Equipment Maintenance; Acquisition Logistics Manager (C-130E, H, and P & HC-130 H/N); Command Manager, Information Satellite Communication Systems; and C4 Computer Security Engineer.

The expanded eligibility for enlisted members to attend the Naval Postgraduate School (NPS) provides future options for the Air Force to enhance its mission capability in Joint Information

Operations; Homeland Defense and Security; National Security Affairs—Middle East, Africa, and South Asia; Special Operations and Irregular Warfare; and Meteorology. The Air Force has not yet identified any personnel to pursue degrees at NPS although several degree programs may be considered on a limited basis in the future. The need to program funding to support expanded NPS opportunities dictates that we carefully consider the priorities given to educational opportunities for all members. The Air Force will continue to send 10 enlisted members per year to these graduate programs.

The Honorable Carl Levin
Chairman, Committee on Armed Services
United States Senate
Washington, DC 20510-6050

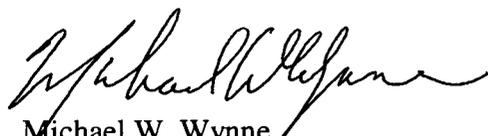

Dear Mr. Chairman:

As directed by the John Warner National Defense Authorization Act for Fiscal Year 2007, Public Law 109-364, page 33, jointly prepared Air Force, Marine Corps and Navy report on use of the Naval Postgraduate School (NPS) and the Air Force Institute of Technology (AFIT) to provide graduate degree opportunities to enlisted members is enclosed.

Each service has addressed its current approach to graduate degrees for enlisted members. Education is an important factor in enabling a resilient, adaptable force ready to meet the demands of a fast-paced, multi-mission environment. We will continue to evaluate education needs to enhance mission accomplishment.

Please let us know if we can be of further assistance. A similar letter has been sent to the Ranking Minority Member of your committee and to the Chairman and Ranking Minority Member of the other Congressional Armed Services Committee.

Sincerely,

Michael W. Wynne
Secretary of the Air Force

Dear Mr. Chairman:

As directed by House Armed Services Committee report 109-452, the enclosed report provides information on the Department of the Navy (DON) Personal Responsibility and Values: Education and Training (PREVENT) Program and the recommendation that the Secretary of the Navy increase funding for the PREVENT Program to ensure that additional Navy personnel have the opportunity to participate. The report also addresses the committee's recommendation that the Secretary extend the benefits of participation in the PREVENT program to enlisted personnel in the Marine Corps.

Presently, the Navy is developing a proposal that will establish a reliable and standardized funding line for the PREVENT program or an equivalent alternative, as well as recommendations on when and where the course should be delivered to best fit the Sailor's developmental processes. The Navy believes that the current cost per student can be improved and is working with the Fleet and Chief of Naval Personnel to develop the most effective solution.

The Marine Corps has a number of proven programs designed to positively enhance personal responsibility and counter alcohol and substance abuse, as described in the enclosed report. For this reason, the Marine Corps believes its current array of programs are effectively meeting the needs of its personnel and that extending PREVENT eligibility to Marines is not necessary.

A similar letter has been sent to Chairmen Levin, Skelton, and Murtha. As always, if I can be of further assistance, please let me know.

Sincerely,

W.A.

Report to Congress on
Department of the Navy Personal Responsibility and Values:
Education and Training Program

PREPARED BY:
Assistant Secretary of the Navy (Manpower and Reserve Affairs)
1000 Navy Pentagon, Room 4E615
Washington, DC 20350-1000

April 2007

Requirement

The House Armed Services Committee report 109-452 contained the following requirement with regards to the Department of the Navy Personal Responsibility and Values: Education and Training (PREVENT) Program:

“Given the positive outcomes this program has achieved in the lives of sailors and its contributions to readiness and mission performance, the committee urges the Secretary of the Navy to increase funding for this program to ensure that additional Navy personnel have the opportunity to participate. Additionally, the committee recommends that the Secretary extend the benefits of participation in the PREVENT program to enlisted personnel in the Marine Corps. Accordingly, the committee directs the Secretary of the Navy to study the feasibility of allocating additional funding to the PREVENT program and extending eligibility to Marine Corps personnel. The committee directs the Secretary to report his findings and recommendations by March 31, 2007, to the Senate Committee on Armed Services and the House Committee on Armed Services.”

This report is submitted to answer this requirement.

Background

The Navy's PREVENT program was initiated in the mid-1970s as the Chief of Naval Operations' (CNO) first alcohol abuse prevention program. PREVENT has evolved into its current three-day course (24 course hours), delivered by contracted instruction at 16 administrative sites worldwide.

CNO policy, OPNAV Instruction 5350.4C, Subject: Drug and Alcohol Abuse Prevention and Control, states that all Navy members in the target age group (18-25 years old) should attend PREVENT or complete “Skills for Life” within four years of accession, and that the integration of PREVENT contributes toward command prevention program requirements. “Skills for Life” is a computer-based training program suggested as an alternative to the PREVENT program. However, funding constraints restrict delivery of PREVENT to enlisted personnel only and requires commands to determine who would most benefit from attending PREVENT.

As the PREVENT program has matured, topics in addition to alcohol abuse prevention have been woven into the course content in order to demonstrate, in part, the effect that alcohol abuse has on life skills and capabilities. A core learning feature is the development of decision-making and alcohol refusal skills. Currently, PREVENT course content includes:

- Alcohol misuse and drug and tobacco use prevention
- Interpersonal responsibility (including communication, sexual behavior, workplace equal employment opportunity, and violence)
- Personal finances
- Health and readiness (including mental health, stress management and suicide prevention; physical health and responsibility, sexual health, sleep, fitness, and nutrition).

Presently, the Pacific Institute for Research and Evaluation is the contractor for the PREVENT program.

Program Throughput and Cost

Since its inception, PREVENT has served over 760,000 Sailors. Within the Navy, the PREVENT Program is funded as a Center for Personal and Professional Development (CPPD) program. The chart below provides data on the number of participants and program costs for the previous four fiscal years.

Fiscal Year	Recruit class graduates	Number of PREVENT graduates	Training Gap *	% of eligibles not receiving training	% of eligibles trained	CPPD budget line	DDR Plus-ups **	Other Plus-ups	FY total funding available	average cost per student	Additional funding required to meet gap
FY03	34,299	28,847	5,452	15.90%	84.10%	\$1,924,451	\$1,017,430	\$362,196	\$3,304,077	\$115	\$624,461
FY04	38,420	26,438	11,982	31.19%	68.81%	\$1,494,000	\$1,016,000	\$563,635	\$3,073,635	\$116	\$1,393,006
FY05	34,164	23,193	10,971	32.11%	67.89%	\$1,567,326	\$1,034,491	\$0	\$2,601,817	\$112	\$1,230,739
FY06	35,215	20,724	14,491	41.15%	58.85%	\$1,440,000	\$1,047,224	\$0	\$2,487,224	\$120	\$1,738,160

* "Training Gap" is the difference between the assumed requirement (all graduates of recruit training who enter the fleet are eligible Sailors within their first enlistment) and those who graduate from a PREVENT class.

** "DDR" refers to Drug Demand Reduction Program. Funds have historically been moved to the PREVENT contract holder to augment availability of classes; however this is a non-budget item and cannot be assumed to be available every year. Navy Education and Training Command has provided between \$984,000 and \$802,000 for classes primarily at schoolhouse locations; U.S. Naval Forces Europe (NAVEUR) has provided between \$232,000 and \$115 for classes in their Area of Responsibility.

Funding and Training Gaps

Historically, the training gap resulting from inadequate funding of PREVENT has ranged from 16 percent of the recruit pool to last year's 41 percent of the recruit pool. With no further cuts to contracting budgets, CPPD would require an additional \$1.739 million in Fiscal Year (FY) 2007 to meet the requirement to train all Sailors who are in their first enlistment. As the recruit plan increases in the out years (additional 2,000 recruits in FY 2007-2009), the requirement will grow by approximately \$240,000 annually. The FY 2008 funding requirement to train all Sailors who are in their first enlistment will be \$4.62 million. However, CPPD anticipates a loss of \$325,000 in PREVENT contract funding due to FY 2008 budget reductions.

In past years, DDR funds have been made available for additional classes as the content of PREVENT is heavily oriented towards providing preventive education for the development of refusal skills and appropriate decision-making. However, DDR funding is uncertain due to the fact that major commands in receipt of DDR funding decide annually where they can best utilize the funding.

Extending PREVENT Eligibility to Marine Corps Personnel

The Marine Corps has a number of proven programs and venues designed to positively enhance personal responsibility and counter alcohol and substance abuse, as described below. For this reason, the Marine Corps believes its current array of programs are effectively meeting the needs of its personnel and that extending PREVENT eligibility to Marines is not necessary at this time.

The Marine Corps educates its senior enlisted personnel through substance abuse prevention training conferences and installation summits. These forums provide information for leadership to increase its ability to train subordinates on personal reliability and responsibility. The Marine Corps also uses the science driven, web-based "Skills for Life" training program to positively enhance personal responsibility for all Marines. Other initiatives that contribute to the enhancement of personal responsibility include partnerships with health promotion and recreation personnel.

The Battalion Alcohol Skills Intervention Curriculum (BASIC) is a science-based program specifically designed for the Marine Corps. The curriculum, based on the Brief Alcohol Screening and Intervention of College Students program produced by the University of Washington, provides Marines with information on how alcohol can negatively impact individual behavior and teaches them the importance of drinking alcohol responsibly.

The Sexual Assault Prevention and Response (SAPR) program, established by Marine Corps Order 1752.5 in September 2004 as a command oriented training activity, focuses on all aspects of the command's sexual assault awareness, prevention, and victim support efforts. SAPR training is included as part of the curriculum at all officer and enlisted entry level training venues (e.g., Marine Corps Basic Training, the Basic School). Additionally, the program is taught at the Staff Non-Commissioned Officer Advanced Academy and the Commander's Course.

The Marine Corps Personal Financial Management Program (PFMP) is designed to prevent potential personal problems that can cost valuable time and money that may detract from mission readiness. PFMP specialists at installation-level Marine and Family Services offices, and Command Financial Specialists within units, help Marines develop sound decision-making skills in managing their personal finances. PFMP specialists address how personal and relational issues, such as marriage, divorce, children, substance abuse, etc., may affect Marines' personal finances.

The Mentors-In-Violence Prevention (MVP) program, developed at Northeastern University, was adapted to the Marine Corps culture and has been in use since 1997. The program focuses attention on men taking responsibility for preventing violence against women and interceding when necessary. The interactive MVP training course is taught by in-house trainers to senior Marines, and prepares the trainees to then train their Marines.

Semper Fit Health and Readiness offers nine interactive health promotion courses to promote optimal health and enhance mission readiness for all Marines. Subjects include fitness, nutrition, injury prevention, hypertension, tobacco cessation, sexual health, suicide awareness and prevention, alcohol and substance abuse prevention, and stress management. Marine Corps Order P1700.29 requires annual training in tobacco cessation, sexual health, suicide prevention, and alcohol and substance abuse prevention. Semper Fit has also collaborated with the Marine Corps Institute to develop two non-resident courses (a basic and advanced course) on Fitness, Nutrition and Injury Prevention. The courses are designed to prevent injuries and enhance performance by providing the necessary knowledge to ensure expertise at every level on strength development and physical conditioning.

Obstacles Other Than Funding

PREVENT is a course designed to function within the goals of a larger, command-centered alcohol and drug prevention program. Command Drug and Alcohol Program Advisors are critical to ensuring that once students return from the PREVENT course, attention is given, at the command level, to personal action plans and the general state of command climate to support success at the individual level. While the course is

designed around a “threat minimization framework,” it requires a supportive command culture in order for classroom learning to be translated into individual behavioral change.

Conclusion and Recommendations

Despite a thorough Human Performance study in 2005, CPPD has no definitive evidence that PREVENT has an impact on alcohol or drug refusal behaviors. This is due, in part, to the reality that a three-day class, by itself, cannot change behavior, and that the environment to which Sailors return has enormous impact on their ability to carry out their personal action plans. CPPD believes that a course of this kind, as a part of a character development continuum – addressing basic behavioral responsibilities and Navy core values – is vital to the early training of Sailors. CPPD believes that the cost per student could be improved, and is currently working with the Fleet and Chief of Naval Personnel (N135) to develop alternative solutions. A proposal is under development and will include a reliable and standardized funding line as well as a recommendation of when and where a course should be delivered to take best advantage of the Sailor’s developmental processes.

THE SECRETARY OF THE NAVY
WASHINGTON, D. C. 20350-1000

March 6, 2007

The Honorable Ike Skelton
Chairman, Committee on
Armed Services
House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

The Fiscal Year 2007 National Defense Authorization Act directed that a report on Navy's Riverine Squadrons be submitted with the President's Budget for Fiscal Year 2008.

The United States Navy has a long, episodic history with riverine operations. Navy's riverine capability reached a zenith during the Vietnam conflict where the number of specialized riverine craft exceeded 500. After the Vietnam conflict, residual riverine capabilities were placed in the Naval Reserve Force and eventually were folded into the Navy component of the United States Special Operations Command, the Naval Special Warfare Command. The Marine Corps established a limited riverine capability in the early 1990s but divestiture of that capability began in September 2005 with the disestablishment of the Small Craft Company. However, the Nation's current operations in the Global War on Terrorism, the stress on the ground forces, and the overall nature of Irregular Warfare have resulted in the requirement for Navy to re-establish an operational riverine capability.

The Department of the Navy's plan for a Riverine Force under Navy Expeditionary Combat Command will provide a timely, effective, and efficient capability in the prosecution of Irregular Warfare.

A similar letter has been sent to Chairmen Levin, Inouye, and Murtha. As always, if I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

Encl: (1) Operational Mission Areas for Navy Riverine Forces
(2) Projected Operating Environment for Navy Riverine
Squadron
(3) Required Operational Capabilities for Navy Riverine
Squadron

1. Purpose. To issue the Required Operational Capabilities (ROC) and the Projected Operational Environment (POE) for Navy Riverine Forces.

2. Discussion. This instruction provides pertinent information describing Navy Riverine Forces mission requirements, capabilities and the types and locations of expected operations as described in references (a), (b). Enclosures (1) through (3) have been prepared per reference (c). These enclosures provide the necessary details to describe the mission areas and operational capabilities for which Navy Riverine Forces were organized. Enclosures (1) and (2) shall also be used to assist in determining specific mission area M-Ratings reported under reference (d). This instruction provides resource agencies with the information they need concerning Naval Riverine Forces mission requirements, capabilities and projected operational environments.

3. Definitions.

a. Navy Riverine Forces (NRF). Provides a conventional riverine capability, as directed, through the conduct of waterborne mobility, security, command and control, and combat operations in support of military operations in a riverine

FOR OFFICIAL USE ONLY
DRAFT

environment (i.e., rivers, dam facilities, FOB, sea based facilities).

b. Riverine Group (RIVGRU). Commissioned, Echelon 4 staff comprised of active duty personnel responsible for standardization and certification of training, strategic concepts, long range operational planning, exercise support, planning intelligence dissemination, administrative support and general logistics support to RIVRON and their subordinate units. RIVGRU provides administrative, financial and supply management, and readiness oversight of their subordinate units. They are organized to be deployable, however, only selected RIVGRU staff qualified personnel may be ordered to support local, regional, littoral or wartime NRF tasks.

c. Riverine Squadron (RIVRON). Commissioned, Echelon 5, operating unit responsible for deploying command, control, communication, computer and intelligence (C4I) and operational support detachments and units to form an ashore operations center. RIVRON provides administrative, financial and supply oversight and readiness of their subordinate units. Squadron staffs are manned by USN active duty personnel.

d. Riverine Boat Detachment (RBD). Commissioned, Echelon 6, deployable operating unit equipped with armed patrol craft and associated supporting equipment. RBD's routinely operate with other NRF assets to provide an enhanced force package for conducting security, command and control and combat operations in support of military operations in a riverine environment. RBD's are manned with USN active duty personnel.

4. Action. Fleet Commanders shall periodically review enclosures (1) through (3) and recommend changes to the Chief of Naval Operations (Attn: N85) when mission or capabilities of the Navy Riverine Forces are significantly altered. Change recommendations should include comments on the expected Activity Manpower Document (AMD) impact.

FOR OFFICIAL USE ONLY
DRAFT

OPERATIONAL MISSION AREAS
FOR
RIVERINE FORCES

1. The Riverine Group (RIVGRU) Commander provides centralized planning, coordination, and integration of Riverine assets for waterborne mobility, security, command and control, and combat operations in support of military operations in a riverine environment. RIVGRU provides administrative support, operational planning, movement planning, intelligence dissemination, organizational and training oversight and certification for all units. RIVGRU is organized to be deployable on a limited basis. However, RIVGRU staff qualified personnel may be selectively ordered to support local, regional, littoral or wartime tasks or missions. The RIVGRU Commander exercises administrative control of Riverine Squadrons (RIVRON) and their Riverine Boat Detachments (RBD).

RIVERINE GROUP											
AMW	ASU	CCC	C2W	FSO	INT	LOG	MIW	MOB	MOS	NCO	NSW
S	S	P	S	P	P	P	S	P	S	P	S

2. The Riverine Squadron (RIVRON) will have a conventional riverine capability, as directed, through the conduct of Primary Missions. Primary Missions are those missions that a unit was established to perform during its wartime role. Secondary Missions are those missions that a unit could be expected to perform but are not essential to carry out its wartime role. The following primary and secondary warfare mission areas are assigned:

RIVERINE SQUADRON											
AMW	ASU	CCC	C2W	FSO	INT	LOG	MIW	MOB	MOS	NCO	NSW
S	S	P	S	P	P	P	S	P	S	P	S

3. The Riverine Boat Detachments (RBD) provide the following primary and secondary warfare mission areas:

RIVERINE BOAT DETACHMENT											
AMW	ASU	CCC	C2W	FSO	INT	LOG	MIW	MOB	MOS	NCO	NSW
S	S	P	S	P	P	P	S	P	S	P	S

Enclosure (1)

4. ROC symbols are used to specify the desired level of achievement of readiness or other work for or during a particular readiness condition. Readiness normally applies to operations and/or evolutions, while other work refers to nonwatch activity such as performing maintenance or training.

CAPABILITIES

"F" = "Full" The capability is to be fully achieved. For operational functions this means that installed equipment or systems will be fully manned to design capability.

"L" = "Limited" The capability is to be only partially realized. Even though only limited capability is realized, it is to be sustained. A limiting statement specifying the limitation must support every "L".

FOR OFFICIAL USE ONLY

DRAFT

PROJECTED OPERATING ENVIRONMENT
FOR
RIVERINE SQUADRON (RIVRON)

1. Navy Riverine Squadron (RIVRON) consist of active duty and reserve units capable of worldwide deployment to a river or delta specific mission environment. RIVRON's Tables of Allowances (TOA) share common equipment/systems for common tasks. This allows maximum inter-changeability.

2. The most demanding projected operating environment for RIVRON's is a wartime deployment to Forward Operating Base or Sea Base within the area of operations. RIVRON's may operate independently or with other naval, joint, allied or coalition forces in all climates and under all threat conditions, including chemical, biological and radiological (CBR).

3. The command and control environment may require RIVRON's to report to the theater combatant command (COCOM).

4. The riverine craft operate both day and night. They are all weather capable and are able to operate with a minimum endurance of 24 hours at patrol speeds. The craft are expected to patrol on navigable portions of rivers, deltas, lakes, harbors and bays up to sea state THREE (defined by the Beaufort scale). The force operates versus a level II threat to include small tactical, waterborne and unconventional warfare units. These hostile units will likely be armed with small arms, rocket propelled grenades and crew served weapons. Due to the expeditionary nature of these forces, they are transportable by military air to be moved to the theater of operations.

Enclosure (2)

DRAFT

ASU 1.6	Engage surface ships with minor caliber gunfire (i.e., 25mm, 20mm, and .50 cal).	F
ASU 1.9	Engage surface ships with small arms gunfire.	F
ASU 1.10	Conduct close in surface self-defense using crew operated machine guns (i.e. 25mm, 20mm, and .50 cal.)	F
ASU 1.12	Plan/direct engagement of surface threats. L - Capability limited to riverine environments.	L
ASU 1.14	Direct embarked or non-organic armed helo to engage surface ships. L - Capability limited to helo availability.	L
ASU 2 ENGAGE SURFACE TARGETS IN COOPERATION WITH OTHER FORCES.		
ASU 2.2	Conduct ASU to support surface forces. L - Capability limited to riverine environments.	L
ASU 2.3	Engage surface targets within assigned anti-surface sector. L - Capability limited to riverine environments.	L
ASU 3 PROVIDE ASU DEFENSE OF A GEOGRAPHICAL AREA (E.G., AOA, BARRIER) INDEPENDENTLY OR IN COOPERATION WITH OTHER FORCES.		
ASU 3.1	Provide ASU defense of a geographic area. L - Capability limited to riverine environments.	L
ASU 3.2	Plan and direct ASU defense of a geographic area. L - Limited Command and Control (C ²) capability. Limited intelligence processing capability. Capability limited to riverine environments.	L
ASU 4 DETECT, IDENTIFY, LOCALIZE AND TRACK SURFACE SHIP TARGETS.		
ASU 4.1	Detect, localize and track surface contacts with radar.	F
ASU 4.4	Detect, identify, classify and track surface contacts visually.	F
ASU 4.5	Detect, identify and track surface contacts with infrared (IR) equipment.	F
ASU 4.7	Identify surface contacts.	F
ASU 4.13	Detect, identify, classify and track surface contacts with Night Vision (NV) goggles.	F
ASU 4.14	Plan/direct detection, identification, localization, classification and tracking of surface targets. L - Limited C2 capability.	L
ASU 6 DISENGAGE, EVADE AND AVOID SURFACE ATTACK.		
ASU 6.1	Employ countermeasures. (Choose as applicable)	F
ASU 6.2	Employ evasion techniques.	F
ASU 6.3	Employ EMCON procedures.	F
ASU 6.5	Plan/direct disengagement, evasion and avoidance of surface attack.	F
ASU 13 CONDUCT PREATTACK DECEPTION IN SUPPORT OF ASU OPERATIONS.		

FOR OFFICIAL USE ONLY
DRAFT

ASU 13.1 Perform preattack deception in support of ASU operations. L - Capability limited to riverine environments.	L
ASU 13.2 Plan/direct preattack deception in support of ASU operations. L - Capability limited to riverine environments.	L
ASU 14 REPAIR OWN UNIT'S ASU EQUIPMENT.	
L - Organizational level repair. Emergency repairs to equipment critical to unit's mission.	L
ASU 16 PERFORM ASU BATTLE DAMAGE ASSESSMENT (BDA).	
ASU 16.1 Perform ASU BDA. L - Capability limited to riverine environments.	L
ASU 16.2 Coordinate and evaluate ASU BDA. L - Capability limited to riverine environments.	L
ASU 17 CONDUCT CASUALTY CONTROL PROCEDURES TO MAINTAIN/RESTORE OWN UNIT'S ASU CAPABILITIES.	F
COMMAND, CONTROL AND COMMUNICATIONS (CCC)	
CCC 3 PROVIDE OWN UNIT'S COMMAND AND CONTROL FUNCTIONS.	
CCC 3.1 Maintain a TOC or COC capable of collecting, processing, displaying, evaluating and disseminating tactical information. L - Limited C ² capability.	L
CCC 3.3 Provide all personnel services, programs and facilities to safeguard classified material and information.	F
CCC 3.4 Carry out emergency destruction of classified material and equipment.	F
CCC 3.11 Establish voice communications with supported forces.	F
CCC 3.12 Repair own unit's CCC equipment. L - Organizational level repair. Emergency repairs to equipment critical to unit's mission.	L
CCC 6 PROVIDE COMMUNICATIONS FOR OWN UNIT.	
CCC 6.1 Maintain tactical voice communications.	F
CCC 6.6 Process messages. L - Provided by supported unit.	L
CCC 6.12 Maintain internal communications systems.	F
CCC 6.16 Provide tactical, secure, anti-jam ultra-high frequency (UHF) voice communications.	F
CCC 6.17 Provide tactical, secure, anti-jam very-high frequency (VHF) voice communications.	F
CCC 19 REPAIR OWN UNITS CCC EQUIPMENT.	
L - Organizational level repair. Emergency repairs to equipment critical to unit's mission.	L
CCC 20 CONDUCT CASUALTY CONTROL PROCEDURES TO MAINTAIN/RESTORE OWN UNIT'S CCC CAPABILITIES.	F
COMMAND AND CONTROL WARFARE (C²W) AND INFORMATION WARFARE (IW)	
C²W 4 PLAN AND IMPLEMENT OPERATIONS SECURITY (OPSEC) MEASURES.

	L - Organizational level repair. Emergency repairs to equipment critical to unit's mission.	L
C²W 16 CONDUCT CASUALTY CONTROL PROCEDURES TO MAINTAIN/RESTORE OWN UNIT'S C²W CAPABILITIES		
FLEET SUPPORT OPERATIONS (FSO)		
FSO 5 CONDUCT TOWING/SEARCH/SALVAGE/RESCUE OPERATIONS.		
	L - Capability limited to riverine environments. Restricted to vessel size.	

FOR OFFICIAL USE ONLY

DEAF

FSO 5.1 Conduct towing operations. L - Own unit, emergency operations.	L
FSO 5.3 Conduct rescue operations.	F
FSO 5.17 Prepare a vessel or craft to be towed. L - Own unit, emergency operations.	L
FSO 5.18 Augment a towing vessel in the conduct of towing operations. L - Own unit, emergency operations.	L
FSO 6 SUPPORT/CONDUCT SEARCH AND RESCUE (SAR) OPERATIONS IN A COMBAT/NONCOMBAT ENVIRONMENT. L - Capability limited to riverine environments. Restricted to vessel size.	
FSO 6.2 Conduct combat/noncombat SAR operations by surface ships.	F
FSO 6.4 Recover man overboard.	F
FSO 6.7 Conduct general surveillance. L - Capability limited to riverine environments.	L
FSO 6.9 Report situation assessment.	F
FSO 6.10 Coordinate SAR operations. L - Capability limited to riverine environments.	L
FSO 6.12 Conduct combat SAR operations in support of battle force operations by special warfare forces in a hostile environment. L - Capability limited to riverine environments.	L
FSO 9 PROVIDE MEDICAL CARE TO ASSIGNED AND EMBARKED PERSONNEL.	

FOR OFFICIAL USE ONLY

DRAFT

	FSO 9.1 Conduct sick call.	F
	FSO 9.5 Conduct sanitation and safety inspections.	F
	FSO 9.6 Conduct occupational health/safety and preventive medicine programs and training using the following personnel (choose as applicable):	DEL FOR DET
(a)	Hospital corpsmen	
	FSO 9.8 Conduct pharmacy services requiring the following personnel (choose as applicable):	DEL FOR DET
(a)	Hospital corpsmen	
	FSO 9.9 Conduct associated administrative/maintenance services (choose as applicable):	F
(a)	Maintain adequate medical supplies for appropriate level health care.	
	FSO 9.10 Conduct on-site emergency medical treatment during hazardous evolutions including flight quarters, underway replenishment/refueling and amphibious assault boat operations.	F
	FSO 9.15 Conduct disease and vector control planning and operations.	DEL FOR DET
	FSO 9.17 Identify, equip and maintain suitable spaces to provide medical care.	DEL FOR DET
	FSO 9.18 Identify, equip and maintain adequate storage spaces for medical equipment and medical supplies.	F
	FSO 9.19 Provide medical care, triage and resuscitation commensurate with health care provider credentials using the following personnel (choose as applicable):	F
(a)	Independent duty corpsman	
	FSO 10 PROVIDE FIRST AID ASSISTANCE.	
	FSO 10.1 Identify, equip and maintain appropriate first aid spaces.	F
	FSO 10.2 Train assigned and embarked personnel in first aid, self and buddy aid procedures.	F
	FSO 10.3 Train stretcher bearers.	F
	FSO 11 PROVIDE TRIAGE OF CASUALTIES/PATIENTS	

FOR OFFICIAL USE ONLY
DRAFT

FSO 11.2	Train assigned and embarked personnel in triage care.	F
FSO 11.3	Provide administrative support to augmentation personnel/associated equipment that are assigned to triage and Chemical, Biological and Radiological (CBR) decontamination stations. L - Limited to number of personnel available	L
FSO 11.4	Train designated non-medical personnel to assist in triage management care for CBR contamination casualties. L - Limited to number of personnel available	L
FSO 11.5	Train designated non-medical personnel in CBR casualty decontaminated procedures. L - Limited to number of personnel available	L
FSO 11.6	Train designated supervisory medical personnel in oversight procedures during CBR casualty decontamination. L - Limited to number of personnel available	L
FSO 11.7	Provide medical treatment for chemical, biological radiological casualties. L - Limited to number of personnel available	L
FSO 12	PROVIDE MEDICAL/SURGICAL TREATMENT FOR CASUALTIES/PATIENTS.	
FSO 12.2	Train assigned and embarked personnel in resuscitation.	F
FSO 12.4	Identify, equip and maintain adequate medical supply storage spaces for appropriate level of resuscitation. NOTE: Equipment and storage spaces adequate to meet the needs of field first aid.	F
FSO 13	PROVIDE MEDICAL, SURGICAL, POST-OPERATIVE AND NURSING CARE FOR CASUALTIES/PATIENTS.	DEL FOR DET
FSO 13.6	Provide suitable care for the dead.	DEL FOR DET
FSO 14	PROVIDE MEDICAL REGULATION, TRANSPORT/EVACUATION AND RECEIPT OF CASUALTIES/PATIENTS.	
FSO 14.4	Transport and/or provide for casualty/patient evacuation. L - Limited to number of personnel available	L
FSO 14.5	Train assigned and embarked personnel in medical evacuation procedures.	F
FSO 20	PROVIDE FLEET TRAINING SERVICES.	
FSO 20.18	Provide anti-fast patrol boat training services for ships and aircraft.	F
FSO 51	REPAIR OWN UNITS FSO-RELATED EQUIPMENT.	F
FSO 55	MAINTAIN READINESS BY PROVIDING FOR TRAINING OF OWN UNIT'S PERSONNEL.	F
INTELLIGENCE (INT)		
INT 1	SUPPORT/CONDUCT INTELLIGENCE COLLECTION.	

FOR OFFICIAL USE ONLY

DRAFT

INT 1.3	Support/conduct imagery intelligence information collection. L - Limited to afloat operations.	L
INT 1.8	Collect or capture selected material or personnel for intelligence exploitation. L - Limited to riverine interdiction of craft and personnel embarked.	L
INT 1.10	Gather intelligence in restricted and shallow water areas relating to disposition and movement of enemy fleet units and ground units.	F
INT 2	PROVIDE INTELLIGENCE.	
INT 2.2	Evaluate and disseminate intelligence information.	F
INT 3	CONDUCT SURVEILLANCE AND RECONNAISSANCE.	
INT 3.2	Conduct covert surveillance and reconnaissance operations. L - Limited to afloat operations.	L
INT 6	CONDUCT SURFACE RECONNAISSANCE.	
INT 6.1	Conduct surface patrols or barriers.	F
INT 6.3	Conduct reconnaissance of surface forces.	F
INT 6.6	Plan/direct surface reconnaissance.	F
INT 6.7	Recognize by sight friendly and enemy aircraft, ships, and potential naval fire support targets which may be encountered in the expected operating areas.	F
INT 9	DISSEMINATE SURVEILLANCE AND RECONNAISSANCE INFORMATION.	F
INT 15	PROVIDE INTELLIGENCE SUPPORT FOR NONCOMBAT EVACUATION OPERATIONS (NEO).	
INT 15.1	Collect and integrate intelligence in support of NEO.	F
INT 15.2	Disseminate integrated all source intelligence to NEO participants.	F
INT 15.3	Debrief evacuees.	F
LOGISTICS (LOG)		
LOG 4	SUPPORT SHIPS AND AIRCRAFT IN SUPPLIES, ORDNANCE AND OTHER SERVICES.	
LOG 4.2	Stock, maintain, issue and provide security for weapons, ammunition pyrotechnics and acoustic evasion devices.	F
LOG 9	REPAIRS OWN UNITS LOGISTICS EQUIPMENT. L - Capability limited to riverine environments.	L
LOG 10	CONDUCT CASUALTY CONTROL PROCEDURES TO MAINTAIN/RESTORE OWN UNIT'S LOG CAPABILITIES. L - Capability limited to riverine environments.	L
MINE WARFARE (MIW)		
MIW 3	CONDUCT MINE NEUTRALIZATION/DESTRUCTION.	

FOR OFFICIAL USE ONLY

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

March 28, 2007

The Honorable Daniel K. Inouye
Chairman, Subcommittee on
Defense
Committee on Appropriations
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

Enclosed is the report on U.S. Navy and U.S. Coast Guard Patrol Vessel requirements that was required by the Fiscal Year 2007 Defense Authorization Conference Report 109-702. The United States Coast Guard concurs with the contents of the report.

The CYCLONE Class Patrol Coastal (PC) vessels bring a significant capability to the Coast Guard as a near-term augmentation to their 110' Patrol Boat (WPB) force and to the Navy as a longer-term operational asset critical to our forward deployed Combatant Commanders. Studies have shown that there is a current Navy requirement for Coastal Patrol vessels and that this requirement is likely to grow in the future. Due to Coast Guard's near term Patrol Boat Operational Hour shortfall, Navy and Coast Guard have agreed that Navy will take a short term risk in the number of Navy Coastal Patrol vessels and will extend the loan of three of the five vessels currently in Coast Guard custody for three additional years until 2011.

A similar letter has been sent to Chairmen Levin, Skelton, and Murtha. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Winter", written in a cursive style.

Section	Page
I. Report Requirements	1
II. Executive Summary	1
III. Report	2
A. History and Background	2
B. Mission requirements for Coast Guard Patrol Boats and Navy Patrol Coastal ships through 2012. 1. Coast Guard Patrol Boats 2. Navy Patrol Craft	4
C. Program plan and alternatives to meet Coast Guard deepwater Patrol Boat requirements through 2012.	6
D. Program plan and alternatives to meet Navy Patrol Coastal ship requirements through 2012.	7
E. Impact to Navy operational requirements if the Patrol Coastal ships currently being operated by the Coast Guard remain with the Coast Guard to support the Coast Guard mission.	8
F. Areas of overlap between the Coast Guard's Patrol Boat requirements and the Navy's Patrol Coastal ship requirements in terms of logistics, operations, and maintenance.	9

I. Report Requirements

The Fiscal Year 2007 Defense Authorization Conference Report 109-702 directs a SECNAV report: "Accordingly, the conferees direct the Secretary of the Navy, in consultation with the Secretary of the department in which the Coast Guard is operating, to submit a report to Congress, not later than March 30, 2007. The report shall: (1) identify validated mission requirements for both Coast Guard patrol boats and Navy Patrol Coastal ships through 2012; (2) identify a specific program plan, including alternatives to meet Coast Guard Deepwater patrol boat requirements through 2012; (3) identify a specific program plan, including alternatives to meet Navy Patrol Coastal ship requirements through 2012; (4) describe the impact to Navy operational requirements if the Patrol Coastal ships currently being operated by the Coast Guard remain with the Coast Guard to support the Coast Guard mission; and (5) identify areas of overlap between the Coast Guard's patrol boat requirements and the Navy's Patrol Coastal ship requirements in terms of logistics, operations, and maintenance."

II. Executive Summary

The USCG has been consulted in accordance with Congressional direction. This report was coordinated with the staff of USCG Headquarters, Assistant Commandant for Operations (USCG 3). The Chief of Staff, USCG completed a review 15 March 2007. The USCG concurs with the content of this report.

There is a current Memorandum of Agreement (MOA) between the Navy and the Coast Guard signed in July 2004 that transferred custody and operational control of four of the Patrol Coastal Ships (PC)s from the Navy to the Coast Guard effective October 1, 2004 until the end of Fiscal Year 2008. This MOA was amended in January 2005 to add a fifth PC to Coast Guard custody effective October 1, 2005 with the same terms as the original MOA.

PCs deliver significant capability in support of Navy and Coast Guard mission requirements. For the Coast Guard they provide near-term augmentation to their 110' WPB force and to the Navy they provide a longer-term critical operational asset to the Combatant Commanders.

Two of the Coast Guard PCs are homeported in San Diego, CA and three PCs are homeported in Pascagoula, MS. These five PCs are engaged in Maritime Homeland Security, Search and Rescue, Alien Migrant Interdiction, and Maritime Law Enforcement operations.

Five of the eight Navy PCs are homeported in Bahrain operating in the Fifth Fleet Area of Operations. These five PCs currently execute the following missions: protecting Iraqi oil platforms; Maritime Interdiction Operations (MIO); escort operations in the Arabian Gulf; and Theater Security Cooperation (TSC) with Gulf Coalition Countries.

The remaining three Navy PCs are homeported in Little Creek, VA and are the training platforms for the thirteen Navy PC crews who rotate to the forward deployed PCs. Additionally, the CONUS based PCs are available to surge to assist with emergency National tasking in support of Maritime Homeland Security operations.

To meet Coast Guard deep water Patrol Boat requirements through 2012, the Navy and Coast Guard agreed in January 2007 that the MOA would be amended again to extend the transfer of three of the five PCs in Coast Guard custody for an additional three years until September 30, 2011. The other two PCs would be returned to the Navy on or about September 30, 2008 in accordance with the original MOA. The Navy and Coast Guard are currently collaborating in the draft of this MOA amendment.

In an effort to update the requirements and characteristics of Small Combatant Craft in support of Navy Patrol Coastal ship requirement through 2012, the Navy completed three studies. The results of these studies identified a valid Navy requirement for a small combatant craft to conduct green water operations and a plan to extend the service life of current PCs as the most cost effective method to address that requirement. As part of the Fiscal Year 2008 President's Budget request, the Navy developed a PC service life extension program (SLEP) designed to extend the service life of PCs by ten years.

Although the demand for Navy small combatant craft to conduct TSC missions is growing, the Navy determined that it could take a short-term risk in the number of Navy PCs to support the Coast Guard near-term shortfall. The impact to Navy operational requirements if none of the PCs loaned to the Coast Guard were returned is that there would be no assets available to complete any expanded TSC missions in the green water, support an increase in COCOM demand, or, after PC SLEP is begun, adequately support underway training and certification of crews deploying to PCs stationed in the Arabian Gulf. Additionally, the operation of USCG 110' WPBs, with a comparable operational profile to the PCs, mitigates the Navy's risk and fulfills patrol vessel mission requirements in the Arabian Gulf theater of operation.

Several areas of overlap between Coast Guard Patrol Boat and Navy Patrol Coastal Ships exist due to similar operational, logistical and maintenance characteristics. Operationally, both assets are able to execute the same missions with some difference in speed, endurance and underway connectivity. The 110' WPB and Navy PC also have numerous maintenance and logistical commonalities including similar engine and hull designs. The Coast Guard PCs are maintained utilizing the existing Navy and Coast Guard infrastructure, procedures and engineering support at Navy and Coast Guard engineering facilities.

III. Report

A. HISTORY AND BACKGROUND

The CYCLONE Class Patrol Coastal ships (PCs) were originally classified as boats and designed as a replacement for the 65 ft MK III Patrol Boats used by Special Operations Command (SOCOM). The ships were procured as a modified non-developmental item (NDI) using commercial off the shelf (COTS) design. The first 13 PCs were commissioned between 1993 and 1996, with PC 14 commissioned in 2000. The U.S. Special Operations Command was the original resource sponsor for the 14 CYCLONE Class PCs. In 2000 PC 1, was transferred to the Coast Guard. Of the remaining thirteen PCs, four were homeported in San Diego, CA and nine were homeported in Little Creek, VA.

After the events of September 11, 2001 the PCs proved particularly well suited for maritime homeland security operations and were employed jointly with the Coast Guard to help protect U.S. ports, waterways and coastline. In October 2002, resource sponsorship for the PCs shifted to the Chief of Naval Operations, Surface Warfare Division. The 13 PCs were operated with the primary employment of coastal patrol, surveillance, and interdiction operations, with a secondary employment of Naval Special Warfare Support. The Navy provided one Navy PC to operational control of the Coast Guard in the Pacific Northwest through rotating deployments to support high value unit escorts. When needed, Navy PCs also operated under operational control of the Coast Guard to fulfill Homeland Security requirements for major ports on the U.S. east and west coasts. In 2004, PC 1 was sold to the Republic of the Philippines.

In July 2004, the Navy and the Coast Guard signed a MOA transferring custody and operational control of four PCs to the Coast Guard from October 1, 2004 until September 30, 2008. This MOA was amended in January 2005 to add a fifth PC to Coast Guard custody effective October 1, 2005 with the same terms as the original MOA. PCs 4, 8, 13 and 14 were transferred to the Coast Guard in 2004 and PC 2 was transferred in 2005. The PCs transferred to the Coast Guard were those that had received a modernization package that included hull stiffening and an improved boat ramp. The Navy's original plan had been to decommission all of the remaining PCs that had not received the modernization package.

In 2005, the Navy's decommissioning plan was changed for the remaining eight PCs under Navy control due to a request for PCs in the CENTCOM AOR to fulfill new requirements in the Arabian Gulf in support of Operation Iraqi Freedom. In 2005, four PCs (PC 5, 6, 9, and 10) were moved to Bahrain and a fifth PC (PC 11) was moved there in 2006. The five PCs in Bahrain are homeported there and Navy crews rotate from CONUS on 185 day deployments to man them. There are a total of thirteen Navy PC crews. The Navy kept three PCs (3, 7 and 12) in CONUS to support underway training and certification for the rotating crews deploying to CENTCOM. Due to the decision to retain the PCs under Navy control, the hull strengthening and ramp improvement modernization package was performed on the remaining eight PCs. The modernization was funded with Cost of War funds and the last PC will complete the modernization in 2007. The current disposition of PCs is that the Coast Guard has custody of five, split between San Diego CA and Pascagoula MS, and the Navy has custody of eight, split between Manama, Bahrain and Little Creek, VA.

In January 2007, the Navy and Coast Guard agreed that the MOA would be amended again to extend the three of the five PCs in Coast Guard custody for an additional three years until 30 September 2011. The other two PCs would be returned to the Navy on or about 30 September 2008 in accordance with the original MOA. A draft copy of this addendum is currently in routing through the Coast Guard and Navy chains of command.

B. MISSION REQUIREMENTS FOR COAST GUARD PATROL BOATS AND NAVY PATROL COASTAL SHIPS THROUGH 2012.

1. Coast Guard Patrol Boats

The Required Operational Capabilities and Projected Operational Environment for the WPB 110' Island Class Patrol Boat are defined in OPNAV Instruction 3501.183A and COMDT Instruction 3501.27A. These instructions state that the 110' WPB mission is to operate offensively in a low to medium intensity, multi-threat environment as a surveillance and interdiction platform, conducting general law enforcement, and enforcing the Exclusive Economic Zones of the United States. These missions include, but are not limited to, Marine Environmental Protection; Ports, Waterways and Coastal Security; Alien Migrant Interdiction Operations; Maritime Law Enforcement; Marine Interdiction Operations; Theater Security Cooperation; and National Defense. The 87' Coastal Patrol Boat operates under the same mission profile as the 110' WPB and provides similar, but reduced, domestic operational capabilities.

The Coast Guard's forty-one 110' WPBs conduct operations throughout the United States, U.S. territories in Guam and the U.S. Virgin Islands, the Caribbean Sea and Southwest Asia regions.

The five Coast Guard PCs play a vital role in keeping non-U.S. citizens from entering the United States by sea. Since 2004, the Coast Guard PCs have interdicted over 400 migrants, made 23 arrests, and seized seven vessels and over 16,958 lbs (8.47 tons) of illegal contraband. The three Coast Guard PCs assigned to the Atlantic Area are programmed for 18.5% of the Patrol Boat Operational Hours (179' WPC and 110' WPB) in the Coast Guard Seventh District's Area of Responsibility in the southeastern United States. The two Pacific Southwest PCs are programmed for 69.4% of the patrol boat hours (179' WPC and 110' WPB) in the Coast Guard Eleventh District's Area of Responsibility in the southwestern United States.

The Coast Guard PCs have greater capabilities than the 110' WPBs, including increased speed, endurance, stern launch facilities and tactical communications. The Coast Guard PCs can sustain speeds of up to 35 knots vice the 30 knot maximum of the 110' WPB and offer increased endurance with the ability to remain underway for 7-10 days. The PCs are also equipped with a stern launched small boat. The stern launch is safer in certain sea states and allows for a quicker small boat launch with reduced manning requirements. The Coast Guard PCs have more electronic capabilities than the regular patrol boats and all have access to classified and regular network connectivity while underway. Other PC 179 C4ISR capabilities include the Officer in Tactical Command Information Exchange System (OTCIXS), which allows the cutter to directly view the Common Operational Picture (COP) network from onboard the ship at sea.

The only capability shortfall the PC has in comparison to the 100' WPB is migrant holding capacity. Due to stability and engineering concerns, the maximum number of migrants a PC can hold is 100, vice 150 for the 100' WPB.

2. Navy Patrol Coastal Ships

General mission requirements for Navy Patrol Coastal Ships are defined in the Required Operational Capabilities and Projected Operational Environment (ROC/POE) for the PC 1 CYCLONE Class ships. This instruction states that the PC 1 Class patrol ship's mission is to conduct coastal patrol and interdiction operations; to conduct barrier surveillance operations; to support operations other than war that may include, but are not limited to, homeland defense, non-combatant evacuation operations, law enforcement operations in conjunction with embarked Coast Guard law enforcement detachment and maritime intercept operations. The primary mission areas for the PC class ship are Command, Control, and Communications (CCC); Mobility; Missions of State; and Non-Combat Operations.

For the near term, the primary mission of the Navy PCs is expected to remain unchanged -- supporting the CENTCOM requirement for a full-time presence of five PCs. It is expected that five Navy PCs will continue to be homeported in Manama, Bahrain operating in the CENTCOM Area of Operations. These five PCs are in high demand and are currently operating an average of 21-25 days per month conducting the following operations:

- Protecting Iraqi Oil Platforms
- Conducting MIO
- Conducting Escort Operations in the Arabian Gulf
- Conducting TSC with Gulf Coalition Countries

Since 2001, PCs in the Arabian Gulf have conducted operations with numerous local countries, including Qatar, Kuwait, Saudi Arabia, and Iraq. The PCs are comparable in size to many of the vessels operated by regional emerging navies and have proven to be outstanding platforms for TSC. CENTCOM PCs have also operated outside the Arabian Gulf off the coasts of Yemen and Somalia.

An unclassified excerpt from a CENTCOM message on PC capabilities states that, "PCs provide vital capability to CENTCOM AOR. From protection of critical Iraqi economic infrastructures to TSC to Expanded Maritime Interdiction Operations (EMIO) in support of GWOT, PCs operate in every part of the CENTCOM AOR. Their speed, agility, and shallow draft allow them to go where other ships cannot and their size is ideal to conduct TSC missions with regional partners to foster a relationship by sharing a common mission and experience. There is no existing or developing platform in the U.S. Navy that has the unique combination of capability and skills provided by PCs."

The remaining three Navy PCs will continue to be homeported in Little Creek, VA. and barring a change in operational requirements, the two PCs returning from the Coast Guard on September 30, 2008 are expected to join them. These PCs will continue to be the training platforms for the thirteen Navy PC crews who rotate to the forward deployed PCs. In addition, these CONUS PCs are available to surge to assist with emergency National tasking in support of Maritime Homeland Security requirements or any additional COCOM request for forces.

The PCs have a unique green water capability that has become more prominent as the GWOT has evolved in recent years. Green water is defined as that very shallow water-space between the brown water occupied by Riverine forces and the deeper blue water occupied by deeper draft surface ships. Many of the current and expected future operations, such as maritime security operations in support of GWOT, and cooperative engagement with partner maritime countries, occur in this very shallow water. The POM 08 Warfighting Capability Plan established green water operations as a required mission. The top capability requirement for craft in this area is to conduct TSC with developing nations' navies. Secondary requirements for these craft are Information, Surveillance, and Reconnaissance (ISR), MIO, Maritime Domain Awareness (MDA), Anti-Terrorism/Force Protection (AT/FP), Law Enforcement Operations, and limited Humanitarian Assistance.

In the recent OPNAV Global War on Terrorism Campaign study, the Navy developed the maritime missions, operational tasks, and capabilities required in green water. The most highly demanded mission requirements were:

- TSC/ Coalition Operations
- Maritime Domain Awareness
- Maritime Interdiction Operations

The analysis determined that the Navy PCs are the only Navy owned forces that currently can meet these mission requirements in green water. The USCG 110' WPBs, with a compatible operational profile to the PCs, also meet the mission requirements in green water.

C. PROGRAM PLAN AND ALTERNATIVES TO MEET COAST GUARD DEEPWATER PATROL BOAT REQUIREMENTS THROUGH 2012

The Coast Guard has taken the following actions to meet its patrol boat requirements through 2012.

- The Commandant of the Coast Guard has approved a plan to multi-crew eight Seventh District 110' WPBs with the crews and funding from the 123' WPBs which were taken out of service due to severe hull degradation.
- An amended Coast Guard-Navy PC MOA is under development for three 179 PCs to remain under the operational control of the Coast Guard through FY11 (additional three years).
- Increase the programmed hours of the Coast Guard's 110' WPB fleet by 400 hours from 1800 to 2200 hours (not including the patrol boats in the Arabian Gulf and Seventh District).
- Increase the programmed hours of the 87' CPB fleet by 200 hours from 1800 to 2000 hours.
- Procure four additional 87' CPBs (including homeporting determination) to minimize the impact to the southern Florida AOR.
- Explore leasing other vessels which have WPB-like capabilities.
- Modify the 110' patrol boat Maintenance Effectiveness Project (MEP) execution plan to provide additional operational hours during critical periods.

The Deepwater Program is expected to provide patrol boat hulls in 2010.

- The first Fast Response Cutter (FRC-B) is estimated to be delivered in 2010 with eight of the planned twelve hulls delivered by the end of 2012.
- The first Fast Response Cutter (FRC-A) is estimated to be delivered in 2015.

D. PROGRAM PLAN AND ALTERNATIVES TO MEET NAVY PATROL COASTAL SHIP REQUIREMENTS THROUGH 2012

Based on GWOT campaign analysis, the Navy conducted the following studies to determine how best to fulfill the current need for Navy small combatant craft with the capability to perform Maritime Interdiction Operation, Theater Security Cooperation, and ISR missions.

- Center for Naval Analysis Joint Maritime Integration Study
- RAND analysis of Small Combatant Craft Alternatives

The CNA Joint Maritime Integration study identified options to address GWOT green water TSC. The RAND Small Craft Combatant Alternative analysis identified three craft options to fill the TSC requirement based on key capabilities. These three options were:

- Near Shore Patrol Vessel (<100 tons)
- Coastal Patrol Vessel (300-700 tons)
- Offshore Patrol Vessel (approx 1500 tons)

These three options were assessed against identified missions, tasks, and key required capabilities. After the initial analysis, RAND concluded that the best option would be to focus on the Coastal Patrol vessel and Offshore Patrol vessel in the second part of the analysis where five options were examined:

- Coastal Patrol Vessel
 - Option 1: Coast Guard Deepwater Fast Response Cutter Program
 - Option 2: New Construction Vessel
 - Option 3: Navy PCs
- Offshore Patrol Vessel
 - Option 4: Littoral Combat Ship
 - Option 5: Coast Guard Deepwater Program

Based on these options, RAND concluded that the most capable and cost effective near term (to 2012) option was the Navy PC.

These studies identified a valid requirement for Navy small combatant craft. The most cost-effective solution to meet that requirement is to extend the service life of the current PCs. As part of the Fiscal Year 2008 President's Budget request, the Navy developed a PC service life extension program designed to extend the service life of PCs by ten years to 2023-2026. The program modernizes one PC per year, beginning in FY 2009. PCs loaned to the Coast Guard

will not be modernized until after their return to the Navy. The PC Life Extension Program is comprised of the following:

- Replacement of Main Propulsion Diesel Engines
- Replacement of Ship Service Diesel Engines
- Radar replacement
- Communication Suite upgrades
- Reverse Osmosis replacement
- Weapons System upgrade
- Electronic Warfare Suite Upgrade

The analysis to date has also demonstrated that there is a likely demand for PC capability in other regions besides CENTCOM and that demand is likely to grow. A more in-depth analytical assessment is being conducted as part of the Fiscal Year 2009 President's Budget development process to determine what the expected demand for Navy small combatant craft in 2020 will be.

E. IMPACT TO NAVY OPERATIONAL REQUIREMENTS IF THE PATROL COASTAL SHIPS CURRENTLY BEING OPERATED BY THE COAST GUARD REMAIN WITH THE COAST GUARD TO SUPPORT THE COAST GUARD MISSION

When the significance of the impact of the Coast Guard 123' WPB delays on the Coast Guard Patrol Boat Operational Hour Requirement became apparent, the Chief of Naval Operations directed his staff to assess available options regarding the return of the PCs on loan to the Coast Guard. Three options were assessed in a coordinated effort by the Fleet Forces Command and OPNAV staffs.

- Option One: Return all PCs to the Navy in September 2008 in accordance with the existing MOA.
 - Benefit: Maximum flexibility for Navy to utilize PCs beyond existing CENTCOM requirements, crew rotations, CONUS crew training and Service Life Extension Program (SLEP).
 - Drawback: Would not help the Coast Guard mitigate the WPB 123' operational shortfall.
- Option Two: Extend the MOA for some of the five PCs with the Coast Guard
 - Benefit: Partially supportive of the Coast Guard operational shortfall, increased flexibility for Navy to utilize PCs beyond existing CENTCOM requirements, crew rotations, CONUS crew training and Service Life Extension Program.
 - Drawback: Disruptive to Fleet Forces Command plans for utilizing returned PCs.
- Option Three: Extend the MOA for all five PCs with the Coast Guard
 - Benefit: Totally supportive of Coast Guard operational shortfall.
 - Drawback: Negative impact on deployed Navy PC crew proficiency due to training hull reduction when PC SLEP begins. No capability to address changes in Navy operational requirements.

Option Two was assessed as providing the best balance between Navy and Coast Guard requirements. The Navy and Coast Guard have agreed to amend the existing MOA to extend the loan of three of the five PCs to the Coast Guard until September 2011. These three PCs are part of the current plan to meet Coast Guard Patrol Boat Operational Hour Requirements. The remaining PCs would be returned to the Navy on September 30, 2008 in accordance with the original MOA. The Navy and Coast Guard are currently cooperating in drafting an amended MOA.

Although the demand for Navy small combatant craft to conduct TSC missions is growing, the current Navy requirement is only to provide five PCs to CENTCOM. The Navy determined that it could take short-term risk in the number of Navy PCs to support the Coast Guard near-term shortfall. The return of two PCs from the Coast Guard to the Navy will allow the CENTCOM requirement to be met as well as provide flexibility to support increases in the Navy operational requirement and ensure adequate crew underway training and successful execution of PC SLEP.

The impact to Navy operational requirements if none of the PCs loaned to the Coast Guard are returned is that there would be no assets available to complete any expanded TSC missions in green water or support any increase in COCOM demand beyond the five that are currently operating in CENTCOM. Underway training and certification of crews deploying to PCs stationed in the Arabian Gulf would also significantly decrease with the reduction in the number of training platforms from three to two in order to support PC SLEP.

F. AREAS OF OVERLAP BETWEEN THE COAST GUARD'S PATROL BOAT REQUIREMENTS AND THE NAVY'S PATROL COASTAL SHIP REQUIREMENTS IN TERMS OF LOGISTICS, OPERATIONS, AND MAINTENANCE

Several areas of overlap exist between Coast Guard Patrol Boat and Navy Patrol Coastal Ships due to similar operational, logistical and maintenance characteristics. Operationally, both assets are able to execute the same missions with the 110' WPBs limiting factors being speed, endurance and underway connectivity. As previously mentioned, the PC is faster (5+ knots) and can remain at sea longer (2-3+ days) than the 110' WPB. Additionally, the PCs underway connectivity and superior command and control capabilities link it "real time" to the Coast Guard and Navy's Common Operational Picture (COP).

The 110' WPB and Navy PC also have numerous maintenance and logistical commonalities, including similar engine and hull designs. The Coast Guard PCs are maintained utilizing the existing Navy and Coast Guard infrastructure and procedures at Navy and Coast Guard engineering facilities. The Navy provides annual funding for operation, maintenance costs and Navy engineering support representatives. The Coast Guard has overall responsibility for configuration management, but the Navy has representation in all configuration changes that impact mission accomplishment, operational concerns, and overall cost. At the unit level, the PCs utilize Coast Guard and Navy engineering support (funding and personnel) to repair equipment casualties, whether in homeport or deployed, with no significant parts, labor or logistical delays due to seamless collaboration between Coast Guard and Navy maintenance support organizations.

DEPARTMENT OF THE NAVY
OFFICE OF THE SECRETARY
1000 NAVY PENTAGON
WASHINGTON DC 20350-1000

APR 17 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As directed by the Fiscal Year 2007 House Armed Services Committee report 109-452, the enclosed report provides information on the number of midshipmen participating in foreign language study at the Naval Academy, the languages in which they are enrolled, their levels of proficiency at graduation, and the foreign language classes offered. The report also describes the Naval Academy plans for expanding foreign language programs, provides an update on the current implementation of foreign language initiatives included in the FY 2007 budget request, and describes the costs required for the program expansion.

With the exception of a one-time expenditure of \$10M for facilities modernization in FY 2007, the \$3.2M sought for program expansion are an annual requirement reflected in the Future Years Defense Program. The Naval Academy is aggressively applying the additional funds to expand course offerings in the strategic languages, Arabic, Chinese, Japanese, and Russian, as well as increasing opportunities for summer and semester immersion study abroad.

The Naval Academy has reoriented its recruitment and admissions efforts to identify candidates with strong language skills. The Naval Academy remains committed to providing a sound foundation in science, mathematics and engineering for all its graduates, while maintaining the balance of technical and non-technical skill sets within the constraints of a four-year undergraduate curriculum.

A similar letter has been sent to Chairmen Skelton, Inouye, and Murtha. As always, if I can be of further assistance, please let me know.

Sincerely,

Handwritten signature of William A. Navas, Jr. in black ink, with a stylized flourish at the end.

William A. Navas, Jr.
Assistant Secretary of the Navy
(Manpower and Reserve Affairs)

Report to Congress on
The Current State of Foreign Language Programs
and
The Plans for Implementing
A Strategic Language Development Program at
The United States Naval Academy

PREPARED BY:
Superintendent, United States Naval Academy
121 Blake Road
Annapolis, MD 21402-5000

March 2007

Requirement

The FY 2007 House Armed Services Committee report 109-452 directed the Service Secretaries to report on the current state of language programs and the plans for implementing a strategic language development program at the United States Military Academy, the United States Naval Academy, and the United States Air Force Academy. In consultation with the superintendents of each academy, the secretaries should provide data on the number of students participating in language training, the languages in which they are participating, levels of proficiency, and language classes offered. In addition, the superintendents should identify their plans for expanding foreign language programs, provide an update on their current implementation of the language initiatives included in the fiscal year 2007 budget request, and describe the costs required for the programs.

Current state of language programs

The Language Studies Department at the U.S. Naval Academy offers courses in seven foreign languages: Arabic, Chinese, French, German, Japanese, Russian, and Spanish. As of fall 2007, four years after the initiation of the Arabic program, courses at four curricular levels will be offered in all seven languages.

Midshipmen enrolled in any academic major may simultaneously pursue a minor in any of the seven languages, attaining a degree of proficiency that varies according to the difficulty of the language and the midshipman's background. For example, midshipmen entering USNA often have prior course work in French, German, or Spanish. This allows them to enroll in upper-level courses and attain a high degree of proficiency by graduation. Very few entering midshipmen have backgrounds in Arabic, Chinese, Japanese, or Russian. Given the engineering of the USNA curriculum, most midshipmen begin these languages in their second year, and can only complete six semesters of study. This allows them to earn a minor, but at a lower proficiency level than midshipmen studying more commonly taught languages.

Midshipmen who have completed four semesters of any of these languages may participate in a summer study abroad program in a country in which their selected language is spoken.

In summer 2006, strategic language courses were opened up to a limited number of midshipmen in their first year. It is expected that some of these midshipmen will major in the two newly established majors, Arabic and Chinese.

Plans for implementing a strategic language development program

The Naval Academy received supplementary funding in Fiscal Year 2007, which permitted the Academy to enhance its strategic language program significantly. Eight new full-time faculty members were hired to expand access to strategic or potentially strategic languages (Arabic, Chinese, Japanese, and Russian). Two faculty members were hired in each of these four languages. During summer 2006, a new study abroad program was established in Cairo, Egypt, for the first group of midshipmen to complete four semesters of Arabic. Study abroad programs are also offered in China, Japan, France, Germany, Mexico, Russia, and Spain.

With the start of academic year 2006-2007, fall semester enrollment in courses in the four strategic languages changed as follows:

Arabic: increased from 52 to 134 students

Chinese: increased from 53 to 132 students

Japanese: increased from 86 to 110 students

Russian: decreased slightly from 70 to 64 students.

In March 2007, the Language Studies Department hired an additional Chinese instructor and is in the process of hiring an additional Arabic instructor, as well as a curriculum development/ assessment specialist. This will allow the department to accommodate more students in both Arabic and Chinese in fall 2007.

The Language Study Abroad Program for summer 2007 will increase the number of participants from 102 to 150, with a new program in Chile, an additional six-week program in China, and two additional programs in Japan, as well as the ongoing programs mentioned in the first paragraph of this section. One of the new programs in Japan is an engineering internship at JAXA, the Japanese space agency.

The Naval Academy's Language Studies Department is currently housed in Nimitz Library. Minor renovation of the building is planned for spring 2008 to provide additional classrooms, additional faculty offices, and two new state-of-the-art language laboratory/testing facilities.

Number of students participating in language training:

Fall 2006: 1199
Spring 2007 1118.

Number of students participating in strategic language training (Arabic, Chinese, Japanese, Russian):

Fall 2006 440
Spring 2007 367.

[Note: for a variety of structural reasons, including prior validation and curricular access to elective language courses for midshipmen majoring in technical subjects, fall enrollments tend to be slightly greater than those in the spring semester.]

Midshipman enrollment in foreign language study, by language, Academic Year 2006-2007:

	<u>Fall</u>	<u>Spring</u>
Arabic:	134	105
Chinese:	132	99
French:	177	153
German:	88	77
Japanese:	110	101
Russian:	64	62
Spanish:	482	474.

Levels of foreign language proficiency: Prior to the 2006-2007 Academic Year, the Defense Language Proficiency Test (DLPT) was offered on a voluntary basis. In spring 2006, most midshipmen in third- or fourth-year courses in strategic languages did not elect to take the test. Midshipmen in the commonly taught languages who did take the DLPT had the following results:

French: 4 midshipmen earned at least 2/2 (listening/reading)

German: 5 midshipmen earned at least 2/2 (listening/reading)

Spanish: 40 midshipmen earned at least 2/2 (listening/reading): of whom 12 earned 3/3.

The Defense Language Proficiency Test will be offered on several different dates in spring 2007 to midshipmen in the Class of 2007 who have enrolled in advanced foreign language study (third year or higher).

Language classes offered (all taught in the target language except where noted):

Arabic:

FA101-102	<i>Basic Arabic I and II</i>
FA201-202	<i>Intermediate Arabic I and II</i>
FA301-302	<i>Advanced Arabic I and II</i>
FA350	<i>Window on Arabic Culture</i>
FA 486A	<i>Readings in Classical Arabic</i>
FA 486B	<i>Arabic Literature and Film</i>

New courses approved for Academic Year 2007-2008:

FA325	<i>Media Arabic</i>
FA342	<i>Arabic Dialect</i>
FA425	<i>Arabic Discourse in Society</i>
FA426	<i>Modern Arabic Literature</i>

Chinese:

FC101-102	<i>Basic Chinese I and II</i>
FC201-202	<i>Intermediate Chinese I and II</i>
FC301-302	<i>Advanced Chinese I and II</i>
FC485-486	<i>Advanced Topics in Chinese I and II</i>

New courses approved for Academic Year 2007-2008:

FC350	<i>Chinese Culture through Film</i>
FC360	<i>The Self and Modernity: Twentieth-Century Chinese Literature</i>
FC401-402	<i>Chinese Language and Culture I, II</i>
FC450	<i>Styles of Discourse in Chinese</i>
FC460	<i>Chinese in Media</i>

English as a Second Language

FX101-102	<i>English for Non-native Speakers</i>
-----------	--

French

FF101-102	<i>Basic French I and II</i>
FF201-202	<i>Intermediate French I and II</i>
FF301	<i>Advanced French I: Civilization Readings and Composition</i>

FF302	<i>Advanced French II: Introduction to Francophone Literatures and Cultures</i>
FF411	<i>Development of French Civilization</i>
FF412	<i>Modern France</i>
FF421	<i>Representative Readings in French Literature I</i>
FF422	<i>Representative Readings in French Literature II</i>

New course proposed: La France et le monde arabe (France and the Arab World)

German

FG101-102	<i>Basic German I and II</i>
FG201-202	<i>Intermediate German I and II</i>
FG310	<i>Introduction to Contemporary Germany</i>
FG320	<i>Introduction to German Literature</i>
FG411	<i>Development of German Civilization</i>
FG412	<i>Modern Germany</i>
FG421	<i>Representative Readings in German Literature I</i>
FG422	<i>Representative Readings in German Literature II</i>

Japanese

FJ101-102	<i>Basic Japanese I and II</i>
FJ201-202	<i>Intermediate Japanese I and II</i>
FJ301-302	<i>Advanced Japanese I and II</i>
FJ302X	<i>Accelerated Advanced Japanese II</i>
FJ485-486	<i>Advanced Topics in Japanese I and II</i>

Russian

FR101-102	<i>Basic Russian I and II</i>
FR201-202	<i>Intermediate Russian</i>
FR330	<i>Third Year Russian I: Readings in Language and Culture</i>
FR340	<i>Third Year Russian II: Introduction to Poetry and Prose</i>
FR350	<i>Russian Literature and Culture in Translation (offered in English)</i>
FR411	<i>Development of Russian Civilization</i>
FR412	<i>Modern Russian</i>

Spanish

FS103-104	<i>Basic Spanish I and II (accelerated, not for true beginners)</i>
FS201-202	<i>Intermediate Spanish I and II</i>
FS301	<i>Advanced Spanish with Readings on Contemporary Spanish-American Culture</i>
FS304	<i>Advanced Spanish with Readings on Contemporary Spain</i>
FS412	<i>Contemporary Latin American Civilization</i>
FS413	<i>Spanish Civilization</i>
FS421	<i>Spanish Literature</i>
FS422	<i>Latin American Literature</i>

FS485-486 *Special Topics in Spanish and Latin American Literature and Culture*

Anthropology

FL286 *Cultural Anthropology for Military Application*

New course approved for Academic Year 2007-2008:

FL350 *Intercultural Communication*

Linguistics

FL220 *Principles of Language and Linguistics*

FL480 *Language Studies Research Seminar (Information Technology Capstone)*

Update on current implementation of the language initiatives included in the fiscal year 2007:

In addition to the initiatives listed above which include increased faculty and staff to support the growth in the strategic language development and enrollment, the Naval Academy has expanded aggressively the number of midshipmen who participate in summer language and cultural immersion programs, semester exchanges with foreign military academies and study abroad, professional training with cadets and midshipmen from foreign service academies, and greater participation in foreign academic conferences and orientations. The current projection for Academic Year 2006-2007 (as of March 2007), with a comparison from the prior academic year, includes:

	<u>2007</u>	<u>2006</u>
a. Language/Cultural Immersion:	165	109
b. Semester Exchange with foreign academies:	10	3
c. Professional training programs abroad	60	45
d. Foreign Academy reciprocal visits	25	18
e. Foreign conferences	40	25
f. Semester Study Abroad at civilian universities	8	0
Total	268	200

The total additional annual cost required for the expanded foreign language program at the Naval Academy is:

- (1) Additional language faculty in strategic languages (Arabic, Chinese, Japanese, Russian) - \$1.1M, annually;
- (2) International program staff support - \$.9M, annually;
- (3) Increased language immersion - \$1.2M, annually;
- (4) Building renovation - \$10M (already programmed for FY07 only).

DEPARTMENT OF THE NAVY
THE ASSISTANT SECRETARY OF THE NAVY
(INSTALLATIONS AND ENVIRONMENT)
1000 NAVY PENTAGON
WASHINGTON, D.C. 20350-1000

MAR 30 2007

The Honorable Dave Obey
Chairman, Committee on Appropriations
House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

The House Appropriations Committee Military Quality of Life report 109-464 directed that the U.S. Navy submit a report to the Committee no later than 30 days after completion of the Draft Supplemental Environmental Impact Statement (DSEIS). The attached report explains how the SEIS addresses the deficiencies in the initial EIS that were identified by the courts, and how the Navy reconsidered alternative sites in cooperation with the State of North Carolina.

The DSEIS provides additional analysis of potential environmental impacts of construction and operation of an OLF at five alternative OLF sites while addressing the four FEIS deficiencies identified by federal district and appellate courts. The DSEIS is the culmination of 20 weeks of fieldwork and 12 technical reports produced through consultation with the U.S. Fish and Wildlife Service (Cooperating Agency), wildlife experts, and acoustic engineers. The Navy employed three noted waterfowl experts (PhDs) to provide technical expertise and independent peer review of the study. It is important to note that the Navy's underlying decision on F/A-18E/F basing was not challenged in court. Neither the District Court nor the Appellate Court found any deficiencies with the Navy's range of alternatives for an OLF. Therefore, the DSEIS re-examined the original home-basing alternatives for the OLF but did not revisit the original site screening process, as outlined in the FEIS and the OLF Siting Study, or expand the range of alternatives that had been approved by the courts. At the request of the Governor of North Carolina, the DSEIS did provide a more detailed discussion on alternative OLF sites, such as one in Carteret County, NC, that were initially considered but eliminated from detailed analysis.

Please do not hesitate to contact me if I can be any further assistance.

Sincerely,

BJ Penn

I. REPORT REQUIREMENTS

House Report 109-464 on the Fiscal Year 2006 Military Quality of Life and Veteran's Affairs and related Agencies Appropriations Bill requires the Navy provide the House Appropriation Committee a report detailing how the Supplemental Environmental Impact Statement (SEIS) addresses the deficiencies in the Final EIS (FEIS) as identified by the relevant court decisions. The report is due no later than 30 days after completion of the Draft SEIS (DSEIS), and shall include an explanation of how the Navy complied with the Committee's previous direction to reconsider alternative sites in cooperation with the State of North Carolina.

II. EXECUTIVE SUMMARY

The DSEIS provides additional analysis of potential environmental impacts of construction and operation of an Outlying Landing Field (OLF) at five alternative OLF sites in Northeastern North Carolina while addressing the four FEIS deficiencies identified by federal district and appellate courts: (1) potential impacts to migratory waterfowl and Pocosin Lakes National Wildlife Refuge (NWR); (2) impacts associated with surge operations; (3) identification and evaluation of mitigative measures; and (4) cumulative impacts of the operation of the OLF and other military uses of airspace in North Carolina.

The DSEIS is the culmination of 20 weeks of fieldwork and 12 technical reports produced through consultation with the U.S. Fish and Wildlife Service (Cooperating Agency), wildlife experts, and acoustic engineers. Additionally, the Navy employed three noted waterfowl experts (Ph.Ds) to provide technical expertise and independent peer review of the study. The Navy's decision to home-base eight Super Hornet fleet squadrons and the F/A-18 Fleet Replacement Squadron (FRS) at NAS Oceana and two Super Hornet fleet squadrons at MCAS Cherry Point was not legally challenged. Additionally, the Courts did not find deficiencies with the Navy's site screening process conducted to develop a range of alternatives for an OLF. Consequently, the Navy did not re-examine the original homebasing alternatives or the OLF site screening process as outlined in the FEIS and the OLF Siting Study. At the request of the Governor of North Carolina, the DSEIS did provide a more detailed discussion regarding alternative OLF sites, such as one in Carteret County, NC, that were initially considered but eliminated from detailed analysis.

In conclusion, the additional analysis conducted for the DSEIS takes the requisite "hard look" required under the National Environmental Policy Act (NEPA) and provides the decision maker the best available information to make an informed decision. The Navy is now proceeding with a public comment period on the DSEIS, and will conclude with a FSEIS and a subsequent Record of Decision.

III. REPORT

a. **BACKGROUND**

To address FEIS deficiencies identified by the courts, the DSEIS provides additional analysis of potential environmental impacts of construction and operation of an OLF at the five alternative OLF sites identified in the FEIS that support the homebasing of Super Hornet aircraft at NAS Oceana and MCAS Cherry Point. While the DSEIS focused on the four previously mentioned FEIS deficiencies identified by the Courts, additional analysis on Bird Aircraft Strike Hazard (BASH), impacts to wetlands and to threatened and endangered species was also conducted to ensure the Navy took the required "hard look" and met its obligations under NEPA.

To provide the Navy decision-maker with a comparative assessment of alternatives in accordance with the requirements of NEPA, the Navy re-evaluated the areas of concern identified by the courts for all of the proposed OLF site alternatives that support the home-basing of F/A-18 E/F aircraft at NAS Oceana and MCAS Cherry Point. Therefore, the five alternative OLF sites in Northeastern North Carolina that were evaluated in the FEIS to support the home-basing of the F/A-18 E/F at NAS Oceana and MCAS Cherry Point are considered in the DSEIS.

The DSEIS is the culmination of 20 weeks of fieldwork and 12 technical reports produced through consultation with the U.S. Fish and Wildlife Service (Cooperating Agency), wildlife experts, and acoustic engineers. The U.S. Fish and Wildlife Service (USFWS) is the federal agency with expertise in migratory waterfowl and wildlife refuges, and as a result, is uniquely qualified to contribute to this study as a Cooperating Agency. USFWS participated in the over-wintering study as waterfowl observers, provided updated information on threatened and endangered species, and reviewed and commented on draft technical reports and the preliminary DSEIS.

Additionally, the Navy employed three noted waterfowl experts (PhDs) to provide technical expertise and independent peer review of the study. These experts were involved in all aspects of migratory waterfowl data collection and analysis. The Navy also conducted information briefings and meetings with state and local governments and the media.

It is important to note that the Navy's underlying decision on F/A-18E/F basing was not challenged in court. Additionally, neither the District Court nor the Appellate Court found any deficiencies with the Navy's range of alternatives for an OLF. Therefore the DSEIS re-examined the original home-basing alternatives for the OLF but did not revisit the original site screening process, as outlined in the FEIS and the OLF Siting Study, or expand the range of alternatives beyond that evaluated in the Final EIS. At the request of the Governor of North Carolina, the DSEIS did provide a more detailed discussion regarding alternative OLF sites, such as one in Carteret County, NC, that were initially considered but eliminated from detailed analysis.

The additional analysis conducted for the DSEIS takes the requisite "hard look" required under NEPA and provides the decision maker the best available information to make an informed decision.

b. POTENTIAL IMPACTS TO MIGRATORY WATERFOWL AND POCOSIN LAKES NATIONAL WILDLIFE REFUGE (NWR)

To evaluate the potential impacts to migratory waterfowl and Pocosin Lakes NWR, the Navy conducted an overwintering study, noise response experiments, extensive literature review, and comparative airfield analysis. For the overwintering study, a biologist was in the field for 20 weeks between October 2005 and March 2006, conducting ground and aerial surveys of migratory waterfowl at the three alternative OLF sites with significant waterfowl populations. In conjunction with the overwintering study, three noise flight tests with an F/A-18F aircraft were conducted at Site C to measure aircraft noise levels and waterfowl response to aircraft operations. *The results of these two studies are summarized in technical reports, 2005-2006 Overwintering Waterfowl Study and Summary of Waterfowl Noise Response Evaluations respectively.*

For the literature review, 42 articles in the scientific community that relate to research on the effects of aircraft noise on species of waterfowl were identified and reviewed. Each

article is summarized in technical report, *Review of Studies Related to Aircraft Noise Disturbance of Waterfowl* and includes: (1) salient conclusions from the study; (2) areas of scientific uncertainty and characterization of these uncertainties; and (3) relevance of the study to the relationship of aircraft operations to the waterfowl/wildlife populations in the vicinity of each of the five OLF sites. These studies were used to support an impact assessment of the construction and operation of an OLF on migratory waterfowl populations in Northeastern North Carolina.

For the comparative analysis of existing airfields in proximity to NWRs, information on aircraft operations, waterfowl population and distribution, and waterfowl foraging habitat in and around five operating airfields and two training ranges that closely resemble conditions at alternative OLF sites C and D was reviewed for efficacy of BASH management programs and the impact of aircraft operations on waterfowl. A study was completed to evaluate how overwintering and migrating populations of snow geese, tundra swans, and ducks in the vicinity of existing airfields and military ranges are affected by aircraft over flights and noise. One of the goals of the study was to determine how likely migratory waterfowl would respond to flight operations if an OLF is constructed in Northeastern North Carolina. The Navy conducted site visits and interviews with airfield managers and BASH management teams, and reviewed historical documentation, to include data from field observations and agriculture mapping studies. As a result, conceptual BASH management plans for each site were developed.

The conclusions from these studies indicate that aircraft operations have not negatively impacted the numbers of snow geese, tundra swans, and ducks that overwinter nearby operating airfields, and that aircraft operations are not severely restricted at any airfield/training range despite elevated BASH conditions. The results are summarized in technical report, *Comparative Airfield Analysis: Case Studies at Existing Military and Civilian Airfields and Military Training Ranges*.

USFWS has expressed disagreement with the conclusions reached from the Comparative Airfield analysis, and as such, the impact of the operation of the OLF on Pocosin Lakes NWR. Specifically, they assert that assessment of waterfowl behavior around airfields should have been restricted to comparisons to east coast airfields due to unique and biologically significant differences between waterfowl across the different flyways. A full explanation of USFWS positions and Navy responses is provided in Appendix C of the Draft SEIS.

c. IMPACTS ASSOCIATED WITH SURGE OPERATIONS

Surge operations are defined as a 50% increase in Field Carrier Landing Practice (FCLP) operations over a 30 day period, followed by 50% decrease in operations while forces are deployed. Requirements were compiled from exercise Summer Pulse 04, where four Atlantic Fleet Carrier Strike Groups (CSG) and associated airwings were deployed. Impacts were determined by recalculating noise levels at selected points of interest using operations data under normal, surge, and post-surge slow down conditions. The result was that surge operations increase intensity in the short term, but do not increase the overall number of operations, do not have a significant effect on noise equivalent sound level values, and do not affect average noise contours.

d. IDENTIFICATION AND EVALUATION OF MITIGATIVE MEASURES

The Navy identified several measures to mitigate the impacts of construction and operation of the OLF. First, flight tracks were revised at the alternative OLF sites to avoid population centers and sensitive ecological areas to the extent possible without degrading training quality. Secondly, Class D airspace at the alternative OLF sites was identified in order to minimize potential for conflicts with other aviation operations. Third, Navy will work with U.S. Army Corps of Engineers to develop appropriate wetland mitigation plans if needed. Although not required by the Courts, additional work was conducted on wetlands, and included site assessments of the wetland hydrology and soils on each site to verify National Wetland Inventory maps of wetland areas at each alternative OLF site. The results of this study are summarized in technical report *OLF Wetland Mapping Project*. Navy will consult with USFWS on the red wolf, and will also work with USFWS to ensure access to Navy property to manage the red wolf populations. Navy will also commit to two full-time natural resource specialists to manage the BASH program and to implement a comprehensive integrated natural resources management plan at the OLF site identified in the Record of Decision. Finally, the land acquisition strategy was revised to reduce impacts on the local community and community economics by placing greater reliance on acquisition of easement interests instead of full fee title, enabling a significant reduction in the number of current residents subject to mandatory relocation.

e. CUMULATIVE IMPACTS OF THE OPERATION OF THE OLF AND OTHER MILITARY USES OF AIRSPACE IN NORTH CAROLINA

Navy conducted a cumulative airspace use study of the OLF and all current and proposed airspace uses in Northeastern North Carolina, to include a cumulative noise impact study of operations at OLF Site C and the proposed GUNNY Military Operating Area (MOA). The study found no cumulative noise impact on underlying NWRs and no cumulative noise impact on communities. Results of this study are included in technical report *Analysis of Cumulative Airspace Use in Eastern North Carolina*.

f. ADDITIONAL STUDIES

In addition to the specific studies detailed above, the following studies were also conducted to support the development of the DSEIS: *Results of the Historical Waterfowl Population and Distribution Data Collection Effort; OLF Ambient Soundscape Characterization; Assessment of Potential Foraging Habitat and Crop Mapping; Mobile Avian Radar System Monitoring Program and Data Analysis Report for Fall 2003/Winter 2004, OLF Washington County, North Carolina; Analysis of Acoustical Environment for Proposed OLF sites in Eastern North Carolina; and BASH Assessments and Conceptual BASH Plans*. These additional studies contributed to the overall analysis and conclusions reached in the DSEIS.

g. HOW THE NAVY COMPLIED WITH PREVIOUS DIRECTION TO FULLY RECONSIDER ALTERNATIVE SITES IN COOPERATION WITH THE STATE OF NORTH CAROLINA.

The five alternative OLF sites in Northeastern North Carolina that were evaluated in the Final EIS to support the home-basing of the F/A-18 E/F (Super Hornet) Aircraft at NAS Oceana and MCAS Cherry Point were re-evaluated in the SEIS. The reason for doing so is to provide the Navy decision-maker with the additional analysis required by the court in the form of a comparative assessment of reasonable alternatives that support the home-basing of F/A-18 E/F aircraft at NAS Oceana and MCAS Cherry Point, and is consistent with NEPA. The court decisions invalidated neither the methodology the Navy used nor the results the Navy obtained in arriving at its reasonable range of alternatives, and as long as those alternatives are given a hard look and evaluated in a comparative fashion, the requirements of NEPA are met.

On February 23, 2004, the North Carolina Governor's office announced the formation of a study group charged with examining and reporting on the strategic, environmental, and economic impacts of the proposed OLF in North Carolina. The study group also addressed the issue of alternative OLF sites. The Navy agreed to participate as technical advisors to address questions and concerns generated in the course of the review. Participation by the Navy included the Commander, Navy Facilities Engineering Command and the Commander, Navy Region Mid-Atlantic. The OLF study group met eight times over a 12-week period in early 2004, with the Navy providing representatives to each of these meetings, participating openly as a source of information throughout this process.

In April 2005 the Navy was provided a draft report prepared by the Governor's OLF study group for review and comment. A response was provided in May 2005, but the Navy did not receive any further feedback from the State of North Carolina on this report.

One of the key recommendations from the study group concerning alternative OLF sites was Open Grounds Farm in Carteret County. Open Grounds Farm is an approximately 40,000-acre commercial farm located 18 Nautical Miles (NM) east of MCAS Cherry Point and 120 NM south of NAS Oceana. At the request of the Governor of North Carolina, the Navy re-examined Open Grounds Farm and in several meetings with the Governor and his staff in May 2004, May 2005, and October 2005 provided briefings detailing why Open Grounds Farm is not a feasible alternative. Specifically, Open Grounds Farm was eliminated during the airspace evaluation phase of the OLF Siting Study due to significant conflicts with existing operations at Bombing Target (BT)-11 (Piney Island), and because it is within restricted airspace R-5306A. The Open Grounds Farm is within three miles of the safety zone surrounding the BT-11 target area, and as such, operations at the OLF site could not be conducted simultaneously with operations of BT-11. OLF operations may also be constrained by operations within R-5306A.

Additional sites reconsidered during the SEIS process but still determined to be unreasonable alternatives were MCOLF Oak Grove in Jones County, North Carolina, and Ft. Pickett Army National Guard Maneuver Training Center in Nottoway County, Virginia. A more detailed description and further explanation as to why these three sites are not reasonable alternatives is provided in the DSEIS.

The Navy also coordinated with other State agencies during development of the DSEIS. The Navy conducted an agency information meeting in New Bern, North Carolina in July 2005 with Federal and State agencies. Agency participation from the State of North Carolina included the North Carolina Division of Coastal Management, the North Carolina Department of Environment and Natural Resources, and the North Carolina Wildlife Resources Commission. The meeting was held to provide an overview of the project, including a description of the Final EIS and the OLF Siting Study, areas of concern identified by the District Court, the SEIS process, and the Navy's technical approach for addressing the areas of concern in the SEIS. Follow-on meetings were held in December 2005 and March 2006. These follow-on meetings updated participating Federal and State agencies, to include those State agencies mentioned above, on the progress of the SEIS since the previous meeting and facilitated the exchange of technical ideas and information. North Carolina state agency participation in these meetings resulted in the Navy updating the Coastal Zone Consistency Determination and addressing Clean Water Act Section 401/404 permit requirements.

Finally, the Navy worked with the county governments of Perquimans, Bertie, Washington, Hyde, Craven, and Beaufort Counties to update residential development, roadway and infrastructure improvements, commercial developments, economic impact data, land values, and location of new schools and churches within the counties since completion of the Final EIS.

h. REPORT CONCLUSION

The DSEIS provides the required additional analysis of the environmental consequences of construction and operation of an OLF to address court identified deficiencies in the FEIS. The DSEIS also addresses the issue of alternative sites considered but not included in the FEIS, and the reasons they are not reasonable alternatives. The DSEIS is the culmination of 20 weeks of fieldwork and 12 technical reports produced through consultation with the U.S. Fish and Wildlife Service (Cooperating Agency), wildlife experts, and acoustic engineers. This additional analysis, focused on the five alternative OLF sites identified in the FEIS, takes the "hard look" required under NEPA, and provides the decision maker the best available information to make an informed decision.

The USFWS acknowledges that they could not identify any additional information that could be brought to bear on the issue and placed before decision-makers prior to solicitation of public

comment. USFWS indicated in a recent public hearing on the DSEIS that they did not agree with the Navy's conclusions regarding impacts on waterfowl and the wildlife refuge at Site C. The Navy will fully consider this and all other comments received during the public comment period, and will respond to such comments in the Final SEIS.

THE ASSISTANT SECRETARY OF THE NAVY

(RESEARCH, DEVELOPMENT AND ACQUISITION)

1000 NAVY PENTAGON

WASHINGTON DC 20350-1000

SEP 11 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As directed by the Fiscal Year 2004 Defense Appropriations Conference Report, H. Rep. No. 108-283, the enclosed report provides the Early Operational Assessment for the Tactical Aircraft Directed Infrared Countermeasures (TADIRCM) Program. The 2006/2007 Department of Navy Strike DIRCM Analyses of Alternatives (AoA) is being used to evaluate the feasibility of establishing a program of record that would install TADIRCM technology in naval strike fighter aircraft such as the F/A-18 Type Model Series. The AoA is currently underway.

Although the enclosed report is unclassified, please note that it is marked with a distribution statement to denote that it contains sensitive test and evaluation information. The Department of Navy so marked the report to protect results of the test and evaluation of TADIRCM, the disclosure of which outside the United States Government may cause unfair advantage or disadvantage to the manufacturer of TADIRCM products. Accordingly, I request that you handle the report with appropriate care, for instance by not disclosing the information in any reports disseminated outside of the United States Government.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

REPORT TO CONGRESS

ON

TACTICAL AIRCRAFT DIRECTED INFRARED
COUNTERMEASURES (TADIRCM) PROGRAM
EARLY OPERATIONAL ASSESSMENT (EOA)

Prepared by:
Department of the Navy
Chief of Naval Operations (N880C11)
2000 Navy Pentagon (5D453)
Washington, DC 20350-2000

August 2007

BACKGROUND

The Fiscal Year 2004 Defense Appropriations Conference Report 108-283 provided \$12.0 million for Navy to conduct an initial suitability assessment that was to be obtained through a Tactical Aircraft Directed Infrared Countermeasure (TADIRCM) Early Operational Assessment (EOA), the results of which must be reported back to Congress within 60 days of the EOA completion.

Navy's TADIRCM Advanced Technology Demonstration (ATD) successfully demonstrated an effective directed LASER infra-red (IR) countermeasure technology for tactical jet aircraft. This ATD successfully demonstrated the effectiveness of this technology and demonstrated the technology's potential to develop its manufacturability, suitability and reliability.

Fiscal Year 2005 Congressional Language added \$7.2 million to the TADIRCM EOA effort. \$2.3 million was provided for additional assets and spares to accomplish testing in a flight scenario. \$4.9 million was provided for the EOA flight tests.

Department of the Navy (DON) has a TADIRCM Program Element (PE) and related PE's that fund multiple DIRCM related efforts in two main categories. Strike DIRCM for strike fighter aircraft, and Assault DIRCM for Assault Support Aircraft (ASA) such as DON's cargo, patrol, rotary wing and tilt rotor aircraft. Due to the loss of ASA aircraft in the past few years DON has made the development and fielding of viable Assault DIRCM solutions a higher priority than Strike DIRCM. These acquisition efforts are discussed below.

PROGRAM STATUS

The TADIRCM ATD was completed in 2002. The attached TADIRCM EOA is a pre Milestone "A" DON effort that was completed on July 17, 2007 when the TADIRCM Program EOA OT-A1 Final Report was approved.

The 2006/2007 DoN Strike DIRCM Analysis of Alternatives (AoA) is evaluating the feasibility of establishing a program of record (POR) that would put TADIRCM technology onto strike fighter aircraft such as the F/A-18 Type Model Series (TMS). This AoA is still in progress.

IMPLICATIONS FOR OTHER ACQUISITION PROGRAMS

ASSAULT DIRCM

The 2006/2007 DON Assault DIRCM AoA, which is a companion to the Strike DIRCM AoA, evaluated the feasibility of putting TADIRCM like capabilities on Department of Defense (DoD) cargo, rotary wing and tilt rotor ASA (final report is expected in late FY 2007).

Four acquisition paths are based on this AoA: (1) Rapidly put available DIRCM systems on aircraft that can accept them in response to urgent need; (2) Improve existing AAR-47 threat warning capabilities that cue aircrew and flare countermeasures; (3) Develop Joint and Allied Threat Awareness System (JATAS) as a direct replacement to the AAR-47 capable of cueing the aircrew, flares and DIRCM (Increment 1 of Assault DIRCM); (4) Develop DIRCM technology that fits into assault aircraft that cannot accept current DoD DIRCM systems (due to size & weight constraints)(Increment 2 of Assault DIRCM).

- **DON LAIRCM:** A DON rapid response to an urgent fleet need to put existing DIRCM capabilities on DON medium and large rotary wing and tilt rotor aircraft that have the available space and weight allotment to accept these systems.
- **AAR-47 Upgrades:** Approximately 2,500 DoD and Allied aircraft use the DON AAR-47 missile and laser warning system that can cue the aircrew and flare countermeasures. DON is developing AAR-47B(V)2 upgrades that are expected to start fielding in 3rd Qtr FY 2008 to address deficiencies of the current sensor in some operational environments. These upgrades are urgently needed by the approximately 1,200 DON AAR-47 equipped aircraft.
- **JATAS:** DON created a JATAS Capabilities Development Document (CDD) that is based on the Assault DIRCM AOA and constitutes Increment 1 of Assault DIRCM. This CDD is in the Joint Capabilities Integration and Development System (JCIDS) review/approval process. JATAS will be a direct replacement to the AAR-47 with greatly expanded capabilities including the ability to cue a DIRCM and detect a much wider range of threats as well as cueing the aircrew and flare countermeasures. JATAS is expected to be fielded starting in 2013 on ASA.
- **DIRCM Technology Development.** In coordination with United States Air Force (USAF) and United States Army (USA), DON is funding multiple technology development efforts that are expected to lead to development of light, small DIRCM systems. The resultant DIRCM system will constitute Increment 2 of Assault DIRCM and will be fielded on ASA that remain unprotected by larger, existing DIRCM systems due to weight and size limitations.

REQUIREMENTS

STRIKE DIRCM. The requirement for Strike DIRCM (the direct extension of the TADRIM ATD and EOA) will be developed after the Strike DIRCM AoA is complete.

DON LAIRCM. Requirements are contained in the draft DON Annex to the USAF Large Aircraft Directed Infrared Countermeasures (LAIRCM) requirements. The rapid reaction effort is expected to lead to a POR that will put about 150 DIRCM systems on the MV-22, CH-53E, CH-46E and CH-53D.

AAR-47B(V)2. This system upgrade will improve probability of detection of missile threats expeditiously, with minimal cost and impact to operational units. DON expects to

upgrade all of its approximately 1,200 AAR-47 capable ASA to the AAR-47B(V)2 as soon as this upgrade kit is available (starting in FY 2008).

JATAS. The JATAS CDD is expected to lead (Increment 1) to a POR that will develop an AAR-47 form factor threat warning system that is capable of cueing the aircrew, flare countermeasures and a DIRCM. The system will increase the missile warning performance in all operational environments as well as adding additional threat warning capabilities. Starting in about 2013, JATAS will replace AAR-47 on DON Aircraft.

LIGHT WEIGHT ASSUALT DIRCM. The combination of JATAS and a light weight DIRCM (when it is developed) will form the DIRCM capability (Increment 2) for ASA that cannot accept current DIRCM systems. Smaller aircraft such as the AH-1 and MH-60 do not have the weight nor space capacity to carry existing DIRCM systems. Assault DIRCM must be capable of protecting these small ASA.

ACQUISTION AND SUSTAINMENT STRATEGIES

The acquisition and sustainment strategies for these efforts are being developed.

CONCLUSION

The results of the EOA, to include the congressionally directed flight tests, are outlined in the attached OT-A1 Final Report that was approved on July 17, 2007. These results are inline with Navy's expectations. While the EOA went a lot further than the ATD in developing and demonstrating technology that is directly applicable to Strike DIRCM and indirectly applicable to Assault DIRCM, there is still more that could be done.

- The TADIRCM Pod should be tested for carrier suitability (i.e. cats and traps). This could be used as pre Milestone B work for a Strike DIRCM or Strike Threat Awareness capability.
- The TADIRCM Pod flight clearance should be expanded to match the intended combat aircraft profiles.
- The TADIRCM Pod could be used to evaluate the combined effectiveness of DIRCM and flare countermeasures against advanced IR threats.

Any decision to create a Strike DIRCM POR with the TADIRCM technologies will be a direct result of the ongoing Strike DIRCM AoA. The information contained in this report will be used as input to that study.

THE COMMANDER'S REPORT

This is the Early Operational Assessment (EOA) report (OT-A1) of the Tactical Aircraft Directed Infrared Countermeasures (TADIRCM) Program, COMOPTEVFOR Project No. 3000-249. The purpose of this test was to assess the TADIRCM by identifying system enhancements and significant areas of risk associated with Directed Infrared Countermeasure (DIRCM) technology and its potential for continued development. The TADIRCM is not currently a CNO program of record; however, results of this EOA and related Developmental Testing (DT) may be used to support future Navy DIRCM programs of record. The conduct of this EOA was a result of Congressional direction to perform an "initial suitability assessment obtained through the Early Operational Assessment (EOA)." Furthermore, Congressional direction provided additional funding to "accomplish testing in a flight scenario." This assessment was accomplished by the Operational Test Director, Lieutenant Sarah Higgins, in conjunction with the Operational Test Coordinator, Commander David Chang.

The TADIRCM accumulated 9.6 operating hours over a 4-month period (30 November 2006 to 23 March 2007) in a podded configuration installed on FA-18E/F aircraft at the Atlantic Test Range (ATR), Naval Air Station (NAS) Patuxent River, MD, and at Armitage Field and North Test Range, Naval Air Weapons Station (NAVAIRWPNSTA) China Lake, CA.

OVERALL TEST RESULTS

The system met the objectives (refer to enclosure (1)) for OT-A1. See Critical Operational Issue (COI) assessments below, and enclosure (1), table (4), for quantitative test results.

The level of risk associated with the successful resolution of COIs and future development of DIRCM technology is addressed in the following table. This risk is based upon program documentation, program plans, and subject matter expert analysis.

COI Assessments	
COI	OT-A1 (EOA)
Strike Warfare (STW) Performance	Yellow
Air Warfare (AW) Performance	Yellow
Reliability	Green
Maintainability	Yellow

COI Assessments	
Availability	Yellow
Compatibility	Yellow
Safety	Green
Documentation	White
Color codes for EOAs are:	
Red - High level of risk identified.	
Yellow - Moderate level of risk identified.	
Green - Little or no risk identified.	
White - Not evaluated or assessed as a result of system immaturity or lack of information.	

The DIRCM technology and its system immaturity prevented a thorough assessment of many mission areas, such as night, shipboard, joint, or live fire operations.

In the FA-18E/F aircraft used during test, system installation was seamless with no effect on the current aircraft systems. However, cockpit situational awareness displays were minimal, providing aircrew with no visual or audible cueing that the system was responding to a target.

MAJOR LIMITATIONS TO THE SCOPE OF TESTING

The limitations, listed below, although expected due to system level of maturity, affected the test team's ability to assess the STW and AW COIs:

- Range testing at the maximum threat density specified for the TADIRCM was not achieved due to range limitations. Only a limited number of threats were available at any one facility. Therefore, the maximum threat density handling capability of the TADIRCM was not fully tested.
- Nonavailability of some threat systems or simulators precluded testing against all relevant threat systems.
- The limited flight clearance issued prevented a full assessment of the TADIRCM system in a tactical environment.
- The immature level of the TADIRCM pod and associated aircraft software prevented COMOPTEVFOR's ability to assess the future capabilities of many COIs. Given the immature state of the TADIRCM System, suitability COIs were not fully investigated.
- No open-air capability currently exists to assess DIRCM spatial algorithms.

EFFECTIVENESS AND SUITABILITY FINDINGS

There is moderate risk in proceeding with future development, as the scope of the test did not facilitate evaluating all risk areas normally assessed in a full Operational Test and Evaluation (OT&E). That lack of data, combined with the current test results, identified the following significant risk areas for the TADIRCM:

For operational effectiveness:

- The effect of an active laser system on other host platform IR weapon systems.
- The effect of host platform defensive IR countermeasures on the TADIRCM missile warning system.
- Lack of visual and audible cuing for aircrew situational awareness that the system is operating and effective.

For operational suitability:

- Operation of the system capabilities in its intended tactical environment, to include carrier flight deck operations.

RECOMMENDATIONS

I recommend continuing development of TADIRCM as a tactical aircraft IR countermeasure system. The moderate risk level assessed with development of the DIRCM technology may be lowered as those areas that were not evaluated are observed during future test periods. Specific risk areas that, at a minimum, should be resolved prior to the next phase of test and evaluation are identified below:

- Limited available TADIRCM or DIRCM type system quantities for use on a tactical aircraft.
- Nonintegration of TADIRCM or follow-on DIRCM System with onboard expendables.
- Lack of pod operation and maintenance documentation.

Additional recommendations requiring correction are found in enclosure (1), section 4.

Overall, the TADIRCM System clearly demonstrated the potential to significantly upgrade the FA-18E/F's capability to protect itself against IR threats and warrants further development.

S. S. WOETSCH
Rear Admiral, U.S. Navy

SECTION 1 - - TEST OPERATIONS

1. CHRONOLOGY

Project operations were conducted per references (a) and (b) from 16 to 20 March 2007 at Armitage Field and North Test Range, China Lake, CA.

2. SYSTEM DESCRIPTION

The TADIRCM is a stand-alone, podded system that includes a two-color Missile Warning System (MWS) and a DIRCM System. The MWS detects the threat and cues the DIRCM to the threat location. The DIRCM slews to the threat, establishes a track, and creates an optical break-lock (jam) using modulated IR radiation generated from a laser. The TADIRCM System was integrated into a lightweight pod to assess a stand-alone IR self-protection capability and was tested on fighter/attack aircraft (FA-18E/F). Figure 1 provides a visual depiction of the TADIRCM System in a podded configuration.

Figure 1. TADIRCM Pod

- The MWS is comprised of an electronic control unit and six IR sensors (see figure 2). The sensors detect IR radiation from a missile's motor plume. The control unit provides central processing for the MWS and control of the TADIRCM System.
- The DIRCM component counters IR-guided weapon systems, using information from the MWS via the control unit to locate the threat and direct output power with an appropriate jamming waveform. The DIRCM consists of a jam head control unit and an IR laser.

For the test, the TADIRCM System was installed into a lightweight pod with a single, aft-mounted jam head and fore and aft MWS sensors on FA-18E/F aircraft on stations 2 or 10. The TADIRCM pod operated autonomously with only aircraft power required.

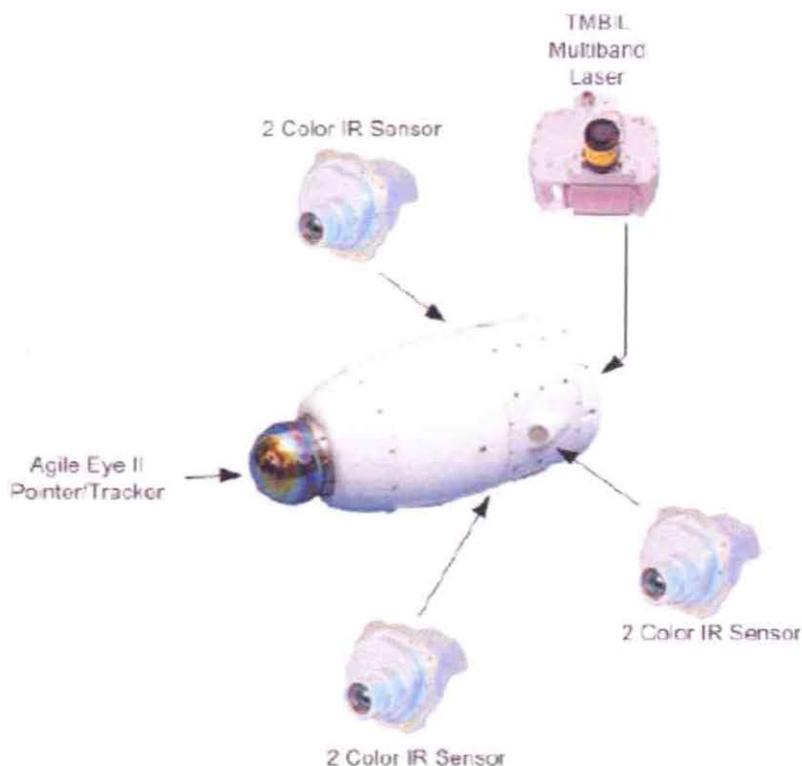

Figure 2. Two-Color IR Sensor

3. SYSTEM OPERATION

The system was operated by Naval Research Laboratory (NRL) personnel with minor Fleet personnel assistance in the intended operating environment. Personnel in assigned aircraft squadrons operated and tested the TADIRCM System as COMOPTEVFOR trusted agents.

4. METHODOLOGY

4.1 Risk Assessments

Table 1 describes the methodology used in analyzing mission impact and likelihood of occurrence.

4.1.1 Mission Impact

As issues that impacted mission accomplishment were identified, they were first classified based on the definitions in table 1.

Risk Assessment Level	Issue Definition
Minimal	Annoying system characteristic or nuisance which does not degrade operational/mission performance or suitability
Minor	Issue that degrades (but does not prevent) operational/mission performance or suitability but can be overcome with operator compensation/workaround
Moderate	Issue that degrades (but does not prevent) operational/mission performance or suitability, no acceptable operator compensation/workarounds exists
Significant	Issue that prevents operational/mission performance or suitability, but can be overcome with operator compensation/workaround
Severe	Issue that prevents operational/mission performance, cannot meet mission objectives or suitability threshold, no workarounds available

4.2 System Test

4.2.1

The purpose of this test was to assess the TADIRCM EOA pod for operational effectiveness and operational suitability while flown in a captive carriage environment, on FA-18 E/F aircraft stations 2 or 10. The system and its IR sensors were also evaluated to determine the effects of urban clutter, afterburner, and wingman and flare countermeasures. The test shall offer Congress and the DIRCM team more information and data as to the requirements associated with a DIRCM system onboard a strike aircraft. This data and lessons learned shall be incorporated into any follow-on systems.

4.2.2

Two FA-18E/F aircraft; three ground-mounted actual surface-to-air missile seekers; one ground-mounted actual air-to-air missile seeker; and two IR plume simulators were dedicated to conducting DT. During OT-A1, eight Fleet pilots flew the aircraft. Available actual IR seekers were used for this test. Live missile shots were not conducted.

4.2.3

The IR plume simulators (used to stimulate TADIRCM responses), surface-to-air, and air-to-air missile systems are described below.

4.2.3.1

The Optical Beam Evaluator and Wander Analyzer (OBE/WAAN) is an NRL-developed system that simulates a missile motor plume and measures jam-laser energy and pointing accuracy. The five photo detectors in the OBE/WAAN system shown in figure 3 were used to determine Agile-Eye pointing accuracy during both the ground and the airborne system checkouts. The IR source was activated via command from the NRL trailer. The photo detectors measured the laser energy received at the source from the TADIRCM pod.

Figure 3. OBE/WAAN

4.2.3.2

The Center for Countermeasures (CCM) IR Seeker Test Van (IRSTV) is a mobile system consisting of a 53-foot trailer and a Contraves Kineto Tracking Mount (KTM). The system is capable of testing up to eight actual IR seekers at one time, depending on the seeker configurations. The seekers can be configured in either a preemptive (with launch tubes and grip stocks) or a reactive mode. In the reactive mode, seekers are mounted to look down into a mirror. The mirror mount is used to simulate an endgame situation. The mirror is aligned with the tracking mount in such a way as to allow the seekers to track aircraft that are being tracked by the seeker mount. Because the seekers are mounted parallel to the mount spin axis, only a slight roll is induced on the missile seeker body, and, therefore, the

seekers only experience minimal tracking rates. Spin control and seeker interface boxes are mounted on the rack above the mirror or on the KTM arms, depending on seeker configuration. The control cable for each seeker is connected to the seeker interface box, which can accept 8 control signals from the seeker control panel in theIRSTV and can buffer and drive up to 16 differential analog signals to a patch panel in the seeker van.

4.2.3.3

The Infrared Target Array and Radiometer System (ISTARS) (figure 4) has similar functions as the OBE/WAAN. However, it has the capability to more accurately simulate an incoming missile and its hot exhaust trajectory. This is accomplished by a series of flame modules that ignite in various speeds, temperatures, and sequences, to give the appearance of a moving missile.

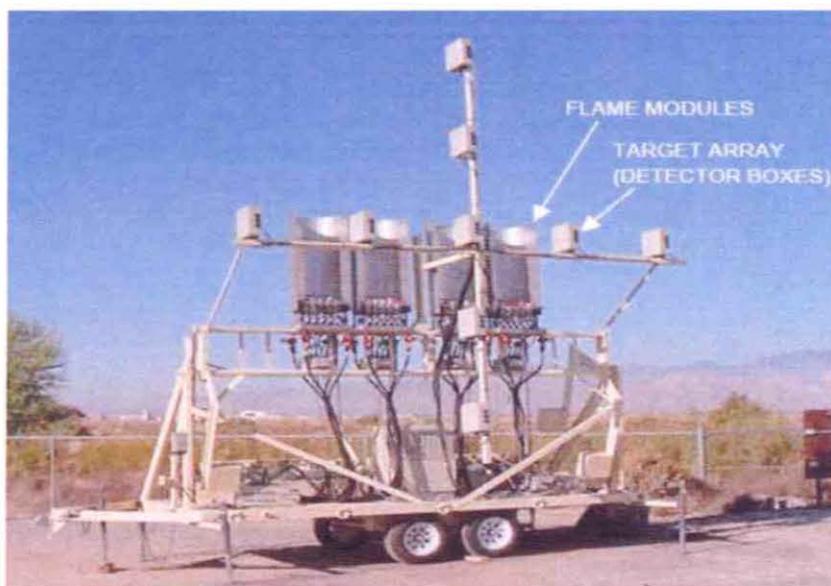

Figure 4. ISTARS

4.2.4

The aircraft was modified with cabling from the Ordnance and Electric Laboratory per drawings TADIRCMUMB, 61P-F001B1, 61P-F001B2, 61P-F001F, TADIRCM1, dated 24 October 2005 reference 5, 6, 7, 8, and 9, respectively. This kit contains cables allowing the pilot to enable the laser through cockpit selection of the air-to-ground master mode and allows for AC and DC current to flow to the pod by activating the IR Cool switch

located in the cockpit. The primary test aircraft was FA-18E 204, bureau number 165660. For the purposes of the test, this aircraft was Fleet representative.

4.3

Eight missions in 9.6 operating hours, using the flight profiles shown in figure 5, were accumulated for dedicated effectiveness flight test. The TADIRCM System underwent flight evaluations using pilot profiles outlined in reference (b). The majority of the aircraft missions were flown from NAVAIRWPNSTA China Lake, CA. Table 2 provides a summary of the number of flight profiles per day flown during the eight missions.

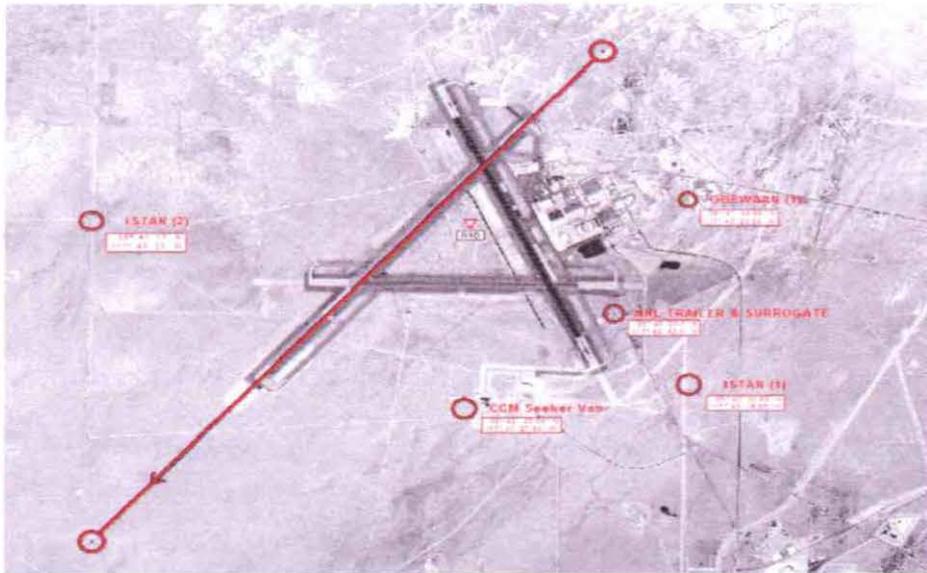

Figure 5. Flight Profile at Armitage Field

Table 2. OT-A1 Missions Summary				
	16 Mar 07	19 Mar 07	20 Mar 07	Totals
No. of Profiles Flown	17	15	17	49
Simulated Threat Engagements	77	82	103	262

4.4

Carrying the TADIRCM pod, FA-18E/F aircraft over flew Armitage Field, conducting multiple passes over a 3-day period. The CCM IRSTV with four actual ground-mounted seekers and both the OBE/WAAN and ISTARs were stationed southeast of the runway and

stimulated the pod at various, preplanned and coordinated times at each overflight. The aircraft varied in altitude and airspeed.

4.5

Los Angeles clutter flight profile is shown, below, in figure 6. False targets were initially generated, but system software refinement significantly reduced the false target rate.

Figure 6. Clutter Measurement Flight Profile at Los Angeles

4.6 Wingman Flight

Two FA-18E/F aircraft flew a 1.5-hour mission in various operational, two-ship formations. Each aircraft dispensed flares to determine the effect on the TADIRCM pod. Data were gathered from the TADIRCM pod located on the lead jet.

4.7 Post-Test Data

Pilots provided thorough debriefs after each test flight. Maintenance personnel provided input and observations after test completion. No questionnaires or evaluations were used.

5. LIMITATIONS

5.1 Major

The following major limitations, although expected due to system level of maturity, affected the test team's ability to assess the COIs, but did not affect the ability to provide a

recommendation regarding TADIRCM System continued program development:

5.1.1

Range testing at the maximum threat density specified for the TADIRCM was not achieved due to range limitations. Only a limited number of threats were available at any one facility. Therefore, the TADIRCM maximum threat density handling capability was not fully tested. (STW, AW)

5.1.2

Nonavailability of some threat systems or simulators precluded testing against all relevant threat systems. Whenever practical, real threat IR systems were used. (STW, AW)

5.1.3

The immature level of the TADIRCM pod and associated aircraft software prevented COMOPTEVFOR's ability to assess the future capabilities of many COIs. Given the immature state of the TADIRCM System, suitability COIs were not fully investigated. (Reliability, Maintainability, Availability, Compatibility, Safety, Documentation)

5.1.4

No open-air range capability currently exists to assess DIRCM spatial algorithms. (STW, AW)

5.1.5

The issued flight clearance limited TADIRCM pod captive carry on the FA-18E/F to pylons 2 and 10, 400 knots calibrated air speed and negative 1.0 to plus 3.0 g. (STW, AW, Compatibility)

5.1.6

Pod configuration, interim air worthiness certification, and Naval Air Training and Operating Procedures Standardization restrictions limited test aircraft flight scenarios and regimes. (STW, AW, Availability)

5.2 Minor

The following minor limitations did not affect the assessment of COIs or the ability to provide a recommendation regarding the continued program development of the TADIRCM System:

5.2.1

Laser jamming restrictions prevented operating the TADIRCM System throughout its entire operating range. This limitation was mitigated by extrapolating TADIRCM's jamming performance in allowable ranges.

5.2.2

The number of FA-18E/F aircraft available during OT-A1 precluded collection of adequate reliability and maintainability data.

5.2.3

TADIRCM testing was not conducted under all possible environmental conditions. The system was tested in environmental conditions occurring at the actual time of testing at previously listed ranges and air fields.

BLANK PAGE

SECTION 2 - - PROJECT BACKGROUND

1. HISTORY

1.1 Requirement

The TADIRCM EOA Pod is a Congressionally mandated flight demonstration program designed to assess technology suitability in a tactical airborne environment. The TADIRCM capitalizes on lessons learned from the highly successful TADIRCM Advanced Technology Demonstration (ATD). The ATD prototype hardware that was demonstrated on a QF-4 drone resulted in 40 successful test events, but was limited in airspeed, vertical acceleration, and roll rates. In addition, the ATD equipment was designed for an internal airframe installation and was not suitable for a weapons station pod environment. Additionally, CNO (N88) desired the FA-18 be used as the flight test vehicle. The pod's effectiveness is to be assessed against state-of-the-art IR threat seekers that tactical aircraft are likely to encounter in today's modern battlefield.

2. PREVIOUS OT&E

2.1

No prior OT&E has been conducted on the TADIRCM. The TADIRCM EOA pod has been through vibration, thermal, and electromagnetic interference testing at Raytheon Indianapolis, ID. All testing was considered successful for the planned test environment and flight envelope for this test. The TADIRCM EOA pod also successfully completed ground testing that included a standard MIL-HDBK-1763 fit test and a laser alignment and functional checkout. A total of four flights were also conducted at Patuxent River, MD, under NAVAIR Test Plan SA06-11-099A; one qualitative captive carriage and three functional flights. The qualitative captive carriage determined the TADIRCM's capability to survive in a limited FA-18 flight environment. The combined DT/OT at Armitage Field and North Test Range at NAVAIRWPNSTA China Lake were conducted per references (a) and (c).

SECTION 3 - - TESTS AND RESULTS

1. TEST RESULTS

1.1 OT-A1 Exit Objectives

Table 3 depicts specific Memorandum of Agreement (MOA) exit objectives for OT-A1 from reference (a). Although these do not directly correlate to the COIs, these were assessed in the course of OT-A1 execution. At the end of OT-A1, all MOA exit objectives were fulfilled. See reference (c) for classified results.

Ground Tests	Demonstrated or Observed
a. Assess installed threat detection and declaration capability.	X
b. Assess handoff of the missile threat to the laser turret assembly.	X
c. Assess installed jammer performance, as designed, and effectiveness against selected threat missile seekers.	X
d. Characterize TADIRCM operation against single and multiple missile threats.	X
e. Verify that the TADIRCM test pod does not degrade other aircraft and weapon avionics while operating autonomously.	X
f. Characterize aircraft wing station environment and its effects on TADIRCM pod operation.	X
g. Acquire background measurements for threat detection probability and false alarm vulnerability.	X

Specific risk areas addressed in this report are referenced to the COIs to better represent current performance and allow the assessment of future risk.

2. TEST E-1 - STRIKE WARFARE

Will the TADIRCM demonstrate the operational performance necessary to effectively support the tactical aircraft in operationally representative STW missions?

2.1 Results (Yellow)

The TADIRCM system was tested against three IR ground-mounted actual surface-to-air threat missile seekers. It proved highly efficient in initiating a track and slewing the laser jammer to illuminate the target against both single and multiple targets. Additionally, the TADIRCM is hands free within the cockpit, allowing the pilot to prioritize his STW mission. However, an added cockpit display indicating system response/activity would add to the pilot's situational awareness in a combat environment. Due to its pod design, TADIRCM will occupy a wing station, decreasing the available weapon load to support the aircraft during STW missions. Overall, a moderate level of risk was assessed.

3. TEST E-2 - AIR WARFARE

Will the TADIRCM demonstrate the operational performance necessary to effectively support the tactical aircraft in operationally representative AW missions?

3.1 Results (Yellow)

The TADIRCM system was tested against one IR ground-mounted actual air-to-air threat missile seeker. It proved highly efficient in initiating a track and slewing the laser jammer to illuminate the target. Additionally, the TADIRCM is hands free within the cockpit, allowing the pilot to prioritize his AW mission. An added cockpit display would add to the pilot's situational awareness in a combat environment. Due to its pod design, TADIRCM will occupy a wing station, decreasing the available weapon to support the aircraft during the AW missions. Overall, a moderate level of risk was assessed.

4. TEST S-1 - RELIABILITY

Will the reliability of the TADIRCM support completion of its mission?

4.1 Results (Green)

4.1.1

There were no hardware failures in 9.6 flight hours (no criterion).

4.1.2

The demonstrated mean time between operational mission faults, software was 4.8 hours (no criterion), based on two software

faults in 9.6 flight hours. However, note that the system showed excellent potential and that the number is low based upon the limited hours flown during test.

4.2 Deficiencies

During flight number five, the TADIRCM system went off line. After several attempts, NRL personnel brought the system back on line, only to go off again. NRL personnel recycled power and turned off part of the track filtering system, which eventually brought the system back on line. The TADIRCM worked correctly for the remainder of the 1.5-hour flight. Various aircraft in the area reported Global Positioning System (GPS) failures at the time of tracker malfunctions. However, NRL personnel determined a GPS failure did not cause the tracker to malfunction.

5. TEST S-2 - MAINTAINABILITY

Will the TADIRCM be maintainable by Fleet personnel, as related to uploading and downloading the pod, as well as release and control checks?

5.1 Results (Yellow)

VX-23 ordnance personnel uploaded and downloaded the TADIRCM pod several times. The team leader determined the ordnance team needed no additional maintenance training. Release and control checks were not tested.

6. TEST S-3 - AVAILABILITY

Will the availability of the TADIRCM support completion of its mission?

6.1 Results (Yellow)

The demonstrated Operational Availability (A_0) was .99 (no criterion), based on 119.8 hours uptime and 0.2 hours downtime, due to the two software faults discussed previously. However, the high A_0 was tempered by the fact that only one TADIRCM pod was available with only the aft laser jammer operating. A moderate risk level was assessed.

7. TEST S-4 - COMPATIBILITY

Will the TADIRCM be compatible with its operating environment?

7.1 Results (Yellow)

7.1.1

During flights, wingman flares had no effect on the TADIRCM. However, own-ship flares did have some effect on TADIRCM losing track.

7.1.2

Based on the results of electromagnetic interference/ electromagnetic compatibility testing to MIL-STD461, EC102, and RE102 conducted prior to flightworthiness certification, the TADIRCM pod had been determined not to interfere with avionics systems onboard an FA-18 aircraft. Detailed information is available in reference (d), Test Report for the Electromagnetic Environmental Effects (E3) Flight Clearance Test of the Tactical Aircraft Directional Infrared Countermeasures (TADIRCM) Pod.

7.1.3

No degraded performance of host aircraft avionics were observed while the TADIRCM EOA pod was installed and operational on an FA-18E/F.

7.1.4

Overall, a moderate level of risk was assessed due to the limited tests conducted with ordnance carried by the host aircraft and wingman. Additionally, operation at sea was outside the scope of this test and remains to be evaluated as to the effects of flight deck operations and the corrosive salt environment, to which a protective shield might be needed for the IR sensors and laser system.

8. TEST S-9 - SAFETY

Will the TADIRCM be safe to operate and maintain?

8.1 Results (Green)

8.1.1

The TADIRCM System was safe to operate and maintain. Laser safety procedures and checklists developed for the test process were effective in preventing any injuries to personnel.

8.1.2

Data collected during TADIRCM pod vibration and thermal environmental testing prior to flight, at conditions expected to be encountered during flight, indicated that the entire system, including jammer, should operate without component failure. The test vibration level was 4.2 g Root Mean Square (gRMS).

Additional data are available in reference (e), Test Report for the Safety of Flight Test of the Tactical Aircraft Directional Infrared Countermeasure (TADIRCM) Pod.

8.1.3

Data collected in flight over a limited flight envelope corroborated the environmental test data, indicating no failures. The most severe vibration level observed, experienced in the vertical direction at the aft end of the pod, was 1.75 gRMS; the average level at that location was 0.15 gRMS. These levels were substantially lower than the 4.2 gRMS test level.

9. TEST S-10 - DOCUMENTATION

Will the technical documentation support operation and maintenance of the TADIRCM?

9.1 Results (White)

There currently is no formal documentation to support operation or maintenance of the TADRICM due to the early stage of development.

BLANK PAGE

SECTION 4 - - RECOMMENDATIONS

1. RECOMMENDATIONS

The following risk areas are identified for correction prior to the next phase of test and evaluation:

1.1 Expand Flight Clearance

Expanded aircraft and pod configuration flight clearance to allow for more realistic testing in STW and AW environments (see page 8, paragraphs 5.1.5, 5.1.6). (STW, AW)

1.2 Limited Aircrew Displays

Develop better cockpit displays to increase aircrew situational awareness that the system is active (see page 14, paragraphs 2.1, 3.1). (STW, AW)

1.3 Forward Laser

Add the second laser to the pod, making it 100 percent operational to get a more accurate assessment in a multiple threat environment (see page 15, paragraph 6.1 and classified reference (c), paragraph 2.3). (Availability)

1.4 TADIRCM False Targets

Determine TADIRCM response while conducting live fire tests with ordnance from the host aircraft, as well as the wingman (see page 16, paragraph 7.1.1). (Compatibility)

1.5 Laser Hazard

Determine effect of TADIRCM laser on ordnance carried on additional aircraft wing stations (see page 9, paragraphs 5.1.5 and 5.1.6). (Availability, Compatibility, Safety).

1.6. Operating Environment

Determine carrier suitability (see page 16, paragraph 7.1.4). (Compatibility)

1.7 Software Faults

Conduct further investigation to determine cause of the 2 software faults that occurred (see page 15, paragraph 4.2, S-1) (COI(s): S-1 Reliability).

2. SYSTEM ENHANCEMENTS

Implementation of the following will result in enhanced operational effectiveness and suitability:

2.1 Compatibility

Develop a protective shield for the laser system and DIRCM sensors for flight deck use (see page 16, paragraph 7.1.4).
(Compatibility)

THE ASSISTANT SECRETARY OF THE NAVY
(Research, Development and Acquisition)
WASHINGTON DC 20350-1000

MAY 30 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As directed by the Fiscal Year 2007 Defense Authorization Conference Report 109-702, the enclosed report provides an assessment of the ship repair industrial base. This report focuses on the health of the ship repair industrial base and not the new construction industrial base. Specifically, the report addresses ship repair requirements to support the National Military Strategy; evaluation of the repair industrial base's critical capabilities, capacity, competitive sourcing, geographical disposition; and other critical factors as measured against the determined requirements.

The post-9/11 environment has seen the Fleet shift from a rotational cycle to the Fleet Response Plan enhanced surge capability. The shift requires the maintenance community infrastructure to be flexible. One Shipyard, Multi-Ship Multi-Option, and the private sector provide the flexibility to provide operational and combat ready ships and weapon systems required by the Fleet. Current capacity and capability of the private sector ship repair industrial base are adequate to satisfy the national security interests of the United States. The Navy's goal is to maintain a viable private sector ship repair industrial base while balancing public shipyard workload to comply with Title 10.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink that reads "Delores M. Etter".

Delores M. Etter

REPORT TO CONGRESS

on

Assessment of Ship Repair Industrial Base

Prepared by:
Director, Fleet Readiness (OPNAV N43)
Office of the Chief of Naval Operations
2000 Navy Pentagon
Washington, DC 20350-2000

June 2007

BACKGROUND

The FY 2007 Defense Authorization Conference Report 109-702 directs the Secretary of Defense to submit a report to Congressional defense committees on the current assessment of the ship repair industrial base. The conference report refers to Section 1017 of National Defense Authorization Act (NDAA): "The conferees agree that a strong ship repair industrial base is vital to the national security of the United States. Accordingly, it is important that the Secretary maintain a current assessment of the Nation's ship repair capabilities and capacity and, consistent with the Secretary's assessment, that the Department assign value to the accomplishment of overhaul, repair, and maintenance work in the United States for the evaluation of offerors' proposals in the awards of contracts to carry Department cargo. To guide formulation and implementation of the Secretary's acquisition policy, the Secretary shall conduct an assessment of the ship repair industrial base, to include: (1) a determination of ship repair requirements to support the National Military Strategy; (2) an evaluation of the repair industrial base's critical capabilities, capacity, competitive sourcing, geographical disposition; and (3) other critical factors as measured against the determined requirements."

EXECUTIVE SUMMARY

The current capacity and capability of the ship repair industrial base are adequate to satisfy the national security interests of the United States. The public shipyards and private sector shipyards collectively constitute the naval ship repair industrial base. The requisite facilities and manpower exist to meet navy ship depot maintenance requirements. The Multi-Ship Multi-Option (MSMO) contracting strategy provides continuity for planning and maintenance processes for Navy ships and contractors.

As the Navy enters the second half of this decade, having completed a peak period of major submarine maintenance, ship maintenance providers will experience a net reduction in the overall Navy projected ship depot maintenance workload during FY 2007-2010. Exacerbating the reduced workload are major carrier and submarine maintenance periods, which create significant, episodic surges for shipyard manpower and facilities. The future years' challenges are to

- determine the correct workload balance to maintain effective and efficient public and private shipyards,
- ensure compliance with statutory requirements for public shipyard capability and capacity, and
- allow for flexibility within the industrial base to meet Fleet surge demands.

The February 2007 Naval Shipyard Business Plan provides an assessment of the public sector ship repair industrial base and the way ahead in sustaining core skills, process, and infrastructure capability and capacity for the future. Consequently, this report will focus on the private sector ship repair industrial base.

SHIP MAINTENANCE REQUIREMENTS

Statutory Requirements:

U.S. Code Title 10 contains requirements for public depot maintenance capabilities and capacity. These statutes are also the foundation for building a bottom-up "zero-based" definition of Naval Shipyard capacity and baseline workload requirements.

- Title 10 USC 2464 requires a core logistics capability (skill, processes, and infrastructure) that is government-owned and government-operated, to ensure a ready and controlled source of technical competence and resources necessary to ensure effective and timely response for designated weapon systems.
- Title 10 USC 2466 limits to no more than 50 percent the amount of depot maintenance funds made available in a fiscal year that can be contracted out to the private sector.

- Title 10 USC 2472 requires public depot civilian employment to be managed solely on the basis of workload and the funds available for such depot maintenance. It prohibits management by “end strength.”

Navy Requirements:

The total Navy ship depot maintenance workload is a function of the following:

- Force structure;
- Maintenance plans for each ship class (including the established intervals, durations, maintenance cycles and repair mandays for depot level maintenance availabilities)
- Fleet Modernization Plan;
- Homeport assignments;
- Fleet operational tempo; and
- Planning, Programming, Budgeting and Execution System, including the Capability Plan, which programs the funding and capacity necessary to execute the above workload with only limited surge capacity.

Workload distribution between the public and private sectors is accomplished using the availability assignment criteria approved by the Secretary of the Navy. The governing principles of these criteria aim to strike a balance between a ship’s crew’s quality of life, the cost of the work, the ship’s operational availability, and the private sector or public sector depot’s ability to execute work in accordance with cost and schedule goals. The assessment criteria are as follows:

- Schedule maintenance in ship’s homeport when possible;
- Optimize critical skill usage; and
- Load public shipyards first to efficiently use organic capacity.

When there is more than one option for availability assignment, the following factors, as applicable, will be taken into account:

- Crew impact;
- Cost impact;
- Operational impact;
- Shipyard executability;
- Class Maintenance Plan impact;
- Schedule impact; and
- Modernization impact.

As the Naval Shipyard workload is performed primarily on nuclear-powered submarines, nuclear-powered aircraft carriers and large-deck amphibious ships, the depot maintenance work on the Navy’s conventionally-powered surface ships and on Military Sealift Command (MSC) ships is primarily private sector workload. Refueling overhauls on nuclear-powered aircraft carriers and all maintenance work for USS ENTERPRISE (CVN 65) are performed in the private sector by Northrop Grumman Newport News (NGNN).

The six Regional Maintenance Centers (RMCs), located in Norfolk, VA, Mayport, FL, Ingleside, TX, San Diego, CA, Bremerton, WA, and Pearl Harbor, HI, are the Navy’s contracting agents for private sector ship availabilities, and provide a single point of contact in each fleet concentration area for ship maintenance and modernization issues. In addition to providing contract oversight, the RMCs plan and execute maintenance per Fleet policy and guidance, and assure process compliance.

MSC ships are maintained by private sector shipyards. MSC operates ships under a commercial model using a variety of operating and ownership arrangements that affect how ship repair work is managed.

Government-owned vessels are maintained to commercial standards primarily on the basis of rules of the American Bureau of Shipping (ABS) and the regulations of the United States Coast Guard (USCG), with the exception of ships originally built to Navy standards. Government-owned and government-operated ship maintenance requirements are managed by government employees. Maintenance availabilities are generally competitively bid with some exceptions (e.g., work is sole-sourced at Guam Shipyard as start up work to allow Guam Shipyard to become a viable shipyard). Government-owned and contractor-operated ships are maintained by the commercial operator to commercial standards. Maintenance availabilities are competitively bid. Contractor-owned and contractor-operated ship maintenance is the responsibility of the independent owner.

CAPABILITIES AND CAPACITY

As of January 2007, 119 ship repair firms are certified capable to perform work on U.S. Navy ships. These contractors are geographically located in port areas throughout the Continental United States (CONUS), in Hawaii, and in Guam. Figure 1 provides a graphic illustration of the locations of the large commercial firms and the type of work that they perform.

Private Ship Repair Facilities

Figure 1 – Private Ship Repair Contractors by Port Area

The process for certifying ship repair firms is controlled by the Master Ship Repair Agreement/Agreement for Boat Repair (MSRA/ABR) Program. The MSRA/ABR Program is an eligibility determination that evaluates a ship repair firm's capability and capacity to perform maintenance of U.S. Navy ships. The threefold purpose of establishing MSRAs is to:

- Identify and certify a qualified ship repair industrial base in each homeport area;
- Develop a uniform set of standard criteria to evaluate ship repair firms seeking to perform maintenance on Navy ships; and
- Provide consistent nationwide interpretation and application of the MSRA criteria in the certification and recertification process.

Ship repair firms holding an MSRA with the Navy must meet the following certification criteria:

- Capable of accomplishing a Selected Restricted Availability (SRA) on an FFG-7 Class (frigate) ship or larger;
- Perform 55 percent of the SRA using their own facilities and their own workforce; and
- Possess or have access to a pier with the requisite support and technical services available to accommodate an FFG-7 Class ship.

ABR certification criteria are less stringent and allow smaller ship repair firms to perform ship repair work. To qualify for an ABR, a contractor must be primarily engaged in ship and/or boat/craft repair. Contractors must meet the general criteria of the North American Industry Classification System (NAICS) code 335511, Shipbuilding and Repairing, or code 336612, Boatbuilding. Contractors must demonstrate managerial and technical capabilities. ABR contractors are also evaluated on their ability to accomplish a variety of industrial work, including ship fitting, sheet metal, welding, pipefitting, machinist, electrical, electronics, woodworking and rigging.

The intent of the MSRA/ABR Program is to provide a written instrument of understanding for the Navy to solicit and award single ship, firm fixed-price contracts to a universe of capable contractors. MSMO contracts, discussed in the following section, do not require an MSRA/ABR. However, the MSRA criteria are built into the MSMO solicitation. In addition, in accordance with Title 10 USC 7299a, solicitations for short-term repair availabilities (six months or less in duration) are restricted to firms capable of performing work within a ship's homeport, assuming adequate competition. Availabilities longer than six months in duration must be competed coast-wide.

Appendix A lists the MSRA and ABR certificate holders sorted by the port area.

Contracting Strategy:

MSMO contracts are repair and overhaul contracts for a specific number of ships in a ship class in a single homeport that are awarded to a prime contractor for a base plus several option years. The MSMO contract provides continuity for planning and maintenance processes for Navy ships and private sector teams awarded the work.

MSMO contracts awarded after May 2004 must meet the requirements of Title 10, USC 2382

"Consolidation of contract requirements: policy and restrictions," which requires the Department's senior procurement executive to:

- Address small business concerns;
- Conduct market research;
- Identify alternative contracting approaches involving a lesser degree of consolidation; and
- Determine that consolidation is necessary and justified.

MSMO contracts are crucial to meeting the Navy's Fleet maintenance needs, while supporting operational schedules. MSMO contracts provide execution planning, ship repair, modernization, and inter-availability maintenance coverage for a number of years vice issuing a single fixed-price contract for each ship repair action. Benefits of this arrangement include the following:

- Establishes a long term relationship between ship and contractor;
- Reduces cost and rework on repetitive alterations on same ship class/platform;
- Provides for a quick response to emergent work/growth (critical for surge capability concept);
- Provides program stability for the Fleet and contractor, creating added incentives for contractor facility investment;
- Facilitates level loading of work, resulting in improved contractor efficiencies and cost savings;
- Reduces time to the government and contractor resulting from issuing one contract to cover multiple years vice the time associated in the acquisition cycle to issue a single contract for each individual repair availability;
- Accommodates advance planning for repair availabilities throughout contract duration, which improves contractor efficiencies; and
- Establishes workforce familiarity with the specifics of a ship class enabling long-term functional excellence within a particular discipline.

The MSMO contracting strategy is used for surface ships (except carriers in San Diego) where the basic award is competed for a class of ships in a homeport and all subsequent availabilities for that class of ships are separate options that are effectively sole source to the MSMO winner. The MSMO contracting strategy is also used for carriers in San Diego; however, the basic award is not competed (i.e. carrier availabilities are competed in Norfolk and the Pacific Northwest were a Naval Supervising Activity is present to supervise the winning private firm). Although competition is sought for submarine availabilities, these are generally sole-source single availabilities.

Dry Docks:

The Navy manages a safety certification program for dry docking facilities and shipbuilding ways for U.S. Navy ships. The program functions to ensure the safety of U.S. Navy ships during all dry docking evolutions, launchings and lay periods, and to establish certified rated capacity of each facility. Certification is required for all Navy dry docking facilities and private sector dry docking facilities with contracts to build, overhaul or repair Navy ships. Certification is also required for MSC ships repaired in CONUS. The dry dock certification program serves to:

- Assure safe dry docking of U.S. Navy ships;
- Protect human life and property;
- Provide a sufficient number of certified dry docking facilities, geographically located, to meet Fleet requirements;
- Promote and maintain sound dry docking practices; and
- Maintain existing dry dock assets and ensure their adequacy in the future.

Certification is not required to dock small boats and service craft. Currently, 78 public and private facilities are in the dry dock safety certification program. Thirty-two of these facilities are in the private sector. Appendix B displays a matrix of ship classes and the certified private sector dry docks that can accommodate them.

Employment:

The private sector ship repair industrial base is comprised of the 36 MSRA holders and 83 ABR contractors. Employment of private sector workers occupied on Navy ship repair work has fluctuated over the years consistent with contracted workload and as a function of the cyclic nature of ship maintenance requirements. Figure 2 below shows both public sector and private sector shipyard employment engaged on ship repair work on all classes and types of U.S. Navy ships from 1990 to 2006. The private sector repair workforce has remained relatively stable at somewhat less than 20,000. Conversely, public sector shipyard employment has declined nearly 60 percent during that timeframe.

Public/Private Employment Levels

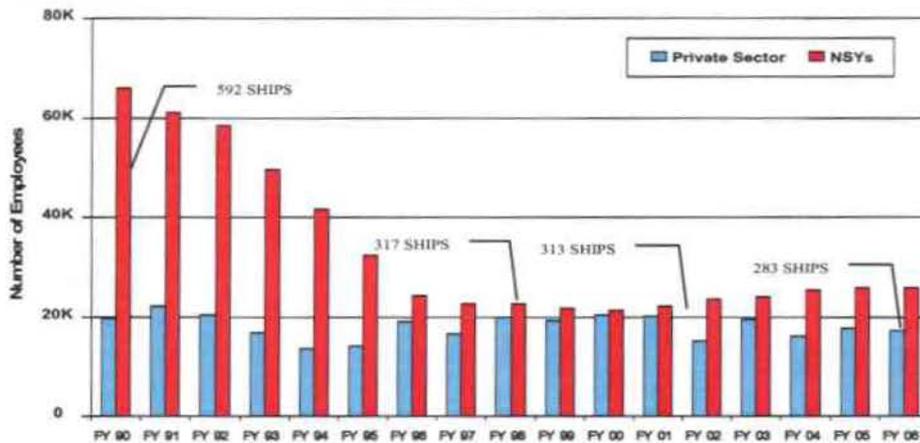

Figure 2 – Public & Private Ship Repair Employment FY 1990-2006

Capacity and Workload:

Capacity of the private sector ship repair industrial base is adequate to satisfy national security interests and fulfill current Navy ship maintenance requirements. Long-term maintenance trends fluctuate by region and will impact workload. In the Northeast and Mid-Atlantic regions, planned submarine depot maintenance work contracted to General Dynamics Electric Boat (GDEB) and NGNN, respectively, will phase out in FY 2007. Future submarine work for the private sector will be limited to an “on-exception” basis. Future homeporting plans and ship decommissionings will also have an impact. Navy repair work in the Ingleside, TX area will cease after FY 2009 as mine warfare ships relocate to San Diego, CA. Decommissioning of USS JOHN F. KENNEDY and FFGs will reduce workload in the Southeast. Due to cyclic nature of carrier maintenance, workload in the Pacific Northwest will decrease in FY 2008, but will rebound in FY 2009. Aggregate private sector surface ship loading will remain relatively constant in the Mid-Atlantic area. In San Diego, private sector workload will increase slightly from FY 2007 as the mine warfare forces and Littoral Combat Ship homeporting occurs. Hawaii private sector workload will remain constant.

The private sector capacity to perform ship repair work is displayed below by region in table 1. The capacities are estimates of the number of production workers available per day within the port area for FY 2006. The production workforce is composed of trade skill workers, and does not include engineers and support personnel.

<u>Region/Port</u>	<u>Capacity</u>
Northeast/Groton, CT	1,800
Newport News, VA	5,200
Mid-Atlantic/Norfolk, VA	3,600
Southeast/Mayport, FL	750
South Central/Ingleside, TX	250
Southwest/San Diego, CA	4,300
Northwest/Puget Sound, WA	1,500
Hawaii/Pearl Harbor, HI	<u>450</u>
	17,850

Table 1 – Private Sector Capacity, by Region

OTHER CRITICAL FACTORS

One Shipyard

In 2001, the Naval Sea Systems Command (NAVSEA) introduced the One Shipyard concept of the Industrial Base Workload and Resource Enterprise to provide the most efficient ship maintenance for the Fleet operating via a Surge, Sustain and Reconstitute construct. One Shipyard focuses on cost, schedule, and quality through standardizing processes, sharing resources among public yards, and partnering with private yards. Other vital elements of the One Shipyard concept are a corporate approach to material support and the resolution of critical skill shortages. One Shipyard is a descriptor for this distributed complex of facilities, people and processes. The size and location of the public sector and private sector industrial base workforce can create geographic critical skill shortfalls, particularly when the actual workload varies from programmed workload in a surge scenario. To mitigate skill imbalances, workers are loaned and borrowed across shipyards rather than having each shipyard hire, train and employ capacity to execute peak workload that would be underutilized and costly to maintain during off-peak times. Although the industrial base today has adequate worker capacity, the workers must be carefully managed and moved to where the work is geographically located. This facet of ship repair is unique in the depot industry – all other depot repairs are conducted by moving the units to be repaired to where the workers are employed.

Partnerships

In accordance with Title 10 USC 2474, the public shipyards are designated Centers of Industrial and Technical Excellence (CITE) for maintenance and repair, modernization, inactivation, disposal, and emergency repair of Navy ships, systems, and components. Title 10 USC 2474 authorizes and encourages public private partnerships, permits performance of work related to core competencies, and permits use of facilities and equipment. The conversion of four USS OHIO Class Ballistic Missile submarines (SSBN) to Guided Missile submarines (SSGN) are prime examples of CITE partnering between the Naval Shipyards and private industry. In partnership with GDEB, both Norfolk Naval Shipyard (NNSY) and Puget Sound Naval Shipyard and Intermediate Maintenance Facility (PSNS&IMF) provided facilities, equipment, and augmented production resources to execute the conversion work.

The One Shipyard concept has been instrumental in fostering partnerships between the public and private sectors. Private sector partnering with the Naval Shipyards has resulted in GDEB support on submarine availabilities at Groton, CT and at Portsmouth Naval Shipyard (PNSY). Likewise, the Naval Shipyards

have provided support at both GDEB and NGNN. Partnering is not limited to submarine work. In the Norfolk area, the public sector shares carrier work with Earl Industries and large-deck amphibious ship work with BAE Systems Norfolk Shipbuilding. PSNS&IMF shares carrier work with Todd Shipyard in the Northwest. In San Diego, PSNS&IMF also shares carrier work with the private sector in that NGNN serves as an integrator, subcontracting to local private firms. In Hawaii, Pearl Harbor Naval Shipyard (PHNSY)&IMF partners with BAE Systems Hawaii Shipyards in providing the facility and support for docking surface ships.

Many more partnerships and teaming arrangements exist among private contractors. In the past, MSMO contracting has strongly encouraged the prime contractor to subcontract work to small businesses through incentives. A new policy requires that MSMO contracts awarded after May 2004 include a requirement to subcontract 40 percent of the work to small businesses. Teaming arrangements by joint ventures and partnerships have been a result of MSMO contracting. When the Navy awards a MSMO contract to a prime contractor involved in a contractor team arrangement, the Navy, acting under the Federal Acquisition Regulation, recognizes the integrity and validity of that arrangement while retaining its right to require consent to subcontracts, to pursue its policies on competitive subcontracting, and to hold the prime contractor fully responsible for contract performance.

CONCLUSION

The post-9/11 environment has seen the Fleet shift from a rotational cycle to the Fleet Response Plan enhanced surge capability. The shift requires the maintenance community infrastructure to be flexible in response to an evolving demand signal from Combatant Commanders. One Shipyard and MSMO contracting provide flexibility to help meet the demand. The Navy will continue to require the private sector and the Naval Shipyards to provide operational and combat ready ships and weapon systems required by the Fleet.

Current capacity and capability of the private sector ship repair industrial base are adequate to satisfy the national security interests of the United States. The Navy's goal is to maintain a viable private sector ship repair industrial base while balancing public shipyard workload to comply with Title 10.

Appendix B (continued) Legend for Drydocking Matrix

Facility Types:

FL Floating Dry Dock
GR Graving Dock
MR Marine Railway

Symbol/Abbreviation:

- ✓ Indicates that the ship will dimensionally fit in the dry dock at practical docking drafts and the ship's displacement is within the dock's certified capacity. Also may indicate that the ship or like ship has been safely docked previously which may have exceeded the certified capacity of the dock. The ship can be docked using standard docking practices. A blank indicates that a ship will not dimensionally fit at practical docking drafts or is unsuitable for other reasons.

Indicates that the ship/dock combination has not yet been verified using the latest assumptions.

Upper case abbreviation indicates that the hull will dimensionally fit, but it is impossible to dock the ship without dock modification/relocation.

FS	Fueling sponsons
PD	Prior docking, below light load
RC	Dock cover precludes docking
RM	Multiple restrictions

Lower case abbreviation indicates that the hull will dimensionally fit, and a potential docking capability/limitation exists. In some docks the blocking arrangement will have to be modified.

ba	Use of existing buoyancy assist modules (BAMs)
fba	BAMs could be designed to accommodate ship
hd	Hang dome over end of pontoon
hp	Hang propeller(s) over end of pontoon
nn	Not nuclear capable
rb	Bridge restriction
ri	Existing interferences must be removed
st	Use of special techniques to reduce required water depth such as installing moveable/hinged blocks (more than six)
sb	Use of special blocking arrangement required to meet certified limits
xc	Ship fits in dock, but exceeds the certification capability limits
xtr	Tray removal docking exceeds the certification capability limits

THE SECRETARY OF THE NAVY
WASHINGTON, D. C. 20350-1000

June 29 2007

The Honorable Daniel K. Inouye
Chairman, Subcommittee on Defense
Committee on Appropriations
United States Senate
Washington, DC 20510-1102

Dear Mr. Chairman:

As directed by the Fiscal Year 2007 Senate Appropriations Committee Report 110-37, the enclosed report provides the requested information on the Navy Expeditionary Combat Command. Additionally, as a follow-on to the Riverine Squadrons Report submitted to Congress in February 2007, this report is designed to provide a greater level of understanding for all current and planned expeditionary forces.

The Navy Expeditionary Combat Command was established in January 2006 to centralize management of current and future readiness, resources, manning, training, and equipping of Navy Expeditionary Forces under a single functional command. The command's primary role is to provide combat-ready units for Joint Force Maritime Component Commanders and Navy Component Commanders tasking across the wide range of joint and service-specific expeditionary missions.

The Department of the Navy's plan for Navy Expeditionary Combat Command, as reflected in this report, will provide the recapitalization and future budget planning required to effectively and efficiently sustain its current taskings from the Joint Force Maritime Component Commanders and Navy Component Commanders.

A similar letter has been sent to Chairmen Levin, Skelton and Murtha. If I can be of any further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

Report Requirement

Senate Appropriations Committee Report 110-37 (Fiscal Year 2007 Supplemental)
Section 361(e) of Fiscal Year 2007 directs the following:

“The Committee therefore directs the Secretary of the Navy to submit a report to the congressional defense committees no later than June 15, 2007, which sets forth the requirements for the following:

- (A) The requirements for recapitalizing each of the NECC forces*
- (B) The requirements for equipping new and planned NECC forces*
- (C) A description of how those requirements will be addressed by Fiscal Year 2008 budget submission and future budget requests”*

Background

In January 2006, the Chief of Naval Operations (CNO) established the Navy Expeditionary Combat Command (NECC) to provide oversight of the current Navy expeditionary forces and to develop new capabilities to address emerging missions in the rapidly evolving maritime security environment. NECC's mission enables the Navy to better balance its force across the blue to brown-water maritime environments, ensuring effective Navy expeditionary warfighting, closing capability gaps, and aligning seams in global maritime security operations (MSO). NECC's purpose is three-fold:

(1) To centrally organize, man, train, equip, and maintain the existing Navy expeditionary forces, including the Naval Construction Force (NCF), Navy Explosive Ordnance Disposal (EOD) Groups, Maritime Expeditionary Security Force (MESF)/Naval Coastal Warfare (NCW) Groups¹, Mobile Diving and Salvage (MDS) Units, Navy Expeditionary Logistics Support Group (NAVELSG), and Combat Camera to deliver more effective combat support and combat service support capability.

(2) To establish and coherently organize new and evolving expeditionary warfighting capabilities, including riverine, maritime civil affairs, expeditionary foreign military training, maritime expeditionary security, management of in lieu of (ILO) forces, enhanced support for humanitarian assistance, civil military operations and crisis response operations, and other emerging missions, to support MSO around the world.

(3) To serve as the single process owner for the man, train, equip, deploy and redeploy functions for all Navy Individual Augmentee (IA), ILO, and Ad Hoc units.

NECC combines the Navy's expeditionary forces under a single operational commander with the capability to conduct operations across the full spectrum of maritime expeditionary operations, including maritime security operations; theater security cooperation support; security assistance; shaping operations; and stability,

¹ In 2007, NECC will be transitioning existing Naval Coastal Warfare (NCW) units to MESF - a more capable, adaptable, and ready force. This reorganization will reshape current structure into a mission-focused organization that has the capability to meet new and evolving operational requirements in both peacetime and war.

security, transition, and reconstruction (SSTR) operations. As such the NECC Force will deliver a wide range of capabilities to effectively execute MSO as summarized below:

NECC Functions and Capabilities

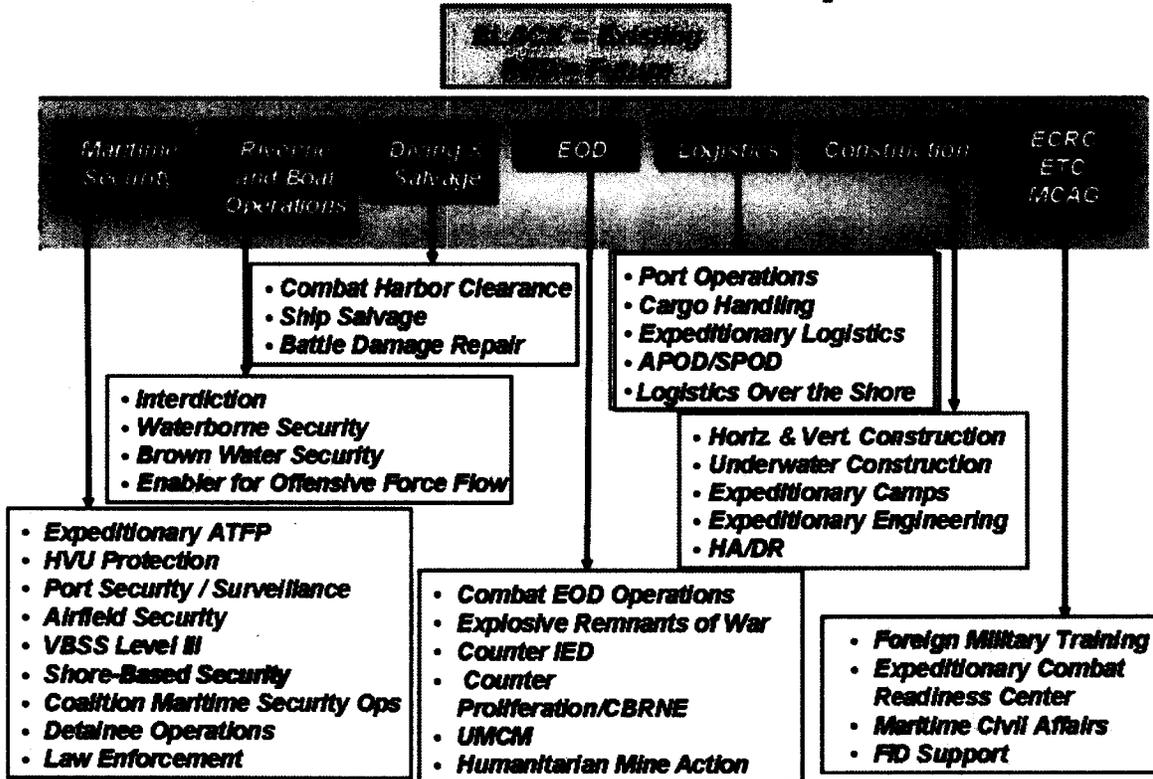

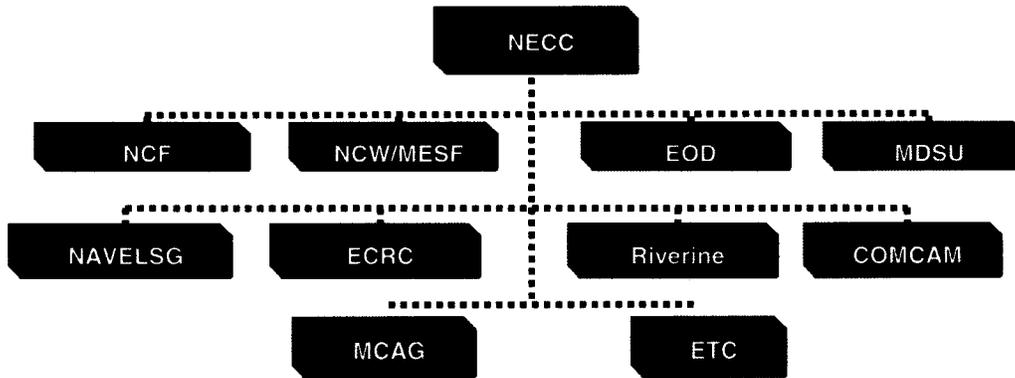

Figure 1 – Navy Expeditionary Combat Command Functions and Capabilities

Mission

NECC's mission is to organize, man, train, equip, and maintain Navy forces to operate in an expeditionary environment to:

- Provide a secure area for forces and logistics to flow ashore from the sea base and operate through the full continuum of environments from blue water to ashore
- Support naval and joint combat forces with EOD, expeditionary engineering and construction, mobile diving and salvage, riverine operations, expeditionary logistics, maritime civil affairs, expeditionary training, and maritime security/force protection
- Use the distributed capability of assigned forces to extend Joint Forces Maritime Component Commander/Navy Component Commander (JFMCC/NCC) domain awareness to the near-coast, inshore, and riparian environments

NECC Force Organizations and Missions

Command	Title	Mission
NCF	Naval Construction Force	Provides contingency construction support throughout the AOR to include forward operations base construction and operation, bridge/airfield maintenance, fleet hospital set-up and operations, underwater construction and disaster relief
NCW/MESF	Maritime Expeditionary Security Force	Conducts security operations in support of Navy Component Commander (NCC)/Joint Force Maritime Component Commander (JFMCC) in order to defeat Level I and II Threats in the near-coast, inshore, and harbor/port environments
EOD	Explosive Ordnance Disposal	Detect, locate, identify render safe, and dispose of unexploded explosive ordnance (UXO), counter improvised explosive devices (IEDs), and disarms underwater explosives, such as subsurface mines
MDSU	Mobile Diving and Salvage Unit	Performs expeditionary diving and salvage operations, battle damage repair, harbor clearance, and fleet support
NAVELSG	Naval Expeditionary Logistics Support Group	Provides support for port and air cargo handling missions, customs inspections, and ordnance reporting and handling
ECRC	Expeditionary Combat Readiness Center	Train, equip, certify, deploy, provide oversight, reach-back and redeploy Navy Individual Augmentees, in lieu of individuals and provisional units deploying for non-traditional expeditionary missions in support of the Global War on Terrorism
NRG	Navy Riverine Group	Establishes and maintains control of rivers and waterways for military and civil purposes, denies their use to hostile forces, and destroys waterborne hostile forces or personnel
COMCAM	Combat Camera, Atlantic	Conducts counterterrorism, psychological operations, information operations, battle damage assessment, force protection. Support to: medical, investigative, historical documentation, intelligence gathering support, and public affairs
MCAG	Maritime Civil Affairs Group	Integrates both Department of Defense (DoD) and non-DoD initiatives to provide Civil Military Operations focused on the maritime and near-coast environments
ETC	Expeditionary Training Command	Supports Combatant Commanders' Theater Security Cooperation efforts by delivering timely, focused, and customized training to designated foreign country military, civil and security personnel Host Nations to govern and protect themselves and their AOR from enemy forces

Figure 2 – Navy Expeditionary Combat Command Force Organization and Mission

NECC forces bring special skill sets and operational focus to MSO. The guiding principle of this force will be to establish relationships and ensure access across the expeditionary environment. From the sea base, across the near-coast littoral, on the inland waterways and ashore, NECC forces will deliver critical and unique capabilities for joint forces operating in support of national security objectives worldwide. NECC forces will provide distributed capability of assigned forces to extend JFMCC/NCC domain awareness and influence in the near-coast, inshore, and riparian environments.

NECC Support of JFMCC Environment Adaptive Expeditionary Capability

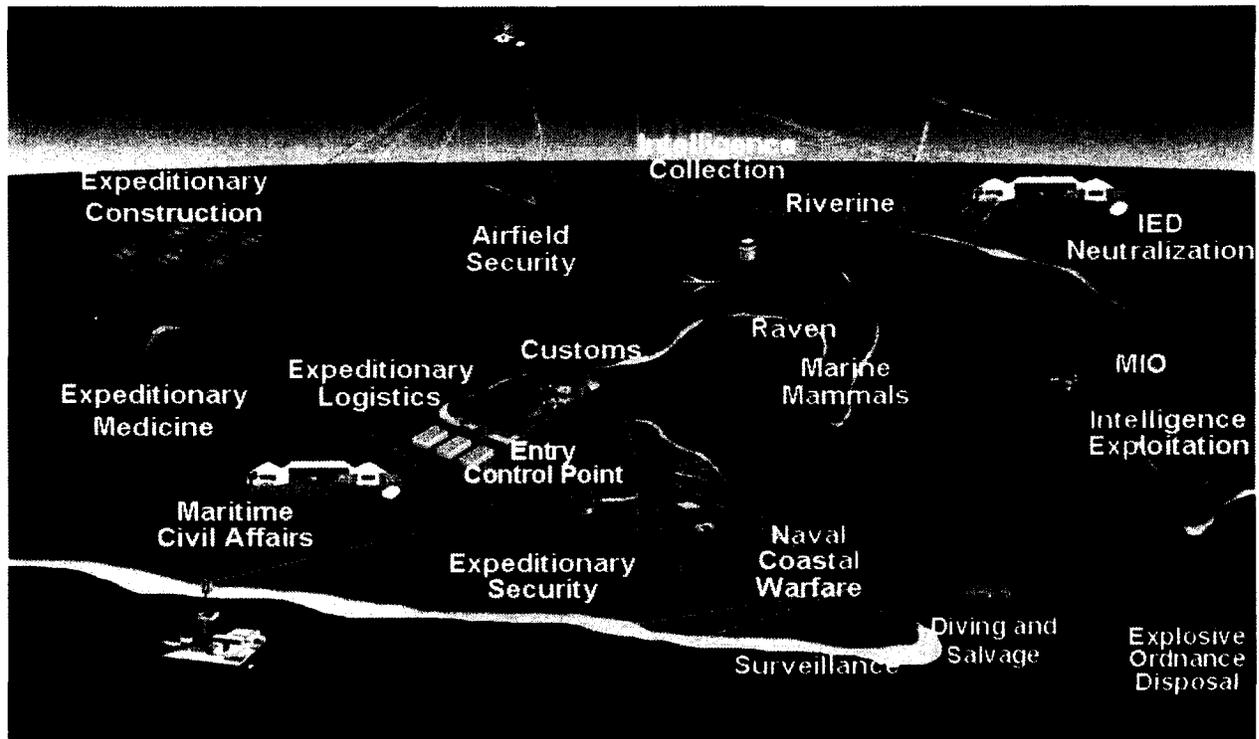

Figure 3 – Navy Expeditionary Combat Command Support to JFMCC Environment

Significant Operations and Accomplishments

Today, NECC is the functional type commander (TYCOM) for Navy expeditionary forces with Title X responsibilities for manning, training, and equipping approximately 40,000 active duty and reserve Sailors, or 12% of the total Navy force. The following significant operations and accomplishments highlight NECC's vital role in the Navy's contribution to our nation's defense.

Naval Construction Force, comprised of 9 active² and 12 reserve NCF battalions, continues operations throughout Iraq and Kuwait with 2,600 Seabees currently deployed worldwide, which is 35% of the active force. NCF completed airstrip improvements in Afghanistan and supported the Army's 10th Mountain Division by constructing outposts, shower and berthing facilities. Other NCF operations include Humanitarian Relief in Pakistan and infrastructure improvements in Indonesia, Bangladesh, East and West Timor, and the Philippines following the 2005 Tsunami disaster. NCF detachments provided critical repairs to impoverished medical facilities during USNS Mercy's 2006 humanitarian deployment. Other projects included construction of base camps; road, airfield and

² Figure reflects the addition of the 9th NCF battalion programmed in fiscal year 2008 budget submission.

bridge repairs; building renovations; and force protection projects such as hardened dining facilities and medical/surgical facilities.

Naval Coastal Warfare/Maritime Expeditionary Security Force (MESF), is comprised of one active, five blended and four reserve squadrons. MESF maintains a continuous presence in the Persian Gulf, protects strategic shipping in-transit to strategic port of embarkation / debarkation (SPOE/SPOD), and provides point and area defense to SPOE/SPOD and critical offshore infrastructure protection. Currently there are expeditionary detachments deployed worldwide that provide maritime security for critical economic infrastructure and designated high value assets. The assets support Operations Vigilant Mariner (OVM), Enduring Freedom (OEF), and Iraqi Freedom (OIF) in the Pacific Ocean, Mediterranean Sea, Red Sea, and Persian Gulf. In response to 2005's catastrophic tsunami, MESF units provided critical afloat / ashore security in support of USNS Mercy's 2005 and 2006 humanitarian deployments.

Explosive Ordnance Disposal (EOD), comprised of 76 active³ and 14 reserve detachments, continues operations and support for Combined Joint Task Force (CJTF) TROY and Operation Iraqi Freedom (OIF). It supports Navy and joint requirements for Operation Enduring Freedom (OEF) in Afghanistan, with 41 detachments currently deployed or providing operational support. Navy EOD forces are the vanguard of critical counter-IED efforts in Iraq. They have responded to thousands of IED and unexploded ordnance (UXO) incidents since the beginning of OIF.

Mobile Diving and Salvage Unit (MDSU), comprised of 17 active detachments, continues to support COMFIFTHFLT diving and salvage requirements. It performed Humanitarian Aide/Disaster Relief (HA/DR) for hurricane Katrina, and conducted Joint POW/MIA Accounting Command (JPAC) recovery mission. MDSU augmented EOD detachments aboard CSGs and provided AT/FP diving services throughout the world.

Navy Expeditionary Logistics Support Group (NAVELSG), comprised of one active and 13 reserve battalions, maintains deployed Navy Customs Battalions to both Iraq and Kuwait in support of the various customs missions for OIF. Additionally, Port Groups CHARLIE, DELTA and ECHO were mobilized and deployed for cargo operations, including Mobile Air Cargo Handling Teams in Kuwait and Iraq. There are five units currently deployed to CENTCOM AOR: NAVELSG FWD HQ, NAVELSG Port Group, and NAVELSG Marine Air Cargo Handling. Customs Det Sierra and a Cargo Transfer Platoon deployed in direct support of Army logistics in Iraq.

Expeditionary Combat Readiness Center (ECRC) was established and organized as the single process owner for manning, training, equipping, deploying, and redeploying functions for all Navy Individual Augmentee (IA) and Ad Hoc forces deploying to the CENTCOM AOR in 2006. In the past year, ECRC established Navy presence at all Army training sites in Kuwait, Iraq, and

³ Total reflects fiscal year 2008 budget submission incremental increase of active detachments across the FYDP.

Afghanistan. It assumed administrative control of over 10,000 Sailors filling IA(s) and Provisional Units in the CENTCOM AOR.

Navy Riverine Group (NRG) One was established in May 2006 to provide oversight of three active riverine squadrons. Riverine Squadron (RIVRON) One completed initial manning, outfitting and certification training in February 2007, and is currently deployed to Iraq. Two additional RIVRONS will be established in 2007 with both squadrons reaching full operational capability (FOC) by 2010.

Combat Camera, Atlantic realigned under COMNECC in October 2006. It supported U.S. Central Command OIF/OEF requirements by providing teams to Iraq, Bahrain, and the Horn of Africa for a variety of Information Operations, historic/archival documentation, and public affairs efforts.

Maritime Civil Affairs Group (MCAG) began training Maritime Civil Affairs Teams (MCAT) last year. Sailors trained in civil affairs have deployed as Individual Augmentees to Afghanistan and Iraq in civil affair units, joint staffs, and as members of Provincial Reconstruction Teams. The first MCAT will be ready for deployment in summer 2007.

Expeditionary Training Command (ETC) provides valuable Foreign Internal Defense support. The ETC focuses on providing training to foreign countries in NECC-type capabilities. ETC teams will be ready to deploy in summer 2007.

(A.) REQUIREMENTS FOR RECAPITALIZATION OF EACH NECC FORCE

NECC's priority is to prepare task-organized expeditionary maritime combat arms, combat support, and combat service support units that are aligned to be effective, flexible, and responsive to JFMCC/NCC demands. In order to accomplish their mission, NECC forces require the necessary resources to recapitalize legacy equipment and material associated with these operations, as well as disaster relief and other contingency operations world-wide. See Figure 4 and Attachment 1 for a breakdown of overall requirements.

Naval Construction Force (NCF). As a result of on-going combat operations in support of the War on Terror (WOT) and the lack of availability for spares and manufactured replacement parts, the need for recapitalization of NCF's equipment inventory is critical to sustain NCF warfighting capability and capacity. *Sixty-four percent of the existing equipment inventory is reaching its projected end of life-cycle expectancy. Increased OPTEMPO, as a result of recent combat operations in support of the WOT, have accelerated wear and tear on an already over-aged equipment inventory. With Combatant Commander (CCDR) demand for NCF capability remaining high, modernization and recapitalization resources are required to sustain NCF capability and capacity.*

Naval Coastal Warfare (NCW)/Maritime Expeditionary Security Force (MESF). Since the beginning of OIF, MESF has provided a continuous presence of security forces in the Persian Gulf. With multiple units completing their second or third deployments since 11 September 2001, MESF's accelerated commitments have out-

paced current funding programmed for sustainment. Recapitalization resources are required to sustain MESF capability and capacity.

Explosive Ordnance Disposal (EOD). The tactical adaptation of the enemy in this dynamic environment has caused EOD to react accordingly and improve operator survivability. The significant and urgent changes in Tactics, Techniques and Procedures (TTPs) in the CENTCOM AOR have led to changes to EOD equipment inventory allocation and distribution. High usage rate and changes to EOD inventory have out-paced previously programmed phased replacement funding. In addition, seven EOD detachments are being stood-up to meet high demand. Additional funding is needed to equip and sustain these new detachments. This additional funding will also provide enhanced capabilities and training for Unmanned Aerial Vehicles (UAV) and EOD Robotics used to meet increased operational tempo and evolving threats. An increasingly high demand signal and routine harsh operating environment projected throughout the FYDP has significantly reduced the service life of equipment and programmed systems. Recapitalization resources are required to sustain EOD capability and address emerging requirements to counter new and evolving threats.

Mobile Diving and Salvage Units (MDSU). Hurricane Katrina recovery operations and OIF's harsh operating environment have significantly reduced the service life of equipment and programmed systems. ARS and T-ARS converted to Military Sealift Command (MSC), and existing afloat MDSU equipment inventory is being updated to reflect new ashore / afloat requirements. These requirements include armored vehicles and salvage and diving gear previously onboard ARS. Recapitalization resources are required to sustain MDSU capability, ARS to T-ARS conversion, and support for contingency diving and salvage operations.

Naval Expeditionary Logistics Support Group (NAVELSG). The increased equipment requirement to support reserve battalion training/mobilization to meet 1.25 battalion CENTCOM presence diminished available inventory. In addition, new developments and evolving threats indicate current armor is insufficient for tactical vehicle protection. A critical requirement is the replacement of personal combat equipment, material handling equipment and support items damaged or worn in support of OIF. Recapitalization resources are required to sustain NAVELSG capability and capacity.

Navy Riverine Group (NRG). The decision to establish NECC's Riverine Force (comprised of Riverine Group [RIVGRU] ONE and component Riverine Squadrons [RIVRONs] ONE, TWO and THREE) was made in support of the Chief of Naval Operations Guidance 2006. RIVGRU ONE and RIVRON ONE were established on 25 May 2006. RIVRON TWO was established on 02 February 2007 and RIVRON THREE is scheduled to be established in June 2007. RIVRON ONE deployed in support of Operation Iraqi Freedom (OIF) in February 2007 and is scheduled to be relieved by RIVRON TWO in late summer/early fall 2007. RIVRON THREE will relieve RIVRON TWO in spring 2008. The Riverine force is projected to remain in the initial outfitting phase through Fiscal Year 2009. Recapitalization of the Riverine Force is planned for future budget requests in accordance with established or estimated service life expectations for major items of equipment, with emphasis on the timely replacement of RIVRON ONE's legacy crafts obtained from the Marine Corps.

Combat Camera (COMCAM), Atlantic. In support of CENTCOM OIF/OEF requirements, COMCAM is providing teams to Iraq, Bahrain, and the Horn of Africa. In addition, COMCAM has provided underwater documentation to support the Joint POW/MIA Accounting Command and the Republic of Palau during bi-lateral recovery operations. COMCAM provides crucial photographic documentation/history of Navy combat missions, as well as chronicling other Joint Force operations when tasked by CCDR. Combat Camera equipment recapitalization is required to replace worn/damaged gear not repairable through depot maintenance facilities.

(B.) REQUIREMENTS FOR EQUIPPING NEW AND PLANNED NECC FORCES

NECC is to establish and coherently organize new and evolving expeditionary warfighting capabilities, including riverine, maritime civil affairs, expeditionary foreign military training, maritime expeditionary security, management of in lieu of (ILO) forces, enhanced support for humanitarian assistance, civil military operations and crisis response operations, and other emerging missions to support MSO around the world. NECC's contribution to the full spectrum of existing expeditionary missions and evolving new capabilities is essential to supporting national strategic objectives, both abroad and for the homeland. To fulfill their new responsibilities, NECC requires the necessary resources to properly equip new expeditionary forces.

Naval Coastal Warfare (NCW)/Maritime Expeditionary Security Force (MESF). MESF provides a focused structure that can adapt to new and emerging maritime security missions. MESF will be trained and equipped to conduct Level III Visit, Board, Search and Seizure (VBSS), Detention Operations, and to support Theatre Security Cooperation Operations. MESF provides Navy and joint commanders capability in these critical mission areas. MESF implementation provides the Navy an essential first step in establishing a dedicated and adaptable maritime security force essential to today's Maritime Security Operations. MESF provides a structure to establish one standard for training, certification, and Training, Tactics and Procedures. It will improve the overall security readiness and capability of the Navy.

Navy Riverine Group (NRG). The current goal is for the Riverine force to achieve Full Operational Capability (FOC) status by fiscal year 2010. Achieving this goal requires that sufficient resources be provided to support procurement of all baseline equipment required by the Force no later than fiscal year 2010. The 2007 budget submission included a request for funds to establish a modest Riverine capability beginning in fiscal year 2007. The decision to accelerate the establishment of a Riverine force into fiscal year 2006 and increase the capacity of that force required funding for initial outfitting to be reprogrammed from existing resources in fiscal year 2006. Fiscal year 2006 reprogramming provided approximately 17% of the total investment estimated to fully outfit the Riverine force. Additional funding support for initial outfitting was included in the fiscal year 2006 Supplemental request. Approximately 50% of that request was approved by conference, but higher priority requirements redirected those funds before release to the Navy. In fiscal year 2007 requested funding for the Riverine Force (2007 budget submission plus modest reprogramming) has provided an additional 15% of the total investment estimated to fully outfit the Riverine Force. Additional funding support was included in the Fiscal Year 2007 Supplemental request and should provide as much as 30% of the total investment funding required for initial outfitting.

Expeditionary Combat Readiness Center (ECRC). The ECRC will be capable of training, equipping, certifying, deploying, and providing oversight for Navy Individual Augmentees (IA) and in lieu of (ILO)/ad-hoc units deploying for non-traditional expeditionary missions in support of Maritime Support Operations (MSO). The ECRC will establish and execute an oversight process, including deployment, reach-back, and redeployment support for Navy personnel assigned to missions outside traditional, Navy platform missions.

Expeditionary Training Command (ETC). The ETC will deliver to a global audience maritime expeditionary core capability training and instruction in the areas of naval construction, maritime civil affairs, maritime expeditionary security, Riverine, expeditionary logistics, explosive ordnance disposal, mobile diving and salvage, naval coastal warfare, and skill sets external to NECC. The goal will be to complement Foreign Internal Defense (training) efforts of Joint U.S. forces across the full spectrum of military operations. This mission will be carried out by teams of ETC personnel with the subject matter expertise to train foreign audiences at a basic to intermediate level. ETC will conduct training throughout the maritime environment, and will account for the security force capabilities of ports, harbors, transportation centers, and high-value waterways critical to Host-Nations' interests.

Maritime Civil Affairs Group (MCAG). MCAG will provide civil affairs with expertise focused on the maritime and near-coast environments in a way that will complement and expand, but not duplicate, current civil affairs capability in the U.S. Army and U.S. Marine Corps. MCAG will be trained on all core Civil Affairs functional areas, but will maintain enhanced expertise in the areas of port operations, harbor and channel construction and maintenance, and marine and fisheries resources. The value of MCAG forces is in the special skill sets and focus they bring to Civil Affairs efforts in the maritime environment. MCAG will provide the JFMCC with dedicated Maritime Civil Affairs specialists with the ability to conduct assessments and planning, interface with local officials, and provide a presence in ports and coastal regions that support military objectives, build partnerships, and result in better information/intelligence. In executing this mission, the MCAG will expand the operational commander's area of influence.

(C.) DESCRIPTION OF HOW REQUIREMENTS WILL BE ADDRESSED IN FISCAL YEAR (FY) 2008 BUDGET SUBMISSION AND FUTURE BUDGET REQUESTS

From inception, NECC has been tasked to deliver expeditionary capability under an aggressive timeline. The current FY2008 budget submission reflects the incremental increase to deliver NECC new capabilities and increased capacity as a result of ongoing combat operations in the CENTCOM AOR and global WOT contingency support.

Naval Construction Force (NCF). NCF must be capable of horizontal, vertical, and underwater construction and engineering in the NECC operational environment. This capability will also include C2, contingency contracting, and expeditionary reach back capability when required. In addition, NCF units are trained in defensive combat when required to support operations in high-threat environments. The FY07 supplemental will be used to recapitalize existing force, and the FY08 budget submission will resource the addition of the 9th NCF battalion. Out-year funding will be

used to maintain the recapitalization rate at nine years, which is the established industry standard for construction equipment.

Naval Coastal Warfare (NCW)/Maritime Expeditionary Security Force (MESF).

As NCW transitions to the MESF, the expeditionary security provided by NCW units today must be capable of seaward security and surveillance. MESF will provide a single integrated security force capable of ground defense, airfield security/defense, rapid response, land convoy escort, surveillance and reconnaissance, waterborne defense, swimmer attack defense, port security and harbor defense, Vessel Board Search & Seizure (VBSS), vessel escort, embarked security, and additional operations such as detention operations, law enforcement, law and order, customs support, humanitarian assistance and civic support. Out-year funding will be used to sustain two new boat detachments and five LVL III MIO/VBSS teams initiated in 2007; establish and sustain additional boat/security detachments required to fill-out and balance MESF squadrons post NCW realignment; and sustain MESF equipment inventory levels consistent with recapitalization rates and mission obligations.

Explosive Ordnance Disposal (EOD). EOD forces must be able to detect, locate, identify, render safe, and dispose of UXO, improvised explosive devices (IEDs), or mines in support of maritime and contingency operations. Mobile EOD detachments must be ready to seamlessly integrate into and support various operational requirements, including carrier strike groups, expeditionary strike groups, contingency, integrated joint, M-HLS/D, mine warfare, and coastal warfare operations. High demand signal for EOD Forces and congruent harsh operating environment projected throughout the FYDP requires supplemental appropriations to reset/refresh the force. Out-year funding will be used to establish seven new EOD detachments and associated equipment, while maintaining inventory levels consistent with recapitalization rates and future mission obligations.

Mobile Diving and Salvage Units (MDSU). Mobile Diving and Salvage Units (MDSUs) shall be capable of planning, coordinating and conducting sustained salvage, battle damage assessment/repair, harbor clearance services/port recovery, and surface-supplied air, mixed gas and SCUBA diving operations in various bodies of water (open ocean, harbor, and beach surf /littoral areas). Two types of detachments are employed by MDSUs: Mobile Diving Salvage Detachments (MDSD) and Fleet Maintenance Diving Detachments (FMDD). These units will be able to rapidly deploy as specialized teams to conduct underwater emergency repair and salvage missions to recover ships, aircraft or other objects of value; conduct harbor clearance services to remove vessels and/or objects obstructing port access; and perform underwater ship's husbandry operations continuously until the recovery, repair, or salvage operation is completed. Hurricane Katrina recovery and OIF operating environment requires supplemental appropriations to reset/refresh the force. Out-year funding will be used to support establishment of five new detachments; ARS to T-ARS conversion; and associated equipment inventory levels consistent with historical recapitalization rates and future mission obligations.

Naval Expeditionary Logistics Support Group (NAVELSG). The Navy Expeditionary Logistics Support forces must be ready to provide cargo and ordnance handling services, supply support, and customs to forces deployed ashore. With increased OPTEMPO is support of GWOT, the current supplemental is to re-

fit/refresh/replace equipment that has been destroyed in support of OIF or is not economically feasible for repair. Out-year funding will maintain equipment inventory levels consistent with recapitalization rates and mission obligations.

Navy Riverine Group (NRG). The fiscal year 2008 budget submission includes procurement resources that would provide an additional 18% of the total investment funding estimated as required to fully outfit the Riverine Force. Future budget requests will include procurement resources to fund all remaining initial outfitting requirements necessary to achieve FOC by fiscal year 2010.

Combat Camera (COMCAM), Atlantic. COMCAM teams will be capable of providing photographic documentation covering air, sea, ground, and underwater operations of military forces engaged in combat, combat support operations, humanitarian operations, scientific research, and related peacetime activities, such as exercises and war games. COMCAM will receive requisite combat training, to include Survival, Evasion, Resistance, and Escape (SERE) training, desert survival and small arms training. This training will enable combat photographers to integrate with military forces on the ground without being a liability. At least one team will have trained divers capable of undersea still and video imaging. Due to the expanded COMCAM mission, out-year funding will be used for requisite combat training, equipping COMCAM teams with required photographic equipment, and maintaining and recapitalizing COMCAM equipment to meet future mission obligations.

Expeditionary Combat Readiness Center (ECRC). NECC is providing support for several functional areas of non-traditional Navy missions. ECRC must be capable of training, equipping, certifying, deploying, and providing oversight for Navy Individual Augmentees (IA) and in lieu of (ILO)/ad-hoc units deploying for nontraditional expeditionary missions in support of Maritime Security Operations (MSO). In addition, ECRC must increase individual and provisional unit combat readiness by ensuring Navy personnel receive ground combat skills training and coordinating mission-specific training where required. Concurrently, ECRC must provide support to family members of military members assigned as IAs or to ILO/ad hoc units during deployment. Out-year funding will be used to recapitalize used equipment and support NECC's Warrior Transition Plan, which facilitates Sailors returning from IAs.

Expeditionary Training Command (ETC). ETC will be responsible for delivering timely, focused, and customized maritime core training in support of the Joint Forces Maritime Component Commander/Navy Component Commander (JFMCC/NCC) shaping operations and Combatant Commander (CCDR) Theater Security Cooperation Plan (TSCP). Future funding requirements include training equipment to strengthen Foreign Internal Defense missions and Theater Security Cooperation initiatives with friends and allies world-wide.

Maritime Civil Affairs Group (MCAG). Funding is required for cultural awareness training programs essential for the ability to focus on civil military operations, assessment, and planning in the maritime environment. Without funding for training, near-immediate response capability for focused MCA support will be severely hampered. Out-year funding will support day-to-day operational requirements as well as maintain the operational equipment inventory.

Units	Net Cap/Equip Requirement (\$M)	FY07 Supplemental (\$M, OPN)	FY08 (\$M, OPN)	Delta (\$M, OPN)
NCF	321.3	283.4	30.4	7.5
NCW/MESF	69.7	43.1	26.6	0.0

ECRC	5.4	5.1	0.3	0.0
ETC	2.9	2.6	0.3	0.0

Figure 4 – NECC Recapitalization Requirement Table

Summary

NECC provides the operational commander tremendous capability and capacity supporting irregular warfare, major combat operations, security, stability, transformation and reconstruction (SSTR) missions. By aligning all the Navy expeditionary forces under NECC, Navy is better able to streamline operations, increase readiness, and maximize resources.

As of this report, six of the NECC forces project recapitalization via supplemental or out-year program budget appropriations. Four of the remaining forces are either new entities and will be effectively outfitted from inception, or possess negligible equipment lines that require recapitalization.

Force	NCF	NCW/MESF	EOD	NRG	ELSG	MDSU	MCAG	ETC	COMCAM	ECRC

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

June 14, 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

The Fiscal Year 2007 Senate Armed Services Committee Report 109-254 directs the Secretary of the Navy to report the preliminary findings of the F/A-18 A-D Service Life Assessment Program II to Congressional Defense Committees by June 15, 2007. The required information is provided as an attachment.

Please let me know if I can be of further assistance. A similar letter is being provided to Chairmen Inouye, Skelton, and Murtha.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

F/A-18 A-D Service Life Assessment Program II Preliminary Findings

Background:

The F/A-18 A-D Service Life Assessment Program II (SLAP II) is a two part assessment of the fatigue life of airframe structural elements affected by flight maneuvers based on actual usage. It provides an analytical foundation to determine the F/A-18 A-D service life extension that is feasible via inspections and structural modifications.

Findings:

- SLAP II flight loads analysis is 73% complete.
 - Efforts to date have focused on developing fatigue spectrums and analyzing the loads and stress that will determine the “safe life” of airframe structural elements in terms of flight hours.
 - Analytical results will be incrementally delivered in August through December 2007.
 - Modifications that extend the service life of airframe structural elements that do not meet the 10,000 flight hour safe life goal will be developed concurrently.
- The teardown of high-time fleet aircraft is 98% complete.
 - The teardown process has revealed fatigue cracks in the vertical tails, engine mount support structure, landing gear retract actuator, and stress corrosion cracks in the aft fuselage and inner wing panels. These conditions are not alarming and can be addressed through inspections or replacement of these elements as part of the planned Service Life Extension Program (SLEP).
 - This analytical effort must be completed before a comprehensive SLEP can be developed.

REPORT TO CONGRESS

**EXTENT OF PROVISION OF TIMELY NOTICE OF LONG-TERM
DEPLOYMENTS**

PREPARED BY

**CHIEF OF NAVAL PERSONNEL/
DEPUTY CHIEF OF NAVAL OPERATIONS (N1)**

2 NAVY ANNEX

WASHINGTON, DC 20370

MAY 2007

REQUIREMENT

Section 548 of the John Warner National Defense Authorization Act for FY2007 directed the Secretary of Defense to submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the number of members of the Armed Forces (shown by service and within each service by reserve component and active component) who, during the period beginning on January 1, 2005, and ending on the date of the enactment of this Act, have not received at least 30 days notice (in the form of an official order) before a deployment that will last 180 days or more. With respect to members of the reserve components, the report shall describe the degree of compliance (or noncompliance) with Department of Defense policy concerning the amount of notice to be provided before long-term mobilizations or deployments.

1. Navy Assessment

This report cites the degree of compliance with the 30-day provision of timely notice of long-term deployments for Reserve Component Mobilizations and Active Duty Individual Augmentations. All possible efforts are expended to ensure members are afforded, at a minimum, 30 days advance notification. In fact, beginning in 2006, Navy has made substantial business process improvements resulting in greatly increased notification times to affected service members. As of March 2007, the average notification times have improved to over 45 days for members of the Reserve Component and over 60 days for Active Duty Individual Augmentees. Some short-notice, mission-critical Combatant Commander requirements preclude issuing orders with more than 30 days notification. In most of those cases, a volunteer who is fully aware of the short-notice deployment is sought to fill requirements that result in less than 30 days notification.

A. Navy Reserve Component (RC) Mobilization.

Notification timelines for members of the Reserve Component during the period from 01 January, 2005 through September, 2006 were implemented in accordance with Paragraph 5.10.5, DODD 1235.10, September 23, 2004 cited below:

“5.10.5. Maximize the predictable use of RC forces by notifying Reserve members early that they are being considered for activation and by issuing mobilization orders as soon as it is operationally feasible to do so. The goal is to provide orders to the activating members at least 30 days prior to the report date. This goal does not apply to units and individuals that provide capabilities in the early stages of an operation that have procedures in place to deploy in less than 30 days without negatively affecting their families or employers. Ensure the existence of a system to document and track the timeliness of the issuance of mobilization orders in relation to the date of mobilization. “

The following table cites the degree of compliance with the 30 day notification goal for members of the Reserve Component who are mobilized from 01 January 2005 through September 2006:

RC Mobilization Notification

Mobilization Orders	Count	%	Average Notification (Days)
< 30 days	4716	45.03	16.8
30 + days	5757	54.97	42.2
Totals:	10473	100	30.8

Reasons for non-compliance within the Reserve Component:

- Short-notice Latest Arrival Date (LAD) requirements received from Combatant Commanders preclude our ability to write orders with greater than 30 days notification.
- Mobilization Delays, Deferments, and Exemptions that require short-notice back-fills in order to meet combatant commander requirements.
- Mobilization cancellations due to lack of member qualification (medical, dental, administrative, etc.) that require short-notice back-fills in order to meet combatant commander requirements.
- Mobilization of volunteers requesting immediate mobilization with knowledge and concurrence of less than 30 days notice.

In cases of non-compliance, every effort is made to minimize the impact to members, their families, and employers. In most cases, a volunteer who is fully aware of the short-notice notification is sought to fill the short-notice mobilization requirement.

B. Navy Active Component (AC) Individual Augmentation (IA)

The following table cites the degree of compliance with the 30 day notification for members of the Active Component performing Individual Augmentation assignments from 01 January 2005 through September 2006:

IA Notification

Augmentation Orders	Count	%	Average Notification
< 30 days	938	27.06	17.4
30 + days	2528	72.94	40.9
Totals:	3466	100	40.1

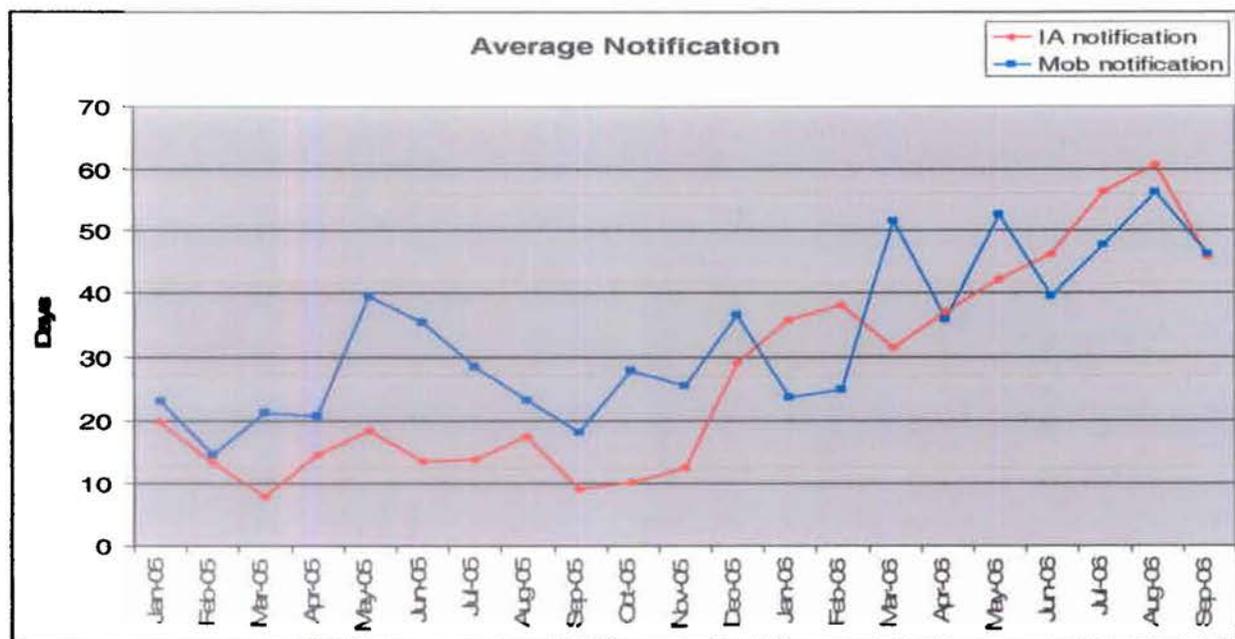

Reasons for non-compliance for the Active Component Individual Augmentees:

- Short-notice Latest Arrival Date (LAD) requirements received from Combatant Commanders preclude our ability to write orders with greater than 30 days notification.
- Order cancellations due to lack of member qualification (medical, dental, administrative, etc.) that require short-notice back-fills in order to meet combatant commander requirements.

In most cases, a volunteer who is fully aware of the short-notice notification is sought to fill the short-notice Individual Augmentation requirement.

C. Navy Historical Averages of Notification Times

The following table provides a graphical representation of the average notification for Reserve Component Mobilizations and Active Duty Individual Augmentations from 01 January 2005 through September 2006.

NOTE: Navy continues to improve the notification process timeline and increase the notification period for service members.

SEC. 548. REPORT ON EXTENT OF PROVISION OF TIMELY NOTICE OF LONG-TERM DEPLOYMENTS.

Not later than March 1, 2007, the Secretary of Defense shall submit to the Committee on Armed Services of the Senate and the Committee on Armed Services of the House of Representatives a report on the number of members of the Armed Forces (shown by service and within each service by reserve component and active component) who, during the period beginning on January 1, 2005, and ending on the date of the enactment of this Act, have not received at least 30 days notice (in the form of an official order) before a deployment that will last 180 days or more. With respect to members of the reserve components, the report shall describe the degree of compliance (or noncompliance) with Department of Defense policy concerning the amount of notice to be provided before long-term mobilizations or deployments.

DEPARTMENT OF THE NAVY
OFFICE OF THE CHIEF OF NAVAL OPERATIONS
2000 NAVY PENTAGON
WASHINGTON, D.C. 20350-2000

May 23, 2007

MEMORANDUM FOR DEPUTY UNDER SECRETARY OF DEFENSE
(READINESS)

SUBJECT: Report to Congress on Extent of Provision of Timely Notice of Long-Term Deployments

Attachment (1) provides Navy input to support development of a draft SECDEF Report to Congress required by attachment (2), Section 548 of the John Warner National Defense Authorization Act for Fiscal Year 2007 (H.R. 5122), on Extent of Provision of Timely Notice of Long-Term Deployments.

I would like to ensure that, once developed, the draft report will be routed for formal coordination to the Military Departments to ensure that the Secretary of the Navy and Chief of Naval Operations are afforded an opportunity to review and comment on the draft report prior to signature by the Secretary of Defense.

J. C. HARVEY, JR.

REPORT TO CONGRESS

Littoral Combat Ship

PREPARED BY

DEPUTY ASSISTANT SECRETARY OF THE NAVY, SHIPS

WASHINGTON, DC 20350

AUGUST 2007

1. REQUIREMENT

The FY 2008 House Armed Services Committee Report (110-146) directed the Secretary of the Navy to submit to the congressional defense committees by August 1, 2007, a report on the Littoral Combat Ship (LCS) program. The report is to include "the analysis of the root causes of the LCS cost overruns; the methods and procedures put in place throughout the various Program Executive Offices ensuring these mistakes are not repeated in other programs; the structure of the Navy's current contractual agreements with both LCS prime contractors along with justification for differences between the two, if any; an explanation of the Navy's plan for testing of the two different ship variants; and an analysis of alternatives for future procurement and deployment of the LCS."

2. BACKGROUND

The LCS program is of critical importance to the Navy. With its great speed and interchangeable modules, the ship will provide unprecedented warfighting flexibility. LCS is the cornerstone of the future Navy, and provides critical capability to the Fleet. Its fast, agile, focused-mission platform is designed for operation in near-shore environments yet is capable of open-ocean operation. It is designed to defeat asymmetric "anti-access" threats such as mines, quiet diesel submarines, and fast surface craft. The modular design integrated into a completely functional weapon system promises to deliver a warship class that will be highly effective, and allows LCS to be tailored specifically for the mission at hand -- flexible solutions to deliver needed capabilities to evolving threats.

LCS is needed now to fill critical, urgent warfighting requirements gaps that exist today. LCS provides capabilities in the areas of:

- Sea mine hunting, identification, and neutralization
- Detect, classify, track, and successfully engage small boats
- Detection and neutralization of quiet diesel submarines in shallow water environments

LCS is required now to establish and maintain U.S. Navy dominance in the littorals and strategic choke points around the world.

LCS is modular and easily upgradeable to ensure continued U.S. and Coalition forces access through strategic choke points and into vital littoral regions to adapt against uncertainties of future threats. As part of the Navy's program review, the warfighting and operational requirements have been revalidated.

The Navy awarded contracts for construction of the first four LCS seaframes (Flight 0). Lockheed Martin (LM) and General Dynamics (GD) have been awarded two ships each. LCS 1 (FREEDOM), the first LM ship was launched in September 2006. Fabrication on

LCS 2 (INDEPENDENCE), the first GD ship, began in November 2006. LCS 3 and 4 options were exercised in June and December 2006, respectively.

The Navy identified significant cost growth with the lead LM ship and issued a 90-day stop work order in January 2007 for the second LM ship, LCS 3, to provide time to assess factors contributing to the cost growth and to develop an executable program plan for the way ahead. The Navy evaluated the overall performance of the program, closely working with the contractor to address cost overruns and root causes.

Since the beginning of the year, the Navy has diligently worked with the two industry teams to identify and evaluate program cost, schedule, and technical risk. After an extensive program assessment, the Navy has developed an executable program plan that adjusts the acquisition profile, ship cost estimates, budgets, and schedules. It also provides resources for effective management of cost, production, and technical risk to deliver ships to the Fleet to support the urgent warfighting requirement.

This plan for LCS includes four core elements:

- Increased Navy oversight
- Selective contract restructuring
 - Unsuccessful for LCS 3 with LM resulting in partial termination
 - An option for GD ships if cost performance warrants
- Reprogramming of resources within the LCS program
- Execution to an achievable schedule

Projected cost growth on LCS 1 and LCS 2 varies between 50-75% depending on the basis of comparison, and the Navy has seen increases on LCS 4. The Navy will forgo LCS procurements currently budgeted in FY 2007 (two ships) and use the FY 2007 Shipbuilding and Conversion, Navy (SCN) funding to cover LCS 1, 2, and 4 cost growth. The Navy appreciates Congress's support of the recent reprogramming request for \$279M of the FY 2007 SCN funds, and looks forward to working with the Congress on the remaining funding required to execute the Navy's revised program plan. The FY 2007 Omnibus reprogramming request recently submitted by the Department includes an additional \$206 million of the FY 2007 SCN funds. The remainder of FY 2007 SCN, approximately \$34 million, is still required due to cost growth seen on LCS 4.

The restructured LCS plan also includes procurement of additional Flight 0 seaframes in FY 2008 and FY 2009 to address critical warfighting gaps. The FY 2008 President's Budget request is sufficient to procure two LCS in FY 2008.

The Navy intends to initiate fixed price incentive contracts starting in FY 2008 to more equitably balance cost risk between the Navy and industry. In addition, the restructured plan provides funding to both industry teams to update their respective designs and implement changes that will improve producibility and reduce cost.

The Navy intends to propose to OSD that a full and open competition for Flight 1 ships in FY 2010 and beyond be held. The two existing seaframe designs will undergo operational performance testing in FY 2009, and the results will be considered as part of the evaluation for a single seaframe design selection for the FY 2010 and follow Flight 1 ships of the LCS class. Flight 1 ships will be based on the selected design and will incorporate lessons learned from test and trials. However, the Navy may elect to continue production of both seaframes should each present unique operational advantage. The Navy also intends to implement a Government-furnished open architecture common combat system/command, control, communication, computers and intelligence (C4I) suite in the design to optimize lifecycle cost and capability across the family of surface combatants.

3. ANALYSIS OF ROOT CAUSES

The Assistant Secretary of the Navy for Research, Development, and Acquisition (ASN(RD&A)) established a Program Management Assist Group (PMAG) to conduct a review of cost growth associated with LCS 1, and to review projected costs for LCS 2, LCS 3 and LCS 4. The PMAG assessment identified the following root causes of cost growth:

- Aggressive cost goal and schedule
- Pressure to build to a schedule was strongly emphasized and generated cost growth
- The ambitious schedule relied upon concurrent design and construction that was not achieved.
- For LCS 1, the timing of LM's bid to the finalization of Naval Vessel Rules resulted in underestimated efforts for design and construction by the contractor.
- The competitive environment created disincentive for the contractor to surface execution challenges to the Navy.

The PMAG made several recommendations based on the assessment of LCS root causes:

- Emphasize rigorous risk management for high risk programs, including incorporation of risk mitigation strategies directly into shipbuilding contracts.
- ASN(RD&A) issue guidance highlighting critical program management functions and emphasizing chain of command notification of unexpected results, including details surrounding changes in contract baselines.
- Conduct formal independent cost estimates before exercising future options or contracts in LCS. Incorporate appropriate risk margins in budgets for future LCS procurements.
- Implement organizational changes across supporting offices: improving timing and staffing levels of on-site government oversight (SUPSHIP) to better match construction schedules; providing adequate resources and manning to the acquisition program office and supporting NAVSEA offices; and improving experience and training levels of the program managers and their staffs.
- Implement contractual and acquisition policy changes to improve visibility and performance expectations.

Responses to these recommendations will be addressed in the following discussion of the revised LCS program plan as well as an overview of changes being made to prevent reoccurrence in other Navy acquisition programs.

4. METHODS AND PROCEDURES ENACTED BY NAVY

As an initial response to the findings of the LCS program assessment, ASN(RD&A) also directed a series of specific actions to reduce risk and improve management of Navy acquisition programs:

- A review of all Navy ACAT I programs to assess the amount of design/build concurrency to identify potential additional risks and ensure proper mitigation. This review is in progress.
- A review of program office staffing for all ship new construction programs. This review is in progress.
- A complete review of Defense Acquisition Workforce Improvement Act (DAWIA) qualifications required and as currently staffed for Navy ACAT I and II programs. This review is complete and did not identify problems with DAWIA qualifications.
- An ASN(RD&A) review of each Program Executive Office's (PEO) span of control to determine if changes in PEO organizational structures or portfolio alignment are required.
 - In one specific action, the span of control for PEO Ships has been reduced by establishing a Team Ships such that one flag officer is responsible for Fleet support, and one flag officer is responsible for ship acquisition.
 - Additionally, the System Commands are transitioning to a Competency Aligned Organization (CAO) to create an organization that responds to the workload "demand signal" in an agile, disciplined and cost effective manner.
- NAVSEA review of Supervisor of Shipbuilding (SUPSHIP) staffing for all ship new construction programs. This review is complete and identified the need for additional billets in the areas of Earned Value Management System (EVMS), technical authority (engineering), and on-site project management. ASN(RD&A) has directed NAVSEA to work with the PEOs to develop an implementation plan for the added personnel.
- ASN(RD&A) has directed a similar Navy review of Defense Contract Management Agency (DCMA) support for all Navy acquisition.
- An increase of the frequency and scope of ASN(RD&A) reviews of acquisition programs, now conducted within "portfolios" (Air, Ships, C5I, Expeditionary Warfare) to improve communication and management transparency.
- Conduct of a series of "Dialogues on Acquisition Excellence" with the leadership of the System Commands, PEOs, and program management offices.

While these actions represent an immediate effort to identify and mitigate risk in current Navy acquisition programs, they have also informed a larger effort that ASN(RD&A) is now leading - an Acquisition Reengineering effort within the Department of the Navy to:

- Better control cost and requirements growth
- More accurately estimate the cost risk in Navy programs
- Match contracting models and incentives to the cost and risk of the program

As part of this effort, ASN(RD&A) is focusing resources where they are most needed, including ensuring that our higher risk and most critical programs are resourced properly.

The key tenets of Navy Acquisition Reengineering include:

- Aligning the organization
 - Ensuring business practices are based on accountability, transparency, and trust
 - Focusing business practices on delivering the required capabilities on time and within budget
 - Focusing organizational structure on PEOs and program managers who are responsible for delivering to the warfighter
- Aligning the resources
 - Focusing resources where they are most needed
 - Ensuring higher risk and most critical programs are properly resourced
 - Improving the timing and staffing levels of on-site government oversight (SUPSHIP/DCMA) to better match production schedules
 - Providing appropriate resources and manning the acquisition program offices and supporting System Command (SYSCOM) offices
 - Improving experience and training levels of the program managers and their staffs
- Cost Risk Management
 - Understanding program cost risk
 - Exploring techniques for isolating/mitigating risk
 - Reflecting cost risk in contract terms and conditions
 - Moving to fixed price incentive contracts as soon as possible
 - Establishing shared understandings of risk across the Navy Enterprise
 - Stabilizing requirements

The Navy's greatest challenge is applying the right resources where they need to be across the Acquisition Enterprise. Like most areas of the Department, Navy Acquisition is faced with the realities of a fiscally constrained environment. It is critical that the Navy execute its programs well, and in a productive partnership with the Navy's counterparts in industry. The Acquisition Reengineering effort will be a key component of the Navy's ability to affordably provide these critical capabilities.

5. STRUCTURE OF CONTRACT ARRANGEMENTS

Both LCS prime contracts are currently Cost-Plus-Award-Fee (CPAF) contracts. The Navy sought to restructure the LM contract for LCS 1 and 3 to Fixed Price Incentive (FPI) terms to more equitably balance cost and risk, but could not come to terms and conditions that were acceptable to both parties. On April 12, 2007, the Navy partially terminated construction of LCS 3 for convenience under the termination clause of the contract.

The Navy will continue to monitor GD performance on LCS 2 and LCS 4. The Navy has established a set of criteria, including cost growth, to monitor GD LCS execution. The Navy will seek to restructure the GD contract to FPI should the performance criteria be breached.

As part of the program restructuring, the Navy intends to initiate FPI contracts starting in FY 2008 to more equitably balance cost risk between the Navy and industry. In addition, the restructured plan provides funding to both industry teams to update their respective designs and implement changes that will improve producibility and reduce cost.

6. NAVY TEST PLAN FOR SHIP VARIANTS

Initial testing of each LCS Flight 0 seaframe and the eventual Flight 1 seaframe occurs at Builder's Trials and Acceptance Trials prior to delivery. At the Builder's Trials, the Navy's Supervisor of Shipbuilding provides oversight, and the Navy's Board of Inspection and Survey conducts the Acceptance Trials. After the delivery, each Flight 0 and Flight 1 seaframe will proceed through a Post Delivery Test and Trials period planned by the LCS and Mission Package program offices. This period includes a Combat System Ship Qualification Trial (CSSQT) to ensure that the ship is safe and effective to operate, and a Final Contract Trials (FCT) to determine the ship meets all of the requirements of the contract.

In addition to these tests, the Navy will conduct formal Developmental, Operational, and Engineering Test (DT/OT/ET) on the first ship of each Flight 0 design. This testing will be accomplished in stages as the ships complete construction and the focused Mission Packages mature. The first stage of the testing will consist of the conduct of a DT/Operational Assessment (OA) of both LCS Flight 0 seaframe designs using a mission-representative Mine Counter Measures (MCM) Mission Package. At this time, an engineering test will also evaluate selected elements from the anti-submarine (ASW) and surface warfare (SUW) packages. Further DT/OT/ET will also be conducted to include testing of the complete ASW and SUW Mission Packages, and of the eventual first Flight 1 LCS.

The LCS 1 and 2 testing, along with other criteria, will be used to select a single seaframe design in FY 2009 for competitive procurement of Flight 1 LCS in FY 2010. Evaluation

criteria are being developed jointly with the Fleet to support a FY 2009 single seaframe selection.

7. ANALYSIS OF ALTERNATIVES FOR PROCUREMENT & DEPLOYMENT

The strategy for LCS procurement beyond FY 2009 is based on a seaframe selection decision in FY 2009. A comparison of the Flight 0 seaframes equipped with identical focused Mission Packages will be one of the criteria for the potential Navy seaframe selection decision for the Flight 1 ships. The Navy decision will consider the available DT and OT results as well as other relevant technical and programmatic considerations. A full and open competition will be conducted in FY 2010 for construction of the selected design for FY 2010 and beyond. However, the Navy may elect to continue production of both seaframes should each present a unique operational advantage.

The Navy carefully considered the two primary alternatives for LCS seaframe acquisition in FY 2010 and beyond: (1) selecting a single seaframe design and (2) continuing to procure two seaframe designs.

Selecting a single Flight 1 seaframe achieves commonality in hull, mechanical, and electrical (HM&E) and C4I systems in the LCS class. This alternative also allows the Navy to move more easily to a common combat system and C4I suite for the class. One seaframe design with a common combat system and C4I suite is projected to reduce life cycle cost with reduced logistics and training costs. To maintain competitive pricing pressure for Flight 1, the Navy intends to conduct a full and open competition for procurement in FY 2010 and beyond. This may result in some additional non-recurring start up costs in the near-term, but expanding potential sources increases competitive pricing pressure and enables higher production rates in the outyears needed to procure a 55-ship LCS class and achieve the CNO's force structure objective of 313 ships.

Continued procurement of two seaframe designs into FY 2010 and beyond is also an alternative since both ships are currently assessed as being capable of meeting all the Key Performance Parameters and critical requirements. Existing Navy and industry nonrecurring investments would be leveraged to the maximum extent under continuation of Flight 0 ship production with the current primes. Additionally, the common combat system and C4I suite would be included in the alternative.

The Navy's decision to move to Flight 1 procurement in FY 2010 allows these ships to more easily incorporate lessons learned from the operational evaluation. The implementation of a common combat system and C4I suite as part of Flight 1 would reduce lifecycle cost of the common warfare system, but does not achieve the savings in seaframe HM&E, crew training, and logistics costs anticipated from selecting a single seaframe design.

The design to implement Flight 1 starting in FY 2010 is driven by the timeline required to complete the operational evaluation, incorporate lessons learned and any necessary

changes to meet the LCS Capabilities Development Document (CDD) for Flight 1, and develop a mature technical data package needed to conduct Flight 1 full and open competition for either seaframe.

In the interim, the Navy intends to continue procurement of Flight 0 seaframes in FY 2008 and FY 2009. These ships are urgently needed and will serve as gap fillers to meet current critical warfighting gaps in the littorals and strategic choke points in the littorals.

The current LCS Flight 0 ships acquisition strategy allowed the industry teams to design and acquire the combat system and C4I suite. As a result, each team developed a combat system/C4I suite with unique components not included on the other seaframe design, or other Navy ships. The lack of commonality between the two current designs and Navy components negatively impacts the expected combat systems ownership costs to support these ship variants: i.e., materiel logistics, training programs, maintenance, system upgrades and technology refreshment. Additionally, some system components are foreign and/or proprietary designs that may not convey with Government Purpose Rights (GPR), limiting sources for obtaining component support.

To minimize impacts to the combat systems ownership costs to acquire, operate, and maintain the LCS 1 class, the Navy is updating its acquisition strategy for acquiring the LCS combat system beginning with FY 2010 Flight 1 procurements. The Navy intends to transition from Contractor Furnished Equipment (CFE) designs to a single common combat system that will be provided as Government Furnished Equipment (GFE)/ Government Furnished Information (GFI). This strategy will incorporate, wherever possible, existing Navy program-of-record combat system components. Where no Navy program-of-record or Fleet-common component exists that meets LCS requirements, a full and open competition will be conducted for these components. This strategy allows the Navy to establish commonality of LCS combat system components across all Flight 1 ships in the class, preserve GPR for the Navy, and assure that required capabilities are met with a set of combat system components that optimizes performance, acquisition, and ownership costs.

The current Flight 0 combat system solutions consist of eight major elements: an open architecture combat management system, volume search radar, identification friend or foe system, electronic surveillance system, medium caliber gun, gun fire control system, electro-optical/infrared sighting system, and a close-in/self-defense weapon system. The common combat system that the Navy will provide will be comprised of these same elements. The Navy is not initiating a new combat system program or adding elements to the current solution configuration. Rather, for Flight 1, the Navy is replacing the two unique sets of Flight 0 combat system components with a single set of Navy-defined combat system components.

A class design services contract with each existing industry team will be utilized as the vehicle to accomplish the Flight 1 design efforts. Each of the teams will update their individual drawing packages to include lessons learned from Flight 0 design and construction, any approved changes or Engineering Change Proposals, as well as any

changes driven by Milestone B documentation such as the CDD. In addition, the products from the common combat system design efforts, in the form of an Interface Control Document (ICD) will be incorporated into the class design services contracts. Similarly, any C4I decisions will be integrated as an ICD input. The product of the class design services contracts will be a Navy design package from which the selected Flight 1 seaframe may be competitively bid and awarded. It is critical to this plan that Congress approve the Navy's request in its FY 2007 Omnibus reprogramming action to use a portion of the reprogrammed LCS funds for the common combat system and C4I suite efforts, the class design services contracts, and other efforts which are essential for the ability to procure the Flight 1 ships in FY 2010.

The test plan for Flight 1 ships will include the conduct of a Technical Evaluation (TECHEVAL) and an Operational Evaluation (OPEVAL) in FY 2014 to demonstrate the operational effectiveness and suitability of the production Flight 1 LCS. The Flight 1 LCS will also undergo a Total Ship Survivability Trial (TSST) to assess any changes from the Flight 0 design in susceptibility or vulnerability with the common combat system onboard.

The LCS Flight 0 ships meet the urgent operational needs of the surface Navy providing Fleet Commanders with a flexible combat capability in the challenging littoral. Flight 0 ships are designed to be completely interoperable with Carrier Strike Groups, Expeditionary Strike Groups, Surface Action Groups and one another. Though the Navy will transition to a Flight 1 design to realize the added advantage of system commonality and continued open architecture, the Flight 0 and Flight 1 ships will be able to perform the same missions with the same degree of interoperability. For ease of supportability and maintenance, the Flight 0 ships will be homeported in the same location, but will be available to the Fleet Commander for deployment world wide. The high degree of Mission Package system modularity allows for Flight 0 enhancement of combat and operational capability through equipment and software modernization.

9. SUMMARY

The Navy has worked diligently with both industry teams to identify and evaluate program cost, schedule and technical risk, and the LCS program office is being resourced to satisfy the required oversight for effective management of the LCS program. After an extensive program assessment, the Navy has developed an executable program plan that adjusts the acquisition profile, ship cost estimates, budgets and schedules, while providing resources for effective management of cost, production and technical risk, to deliver ships to the Fleet to support the urgent warfighting requirement.

THE ASSISTANT SECRETARY OF THE NAVY
(INSTALLATIONS AND ENVIRONMENT)
1000 NAVY PENTAGON
WASHINGTON DC 20350-1000

JUL 31 2007

The Honorable Tim Johnson
Chairman, Subcommittee on Military Construction,
Veterans Affairs, and Related Agencies
Committee on Appropriations
United State Senate
Washington, DC 20510

Dear Mr. Chairman:

The enclosed report provides information regarding Department of the Navy efforts in considering new information for an Outlying Landing Field to serve Naval Air Station Oceana and Marine Corps Air Station Cherry Point, as required by House Report 110-186.

If I can be of further assistance, please let me know.

Sincerely,

I. REPORT REQUIREMENTS

House Report 110-186 on the 2008 Military Construction, Veterans Affairs, and Related Agencies Appropriations Bill requires the Navy to provide a report on progress in considering alternative sites for an Outlying Landing Field (OLF) to serve Naval Air Station Oceana and Marine Corps Air Station Cherry Point. The report is due no later than July 31, 2007.

II. REPORT

a. BACKGROUND

The Draft Supplemental Environmental Impact Statement (DSEIS) for the Introduction of the F/A-18 E/F (Super Hornet) Aircraft to the East Coast of the United States was released to the public on February 23, 2007. Public hearings were held in Hyde, Bertie, Perquimans, Craven, Beaufort, and Washington counties, and in the City of Charlotte between March 19, 2007 and April 17, 2007. A public comment period extended from February 23, 2007 through May 9, 2007.

Comments received through public hearings and the public comment process revealed widespread opposition in North Carolina at the Federal, State, and local level to the preferred alternative OLF site in Washington County. The public also expressed in their comments a desire for the Navy to work with the leadership of North Carolina on identifying alternative sites for the OLF.

While the Navy believes that its examination of the five alternative sites analyzed in the DSEIS has been proper and thorough, the Navy recognizes the concerns that have been expressed about the Navy's preferred alternative, as well as the other four alternative sites analyzed in the DSEIS. The Navy takes these concerns very seriously, and is carefully considering them before making further decisions regarding the proposed OLF. To that end, the Navy is in discussion with the States of North Carolina and Virginia that may result in identification of new information on areas and sites examined during the site screening process employed by Navy. If the Navy receives new information about sites in Virginia or North Carolina that potentially meet Navy OLF siting requirements, the Navy will consider and evaluate that new information and determine whether adjustments in the current SEIS process are warranted to enable formal analysis of such sites under the National Environmental Policy Act.

b. COOPERATION WITH THE STATE OF NORTH CAROLINA

Navy representatives have met with officials from the state of North Carolina to discuss new information about the five OLF sites evaluated in the DSEIS as well as other areas that fall within the siting criteria employed by Navy. State officials have informally provided new information about several areas in Northeastern North Carolina that they believe might merit further evaluation. The Navy has completed an interim analysis of this new information and provided initial feedback to State officials regarding this new information. The Navy remains in continuous discussions with the State of North Carolina on this matter as the State continues to gather information input from other sources. By letter dated July 25, 2007, Governor Easley committed that State staff will help assess the viability of any sites identified through the new information provided by North Carolina.

c. COOPERATION WITH THE STATE OF VIRGINIA

By letter dated May 7, 2007, Virginia Governor Kaine asked the Navy to consider new information that the Commonwealth of Virginia may find concerning the best site for an OLF. The Navy subsequently met with Virginia officials to discuss the siting criteria employed by the Navy and the process for Virginia to provide new information about OLF sites that might merit further evaluation. The process established for receiving new information from Commonwealth officials was consistent with the procedures and timeline used in working with the State of North Carolina.

On July 10, 2007, representatives from the Virginia Office of Commonwealth Preparedness made available to the Navy and the public new information on ten potential sites in Southeastern Virginia that Commonwealth officials believe might be suitable candidates for further consideration. Senator Warner's office also provided new information about Fort Pickett, an alternative site that was initially considered in the EIS but was later eliminated from detailed analysis. The Navy expects to complete an interim analysis of that new information in August 2007, and provide initial feedback to the Virginia Office of Commonwealth Preparedness.

d. CONCLUSION

In response to comments received on the DSEIS and in consideration of concerns expressed about the Navy's preferred alternative location for an additional OLF to support Navy F/A-18 E/F squadrons home-based at Naval Air Station Oceana and Marine Corps Air Station Cherry Point, the Navy is working with the states of North Carolina and Virginia to determine whether there is new information about alternative sites for an OLF that would merit further consideration.

The Navy has received and assessed new information about sites in North Carolina and Virginia and remains in discussion with State leadership.

In September 2007, the Navy expects to complete sufficient analysis of the new information provided by North Carolina and Virginia to determine whether analysis of additional alternative OLF sites is warranted under the National Environmental Policy Act.

The Navy remains committed to continue to work with local, state and federal officials to the successful completion of this process.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

September 20, 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

In response to the House Armed Services Committee Report (110-146) regarding the "Premature Retirement of Navy Vessels," the attached report addresses the committee's concerns that Navy ships are being retired prior to reaching their expected service life. This report provides details of vessels being retired early between fiscal year 2008 and fiscal year 2012 to include a strategy for future design and construction to preclude a ship retiring prior to reaching its expected service life.

The Navy will retire 25 ships between fiscal year 2008 and fiscal year 2012, and 6 of the 25 ships will retire prior to reaching planned expected service life. Each ship's unique operational history and readiness condition are considered when making retirement decisions to include expected service life, material condition, manning requirements, annual operational and life-cycle costs, and total Navy force structure requirements. The 6 ships designated for retirement prior to their expected service life are not required to support the 313-ship force structure. As the Navy transitions to a 313-ship force structure, we continue to balance the numbers and types of ships for evolving current and future Navy mission requirements.

A similar letter has been sent to Chairmen Inouye, Skelton, and Murtha. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

**Report to Congress on
Retirement of Navy Ships Prior to Expected
Service Life (ESL)
FY 2008 - FY 2012**

Prepared By:

Director, Warfare Integration (OPNAV N8F)
Office of the Chief of Naval Operations
2000 Navy Pentagon
Washington, DC 20350-2000

September 2007

Reporting Requirement

This report is in response to House Armed Service Committee Report (110-146) regarding "Premature Retirement of Navy Vessels."

"The committee remains concerned that vessels of the U.S. Navy are being retired prior to the end of useful service life. The committee understands that over the past two decades a significant percentage of the capital ships of the Navy have been retired based on cost avoidance decisions for modernization of surface combatants or refueling of submarines. The committee notes that those decisions have resulted in a current fleet of less than 280 capital ships. The committee strongly believes that future Navy ship classes should be designed and constructed to allow for cost effective upgrades to the ships sensors, communications, and weapons systems as new technologies become available. The committee directs the Secretary of the Navy to submit a report to the congressional defense committees by October 1, 2007, detailing the vessels that the Navy expects to retire between October 1, 2007, and September 30, 2012, which will not have reached the end of useful service life. This report shall specify why it is in the best interest of the nation to retire any such vessel prior to the end of its useful service life. For the purposes of this report, "useful service life" shall be defined as the projected hull life of the ship class. Additionally, this report shall include the Navy's strategy for future design and construction to ensure that capital ships can be upgraded economically, and are not retired prematurely."

II. Background

Inventory management of the Navy's fleet is a long term process. Given the significant investment required, naval ships are procured at relatively low rates and their useful service life is comparatively long: 25 years for smaller ships and up to 40-50 years for ballistic missile submarines and nuclear-powered aircraft carriers. Because of their relatively complex configuration and size, their design time can range from two to seven or more years; similarly, construction time also spans several years. As the Navy transitions to a force that is effective in a 21st Century geo-political environment, 30-40 years will ultimately be required to make a complete change in the Navy's force structure as older ships retire at the end of their useful service and are replaced with newer, more suitable designs.

The total inventory of battle force ships will vary from year to year as a result of the complex interaction between retirements, recapitalization, capability, affordability, design and construction time, and industrial base capacity. The Navy continuously evaluates the threat and evolving security environment to determine the necessary forces required. When determining which vessels will be decommissioned, various factors are taken into consideration, e.g., expected service life, material condition; manning requirements; annual operational and life-cycle costs; and, total Navy force structure requirements.

The Navy's plan to build a force of 313 ships represents a balanced structure of different ship types required to support Navy missions. The numbers of ship types required to support current and future mission requirements has changed from what it was in the past. Consequently, the Navy must respond to an excess of ships of a particular type that are not needed to support operations.

The Navy uses a ship's expected service life (ESL) for planning the number of years that a ship is expected to be in service. For this report, expected service life and "projected hull life" are synonymous.

III. Navy Ship Retirement Plans Fiscal Year 2008-Fiscal Year 2012

A. Retirements

During the period fiscal year 2008 to 2012 Navy plans to retire the 25 battle force ships listed in the table below:

FY 2008	FY 2009	FY 2010	FY 2011	FY 2012
SSN 710	CV 63	FFG 8	SSN 691	FFG 28
T-AFS 3	LHA 1	LPD 13	T-AE 35	FFG 29
T-AFS 9	LPD 10	LPD 7	T-AE 32	FFG 32
	T-AFS 10	SSN 688	T-AE 33	LPD 8
	T-AFS 5	SSN 690		LPD 15
	T-AFS 7	T-AE 26		
		T-AE 34		

Naval Reserve Force, Active (NRFA) ships are not counted as part of the Navy's list of Battle Force Ships to which the Committee refers to. MHC 56, MHC 57, MHC 58, and MHC 62 are among NRFA ships and are scheduled to be retired in fiscal year 2008.

B. Length of Service

The following table outlines the length of service for each ship and compares it to the expected service life that was planned for each class.

Ship Hull Number	Retirement FY	ESL	Age at Retirement	Delta
SSN 710	2008	33	23	-10
T-AFS 3	2008	40	41	1
T-AFS 9	2008	40	41	1
CV 63	2009	45	48	3
LHA 1	2009	35	33	-2
LPD 10	2009	35	40	5
T-AE 26	2010	40	42	2
T-AFS 5	2009	40	40	0
T-AFS 7	2009	40	38	-2
T-AFS 10	2009	40	42	2
FFG 8	2010	30	30	0
LPD 13	2010	35	40	5
LPD 7	2010	35	43	8

Ship Hull Number	Retirement FY	ESL	Age at Retirement	Delta
SSN 688	2010	33	33	0
SSN 690	2010	33	33	0
T-AE 32	2011	40	40	0
T-AE 34	2010	40	38	-2
SSN 691	2011	33	33	0
T-AE 35	2011	40	38	-2
FFG 28	2012	30	30	0
FFG 29	2012	30	30	0
FFG 32	2012	30	30	0
LPD 8	2012	35	45	10
LPD 15	2012	35	41	6
T-AE 33	2011	40	39	-1
(-) Delta means less than expected service life				

IV. Ships Planned for Retirement Prior to their Expected Service Life

Six ships of the 25 planned for retirement between fiscal year 2008 and fiscal year 2012 will be retired prior to their expected service lives, as shown in the following table. Each class is discussed below regarding why it is in the best interest of the Nation to retire the ship prior to the end of its expected service life.

Ship Hull Number	Retirement FY	ESL (yrs)	Age at Retirement (yrs)	Delta (yrs)	313 Force Structure Requirement	Number in Inventory after this ship retires
SSN 710	2008	33	23	-10	48	52
LHA 1	2009	35	33	-2	9	10
T-AFS 7	2009	40	38	-2	0	0
T-AE 33	2011	40	39	-1	0	0
T-AE 34	2010	40	38	-2	0	3
T-AE 35	2011	40	38	-2	0	0
(-) Delta means less than Expected Service Life						

A. Submarines

In the Navy's 313-ship force structure, 48 attack submarines are required to meet the projected warfighting requirements through fiscal year 2020. Upon the fiscal year 2008 delivery of the USS NORTH CAROLINA (SSN 777), the USS AUGUSTA (SSN 710) is being inactivated and is not required to maintain Navy's force structure. Retaining this submarine would require a 24-month engineered refueling overhaul. After USS AUGUSTA's fiscal year 2008 retirement through FY 2012, there will be 52 attack submarines in inventory. The Navy maintains the required number of nuclear attack submarines until fiscal year 2020.

B. Amphibious Ships

Navy requires 9 big-deck amphibious assault ships (LHA/LHD) in its 313-ship force structure. USS TARAWA (LHA 1) is being inactivated in fiscal year 2009 after 33 years of service. Her inactivation will be concurrent with USS MAKIN ISLAND (LHD 8) joining the fleet. Consequently, Navy will have ten big-deck amphibious assault ships in inventory through fiscal year 2012 and will meet Marine Corps amphibious lift requirements. Maintaining TARAWA in active service for two additional years would exceed requirements and would cost approximately \$250 million (\$125 million per year) to operate the ship. A study of any engineering changes needed for extension beyond planned date would be required.

C. Combat Logistics Force Ships

The Navy has evolved its combat logistics support operational requirements to three ship types: Fast Combat Support Ship (T-AOE); Fleet Oiler (T-AO); and Dry Cargo/Ammunition Ship (T-AKE). Reducing the Combat Logistics Force support to three ship types will improve the overall effectiveness of operational fleet support. New construction T-AKE ships will replace both the aging combat cargo and ammunition ships (T-AFS and T-AE), which are no longer required as part of the 313-ship force structure.

V. Navy's Strategy to Preclude Necessity of Future Ship Retirements Prior to Expected Service Life

A. Causes

There are three primary causes that result in a ship or ship class being retired prior to reaching expected service life. First, the mission for which the ship was designed is no longer required, and the ship becomes marginally useful or has no useful role in Navy's force structure. Second, with changing mission requirements, the required numbers of a particular ship type may be reduced and result in excess inventory. Lastly, the cost of maintaining or modernizing the ship to retain its front-line combat readiness status becomes prohibitive or does not make sense from a cost-benefit perspective.

B. Strategies to Minimizing Future Retirements Prior to Expected Service Life

Multi-Mission Capability: Mission requirements can become outdated due to change in the world geo-political environment, new warfighting requirements, new technologies, new concepts of operations, or other changes that would dictate a requirement for a different platform design. The Navy designs its ships with multi-mission capability to have the flexibility to change their operational emphasis without major structural changes in the ship.

Long Range Force Architecture Analysis: The Navy is conducting detailed analysis of potential warfighting requirements farther into the future than it has in the past. The analysis assesses the potential future conflicts and types of warfare that might be required 20-50 years into the future. This approach is expected to yield design requirements for combatant ships that can be used for longer periods of time and be able to adapt to changes in the world environment.

Modular Systems: The cost of maintenance and modernizing the ship to maintain its combat edge over time is a major driver in the decision to retire a ship. Significant flexibility and ultimately the ability to extend a ship's service life may be achieved through the use of modular system installations and open architecture systems.

The use of modular ship systems installations can facilitate the removal and replacement of failed or obsolete components. It also permits modification of the ship's mission capabilities as operational requirements change throughout the life of the ship. The use of modular systems is, however, generally more expensive and results in an increased displacement to accommodate added structure to support the modular systems.

Open Architecture: The use of open architecture for electronic and software systems can reduce the cost of updating a ship's warfare and other operating systems. Electronic systems, frequently become obsolete and are no longer available on the open market. Open architecture enables replacement of the hardware or software of systems without major changes in interfacing software or hardware, much as would occur with the replacement of the mouse or display on a home computer.

VI. Summary

The Navy is transitioning to a 313-ship force structure that balances the numbers and types of ships for evolving current and future Navy mission requirements. This transition will encompass the retirement of six ships prior to reaching their expected service life between fiscal year 2008 and fiscal year 2012. Each ship's unique operational history and readiness condition are

considered when making retirement decisions. The ships designated for retirement prior to their expected service lives are not required to support the 313-ship force structure.

The Navy is pursuing strategies to preclude retirement before its expected service life of its future ships by:

- Designing ships with a multi-mission capability with sufficient flexibility to accommodate changing mission focus during the life of the ship.
- Applying long range force architecture analysis to examine the range of future missions for its ships and identify robust and enduring ship design concepts.
- Using modular systems to facilitate systems modernization and permit modification of Navy ships' primary mission packages to accommodate changing world geo-political environments.
- Using open architecture systems to facilitate introduction of replacement hardware and software to maintain warfare systems at peak operational capability.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

September 20, 2007

The Honorable Daniel Inouye
Chairman, Subcommittee on Defense
Committee on Appropriations
United State Senate
Washington, DC 20510

Dear Mr. Chairman:

House Report 110-146 on the National Defense Authorization Act for Fiscal Year 2008 directs the Secretary of the Navy to provide a report on the full range of costs associated with the construction of nuclear infrastructure and port improvements at Naval Station Mayport necessary to support a nuclear carrier, including an assessment of alternative sites. I am providing the enclosed report in response to House Report 110-146.

The Department of the Navy will consider operational, financial, and environmental factors before making decisions regarding the homeporting alternatives which are being evaluated in the environmental impact statement that is currently underway.

A similar letter has been sent to Chairmen Levin, Murtha, and Skelton. As always, if I can be of any further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

**Report to Congress
On
Carrier Basing**

--

Costs Associated with the Construction of
Nuclear Infrastructure and Port
Improvements at Naval Station Mayport
Necessary to Support a Nuclear Carrier

**Prepared by
U.S. Fleet Forces Command
September 2007**

I. Reporting Requirement

House Report 110-146 on the National Defense Authorization Act for Fiscal Year 2008 directs the Secretary to determine the full range of costs associated with the construction of nuclear infrastructure and port improvements at Naval Station Mayport necessary to support a nuclear carrier, including a detailed assessment of alternative sites, and submit the results of this analysis to the congressional defense committees by October 1, 2007. Specifically, Conference Report 110-146 stated:

The committee understands that the Navy has unused capacity at Naval Station Mayport, Florida, and is conducting an environmental impact statement on the feasibility of stationing additional surface ships, including a nuclear aircraft carrier, at Naval Station Mayport. The committee believes that Naval Station Mayport is an important defense asset that should be fully utilized. The committee is concerned that Naval Station Mayport has not previously served as homeport for a nuclear carrier and does not contain the considerable specialized infrastructure necessary to sustain and maintain such a vessel. Therefore, before the Secretary of the Navy recommends the stationing of a nuclear carrier at Naval Station Mayport, the committee directs the Secretary to determine the full range of costs associated with the construction of nuclear infrastructure and port improvements at Naval Station Mayport necessary to support a nuclear carrier, including a detailed assessment of alternative sites, and submit the results of this analysis to the congressional defense committees by October 1, 2007.

II. Background

In January 2006 the Chief of Naval Operations directed Commander, U.S. Fleet Forces Command to prepare an Environmental Impact Statement (EIS) to review and assess a broad range of alternatives for homeporting additional surface ships at Naval Station Mayport.

The purpose of the proposed action is to ensure effective support of Fleet operational requirements through efficient use of waterfront and shore side facilities at Naval Station Mayport.

The EIS will evaluate the potential environmental impacts for each of the ship homeporting alternatives that are under consideration:

- Cruiser/Destroyer (CRUDES) homeporting
- Amphibious Assault Ship (LHD) homeporting
- Nuclear-Powered Aircraft Carrier (CVN) capable
- CVN homeporting
- Seven different combinations of the above
- Amphibious Ready Group (ARG) homeporting
- No Action

The EIS timeline is as follows:

- 14 Nov 06: Notice of Intent (NOI) published in the Federal Register
- 5 Dec 06: Public Scoping Meeting held in Jacksonville, FL
- 14 Nov – 29 Dec 06: Public Scoping comment period
- Mar 08: Draft EIS (DEIS) released to public
- Apr 08: Public Hearings
- Dec 08: Final EIS (FEIS) released to public
- Jan 09: Record of Decision

The Draft EIS is currently in preparation. A preferred alternative has not been identified.

III. Cost Associated with the Construction of Nuclear Infrastructure and Port Improvements at Naval Station Mayport to Support Homeporting of Nuclear Carrier

The homeporting of a nuclear-powered aircraft carrier (CVN) is one of the alternatives being evaluated in the Mayport EIS. The preliminary cost estimates provided for Military Construction (MILCON) projects are draft planning characterizations associated with the different alternatives that could be required depending on which alternative is selected. These preliminary estimates noted below are subject to substantial refinement as the process continues.

A. Dredging: A dredge project would be required in order to allow unrestricted access for a CVN under all ship loading and tidal conditions. This would include dredging within portions of the Jacksonville Harbor entrance channel, and the Naval Station Mayport entrance channel and turning basin. The cost estimate is \$48M. A refined estimate for the dredging project will be developed based on final determination of the exact quantity, physical and chemical composition and ultimate disposal location of the dredged sediment. These issues are being evaluated in conjunction with the U.S. Environmental Protection Agency and U.S. Army Corps of Engineers who are both cooperating agencies on the EIS.

B. Wharf F upgrades: Structural and utility upgrades would be required for Wharf F to serve as the maintenance berth for a CVN undergoing a Planned Incremental Availability (PIA). Improvements would be necessary to upgrade the electrical capacity, potable water, salt water (fire protection) and compressed air. Installation of plate anchor embedded high wind Type III heavy weather moorings would be required to allow a CVN to remain at Wharf F if it were under maintenance and not capable of relocating in the event of an approaching hurricane. Structural deck upgrades would be required to accommodate crane operations to move large ship components to the maintenance facilities. The cost estimate is \$19M.

C. CVN nuclear propulsion plant maintenance facilities: These facilities include a Controlled Industrial Facility, Ship Maintenance Facility, and Maintenance Support Facility.

The Controlled Industrial Facility would be used for the inspection, modification, and repair of radiological controlled equipment and components associated with naval nuclear propulsion plants. It also would provide facilities and equipment for treatment, reclamation, and packaging for disposal of radiological controlled liquids and solids. It would include non-radiological controlled spaces for administrative and other support functions.

The Ship Maintenance Facility would be used to perform non-radiological depot-level maintenance on CVN propulsion plants.

The Maintenance Support Facility would house the primary administrative and technical staff offices supporting CVN propulsion plant maintenance, and central area for receiving, inspecting, shipping, and storing materials.

The combined cost estimate for all three facilities plus associated industrial equipment is in the range of \$200 - \$300M. This estimate is based on the Navy's previous experience with similar projects at NAS North Island, but would ultimately depend on the site-specific adaptation and design of these facilities for Naval Station Mayport. Due to the complexity of the construction and regulations pertaining to nuclear support facilities, a more refined cost estimate cannot be provided at this time until a further in-depth study of the facility requirements specific to Naval Station Mayport is completed using up-to-date construction materials pricing data.

D. Additional base infrastructure, such as parking and road improvements, may be required to support homeporting of a CVN. If required, such costs are as yet unknown.

IV. Other CVN Related Alternatives Evaluated in the Mayport EIS

Another alternative that is being evaluated in the Mayport EIS is that of making Naval Station Mayport a "CVN capable" port. For purposes of this EIS, "CVN capable" is defined as the ability to provide unrestricted access to the port, adequate berthing, and adequate services to a visiting CVN, under all ship loading and tidal conditions. For this alternative, a dredge project would be required as described in paragraph b (1) above.

V. Alternative Sites

The only alternative site for CVN homeporting on the East Coast is Naval Station Norfolk, which is currently homeport to five CVNs. No additional MILCON projects are required at this time to specifically support homeporting a maximum of five CVNs at Naval Station Norfolk. As these are the only two reasonable sites for homeporting a CVN on the east coast there was no requirement for a detailed assessment of other alternative sites.

VI. Conclusion

The Navy has not yet identified a preferred alternative for the Mayport EIS. The Navy will fully consider operational, financial, and environmental factors before making decisions regarding the homeporting alternatives being evaluated in the EIS.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

September 21, 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

In response to Conference Report 109-702 accompanying the Fiscal Year 2007 National Defense Authorization Act, the enclosed report provides information regarding current status of the ex-JOHN F. KENNEDY (CV 67) and the Department of the Navy's (DON) ongoing study that will support a future recommendation for final disposition of the vessel.

Specifically, Navy has determined that retaining the ship as a mobilization asset would be too costly. The Department is conducting a classified study regarding treatment of structural details of the vessel's hull to determine if the ship could be offered as a museum without causing irrevocable changes. Completing this study is necessary in order to evaluate ship disposition alternatives.

DON will provide a recommendation for final disposition of the vessel no later than October 1, 2008. The Department will retain custody and preserve the vessel through the commissioning of GEORGE H. W. BUSH (CVN 77), as required by Section 1011 of the Fiscal Year 2007 National Defense Authorization Act.

A similar letter has been sent to Chairmen Inouye, Skelton, and Murtha. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Winter", written in a cursive style.

Donald C. Winter

REPORT TO CONGRESS

AIRCRAFT CARRIER FORCE STRUCTURE

-

DISPOSITION OF USS JOHN F KENNEDY (CV 67)

**Prepared by
Naval Sea Systems Command
September 2007**

AIRCRAFT CARRIER FORCE STRUCTURE Disposition of USS JOHN F KENNEDY (CV 67)

I. Introduction

Pursuant to Conference Report 109-702 accompanying the fiscal year 2007 National Defense Authorization Act, Section 1011, the Secretary of the Navy shall report to the Congressional defense committees no later than October 1, 2007, regarding alternatives for the final disposition of USS JOHN F KENNEDY (CV 67). Specifically, Conference Report 109-702 stated:

The conferees further expect that, upon decommissioning from the U.S. Navy and completion of the ship's inactivation availability, the Navy will maintain CV-67 in a state of preservation (dehumidification, cathodic protection, and configuration control) pending determination of final disposition. In the event it is determined that CV-67 is to be retired from operational status, the Secretary of the Navy shall evaluate other alternatives for final disposition, to include maintenance in a reduced mobilization status, donation as a museum article, or striking from the naval vessel registry; and report the findings with the Secretary of the Navy's recommendation to the congressional defense committees not later than October 1, 2007. Under all circumstances, the Navy shall retain custody of CV-67 at least until commissioning of CVN-77. If the aircraft carrier is transferred from the custody and control of the Navy, the Secretary of the Navy shall require as a condition of such transfer that the transferee, upon request of the Secretary of Defense, return the vessel to the United States. In such a case, unless the transferee is otherwise notified by the Secretary of the Navy, the title to the vessel shall revert immediately to the United States.

II. The decommissioning of USS JOHN F KENNEDY (CV 67)

Pursuant to the authority provided in the Fiscal Year 2007 National Defense Authorization Act, Section 1011, the accomplishment of towing preparations and safe stowage inactivation work began on March 30, 2007, in Mayport, FL and completed on schedule. On July 26, 2007, the ship departed Mayport, FL under tow to Naval Station Norfolk, VA, arriving on July 31, 2007. The ship will be further towed to the Navy's inactive ship maintenance facility in Philadelphia, PA upon completion of towing arrangements acceptable to the Delaware River Pilots Association.

The Navy evaluated inactivating the ship in a reduced mobilization status and found the option too costly. The installation of dehumidification and cathodic protection equipment will preserve the ship pending a final disposition decision by the Secretary of the Navy.

The ship's internal cathodic protection system has been energized for the protection of the external underwater hull against corrosion and is currently operational. The installation of dehumidification equipment and distribution systems for the preservation of internal spaces at 40% relative humidity is scheduled to be completed by November 20, 2007, thus completing all required inactivation work necessary to preserve the ship pending determination of its final disposition.

The ship's crew conducted a ceremony on March 23, 2007 in Mayport, FL, to commemorate the ship's decommissioning following more than 38 years of active service. The ship was officially decommissioned and retired from operational status on August 1, 2007.

III. The disposition of ex-JOHN F KENNEDY (CV 67)

The Navy will retain custody of ex-JOHN F KENNEDY in a state of preservation until at least the commissioning of GEORGE H W BUSH (CVN 77), as required by the Fiscal Year 2007 National Defense Authorization Act, Section 1011.

The Navy has initiated a classified study regarding the treatment of structural details of the ship's hull that is necessary to determine the ability to use her as a museum without causing irrevocable changes. Completion of this study is necessary to evaluate alternatives for final disposition of the ship. As a result, the Secretary of the Navy has not yet made a determination regarding the ship's final disposition (e.g., strike, museum hold, etc.) and has not stricken the ship from the Naval Vessel Register. It is anticipated that by October 1, 2008, the Navy will report to the Congressional Defense Committees the findings of the study, along with the Secretary of the Navy's recommendation on final disposition of ex-JOHN F KENNEDY.

Should the ship eventually be authorized for donation, the Navy will issue a Federal Register notice announcing the availability of the ship for donation transfer as a museum/memorial. In this situation, a contractual condition of the ship donation transfer will require that upon the request of the Secretary of Defense, the title and vessel shall revert immediately to the United States.

DEPARTMENT OF THE NAVY
OFFICE OF THE SECRETARY
1000 NAVY PENTAGON
WASHINGTON DC 20350-1000

September 11, 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As you know, Senate Report 109-254 directed the Secretary of the Navy to commission a study to assess the progress of chiropractic health care services in reducing musculoskeletal disabilities among active-duty personnel. This letter covers the Navy's progress from June 14, 2007 to August 31, 2007.

In May 2007, the Center for Naval Analysis (CNA) was contracted to perform the study required by the Senate Report.

This study has four goals:

1. Assess the progress of Department of Defense (DoD) program to provide chiropractic benefits to active duty personnel.
2. Assess the efficacy of these services in reducing musculoskeletal disabilities among active duty personnel. As part of the assessment, the study is to evaluate the effectiveness of the care provided to military personnel, specifically including pilots and infantry.
3. Develop metrics for measurement of appropriate chiropractic treatment outcomes.
4. Identify requirements for further research.

This study will deliver the following reports:

- An interim report is due to the Department of the Navy (DON) for review on September 30, 2007
- A final report, based on original research, will be delivered on April 30, 2008

The core of the study is a retrospective study of medical and personnel records. We will look for evidence of the efficacy of chiropractic care by looking at individuals who have received this care, and comparing various aspects of their experience to matched cohorts of similar individuals with the same conditions or injuries. Additionally, the study will review the DoD chiropractic implementation plan.

This study proposes matching administrative summaries of medical records in TRICARE Management Activity (TMA) data systems to extracts from Navy and Marine Corps personnel records. Only by performing this match do we obtain the range of information necessary to complete this study. However, to accomplish this match, researchers must have access to sensitive protected health information. Due to the potential for harm from unauthorized release

of this information, extensive reviews are conducted in order to assure that appropriate procedures are in place to protect individuals from unauthorized information disclosure.

Progress to date includes the following:

- In July, we submitted the study protocol and supporting documents to the Institutional Review Board at the National Naval Medical Center in Bethesda. This review is required to insure compliance with Title 45 CFR part 46 subparts A-D (human protections) and the Privacy Act of 1974, regarding welfare and privacy of study subjects.
- In August, we submitted a data use agreement to TMA as part of the process of obtaining access to historical medical data.
- Work is in progress on the September 30, 2007, interim report.

Near term deliverables include the following:

- On September 30, 2007, DON will review an interim report. This report will analyze progress in the DoD chiropractic care implementation program. In addition, this report will include an analysis of results and data obtained for a recent study of chiropractic health care conducted for TMA. This will include information on trends in chiropractic care over time and an analysis of current treatment practices.

I will periodically update you on the progress of this study. Please let me know if you have any questions.

Sincerely,

William A. Navas, Jr
Assistant Secretary of the Navy
Manpower and Reserve Affairs

REPORT TO CONGRESS

on the

MINE RESISTANT AMBUSH PROTECTED
(MRAP) VEHICLE PROGRAM

Prepared by:
Assistant Secretary of the Navy
Research, Development and Acquisition
1000 Navy Pentagon
Washington, DC 20350-1000

December 2007

BACKGROUND

The Conference Report to accompany the U.S. Troop Readiness, Veteran's Care, Katrina Recovery, and Iraq Accountability Act, H. Rep. No. 110-107, requested the military services to jointly report to the congressional defense committees on the Mine Resistant Ambush Protected (MRAP) vehicle program's (1) status, (2) requirements, and (3) the execution of funds.

In addition, the National Defense Authorization Act for Fiscal Year 2008, House Armed Services Committee Report, H. Rep. No. 110-146, directed the Assistant Secretary of the Navy for Research, Development and Acquisition to submit updates every 30 days to the congressional defense committees on: (1) MRAP requirements; (2) contracting strategy; (3) test and evaluation; (4) sustainment strategy; and (5) implications for other acquisition programs considering contract priority ratings.

The following sections identify the changes in status since the last monthly report.

PROGRAM STATUS

The joint MRAP program is an ACAT ID program with a validated total requirement of 15,274 vehicles, plus 100 ballistic test vehicles. The program's estimated cost is \$24.547 billion. The program received \$5.2 billion in fiscal year 2008 funding under a continuing resolution in October (Public Law 110-92), and an additional \$11.63 billion under the Fiscal Year 2008 Defense Appropriations Act in November (Public Law 110-116).

As of December 19, 2007, 8,815 vehicles have been ordered, in addition to the original 36 test vehicles and 1,024 Low Rate of Initial Production (LRIP) vehicles that have already been fielded. Upon vehicle acceptance by the Government, integration of communication and countermeasure systems is performed at the Space and Naval Warfare Center, Charleston, South Carolina. Vehicles are then shipped to the warfighter. Attachment 1 shows the timeline of MRAP vehicle production, integration and delivery.

REQUIREMENTS

The Marine Corps announced on November 30, 2007 that, after a thorough review, that it would be reducing its requirement for MRAP vehicles from 3,700 to approximately 2,300 vehicles. The Joint Requirements Oversight Council (JROC) is expected to validate the new Marine Corps requirement in the near term. The JROC will also examine Army MRAP vehicle requirements upon completion of a Theater Operational Assessment in mid-February 2008 and review of future force structure in Theater. The JROC memorandum of September 5, 2007, which validated a combined service requirement for 15,274 vehicles, plus 100 ballistic test vehicles, also stated that the final requirement for MRAP vehicles will be modified by "continual assessment of changing threat conditions, feedback from commanders in theater, and potential changes in strategic landscape and assigned missions."

EXECUTION OF FUNDS

Attachment 2 contains a spreadsheet describing the execution of MRAP vehicle funding as of December 19, 2007.

CONTRACTING STRATEGY

On July 31, 2007, a Request For Proposals (RFP) was released for follow-on MRAP vehicle acquisition – MRAP II – to identify additional manufacturers with the capability to produce life-saving vehicles with survivability characteristics beyond those currently in production. The joint program office has evaluated prototype test vehicles received under the solicitation and on 18 December placed delivery orders with two contractors for armor coupons and 6 test vehicles each.

TEST AND EVALUATION

Developmental Testing – Phase II and III (DT-C2 and DT-C3) continue. One contractor is also in Initial Operational Test and Evaluation (IOT&E) and three other contractors have vehicles on-site preparing for commencement of IOT&E. DT-C2 includes ballistic and automotive performance, human factors, safety, interoperability, and logistics demonstrations. DT-C3 includes survivability testing. Technology improvements, through spiral development, are being incorporated and will be verified through testing. IOT&E will be conducted for each contractor between September 2007 and April 2008 in parallel due to Operational Test personnel (Soldiers and Marines) and fully integrated test vehicle

availability. IOT&E for MRAP II contractors will not be scheduled until contract award.

SUSTAINMENT STRATEGY

The MRAP contracts include one base year and one option year of Contractor Logistics Support, as well as, those contracting line items for organically supporting the MRAP vehicles. The near-term logistics plan for the in-theater support of this urgent fielding is being tailored to ensure maximum vehicle readiness. The JPO is executing a revised hybrid logistics and sustainment strategy to apply lessons learned and to respond to program acceleration and growth and theater feedback.

IMPLICATIONS FOR OTHER ACQUISITION PROGRAMS CONSIDERING CONTRACT PRIORITY RATINGS

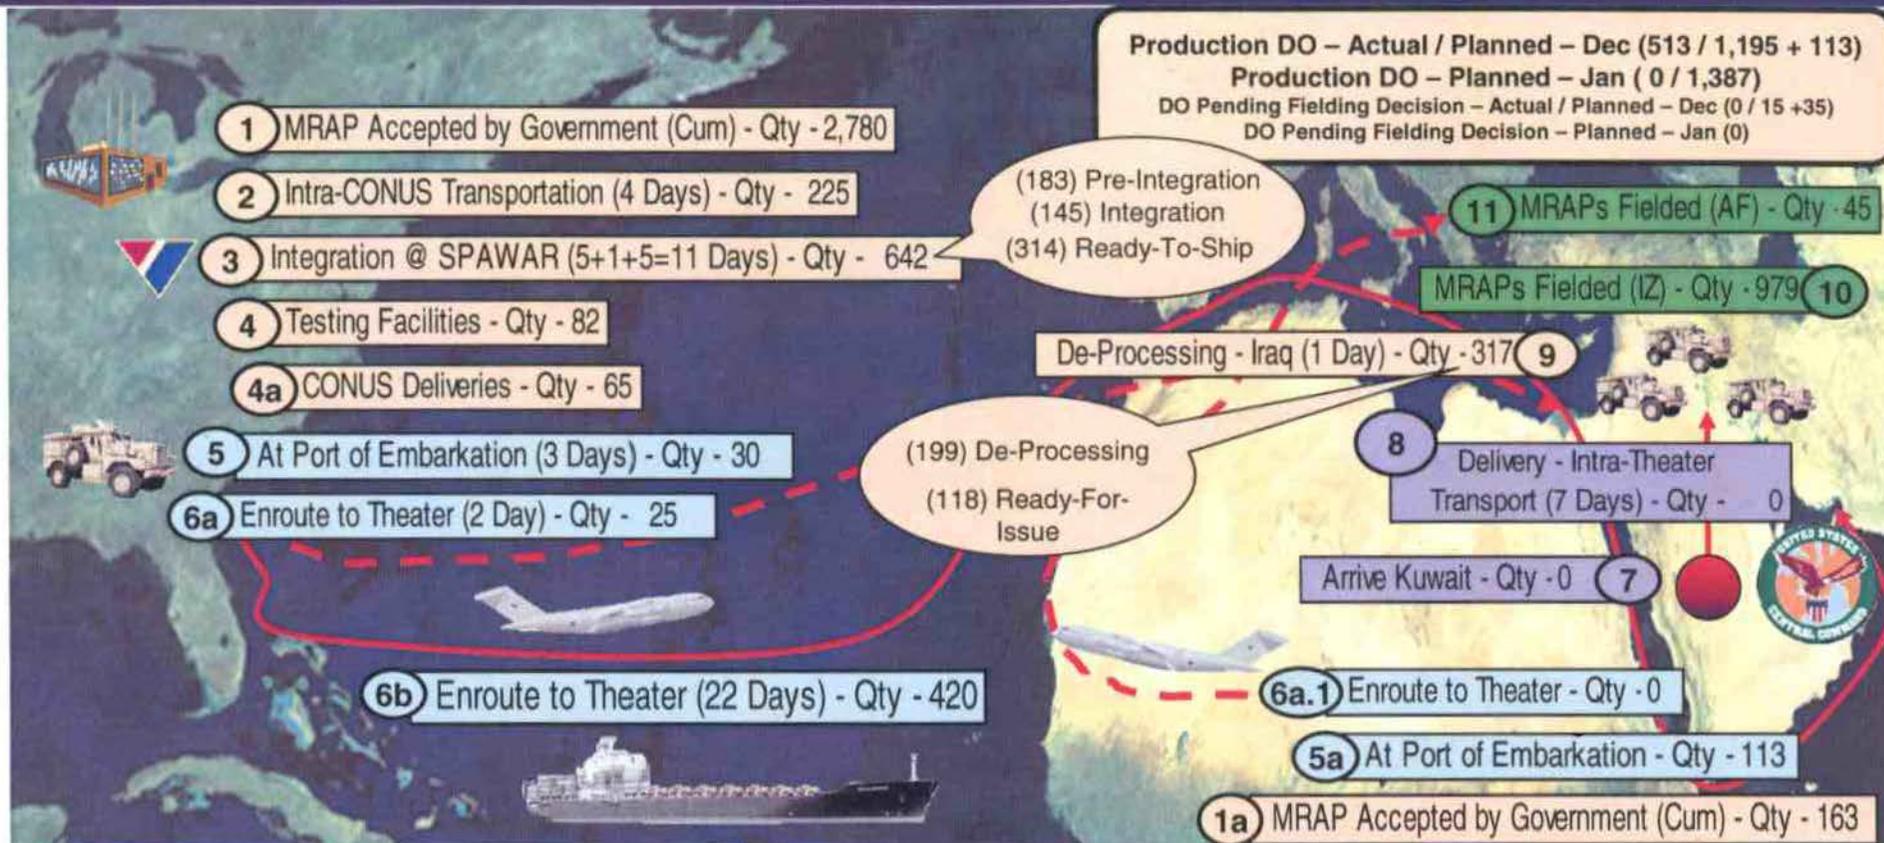

Critical Solutions International, the prime contractor for the Interim Vehicle Mounted Mine Detector (IVMMD) Route Clearance Vehicle (RCV) reported a 30-day slip in production due to the availability of axles from Axletech. This is expected to become a 60 day slip in December 2007 and will affect both new production and the sustainment of systems in theater. Axletech is reportedly not able to provide the required quantities due to competing DX rated MRAP orders. The IVMMD, along with other Army RCV programs, recently received approval to use DX ratings on their orders. Axletech is in the process of developing a domestic capability that would double their production output by May 2008. Both of these changes will help to reduce future delivery disruptions.

The Army incurred a production disruption in October on the Stryker Common Ballistic Shield (CBS) kit program. DO rated Stryker CBS orders at Algoma Steel were pushed back at least two months due to competing MRAP DX orders. To permit CBS production to resume, the Army Secretary approved a waiver from the steel and armor plate prohibition against using steel in arsenals and depots that is not melted and rolled inside the U.S. or Canada. This enabled the program to acquire armor steel plate from Oregon Steel, which normally would not be a qualified supplier because its steel is melted in Mexico and rolled in the U.S.

The Department continues to closely monitor the industrial base and develop proactive mitigation strategies to address potential programmatic impacts.

Production, Integration, & Delivery Times - As Of: 19 Dec 07 (16:16)

NOTES:
 * Included in the "Ready-to-Ship" quantities, under Step 3, are (2) Army Automotive Test vehicles, (5) USMC Automotive Test vehicles, and (2) EFP Fit up Vehicle.

Report to Congress

On

‘Smart Buy’ for a Tenth LPD 17 Class Ship

PREPARED BY:
PEO Ships
1333 Isaac Hull Avenue Stop 2401
Washington Navy Yard, DC 20376-2401

October 2007

I. Report Requirements

The FY 2008 Senate Armed Services Committee (SASC) Report (110-77) directs the Secretary of the Navy to submit a report not later than November 1, 2007, that outlines the funding required for a “smart buy” of LPD 26, maintaining continuous, uninterrupted production at critical vendors’ and shipbuilders’ facilities. The SASC is aware that construction for a tenth LPD 17 ship would not commence until FY 2009, but delaying procurement beyond 2009 would cause significant cost growth and jeopardize industrial base stability by introducing production breaks in the program.

II. Background

In light of competing priorities for resources, the President’s Budget request for FY 2008 represents the best balance of resources to requirements. A significant disruption to the current shipbuilding plan would be created by including additional ships in the procurement plan without accompanying full funding outside Navy’s accounts. However, if Congress provides funds for an additional LPD in FY 2008, the Navy could contract for this ship. Because of long lead material ordering and current LPD workload in the shipyard, this ship would likely begin construction in FY 2009. However, a significant disruption to the current shipbuilding plan would be created by including additional ships in the procurement plan without accompanying full funding from outside Navy’s accounts.

Congress directed the Navy to submit a report outlining the funding required to support procurement of a 10th LPD 17 class ship (LPD 26). The following report identifies major milestones associated with contract award and construction assuming full funding is provided in FY 2008.

III. LPD 17 Class Construction Status

Three ships of the class have been delivered to the Navy. The lead ship is expected to deploy in 2008 after completion of its operational testing phase. LPD 19 recently completed INSURV Acceptance Trials, demonstrating that the technical baseline is stable and the Navy accepted delivery on September 28, 2007. LPD 20 and LPD 21 post-Hurricane Katrina schedules have recently been reset. The construction contract for LPD 22-24 has been awarded and long lead time material for LPD 25 is currently being ordered. The FY 2008 President’s Budget request provides funding to complete LPD 25 and covers program closeout requirements. The contract option for LPD 25 will be exercised once funds are appropriated, and that is expected to happen in time to support an option exercise date no later than January 31, 2008.

If LPD 26 is authorized and appropriated, the Navy will pursue sole-source negotiations with the current LPD 17 class shipbuilder. An aggressive timeline to support Request for Proposal (RFP), fact-finding, and negotiations of a construction contract for LPD 26 is a minimum of six months.

IV. "Smart Buy" Approach

Using the current shipbuilder for the procurement of LPD 26 is the "smart buy" approach to take advantage of equipment pricing while there are current LPD 22-25 vendor production lines and maintain an uninterrupted ship production. Due to global demands on the metals market, a minimum of 13 months for steel lead times is required to support start of construction. The standard build time for an LPD 17 class ship is now 48 months. Factoring six months for proposal development and negotiation prior to contract award, the construction contract would result in a delivery 67 months after the ship construction RFP is released, as shown in Figure 1.

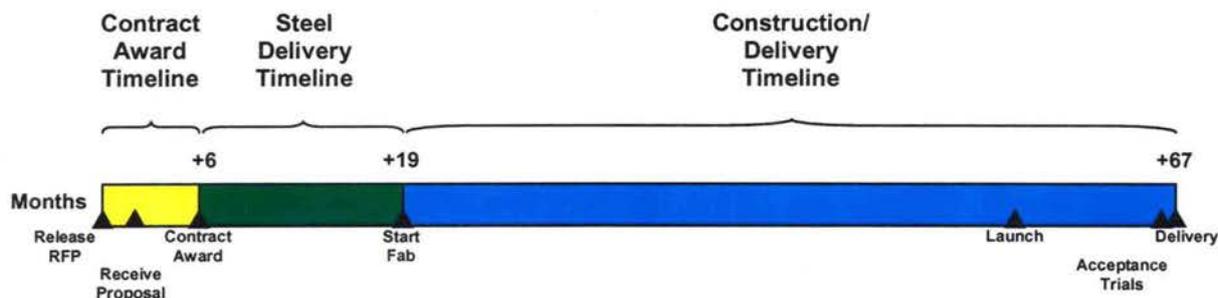

Figure 1: LPD 26 Smart Buy Schedule

To achieve the optimal schedule for start of construction (June 2009), an RFP release date no later than November 2007 is required; and funding in the amount of \$1,700 million is required for contract award no later than May 2008.

V. Conclusion

If Congress were to fully fund LPD 26 in FY 2008, the Navy could execute the "smart buy" approach to maintain continuous, uninterrupted production at critical vendors and shipbuilders' facilities. This "smart buy" approach will facilitate a construction schedule that maximizes the benefits from the learning curve effect and economic order vendor pricing found in continuous production. Any amount less than full funding would require the Navy to provide additional unbudgeted funding in subsequent years and disrupt the balance of the shipbuilding plan. Full funding for LPD 26 in FY 2008 will provide a critical warfighting capability to the Fleet at the earliest opportunity while promoting stability in the shipbuilding industrial base and providing a transition path to future Navy ship acquisition programs.

Dear. Mr. Chairman:

As directed by the Fiscal Year 2008 Senate Armed Services Committee Report 110-77, the enclosed report provides requested information for the LPD 17 program.

Specifically, the report addresses a "smart buy" of a 10th LPD 17 class ship (LPD 26) that would maintain continuous, uninterrupted production at critical vendors and shipbuilders' facilities.

Please let me know if I can be of further assistance. A copy of this letter is also being provided to Chairmen Skelton, Levin, and Murtha.

Sincerely,

A handwritten signature in cursive script that reads "Delores M. Etter".

Report to Congress
On
Ship Insulation

PREPARED BY:
Bureau of Medicine and Surgery
Washington, DC 20376-2401

January 2008

I. Report Requirements

The House of Representatives Committee on Appropriations FY2008 Department of Defense Appropriations report (110-279) directs the Department of the Navy, in consultation with the National Academy of Sciences (NAS), to assess the health effects of respirable, biopersistent manufactured vitreous fibers (MVF) in insulation materials installed on Naval vessels under construction, and to submit a report on those effects to the Committee no later than January 15, 2008.

II. Background

In 1997, the Navy requested the National Academy of Sciences (NAS) to review the Navy's scientific procedure used to justify a Navy unique manufactured vitreous fiber occupational exposure standard of 2 fibers per cubic centimeters (cc) of air established in 1995. Released in 2000, the NAS report specifically addressed the Navy's 2 fiber / cc occupational exposure standard by concluding, "the Navy's documentation does not provide an adequate assessment of the role of fiber biopersistence in health effects". Continued use of this exposure standard would have required Navy to provide significant toxicologic and biopersistence research to establish scientifically defensible evidence this exposure standard met or exceeded other recognized exposure standards.

In 2000, to best protect Navy civilian and military workers, the Navy implemented the alternative NAS recommendation in the report by adopting a scientifically valid occupational exposure standard of 1 fiber / cc. This exposure standard, developed by the American Conference of Industrial Hygienists (ACGIH) and currently adopted by the Department of Defense, considers all relevant toxicologic properties including biopersistence.

III. Assessment of the Health Effects

In response to the Committee's direction to assess health effects related to the use of manufactured vitreous fibers on Navy ships, the following actions have been taken:

a. Navy conducted an epidemiologic review to determine if a relationship exists between Navy and Marine Corps occupational exposures to MVF and pulmonary diseases that could be associated with these exposures. Relevant Navy and Marine Corps diagnoses were reviewed for the years 2001 through 2006 and then cross matched to the Navy's database containing MVF dust and fiber air sample results. This review did not find evidence of pulmonary disease due to MVF use or exposure.

b. Navy reviewed all obtainable worker exposure data for the representative types of manufactured vitreous fibers used by the Navy. The results indicated that occupational exposures above 1 fiber / cc were extremely rare occurrences and personnel were properly provided with protective equipment or other measures to prevent inhalation of fibers.

c. Navy will continue to monitor and analyze scientific literature of reputable peer reviewed MVF biopersistence studies to ensure there are no gaps in our understanding of biopersistence and its effect on health.

IV. Conclusion

The Navy chose to adopt the MVF standard of 1 fiber/ cc used by industry and the Department of Defense rather than promulgate a Navy unique standard requiring our own independent research to support such a standard. The Navy remains committed to protecting the health and welfare of our military, civilian, and contracted personnel.

The Navy has consulted with the National Academy of Sciences on this report. A representative of the National Academy is in the process of contacting the chairman of the original review committee to determine if there are any further actions.

Report to Congress

On

National Defense Sealift Fund

PREPARED BY:
Strategic Mobility & Combat Logistics, OPNAV N42
1550 Crystal Drive, Suite 1002
Arlington, VA 22202

December 2007

I. Report Requirements

The FY 2008 Senate Armed Services Committee Report (S.Rept. 110-77) directs the Secretary of Defense to submit a report no later than January 1, 2008, that outlines the future viability and availability of defense related university-based research and development (R&D) capabilities and the future opportunities for industry collaboration in support of military strategic sealift mobility.

II. Background

Section 2218.c.1.D of Title 10, United States Code, authorizes the National Defense Sealift Fund (NDSF) to fund “research and development relating to national defense sealift” for vessels that include maritime prepositioning and combat logistics force ships. The February 2007 PB 2008 NDSF Budget request included \$96.6 million for R&D. The FY 2008 Defense Appropriations law (P.L.110-116) reduced NDSF R&D by \$30 million. This cut mirrors language included in the Senate Armed Services Committee report calling on the Navy to rephase certain MPF(F) research and development efforts.

The current NDSF R&D budget of \$66.6 million is subdivided into three Projects:

Project #	Title	PB08 (\$M)
3110	MPF(F) R&D	37.86
3116	Sealift R&D	6.19
3117	Operational Logistics Integration (OPLOG)	22.59

III. Project 3110: Maritime Preposition Force (Future) – MPF(F) R&D

In FY 2008, \$37.86 million (57%) of the NDSF R&D appropriation is provided in Project 3110 for the MPF(F) program, a reduction of \$30.0 million from the PB 2008 estimates for this project. MPF(F) is designed to meet Navy/Marine Corps strategic sealift prepositioning and operational requirements using largely commercial ship capabilities. R&D funds are being used for MPF(F) squadron system definition; engineering and operational studies and ship concept designs; acquisition planning and documentation development; and technology demonstration and validation efforts supporting ship acquisition risk-reduction. Efforts include systems level tests of specific components and subsystems leading to full-scale operational tests and demonstrations. Specifically these efforts address technology evaluation across the MPF(F) family of ships and interface development for the integrated operation of MPF(F), including interoperability with Joint, coalition, and commercial vessels. Contracts will be awarded in FY 2008 to the shipbuilding industry to initiate the Phase I (preliminary/contract design) for the Mobile Landing Platform ship. Commercially-developed technologies such as an inter-ship ramp system, propulsion system, dynamic positioning system and advanced crane system are planned for the MPF(F) concept of operations and are included in the MPF(F) risk reduction efforts.

IV. Project 3116: Sealift R&D

In FY 2008, \$6.19 million (9%) of the NDSF R&D appropriation is provided in Project 3116 (Sealift R&D program) in support of concept and technology development of future strategic sealift systems. In FY 2008 (and beyond) a portion of these funds will be used for risk-reduction demonstration of advanced at-sea container handling technologies to transition that capability to future and/or in-service sealift platforms. Additionally the Sealift R&D portfolio includes lighterage and crane technology improvements to provide integrated strategic mobility for Joint and coalition forces.

V. Project 3117: Operational Logistics Integration (OPLOG)

The remaining \$22.59 million (34%) of the FY 2008 NDSF R&D appropriation is provided in Project 3117 (OPLOG program) supporting development of enabling technologies for future and in-service combat logistics force and combatant afloat operational logistics. In FY 2008, \$12 million of those funds will support development, testing and evaluation of improved connected replenishment (CONREP) technologies for combat logistics force vessels supporting Navy surface combatants and aircraft carriers. Managed within OPLOG, these efforts will provide required ship-to-ship material transfer capabilities for emerging and in-service weapons and logistics systems while reducing the total ownership cost of fielding and maintaining shipboard underway replenishment systems. In addition to improved CONREP development, OPLOG is conducting integration, testing and evaluation of commercially-developed dual use technologies including automated storage and retrieval capability, automated identification technologies such as active and passive radio-frequency identification, and intermodel containerization and packaging for Joint and commercial logistics communities. The latter effort is the subject of a three-year OSD/multi-Service funded Joint Capabilities Technology Demonstration (JCTD) designed to rapidly introduce, evaluate, and field improved capability to the warfighter.

The OPLOG program solicited and funded industry proposals via a Broad Agency Announcement (BAA) in FY 2006 and will do so again in FY 2008. The BAA provides an opportunity for industry and academia to propose integrated technologies, representative modes and prototype systems for competitive consideration and award. Specific focus will be given to ensure proposals from academia are requested.

VI. Conclusion

The NDSF R&D portfolio has been developed to fund technology development, ship system interface definition, and conduct phased testing and evaluation to transition improved capabilities to strategic sealift pre-positioning and combat logistics force vessels and programs of record. This portfolio provides a balance of technology development and transition in the face of declining budgets over the Fiscal Year Development Plan (FYDP).

Industry and academia have proven valuable partners through the competitive procurement process (currently Virginia Tech, University of Colorado at Boulder, Michigan Tech, University of Texas, and Naval Postgraduate School are actively working on NDSF-funded projects) and will continue to be engaged through BAAs and other open solicitations. Industry participation has and will continue to include shipyards, naval and marine equipment designers, fabricators, and suppliers and offshore service providers. Additionally, logistics R&D opportunities are available through Navy and DoD organizations such as ONR, United States Marine Corps (particularly in areas of sense and respond logistics) and U.S. Transportation Command. NDSF-funded programs cooperate with DoD partners to sponsor integrated technology development efforts consistent with organizational and mission requirements and responsibilities.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

February 1, 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

This responds to a requirement set forth in the Report on the National Defense Authorization Act for Fiscal Year 2008 by the House Armed Services Committee. The Department of the Navy is required to submit to the Senate and House Committees on Armed Services a report on those activities undertaken by the Department under the authority of the National Defense Exemption (NDE) for certain military readiness activities employing mid-frequency active (MFA) sonar from the legal requirements of the Marine Mammal Protection Act (MMPA).

As required by the Committee, the enclosed report includes an assessment of the increase in military readiness, the estimated number and species of marine mammals injured and killed as a result of those activities undertaken under the authority of the national defense exemption, and an estimate of the population level effect, if any, on these species. Additionally, the report provides an update on activities undertaken by the Navy to achieve full compliance with the MMPA.

The report concludes that the Navy's use of MFA sonar in various training activities over CY07 did not kill or injure any marine mammals. Furthermore, the potential for population level effect on any marine mammal species or stock was found to be negligible.

The NDE continues to be a critical and essential bridge to long-term compliance with the MMPA regarding the Navy's need to train effectively with MFA sonar. The Navy remains fully committed to working closely with the National Marine Fisheries Service through the environmental planning and MMPA authorization processes toward completion of the environmental impact statements for the Navy's ranges and operating areas.

A similar letter has been sent to Chairman Skelton. As always, if I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

**Activities Taken under the Authority
of the National Defense Exemption
under the
Marine Mammal Protection Act
Issued on 23 January 2007**

February 2008

EXECUTIVE SUMMARY

The Department of the Navy (Navy) has prepared this report as required by the House Committee on Armed Services (HASC) in its Committee's Report on the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2008. This report provides information regarding the activities undertaken by the Navy under the authority of the National Defense Exemption (NDE) (Appendix A) under the Marine Mammal Protection Act (MMPA) invoked by the Deputy Secretary of Defense (DEPSECDEF) on January 23, 2007, an assessment of the military readiness during this period, the estimated number of marine mammals killed or injured during this period, an estimate of the population level effects, if any, and an update on Navy's progress to achieve full compliance with the MMPA.

In Calendar Year (CY) 2007, the Navy conducted myriad testing and training activities within the Department of Defense's (DoD's) established ranges and established operating areas (OPAREAs), including 12 major training exercises employing mid-frequency active sonar (MFAS), the use of which was exempt from compliance with the legal requirements of the MMPA. These exercises included three Undersea Warfare Exercises (USWEXs) in the Hawaiian Islands Range Complex (HRC); two Joint Task Force Exercises (JTFEXs) in the Southern California (SOCAL) OPAREA; five Composite Training Unit Exercises (COMPTUEXs), three in the SOCAL OPAREA and two on the East Coast; one combined COMPTUEX/JTFEX on the East Coast; and one Valiant Shield (VS) around the Northern Mariana Islands. Prior to conducting these exercises, the Navy prepared appropriate environmental planning documentation. The analysis of potential effects to marine mammals from the use of MFAS during these exercises did not predict mortality or injury to marine mammals. Additionally, this analysis concluded that there would be no adverse effects on the annual rates of recruitment or survival of any marine mammal species or stocks, including strategic or depleted stocks. Through the use of after action reporting (AAR), the Navy verified that the conclusions drawn in their environmental planning documentation were appropriate. Additionally, the observers onboard Navy vessels did not see any marine mammals within the geographic distance of a transmitting vessel which would cause harm. To the best of the Navy's knowledge, there were no individual marine mammals harmed during these activities, and the Navy determines the potential for a population level effect is negligible.

This report concludes that military readiness has not increased under the NDE; rather, one statutory basis on which the Navy can be challenged regarding environmental compliance has been removed. Prior to the NDE, legal claims under MMPA resulted in restrictions on the Navy's ability to train effectively. The required training was compromised, with future training in jeopardy without the exemption. While the MMPA has been removed as a basis for legal challenges, the Navy's ability to train and meet its statutory requirement to train and maintain a ready force, which includes training with MFAS, remains at risk due to legal challenges based on other environmental laws, specifically the National Environmental Policy Act (NEPA), the Coastal Zone Management Act (CZMA), and the Endangered Species Act (ESA).

1.0 INTRODUCTION

1.1 Report Requirement

This report is submitted in response to a House Committee on Armed Services (HASC) requirement contained in the HASC Committee Report 110-146, page 299.

Excerpt from the HASC Committee Report: "Until such time as the Navy achieves full compliance with the [Marine Mammal Protection Act] (MMPA), the committee directs the Secretary of the Navy to document those specific activities undertaken under the authority of the National Defense Exemption. Further, the committee directs the Secretary of the Navy to submit a report on those activities to the Senate Committee on Armed Services and the House Committee on Armed Services by February 1, 2008. In addition, the committee encourages the Department to submit a report by February 1 of each subsequent year for as long as the exemption is in effect. The report shall include an assessment of the increase in military readiness, the estimated number and species of marine mammals injured and killed as a result of those activities undertaken under the authority of the exemption, and an estimate of the population level effect, if any, on these species. Additionally, the report should provide an update on activities undertaken by the Navy to achieve full compliance with the MMPA."

1.2 National Defense Exemption (NDE) Background

The National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2004 (Public Law (PL) 108-136) amended the MMPA to include a provision whereby the Secretary of Defense, after conferring with the Secretary of Commerce, may exempt any action or category of actions undertaken by the Department of Defense (DoD) or its components from any requirements of the Act should it be necessary for national defense. Based upon a determination that continued training with mid frequency active sonar (MFAS) is vital to the Navy's Anti-Submarine Warfare (ASW) training program and, therefore, key to ensuring national defense, the Deputy Secretary of Defense (DEPSECDEF) exercised this authority. On January 23, 2007, DEPSECDEF issued a two-year NDE (Appendix A) to exempt all military readiness activities that employ MFAS (operating within the frequency range of 1kHz to 10 kHz) or Improved Extended Echo Ranging (IEER) Sonobuoys used either during major training exercises or within established DoD maritime ranges or established operations areas from compliance with the permitting requirements of the MMPA. This exemption expires January 23, 2009.

The NDE requires the Navy to employ 29 specific mitigation measures developed with, and fully supported by, the National Marine Fisheries Service (NMFS) for MFAS activities occurring during major exercises or on DoD ranges. These measures afford significant protection to marine mammals while enabling the Navy to train with MFAS. Because IEER is a new sensor system under development and nearing deployment, the DoD will develop with NMFS mutually agreeable mitigation measures applicable to IEER before using IEER for training if that use occurs under the period of the NDE.

The NDE enables the Navy to employ MFAS in a manner that maintains testing and training fidelity while providing significant protection to marine mammals. By enabling critical MFAS and IEER testing and training to continue in an environmentally sound manner protective of marine mammals, the NDE serves as a bridge to future compliance with the authorization requirements of the MMPA.

1.3 Mitigation Measures during the NDE Period

The NDE requires implementation of mitigation measures when using MFAS (Appendix A). To implement the NDE and ensure that these mitigation measures were carried out, the Navy took the following actions to broadly disseminate the measures and ensure their implementation:

- The Chief of Naval Operations (CNO) issued a naval message on February 22, 2007, directing all Navy commands and operating units to utilize these mitigation measures. The message included the mitigation measures themselves and background information regarding the NDE. Naval messages are operating orders; their directives must be carried out by all addressees. This message was reiterated by the Echelon II commands, U.S. Fleet Forces (USFF), Commander Pacific Fleet (CPF), and Naval Sea Systems Command (NAVSEA), to their subordinate commands by naval message or Letters of Instruction.
- The NDE measures were incorporated into the standard training materials used by shipboard personnel.
- The NDE measures are reinforced prior to each major exercise through the issuance of mitigation measure messages and Letters of Instruction. As previously stated, these are operating orders and must be carried out by all addressees.

2.0 ACTIVITIES TAKEN UNDER THE AUTHORITY OF THE NDE

For purposes of this report, actions conducted under the authority of the NDE are presented in three categories: (1) those MFAS activities undertaken on DoD established maritime ranges or designated Operating Areas (OPAREAS), (2) MFAS activities during major training exercises regardless of location, and (3) activities associated with IEER Sonobuoy.

2.1 Activities Undertaken within Established DoD Maritime Ranges or Established OPAREAs

While myriad testing and training activities occur within the Navy's established ranges and OPAREAs, the following describes only those activities associated with the use of MFAS covered by the NDE.

2.1.1 Unit Level Training Activities

Unit level training (ULT) activities encompass training that each individual unit (vessel, aircraft, or submarine) conducts. ULT is a building block, or foundation, during which a unit's Commanding Officer trains his/her unit to develop and maintain basic skills in preparation for advanced training.

The majority of ULT activities involving active sonar components are conducted to meet Mine Warfare (MIW) and ASW training requirements. Some guided missile destroyers (DDGs), Aegis guided missile cruisers (CGs), fast frigates (FFGs), and submarines can operate their hull-mounted sonar, normally used for ASW, in an object detection mode. This mode allows ships to detect mines and other objects in the water as well as to navigate through the area. MIW ULT activities focus on training sonar operators to detect, locate, and characterize mine-like objects under various environmental conditions, including those suspended in the water (i.e., moored mines), mines on the ocean floor (i.e., proud mines), and mines buried under the ocean floor. ASW ULT activities focus on training sonar operators on the detection, classification, and tracking of underwater targets. Activities include both near-shore and open-ocean ASW training activities.

2.1.2 Coordinated Unit Level Training Activities

Coordinated ULT activities involved one or more units and concentrate on training warfare teams during initial multi-unit operations. During this phase, vessels and aircraft begin to coordinate warfare skills with other units while continuing to maintain individual unit proficiency. South Eastern ASW Integrated Training Initiative (SEASWITI) and specialty training operations (Ops) such as Submarine Command Course (SCC) Ops are examples of coordinated ULT.

2.1.3 Major Training Exercises

Strike Group training activities continue to develop and refine integrated strike group warfare skills and command and control procedures. The objective of this phase is to ensure that all units in the strike group are prepared to support the group commander's specific mission requirements. Strike Group training activities include exercises such as Composite Training Unit Exercises (COMPTUEXs), Joint Task Force Exercises (JTFEXs), and Undersea Warfare Training Exercises (USWEXs). These training exercises provide realistic training opportunities in a battlefield environment that mimics challenges strike groups could face during deployment. Some of these exercises do not occur entirely within a designated DoD maritime range or designated operating area, yet they are considered a major training exercise. Additional information regarding this category of exercises is provided in Section 2.2.

2.1.4 Research Development Testing & Evaluation (RDT&E)

RDT&E activities associated with ASW and MIW systems are typically conducted to ensure that the ASW and MIW active sonar function properly and meet the operational requirements set forth in the test plan. The sensors tested in conjunction with RDT&E activities are either existing systems or new systems with similar operating parameters. Approximately 64 RDT&E events were undertaken on established DoD Ranges or OPAREAS under the provisions of the NDE during CY 2007.

2.1.5 Active Sonar Maintenance

Active sonar maintenance includes both pier-side and at-sea activities. These activities are required before deployment, after major sonar array maintenance, and when the systems are suspected of not operating at optimal levels.

2.2 Major Training Exercises Conducted Under the NDE

There were 12 major training exercises, as described in section 2.1.3., conducted under the NDE during CY 2007 (Table 1). These included three USWEXs performed in the Hawaiian Islands Range Complex (HRC); two JTFEXs performed in Southern California (SOCAL) OPAREA; five COMPTUEXs – two performed on the East Coast and three performed in SOCAL OPAREA; one combined JTFEX/COMPTUEX performed on the East Coast; and one Valiant Shield (VS) performed near the Mariana Islands. For each of these major exercises appropriate environmental planning documentation was prepared under the National Environmental Policy Act (NEPA) and/or Executive Order (EO) 12114. In addition, where applicable, each of these exercises completed a Section 7 consultation under the Endangered Species Act (ESA).

The major training exercises are conducted by Carrier Strike Groups (CSG) and Expeditionary Strike Groups (ESG). A Carrier Strike Group (CSG) generally consists of six units: an aircraft carrier and five surface combatants (cruisers, destroyers, and frigates). Training workups for deployment include exercising with one or more attack submarines and a combined ammunition, oiler, and supply ship. An Expeditionary Strike Group (ESG) consists of an amphibious ready group (amphibious assault ship, transport dock ship, dock landing ship, and various Marine units) in addition to surface combatants, such as those in a CSG. CSGs and ESGs both conduct COMPTUEX in preparation for deployment.

Type of Exercise	# of Exercises	Locations
COMPTUEX	2	East Coast (Cherry Point/Virginia Capes (VACAPES)/Jacksonville (JAX)/Charleston (CHASN) OPAREAs
COMPTUEX	3	SOCAL OPAREA
JTFEX	2	SOCAL OPAREA
JTFEX/COMPTUEX	1	East Coast (Cherry Point/JAX/CHASN OPAREA)
USWEX	3	HRC
Valiant Shield	1	Mariana Islands Range Complex (MIRC)

Table 1 – Major Exercises using MFAS by Type and Location

2.2.1 COMPTUEXs

COMPTUEX is the first opportunity for a strike group to practice coordinated, integrated skills in a complicated threat-based scenario environment simulating real-world situations. Each COMPTUEX lasts approximately 3 to 4 weeks. A critical portion of COMPTUEX is the strike group demonstrating the ability to execute ASW since history has consistently proven that the enemy's strategy with submarines is to interdict its opposition before it can affect the fight. The active sonar training portion of a COMPTUEX consists of approximately 10 days. MFAS employed in this scenario include helicopter dipping sonar, sonobuoys, and hull-mounted ship sonar; however, not all surface ships are equipped with hull-mounted sonar.

2.2.2 JTFEXs

JTFEX is an advanced, free-play, scenario-driven exercise that requires adaptive mission planning by naval forces and operational staffs and often includes other Department of Defense (DoD) services and/or Allied Forces. JTFEX follows COMPTUEX and validates the attainment of integrated skills in more complicated conditions and scenarios. CSGs and ESGs both conduct JTFEX in preparation for deployment. JTFEX serves as a venue for Fleet Commanders to assess the readiness, interoperability, and proficiency of naval forces in realistic free-play scenarios spanning the spectrum of armed conflict. At the conclusion of JTFEX, the Fleet Commander certifies the strike group's readiness to deploy.

Each JTFEX usually lasts less than two weeks. Like COMPTUEX, a critical portion of JTFEX and certification for deployment is the strike group's ability to effectively execute ASW. The active sonar training portion of a JTFEX consists of approximately 7 days. MFAS employed in this scenario is of the same type as that employed in COMPTUEX.

2.2.3 USWEXs

A USWEX is an assessment-based ASW exercise conducted by the CSG or ESG while in transit from the west coast of the United States to the Western Pacific Ocean. Along with the assessment goal, there is significant training value in USWEX, as training is inherent in all at-sea exercises. Training may be considered a subset of the USWEX efforts designed to assess our ability to conduct ASW in the most realistic environment, against the level of threat expected in order to effect changes to both training and capabilities, (e.g., equipment, tactics, and changes to size and composition of the Strike Groups and manning). While other training exercises occur during the remainder of the deployment, USWEXs are conducted shortly after deployment to ensure the Strike Groups are fully capable of conducting strike warfare while defending themselves against submarines.

All USWEX activities conducted during the NDE period were within the HRC, which encompasses offshore, near shore, and onshore areas located on or around the major islands of the Hawaiian Island chain. ASW training conducted during a USWEX utilizes ships, submarines, aircraft, non-explosive exercise weapons, and other training systems and devices. During an ESG USWEX, amphibious forces would utilize the beaches at Pacific Missile Range Facility or at Marine Corps Training Area Bellows to conduct amphibious landings.

2.2.4 Exercise Valiant Shield 07

Valiant Shield (VS 07) consisted of a Joint multi-strike group scenario that required three CSG strike groups to demonstrate the Navy's ability to operate in an environment designed to replicate the types of challenges that could be faced during real world events. Valiant Shield involved Navy assets engaging in a schedule of events (SOE) battle scenario, with United States forces pitted against a notional opposition force (OPFOR). Participants used and built upon previously gained training skill sets to maintain and improve the proficiency needed for a mission-capable, deployment-ready Strike Group.

Three CSGs participated in VS 07. The exercise area was located in the western Pacific Ocean within and near the Mariana Islands Range Complex (MIRC) and included the airspace and sea space in and around the MIRC.

2.3 Activities Relating to the IEER Sonobuoy

The IEER sonobuoy has not yet been placed into service. Therefore, with respect to IEER, the NDE was not used during CY 2007. The Navy and NMFS continue to examine the marine mammal mitigation measures for this system. Those mitigation measures will be implemented if IEER sonobuoys are employed during the NDE period.

3.0 MILITARY READINESS ASSESSMENT

3.1 The Navy's Statutory Mission – Maintain Military Readiness

Section 5062 of Title 10 of the U.S. Code mandates that the Navy be organized, trained, and equipped for combat.

3.2 Readiness through Training

The key to combat effectiveness is realistic training in the air, on land, on and under the sea – the single greatest tool the military has in preparing and protecting our naval forces. "Train As We Fight" is not just a phrase - it is a statement of the absolute necessity to realistically train our naval forces for the conditions in which they may find themselves while protecting the nation. Training "as we intend to fight" means realistic exercises which replicate the stress, discomfort, and physical conditions of combat. A realistic training program is the best means, short of combat, of preparing our forces and generating confidence in, and knowledge of, our plans, tactics, and procedures. Large-scale training exercises, including exercises at sea, involve all elements of naval forces and connect people to their missions before they are actually employed. The Navy trains as if full-scale armed conflict were imminent. Whether conducting training or combat, the same organizational structure, procedures, command and control, equipment, and thinking apply. Since the Navy fights as a component and fights as a member of a joint or combined team, Navy must train as joint and combined teams to ensure development of maritime component core competences.

The Navy's at-sea training range complexes and operating areas are where the learning takes place, the warfighting skills are honed, the "first encounters" are realistically re-created, and mistakes are made without lethal results. The Navy relies on the full use of at-sea range complexes and operating areas to provide the combat-like experience that gives our forces a competitive advantage in war. These complexes and areas, individually and collectively, provide land, sea, undersea, and airspace where naval forces can train as they will fight, while providing the ability to test and evaluate future capabilities.

No amount of technology, hardware, or classroom education can achieve the required level of combat readiness without access to quality range complexes and operating areas that afford our naval forces the realistic training needed to execute their missions. Simulation and models can help, but they are no substitute for training and operating in the environment operations will occur.

3.2.1 Training with Sonar

ASW proficiency requires constant attention. While our long-term compliance documents are being developed, we cannot stop training. The inability to train and maintain strike group ASW capability to succeed at the highest level possible would present an overwhelming national security concern, as the failure to do so could result in significant adverse results in combat, including the loss of ships and life. Our Sailors and Marines must receive the training they need to fight and win. The key to maintaining the Navy's ability to defend against adversary submarines is the comprehensive "at-sea" training regime, especially the use of active sonar.

Modern diesel electric submarines utilize quieting technologies, take advantage of the shallow water littoral environment to defeat passive sonar, and are armed with anti-ship weapons of increasing range and lethality. MFAS has been used for decades as the most effective tool for locating and tracking these submarines at distances that preclude them from effectively attacking ships. Without MFAS, Navy ships are vulnerable to enemy modern, quiet submarines. Training with MFAS is, therefore, critical to national security.

To effectively detect, track, and neutralize an adversary's submarines, our air, surface and submarine assets must work seamlessly together to share and exploit limited location and intelligence data. Unit level ASW training only addresses internal unit skills and does not exercise and integrate other air, surface, and undersea combat assets. Each of these combat assets must train and work together with a broad array of tools, including MFAS, to effectively locate and neutralize the adversary.

ASW is the linchpin of sea control. With the proliferation of modern, quiet submarines, the ASW challenge has become more significant. To counter adversarial submarine challenges, the Navy's only course of action is to conduct extensive integrated training including the use of active sonar that mirrors the intricate operating environment that would be present in hostile waters.

3.3 The NDE and Military Readiness

The NDE has not increased the Navy's readiness; rather, the NDE merely removed one statutory basis upon which the Navy can be challenged regarding environmental compliance while it prepares its range Environmental Impact Statements (EISs). Prior to the NDE, legal claims under MMPA resulted in restrictions on the Navy's ability to train effectively, as evidenced in Rim of the Pacific (RIMPAC) 2006 wherein the Navy was restricted from training with active sonar for three days due to a temporary restraining order. The training was compromised, with future training in jeopardy without the exemption.

While the NDE has met the Navy's needs with respect to compliance with MMPA, the Navy continues to face several challenges in fulfilling its statutory mandate to organize, train, and equip naval forces for combat due to other environmental laws (i.e., ESA, NEPA, and the Coastal Zone Management Act (CZMA)). The Navy is currently defending against four separate lawsuits

involving MFAS with respect to these environmental laws. While a discussion of how an agency will comply with substantive statutes is appropriately addressed under NEPA, the analysis required under NEPA does not serve to establish substantive requirements or supplant the substantive statute intended by Congress to serve as the regulatory regime for a particular resource such as marine mammals. Nonetheless, these lawsuits seek to impose additional mitigation related to the protection of marine mammals that will significantly adversely impact military readiness. For example, in *NRDC v. Winter*, a matter in current litigation concerning the Navy's use of MFAS during vital certification exercises occurring in the Navy's SOCAL operating area, the trial court originally issued an injunction based upon a preliminary determination that the Navy was not in compliance with the CZMA and NEPA.

4.0 ESTIMATED NUMBER AND SPECIES OF MARINE MAMMALS KILLED OR INJURED

This portion of the report contains the estimated number of marine mammals and species that were killed or injured as a result of the Navy conducting activities under the NDE presented in Section 2.0. The analysis of potential effects contained in the Navy's environmental planning documentation predicted the use of MFAS would result in no deaths or injuries of an individual or group of marine mammals. Additionally, in its Biological Opinions (BOs) issued under the ESA for the major training exercises conducted under the NDE, NMFS determined that the use of MFAS covered by the NDE was not likely to kill or injure threatened or endangered marine mammals.

The Navy determines whether a marine mammal has been injured from exposure to acoustic energy if the marine mammal has experienced a physiological effect. Permanent threshold shift (PTS) is the non-recoverable destruction of tissues within the auditory system and is used as the criteria for physiological effects. The smallest amount of PTS (onset-PTS) is taken to be the indicator for the smallest degree of injury that can be measured. Marine mammals predicted to receive a sound exposure with energy flux density level (EL) of 215 dB re 1 $\mu\text{Pa}^2\text{-s}$ or greater are assumed to experience PTS. Generally, acoustic energy will propagate such that an EL greater than 215 dB re 1 $\mu\text{Pa}^2\text{-s}$ will not occur at a distance greater than 10 m from the MFAS source. Thus, if a marine mammal is sighted within 10 m of the transmitting vessel, we can assume that the marine mammal has experienced PTS, and thus has been injured.¹

The Navy's after action reporting system requires units participating in major exercises to report the number of marine mammals that were sighted during the conduct of the exercise. Participating ships, submarines, and aircraft are required to report the date, time, distance from unit, and action taken by the unit, if any. Based on these After Action Reports (AARs), no marine mammal was sighted within 10 meters of any transmitting vessel during these exercises (Table 2). Additionally, these AARs contain no evidence that marine mammals were killed or injured during these exercises. Therefore, the Navy concludes that no marine mammals were injured or killed as a result of the conduct of the activities under the NDE.

¹ This assumption does not apply to dolphins engaging in bow-riding behavior because they remain outside the propagation pattern of hull-mounted MFAS.

Exercise	Mortality Predicted from Environmental Planning Document	Injury predicted from Environmental Planning Document (PTS >215 EL)	Sightings within 10 meters (11 yards) of transiting MFAS vessel
CPF ESG C2X 07-02	0	0	0
CPF CSG C2X 07-07	0	0	0
CPF CSG C2X 08-01	0	0	0
USFF ESG C2X 07-02	0	0	0
USFF Combined CSG C2X/JTFEX 07-01	0	0	0
USFF ESG C2X 08-1	0	0	AAR is not completed ³
CPF CSG JTFEX 07-03	0	0	0
CPF ESG JTFEX 07-05	0	0	0
CPF ESG USWEX 07-03	0	0	0
CPF CSG USWEX 07-02	0	0	0
CPF USWEX 08-01	0	0	0
VS 07	0	0	0

Table 2 - Marine Mammal Exposure Estimates and Sightings From Major Training Exercises Conducted in 2007

5.0 POPULATION LEVEL EFFECTS

In its environmental planning analyses, the Navy concluded that no MFAS adverse effects on the annual rates of recruitment and survival of any marine mammal species or stock or population level impacts were expected.

No animals were sighted within the range of injury (10 meters) while MFAS was employed. Marine mammals sighted at distances greater 10 m were monitored to ensure that they did not enter the range of injury. The AARs contained no evidence of injury or death to marine mammals as a result of MFAS usage. The Navy acknowledges that it is not possible to account for animals not observed; however, the low number of marine mammal sightings qualitatively indicate a lower density of marine mammals than used for predictive analysis, which further reduces the likelihood of a population level effect.

² Based on the modeling, eight Common Dolphins would be exposed to the PTS threshold of 215 dB re 1 μ Pa²-s for the JTFEX/COMPTUEX in SOCAL. However, no serious injury or mortality of any marine mammal species is reasonably foreseeable as mitigation measures were expected to be effective in reducing the potential for injury.

³ AARs are due within 120 days of the completion of the exercise, which had not passed at the time of drafting this report.

5.1.1 Summary of NMFS' Population Level Effects Findings for Navy MFAS Actions

Per Section 7 of the ESA, the Navy consulted with NMFS for those major exercises in which the Navy determined that there may be effects to ESA listed species from the exposure of MFAS. This includes all USWEXs conducted in the HRC, all COMPTUEXs and JTFEXs conducted in the SOCAL OPAREA, the Combined CSG COMPTUEX/JTFEX conducted on the East Coast, and VS 07. For each of the BOs received (total of 4 covering 10 exercises)⁴, NMFS concluded that exposure to MFAS would not have fitness consequences to an individual ESA-listed species, therefore there would not be any population level effects. This assessment from NMFS resulted in a "no jeopardy" opinion for each of the 4 BOs.

6.0 MMPA COMPLIANCE PROGRESS AND UPDATE FOR 2007

6.1 Background

The Navy's compliance strategy is described in two primary documents: the Secretary of the Navy's (SECNAV) Compliance with Environmental Requirements in the Conduct of Naval Exercises or Training at Sea ("At Sea Policy"), dated December 28, 2000, and the CNO Mid-Frequency Active Sonar Effects Analysis Interim Policy, dated March 6, 2006 ("Sonar Policy"). The "At Sea Policy" stipulates the Navy's requirements for environmental planning documentation for the conduct of exercises and training at sea. It further states that the Navy will prepare environmental planning documents required by NEPA, CZMA, and EO 12114; initiate consultations with regulatory agencies under ESA; and apply for Incidental Take Statements (ITSs) under the ESA or similar permission under the MMPA. The CNO "Sonar Policy" established criteria and thresholds by which the Navy will conduct its effects analyses. It further established the milestones the Navy will complete all environmental compliance documentation.

For all major ranges and OPAREAS, the Navy's strategy is to produce EISs, prepared under NEPA, to consult under the ESA, and to seek authorization from NMFS for MMPA compliance. In 2005, the Navy exchanged letters with NMFS regarding Navy's long-term strategy towards environmental compliance.

In 2006, the CNO, through his "Sonar Policy" directed the Navy to seek appropriate regulatory authorizations under MMPA and consultation under ESA, if required, for all major training exercises using MFAS. This policy required all exercises commencing after January 1, 2007, to have the appropriate environmental planning and regulatory compliance in place. Per this policy and strategy, in August 2006, the Navy submitted two requests for Incidental Harassment Authorization (IHA) under the MMPA and associated requests for consultation and Environmental Assessments (EAs). One was for the conduct of USWEXs in the HRC over a two-year period of time, and the other was to conduct JTFEX/COMPTUEX exercises in the SOCAL Range Complex over a two-year period of time.

In its letter dated October 5, 2006, NMFS informed the Navy that they would not be able to conclude with a degree of certainty that mitigation measures would eliminate or reduce the potential for serious injury to or mortality of certain species of marine mammals; therefore IHAs could not be utilized to meet the Navy's MMPA compliance requirements. NMFS stated that the Navy should seek authorization through the utilization of a Letter of Authorization (LOA). In addition, NMFS recommended that the Navy prepare EISs, vice EAs, under NEPA to support these LOA requests. Because the time required for preparing and completing an EIS and an LOA for an individual or group of exercises exceeds the time it takes to plan an exercise, the use of the EIS/LOA process is not possible for a single exercise or group of exercises. Therefore, the

⁴ Two exercises did not require consultation under the ESA.

Navy adopted an approach by which resources would be concentrated on completing the comprehensive EISs for its major training activities.

To meet the milestones required to complete a LOA (approximately 18 months) and an EIS (approximately 2 years), it was necessary for the Navy to be exempted from the permitting requirements of the MMPA while performing the regulatory and environmental planning procedures. The Navy is using the NDE to comply with the MMPA while LOAs are being obtained and appropriate supporting NEPA documents are being prepared. NMFS concurred with this approach and worked with Navy to develop a list of 29 mitigation measures for the NDE (Appendix A) to reduce the likelihood of adverse consequences to marine mammals during this two-year period of time.

6.2 Navy Range EIS Status

Per the strategy above, the Navy is preparing 11 EISs: Atlantic Fleet Active Sonar Training (AFAST), HRC, SOCAL, Virginia Capes (VACAPES) Range Complex, Cherry Point Range Complex, Charleston/Jacksonville Range Complex, Northwest Range Complex, MIRC, Gulf of Mexico Range Complex, NAVSEA Keyport Range Complex, and Naval Surface Warfare Center Panama City.

Navy published Notices of Intent to initiate the NEPA process for all 11 EISs covering ranges and OPAREAS. Three of these EISs will cover approximately 75% of the Navy's use of MFAS during training activities (HRC, SOCAL, and AFAST). NMFS and Navy have been actively working through the NEPA and MMPA processes for all of these EISs. For example, the Draft HRC EIS was released to the public and the Navy is currently incorporating comments received from the public. Additionally, Navy submitted an LOA to NMFS and NMFS has published a notice of receipt in the Federal Register. An LOA will be obtained for the three documents analyzing the majority of sonar use (HRC, SOCAL, AFAST) by January 2009, prior to the expiration of the NDE.

7.0 SUMMARY

Over CY 2007, the Navy used MFAS in various testing, unit level training activities, and major training exercises within established ranges and OPAREAS. The use of MFAS did not kill or injure any marine mammals. The potential for population level effect to any marine mammal species or stock is negligible.

While military readiness has not increased under the NDE, one statutory basis upon which the Navy can be challenged regarding environmental compliance has been removed. Prior to the NDE, legal claims under MMPA resulted in restrictions on the Navy's ability to effectively train. Such restrictions jeopardize training and threaten to impact military readiness and national security. Without the current NDE, the Navy would be unauthorized to execute the training required and vital to the national security of the United States.

The NDE has been a critical, essential bridge to compliance with the MMPA. The Navy remains committed to working closely with NMFS through the NEPA and MMPA processes toward completion of Navy's 11 range and OPAREA EISs.

Appendix A – National Defense Exemption

DEPUTY SECRETARY OF DEFENSE
1010 DEFENSE PENTAGON
WASHINGTON, DC 20301-1010

JAN 23 2007

MEMORANDUM FOR SECRETARY OF THE NAVY

SUBJECT: National Defense Exemption from Requirements of the Marine Mammal Protection Act for Certain DoD Military Readiness Activities That Employ Mid-Frequency Active Sonar or Improved Extended Echo Ranging Sonobuoys

Pursuant to Title 16, Section 1371(f), of the United States Code, and having conferred with the Secretary of Commerce, I have determined that it is necessary for the national defense to exempt all military readiness activities that employ mid-frequency active sonar or Improved Extended Echo Ranging sonobuoys (IEER), either during major training exercises, or within established Department of Defense maritime ranges or established operating areas, from compliance with the requirements of the Marine Mammal Protection Act, Title 16, Sections 1361 – 1421h, of the United States Code. For purposes of this exemption, mid-frequency active sonar is defined as those active sonar systems operating within the frequency range of 1 kHz to 10 kHz. IEER is a new sensor system that is finishing development and nearing deployment. A military readiness activity is defined in Section 315(f) of Public Law 107-314.

Specific actions falling within these categories of actions are exempted for a period of two years from today's date, or the date at which the Department of Navy is granted authorization under the Marine Mammal Protection Act for one or both of these categories of actions as associated with a specific proposed activity, whichever is earliest. In the event the exemption terminates as to a specific proposed activity having been granted authorization under the Marine Mammal Protection Act for one or both of these categories of actions, the exemption shall remain in full force and effect as to all other exempted categories of actions.

During the exemption period, the Department of the Navy will execute the plan coordinated with the Department of Commerce to come into full compliance with the requirements of the Marine Mammal Protection Act. During this exemption period, all exempted military readiness activities employing mid-frequency active sonar shall follow the attached "Mid-Frequency Active Sonar (MFAS) Mitigation Measures during Major Training Exercises or within Established DoD Maritime Ranges and Established Operating Areas." Before using IEER for training, the Department of the Navy will develop with the National Marine Fisheries Service mutually agreeable mitigation measures applicable to IEER as information evolves on its use and tactics.

Attachment:

Mid-Frequency Active Sonar (MFAS) Mitigation Measures during Major Training Exercises or within Established DoD Maritime Ranges and Established Operating Areas

Mid-Frequency Active Sonar Mitigation Measures during Major Training Exercises or within Established DoD Maritime Ranges and Established Operating Areas

I. General Maritime Protective Measures: Personnel Training:

1. All lookouts onboard platforms involved in ASW training events will review the NMFS-approved Marine Species Awareness Training (MSAT) material prior to use of mid-frequency active sonar (MFA).
2. All Commanding Officers, Executive Officers, and officers standing watch on the bridge will have reviewed the MSAT material prior to a training event employing the use of MFA.
3. Navy lookouts will undertake extensive training in order to qualify as a watchstander in accordance with the Lookout Training Handbook (NAVEDTRA 12968-B).
4. Lookout training will include on-the-job instruction under the supervision of a qualified, experienced watchstander. Following successful completion of this supervised training period, lookouts will complete the Personal Qualification Standard program, certifying that they have demonstrated the necessary skills (such as detection and reporting of partially submerged objects). This does not preclude personnel being trained as lookouts from being counted as those listed in previous measures so long as supervisors monitor their progress and performance.
5. Lookouts will be trained in the most effective means to ensure quick and effective communication within the command structure in order to facilitate implementation of protective measures if marine species are spotted.

II. General Maritime Protective Measures: Lookout and Watchstander Responsibilities:

6. On the bridge of surface ships, there will always be at least three people on watch whose duties include observing the water surface around the vessel.
7. In addition to the three personnel on watch noted previously, all surface ships participating in ASW exercises will, have at all times during the exercise at least two additional personnel on watch as lookouts.
8. Personnel on lookout and officers on watch on the bridge will have at least one set of binoculars available for each person to aid in the detection of marine mammals.
9. On surface vessels equipped with MFA, pedestal-mounted "Big Eye" (20x110) binoculars will be present and in good working order to assist in the detection of marine mammals in the vicinity of the vessel.
10. Personnel on lookout will employ visual search procedures employing a scanning methodology in accordance with the Lookout Training Handbook (NAVEDTRA 12968-B).

11. After sunset and prior to sunrise, lookouts will employ Night Lookouts Techniques in accordance with the Lookout Training Handbook.
12. Personnel on lookout will be responsible for reporting all objects or anomalies sighted in the water (regardless of the distance from the vessel) to the Officer of the Deck, since any object or disturbance (e.g., trash, periscope, surface disturbance, discoloration) in the water may be indicative of a threat to the vessel and its crew or indicative of a marine species that may need to be avoided as warranted.

III. Operating Procedures

13. A Letter of Instruction, Mitigation Measures Message, or Environmental Annex to the Operational Order will be issued prior to the exercise to disseminate further the personnel training requirement and general marine mammal protective measures.
14. Commanding Officers will make use of marine species detection cues and information to limit interaction with marine species to the maximum extent possible consistent with safety of the ship.
15. All personnel engaged in passive acoustic sonar operation (including aircraft, surface ships, or submarines) will monitor for marine mammal vocalizations and report the detection of any marine mammal to the appropriate watch station for dissemination and appropriate action.
16. During MFA operations, personnel will utilize all available sensor and optical systems (such as Night Vision Goggles to aid in the detection of marine mammals.
17. Navy aircraft participating in exercises at sea will conduct and maintain, when operationally feasible and safe, surveillance for marine species of concern as long as it does not violate safety constraints or interfere with the accomplishment of primary operational duties.
18. Aircraft with deployed sonobuoys will use only the passive capability of sonobuoys when marine mammals are detected within 200 yards of the sonobuoy.
19. Marine mammal detections will be immediately reported to the assigned Aircraft Control Unit for further dissemination to ships in the vicinity of the marine species as appropriate when it is reasonable to conclude that the course of the ship will likely result in a closing of the distance to the detected marine mammal.
20. Safety Zones - When marine mammals are detected by any means (aircraft, shipboard lookout, or acoustically) within 1,000 yards of the sonar dome (the bow), the ship or submarine will limit active transmission levels to at least 6 dB below normal operating levels.
 - (i) Ships and submarines will continue to limit maximum transmission levels by this 6-dB factor until the animal has been seen to leave the area, has not been detected for 30 minutes, or the vessel has transited more than 2,000 yards beyond the location of the last detection.
 - (ii) Should a marine mammal be detected within or closing to inside 500 yards of the sonar dome, active sonar transmissions will be limited to at least 10 dB below the equipment's normal operating level. Ships and submarines will continue to limit maximum ping levels by this 10-

dB factor until the animal has been seen to leave the area, has not been detected for 30 minutes, or the vessel has transited more than 2,000 yards beyond the location of the last detection.

(iii) Should the marine mammal be detected within or closing to inside 200 yards of the sonar dome, active sonar transmissions will cease. Sonar will not resume until the animal has been seen to leave the area, has not been detected for 30 minutes, or the vessel has transited more than 2,000 yards beyond the location of the last detection.

(iv) Special conditions applicable for dolphins and porpoises only: If, after conducting an initial maneuver to avoid close quarters with dolphins or porpoises, the Officer of the Deck concludes that dolphins or porpoises are deliberately closing to ride the vessel's bow wave, no further mitigation actions are necessary while the dolphins or porpoises continue to exhibit bow wave riding behavior.

(v) If the need for power-down should arise as detailed in "Safety Zones" above, the ship or submarine shall follow the requirements as though they were operating at 235 dB - the normal operating level (i.e., the first power-down will be to 229 dB, regardless of at what level above 235 sonar was being operated).

21. Prior to start-up or restart of active sonar, operators will check that the Safety Zone radius around the sound source is clear of marine mammals.
22. Sonar levels (generally) - The ship or submarine will operate sonar at the lowest practicable level, not to exceed 235 dB, except as required to meet tactical training objectives.
23. Helicopters shall observe/survey the vicinity of an ASW exercise for 10 minutes before the first deployment of active (dipping) sonar in the water.
24. Helicopters shall not dip their sonar within 200 yards of a marine mammal and shall cease pinging if a marine mammal closes within 200 yards after pinging has begun.
25. Submarine sonar operators will review detection indicators of close-aboard marine mammals prior to the commencement of ASW operations involving active mid-frequency sonar.
26. Increased vigilance during major ASW training exercises with tactical active sonar when critical conditions are present:

Based on lessons learned from strandings in the Bahamas (2000), the Madeiras (2000), the Canaries (2002) and Spain (2006), beached whales are of particular concern since they have been associated with MFA operations. Navy should avoid planning major ASW training exercises with MFA in areas where they will encounter conditions that, in their aggregate, may contribute to a marine mammal stranding event.

The conditions to be considered during exercise planning include:

- (1) Areas of at least 1,000 m depth near a shoreline where there is a rapid change in bathymetry on the order of 1,000-6,000 meters occurring across a relatively short horizontal distance (e.g., 5 nm).

(2) Cases for which multiple ships or submarines (≥ 3) operating MFA in the same area over extended periods of time (≥ 6 hours) in close proximity (≤ 10 nm apart).

(3) An area surrounded by land masses, separated by less than 35 nm and at least 10 nm in length, or an embayment, wherein operations involving multiple ships/subs (≥ 3) employing MFA near land may produce sound directed toward the channel or embayment that may cut off the lines of egress for marine mammals.

(4) Although not as dominant a condition as bathymetric features, the historical presence of a significant surface duct (i.e., a mixed layer of constant water temperature extending from the sea surface to 100 or more feet).

If the major exercise must occur in an area where the above conditions exist in their aggregate, these conditions must be fully analyzed in environmental planning documentation. Navy will increase vigilance by undertaking the following additional protective measure:

A dedicated aircraft (Navy asset or contracted aircraft) will undertake reconnaissance of the embayment or channel ahead of the exercise participants to detect marine mammals that may be in the area exposed to active sonar. Where practical, advance survey should occur within about two hours prior to MFA use, and periodic surveillance should continue for the duration of the exercise. Any unusual conditions (e.g., presence of sensitive species, groups of species milling out of habitat, any stranded animals) shall be reported to the Officer in Tactical Command (OTC), who should give consideration to delaying, suspending or altering the exercise.

All Safety Zone requirements described in Measure 20 apply.

The post-exercise report must include specific reference to any event conducted in areas where the above conditions exist, with exact location and time/duration of the event, and noting results of surveys conducted.

IV. Coordination and Reporting

27. Navy will coordinate with the local NMFS Stranding Coordinator regarding any unusual marine mammal behavior and any stranding, beached live/dead, or floating marine mammals that may occur at any time during or within 24 hours after completion of mid-frequency active sonar use associated with ASW training activities.
28. Navy will submit a report to the Office of Protected Resources, NMFS, within 120 days of the completion of a Major Exercise. This report must contain a discussion of the nature of the effects, if observed, based on both modeled results of real-time events and sightings of marine mammals.
29. If a stranding occurs during an ASW exercise, NMFS and Navy will coordinate to determine if MFA should be temporarily discontinued while the facts surrounding the stranding are collected.

THE SECRETARY OF THE NAVY
WASHINGTON, D. C. 20350-1000

February 4, 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

The Fiscal Year 2008 Senate Armed Services Committee Report 110-77 directed the Secretary of the Navy to submit a report to the congressional defense committees outlining the alternative acquisition strategies under consideration for the DDG-51 modernization program. Specifically, the enclosed report provides a program plan and acquisition strategy for the DDG-51 modernization program.

A similar letter has been sent to Chairmen Skelton, Inouye, and Murtha. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Winter".

Donald C. Winter

REPORT TO CONGRESS

**DDG-51 CLASS GUIDED MISSILE DESTROYERS
MODERNIZATION PLAN**

PREPARED BY

**Naval Sea Systems Command
Surface Warfare Directorate (SEA 21)
Washington D.C. 20376**

February 2008

TABLE OF CONTENTS

- 1. REPORT REQUIREMENTS**
- 2. EXECUTIVE SUMMARY**
- 3. PRIOR CONGRESSIONAL REPORTS**
- 4. PROGRAM PLAN**
- 5. ACQUISITION STRATEGY AND AVAILABILITY EXECUTION**
- 6. CONCLUSION**

1. REPORT REQUIREMENTS

The FY 2008 Senate Armed Services Committee Report 110-77 provides the following on page 131:

“The Secretary of the Navy's fiscal year 2007 report to Congress on the long-range plan for construction of naval vessels identified the requirement to operate the 62-ship DDG-51 class for a 35-year service life in order to meet the Navy's surface combatant force structure requirements. The DDG-51 modernization program, which upgrades the DDG-51 class with key technologies for improved warfighting capability and reduced operating and support cost, is essential to achieving this 35-year expected service life. The Navy plans to accomplish the modernization at the approximate mid-life point for each ship, commencing with USS Arleigh Burke (DDG-51) in 2010. As currently programmed, the 62-ship modernization effort would span approximately 20 years at a cost in excess of \$5.0 billion. The magnitude of this investment, coupled with the criticality of the modernization effort to surface combatant mission effectiveness, warrants a thorough understanding of how the Navy is balancing requirements for system performance, affordability, schedule, competition, quality of life, industrial base factors (including consideration of the Building Yards, other Private Yards, and the Navy Shipyards), risk, and other priorities in its procurement of the DDG-51 modernization program.”

The Senate Armed Services Committee Report 110-77 directs “the Secretary of the Navy to submit a report to the congressional defense committees, with the fiscal year 2009 budget request, outlining the alternative acquisition strategies under consideration for the DDG-51 modernization program. The report shall address the specific factors identified above, the priorities assigned to these factors, and the methodology the Navy is using to optimize the DDG-51 modernization program in accordance with its established priorities.”

2. EXECUTIVE SUMMARY

In response to Senate direction to submit a report with the FY 2009 budget request, the Secretary of the Navy has prepared this document in addition to previous Congressional Reports provided in 2004 and 2005. This report comprehensively reviews the methodology for procuring the Program.

NAVSEA supports America's Fleet of ships and combat systems. Within NAVSEA, the Surface Warfare Directorate, SEA 21, is the Navy's designated acquisition organization for the life cycle maintenance and modernization of surface combatants. As such, SEA 21 is responsible for the engineering, procurement and management of the DDG Modernization Program. The DDG Modernization Program was established by Chief of Naval Operations (CNO) direction in 2003 memo (“DDG 51 CLASS

MODERNIZATION PROGRAM” Ser N762/3U622901 dated January 17, 2003) with the following requirements:

- Increase War-fighting Capability,
- Leverage the DDG-51 shipbuilding program,
- Utilize Aegis Test Team lessons learned,
- Reduce Total Ownership Costs (TOC), and
- Adopt Open Architecture (OA) Upgrades

DDG Modernization is currently planned to be executed in two separate phases during CNO scheduled availabilities; Phase 1 consists of the HM&E upgrades, and Phase 2 consists of the Combat System upgrades to complete the Modernization package.

HM&E Upgrades include:

- Integrated Bridge System (IBS),
- Machinery Control System (MCS)/Damage Controls Systems (DCS),
- Gigabit Ethernet Data Multiplex System (GEDMS),
- Wireless Communications,
- Digital Video Surveillance System (DVSS),
- Quality of Life Upgrades,
- Advanced Galley, and
- Mission Life Extension Upgrades (including bow strengthening, digital compass and digital indicators).

Combat Systems Upgrades include:

- Land Attack and Naval Fires (MK 160 Mod X Gun Computing System, Tactical TOMAHAWK Weapon System),
- Battlespace Dominance (Open Architecture Computing Environment, Open Architecture Combat Information Center, Cooperative Engagement Capability (CEC), Multi-Mission BMD Capability, Multi-Mission Signal Processor (MMSP), Vertical Launching System (VLS) Modifications, Single Integrated Air Picture (SIAP), SM-6 Missile/Navy Integrated Fire Control-Counter-Air (NIFC-CA), Close In Weapon System (CIWS) Block 1B, AN/SQQ-89A(V)15 with Multi-Function Towed Array (MFTA)), and
- Command, Control, Communication, Computers and Intelligence (Integrated Shipboard Network System (ISNS) LAN Gigabit Ethernet , Global Command and Control System – Maritime, Identification Friend or Foe (IFF), Navigation Sensor System Interface (NAVSSI) Block 4, Tactical Data Link (TDL) Upgrade).

The Navy evaluated the following acquisition options for executing modernization availabilities based upon Affordability, Competition, Quality of Life, Industrial Base, and Risk:

- Sole source award to DDG Lead Shipbuilding Yard or a limited competition between DDG new construction builders,

- Full and open competition to sources local to the homeport using Multi-Ship-Multi-Option (MSMO) contracts (includes Private Repair Yards, Naval Shipyards, and Building Yard affiliates and partners), and
- Full and open coastwide competition (includes Private Repair Yards, Naval Shipyards, and Building Yards).

The Navy has analyzed these options and envisions that the DDG Modernization Program would be best executed within current statutory constraints and Navy homeport policy.

3. PRIOR CONGRESSIONAL REPORTS

This report was directed by FY 2008 Senate Armed Services Committee Report 110-77, and details the Program as presented in the FY 2009 President's Budget request. The Navy also submitted Reports to Congress on the DDG-51 Class Modernization Plan in response to requirements in FY 2004 Senate Armed Services Committee Report 108-46 and the FY 2005 Department of Defense Appropriations Conference Report 108-622, and Section 121 of the FY 2005 National Defense Authorization Act (Public Law 108-375).

The DDG Modernization Program as described in the 2004 and 2005 reports to Congress focused on leveraging the new construction shipyard capabilities to reduce risk and complete the design and testing of Hull, Mechanical, and Electrical (HM&E) alterations. The plan encompasses a set of core HM&E changes, using proven technologies with upgrades that result in a common control and monitoring system for the entire DDG-51 Class. The core changes, when implemented in a unified package, enable automation that reduces watchstander workload as well as associated maintenance and logistics. The reduced workload and the subsequent billets that can be eliminated will contribute to a significant reduction in TOC, estimated at \$2.3B, across the entire 62 ship Class. A more detailed description of TOC reduction is addressed in Section 5 of this report. The plan also introduces commercial computing technology to the Aegis Weapon System processing and display equipment (as is being accomplished in the CG Modernization Program) for ships delivered before commercial computing technology was available. The commercial computing environment establishes a springboard for the addition of future warfighting capabilities, and is crucial to keeping the ships operationally relevant throughout their intended service life.

In addition to the above report requirements, the FY 2005 and 2006 Defense Appropriations Acts (Public Laws 108-287 and 109-148 respectively) each added \$50 million in Ship Construction Navy (SCN) to accelerate a modernization program for the DDG-51 Class. In FY 2007, Congress appropriated an additional \$30 million in Other Procurement, Navy (OPN) for DDG Modernization Program.

4. PROGRAM PLAN

The DDG Modernization Program installs modifications and equipment upgrades in the DDG-51 Class Destroyers to ensure enhanced warfighting capability and life cycle sustainability over the expected 35 years of service life. The goals of the DDG Modernization Program are to reduce the total ownership cost of the Class, primarily through reduction in crew size, and make significant enhancements to warfighting capability.

DDG Modernization is composed of a series of improvements in the HM&E Systems and Combat Systems areas. The improvements are installed respectively in two phases. The HM&E phase of the program will be comprised of the technologies transitioned from the forward-fit effort on DDG 111/112, and those additional improvements required to support the expected service life of the DDG-51 Class. The centerpiece of the Combat System phase will be the Aegis Weapon System (AWS) upgrade and the introduction of an integrated Ballistic Missile Defense (BMD) capability providing the ability to conduct an Anti-Air Warfare (AAW) and ballistic missile engagement simultaneously.

The preliminary planning processes for HM&E upgrades have already commenced in order to implement the DDG Modernization design into two FY 2005 new construction DDGs (DDG 111-112). The initial System Requirements Review (SRR) of the DDG Modernization requirements occurred in September 2004, the Preliminary Design Review (PDR) in June 2005, followed by a Critical Design Review (CDR) in February 2006. This schedule allows the prototype system to be received from vendors, assembled, integrated and land based tested at the Naval Surface Warfare Center Carderock Division's Ship System Engineering Station (NSWC-SSES) prior to installation aboard DDG 111. The final two ships of the DDG-51 Class will be delivered with the new modernized HM&E production configuration.

The first DDG Modernization back-fit availability will be executed in FY 2010 as DDG 111 is delivered. This is scheduled to occur on DDG 51 and is shown in Figure 1.

Phase 2: Combat System upgrades for the DDG Modernization Program will be performed in a 40-week Extended Selected Restricted Availability (ESRA). The current notional plan is 20 weeks of industrial availability, followed by 20 weeks pier side system testing and checkout.

An added benefit of separating the Combat System and HM&E upgrades into the two respective phases is that it best aligns the availability execution schedule with the FRP principles. The tight constraints of the FRP require that DDG Modernization be accomplished in a manner that minimizes the amount of time the ship is non-operational.

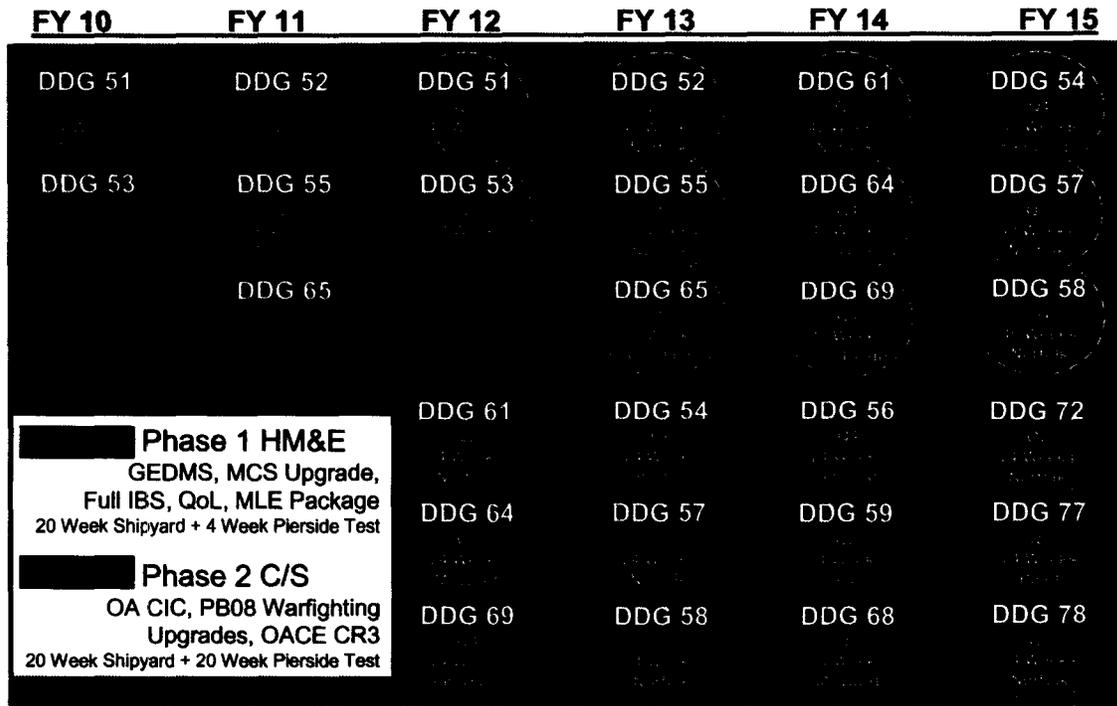

Figure 2 - DDG Modernization Fielding Plan

4.3 System Procurement

NAVSEA 21 is the organization responsible for the overall execution of the DDG Modernization Program. The Program Manager, PMS 400F, is charged with coordinating the overall program development and fielding schedule. This includes coordination with system Participating Acquisition Resource Manager(s) (PARM(s)) in both the HM&E and Combat Systems and C4I areas. The Program Executive Officer Integrated Warfare Systems (PEO IWS) will lead Combat Systems development and integration and will be responsible for the delivery of the warfighting functionalities, as required. These efforts shall include hardware and Open Architecture (OA) software upgrades.

Maintaining a single Program Manager construct for the DDG Modernization Program while assigning PARM responsibility for individual system design and procurement

contracts ensures effective integration of alterations approved within the Navy Modernization Process (NMP). By relying on PARM(s) to deliver their respective systems, the DDG Modernization 'Program of Programs' approach deliberately and intelligently shares the workload by delegating the detailed responsibilities to the established activities that are best qualified and positioned to successfully field the Program's discrete capabilities. Furthermore, by utilizing the DDG Planning Yard design and engineering teams to develop work specifications and other availability planning and specialized material support products, the Program ensures several acquisition advantages. This links the industrial base involvement back to the Building Yard by incorporating DDG 111 and 112 lessons learned, using the DDG-51 Class design expertise, and capitalizing on the non-recurring engineering investment by the DDG Shipbuilding Program.

4.4 Budget

The FY 2009 President's Budget (PB) supports execution of the DDG-51 Class Modernization Plan as described in the previous sections. Following is a summary of funds programmed for DDG Modernization, across the Future Year's Defense Program.

DDG Modernization Funding Summary

PB09 (\$M)	FY07	FY08	FY09	FY10	FY11	FY12	FY13	Total
DDG Modernization*	35.9	74.2	205.4	247.1	415.2	445.0	509.1	1,932.0

*Equipment Procurement related funding only

Does not include Combat System RDT&E for Computer Program Development

5. ACQUISITION STRATEGY AND AVAILABILITY EXECUTION

The DDG Modernization Program will pursue a tailored acquisition approach to achieving requirements. While not directly responsible for the design, development, and procurement of these systems, the DDG Modernization Program is charged with coordinating the delivery, integration, and test of systems required in a manner that supports scheduled availabilities. The Program Manager to Program Manager (PM to PM) agreement that SEA 21 has in place with PEO IWS facilitates a collaborative work environment, ensuring accountability and predictability in accomplishing the objectives of the Program. Additionally, the Program must carefully evaluate and select the most capable shipyard that will provide the best value to the Navy.

5.1 Acquisition Approach Considerations

The approach to developing the DDG Modernization Program acquisition strategy was founded on using existing industry best practices and maximizing available proven resources and processes that have been successfully implemented in similar Navy ship modernization programs such as CG Modernization and DDG Post Shakedown Availabilities (PSAs). These programs offered valuable lessons learned for acquisition strategy considerations. For example, the DDG PSA Program utilizes shipbuilder and homeport repair industrial bases by contracting the Building Yard to serve as the PSA Planning Yard for engineering and material procurement, and has competitively awarded

multiple ship contracts in each homeport for the execution of the availabilities. Besides spreading the industrial base, this plan of action has other inherent benefits such as ensuring competition, reducing risk, and preserving QOL through local availability execution. An initial lesson learned from the CG Modernization Program was the need for an analytical approach to determining the proper phasing and combination of trades required to achieve the best production schedule within a minimum amount of time. While leveraging lessons learned, the DDG Modernization Program focused on the following factors (listed in order of priority) for evaluating the logical acquisition options: Affordability, Competition, Quality of Life, Industrial Base, and Risk.

Affordability:

The DDG Modernization Program is required to execute within the budget set forth in PB 2009. The factors expected to impact the Program's ability to execute within cost constraints include, but are not limited to: geographic location of availabilities (e.g., TDY, PCS, temporary berthing, messing), available local resources (infrastructure and expertise), and repetitive learning curve cost reductions.

Competition:

The DDG Modernization acquisition strategy for availability execution will be crafted to foster competition with the goal of achieving the best value for the Navy. The apparent existence of multiple sources for execution is expected to support that pursuit. To further ensure best value, the Navy will require robust subcontracting plans at the system and component level.

Also, in accordance with FAR 19.7, DFARS 219.7, and Navy Marine Corps Acquisition Regulation Supplement 5219.201 and 5219.7, the following considerations will be addressed as appropriate in DDG Modernization acquisitions to maximize participation across the industrial base: FAR Clauses 52-219-8 (Utilization of Small Business Concerns), 52.219-9 (Small Business Subcontracting Plan), 52.219-16 (Liquidated Damages – Subcontracting Plan), and DFARS Clause 52.219-7003 (Small, Small Disadvantaged and Women-Owned Small Business Subcontracting Plan (DoD Contracts)) and 52.219-7004 (Small, Small Disadvantaged and Women-Owned Small Business Subcontracting Plan (Test Program)).

Quality of Life:

The DDG Modernization Program considers the impact to QOL for the Sailors and their families. The Program must minimize adverse impacts to the components of QOL affected by the extensive industrial availability and test periods, which will be necessary to accomplish the DDG modernization upgrades. Examples of components which will be assessed for impact are listed below:

Basic Components

- Medical care
- Housing

Traditional Components

- Family
- Child care
- Education
- Residential Stability
- Recreation
- Military Facility Privileges – Exchange/Commissary

Work Components

- Shipboard/Industrial Facility living arrangements
- Training/Professional Development
- Crew cohesiveness and morale

Industrial Base:

For the purposes of the DDG Modernization Program, the status and construct of the U.S. shipbuilding and ship repair industries must be understood and carefully assessed when weighing acquisition options. The U.S. Naval industrial base for the DDG-51 Class is composed of two major Private Shipyards for DDG-51 Class new construction, General Dynamics Bath Iron Works (Bath, ME) and Northrop Grumman Ship Systems (Pascagoula, MS); and several Private Shipyards for execution of DDG-51 Class industrial availabilities. The primary functions of the Private Naval Shipbuilders are to construct the ship, provide design and engineering services for the Class, and perform Planning Yard functions. Private Shipyards located within proximity of U.S. Naval homeports perform three basic types of actions during industrial availabilities: preventative or scheduled maintenance, corrective or unscheduled repair, and modernization or upgrades for alterations approved within the NMP.

An ideal industrial base is one that is reliable, cost effective, and sufficiently delivers the products and services required by the Program. Several traits are considered when evaluating the industrial base factor against the acquisition options for DDG Modernization. Those traits include: Shipyard Facilities, Competency, Resources, and Certification. The shipyard's ability to accommodate the ship and its crew, its corporate knowledge and experience with accomplishing complex alterations aboard Navy ships, the availability of a skilled workforce, and the certifications it has obtained will be determined. From a geographic perspective, the Navy must consider regional resources and capabilities as well as the socioeconomic impact to the area.

In light of these industrial base considerations, the Navy has successfully employed the cost type MSMO contract vehicle over the last several years executing maintenance, modernization and repair availabilities on its surface combatants. The Navy has MSMO contracts in place in Puget Sound, WA; San Diego, CA; Ingleside, TX; Mayport, FL; Pearl Harbor, HI; and Norfolk, VA to accommodate industrial work in each homeport. Employment of multiple ship contract awards were encouraged in the March 17, 1982 GAO report to the Chairman, Subcommittee on Defense, House Committee on Appropriations entitled, "*Actions Needed To Reduce Schedule Slippage And Cost Growth On Contracts For Navy Ship Overhauls.*" The MSMO consolidation of requirements

under a single procurement for ship repair, modernization, continuous and emergent maintenance is necessary to meet the Navy's vision and the intent of the FRP and NMP.

Execution of the DDG Modernization Program will also require the involvement and expertise of the DDG-51 Class Planning Yard for preplanning, kitting, design, and execution phases of planned availabilities. As such, DDG Modernization is expected to represent additional workload for the Class Planning Yard. This follows the CG Modernization model in which the CG-47 Class Planning Yard executed availability planning responsibilities.

Risk:

The level of risk associated with executing the modernization availabilities is important to assessing the Program's acquisition options. The availability of an experienced and skilled workforce is required to successfully execute modernization availabilities with this complexity. Other critical factors affecting risk are the shipyards' facilities, projected workload, and overall port loading as it impacts the availability of resources across the waterfront.

5.2 Acquisition Options

The following acquisition options have been evaluated. These options are analyzed below using the evaluation factors described in Section 5.1.

Option A

Sole source award to DDG Lead Shipbuilding Yard or a limited competition between DDG new construction builders:

While sole source contract award to the builders for execution of the modernization availabilities helps mitigate execution risk, it presents a negative impact to competition. The DDG-51 Class Modernization Availabilities are extraordinarily complex and the new construction shipyards likely possess the inherent knowledge and ability to successfully execute the modernization. However, limiting competition to only the Building Yards not only eliminates the Homeport Shipyard and repair facilities from competing for the work, but also increases costs due to transportation, temporary berthing, and messing requirements. Additionally, this option would displace some, or all, of the crew from ship's homeport or require "de-crewing" the ship.

Option B

Full and open competition to sources local to the homeport using MSMO contracts (includes Private Repair Yards, Naval Shipyards, and Building Yard affiliates and partners):

A full and open competition for executing Modernization Availabilities between sources local to the homeport will leverage expertise in planning and executing extensive alterations on completed ships and facilitate the use of existing MSMO contracts ensuring significant competition occurs between offerors. Availability risk is mitigated by the homeport shipyards industrial expertise gained from executing Surface Combatant

availabilities and likely access to a skilled labor pool. Finally, QOL for ships' force is preserved by remaining in the homeport, and avoiding the potential for added costs of executing in areas outside of the homeport.

Option C

Full and open coastwide competition (includes Private Repair Yards, Naval Shipyards, and Building Yards):

This option optimizes competition through full and open coastwide solicitation. As discussed in previous options, the risk factor is mitigated by the apparent ability of all previously mentioned sources' to successfully execute the modernization availabilities leveraging their respective strengths. Evaluation of other factors relative to this option is dependent upon whether the work is awarded to the Building Yards, offerors within the homeport, or offerors outside of the homeport area. From an industrial base perspective the Navy acknowledges that work gained by one shipyard is work not realized by another. However, as the Homeport Shipyards have programmed Modernization into their workload assumptions, loss of this work would have a significant negative impact to other program costs in respective homeport. Sailors QOL is best served by executing the availabilities in the homeports therefore avoiding the additional transportation, berthing, and messing costs levied if accomplished in the Builders Yards.

5.3 Statutory Considerations

Execution of the DDG Modernization Program will comply with all existing statutes and instructions. This includes 10 USC 2799a, Construction of Combatant and Escort Vessels and Assignment of Vessel Projects, which states that the Navy shall, in determining the cost or price of work to be performed in an area outside the area of the homeport of the vessel, consider foreseeable costs of moving the vessel and its crew from the homeport to the outside area and from the outside area back to the homeport at the completion of the contract. In addition, 10 USC 2799a directs that before issuing a solicitation for a contract for short-term work (defined as six months or less) for the overhaul, repair, or maintenance of a naval vessel, the Secretary of the Navy shall determine if there is adequate competition available among firms able to perform the work at the homeport of the vessel.

This statute is further reflected in OPNAV Instruction 4700.7K, which directs that all CNO scheduled private sector depot-level availabilities of six months duration or less be solicited to be accomplished in the ship's homeport area, or cluster, or as close to same as is required to ensure adequate competition, capacity, and capability, to comply with personnel tempo of operations requirements. The intent of this provision is to improve the ship crew's quality of life by reducing time away from home when possible. If the duration of work is expected to last longer than six months, the Navy expands the solicitation to a coast-wide versus homeport industrial base.

5.4 Acquisition Strategy Summary

The DDG Modernization acquisition strategy will balance all factors in assessing best value for the Navy. In addition, the execution of DDG Modernization availabilities will

comply with all existing statutes and instructions, including Navy homeport policy outlined in Section 5.3, which directs that all availabilities of a duration of six months or less are to be conducted in the ship's homeport, when possible. Based on this statutory condition and the results of the analysis of factors reflected in Section 5.2, the Navy envisions conducting DDG Modernization utilizing full and open competition to sources local to the homeport. As such, work would be awarded on a competitive basis within the construct of respective MSMO contract vehicles.

6. CONCLUSION

Modernizing the DDG-51 Class is an integral component of the Navy's recapitalization strategy and critically supports surface combatants future force structure requirements. In light of this, the Navy is pursuing a proven acquisition approach that carefully evaluates the critical factors necessary for ensuring best value for the Navy. NAVSEA is confident that it will meet the precepts put forth by the CNO in 2003; fill the previously identified warfighting and capability gaps; reduce TOC; maintain expected ships' service life; and improve QOL for the crew. Selecting the right strategy, as referenced in Section 5.4, to execute these Modernization availabilities will be paramount to the Program's success. The end result is a more effective and efficient war fighting capability for this combatant Class that will comprise the majority of the surface fleet for the foreseeable future. The Navy is currently positioned to execute the plan as described in this report.

THE ASSISTANT SECRETARY OF THE NAVY

(RESEARCH, DEVELOPMENT AND ACQUISITION)

1000 NAVY PENTAGON

WASHINGTON DC 20350-1000

FEB 4 2008

The Honorable Daniel K. Inouye
Chairman, Subcommittee on Defense
Committee on Appropriations
United States Senate
Washington, DC 20510-6028

Dear Mr. Chairman:

The Fiscal Year 2008 Senate Armed Services Committee Report 110-77 directed the Secretary of the Navy "to submit a report to the Congressional Defense Committees, commencing with the fiscal year 2009 budget request, to be updated quarterly, that outlines the Navy's plan and progress with implementing Open Architecture (OA)."

This report addresses the concerns of the Senate Armed Services Committee as identified in the list of specific OA questions in Senate Report 110-77; reviews progress and accomplishments related to Naval OA from the inception of the Naval Open Architecture Enterprise Team (OAET) in August, 2004 through December, 2007; highlights the significant challenges the Navy faces in implementing OA; and describes the Navy's long term focus for implementing OA.

Please let me know if I can be of further assistance. A copy of the Navy report is also being provided to Chairmen Skelton, Levin, and Murtha.

Sincerely,

A handwritten signature in black ink, appearing to read "J. Thackrah", is written over the typed name.

**FIRST QUARTERLY
REPORT TO CONGRESS
ON
NAVAL OPEN ARCHITECTURE (NOA)**

Prepared by:

**Open Architecture Enterprise Team
Program Executive Office, Integrated Warfare Systems
Washington, DC 20376**

February 2008

Table of Contents

I. Report Requirement.....	2
II. NOA Background.....	2
III. NOA Strategy and Accomplishments.....	5
IV. Challenges and Performance	18
V. Long Term Focus – Fiscal Year 2009 Planning	18
VI. Summary.....	25
Appendix 1 – List of Acronyms.....	26
Appendix 2 – Domain OA Roadmaps	28

I. Report Requirement

The Fiscal Year 2008 Senate Armed Services Committee Report 110-77 directed "...the Secretary of the Navy to submit a report to the congressional defense committees, commencing with the fiscal year 2009 budget request, to be updated quarterly, that outlines the Navy's plan and progress with implementing Open Architecture (OA)."

As directed by the Senate Armed Services Committee, the "report shall include: (i) an integrated schedule outlining OA development and the related surface ship fielding plan; (ii) an assessment of OA development, test, procurement, installation, and operating and support costs; (iii) the Navy's acquisition strategy for leveraging competition in software development; and (iv) the Navy's performance to the OA plan. Additionally, the report shall: (i) identify software that is intended to be available for re-use by third parties in support of the OA implementation plan; (ii) describe the Navy's progress in making that software and related documentation available through the Navy's Software, Hardware Asset Re-use Enterprise (SHARE) Library; (iii) describe how the Navy is assuring quality and appropriate data rights for software and related documentation deposited in the SHARE Library; (iv) describe how the Navy is driving re-use of SHARE Library software; (v) outline contracts which have re-used third party software from the SHARE Library; and (vi) identify the impediments to entering outstanding Navy system software into the SHARE Library and the plan for managing these impediments."

The purpose of this report is to:

- Address the concerns of the Senate Armed Services Committee;
- Review progress and accomplishments related to Naval Open Architecture (NOA);
- Highlight the significant challenges the Department of the Navy (DoN) faces in implementing OA; and
- Describe DoN long term focus for implementing OA.

II. NOA Background

NOA is the confluence of business and technical practices yielding modular, interoperable systems that adhere to open standards with published interfaces. The Navy and Marine Corps have adopted OA as one way to reduce the rising cost of Naval warfare systems (also known as National Security Systems or NSSs) and platforms and to increase the capabilities of Naval systems. NOA allows for incorporating more commercial-off-the-shelf (COTS) technology or technology built to generally accepted or open standards in warfare systems and supports re-use of software and related assets. In addition, NOA is an enabler of FORCENet, the operational construct and architectural framework for Naval warfare in the information age. More importantly, OA fosters greater competition among system developers at both the prime and subcontract level by incorporating business and technical principles such as adherence to open standards and

publishing interfaces as part of the acquisition process. These same mechanisms also encourage greater collaboration among various organizations. The U.S. Government's (hereinafter "Government") ability to define or re-use the architecture and acquire at least Government Purpose Rights (GPR) to data and intellectual property and to minimize proprietary elements that prevent alternative solutions to the lowest component level is important to this effort.¹

The Advanced Combat System Technology (OA) program (Program Element 0603382N) implements Department of Defense (DoD), Office of the Chief of Naval Operations (OPNAV), and Assistant Secretary of the Navy (Research, Development, & Acquisition) (ASN(RDA)) direction to incorporate modularity and openness throughout DoN business and technical approaches to NSS acquisition. The NOA effort is the only Naval Program Element that aligns efforts to radically improve the way DoN develops and procures NSSs across all Domains (Surface, Submarine, Aviation, C4I, Space, and Marine Corps). Significant milestones in NOA include:

- In June 2004, a "Red Team" conducted an assessment of the DoN plan to implement an "OA" strategy that was originally approved in October 2003. The Red Team cited OA's criticality to achieving the DoN goal for cost-effective sustainability and recommended that the DoN place greater emphasis on the business and cultural aspects of OA.
- In August 2004, DoN established the OA Enterprise Team (OAET) to lead the Naval OA Strategy, stating that OA *"is essential as a key enabler and pillar of the Department of Defense's (DoD) focus on joint architectures and evolutionary acquisition."* The Program Executive Office for Integrated Warfare Systems (PEO IWS) was assigned overall responsibility and authority for directing the DoN OA Enterprise Effort. The team is comprised of OA Domain Leads and Representatives from Aviation, C4I, Space, Submarines, Surface, Marine Corps, OPNAV, the Antisubmarine Warfare (ASW) Community of Interest (COI), System Commands (SYSCOMs), support contractors and University Affiliated Research Centers. The OAET is primarily responsible for recommending Naval Enterprise-wide strategies, assessment tools, contract guidance, and other capabilities in support of OA implementation by programs within each Domain.
- The Deputy Chief of Naval Operations (DCNO) (N6/N7) issued a Requirement for OA Implementation, dated December 23, 2005 that established the requirement to implement OA principles across the Naval Enterprise.
- On August 28, 2006, the Chief of Naval Operations sent a letter to ASN(RDA) stating his vision for OA as being *"not limited to systems built to a set of open standards, but rather it is focused on open business models for the acquisition and spiral development of new systems that enable multiple developers to collectively and competitively participate in cost-effective and innovative capability delivery to the Naval Enterprise."*

¹"Government Purpose Rights" or "GPR" is defined in the Defense Federal Acquisition Regulation Supplement, (DFARS) Section 252.227-7013(a)(11).

- The Secretary of the Navy, Chief of Naval Operations (CNO), and the Commandant of the Marine Corps jointly called for the implementation of Naval OA across Navy and Marine Corps combat systems as one of the DoN 2007 and 2008 Objectives.
- ASN(RDA) chaired four OA Executive Committee Meetings (EXCOMMs) and co-chaired the most recent EXCOMM (October 2006) with the CNO. These meetings have provided DoN leadership an opportunity to assess the processes, progress, and roadblocks encountered in carrying out their direction to employ OA principles in all applicable Naval system acquisitions. Based on the information provided by the Domains, the chair(s) of the EXCOMM have assigned actions and set policy.
- The OAET hosted two OA Industry Symposia (in March 2005 and February 2006), each attended by over 100 representatives from the private sector.
- ASN(RDA) issued a series of policy memoranda related to developing an Open Business Model in the Surface Domain in 2007.
- The Software Productivity Improvement Initiative under the direction of ASN(RDA) promulgated requirements designed to improve DoN acquisition managers' visibility into Offerors' and contractors' software development processes to ensure that there are well-documented, effective software processes and continuous process improvement practices in place during contract performance. In July 2007 ASN(RDA) provided additional guidance regarding tailorable and non-tailorable language and information on the directed contract language.
- The President's Budget Request for the Naval Enterprise OA Initiative for Fiscal Year 2009 is as follows; it does not include program-specific funding such as investments in Aegis OA.

Fiscal Year	Naval Enterprise OA Budget
2007	\$20.3M
2008	\$11.5M
2009	\$4.4M
2010	\$10.1M
2011	\$12.1M
2012	\$12.1M
2013	\$10.1M

1. Fiscal Year 2007 funding includes a \$1.3M Congressional add for OA Maintenance Free Operating Period.
2. Fiscal Year 2008 funding includes a \$2.4M Congressional add for OA Maintenance Free Operating Period.

III. NOA Strategy and Accomplishments

NOA accomplishments at the Naval Enterprise level and NOA objectives for Fiscal Year 2008 are summarized below.

A. Enterprise Accomplishments

The OAET executes all requirements and tasking in accordance with the August 2004 OA Policy Statement, December 2005 OPNAV OA Requirements Letter, and OA EXCOMM Action Items. These requirements and tasks comprise the Naval OA Strategy which was signed out by PEO IWS as the Chair of the OA Lead Council in December 2006. The strategy is comprised of three overarching goals, addressing the business, technical, and cultural aspects of transformation.

Goal 1 - Change Naval processes and business practices to utilize open systems architectures in order to rapidly field affordable, interoperable systems

Goal 1 – Accomplishments

The following actions have been taken to achieve this goal:

- In response to the Red Team's recommendation to increase industry involvement with the transition to NOA, PEO IWS competitively selected two firms to provide advice and recommendations to PEO IWS and the OAET on technology and business trends, leading industry practices for developing software intensive systems, and organizational transformation.
- Developed and promulgated the Naval Enterprise definition of NOA, along with an extensive glossary of terms associated with NOA.
- Built the Open Architecture Assessment Tool (OAAT) released in December 2005 and updated in October 2006.
- Performed baseline assessments of DoN OA contracting and re-use practices. Used the results to develop the *Naval OA Contract Guidebook for Program Managers*, issued in July 2006 and used by over 150 Naval Programs. An updated *Guidebook* incorporating "lessons learned" was released in October 2007.
- Made investments in infrastructure to facilitate collaboration and re-use of system components and assets across the Naval Enterprise.
 - Established the SHARE repository as a pilot within the Surface Domain in early 2006 to rapidly provide a basic capability for asset delivery and re-use. To date, 60 assets have been submitted by the following programs: Aegis (Release BL 7.1.1.1), the Ship Self Defense System (SSDS), Littoral Combat Ship (LCS), DDG 1000 Zumwalt Class Destroyer (partial deposits), and Single Integrated Air Picture (SIAP) Integrated Architecture Behavior Model (IABM). The user community has grown to 153 registered users and over 132 requests for assets have been fulfilled.

- Established PEO Command Control Communications Computer and Intelligence (C4I's) Net-centric Enterprise Solutions for Interoperability (NESI) collaborative environment in 2004 in partnership with the USAF Electronic Systems Command (ESC) to provide a capability that facilitates software re-use and promotes interoperability.

Goal 1 – Fiscal Year 2008 Objectives

Objective 1: Provide OA implementation oversight by providing and refining policies, guidance, and terminology required to establish a consistent approach for OA; developing additional guidance as needed; and, supporting accomplishment of OA EXCOMM actions.

Objective 2: Assist Milestone Decision Authorities, Program Managers (PMs), and Resource Sponsors in assessing program openness, where appropriate, to make informed OA investment decisions by providing analytical toolsets needed to assess programs; establishing guidance on how to utilize OA Assessment results for decision-making; and, conducting Program Assessments.

Objective 3: Implement and refine OA Contract Guidance to be used in applicable procurements tailored as necessary to meet Domain-specific requirements by managing *OA Contract Guidebook* development and improvement; assisting PMs with incorporating OA language into acquisition documents; and reporting progress.

Objective 4: Facilitate design disclosure and cross-domain component re-use (where feasible) to reduce costs and enable more effective technology insertion. This includes developing a Naval Enterprise process for software (and other asset) re-use based on the recommendations from the *OAET Software Re-use Baseline Assessment*; supporting the OPNAV OA Cross Functional Board with aligning common requirements across programs to achieve commonality and interoperability; building an OA Enterprise Asset Repository Capability that incorporates a common end-user licensing agreement and Enterprise configuration management process that is open and accessible to all Naval and Joint programs and qualified vendors; align SHARE and NESI to support Enterprise Asset Repository Capability; and participating in and supporting the ASW COI to facilitate re-use.

Goal 2: Provide Naval OA systems engineering leadership to field common, interoperable capabilities more rapidly at reduced costs

Goal 2 – Accomplishments

The following actions have been taken to achieve this goal:

- The OAET conducted the first OA/FORCENet Experiment in 2006. The experiment used a common data model to enhance situation awareness by

integrating Track (Sub, Surface, Air), Electronic Intelligence, and imagery data from five different combat systems into a single display using a single data model – an innovative departure from traditional, closed point-to-point interfaces used to integrate different systems. The 2006 Experiment demonstrated the feasibility of using collaborative engineering across Domains to support efficient development of new modular, open components. Collaboration was maintained throughout code development and testing. Models and technologies were available to third party vendors. Small businesses played a large role in development of the test technologies.

- The 2007 OA/FORCEnet experiment built off the 2006 Experiment by extending participation to a wider group including seven DoD Players/Nodes and eight Industry/Academia Players. This year extended the principle of shared and reused components, focusing on maturing and extending a joint core data model, reusing many attributes of the Fiscal Year 2006 model, linking multiple systems together for the first time to produce a common operating picture. During this experiment, common track data was selectively shared across several platforms in an ASW scenario to improve interoperability and improve warfighter performance. Selected Fiscal Year 2007 design artifacts from the Experiment will be made available in both SHARE and NESI repositories in Fiscal Year 2008.
- PEO C4I created technical guidance in support of NESI, consisting of a body of architectural and engineering knowledge that guides the design, implementation, maintenance, evolution, and use of the information technology portion of net-centric solutions for military application interoperability.
- The ASW COI was established “to prove out definitions, capabilities and concepts,” and is currently reusing software across several ASW platforms. The COI is crafting software development and maintenance governance and processes to support the efficient development and additional re-use of ASW application software across all ASW platforms.

Goal 2 – Fiscal Year 2008 Objectives

Objective 1: Conduct OA/FORCEnet systems engineering experimentation to facilitate the fielding of interoperable capabilities and encourage collaboration.

Objective 2: Oversee OA implementation efforts to ensure standardized and disciplined processes are used across Domains.

Objective 3: Identify and foster “quick win” candidates and near-term proofs of concept for OPNAV to field additional capabilities at reduced costs.

Objective 4: Ensure Naval OA remains relevant to Science and Technology (S&T) advancement by identifying OA-related research and development, Rapid Technology Transition, and Small Business Innovative Research candidates; assisting in development of OA-based approaches to bridge the gap between S&T and acquisition programs as required; and coordinating with the Office of Naval Research on emerging technologies or approaches that may impact OA or the “next OA.”

Objective 5: Support the Test and Evaluation (T&E) community and academia/industry partners to identify opportunities to reduce T&E expenses as a result of OA.

Goal 3: Change Navy and Marine Corps cultures to institutionalize OA principles

Goal 3 – Accomplishments

The following actions have been taken to achieve this goal:

- Naval OA outreach efforts have included two OA Industry Days held in 2005 and 2006, an internal DoN OA Contract Symposium in 2006, and numerous speaking engagements at other DoN, Defense Department, or Government-related conferences, symposia, and trade expos through 2007. The Armed Forces Communications and Electronics Association (AFCEA), with the support of NAVAIR stakeholders, hosted a two-day OA Conference in August 2007.
- OA training sessions have been conducted with a wide range of Naval and DoD activities, including Fleet Forces Command, Marine Corps System Command, the Navy Research Laboratory (NRL) Multi-Function Electronic Warfare program, NAVSEA Contracts Office (SEA 02) and the Evolved NATO Sea Sparrow Missile program office.
- PEO IWS has held numerous collaborative sessions with a broad range of U.S. organizations and Allied Navies including the Defense Information Systems Agency, the U.S. Coast Guard, the Royal Navy, the U.S. Air Force and the Royal Australian Navy.
- Convened the first OA Wargame in May 2007, examining issues related to incorporating Naval OA into the CVN 21 (CVN 78) program. Over the course of the two-day exercise, the CVN 21 Program was notionally advanced through several stages of the business and acquisition cycle while the participants, arranged into groups, analyzed scenario questions designed to generate ideas in a collaborative forum. The groups worked independently on the same scenarios and reported their results during plenary sessions. While the game's moves, discussions, and subsequent facilitator observations and discussions generated recommendations for the CVN 21 Program, there were a number of recommendations that also applied to the wider Naval enterprise and are under consideration by the OAET.
- Established the Naval OA special interest area website (<https://acc.dau.mil/oa>) as a central point of communication to internal and external stakeholders. It currently receives about 40,000 page views per month and has been extensively used to download products such as the OAAT, Glossary of Terms, briefings and the *OA Contract Guidebook*. The NOA website is also a portal to access the NOA Continuous Learning Module described below.
- Funded the Naval Postgraduate School (NPS) to conduct an extensive program of OA-related research in conjunction with the NPS Acquisition Research Program.

- NPS has adopted an OA-specific Educational Skills Requirement, which applies to all Systems Engineering Master of Science programs, both resident and distance learning, and all Systems Engineering Certificate programs.
- The OAET, in conjunction with the Defense Acquisition University, developed the Naval OA Continuous Learning Module, available to the public on the Internet. As of January 14, 2008, 435 individuals have taken the course.

Goal 3 – Fiscal Year 2008 Objectives

Objective 1: Increase the awareness of OA through the development of standard communications tools and reporting (i.e. presentations, papers, web content).

Objective 2: Increase workforce skill sets through targeted training and ongoing research.

Objective 3: Conduct Outreach to External Stakeholders to increase the awareness of the NOA Initiative.

Objective 4: Measure progress on Cultural Change using a Cultural Dashboard.

B. SHARE and Naval Enterprise OA Data Consolidation Repositories

The SHARE repository was established in early 2006 by PEO IWS as a pilot project within the Surface Domain and PEO IWS to facilitate access to Aegis and other Domain combat system components.

The C4I Domain developed the NESI collaborative environment in 2004 in partnership with the USAF ESC to provide a capability that facilitates software re-use and promotes interoperability. PEO C4I also developed NESI guidance that requires all C4I programs to obtain the appropriate level of data rights favorable to DoN, and to have all deliverables placed in the NESI Collaboration Web Site so that they can be made available for re-use by others within the Naval Enterprise.

Specific responses to the Committee's request for information regarding re-use and repositories follow.

(i) Making software available for re-use by third parties in support of the Naval OA implementation plan.

The Surface Domain's current policy is to add all artifacts that the Government has GPR or less restrictive rights to into SHARE with the intention of facilitating both re-use or design disclosure. "Less restrictive rights" means that the actual restrictions placed on the Government's ability to use such software are fewer than those customarily available under GPR. As the Surface Domain's experience with SHARE and re-use expands, it will evolve policies governing asset management and use. The items available in

SHARE and NESI are identified below. The first re-use product provided to SHARE was a firm's product set and its use of the Aegis artifacts in SHARE as described in (ii)-(v) below. To some degree the Total Ship Computing Environment Infrastructure and LCS data models are also available for re-use. Re-use enabled by NESI is also discussed below.

SHARE and NESI are not the only mechanisms or models for supporting re-use. The Submarine Domain uses a third party incorporation plan that supports cross-platform re-use on a large scale. The Submarine Domain, at the direction of the Program Office, requires re-use on a case-by-case basis and is becoming more effective in supporting re-use at the subsystem level. The Marine Corps regularly incorporates capabilities developed by other organizations and Services. For Example, Marine Air Ground Task Force Command and Control is a collection of capabilities that incorporates programs from both Marine Corps and other organizations and Services. The Ground/Air Task Oriented Radar System is investigating re-use of components from an Air Force radar system.

(ii) Progress in making software and related documentation available in Naval asset repositories.

Currently 60 assets (containing over 10,114 artifacts)² have been made available in SHARE. These include the following:

- Aegis – 40 documentation assets (containing 173 artifacts), five application/code assets, one system service (code) asset; approximately 1,314 Thousand Source Lines of Code (KSLOC)
- DDG 1000 – two documentation assets (containing 30+ artifacts), two application/code assets (containing 1,884+ artifacts); approximately 1,500 KSLOC
- LCS – two architecture/design assets (data models) (containing 93 artifacts)
- SIAP – one model (containing 101 artifacts)
- SSDS – five documentation assets (containing five artifacts), two application/code assets (containing 7,828 artifacts); approximately 1,108 KSLOC

NESI contains 73 programs and projects (consisting of over 2500 artifacts), which are available in NESI for re-hosting or porting re-use by the Naval Enterprise. These include the following:

- Common Link Integration Processing – 32 documentation artifacts, 22 application/code/model artifacts

² **Artifact:** Products of a system/software development life cycle, including requirements, design documents, test cases, code, source files, executables, test reports, prototypes, user manuals, use case models, design models, and contract language. **Asset:** Any cohesive collection of artifacts that provide a solution to a user's need.

- Next Generation Navy Integrated Tactical Environmental System (NITES Next) Government Furnished Information – 24 documentation artifacts, 20 application/code artifacts
- Joint Tactical Radio System Application Program Interfaces (API) – 220 documentation artifacts, 40 API artifacts
- Future Consolidated Afloat Network Enterprise Services (CANES) Federated Development & Certification Environment (FDCE tools) – six documentation artifacts
- Future Command & Control Capability (Extensible Common Operational Picture - XCOP) – ten application/code artifacts
- Automated Identification System (AIS) – six application/code artifacts
- Automated Digital Network System (ADNS) Increment III – eight documentation artifacts
- All C4I artifacts used in the 2007 OA/FORCEnet (OA/Fn) Experiment including those items developed using composable FORCEnet software development kits taken directly from the NESI.

Future planned re-use will include the Universal Core Data model, Web Service Definition Language components, Security components and services, Universal Description, Discovery and Integration schema/taxonomies, portlets, Enterprise Service Bus software configurations, specifications and supporting documentation.

(iii) How DoN is assuring quality for software and related documentation deposited in the SHARE, NESI and Similar Libraries.

Artifacts deposited into SHARE and NESI are limited to those that have GPR or less restrictive rights associated with them. This restriction is necessary because the Government generally does not have legal authority to provide assets outside of the Government except in limited circumstances. Therefore, all artifacts submitted for deposit into SHARE and NESI are audited for intellectual property markings. Artifacts will occasionally contain embedded COTS, Open Source or proprietary software. Any inappropriate markings (more restrictive than GPR) must be justified or replaced. Any justified restrictive markings and related assets cannot be placed in SHARE. This same restriction is enforced on any modification or derivative use of the artifacts. As DoN moves to open, modular systems, its ability to add appropriate materials into its repositories for re-use will increase.

All software and other items entered into both SHARE and NESI are provided without warranty of any kind. Users are allowed to withdraw components or subsystems that are not separately tested and certified. Though not all components and artifacts were tested separately, they did undergo developmental and/or operational testing as part of the overall source system. Therefore, the quality of software as it enters either the SHARE repository or NESI Collaboration Site is assured. However, this prior testing of these components does not relieve the user or contractor from any testing or recertification required by the system that will be incorporating these materials. While reused software has been shown to have significantly fewer trouble reports and higher stability, PMs

reusing artifacts are responsible for ensuring that their systems, including components from SHARE, meet current testing and certification requirements.

NPS is currently conducting research to improve the use of SHARE by refining the repository ontology and developing a component specification framework. This specification framework will provide a model of the components in the repository as well as the relationships that provide contextual meaning. This ontology and component specification will be extended across not only SHARE, but also other Naval repository efforts to promote consistency and enable wider re-use across the Naval Enterprise. Conformance to the specification framework will ensure that assets provided are complete (i.e., have sufficient information to be useful) and of consistent format and content.

(iv) How DoN is driving re-use of software and other assets.

The DoD 5000.2A *Acquisition Guidebook* and other DoN guidance encourage programs to “identify and exploit, where practicable, Government and commercial software re-use opportunities before developing new software.” Domains are working with programs as appropriate to re-use software and related assets located in repositories such as SHARE and NESI. The *OA Contract Guidebook* also contains specific language that can be incorporated into acquisition documents that requires contractors to evaluate incorporation of repository assets (as Government-furnished Information) into their proposed solution.

DoN is working through the responsible PMs to include the requirement to participate in SHARE and NESI through two avenues. First, PMs and Offerors (contractors) are being encouraged to contractually require that their vendors provide deliverable assets in a form for the PM to submit to SHARE (and NESI for C4I artifacts). Secondly, PMs are encouraged to investigate assets in SHARE and NESI not only for their potential re-use, but also as part of a broader effort to strengthen industrial capability through a process of design disclosure. Enhancing participating vendors’ understanding of the interfaces and other attributes of the applications that new or revised components interact with enables greater system interoperability and facilitates competition.

As PMs become aware of capabilities such as SHARE and NESI, and the benefits gained from using them, they will require that those responsible for developing products for their respective programs submit assets to and retrieve assets from these Naval repositories and collaboration sites. Although it contains mostly Surface Domain artifacts, SHARE can be scaled to serve as a Naval Enterprise resource and is a model for asset re-use. For example, NRL is working to add an asset that it developed to SHARE. Currently, there are 151 registered users comprised of 89 Government and 62 contractor (representing 18 small and 15 large companies) personnel. In addition, 249 requests for assets have been made of which 132 have been fulfilled and 33 are outstanding. Eighty-four requests were withdrawn after discussions between the SHARE administrators and asset requesters. Reasons for withdrawals include the requesters deciding to seek other assets, defer the request because they are not ready to use the asset, or have determined that they should

wait until a different version of the asset is available. Several requesters also completed the work they were performing for DoN before receiving the asset. Four companies who have used 29 assets from SHARE have already returned eight new assets to SHARE.

In addition, Marine Corps makes available the Statement of Work, Contracts Data Requirements List And Tracking Tool (SCATT) to all Marine Corps project officers for use in developing contract language. That tool has been modified to include language relevant to OA as prescribed in the *OA Contract Guidebook* version 1.0. SCATT has been advertised to other domains and made available via web-access. Additionally, Marine Corps is currently investigating making SCATT available on SHARE.

(v) Progress in re-using third party software from the SHARE and NESI Repositories.

While it is too early to expect widespread re-use of SHARE and NESI assets, the first substantive use of the SHARE library has been achieved. A contractor was competitively awarded a contract to provide system engineering and development of the artifacts required to facilitate making the IABM ready for integration within the Navy SIAP Pathfinder programs. This contract is managed through a series of Technical Instructions (TIs). In December 2006, a TI was issued to develop a “framework model of the Objective Joint Track Management Architecture and Open Command and Control (C2) functionality to allow incorporation of the existing Aegis Weapon System and IABM.” The contractor, along with its three subcontractors checked out 28 Aegis assets (containing 105+ artifacts) and the LCS Data Model (containing 45 artifacts) from SHARE. The contractor submitted assets back to SHARE as a result of this effort. Navy is now evaluating these assets as part of an overall plan to migrate Surface Navy combat systems into a fully opened architecture.

Government-owned Mission Essential Meteorological and Oceanographic Center application software and NITES application software were placed in the NESI Collaboration Site for developers to leverage and aid the development of the next generation of meteorological and tactical environment decision aide capability under the NITES-Next Program. Additionally, components of currently fielded PEO C4I command and control applications, such as the XCOP, were placed in NESI and successfully re-used by the Rapid Deployment Capability (RDC) program AIS to satisfy a quick fill CNO-mandated real world requirement. In another example, the software development kits from the latest ASW Limited Objective Experiment (LOE) have been placed in NESI for leveraging and re-use in the development of components for the future CANES program. Finally, components of the Undersea Warfare Decision Support System, which are hosted in SHARE – and are linked to the NESI Collaboration Site, are going to be reused by early adopters engaged in the development of Maritime Tactical Services.

(vi) Addressing the impediments to entering DoN system software and assets into the SHARE and NESI repositories and re-using these assets.

The most prominent impediments to adding additional Naval software and assets into the SHARE and NESI repositories are issues related to data rights and the monolithic nature of many of the Department's legacy combat systems. If the Department does not have GPR or less restrictive rights on software and other system assets, it is precluded from reusing these items except through the owner of those assets. This situation arises when the Naval community accepts deliverables that have restricted data rights (e.g. COTS and Independent Research and Development-funded work) or accepts offers for deliverables with restrictive data rights when the business case warrants. Assets with restrictive rights cannot be deposited into the SHARE and NESI repositories. DoN will continue to evolve and streamline the processes it uses to allow access to assets as it gains experience with its SHARE and NESI repositories.

DoN has been slow in incorporating or transitioning to a modular, open system approach in their designs, due in part, to cost considerations or future fielding requirements. These monolithic systems cannot be easily componentized, making it difficult to re-use system elements without making a significant investment in breaking the entire system into smaller parts. This "re-engineering" is particularly challenging for vendors interested in using part of the system. In most cases, these entities do not have the in-depth knowledge of the overall system that the original developer has. Furthermore, potential third party vendors often do not have the financial resources necessary to "reverse engineer" the system to create the components they require. The lack of components with published, open standards-based interfaces makes legacy system artifacts less re-usable.

There are currently no specific requirements regarding the artifacts and format that constitute an "asset" that can be submitted into the repository. Therefore, items are sometimes received with no structure, no file extensions, and containing a range of file types (encrypted, compressed, jpgs, etc.). The *OA Contract Guidebook* and other guidance makes recommendations for specific deliverables that a program should receive in order to facilitate asset re-use. Through efforts such as the Consolidated Netcentric Data Environment and the Joint C2 effort, the Naval community is taking steps to develop and enforce Enterprise-wide component specification frameworks at various levels. When developed, these frameworks will ultimately eliminate the root cause of this impediment. This work is being closely coordinated to ensure that the lessons learned from the use of SHARE can be extended to other repositories such as NESI and contribute to an eventual realization of the broader Naval Enterprise repository capability.

Each artifact that is considered for insertion into the SHARE and NESI repositories must be audited for intellectual property that is more restrictive than GPR using a combination of manual and automated (tool) techniques. The time required to perform these audits depends on the makeup and size of the artifacts submitted. Currently, most of the artifacts that have been submitted to SHARE are legacy products containing a range of potential intellectual property markings. A SHARE/Legal Integrated Process Team has been established to address changes and improvements to the audit and analysis process

that will aid in expediting the analysis of artifacts. For example, DoN is looking at automated tools to help reduce the time required for the analysis of markings. Adoption of contractual requirements requiring insertion of deliverables and work products into SHARE and NESI, along with greater enforcement of GPR, will increase the number of assets that must be reviewed. As the Department becomes more familiar with this review process, the frequency and severity of these sorts of issues will decrease.

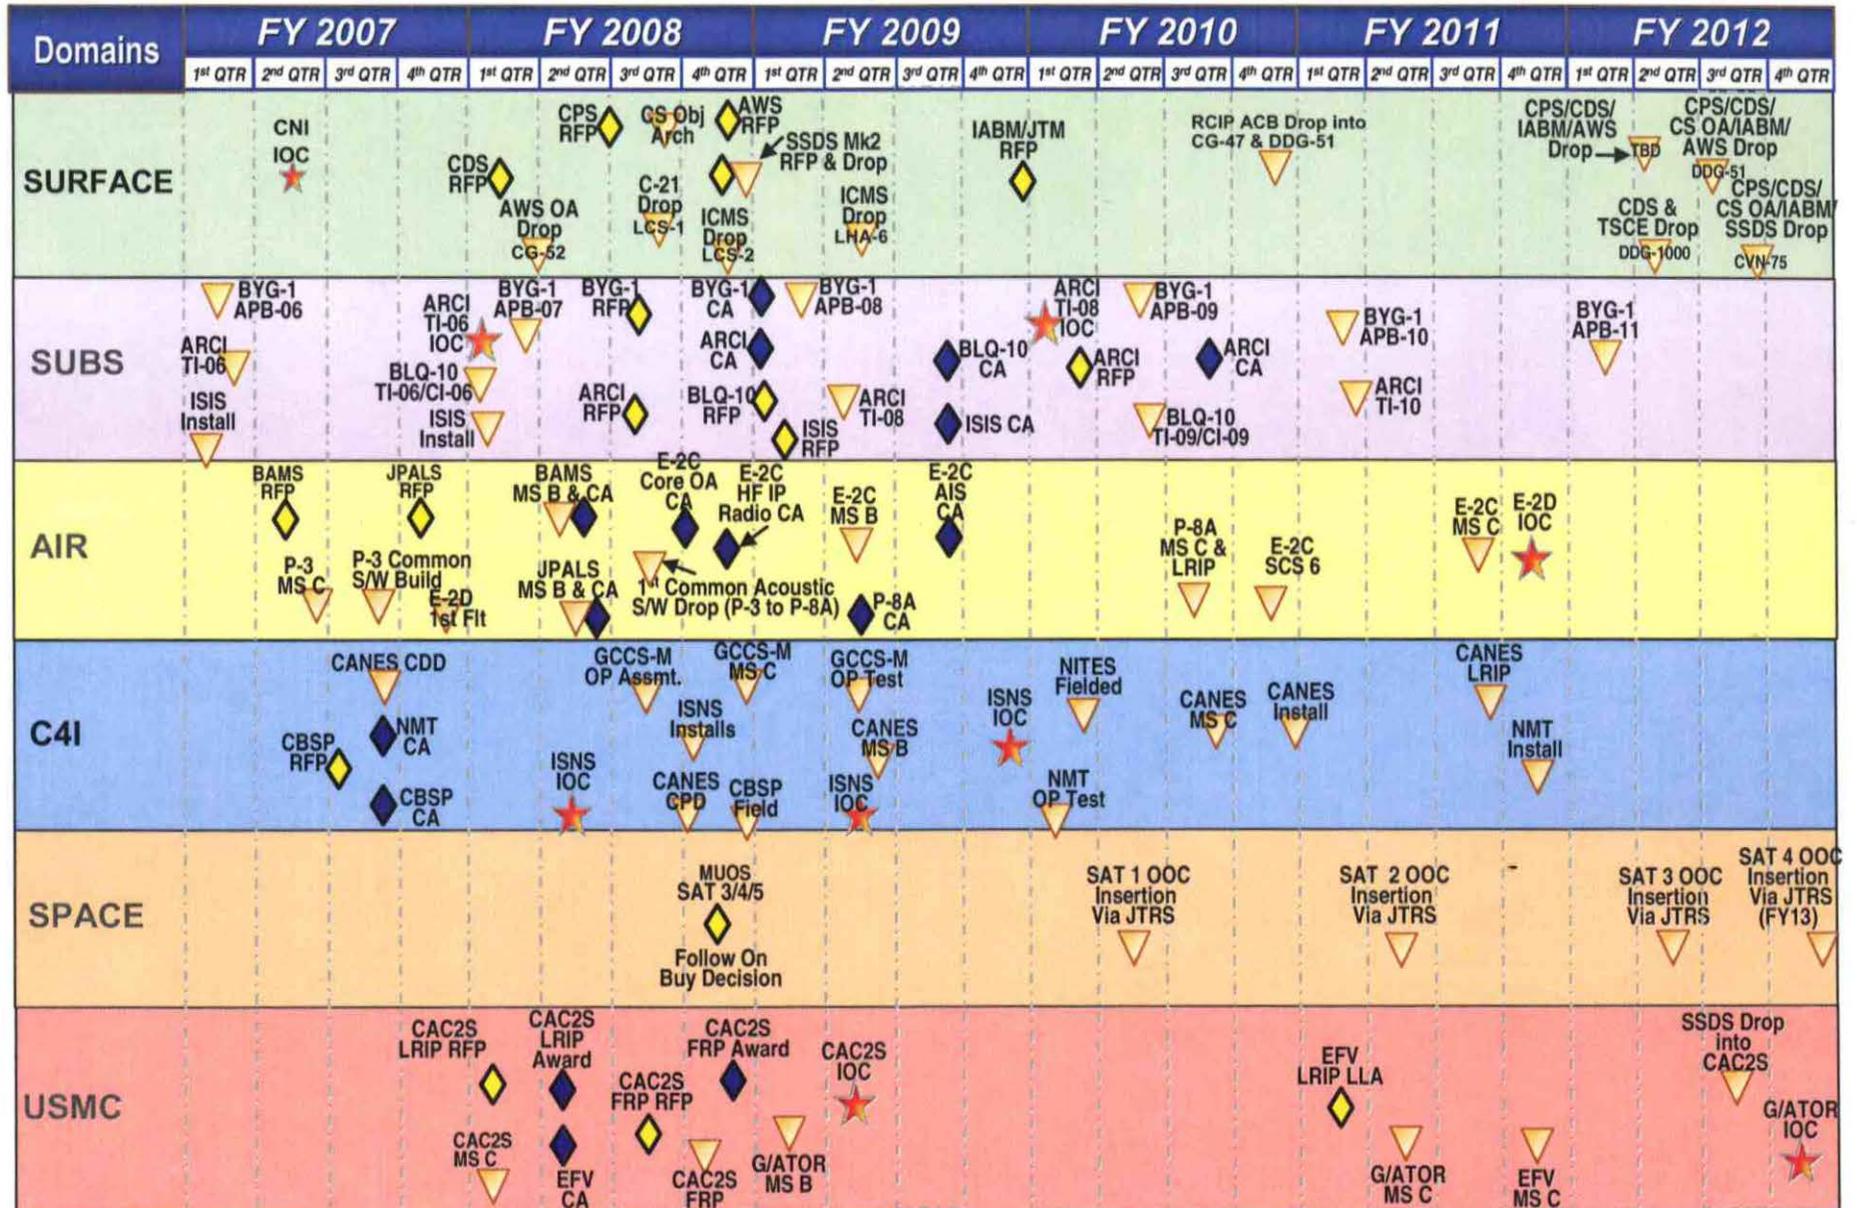

As with any broad effort involving cultural change, there remain challenges in instituting new business practices and approaches. There remains a lack of awareness of the benefits of SHARE and perceptions that act as disincentives to both government and industry to fully participate in SHARE. These impediments can be addressed by: continued up-front engagement and education; continued evolution of contracts language requiring use of SHARE; and, the sustained commitment of Naval Enterprise leadership to inclusion and enforcement of contractual requirements to use SHARE.

As the Department continues to make progress in addressing the technical aspects of OA (including incorporating greater modularity into system architectures, limiting or isolating proprietary components, and creating and publishing open-standards-based component interfaces) and incorporating OA principles into the business aspects of system acquisition (such as obtaining and exercising appropriate data rights), these obstacles will be less of an interest.

C. Naval Enterprise OA Development Schedule and Fielding Plan

DoN is implementing an overarching strategy to acquire combat systems using an OA business model approach which takes into account acquisition law, existing program delivery schedules, and supportability from both a financial and personnel resources perspective. The figure below outlines the OA development and related fielding plan for the Naval Enterprise. Individual Roadmaps for each of the Domains can be found in the Appendix to this report.

Enterprise OA Implementation Roadmap

Symbology and Acronym Legend

	Significant program event		Non OA configured platform
	Opportunity for insertion of OA contract language		Platform partially configured to receive OA components
	OA language inserted into contract(s)		Platform configured to receive OA components
	OA component insertion		Elements of Combat Systems Objective Architecture
	OA component available for insertion		Convergence of Commonality among Combat Systems
	Initial Operational Capability		

Acronyms		
ACB – Advanced Capability Build	FRP – Full Rate Production	MUOS – Mobile User Objective System
ADD – Architecture Description Document	G/ATOR – Ground / Air Task Oriented Radar	NITES – Navy Integrated Environmental Support Sub-system
APB – Advanced Processing Build	GCCS-M – Global Command Control System – Maritime	NMT – Navy Multi-band Terminal
ARCI – Acoustic Rapid COTS Insertion	H/W – Hardware	OOB – On Orbit Capability
AWS – Aegis Weapon System	IABM – Integrated Architecture Behavior Model	RCIP – Rapid Capability Insertion Process
BAMS – Broad Area Maritime Surveillance (Unmanned Air Platform)	ICMS – Integrated Combat Management System	RFP – Request For Proposal
C-21 – COMBATTS 21	IOC – Initial Operational Capability	SAT 1/2/3/4 OOB – Satellite #1/2/3/4 On Orbit Capacity
CA – Contract Award	IP – Internet Protocol	SDD – System Development & Demonstration
CAC2S – Common Aviation Command & Control System	ISIS – Integrated Submarine Imaging System	SSDS – Shipboard Self Defense System
CANES – Consolidated Afloat Networks & Enterprise Services	ISNS – Integrated Shipboard Network System	S/W – Software
CBSP – Commercial Broadband Satellite Program	JPALS – Joint Precision Approach and Landing System	TC – Tactical Control
CDD – Capability Development Document	JTRS – Joint Tactical Radio System	TI – Technology Insertion
CDS – Common Display System	LLA – Long Lead Award	TR – Technology Refresh
CNI – Common Network Interface	LRIP – Low Rate Initial Production	TSCE – Total Ship Computing Environment
CPD – Capability Production Document	MIDS-JTRS – Multi-function Information Distribution System - Joint Tactical Radio System	WC – Weapons Control
CPS – Common Processing System	MS B/MS C – Milestone Decision B/C	
CS OA – Combat System Objective Arch.		
EFV – Expeditionary Fighting Vehicle		

IV. Challenges and Performance

1. The Department's Transformation Challenges

During EXCOMM V (October 2006), ASN(RDA) and the CNO called for development of an "OA Cultural Dashboard" with metrics that can be used to assess the Navy and Marine Corps progress in transforming the way it acquires its combat systems through OA. To provide a foundation for this dashboard, the OAET surveyed Navy and Marine Corps civilian and military in June 2007 to obtain their input on the internal and external barriers to implementing OA across the Naval Enterprise. Survey respondents identified the top internal barrier to OA implementation as the current flow of money to programs; the top external barrier is the loss of intellectual property rights (IPR). According to the survey, additional significant internal barriers are the lack of a defined reference architecture describing Enterprise and common standards/interfaces; a lack of OA understanding; the lack of resources; and an unwillingness of the Government to break existing contracts. Additional significant external barriers are the perceived company loss of market share; the perceived company loss of profit; the perceived company low return on investment; and a need for improved contractual requirements by the Department.

In order to address these challenges, the OAET has defined a Strategy based on four goals and related objectives, as previously discussed in Section III. These objectives are supported by work streams that are performed at either the OAET (Naval Enterprise) or Domain (PEO, Program or SYSCOM) level.

2. Measuring the Department's Performance to the Plan.

DoN is developing a set of metrics to track the Naval OA transformation. These metrics are being developed at the request of the CNO and ASN(RDA) and will reflect the overall maturity of DoN as its culture and business practices evolve. Development progress will be reported in subsequent reports.

V. Long Term Focus – Fiscal Year 2009 Planning

1. Assessing the Impact of OA on Development, Test, Procurement, Installation, and Operating and Support Costs

OA is a shift in the business paradigm for acquisition programs. OA helps Naval programs evaluate opportunities to acquire capability with a greater degree of flexibility to swap out the underlying mission computing infrastructure. The dividend from an OA investment is to allow programs to affordably keep abreast of the rapid refresh of commodity items while also providing a stable, open environment for innovation.

Because OA requires a course change in business and technical practices, successful incorporation of OA requires upfront investment in moving from closed, monolithic architectures to open, modular architectures. OA does not require contractors to “give up their data rights” but instead positions the Naval community to leverage its prior research and development investments. By publishing (and exercising control over) component interfaces, OA will allow proprietary components to be inserted into the overall system – where the business or performance case warrants. Offerors that use their own funds to develop proprietary components with improved performance can offer these to the Navy, Marine Corps or the integrator for use in the overall system. Under this approach, both large and small businesses are afforded an opportunity to compete at both the prime and subcontract level.

Each Domain differs in their “OA maturity” – in effect, how long they have incorporated OA business and technical principles in their acquisition models. As a general rule, OA development, test, procurement, installation, and operating and support cost can be estimated in several ways, but none are readily calculated in terms of cost awarded or money saved until the Department has had an opportunity to mature the processes involved in operating, maintaining and upgrading OA-based systems. Some of the factors that should contribute to a positive Return on Investment include: reduced Non-Recurring Engineering costs, reduced time to field upgrades, reduced T&E over system lifecycle, reduced risk; improved operator and system performance, greater Human Factor Integration, introduction of competition and innovation, elimination of total regression testing, and cost avoidance from software re-use across multiple platforms. As the Domains revise their business models at the program or project level, they obtain valuable insights regarding the costs and benefits of OA. Documenting these “lessons learned” and the tools and practices that lead to the realization of OA benefits is a critical effort for Fiscal Years 2008 and 2009. There are several examples that illustrate these benefits.

a. Submarine Domain

The Submarine Domain’s Acoustic Rapid Commercial-off-the-Shelf Insertion (A-RCI) program is widely recognized as the Navy’s most mature OA program. Based on studies in 2006, the development and production costs for the A-RCI model process were roughly 1/6th of those costs for previous systems acquired under the traditional ‘Mil Standard’ model. Consequent operating and support costs for the A-RCI model were approximately 1/8th of those for its predecessor systems. Fiscal Year 2009 efforts will be focused on alignment of three additional Non-Propulsion Electronic Systems submarine program business models with A-RCI and the AN/BYG-1 Submarine Combat Control System to maximize the OA benefits that are visible in test conduct events and new capability introduction.

b. Aviation Domain

The Aviation Domain's investment in Core OA for the E-2 Hawkeye platform will provide flexibility in computing infrastructure, with the benefit of greatly reduced cost to integrate and maintain software. The E-2 SIAP integration strategy leverages Core OA to reduce risk and cost. The Core OA is planned for the E-2C to mature the model and then be applied to future E-2D spirals. This open business model enhances the program's ability to rapidly develop, integrate, field, and sustain future mission capabilities.

The P-8A Maritime Patrol and Reconnaissance Aircraft program, which will replace the P-3C, expects to achieve significant cost avoidance over the life of the program, as well as a reduction in the time needed to field new and improved capabilities, as a result of building in an open architected system from inception. The P-8A's core mission computer and display subsystem architecture has already allowed the program to realize significant software savings in the baseline plan. This open architected system has facilitated the implementation of a COTS operating system, as well as offered the ability to realize a sizeable reduction in SLOC resulting from considerable software re-use in the weapons, data link, acoustic and radar subsystems. Another example where the use of COTS and OA have resulted in benefit to both currently fielded and developmental systems has been in the area of acoustic signal processing, where development costs have historically been large. The P-3C and P-8A acoustic subsystem contractors have elected to work collaboratively to take advantage of OA features that currently exist in the P-3C acoustic subsystem, and that are being designed into the P-8A. The resulting acoustic hardware and software design/implementation will yield overall decreased lifecycle costs for both the P-3C and P-8A, as well as field this much needed capability improvement in the current P-3C fleet several years before P-8A IOC. In this instance, the entire Naval Aviation Enterprise (NAE) will benefit greatly from the ability to take advantage of OA architecture and business practices.

NAVAIR and PEO, Tactical Air (PEO(T)) have developed an acquisition process improvement initiative in conjunction with the NAE Future Capabilities Cross Functional Team to address how OA requirements are developed and incorporated into Aviation Domain programs. The first step in this process is to provide training to the OPNAV requirements officers on the development and insertion of OA requirements into the Program's Capabilities Description Document or Operational Requirements Document. To make sure that the requirements officers, acquisition professionals, and the contractors are working together on OA, PEO(T) and NAVAIR are co-sponsoring a Lean 6-Sigma project to identify and promulgate a Key Open Sub-Systems (KOSS) process. The KOSS process outputs feed into program requirements, supports business case analysis, assists engineers in evaluating contractor key interfaces and provides a framework for building the Open Systems Management Plan, an important contractor deliverable identified in the *OA Contracts Guidebook*. This acquisition process improvement has the endorsement of the Director, Air Warfare Division (OPNAV N88).

NAVAIR is also integrating the OA assessment process into the normal course of program execution. NAVAIR will incorporate the OAAT version 1.1 questions into the

Systems Engineering Technical Review (SETR) process, a key element in the technical assessment of all Aviation Domain development and acquisition activities. This integration of the OAAT into the SETR means that all aviation programs will be evaluated for OA.

c. C4I Domain

The common theme throughout PEO C4I's Masterplan is the reduction, or necking down, of systems in every enclave across the C4I Domain and reusing the same terminal, network, computing environment for all functions and security levels. This approach is expected to reduce development, test, procurement, installation, training, and support costs. By moving C4I programs to a Common Computing Environment architecture with smaller, COI service capabilities riding on that infrastructure, PEO C4I intends to make the spiral development cycle much shorter for the Command & Control and Intelligence / Surveillance applications. In addition, by using an incremental build approach, mature technologies can be more rapidly fielded at a lower risk. In testing, PEO C4I intends to pursue a concept similar to the Defense Information Systems Agency's FDCE. PEO C4I intends to achieve a more rapid capability delivery strategy by engaging the warfighter, the requirements process, the testing community and the approval stakeholders much earlier in the development process. This approach reduces the requirement for stovepipe test events and migrates toward a more integrated, end-to-end testing environment. Additionally, C4I Applications will be fielded using a stream-lined testing process by demonstrating how they meet future CANES certification criteria, requiring minimum standards compliance, security, interoperability and operational suitability/effectiveness.

By taking advantage of innovative acquisition processes, such as the RDC, PEO C4I intends to make a significant paradigm shift in how certain C4I programs operate. Taking best advantage of emergent OA contract guidance and improved S&T transition plans will afford PEO C4I a more streamlined process and more rapid delivery of capability. As described in SECNAVINST 5000.2C, the RDC process "provides the ability to react immediately to a newly discovered enemy threat(s) or potential enemy threat(s) or to respond to significant and urgent safety situations through special, tailored procedures..." Currently, PEO SPACE has four RDC programs in development: Commercial Broadband Satellite Program; Expanded Maritime Interception Operations Wireless Reachback; Subnet Relay and High Frequency Integrated Protocol; and AIS.

d. Surface Domain

In the Surface Domain, the ability to isolate the hardware from the software programs and install COTS based systems was the first major step in achieving open systems. With the use of the Common Processing System and Common Display systems hardware sets, both being competitively procured and based on COTS technologies, the Navy will achieve common computing infrastructure on several ship classes where the contracting strategy allows it. By moving to software applications that run on several ship classes the Navy will avoid duplication of costs and lay the groundwork for future savings in software lifecycle maintenance. In the near future, Navy will coordinate the re-use and

sharing of Dual Band Radar and DDG-1000 software on the CVN-78 Combat System and the improved track server software on Aegis and SSDS. The sharing of software in the SHARE repository is a major enabler in this movement to open software, and almost all of our programs are now taking advantage of that approach for GPR software programs. Currently the Navy team is working to implement rapid capability improvement processes and conduct regular testing on experimental software builds. Improving the methods by which combat systems are tested and certified will be a major focus area over the next two years, with particular emphasis on saving costs when testing functionality that will field on multiple platform types. The implementation of the common architecture across Surface combat systems programs will start in Fiscal Year 2008 for the programs where there is contractual flexibility (Aegis and SSDS). The evolution from closed, monolithic to open, modular architectures cannot be done in a single step. Competitive procurements will be used to implement this strategy for software and for hardware on platforms where the acquisition strategy allows the use of GFE systems. Software architectures that span the Naval Enterprise will be reviewed in the future as DoN continues its implementation of OA in the Surface Domain.

The Surface Domain's SSDS is using test results from the LPD-17 to reduce follow-on testing requirements for other ships, including CVN-76, LHD-8, and LHA-6. LPD-17 is the first ship in the Capstone Enterprise Air Warfare Ship-Self Defense Test and Evaluation Master Plan (TEMP) evolution. The capture of LPD-17 test events within this Navy T&E enterprise approach contributes significant benefits in cost avoidance through model validation and the reduction of redundant testing. Data captured from these events will assist in the development and validation of models, enabling modeling and simulation that will assess the combat system's ability to meet specific effectiveness requirements such as the Probability of Raid Annihilation or P_{RA} (the ability of a standalone ship to defend itself against a specific attack scenario). These models will be re-used for cross-ship model migration and will include communication and combat system elements. This TEMP has been concurred with by Deputy Chief of Naval Operations for Integration of Capabilities and Resources (N8) and approved by Director, Test & Evaluation and Technology Requirements (N091).

As a result, the Probability of Raid Annihilation data acquired will contribute to Developmental Testing and support the resolution of Operational Testing Critical Operational Issues. The re-use and assessment of performance with models, as validated by LPD-17 testing, will reduce the amount of testing required for follow-on ships that use the same combat system variant. In addition, the Surface Domain plans to reuse this process for aspects of the LCS, DDG-1000, and CVN-78 (formerly CVN-21) programs. The underlying concept is that if a follow-on ship's combat system functionality has not changed from previous versions, and the models have already been validated with live fire testing, then the model would not change. If it has, then the model would be integrated with the new models to represent the change.

The Navy is currently developing the acquisition strategies, technical approaches, integrated schedules and fielding plans for Surface Domain warfare systems that will

further describe how OA principles are being implemented in these programs. Additional progress will be reported in subsequent quarterly Reports to Congress.

e. Space Domain

The Space Domain's Mobile User Objective System (MUOS) program pre-dates the fully defined OA initiative. However many aspects of its acquisition strategy were incorporated into the principles of OA and into the *OA Contracts Guidebook*. MUOS is being built with an unprecedented level of COTS components and software re-use. PEO Space Systems is evaluating the potential for further enhancing MUOS program alignment with OA principles, including the use of Software Reconfigurable Payloads (SRP), a concept to rapidly insert capability into satellite systems. SRP would allow the insertion of capabilities, such as enhanced anti-jam protection, after a satellite was launched. SRP could be embedded on a satellite, in its ground infrastructure or both. By decoupling satellite hardware from its software applications with SRP, the technical barrier to smaller vendors is removed, increasing competition and reducing development time.

2. The Department's acquisition strategy for leveraging competition in software development;

DoN is seeking to leverage competition for component and subsystem software development by both prime contractors and subcontractors to reduce costs and stimulate innovation. The Department's acquisition strategy for leveraging competition in software development is based on the core OA principles of modular design and design disclosure; use of open, published interfaces; and software and asset re-use; augmented by key OA tools such as Peer Reviews and software asset repositories such as SHARE. In addition, the understanding and acquisition of the necessary IPR for these assets, an emphasis on the use of COTS/Government-off-the-shelf (COTS/GOTS) software, and the potential use of shorter term contracts with options instead of long-term software development contracts are being considered as part of this strategy.

Software asset repositories such as SHARE enable the Navy and Marine Corps to increase competition because they facilitate design disclosure and asset re-use. By storing software assets for which the Department has GPR or less restrictive rights, repositories like SHARE enable other qualified DoD contractors to examine the contents and designs of these assets. When more companies and developers are provided access to software assets the Navy and Marine Corps use, a wider developer base with more knowledge of Naval systems is created, increasing the potential for competition when system component and subcomponent upgrades or extensions are needed. Enhanced competition will increase the supply of innovative solutions and lower prices.

As implemented by the Submarine Domain, the Peer Review process leveraged competition and innovation in software development. Participants in the Submarine Domain's Peer Review process were selected so that the membership (taken as a whole)

was unbiased and impartial. The Submarine Peer Review process was conducted as a “performance meritocracy.” That is, candidate technologies were evaluated with common metrics and common data from real-world operations and those technologies – drawn from a diverse pool assembled through market research and surveys of the state of the practice. PMs, Fleet and OPNAV resource sponsors then collaborated to determine the next periodic delivery of improved capabilities.

On March 16, 2007 the CNO directed the Surface Domain to establish peer review processes within the Domain. Some Peer Reviews will examine and comment on the openness of architectures, systems, subsystems and components that are being considered for use in performance of a contract requirement. Peer Reviews may take many forms. One example of a Peer Review Group is a system working group. This group’s focus is typically at the system level and has primary objectives of: 1) developing and overseeing the implementation of a coordinated set of plans and processes aimed at resolving specific system performance issues; and 2) identifying system shortfalls, selecting the best solutions from existing Government programs and establishing the proper feedback processes and tools to enable a data-driven, build-test-build approach to continuous sub-system performance improvement. While substantial effort has been spent, progress toward achieving this goal has been slow as a range of legal, contractual and programmatic issues related to the Surface Domain Business Model are being addressed.

The modular design of software components and use of open, published interfaces allows greater innovation through competition in software development and requires new acquisition models. When software is developed in a modular fashion with open, published interfaces, it becomes easier and cheaper to upgrade. The principle of modularity can be extended to support solutions that are usable across multiple platforms in a manner that reduces future requirements for large-scale new combat system development efforts.

As the Department’s combat systems evolve to more modular approaches and functionalities become more open, they become candidates for open competition. Ideally, these competitions will be conducted among a large developer base familiar with the functionality of a component and the interfaces it uses to develop potential solutions. Therefore, pieces or modules can be upgraded on an as-needed basis, rather than having to wait for a larger percentage of non-modular software to become obsolete before it is more cost-effective to upgrade the entire system rather than mere components. The upgrade of a system as a whole rather than modules also favors an incumbent familiar with the entire system and reduces competition.

The length of contracts also affects the ability to reap greater benefits from competition in software development. In general, moving from large, long-term software development contracts, in which an incumbent has little fear of losing its business with the Naval community, to shorter term contracts with multiple vendors will enhance competition and increase agility in providing OA solutions. In the same manner, short-term contracts with option years enable the Department to either (1) reward highly performing contractors with additional years of software development work or (2) re-compete development work

when base years have expired, when improved technology solutions become available or when cyclical peer reviews indicate that the Department is not satisfied with the outcomes of work performed. Both options should allow the Department to fully leverage the benefits of competition on price, quality of work and innovative solutions.

Finally, DoN is also working to more completely understand the ramifications of its IPR choices with respect to software acquisition to help leverage competition in software development. By acquiring and exercising its GPR in the systems it acquires, where appropriate, the Department will be better able to affordably share software assets and designs with third-party developers and, therefore, increase competition in the market for NSS software.

VI. Summary

This first NOA Report to Congress provides a baseline report of the history and the accomplishments of the NOA program since its inception. OA efforts of the Naval Enterprise and each of the six Naval Domains were discussed. Activities of the two primary Naval Enterprise repositories (SHARE and NESI) were described and the specific Committee questions answered. Additional NOA progress will be reported in subsequent Reports to Congress.

Appendix 1 – List of Acronyms

ADNS	Automated Digital Network Systems
AFCEA	Armed Forces Communications and Electronics Association
AIS	Automated Identification System
API	Application Program Interfaces
A-RCI	Acoustic-Rapid Commercial-off-the-Shelf Insertion
ASN(RDA)	Assistant Secretary of the Navy (Research, Development, & Acquisition)
ASW	Antisubmarine Warfare
C2	Command and Control
CANES	Consolidated Afloat Network Enterprise Services
CNO	Chief of Naval Operations
COI	Community of Interest
COTS	Commercial-off-the-Shelf
DCNO	Deputy Chief of Naval Operations
DoD	Department of Defense
DoN	Department of the Navy
ESC	Electronic Systems Command
EXCOMMs	Executive Committee Meetings
FDCE	Federated Development & Certification Environment

THE SECRETARY OF THE NAVY
WASHINGTON, D. C. 20350-1000

February 14, 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

The Fiscal Year (FY) 2007 Senate Armed Services Committee Report 109-254 requested that the Secretary of the Navy submit to the Congressional Defense Committees a report outlining the acquisition strategy for the Littoral Combat Ship (LCS) program.

In a letter of April 30, 2007, the Navy notified the Congress that this report would be submitted prior to seeking Milestone B approval for the LCS program. Over the past several months, the Navy has been reevaluating the acquisition strategy for the program. On January 26, 2008, the Defense Acquisition Executive approved an LCS Acquisition Strategy covering procurements of seaframes for FY 2008 and FY 2009. The enclosed report describes the revised Acquisition Strategy.

The Navy intends to conduct a limited competition with the incumbent suppliers for the FY 2008 and 2009 procurements, using fixed price incentive contracts. Procurement of these ships is vital to fill critical warfighting requirement gaps. Additionally, the Navy is focused on continuing through first-of-class construction challenges to complete LCS 1 and LCS 2. When these ships are delivered, the Department will be able to better evaluate their costs and capabilities, informing development of the acquisition strategy for the procurements in FY 2010 and beyond.

A similar letter has been sent to Chairmen Inouye, Skelton, and Murtha. If I can be of any further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

Donald C. Winter

- 6. COMPETITION PLAN**
- 7. COST CONTAINMENT STRATEGY**
- 8. PROGRAM COSTS**
- 9. ACQUISITION OF TWO DESIGNS**
- 10. CONCLUSION**

1. REPORT REQUIREMENT

The FY 2007 Senate Armed Services Committee Report 109-254 included the following request:

"...the committee directs the Secretary of the Navy to submit a report on the LCS program, no later than December 1, 2006 to the congressional defense committees. The report shall outline the Navy's acquisition strategy for the program, including the competition plan, the flight strategy, and the cost containment strategy for the program; contain a clear representation of all R&D and procurement costs for the total program; and assess the added life cycle costs associated with operation and support for two dissimilar flight 0 LCS designs."

Subsequent requests by the Navy submitted on November 16, 2006, January 30, 2007, and April 30, 2007, requested extensions of the submission date to February 5, 2007, May 4, 2007, and prior to Milestone B, respectively, in order to allow for the inclusion of final program acquisition strategy decisions.

2. EXECUTIVE SUMMARY

The Littoral Combat Ship (LCS) program is currently in active construction for first of class deliveries in FY 2008 and FY 2009. Following the cancellation of LCS 3 and 4, in April and November 2007 respectively, and the FY 2008 appropriation of a single seaframe, the Navy focused on near-term efforts to deliver LCS 1 and LCS 2 and to procure the FY 2008 and planned FY 2009 seaframes. The current Acquisition Strategy continues to focus on affordability, rapid fielding of capability to address critical Fleet operational gaps and competition as a means of cost control.

This report outlines near-term LCS procurement plans, detailing proposed competition strategies and tools to maintain cost control. The report focuses on the seaframe aspects of the LCS Acquisition Strategy. Further detail on the LCS Mission Package (MP) aspects will also be included in the Report to Congress on the LCS Mission Modules being submitted with the FY 2009 President's Budget request.

Major features include:

- Procurement of a single seaframe in FY 2008 and request for two additional seaframes in FY 2009.
- Contract awards will be based on a limited competition for quantity between the current LCS seaframe prime contractors of a Fixed Price Incentive Fee (FPIF) type contract for the FY 2008 ship with options for the additional two ships in FY 2009.
- The FY 2008 and FY 2009 ships will be designated as Flight 0+ and will include all existing approved engineering changes and essential redesigns stemming from lessons learned, along with any current improvements to construction or fabrication procedures.
- The Office of the Secretary of Defense (OSD) will conduct a Milestone A-prime interim defense acquisition review of the LCS program prior to procurement of the FY 2008 seaframe.

- Acquisition strategies for FY 2010 and outyear ships are under Navy review. OSD will conduct a Milestone B prior to FY 2010 procurement. The Navy and OSD will consider the questions of downselecting seaframes (or not) and the transition to full and open competition (or not) as part of the FY 2010 acquisition strategy deliberations.
- Navy remains committed to effective cost control and has improved contracting strategies and management practices to ensure program stability.

3. BACKGROUND

Several changes to the program plan have occurred since Milestone A and are reflected in the revised LCS Acquisition Strategy, approved by the Undersecretary of Defense for Acquisition, Technology, and Logistics (USD(ATL)) on January 26, 2008.

- In 2005, the Navy revisited the existing strategy of a new Flight of ships in FY 2008. A Navy decision was made to continue procurement of both Flight 0 seaframe designs at least through FY 2009, as the Draft Flight 1 Capabilities Development Document (CDD) spiral confirmed the validity of Flight 0 requirements, and both designs established their ability to meet those requirements with the use of modeling and simulation tools.
- Congress appropriated two additional ships in FY 2006. The Navy exercised two FY 2007 contract options awarding the LCS 3 contract option to Lockheed Martin (LM) on June 26, 2006 and LCS 4 contract option to General Dynamics (GD) on December 8, 2006.
- Cost growth on LCS 1-4 ships resulted in a detailed Navy assessment of program cost and structure. Negotiations to restructure the LM contract were unsuccessful, and on April 12, 2007, the contract option for construction on LCS 3 was terminated in part for convenience. As planned, the Navy was to continue the procurement of both Flight 0 seaframe designs, but at a reduced quantity.
- The strategy for LCS seaframe procurement beyond FY 2011 envisioned a Navy test, evaluation, and selection decision in FY 2009 of the most operationally suitable seaframe. A full and open competition was planned in FY 2010 for construction of the selected design for FY 2011 and beyond. However, the Navy retained the option to continue production of both seaframes should each present a unique operational advantage.
- The FY 2008 President's Budget request included changes to mission systems quantities. The Navy plans additional analysis in order to further refine the numbers and mix of MP systems. Changes are summarized as follows:
 - Reduction of one each of the following mission systems from the mine countermeasures (MCM) MP: Organic Airborne and Surface Mine Influence Sweep (OASIS), Airborne Mine Neutralization System (AMNS), Airborne Laser Mine Detection System (ALMDS), AQS-20A, and Rapid Airborne Mine Clearance System (RAMICS)
 - Deletion of the Advanced Deployable System (ADS) from the anti-submarine (ASW) MP
 - Addition of Maritime Security (MS) module (consisting of Visit, Boarding, Search and Seizure (VBSS) equipment, berthing and Rigid Hull Inflatable Boat (RHIB) cradles), as

part of the surface warfare (SUW) MP, to meet a new requirement for sustained Enhanced Maritime Interdiction Operations (EMIO), where naval teams board and search vessels. EMIO is the maritime component of the Global War on Terrorism and its mission is to deter, deny and disrupt the movement of terrorists and terrorist-related materials at sea. The MS modules will be procured beginning in FY 2010, to augment deployed surface warfare MPs.

- Because of continued cost growth on LCS 2 and 4, the Navy entered into negotiations with GD to restructure the construction contract to a FPIF type contract. These negotiations were ultimately unsuccessful and the contract for LCS 4 was terminated in part for convenience on November 1, 2007.
- Congress appropriated one seaframe in FY 2008, with report language directing that material and funding remaining from the termination of LCS 3 and 4 should be applied to the FY 2008 seaframe.
- The Navy was directed by the Defense Acquisition Executive to submit a revised Acquisition Strategy in January 2008 specifically outlining the program's plan for the FY 2008 procurement as well as possible procurements for the planned FY 2009 seaframes.

Navy Labs are integrating and delivering the first six MPs (two MCM, two ASW, two SUW). Subsequent to Milestone A and following a competitive solicitation, a contract was awarded to Northrop Grumman Integrated Systems in FY 2006 for MP integration. This long term acquisition strategy centralizes integration for all MPs, with Northrop Grumman assuming the integrator role with the seventh package.

4. LCS ACQUISITION STRATEGY

The previous LCS Acquisition Strategy, approved in May 2004, was based on the tenants of a modular and open system architecture, Cost As an Independent Variable design process, a rapid two year construction cycle to deliver capability to the Fleet, and continuous competition at all levels of the program to control costs. This strategy included an initial limited procurement of four Flight 0 seaframes and the development of independent Spiral Alpha focused MPs, followed by incorporation of lessons learned and immediate transition into a spiral development redesign for Flight 1 serial procurement beginning in FY 2008. This strategy resulted in the award of two seaframe contracts to GD and LM.

The two congressionally added seaframes in FY 2006 utilized the options for additional ships included with the original LCS contracts, leaving the Navy with no procurement/contract vehicle in place for FY 2007 and beyond. To support possible acceleration of Flight 1 into FY 2007, a preliminary Flight 1 CDD draft was developed. Upon evaluation by the Navy leadership it was determined that the Flight 1 CDD draft did not identify any fundamental changes in requirements. As a result, the Navy decided to continue procurement of Flight 0 seaframes at least through FY 2009.

Cost growth on LCS 1 through 4 resulted in a detailed assessment of program cost and structure. On January 12, 2007, a stop work order was issued against LCS 3. Following a program

assessment, the Navy entered negotiations with LM to restructure the contract to FPIF terms. On April 12, 2007, LM was issued a partial contract termination for convenience when negotiations to reach FPIF terms were unsuccessful. The Navy continued to closely monitor the cost trend on LCS 2, the GD lead ship. In September 2007, the Navy determined that the GD cost trend was very similar to that of LCS 1 and entered into discussions with the GD industry team to restructure the LCS 2 and 4 contract to FPIF terms. On November 1, 2007, LCS 4 was terminated for convenience when acceptable terms for a fixed price contract restructuring of the construction contract was deemed not achievable.

Based on ongoing program restructuring, the Navy requested and received congressional approval to reprogram FY 2007 SCN appropriations to fund cost increases on LCS 1 and 2. Congress appropriated a single seaframe in FY 2008 and included report language stating that material and funding remaining from the termination of LCS 3 and 4 should be applied to the FY 2008 seaframe. The Navy plans to procure an additional two LCS vessels in FY 2009 to meet the continuing urgent warfighting requirement.

The FY 2008 and FY 2009 ships, designated Flight 0+, will incorporate all existing approved engineering changes proposals, necessary redesigns of the water jets and/or propulsion tunnels and changes to production processes based on lessons learned. The strategy for procurement of the Flight 0+ seaframes is now based on a limited competition for quantity utilizing a FPIF type contract solicitation for a single ship in FY 2008, and options for an additional two seaframes in FY 2009. Award will be based on best value to the Government with the proposed price for FY 2009 ship(s) contingent on that proposed for the single FY 2008 ship, and the efficient use of existing procured material from the terminated LCS 3 and 4 contracts in the first seaframe of each design to be awarded under the FY 2008/2009 solicitation.

Additionally, Navy desires the opportunity to inform the procurement of Flight 0+ ships based on the results of trials and testing of the lead ships. To accomplish this, the successful FY 2008 offeror will not proceed through Production Readiness Review until their lead ship has successfully completed Builders Sea Trials and any lessons learned are incorporated into their proposed integrated master schedule. Any changes for Flight 0+ as a result of sea trials will be minimized to those which must be addressed for safety and operability.

These decisions have been incorporated in a revised LCS Acquisition Strategy which was approved by USD(ATL) on January 26, 2008. OSD will conduct a Milestone A-prime interim defense acquisition review of the LCS program prior to procurement of the FY 2008 seaframe.

Acquisition strategies for FY 2010 and outyear ships are under Navy review. OSD will conduct a Milestone B prior to FY 2010 procurement. The Navy and OSD will consider the questions of downselecting seaframes (or not) and the transition to full and open competition (or not) as part of the FY 2010 acquisition strategy deliberations.

This report focuses on the seaframe aspects of the LCS Acquisition Strategy. Further detail on the LCS MP aspects will also be included in the Report to Congress on the LCS Mission Modules being submitted with the FY 2009 President's Budget request.

5. FLIGHT STRATEGY

The LCS program was established as a spiral development program to maximize early delivery of capability to the Fleet while optimizing the design over subsequent procurements. The modular open system architecture used for the LCS design resulted in the independent development of seaframes and MPs that integrate across a controlled interface specification to ensure complete interoperability. This allows the relatively rapid change in technologies and threats associated with the modular MPs to be continuously improved through annual spiral upgrades without major design impacts to seaframes. The result is a program that minimizes the risks of a highly interdependent system of systems by decoupling seaframe procurement from MP procurement, and allows continuous cost efficient delivery of state-of-the-art capability to the warfighter via new MPs upgrades.

As outlined above, the baseline program consisted of limited production of four Flight 0 ships (two of each design), and was modified to two seaframes. LCS 1 and 2 will be used for design stabilization and as data collection assets to facilitate future acquisition decisions. Upon completion of post delivery industrial availabilities and necessary testing and system certification, LCS 1 and 2 will be made available to the Fleet for operational tasking.

Flight 0+ ships will include all existing approved engineering changes and essential redesigns stemming from lessons learned with any current improvements to construction or fabrication procedures. FY 2010 and follow ships are under review.

6. COMPETITION PLAN

The Navy will competitively award a FPIF contract in FY 2008 for a Flight 0+ seaframe, with options for two additional seaframes in FY 2009, in a limited competition for quantity as discussed in Section 4 of this report. Offerors will be tasked and incentivized to use remaining material from the terminated LCS 3 and 4 contracts to the greatest extent possible. Incentive fee criteria will be identified for on, or ahead of, schedule accomplishment of various production and testing accomplishments that support meeting critical ship construction/test events, as well as cost and schedule performance.

7. COST CONTAINMENT STRATEGY

The Navy has worked diligently with both industry teams to identify and evaluate program cost, schedule and technical risk, and the LCS program office is being resourced to provide the required oversight for effective management of the LCS program. After an extensive program assessment, the Navy has developed an executable program plan that adjusts the acquisition profile, ship cost estimates, budgets and schedules, while providing resources for effective management of cost, production and technical risk, to deliver ships to the Fleet to support the urgent warfighting requirement.

The Flight 0+ and follow ships are expected to be competitively awarded using fixed price-type contracts. Configuration baseline stability and minimizing future changes will be fundamental tenants of the program.

A foundation for success for execution of the FY 2008/2009 procurements will be an effective cost and scheduling performance monitoring effort. Earned Value Management (EVM) and the Integrated Baseline Review (IBR) are key tenets of these cost control efforts. These efforts will include the lessons learned from LCS 1-4, and the recommendations of the Naval Inspector General and Naval Audit Service from their reviews during the program assessment in 2007.

EVM is a key integrating process in the management and oversight of acquisition programs, used to monitor performance on cost, schedule, and work scope aspects of contracts. The LCS program continues to implement DoD EVM requirements on applicable contracts, subcontracts and other agreements as prescribed in DoD Instruction 5000.2, the Defense Acquisition Guidebook, and the EVM Implementation Guide. The program continues to improve EVM Systems reporting to better monitor cost and schedule performance of applicable LCS contracts.

Execution Cost Controls

While the elements embedded in the LCS Acquisition Strategy are necessary enablers for effective cost control, effective program management is also critical to achieve successful cost control measures. Since the LCS program review, the following management practices have been improved to better monitor cost performance.

Change Control: Two of the most frequently cited reasons for acquisition cost growth are changing program requirements and Government directed design changes. The LCS program has proactively addressed each of these through continuous efforts to sensitize program stakeholders to the costs of requirements changes. At the same time, flexibility inherent in the modular LCS design provides for evolution of MP requirements without requiring changes to the seaframe.

The LCS program has implemented a disciplined change control process intended to eliminate non-essential design changes and allow only those change proposals that are critical to the success of the program and meet limited criteria for approval. The LCS Configuration Control process manages, controls and documents changes in the configuration of the seaframe. Only those changes due to Government responsible deficiencies meeting the following criteria are considered for implementation on the other seaframe design, as per the December 4, 2006 policy of the Assistant Secretary of the Navy for Research, Development, and Acquisition (ASN RDA) on Acquisition Program Cost Growth; Management of Engineering Change Proposals:

- Safety (personnel or equipment)
- Contractual defects (correction of defective specifications or Government furnished equipment or information)
- Unavailable contractor furnished equipment (CFE) (form, fit, and function replacement of Government specified CFE or components that are no longer available)

- Testing or trial deficiencies
- Affordability (reduced cost or no cost changes)

Program Management Offices: The LCS Program Office (PMS 501) management structure consists of a PM, a Deputy PM and supporting staff with the responsibility, authority and accountability necessary for program execution. As a result of the Navy analysis of cost growth on LCS 1-4, program office staffing has been increased to provide more Government oversight. This includes increases to the Supervisor of Shipbuilding staffs at both building yards where a PM Representative conducts the day-to-day management of seaframe construction. The PM manages cost, schedule and performance objectives and reports regularly to Navy and Defense Department leadership.

Additionally, the PM is supported by the following Integrated Product Teams:

- Life Cycle Cost/Performance
- Acquisition Strategy
- Test and Evaluation
- Critical Technology
- Integrated Logistics Support

8. PROGRAM COSTS

Program Acquisition Cost

The Government Accountability Office (GAO) completed a report on cost growth in Navy shipbuilding programs in February 2005¹, examining causes and mitigation approaches for unplanned increases. One of the principle recommendations of the report was that shipbuilding programs should more fully incorporate risks associated with cost estimates, observing that:

"Navy practices for estimating costs, contracting, and budgeting for ships have resulted in unrealistic funding of programs, increasing the likelihood of cost growth. Despite inherent uncertainties in the ship acquisition process, the Navy does not account for the probability of cost growth when estimating costs."

This GAO report, the root causes and budgeting principles behind it, and the revised LCS Acquisition Strategy informed the development of the current LCS program estimates.

The President's Budget request for FY 2009 LCS program acquisition costs are identified in Table 1. The LCS FY 2009 Budget request includes RDT&E, SCN, O&MN, OPN and WPN funding. RDT&E funds are being used for seaframe system development, MP development and procurement of four MPs, in addition to the procurement of the lead ship from each industry team. SCN funds procure all follow ships. MP procurement subsequent to the first four packages funded using OPN and WPN. Table 1 reflects the acquisition costs for the LCS

¹ Government Accountability Office, "Defense Acquisitions: Improved Management Practices Could Help Minimize Cost Growth in Navy Shipbuilding Programs," GAO-05-183, February 2005.

program with the exception of the costs for Vertical Take Off and Landing Tactical Unmanned Aerial Vehicles and H-60s helicopters that are non-LCS specific assets procured using APN funding managed by the Naval Air Systems Command. Based on the cost growth identified on LCS 1 through 4, and partial termination of LCS 3 and 4, the Navy has developed revised estimates for the program going forward.

The Navy appreciates Congress' consideration of the Navy's request to increase the LCS cost cap from \$220 million to \$460 million end cost, as per Section 125 of the FY 2008 National Defense Authorization Act (Public Law 110-181). However, execution within the cost cap will be a challenge as the initial Navy estimate of \$460 million end cost was predicated on two ships being appropriated in FY 2008. This would have allowed sharing of some program costs between seaframes. The \$460 million estimate was the Navy's most likely estimate for two FY 2008 seaframes. The limitation of Government liability clause, and language prohibiting adjustments to the cost cap for economic inflation, will jeopardize the Navy's ability to award future ships in compliance with the cost cap language as currently proposed.

Table 1: LCS Program Acquisition Costs and Quantities

PB09, \$M	Prior	FY 07	FY 08	FY 09	FY 10	FY 11	FY 12	FY 13	Total

* Funding levels include congressionally approved reprogrammings.

Note 1: Prior Year SCN Quantities do not reflect termination of LCS 3 and LCS 4.

Quantities shown are for LCS seaframes

Operation and Support Cost

The Operation and Support (O&S) cost estimate will be updated in support of Milestone B Program Life Cycle Cost Estimate requirements, prior to FY 2010 procurements. This O&S estimate will capture costs for LCS from delivery until disposal and will be tailored to the specific requirements and estimated LCS operational tempo. Manning will be based on the current manning concept for LCS and estimated by the actual pay grades of the crew. Training costs will include traditional sailor training as well as specific training required for the "Train to Qualify" requirements unique to the LCS operating concept. Additional training, infrastructure and support will be estimated for homeport proficiency training, including LCS Shore Based

trainers for both Flight 0/0+ designs. Maintenance and support infrastructure and recurring costs will include Maritime Support Detachment effort and LCS specific organic, intermediate and depot maintenance level costs. Additional maintenance and support costs to be captured include increased In-Service Engineering Agents (ISEA), Configuration Management and planning costs for dual design (program of record), as well as systems that are not currently in the U.S. Navy inventory.

9. ACQUISITION OF TWO DESIGNS

As planned, and due to the urgent need to fill critical warfighting gaps, the Navy will continue the procurement of Flight 0+ designs in FY 2008 and FY 2009 with a limited competition for quantity between the two incumbent suppliers.

The Navy has performed an assessment of the cost implications associated with continuing to carry two designs forward or down-selecting to one design. This assessment included acquisition costs as well as costs associated with manpower, training, fuel, maintenance, configuration management, planning and engineering, supply support, and other factors.

For O&S costs, the potential trade space is about 35 percent of total life cycle costs, with only a portion of these costs impacted by a single design. The majority of O&S cost – fuel (40 percent), ship maintenance (25 percent) and manning (25 percent) – will be minimally affected by dual, versus single, design.

- Fuel costs depend on the ship efficiency and not the number of different variants in operation.
- Likewise with manning costs, both designs will be operated with a 40 person crew (four crews to three ships) regardless of the number of designs in the fleet.

The potential savings, i.e. the trade space, results from the training, configuration management and ISEA/industry support required for both designs.

- Configuration management costs are included in all maintenance and support costs (estimated per ship per year) to track, trace and manage parts and repairs.
- Training savings will come from the infrastructure and support of the training pipe-lines, which are dependent on the number of designs.
- Similarly, ISEA/industry and maintenance planning are estimated by design per year.

However, should the Navy eventually down-select to one design and the unique ships are kept in the U.S. Navy inventory, these training and ISEA/industry costs will still be required to support both designs in the Fleet.

Overall, the areas that are impacted by supporting multiple designs account for 10 percent of the total O&S cost. Removing the losing design from the Navy inventory after a potential future downselect can achieve potential O&S savings of approximately six percent. However, if the unique design ships are replaced through additional future acquisition of the down-selected seaframe to maintain overall force structure quantities, then the best case scenario (earliest implementation) provides only a break even result on total life cycle costs due to the additional procurement cost.

Acquisition strategies for FY 2010 and outyear ships are under Navy review. OSD will conduct a Milestone B prior to FY 2010 procurement. The Navy and OSD will consider the questions of downselecting seaframes (or not) and the transition to full and open competition (or not) as part of the FY 2010 acquisition strategy deliberations. Any such decisions will consider the latest estimates of life cycle costs, including both procurement costs (including consideration of competitive options) and operation and support costs. Operational requirements and assessments of operational effectiveness, as demonstrated by LCS 1 and 2, would also be a key consideration of future decisions.

10. CONCLUSION

To date, the LCS program has proven to be both revolutionary in design and acquisition approach, yet has faced challenges typical in the procurement of a new class of ships. As the program moves forward into production of the Flight 0+ designs, it is anticipated that risks inherent to first-of-class shipbuilding programs will diminish. The revised and now approved LCS Acquisition Strategy incorporates lessons learned and is based on competition, fixed-price contract awards, configuration control and program stability. FY 2010 and outyear LCS acquisition will be determined at Milestone B, which will be conducted prior to FY 2010 procurements.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

July 13, 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

This letter provides the Department of the Navy response regarding military to civilian conversions within the Navy Medical Department as required by the Fiscal Year (FY) 2007 National Defense Authorization Act (Public Law 109-364, Section 742). As required by law, detailed reports of the 215 billets converted to civilian positions in FY 2006, 689 billets programmed for conversion in FY 2007 and 1,036 billets programmed for conversion in FY 2008 are enclosed.

Based on our cost, quality and access experience with FY 2005 and FY 2006 conversions to date, I recertify that the FY 2006 conversions did not increase cost while access and quality were maintained.

Based on our current analysis of fully burdened governmental personnel costs, I certify that 559 of the 689 FY 2007 and 791 of the 1,036 FY 2008 military positions programmed for conversion are achievable without increasing cost or decreasing access and quality. We will continue to evaluate the remaining 130 conversions for FY 2007 and the remaining 245 conversions for FY 2008 to determine if they will be cost effective or impact access and quality of care.

Consistent with the requirements of the FY 2006 National Defense Authorization Act (Section 744) and FY 2007 National Defense Authorization Act (Section 742), 130 FY 2007 military positions and, if necessary, 245 FY 2008 military positions will be restored as expeditiously as possible.

I will continue to monitor these conversions and will promptly notify you should any of this information change. A similar letter has been sent to Chairman Skelton. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Winter".

CONGRESSIONAL RESPONSE.....	1
Process.....	1
Baseloading and Unit Overview.....	1
Military Construction Plan.....	5

REQUIREMENT

The Conference report (Report 110-107) to accompany H.R. 1591 requires the Secretary of Defense to provide Congress a detailed stationing plan on the Marine Corps' Grow the Force initiative prior to the obligation and expenditure of \$324.3 million of funds made available under the heading Military Construction, Navy and Marine Corps to include the following for the entire 27,000-Marine increase:

1. The new units to be created and the number of Marines in each such unit.
2. The specific increases in the number of Marines to existing units.
3. The installations where each new unit or augmented unit will be located.
4. The estimated dates of initial operational capability and full operational capability of each new unit.
5. The types of temporary and permanent facilities required (including family housing) and the estimated cost.
6. Any other pertinent information.

BACKGROUND

Upon reexamination of the Marine Corps' structure and manning relative to its expected long term mission needs, President Bush approved a permanent end strength increase of 27,000 Marines, from the base of 175,000 to 202,000 Marines. This increase will enhance the capability of the Marine Corps to conduct the full spectrum of contingency operations from warfare to military operations other than war, improve the posture of the Marine Corps forces for the Long War, and relieve strain on those superb Americans who have volunteered to fight the Nation's battles. The additional end strength will result in the equivalent capability of three, fully effective Marine Expeditionary Forces (MEFs) to meet the Nation's demand for the Marine Corps "to be most ready when the Nation is least ready." The target date for achieving this end strength is FY 2011.

To ensure that these Marines have adequate facilities in which to live and work, the President's FY 2007 Supplemental request included \$324 million to accomplish critical path infrastructure projects. This effort is continued with the President's FY 2008 Global War on Terror (GWOT) request of \$169 million and the President's FY 2008 budget request of \$605 million. In all, it is estimated that the infrastructure requirement to support the President's directive will total \$7.0 billion, including military construction, family housing, and the acquisition of temporary facilities. The balance of these projects will be aggressively programmed in future years to support the FY 2011 target date for a Corps of 202,000 Marines.

On September 11, 2001 the Marine Corps' permanent end strength was 172,600. This was increased to 175,000 in FY 2003 to support the Global War on Terror and establishment of the 4th Marine Expeditionary Brigade / Anti-Terrorism Battalion. In FY 2004, the Marine Corps procured facilities and a partial table of equipment for two additional infantry battalions (1/9 and 2/9), however the end strength associated with 1/9 and 2/9 was not realized due to the establishment of the Marine Special Operations Command (MARSOC) in FY 2005, as directed by the Secretary of Defense. The force structure changes for MARSOC were achieved within the then permanent force level of 175,000 Marines through the reduction of lower priority units, to include 1/9 and 2/9, and the elimination of functions that were no longer required or could be accomplished by civilians or contractors. The end strength associated with 1/9 and 2/9 has been included in the 27,000 increase.

CONGRESSIONAL RESPONSE

Process

The Marine Corps' force structure requirements for 27,000 additional Marines were developed through a structured planning process to examine Marine Corps capabilities and capacities to support the Combatant Commanders and balance our Marine Air Ground Task Forces in order to be postured for the future. The planning process addresses Doctrine, Organization, Training, Materiel, Leadership and Education, Personnel and Facilities (DOTMLPF) resulting in the identification of specific units, locations and operational capability required over the next four years.

Subsequent to the President's January 2007 announcement of an increase of 27,000 Marines, the DOTMLPF group continued to meet through Spring 2007 in order to further refine the Marine Corps' future requirements and planning. The results of the DOTMLPF are reflected in the Future Requirements section of this report, but do not impact either the enacted FY GWOT Supplemental or the FY 2008 President's budget request.

Baseloading and Unit Overview

Table 1-1 summarizes the end strength increase by base over time. Tables 1-2 and 1-3 provide unit level detail. Table 1-2 identifies existing units and their locations, the number of Marines that will augment these units, and the dates these units will be augmented. Table 1-3 identifies new units, their locations, the number of Marines to be employed by these units and their estimated Initial Operational Capability (IOC) and Full Operational Capability (FOC) dates.

Military Construction Plan

FACILITIES PROJECTS

Permanent facilities, facility planning and design, and site preparation for the 27,000 end strength increase were included in the FY 2007 and FY 2008 GWOT requests, as well as the FY 2008 President's Budget request.

Table 2-1, 2-2, and 2-3 identify the permanent facilities and site preparation efforts associated with the end strength increase in FY 2007 and FY 2008. Funds were also requested in the FY 2008 President's Budget for the procurement of temporary facilities that will be used as temporary shelters until completion of permanent facilities (\$147 million). Temporary facilities are discussed separately below.

Table 2-3 FY08 Baseline Budget

TEMPORARY RELOCATABLE FACILITIES

The Marine Corps will procure approximately 1,500 temporary, relocatable facilities, with the majority located at Camp Pendleton (469), Camp Lejeune (300), and Twentynine Palms (446). Relocatable facilities include pre-engineered buildings, sprung shelters (large span tents), and trailers. Operational units (armory, maintenance, storage, etc) will be housed primarily in pre-engineered buildings and sprung shelters. Headquarters elements and classroom training units will be housed in trailers. Bachelor berthing needs will be met using existing barracks and waiving assignment policy standards until permanent facilities are completed. Trailers may be used for berthing on a case-by-case basis.

FUTURE REQUIREMENTS

Military construction will be required in FY 2009 and beyond to continue preparing the bases for the ramp-up of additional personnel. Facilities constructed in FY 2007 through FY 2009 are National Environmental Policy Act (NEPA) compliant. Those permanent facilities and infrastructure projects that are contingent upon the completion of any NEPA efforts are planned to begin in FY 2010. Table 3-1 below reflects requirements planning in FY 2009 and beyond to complete construction for the entire 27,000 end strength ramp-up.

FUTURE REQUIREMENTS (\$ millions)

Administrative Buildings	1,036.6
Airfield Pavements	75.8

SECRETARY OF DEFENSE
1000 DEFENSE PENTAGON
WASHINGTON, DC 20301-1000

SN

DEC 8 2006

The Honorable John Warner
Chairman
Committee on Armed Services
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

Section 1011 of the John Warner National Defense Authorization Act for Fiscal Year 2007 requires that I evaluate the feasibility of **transferring** custody and control of USS JOHN F KENNEDY (CV 67) to either the Department of Homeland Security or the North Atlantic Treaty Organization. The same provision also requires that, before retiring the ship, I certify to the Committees on Armed Services of the Senate and the House of Representatives that neither of the aforementioned organizations desire to maintain and operate the ship.

In the enclosed letters, the Secretary of Homeland Security and the Supreme Allied Commander Europe declined my offer to maintain and operate the ship. Therefore, I have directed the Secretary of the Navy to begin the decommissioning process for USS JOHN F KENNEDY (CV 67).

A similar letter has been sent to Chairman Hunter of the House Armed Services Committee.

Sincerely,

cc:

The Honorable Carl Levin
Ranking Member

Enclosure:

November 2, 2006

The Honorable Donhld Rumsfeld
Secretary of Defense
Washington, D.C. 20301

Dear Mr. Secretary:

Thank you for your October **13, 2006** letter regarding the feasibility of maintaining the USS **JOHN F. KENNEDY** (CV 67) in **an** operational status by transferring **custody** and control to the Department of Homeland Security.

Given the current mission profiles and needs of our operations components, **we feel that** the projected expenditure required to maintain and operate **the** subject vessel would **not be** a sound investment the Department of Homeland Security. As such, the Department of Homeland Security is unable to assume control and custody of the vessel.

Sincerely,

A handwritten signature in black ink, appearing to read "Michael Chertoff", written over a horizontal line.

Michael Chertoff

SUPREME ALLIED COMMANDER **EUROPE**
SHAPE, BELGIUM

10 November 2006

The Honorable Mr. Donald H. Rumsfeld
Secretary of Defence
The Pentagon
Washington D.C. 20520

Dear Secretary Rumsfeld

Your letter of 13 October 2006 requested that we consider **the transfer of custody** and control of **USS John F. Kennedy (CV 67)** from the United States to NATO.

The NATO method of sourcing naval force requirements is to call on member nations to provide units on either a temporary basis to meet short-term requirements or to provide units on a rotational basis to meet **its long-term** (standing) requirements. The current NATO standing maritime force requirement does not include a requirement for an aircraft carrier.

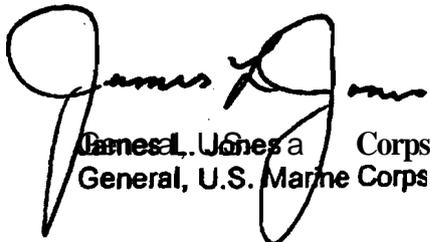

While the NATO Response Force 7-8 Combined Joint Statement of Requirements dated 1 March 2005 does state a requirement for an aircraft carrier with organic fixed wing assets and the capacity to act as a command platform, this requirement is temporary in nature and will end **when the asset** is no longer required for the contingency.

There is no known requirement or intention **for** the alliance to operate an **aircraft** carrier on a permanent long-term basis. We do not have the infrastructure to man, train **and** equip a force **structure** element outside of national organizations.

Additionally, there is the **practical** issue of affordability. Within NATO, there is no method to fund NATO force **structure** outside of national force contributions.

It is my judgment that there is no military requirement for accepting this kind offer.

Very respectfully

James L. Jones a Corps
General, U.S. Marine Corps

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

ACTION MEMO

November 21, 2006

FOR: SECRETARY OF DEFENSE

FROM: Donald C. Winter, Secretary of the Navy

SUBJECT: USS JOHN F KENNEDY Coordination Letters

- FY 2007 National Defense Authorization Act (NDAA) language, TAB 1, requires that DoD evaluate the feasibility of maintaining USS John F Kennedy in an operational status by transferring custody and control to the Department of Homeland Defense or the North Atlantic Treaty Organization (NATO)

TAB 2 and TAB 3 are letters from the Secretary of the Department of Homeland Security (DHS) and the Supreme Allied Commander Europe, both declining control and custody of JFK.

- As required by the FY 2007 NDAA, TAB 4 contains letters from SECDEF notifying the chairmen of the Senate and House Armed Services Committees that DHS and the Supreme Allied Commander Europe declined the offer to accept control of custody of the JFK and the Department's intent to initiate the immediate decommissioning of the JFK.

RECOMMENDATION: SECDEF sign letters at TAB 4.

COORDINATION: ~~None~~ TAB 5

WASHINGTON, D.C. 20350-1000

OCT 30 2006

The Honorable Kay Bailey Hutchison
Chairman, Subcommittee on Military Construction
and Veterans Affairs
Committee on Appropriations
United States Senate
Washington, DC 20510

Dear Madam Chairman:

House Report 109-95, accompanying the Fiscal Year 2006 Military Quality of Life and Veterans Affairs, and Related Agencies Appropriations Bill, directs the Department to report quarterly on the details of any new or renewal family housing domestic lease entered into during the previous quarter which exceeds \$15,000 per year.

The attached report is submitted for twenty-three Navy family housing high cost leases executed during the fourth quarter of fiscal year 2006. The twenty-three leases were for Navy recruiters outside the commuting zone of military installations. The U.S. Army Corps of Engineers (USACE) executed these leases. The USACE Districts certified that there were no other suitable housing units available to lease at a lower cost.

A similar letter has been sent to the Chairman of the House Appropriations Subcommittee on Military Quality of Life and Veterans Affairs. As always, please let me know if I can be of further assistance.

Sincerely,

Wayne Army
Deputy Assistant Secretary

NOV 20 2007

The Honorable Chet Edwards
Chairman, Subcommittee on Military Quality of Life,
Veterans Affairs, and Related Agencies
Committee on Appropriations
United States House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

House Report 109-95, accompanying the Fiscal Year 2006 Military Construction Appropriations Bill, directs the Department to report quarterly on the details of any new or renewal family housing domestic lease entered into during the previous quarter which exceeds \$15,000 per year.

The attached report is submitted for eighteen Navy family high cost leases executed during the third quarter of fiscal year 2007. The leases were for Navy recruiters outside the commuting zone of military installations. The U.S. Army Corps of Engineers (USACE) executed these leases. The USACE District certified that there were no other suitable housing units available to lease at a lower cost.

A similar letter has been sent to the Senate Appropriations Subcommittee on Military Construction, Veterans Affairs, and Related Agencies. As always, please let me know if I can be of further assistance.

Sincerely,

A handwritten signature in black ink, appearing to read "Wayne Army", written over a horizontal line.

REPORT TO CONGRESS
METHODOLOGY TO CERTIFY MEDICAL MILITARY TO
CIVILIAN CONVERSIONS FOR FISCAL YEAR 2006

PREPARED BY
Bureau of Medicine and Surgery, Department of the Navy
2300 E Street, NW, Washington, DC 20372-5300

July 10, 2007

Report Requirement

Fiscal Year (FY) 2007 National Defense Authorization Act (P.L. 109-364, Sec 742) requires resubmission of certification required by Section 744 of the Fiscal Year 2006 Defense Authorization Act, Public Law 109- 163 which prohibits the Secretaries of the military departments from converting any military medical or dental position to a civilian medical or dental position until the Secretary submits to the Committees on Armed Services of the Senate and the House of Representatives a certification that the conversions within that department will not increase cost or decrease quality of care or access to care. It also

directed a report with the certification:

“Report with certification-A Secretary submitting such a certification shall include with the certification a written report that includes-

- (A) the methodology used by the Secretary in making the determinations necessary for the certification, including the merit to which the Secretary took into consideration the findings of the Comptroller General in the report under subsection (b)(3);
- (B) the results of a market survey in each affected area of the availability of civilian and dental care providers in such area in order to determine whether the civilian medical and dental care providers available in such area are adequate to fill the civilian positions created by the conversion of military medical and dental positions to civilian positions in such area; and
- (C) any action taken by the Secretary in response to recommendations in the Comptroller General report under subsection (b)(3)”.

The methodology and action taken in response to Comptroller General recommendations will be discussed as they pertain to the Secretary of the Navy certification concerning cost, quality of care, and access to care. The Market Survey requirement is discussed at the end of this report.

Cost

Summary

Medical military to civilian conversions will not increase cost to the Department of the Navy. The amount of funding received for FY06 for the FY05 conversions and for the FY 06 conversions is currently adequate to fund the civilian hires.

Methodology

FY05 Conversions

Navy compared the amount of funding received versus the amount of budgeted dollars required to hire all necessary and requested civilian personnel. PB05 provided the Navy Defense Health Program (DHP) an annualized Operations and Maintenance amount of \$148.3M (FY06 dollars). In comparison, Navy Military Treatment Facilities (MTFs) who had military conversions initially requested a total of \$82M to hire 1,225 specific Federal civilian and contractor positions based on multiple levels of analysis. The \$82M was calculated by costing out the specific wage grade, by geographical location, of all MTF requested Federal civilians and various salary surveys for contractors. The comparison between the amount received and the amount required was duplicated for all outyears.

FY06 Conversions.

Navy used a similar comparison methodology for FY06 conversions. However, the amount of funding received was based on the Military Personnel Appropriation program rates (programming rates) allocated to the Assistant Secretary of Defense (Health Affairs) for

Navy military positions.

GAO Report

General Accounting Office (GAO) report (GAO-06-642) stipulates that it is “unknown whether the conversion of military health care positions to civilian conversions will ultimately increase or decrease costs for DoD” because actual civilian hire costs are unknown and the military personnel programming rates “do not include the full compensation costs for military personnel.” Because of these findings, GAO recommended that the Secretary of Defense direct the Service Secretaries to take two actions.

Recommendation 1

“Coordinate the development of their (Services) Congressional certifications for military health care conversions with the Office of Program Analysis and Evaluation (PA&E) in order to consider the full cost for military personnel and for federal civilian or contract replacement personnel in assessing whether anticipated costs to hire federal civilian or contract replacement personnel will increase costs to DoD for defense health care.”

Navy comments on Recommendation 1

PA&E’s analysis generates a higher average cost per military member than that reflected in the programming rates. PA&E’s analysis adds several items of personnel cost that, although part of the total government cost, are not included in the programming rates. Navy is able to certify for FY06 using the current programming rates. The Deputy Secretary of Defense memorandum of 22 June 06 on Managing Military Personnel Resources in the Defense Health Program and Special Operations Command mandates that future transfer of funds be based on the annual DoD Composite Rate, unless negotiated differently between ASD (HA) and the military departments. Certification based on the PA&E data is therefore not necessary.

Recommendation 2

“Address in their (Services) Congressional certification for military health care conversions the extent to which total projected costs for hiring Federal civilian or contract personnel include actual compensation costs for completed hires and anticipated compensation for future hires.”

Navy comments on Recommendation 2

The \$82M allocated to hire FY05 conversion civilian personnel was determined by applying budgeted, vice actual, funding required. Actual funding amounts were not used for several reasons: First, all FY05 civilian conversions hires would have to be complete to determine actual amounts; second, actual amounts will vary slightly (upward or downward) by the number of hours an individual works and any special pays they may receive; and, third, the amount of funding required to hire civilian personnel is determined prior to actual hiring in accordance with normal budgeting practices. The budgeting process determines the amount of funding required.

Quality of Care

Summary

Navy Medicine demands the same quality of care standards from all employees, including new military to civilian conversion hires, regardless of human resource category (military, Federal civilian, or contractor). No decrease in quality of care has occurred due to military to civilian conversions.

Methodology

Navy has multiple processes and performance measures to ensure high quality healthcare is being delivered. However, in order to obtain individual position level information the methodology for certification focused on ensuring that the hiring process of Federal civilians or contractors provided the appropriate quality level required.

Federal civilian hiring process

In order to ensure that the federal civilian recruitment process meets the quantitative and qualitative hiring needs of the activity, a three-step process is used. Specifically,

1. The Navy's Federal civilian recruitment process responds to the demand signal provided by an activity to hire a federal civilian with certain predetermined criteria (knowledge, skills, and abilities). This process ensures the appropriate experience and education requirements are met to ensure the minimum qualifications and the proper grading of the position. This process creates a pool of potential applicants. The pool then is referred to the selecting official of the activity requesting the recruitment action.
2. The activity interviews the pool of candidates and either makes a selection based on predetermined criteria or not. If selecting officials question or are dissatisfied with the qualifications or quality of specific applicants the selecting officials are encouraged to discuss these concerns with their human resource advisors. When concerns are raised, additional reviews are conducted prior to making a job offer would be made.
3. Credentialing and Privileging

Once the selecting officials tender an offer the candidate is required to meet the condition of the Bureau of Medicine and Surgery (BUMED) Instruction 6320.66D entitled "Credentials Review and Privileging Program". The Credentialing Review and Privileging program does not differentiate between active duty, federal civilian, or contractor. The BUMED instruction references DoD directive 6025.13, entitled "Medical Quality Assurance (MQA) in the Military Health System (MHS)". Neither the BUMED nor DoD instruction differentiates between active duty and civilian (federal civilian or contractors) personnel.

Contractor hiring process

Contract personnel hired are required to meet the same quality standards as other personnel. Credentialing and privileging of contractors use the same process as that is used for Federal civilians.

Verification

Navy officials, working with GAO, used Naval Medical Center, Portsmouth, Virginia as a sample to verify that conversion hired healthcare providers met the necessary quality standards. The examination of providers found that all necessary credentialing and privileging documentation had been completed and the necessary queries of the National Practitioner Data Bank found no adverse information.

Access to Care

Summary

Navy is not able to attribute or correlate any access increases or decreases in either the direct or purchased care (TRICARE (DoD's Tri-Service managed care program) network) system to any one specific reason, including conversions, due to the multiple factors that influence both supply and demand within the military health care system.

The supply of active duty available providers and support staff depends on the number of

authorized billets, Navy's personnel distribution system filling authorized billets, current retention rates, Combatant Commander and Department of Navy required deployments, and the economics of delivery of health care within the direct care system versus the purchased care system.

The supply of Federal civilian and contract providers is dependent upon manning requirements, funding availability, and labor market forces. The demand for care in the direct care system is dependent on operational tempo, the size of the beneficiary population, seasonality of use, and the population's associated health care requirements. The availability of network providers and the geographical location of beneficiaries are also factors.

Methodology

Direct Care

Navy performed a comprehensive review of access to care metrics within the Continental United States (CONUS) direct care system by examining the percent of appointments meeting access standards and the average days to get an appointment (versus the TRICARE access standard). The data included all primary care appointment types (acute, routine, specialty, and wellness) within CONUS activities since (a) the majority of military provider billets converted were primary care based, (b) conversion hiring occurred at CONUS MTFs, and (c) there were no inpatient specific specialty conversions. A longitudinal study from August 2003 - September 2006 was undertaken to measure any variation in the defined categories. The conclusion is that appointments continue to be made within the TRICARE Access Standards.

Purchased Care

Navy reviewed Purchased Care metrics on a longitudinal basis from October 2002 - September 2006. The data examined included CONUS Navy-wide inpatient and outpatient purchased care. Inpatient purchased care, measured by Relative Weighted Product (RWP), climbed steadily since 2003, with no appreciable increase when military to civilian conversions began. Outpatient purchased care, measured by Relative Value Unit (RVU), varied over the three fiscal years with no discernable link to military to civilian conversions. Comment on GAO Report does not provide any specific recommendations on Access to Care metrics. Navy concurs with report and findings.

Results of Market Survey

Summary

Navy medicine received an initial market availability analysis conducted by the Center for Naval Analyses, and subsequently completed two full analyses by local Military Treatment Facilities, Navy Medicine Regional Commands and the Bureau of Medicine and Surgery to determine the initial availability of civilian personnel. Converting military positions, eliminating billets and moving military personnel through permanent change of station (PCS) orders began 15 months prior to the passage of the FY 2006 National Defense Authorization Act.

REPORT TO CONGRESS
METHODOLOGY TO CERTIFY MEDICAL MILITARY TO
CIVILIAN CONVERSIONS FOR FISCAL YEAR 2007

PREPARED BY
Bureau of Medicine and Surgery, Department of the Navy
2300 E Street, NW, Washington, DC 20372-5300

July 2007

Report Requirement

Under the guidelines of Section 742 of the Fiscal Year 2007 Defense Authorization Act, Public Law 109- 364, the Secretary of the Navy submits the following report addressing the FY 2007 medical military to civilian conversions.

The report includes the following sections:

- A. The methodology used in making determinations
- B. The number of positions planned for conversion
- C. The results of a market survey by area and availability of providers
- D. An analysis of direct and purchased care
- E. The effect of conversions upon recruiting and retention
- F. The comparison of full costs of conversions
- G. The effect of conversions upon readiness
- H. Positions scheduled to be converted in FY08
- I. Conclusions

A. Methodology

The methodology in making the determination necessary for certification begins with review of military requirements. The Operational Support Algorithm (OSA) (Figure 1) determines military essentiality and the ultimate demand signal for our uniformed medical force. There are three components to the algorithm:

(1) Daily Operational Support: medical personnel who are organic to and a daily part of the command structures of the Fleet and FMF

(2) Surge personnel: dual use personnel required to augment deploying force, working in our Force Projection Platforms, i.e. Hospitals and Clinics who augment Marine Corps units, EMF's, T-AH, casualty receiving ships and serve as our Individual Augment manpower pool

(3) Force sustainment: personnel required to insure that we are acquiring and training the requisite specialty inventories for an adequately sized and clinically proficient medical force.

Billets, not included in the requirements defined by the OSA, were reviewed by the Center for Naval Analyses (CNA). CNA validated that the billets were not contained within the OSA and further identified which billets were most cost effective for conversion.

Meeting Operational Capability

Operational Support Algorithm (Tri-Service/OSD Validated)

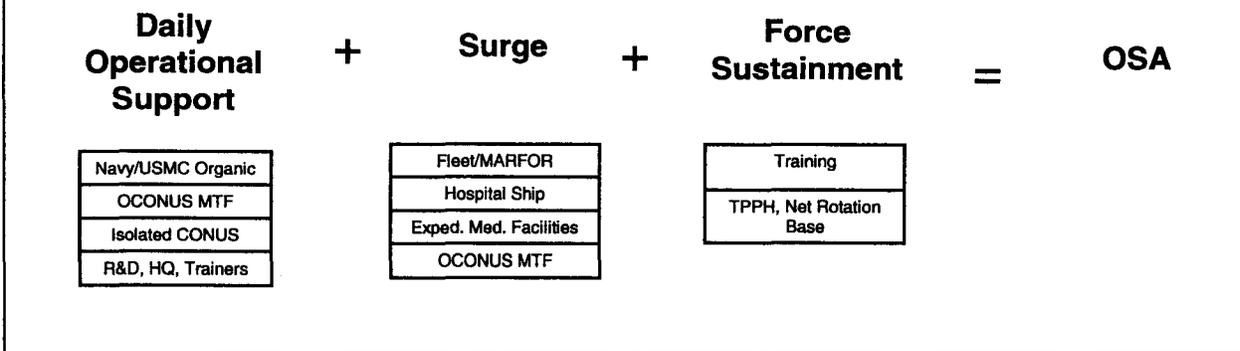

Figure 1: Operational Support Algorithm Diagram

Those billets identified by CNA for possible conversion were forwarded to the affected commands to review their affordability, hireability, and availability. After reviewing business plans and hiring projections, Medical Commanders recommended modifications. This process is ongoing and allows commands to have an active role in determining what type of civilian positions to hire. Additionally, for those billets identified for FY 07 and FY 08 we employed an outside contractor, Altarum, to perform a market survey in affected areas to determine availability and to compare full costs in those areas for the planned conversions.

B. Number of billets planned for conversion

In FY 07, the total number of planned conversions is 689 positions. These planned conversions include 33 Dental Corps Officers, 14 Medical Service Corps Officers, 10 Nurse Corps Officers, and 632 enlisted members. Table 1 displays the breakdown of officers by designator and rank. Table 2 displays the breakdown of enlisted by rating and rank.

Table 1. Officer Distribution by Corps and Grade for FY 07

CORPS	Captain O-6	Commander O-5	Lieutenant Commander O-4	Lieutenant O-3	Lieutenant Junior grade O-2	Ensign O-1	Grand Total
Dental Corps	9	6	9	9			33
Medical Service Corps		1	2	11			14
Nurse Corps				5	3	2	10
Grand Total	9	7	11	25	3	2	57

Table 2. Enlisted Billets Converted by Rating and Rank for FY 07

ENLISTED RATE	E-3	E-4	E-5	E-6	E-7	E-8	Grand Total
Culinary Specialist			1				1
Dentalman	64						64
Dental Tech		21	12	3			36
Hospital Corpsman		140	92	43	15	1	291
Hospitalman	233						233
Master at Arms		6	1				7
Grand Total	297	167	106	46	15	1	632
The Dental Technician and Hospital Corpsman ratings merged after the military to civilian conversion process							

C. Marketing Survey and Availability Analysis

Navy Medicine relied upon an analysis conducted by an outside contractor to project market availability of civilian medical and dental care providers by locality (zip code) and to estimate the full cost of replacing military personnel with civilians or contractors. This model incorporated market constraints based on the Bureau of Labor and Statistics, Salary.com and other external data to identify the ratio of specialties/technicians per 100,000 population in a market and corresponding salaries. Using this calculated ratio to predict constrained areas and forecast the potential costs of hiring a civilian or contractor, the model identified those FY 07 billets in moderate or highly constrained markets.

The market analysis uses the Annual DoD Composite Rate for military positions selected for conversion and examines the market availability in the area where the position is located. The model estimates full costs for civilian positions (including costs associated with recruiting, salary benefits, training and other costs) through a 25% increase over the civilian rate. The model projects that 420 of the 689 projected FY 07 conversions will be challenging, but attainable. Tables 3 through 5 display a sampling of hiring success rates by job title and fiscal year, for previous conversions.

Table 3. Navy Medicine's Hiring Statistics of FY 05 Conversions

TITLE	SERIES	BUDGETED HIRES	HIRES (BUDGETED)	non-HIRES (BUDGETED)	SUCCESS RATE (%)

Using the model to evaluate the availability of civilian specialties for FY07, those specialties identified as highly constrained (specialties experiencing shortages in specific medical labor markets) were identified. Pairing this data with the experiential hiring data in Table 5, 130 positions (19%) were identified as high risk for conversion based on personnel costs and/or the availability of the skill set in the civilian market. Table 6 summarizes these billets by medical specialty. Appendix A is a detailed billet list of these positions. Appendix B lists those billets where the risk is considered low to moderate for conversion.

D. Access, Quality and Cost in the Direct and Purchased Care Systems

Direct Care

1. The availability of staff directly correlates with cost and access. The total supply of available active duty providers and support staff depends upon the number of authorized billets, which include the billets required for readiness and those used in training programs and day-to-day operations as defined by the OSA model. The supply of Federal civilian and contract providers is dependent upon manning authorizations, funding availability and labor market forces. The demand for healthcare in the direct care system is dependent on the size of the military force, the local beneficiary population, seasonality of use, and the population's health status.

A comprehensive review of access to care within the Continental United States (CONUS) direct care system, examined the percent of appointments meeting access standards and the average days to get an appointment. The data included all primary care appointment types (acute, routine, specialty, and wellness) within CONUS activities since (a) the majority of military provider billets converted were primary care based, (b) conversion hiring occurred at CONUS MTFs, and (c) there were no inpatient specific specialty conversions. A longitudinal study from August 2003 through September 2006 searched for any variation in the defined categories.

Results of the comprehensive review conclude that appointments continue to be within the TRICARE Access Standards.

Purchased Care

2. The availability of network providers and the geographical location of beneficiaries are factors affecting both cost and access of purchased care.

TRICARE beneficiaries enrolled in TRICARE Prime are guaranteed access to care in accordance with established access standards. Military medicine is required to refer beneficiaries into the managed care support network if the wait time in the direct care system exceeds these standards. Navy reviewed Purchased Care metrics on a longitudinal basis from October 2002 - September 2006. The data examined included CONUS Navy-wide inpatient and outpatient purchased care. Inpatient purchased care, measured by Relative Weighted Product (RWP), climbed steadily since 2003, with no appreciable increase when military to civilian conversions began. Outpatient purchased care, measured by Relative Value Unit (RVU), varied over the three fiscal years with no discernable link to military to civilian conversions.

The planned military to civilian conversions to date have not had a measurable impact upon purchased care from the network or access to care. The challenge remains to ensure the 7,790 conversions and 901 divestitures between 2005 and 2013 coupled with the current efforts to fill direct care systems in a highly competitive medical marketplace do not decrease access to care in the direct care system, force care to the

network or increase the cost of healthcare. Table 7 describes the projected conversions and divestitures for FY 2005 – FY 2013.

Table 7. Projected Conversions and Divestitures for FY 2005 – FY 2013

FY	POM 06 Conversions	PDM IV Conversions	Total Conversions	PDM IV Divestitures	Total Active Duty Conversions or Divestitures
2005	1772*	0	1772	0	1772

2013	0	672	672	50	722
Total	5425	2365	7790	901	8691

Quality of Care

Navy Medicine demands the same quality of care standards from all employees, including new military to civilian conversion hires, regardless of human resource category (military, Federal civilian, or contractor). No decrease in quality of care has been noted due to military to civilian conversions.

Navy has multiple processes and performance measures to ensure high quality healthcare is being delivered. However, in order to obtain individual position level information the methodology for certification focused on ensuring that the hiring process of Federal civilians or contractors provided the appropriate quality level required.

In order to ensure that the federal civilian recruitment process meets the quantitative and qualitative hiring needs of the activity, a three-step process is used. Specifically,

1. The Navy's Federal civilian recruitment process responds to the demand signal provided by an activity to hire a federal civilian with certain predetermined criteria (knowledge, skills, and abilities). This process ensures the appropriate experience and education requirements are met to ensure the minimum qualifications and the proper grading of the position. This process creates a pool of potential applicants. The pool then is referred to the selecting official of the activity requesting the recruitment action.
2. The activity interviews the pool of candidates and either makes a selection based on predetermined criteria or not. If selecting officials question or are dissatisfied with the qualifications or quality of specific applicants the selecting officials are encouraged to discuss these concerns with their human resource advisors. When concerns are raised,

additional reviews are conducted prior to making a job offer.

3. Credentialing and Privileging

Once the selecting officials tender an offer the candidate is required to meet the condition of the Bureau of Medicine and Surgery (BUMED) Instruction 6320.66D entitled "Credentials Review and Privileging Program". The Credentialing Review and Privileging program does not differentiate between active duty, federal civilian, or contractor. The BUMED instruction references DoD directive 6025.13, entitled "Medical Quality Assurance (MQA) in the Military Health System (MHS)". Neither the BUMED nor DoD instruction differentiates between active duty and civilian (federal civilian or contractors) personnel.

Contractor hiring process

Contract personnel hired are required to meet the same quality standards as other personnel. Credentialing and privileging of contractors use the same process as that is used for Federal civilians.

E. Recruiting and Retention

There is no apparent adverse effect on recruiting and retention at this time. Applicants to direct accession programs are fully trained professionals seeking to join the Navy Medicine team. In most cases, direct accession applicants are looking at the military as a long-term career, so during interviews this subject is mentioned and discussed, thus causing some concern for these applicants; however, there has been little indication that military to civilian conversions have deterred a direct accession applicant's or scholarship applicant's desire to join the Navy.

Losses in Navy Medicine active duty personnel have exceeded gains for some specialties affected by military to civilian conversions. Anecdotally, some medical officers have elected to retire and accept military to civilian conversion positions. In a few specialties, some officers view additional military to civilian conversions as jeopardizing their career potential and have made the decision to leave prior to the 10-year active duty mark. Despite these findings, the military to civilian conversions have had a minimal impact on retention to date.

F. Estimated Cost

The current cost of the 689 billets identified for conversion in FY 07 based on the "fully burdened" (total cost to the Government) cost methodology is \$59M. The estimated cost of the FY 07 conversions based on the Altarum model is \$55M for Government Service civilians and contractors.

The challenge remains to manage and sustain the hiring of healthcare professions such as specialized physicians, dentists, pharmacists, nurses, other providers and various

medical technicians where supply is projected to remain steady or grow at a slower rate than demand within planned budget and civilian pay authority.

G. Readiness

As discussed earlier, the military billets selected for conversion were above the operational requirement identified by the OSA model and validated by the CNA Corporation. The OSA model does not take into account all missions Navy Medicine is directed to accomplish and this omission is creating a stress on the direct care system. Increasing shortages caused by the inability to hire health professionals and additional cuts will cause an increased migration to the private sector care. Shifting more care to the network will increase the overall cost of military healthcare. Sustainment of the deployment tempo in current GWOT operations will be challenging over time, particularly as an increasing number of Individual Augmentation requirements are filled by Navy Medicine.

H. Identification of conversions

Appendix C is a detailed table of the individual military billets to be converted in FY08, including the location of each position and local availability for hire. Table 8 displays the breakdown of officers by designator and rank. Table 9 displays the breakdown of enlisted by rating and rank.

Table 8. Officer Billets Converted by Designator and Rank for FY 08

CORPS	Captain O-6	Commander O-5	Lieutenant Commander O-4	Lieutenant O-3	Lieutenant Junior grade O-2	Ensign O-1	Grand Total
General Medical Department Officer (2XXX)	1	0	1	0	0	0	2
Medical Corps (21XX)	1	7	18	10	0	0	36
Dental Corps (22XX)	8	13	12	12	0	0	45
Medical Service Corps (23XX)	0	1	11	25	11	1	49
Nurse Corps (29XX)	1	1	3	13	6	5	29
Grand Total	11	22	45	60	17	6	161

Table 9. Enlisted Billets Converted By Rating and Rank for FY 08

BILLET TITLE	E-9	E-8	E-7	E-6	E-5	E-4	E-3	Grand Total
Hospital corpsman (HM)	2	3	10	76	145	194	251	681
Dental corpsman (DT)	0	0	0	5	28	46	112	191
Storekeeper (SK)	0	0	0	0	1	0	2	3
Grand Total	2	3	10	81	174	240	365	875

Note that Table 8 and 9 totals include 107 enlisted and 45 officer billets from NH Keflavik and NMCL LaMaddalena to be deleted and not converted.

I. Conclusions

Based on cost and availability data, Navy can only partially certify for FY 07. Data suggests that 559 billets (Appendix B) will be cost-effective to convert and local labor markets can support availability. 130 billets (Appendix A) will not be able to be filled due to cost or availability and should not be certified for conversion. Consistent with the legal requirements of FY 06 National Defense Authorization Act (Sec 744) and FY 07 National Defense Authorization Act (Sec 742) 130 military positions will be restored as expeditiously as possible.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

July 13, 2007

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

This letter provides the Department of the Navy response regarding military to civilian conversions within the Navy Medical Department as required by the Fiscal Year (FY) 2007 National Defense Authorization Act (Public Law 109-364, Section 742). As required by law, detailed reports of the 215 billets converted to civilian positions in FY 2006, 689 billets programmed for conversion in FY 2007 and 1,036 billets programmed for conversion in FY 2008 are enclosed.

Based on our cost, quality and access experience with FY 2005 and FY 2006 conversions to date, I recertify that the FY 2006 conversions did not increase cost while access and quality were maintained.

Based on our current analysis of fully burdened governmental personnel costs, I certify that 559 of the 689 FY 2007 and 791 of the 1,036 FY 2008 military positions programmed for conversion are achievable without increasing cost or decreasing access and quality. We will continue to evaluate the remaining 130 conversions for FY 2007 and the remaining 245 conversions for FY 2008 to determine if they will be cost effective or impact access and quality of care.

Consistent with the requirements of the FY 2006 National Defense Authorization Act (Section 744) and FY 2007 National Defense Authorization Act (Section 742), 130 FY 2007 military positions and, if necessary, 245 FY 2008 military positions will be restored as expeditiously as possible.

I will continue to monitor these conversions and will promptly notify you should any of this information change. A similar letter has been sent to Chairman Skelton. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Winter".

REPORT TO CONGRESS
METHODOLOGY TO CERTIFY MEDICAL MILITARY TO
CIVILIAN CONVERSIONS FOR FISCAL YEAR 2008

PREPARED BY
Bureau of Medicine and Surgery, Department of the Navy
2300 E Street, NW, Washington, DC 20372-5300

July 2007

Report Requirement

Under the guidelines of Section 742 of the Fiscal Year 2007 Defense Authorization Act, Public Law 109- 364, the Secretary of the Navy submits the following report addressing the FY 2008 medical military to civilian conversions.

The report includes the following sections:

- A. The methodology used in making determinations
- B. The number of positions planned for conversion.
- C. The results of a market survey by area and availability of providers
- D. An analysis of direct and purchased care.
- E. The effect of conversions upon recruiting and retention
- F. The comparison of full costs of conversions
- G. The effect of conversions upon readiness.
- H. Positions scheduled to be converted in FY09
- I. Conclusions

A. Methodology

The methodology in making the determination necessary for certification begins with review of military requirements. The Operational Support Algorithm (Figure 1) determines military essentiality and the ultimate demand signal for our uniformed medical force. There are three components to the algorithm:

(1) Daily Operational Support: medical personnel who are organic to and a daily part of the command structures of the Fleet and Fleet Marine Force (FMF)

(2) Surge personnel: dual use personnel required to augment deploying force, working in our Force Projection Platforms, i.e. Hospitals and Clinics who augment Marine Corps units, EMF's, T-AH, casualty receiving ships and serve as our Individual Augment manpower pool

(3) Force sustainment: personnel required to insure that we are acquiring and training the requisite specialty inventories for an adequately sized and clinically proficient medical force.

Billets not included in requirements defined by the Operational Support Algorithm (OSA) were reviewed by the Center For Naval Analyses (CNA). CNA validated that the billets were not contained within the OSA and further identified which billets were most cost effective for conversion.

Meeting Operational Capability

Operational Support Algorithm (Tri-Service/OSD Validated Methodology)

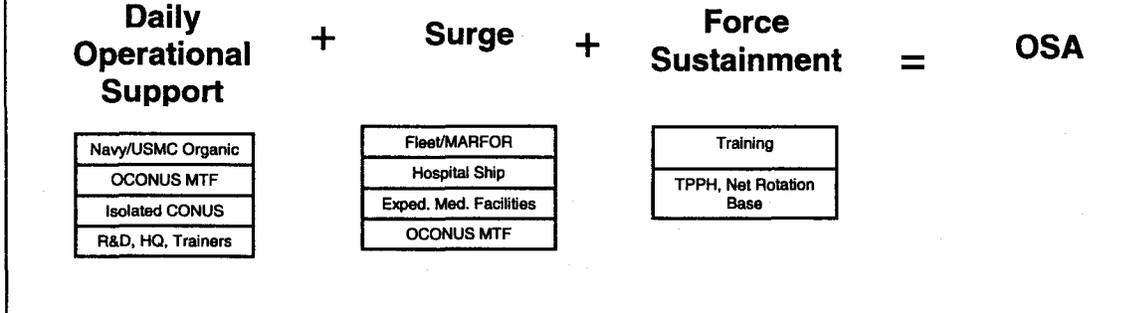

Figure 1: Operational Support Algorithm Diagram

The billets identified by CNA for possible conversion were forwarded to affected commands to review affordability, hireability, and availability. After reviewing business plans and hiring projections, Medical Commanders recommended modifications. This process is ongoing and allows commands to have an active role in determining what type of civilian positions to hire. Additionally, for those billets identified for FY07 and FY08 we employed an outside contractor, Altarum, to perform a market survey in affected areas to determine availability and to compare full costs in those areas for the planned conversions.

Additionally, a preliminary DoD PAE “fully burdened cost” model, which estimates the total cost to the government of a military position was considered. This estimate would increase the cost of a military billet by 26% over the composite rate.

B. Number of billets planned for conversion

In FY08, the total number of planned conversions is 1,036 positions (802 CONUS and 234 OCONUS). These planned conversions include 2 General Medical Department Officers, 36 Medical Corps Officers, 45 Dental Corps Officers, 49 Medical Service Corps Officers, 29 Nurse Corps Officers, and 875 enlisted members. Table 1 displays the breakdown of officers by designator and rank. Table 2 displays the breakdown of enlisted by rating and rank.

Table 1. Officer Billets Converted by Designator and Rank for FY08 and MRR Conversions

CORPS	Captain O-6	Commander O-5	Lieutenant Commander O-4	Lieutenant O-3	Lieutenant Junior grade O-2	Ensign O-1	Grand Total
General Officer (2XXX)	1	0	1	0	0	0	2
Medical Corps (21XX)	1	7	18	10	0	0	36
Dental Corps (22XX)	8	13	12	12	0	0	45
Medical Service Corps (23XX)	0	1	11	25	11	1	49
Nurse Corps (29XX)	1	1	3	13	6	5	29
Grand Total	11	22	45	60	17	6	161

Table 2. Enlisted billets converted by rating and rank for FY08 and MRR conversions

BILLET TITLE	E-9	E-8	E-7	E-6	E-5	E-4	E-3	Grand Total
Hospital corpsman (HM)	2	3	10	76	145	194	251	681
Dental corpsman (DT)	0	0	0	5	28	46	112	191
Storekeeper (SK)	0	0	0	0	1	0	2	3
Grand Total	2	3	10	81	174	240	365	875

C. Marketing Survey and Availability Analysis

Navy Medicine relied upon an analysis conducted by an outside contractor to project market availability of civilian medical and dental care providers by locality (zip code) and to estimate the full cost of replacing military personnel with civilians or contractors. This model incorporated market constraints based on the Bureau of Labor and Statistics, Salary.com and other external data to identify the ratio of specialists per 100,000 population in a market and salaries. Using the calculated ratio to predict constrained areas and forecast the potential costs of hiring a civilian or contractor, the model identified those FY08 billets in moderate or highly constrained markets.

The market analysis uses the Annual DoD Composite Rate for military positions selected for conversion and examines the market availability in the area where the position is located. The model estimates full costs for civilian positions (including costs associated with recruiting, salary benefits, training and other costs) through a 25% increase over the civilian rate.

The model projects that 463 of the 802 CONUS projected FY06 conversions would be difficult to fill with civilians or contractors, at a cost equal to or less than the composite rate for military personnel. Our experience confirms this finding as many professional positions in moderately to highly constrained markets are difficult to fill and appear to require higher priced contractors or higher-grade GS personnel for the Navy to successfully fill these positions. Tables 3 through 5 display the hiring success rates by job title and fiscal year for previous conversions.

Using the model to evaluate the availability of civilian specialties for FY08, those specialties identified as highly constrained (specialties experiencing shortages in specific medical labor markets) were identified. Pairing this data with the experiential hiring data in Table 5, 245 positions (24%) were identified as high risk for conversion based on personnel costs and/or the availability of the skill set in the civilian market. Table 6 summarizes these billets by medical specialty. Appendix A is a detailed billet list of these positions. Appendix B lists those billets where the risk is considered low to moderate for conversion.

D. Access, Quality and Cost in the Direct and Purchased Care Systems

Direct Care

1. The availability of staff directly correlates with cost and access. The total supply of available active duty providers and support staff depends upon the number of authorized billets, which include the billets required for readiness and those used in training programs and day - to - day operations as defined by the OSA model. The supply of Federal civilian and contract providers is dependent upon manning authorizations, funding availability and labor market forces. The demand for care in the direct care system is dependent on the size of the local beneficiary population, seasonality of use, and the population's health status.

A comprehensive review of access to care within the Continental United States (CONUS) direct care system, examined the percent of appointments meeting access standards and the average days to get an appointment. The data included all primary care appointment types (acute, routine, specialty, and wellness) within CONUS activities since (a) the majority of military provider billets converted were primary care based, (b) conversion hiring occurred at CONUS MTFs, and (c) there were no inpatient specific specialty conversions. A longitudinal study from August 2003 through September 2006 searched for any variation in the defined categories.

Results of the comprehensive review conclude that appointments continue to be within the TRICARE Access Standards.

Purchased Care

2. The availability of network providers and the geographical location of beneficiaries are factors affecting both cost and access of purchased care.

TRICARE beneficiaries enrolled in TRICARE Prime are guaranteed access to care in accordance with established access standards. Military medicine is required to refer beneficiaries into the managed care support network if the wait time in the direct care system exceeds these standards. Navy reviewed Purchased Care metrics on a longitudinal basis from October 2002 - September 2006. The data examined included CONUS Navy-wide inpatient and outpatient purchased care. Inpatient purchased care, measured by Relative Weighted Product (RWP), climbed steadily since 2003, with no appreciable increase when military to civilian conversions began. Outpatient purchased care, measured by Relative Value Unit (RVU), varied over the three fiscal years with no discernable link to military to civilian conversions.

The planned military to civilian conversions to date have not had a measurable impact upon purchased care from the network or access to care. The challenge remains to ensure the 7,790 conversions and 901 divestitures between 2005 and 2013 coupled with the current efforts to fill direct care systems in a highly competitive medical marketplace do not decrease access to care in the direct care system, force care to the network or increase the cost of healthcare. Table 7 describes the projected conversions

and divestitures for FY 2005 – FY 2013.

Table 6. Projected Conversions and Divestitures for FY 2005 – FY 2013

FY	POM 06 Conversions	PDM IV Conversions	Total Conversions	PDM IV Divestitures	Total Active Duty Conversions or Divestitures
2005	1,772*	0	1,772	0	1,772
2006	215	0	215	0	215
2007	689	0	689	0	689

2013	0	672	672	50	722
Total	5,425	2,365	7,790	901	8,691

Quality of Care

Navy Medicine demands the same quality of care standards from all employees, including new military to civilian conversion hires, regardless of human resource category (military, Federal civilian, or contractor). No decrease in quality of care has been noted due to military to civilian conversions.

Navy has multiple processes and performance measures to ensure high quality healthcare is being delivered. However, in order to obtain individual position level information the methodology for certification focused on ensuring that the hiring process of Federal civilians or contractors provided the appropriate quality level required.

In order to ensure that the federal civilian recruitment process meets the quantitative and qualitative hiring needs of the activity, a three-step process is used. Specifically,

1. The Navy's Federal civilian recruitment process responds to the demand signal provided by an activity to hire a federal civilian with certain predetermined criteria (knowledge, skills, and abilities). This process ensures the appropriate experience and education requirements are met to ensure the minimum qualifications and the proper grading of the position. This process creates a pool of potential applicants. The pool then is referred to the selecting official of the activity requesting the recruitment action.
2. The activity interviews the pool of candidates and either makes a selection based on predetermined criteria or not. If selecting officials question or are dissatisfied with the qualifications or quality of specific applicants the selecting officials are encouraged to discuss these concerns with their human resource advisors. When concerns are raised, additional reviews are conducted prior to making a job offer would be made.

3. Credentialing and Privileging

Once the selecting officials tender an offer the candidate is required to meet the condition of the Bureau of Medicine and Surgery (BUMED) Instruction 6320.66D entitled "Credentials Review and Privileging Program". The Credentialing Review and Privileging program does not differentiate between active duty, federal civilian, or contractor. The BUMED instruction references DoD directive 6025.13, entitled "Medical Quality Assurance (MQA) in the Military Health System (MHS)". Neither the BUMED nor DoD instruction differentiates between active duty and civilian (federal civilian or contractors) personnel.

Contract personnel hired are required to meet the same quality standards as other personnel. Credentialing and privileging of contractors use the same process as that is used for Federal civilians.

E. Recruiting and Retention

Conclusive impact upon recruiting and retention is unknown at this time. Applicants to direct accession programs are fully trained professionals seeking to join the Navy Medicine team. In most cases, direct accession applicants are looking at the military as a long-term career, so during interviews this subject is mentioned and discussed, thus causing some concern for these applicants; however, there has been little indication that military to civilian conversions have deterred a direct accession applicant's or scholarship applicant's desire to join the Navy.

Losses in Navy Medicine active duty personnel have exceeded gains for some specialties affected by military to civilian conversions. Anecdotally, some medical officers have elected to retire and accept military to civilian conversion positions. In a few specialties, some officers view additional military to civilian conversions as jeopardizing their career potential and have made the decision to leave prior to the 10-year active duty mark. Despite these findings, the military to civilian conversions have had a minimal impact on retention to date.

F. Estimated Cost

The current cost of the 802 billets identified in POM-06 for conversion in FY08 based on the "fully burdened" (total cost to the Government) cost methodology is \$64M. The estimated cost of these same conversions based on the Altarum model is \$61M for Government Service civilians and contractors. The 209 OCONUS billets and the 25 Full Time Support billets identified in PDM IV for conversion in FY08 were not included in this costing model. A feasibility study conducted by CNA concluded that, "the potential cost savings of OCONUS conversions isn't significant enough to outweigh the considerable risks."

The supply of some healthcare professionals such as specialized physicians, dentists, pharmacists, nurses, other providers and various medical technicians is low and projected to remain steady or grow at a slower rate than demand, which continues to

grow. High demand and low supply may drive the cost of these professionals above that which Navy Medicine can pay under current civilian pay authorities.

G. Readiness

As discussed earlier, the military billets selected for conversion were above the operational requirement identified by the OSA model and validated by the CNA Corporation. The OSA model does not take into account all missions Navy Medicine is directed to accomplish and this omission is creating a stress on the direct care system. Increasing shortages caused by the inability to hire health professionals and additional cuts will cause an increased migration to the private sector care. Shifting more care to the network will increase the overall cost of military healthcare. Sustainment of the deployment tempo in current GWOT operations will be challenging over time, particularly as an increasing number of Individual Augmentation requirements are filled by Navy Medicine.

H. Identification of conversions

Appendix C is a detailed table of the individual military billets to be converted to a civilian position in FY09, including the location of each position and local availability for hire. Table 7 displays the breakdown of officers by designator and rank. Table 8 displays the breakdown of enlisted by rating and rank.

Table 7. Officer Billets Converted by Designator and Rank for FY09 and MRR Conversions

CORPS	Captain O-6	Commander O-5	Lieutenant Commander O-4	Lieutenant O-3	Lieutenant Junior grade O-2	Ensign O-1	Grand Total

Grand Total	0	2	18	69	166	252	341	848

I. Conclusions

Based on cost and availability data, Navy can only partially certify military to civilian conversions for FY 08. Data suggests that 791 billets (Appendix B) will be cost-effective

to convert and local labor markets can support availability. Conversion of 245 billets (Appendix A) present considerable risk due to cost or availability and should not be certified for conversion. Consistent with the legal requirements of FY 06 National Defense Authorization Act (Sec 744) and FY 07 National Defense Authorization Act (Sec 742), if necessary, 245 military positions will be restored as expeditiously as possible.

DEPARTMENT OF THE NAVY
BUREAU OF MEDICINE AND SURGERY
2300 E STREET NW
WASHINGTON DC 20372-5300

07UN093-000378
June 29, 2007

The Honorable Daniel Inouye
Chairman, Subcommittee on Defense
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

As directed by Senate Appropriations Committee Report 110-37, this letter serves as a report to the Senate Appropriations Committee regarding the Navy's use of the \$120 million (\$20 million for procurement and \$100 million for O&M) allocated on page 45 of the report. The Navy intends to allocate the \$20M of procurement funding to improve our radiography and digital imagery systems. Specifically:

- Digital Imaging Network-Picture Archiving and Communication System \$9.43M
- Magnetic Resonance Imaging \$2.35M
- Tomotherapy Linear Accelerator \$3.39M
- CT Scanners \$3.47M
- Radiographic/Fluoroscopy System \$0.82M
- X-ray Units \$0.54M

While Navy received \$100M in FY07 O&M funding, \$17.06M has been taken by OSD (HA) via the Prospective Payment System (PPS). With the remaining \$82.94M, Navy Medicine will fund the following areas:

- Wounded Warrior Sustainment, Restoration, & Modernization \$12M
- PDHRA - Combat Stress \$17.05M
- Force Protection \$5.075M
- Warfighter Refractive Surgery Enhancements \$3.632M
- Facility Sustainment, Restoration, & Modernization \$21.008M
- Minor Equipment replacement \$24.175M

Please let me know if I can be of any further assistance.

Sincerely,

J. M. Mateczun
Rear Admiral
Senior Health Care Executive
United States Navy
Acting

June 29, 2007

The Honorable Robert Byrd
Chairman, Senate Appropriations Committee
United States Senate
Washington, DC 20510

Dear Mr. Chairman:

As directed by Senate Appropriations Committee Report 110-37, this letter serves as a report to the Senate Appropriations Committee regarding the Navy's use of the \$120 million (\$20 million for procurement and \$100 million for O&M) allocated on page 45 of the report. The Navy intends to allocate the \$20M of procurement funding to improve our radiography and digital imagery systems. Specifically:

- Digital Imaging Network-Picture Archiving and Communication System \$9.43M
- Magnetic Resonance Imaging \$2.35M
- Tomotherapy Linear Accelerator \$3.39M
- CT Scanners \$3.47M
- Radiographic/Fluoroscopy System \$0.82M
- X-ray Units \$0.54M

While Navy received \$100M in FY07 O&M funding, \$17.06M has been taken by OSD (HA) via the Prospective Payment System (PPS). With the remaining \$82.94M, Navy Medicine will fund the following areas:

- Wounded Warrior Sustainment, Restoration, & Modernization \$12M
- PDHRA - Combat Stress \$17.05M
- Force Protection \$5.075M
- Warfighter Refractive Surgery Enhancements \$3.632M
- Facility Sustainment, Restoration, & Modernization \$21.008M
- Minor Equipment replacement \$24.175M

Please let me know if I can be of any further assistance.

Sincerely,

J. M. Mateczun

Appendix	9

I. Report Requirement

Section 124 (e) of the Fiscal Year 2006 Defense Authorization Act, Public Law 109-163, directed *"The Secretary of the Navy shall submit to the Congressional defense committees each year, at the same time as the President's budget for the next fiscal year is submitted under section 1105(a) of title 31, United States Code, a report that provides current information regarding the content of any element of the Littoral Combat Ship (LCS) class of vessels that is designated as a "mission package", the estimated cost of any such element, and the total number of such elements anticipated."*

II. Executive Summary

The Littoral Combat Ship (LCS) will counter a spectrum of threats in the littorals to assure maritime access for Joint Forces. The LCS is a fast, agile, and networked surface combatant, optimized for operating in the littorals and focused on three primary threats: mines, submarines, and small, fast patrol boats. The underlying strength of the LCS lies in its innovative design approach, applying modularity for operational flexibility. Fundamental to this approach is the capability to rapidly install interchangeable Mission Packages (MPs) into the Seaframe.

The LCS MPs will provide the Combatant Commanders a modular, focused mission capability to provide assured access against littoral mine, submarine and surface threats. Mission Systems are incrementally added to the MP as they reach a level of maturity necessary for fielding. These systems provide warfighting capability that will be continuously improved through an evolutionary acquisition development process. MP modular capability provides an Open Architecture environment which enables future rapid insertion of new technologies. Warfighting analysis will be the primary tool for determining which technologies to pursue. Modularity, an Open Business Model, and Open System Architecture are critical to enabling future development.

III. Background

A MP consists of Mission Modules (MM), Mission Crew and Support Aircraft. Each MP provides warfighting capability for one of three focused mission areas:

- Mine Countermeasures (MCM)
- Surface Warfare (SUW)
- Anti-Submarine Warfare (ASW)

MMs combine Mission Systems (vehicles, sensors, weapons) and support equipment that install into the Seaframe via standard interfaces. The Mission Package Computing Environment (MPCE) is the primary interface that enables the MP to work on the ship. The hierarchal concept of modularity that yields a MP fielded onboard a LCS is described in three layers:

- Mission Systems = vehicles, sensors, or weapons
- Mission Module = Mission Systems + Support equipment + Standard interfaces
- Mission Package = Mission Modules + Mission Crew + Supporting Aircraft

Figure 1 depicts the layers that define a Mission Package.

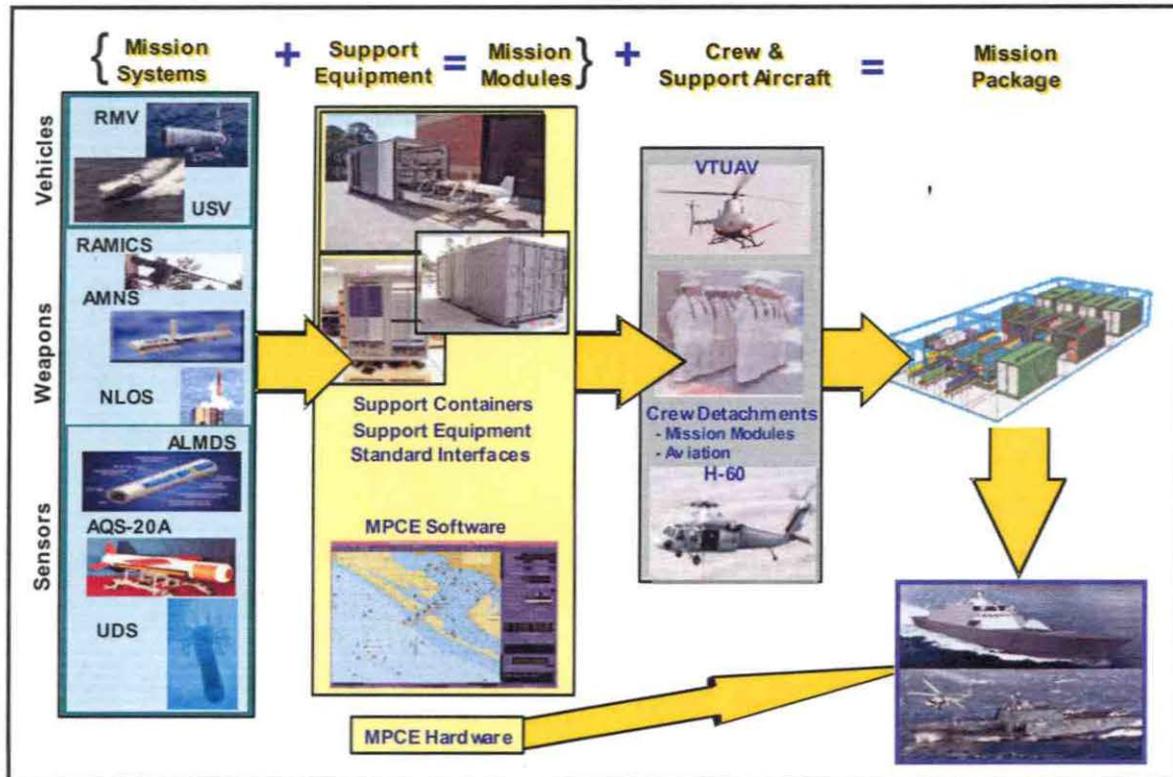

Figure 1 – Mission Package Defined

The ability to modify the LCS configuration changes the operational parameters applied to traditional surface combatants. MPs can be swapped in order to reconfigure the ship for a different mission in a short period of time, giving a Combatant Commander a uniquely flexible response to changing warfighting requirements. To achieve this flexibility, the Navy is developing and procuring specific numbers of MPs to meet the Fleet's warfighting requirements. The quantity of each MP type differs based on analysis of projected operational needs, therefore MPs are developed and procured separately from the Seaframes. This also allows the LCS warfighting capability to quickly adapt to evolving threats, using improved technology.

The "Cost As Independent Variable" (CAIV) target for each type of Mission Package is \$75 million (Objective) to \$150 million (Threshold) in base year Fiscal Year 2005 dollars. The budgeted end cost of the first baseline Mission Package of each variant in the fiscal year 2009 President's Budget request is: MCM \$72.6 million; ASW \$46.3 million; and SUW \$16.4 million. An Independent Cost Estimate (ICE) is in progress.

IV. Incremental Development Plan

The current incremental development plan for the MCM, ASW and SUW MPs is shown in Figures 2 through 4. This phased plan provides incremental capability through the introduction of mature programs of record into the respective MP until the baseline capability defined in the Capabilities Development Document (CDD) is reached.

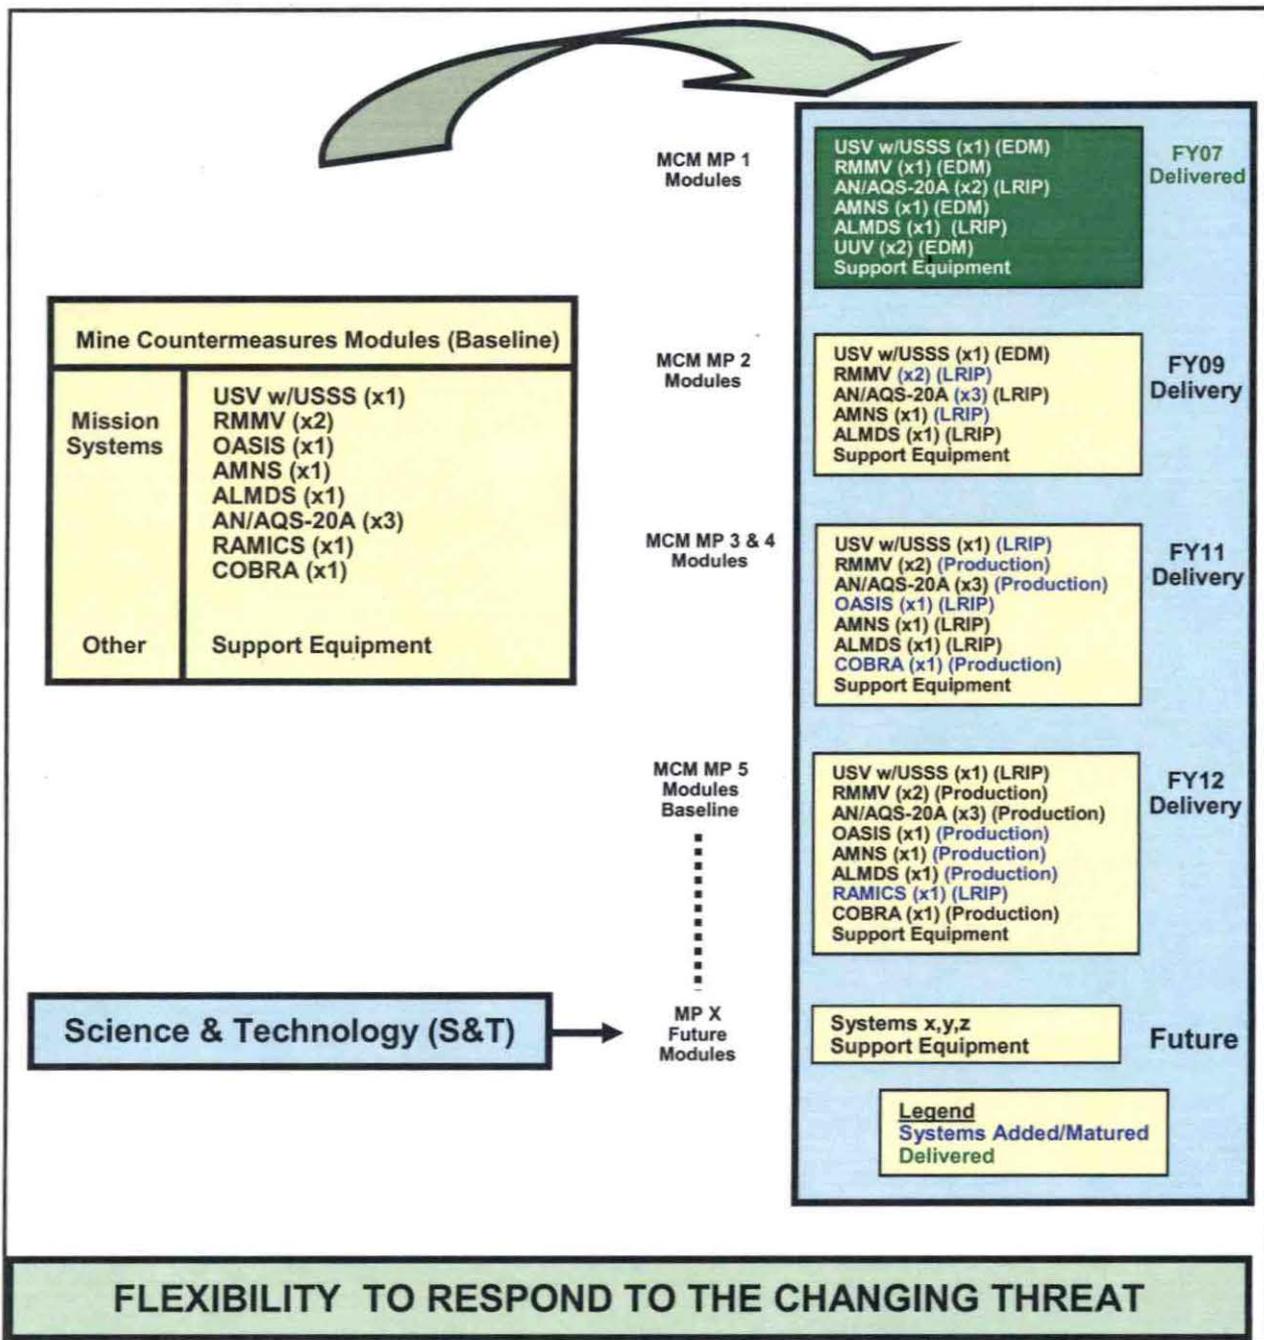

Figure 2 – MCM Mission Package Phased Delivery

Figure 2 demonstrates the development plan for the MCM MP. The initial MP (MP1) was delivered on time and on budget in Fiscal Year 2007. This first MP provides an initial capability for the detection and neutralization of volume and bottom mines. As most of the systems are designed to operate from any MH-60S helicopter, MP1 provides MCM capability to the Fleet even though the LCS Seafame has not delivered.

MP2 is set to deliver in Fiscal Year 2009. This package will provide the same capabilities as MP1, but with greater quantities of some systems. MPs 3 and 4 will introduce magnetic and acoustic sweep capability to address the bottom/buried mines threat via the

Organic Air and Surface Influence Sweep (OASIS) system, as well as an inshore detection capability via the Coastal Battlefield Reconnaissance and Analysis (COBRA) system. MPs 3 and 4 are scheduled to deliver in Fiscal Year 2011. The MCM baseline capability is reached in Fiscal Year 2012 with the delivery of MP5. MP5 adds the Rapid Airborne Mine Clearance System (RAMICS) which neutralizes near surface and floating mines.

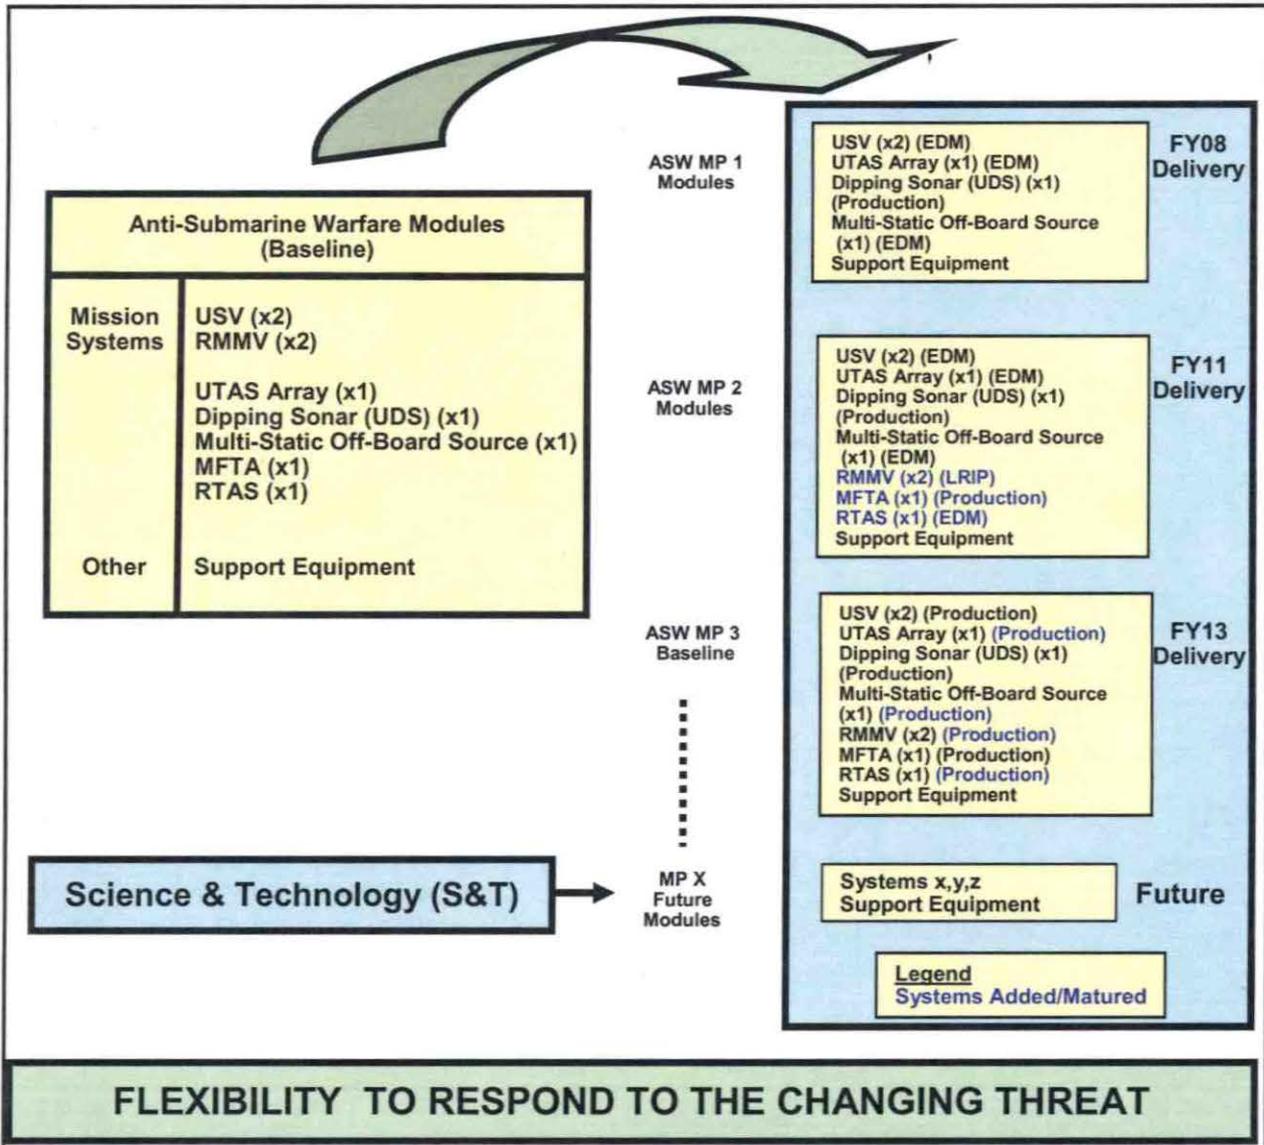

Figure 3 - ASW Mission Package Phased Delivery

Figure 3 demonstrates the development plan for the ASW MP. MP1 is set to deliver in Fiscal Year 2008 and provides an initial ASW capability through the introduction of an Unmanned Surface Vehicle (USV) and active and passive acoustic systems. This first ASW MP will provide critical training for the crew and will serve to validate and refine operational ASW concepts for LCS.

MP2 provides additional capability in Fiscal Year 2011 through the introduction of a semi-submerged Remote Multi-Mission Vehicle (RMMV) and its associated systems. RMMV provides LCS with a remote long endurance search capability.

The baseline ASW capability will be provided in Fiscal Year 2013 with MP3. Low Rate Initial Production (LRIP) and Engineering Development Models (EDM) will be replaced by the production versions of these systems.

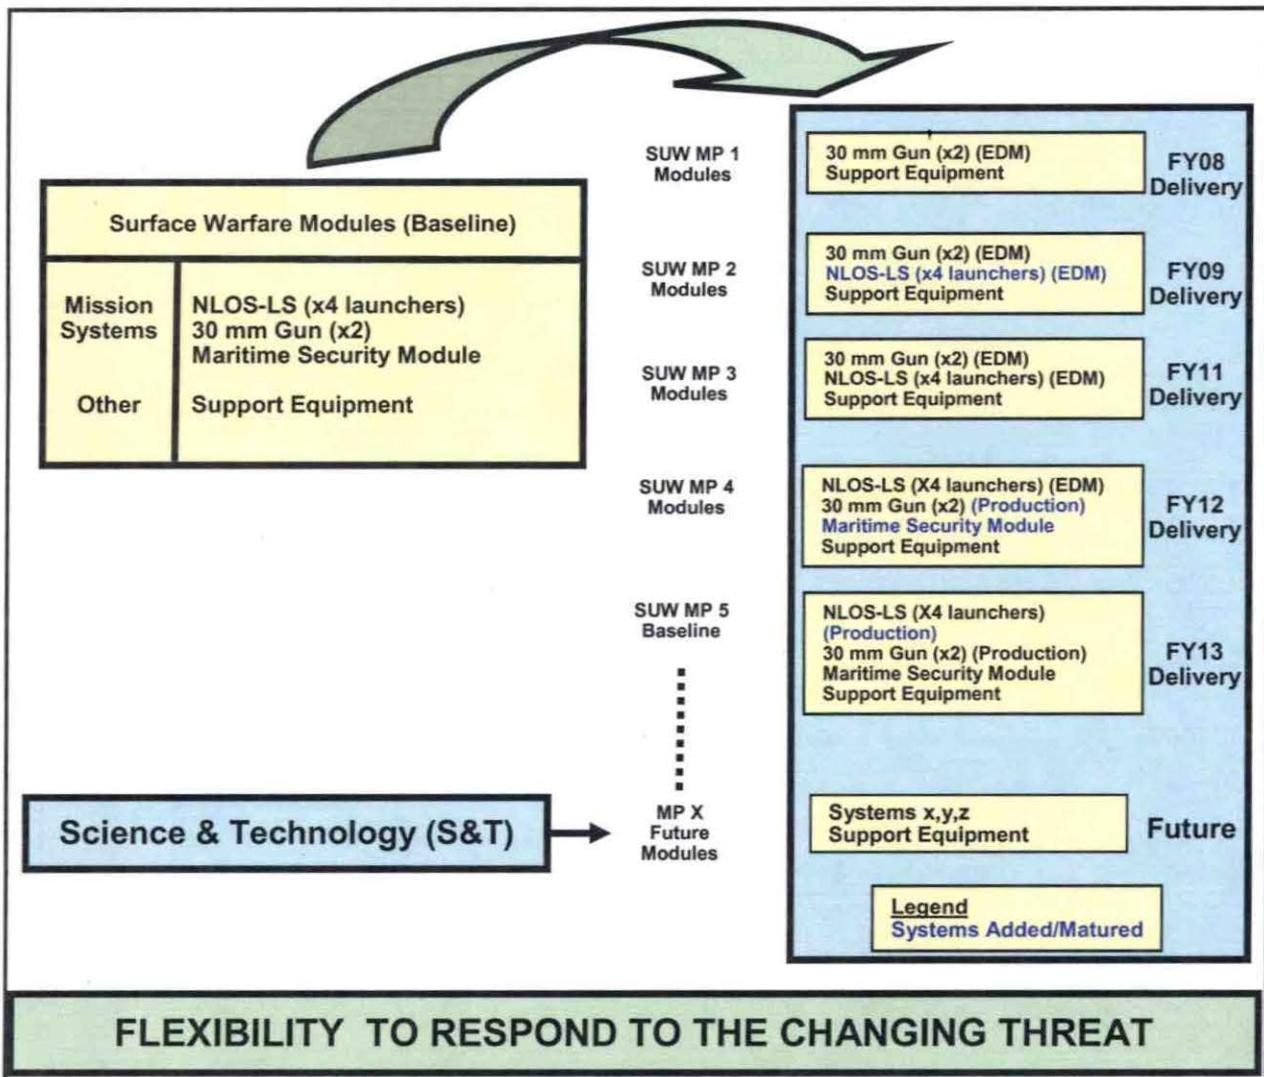

Figure 4 – SUW Mission Package Phased Delivery

Figure 4 demonstrates the development plan for the SUW MP. MP1 is set to deliver in Fiscal Year 2008. MP1 delivers a EDM dual 30 mm gun system, designed to counter small boat threats. MP2 provides additional capability through the introduction of the Non-Line of Sight Launching System (NLOS-LS). The versatile NLOS-LS offers the ability to prosecute sea and shore based threats in the littoral. The NLOS-LS system will employ the Precision Attack Missile (PAM). The PAM is currently under development, and only limited quantities will be available for testing and integration until Fiscal Year 2012. MP3 provides the same capability as MP2.

MP4 delivers in Fiscal Year 2012 and introduces a Maritime Security (MS) module. The MS module provides berthing, small boats, and the support to embark a Vessel Boarding, Search and Seizure team. The introduction of the MS module will provide LCS with an Enhanced

Maritime Interdiction Operations (EMIO) capability that is in demand in critical theaters around the globe.

The baseline SUW capability is reached in Fiscal Year 2013 with the introduction of MP5. MP5 replaces the EDM version of the NLOS-LS system with a production model.

V. Embarked Aviation Assets

	Mine Warfare	Anti-Submarine Warfare	Surface Warfare
Aircraft	VTUAV ¹ MH-60S	VTUAV ¹ MH-60R	VTUAV ¹ MH-60R
Aircraft Mission Systems	H60 MIW mission kit • CSTRS ² • Common Console • Aux Fuel Tank • Additional RME ³	H60 ASW mission kit • ALFS ⁴ • Sonobuoys • Mk54 Torpedo	H60 SUW Armed Helo mission kit • EO/IR Sensor • Crew served guns • Hellfire missiles

1- VTUAV comes with EO/IR Sensor
 2- Carriage, Stream, Tow and Recovery System (CSTRS)
 3- Removable Mission Equipment (RME)
 4- Airborne Low Frequency Sonar (ALFS)

Figure 5 – Mission Package Aircraft and Aircraft Mission

Each MP also contains embarked aircraft and their organic mission and support systems, as shown in Figure 5. These aircraft and systems are procured and maintained separate from the LCS program.

VI. Procurement Updates Since Last Year’s Annual Report

The Fiscal Year 2009 President’s Budget request includes minor changes to system quantities and modifies the phased delivery plan for the near term ASW and SUW MPs in order to support the restructured LCS program. Changes are as follows:

- One MCM MP and one SUW MP were eliminated to align MP procurement with the LCS procurement profile.
- The MCM baseline capability delivery was delayed until Fiscal Year 2012 based on the availability of the RAMICS system.
- One Airborne Mine Neutralization System and one Airborne Laser Mine Detection System in MCM MP 2 were eliminated to make MCM MP2 consistent with the baseline MCM MP.
- ASW MPs 2 and 3 were delayed in order to align schedules and priorities with the LCS Seaframe program.
- SUW MPs 3 through 6 were delayed to mitigate risk associated with maturing the MP.

VII. Mission Package Procurement Quantities and Budgeted Cost Estimate

Figure 6 provides a detailed breakdown of the MP costs and prices per fiscal year. The annual unit cost includes hardware cost for MP systems and support equipment. Backfit quantities and costs to upgrade initial MPs to a baseline configuration are also provided.

In accordance with Seaframe inventory numbers, the MPCE is procured as a shipset not per MP, and is therefore shown separately. MPCE quantities include procurements for shore sites. These sites are necessary for training and integration efforts and are therefore included in the total MPCE quantities.

MP "Buys"	Prior Years	FY07	FY08	FY09	FY10	FY11	FY12	FY13	Delivery FY
MCM MP Total Qty		1		2	2	2	2	2

***Figure 6 – Mission Package Procurement Synopsis with Budget Detail (\$M)**

*Note: Figure 6 funding includes all MP OPN and WPN funding, and applicable Engineering EDM funding in RDT&E,N.

VIII. Conclusion

The LCS MP program provides the Fleet with a modular, focused mission capability to counter littoral mine, submarine and surface threats. It uses a phased development approach that introduces systems as they mature and provides the basis for the future insertion of new technologies. Funding is consistent with cost estimates and the procurement plan is aligned with the LCS Seaframe schedule.

APPENDIX A	Abbreviations.....	8

I. BACKGROUND

The Senate Armed Services Committee Report 110-77 “directs the Secretary of the Navy to conduct an independent assessment, and submit a report to the Congressional Defense Committees, with the fiscal year 2009 budget request on the Marine Corps acquisition of the Ground/Air Task Oriented Radar (G/ATOR) to address: (1) the Marine Corps requirement for weapons engagement, and verify that the planned S-band radar design will support that requirement; (2) an assessment of the phasing for planned increments, recognizing that the Marine Corps does not yet have a defined weapons engagement requirement (other than cueing of terminal weapons such as Stinger); and (3) an examination of the technical and program management resources needed to effectively execute this complex state-of-the-art development program.”

In response to the Senate report, the Marine Corps initiated an independent technical assessment of the G/ATOR program. Naval Surface Warfare Center, Dahlgren Division (NSWC/DD) examined weapons engagement requirements, S-band performance and G/ATOR increment phasing through a rigorous Independent Assessment Team (IAT). Dayton Aerospace Incorporated (DAI) and ICF International assessed the program’s technical and management resources.

II. EXECUTIVE SUMMARY

There are valid requirements for weapons engagement contained in Air Defense Mission Needs Statements (MNS), Operational Requirements Documents (ORD) and Capability Development Documents (CDD). The requirements identified in these documents support key warfighting concepts such as Seapower 21, Operational Maneuver From The Sea and Ship To Objective Maneuver. The Marine Corps is in the process of drafting a weapons replacement Initial Capabilities Document (ICD) to define weapon engagement requirements, describe the supporting concept of operations and outline the gap analysis.

The IAT identified nothing inherent in S-band nor specific to the G/ATOR proposed design that would inhibit the system from meeting the requirements in the foregoing documents. S-band is a reasonable and appropriate choice to fulfill the air surveillance, air defense, air traffic control, and weapons support requirements identified in the Multi-Role Radar System (MRRS) Analysis of Alternatives (AoA).

The IAT also concluded that the G/ATOR phasing plan supported operational requirements resulting from the retirement of five radar systems. G/ATOR’s S-band design meets or exceeds the functionality and performance capabilities of these legacy systems.

The DAI study confirmed the Program Office’s current authorized level of sixty-five personnel, which is consistent with the Program Manager’s estimate, and that the G/ATOR program is undermanned by 7.7%, or five personnel. At the time of the study, there were five vacancies in the Program Office, two of which have been filled. The remaining positions are temporarily staffed with support contractor personnel pending permanent fills.

III. REQUIREMENTS FOR WEAPONS ENGAGEMENT

While there is no overarching ICD for weapons engagement, there are valid requirements identified in recent Joint Capability Assessments, Air Defense MNS as well as ORDs and CDDs for the MRRS, and the Complementary Low Altitude Weapons System (CLAWS).

The Fiscal Year (FY) 2008 Force Protection and Fires gap analyses identified several key weapons engagement capability gaps. The Force Protection analysis highlighted gaps in Anti-Air Warfare and Point-Defense which required a Short Range Air Defense (SHORAD). G/ATOR was specifically identified as the program of record addressing this need.

Required Weapons Engagement capabilities are identified in the 1992 Advanced Low Altitude Air Defense MNS and the 1993 Mobile Surface-to-Air Missile System MNS. These documents highlight the need to detect, classify and engage missile and aircraft threats. These MNS provided the basis for development of several programs such as CLAWS and MRRS.

The MRRS ORD holds the radar requirements for the air surveillance and air defense missions. The requirements in the MRRS ORD are the result of combining the capabilities of five radars scheduled for replacement covering four mission areas. Although not specifically identified as engagement support requirements, the MRRS ORD requirements support engagements for the four mission areas.

The first mission area covered by MRRS is Air Surveillance, where the radar tracks airborne targets for cueing to an interceptor. The AN/TPS-63 currently performs this mission and its coverage, accuracy, and detection range capabilities provide the basis for the associated Key Performance Parameters (KPPs) in the MRRS ORD.

The second mission area is Air Defense, where the radar is required to track airborne targets and support handover to a surface-launched weapon for engagement. The AN/UPS-3 and AN/MPQ-62 performed this mission with the Stinger and Avenger weapon systems, but have been retired. The MRRS ORD was written to capture the radar-related scan rate and tracking accuracy capabilities. The MRRS ORD also adds the height dimension with equivalent accuracy to support the new CLAWS weapon system. The CLAWS ORD complements the MRRS ORD by stating associated weapon system requirements for air defense.

The third mission area is Air Traffic Control (ATC), which provides air traffic management around air fields and within air space controlled by friendly forces. The AN/TPS-73 currently performs this mission. The MRRS ORD captures the AN/TPS-73 coverage and tracking capabilities.

The MRRS ORD also contains interoperability and compatibility requirements regarding its association with CLAWS and the Marine Corps Composite Tracking Network (CTN).

Specifically:

- During forced-entry-type operations where enhanced protection is required, MRRS will provide direct support to CLAWS or SHORAD units via direct interface to current or future data links.
- MRRS shall be interoperable with the Marine Corps CTN contributing node to provide accurate, real time fire control data to remote CLAWS and SHORAD units. In this configuration, MRRS can be deployed independent of command and control systems.

The CLAWS ORD specifies surface-to-air weapon requirements for the weapon including: mobility, rapid emplacement and displacement, employment under the Common Aviation Command and Control System (CAC2S), electronic protection, integrated Combat Identification (CID) information, reaction time, reliability, availability, missile performance requirements, including active seeker, capability to engage Type I and Type II cruise missiles, single shot probability of kill, operator-initiated command destruct, and the capability for external cueing.

The fourth mission area is Ground Weapons Locating, currently provided by the AN/TPQ-46A with anticipated upgrades. Since the MRRS ORD's approval, additional requirements for MRRS' Ground Weapons Locating Radar (GWLR) capability were identified. The Fires and Maneuver analysis revealed additional gaps in target acquisition and counterfire/targeting.

The GWLR CDD, an annex to the MRRS ORD, specifies radar performances for the GWLR mission, including: coverage, detection ranges, target classification, probability of location (acquisition), hostile weapon location circular error probable, projectile impact point prediction, location rate, cueing, and false report rate, among others. These new requirements are part of the GWLR CDD and capture the general coverage and detection performance capabilities of the AN/TPQ-46A.

Valid weapon engagement requirements for G/ATOR exist. These requirements can be traced from Joint Capability Gaps and mission needs to operational requirements and capability documents.

IV. SUFFICIENCY OF S-BAND DESIGN

The MRRS ORD identifies four KPP groups and fourteen individual KPPs related to weapons engagement. The S-band based G/ATOR system shows promise in meeting these parameters while providing optimal capability across a variety of operational missions.

The first KPP group addresses interoperability and compatibility and ensures that critical exchange requirements will be met. The second KPP group focuses on target detection in a variety of operational profiles. CID and mobility, deployability, and transportability comprise the third and fourth KPP groups respectively.

Interoperability and compatibility are key elements of the G/ATOR design. G/ATOR is poised to operate with multiple joint and Marine Corps systems including the Joint Strike Fighter and CLAWS. In this capacity, G/ATOR meets or exceeds the functionality and performance capabilities of the five legacy radars it replaces.

G/ATOR provides sufficient capability for target detection. The proposed S-band radar meets or exceeds weapons engagement requirements with the following exceptions noted by the IAT: (a) firm track coverage at some high elevation angles (identified through simulation) and (b) unrealizable firm track range at the lowest elevation (identified through simulation and confirmed in the proposal to be limited by physics). Under specific conditions, these shortfalls may result in a momentary delay in achieving firm track. Analysis indicates that a shift to an X-band design would provide marginal to no improvement in these extreme elevations. Minor design changes of the S-band system appear to be the most promising option to address the first shortfall. The recently completed Independent Assessment and MRRS AoA validated that the S-band design is a reasonable and appropriate choice to meet all MRRS target detection requirements for the air surveillance, air defense, ATC, and weapons support mission areas.

The G/ATOR design provides Identification Friend or Foe (IFF) compatibility that meets combat identification KPPs. The first increment of the G/ATOR system supports IFF Modes 1, 2, 3, 4, and C. The third G/ATOR increment is scheduled to add coverage for IFF Modes 5 and S. In addition to providing an IFF capability, the systems waveforms and inherent signal processing allow collection and comparison of signature data for non-cooperative targets. The generation, reception, and communication of data provided through these radar modes satisfy the basic KPP requirement for incorporating Non-Cooperative Target Recognition (NCTR) technology within the radar design.

G/ATOR is currently designed to meet mobility, deployability and transportability KPPs. However, the system design provides a relatively small (2 percent) weight margin and presents a significant risk given the immaturity of the proposed antenna design. Recent initiatives to employ the system from Up-Armored High Mobility Multi-purpose Wheeled Vehicles (HMMWV) eliminates this margin and results in a design that may not meet some key system attributes. Additional efforts are in progress to address the risk in this area.

V. INCREMENTAL DEVELOPMENT

The phasing of G/ATOR Increments is properly aligned with the planned divestiture of five radar systems that G/ATOR will replace. The phasing plan also provides the functionality to fulfill the interoperability requirements that enable weapon engagement capabilities.

The G/ATOR provides adequate phasing increments to fulfill gaps resulting from retiring legacy radars. Increment I replaces three radars: AN/TPS-63, AN/UPS-3, and the AN/MPQ-62 providing air surveillance and SHORAD capabilities. The AN/UPS-3 and AN/MPQ-62 are already retired and the AN/TPS-63 will be sustained until replaced by G/ATOR. Increment II provides the GWLR mission and replaces the AN/TPQ-46A. Increment III will provide NCTR, CTN, Integrated Architecture Behavior Model (IABM) upgrades and advanced Electronic

Counter-Counter Measure capabilities. Increment IV will provide ATC and replace the AN/TPS-73. In its aviation radar roles, G/ATOR Increments I, III, and IV will be employed by the Marine Air Control Squadron to directly support the execution of the six functions of Marine Aviation by providing precise airborne target information. In its ground radar role, G/ATOR Increment II will be employed by the Headquarters Battery of the artillery regiment in direct support of artillery battalions for precision registration and hostile weapon location.

G/ATOR provides appropriate phasing increments to fulfill the interoperability requirements that enable the engagement capabilities. Increment I has provisions for the transfer of information and data to and from the CAC2S, CTN, and SHORAD systems. Increment II provides connectivity with the Advanced Field Artillery Tactical Data System. G/ATOR will integrate IABM in increment III. Increment IV provides ATC interface.

This phasing plan is consistent with the operational requirements contained in related MNS, ORDs, CDDs, and the Weapons Replacement ICD that is being developed by the Marine Corps. G/ATOR tracking data provides the required accuracy and timeliness to support SHORAD by cueing available joint/coalition weapons assets via existing command and control and weapons systems (e.g., Standard Missile - 6 via CTN/Cooperative Engagement System, Patriot/SLAMRAAM via Link - 16).

VI. MANNING/RESOURCES

An independent assessment by DAI and a recently completed study by ICF International assessed that the G/ATOR Program Office is authorized sufficient personnel and management resources. While a few of the billets are filled with temporary support contractors, efforts are underway to fill these positions with permanent government employees in the near term.

On September 26, 2007, the Marine Corps Systems Command (MCSC) notified the Assistant Secretary of the Navy (Research, Development and Acquisition), via COMMARCORSYSCOM letter 5000/SG 06, that in order to evaluate the sufficiency of staffing levels to meet Marine Corps acquisition requirements, a study was conducted by ICF International to assess current and projected workload and staffing needs to support MCSC, PEO Land Systems, and the full range of Acquisition Category I through IV acquisition programs. The study identified a need for staffing increases in Contract Specialists, General Electronic Engineers, and Logistics Managers. Based on the results of the study, MCSC is pursuing additional authorizations to be added to its Quantico end strengths incrementally from Fiscal Years 2009 – 2011. The results of the MCSC study were based upon benchmarking against other Department of Defense organizations with mission responsibilities similar to MCSC.

DAI conducted a "Manpower/Staffing Study" in July 2007 using the Sustainment and Acquisition Composite Model (SACOM) Program Office manpower model. At that time, the SACOM model revealed:

- G/ATOR's authorized manning (65) was valid and consistent with the Program Manager's estimate.
- There are currently five (5) vacancies in the Program Office (two program analysts, one systems engineer, one business manager, and one logistician).

- The Program Office is geographically separated from its major technical support organization (NSWC/DD) and therefore additional matrix support from MCSC would be prudent. This finding was consistent with the results of the recently completed ICF International staffing study.
- The program benefits from three personnel acting as liaisons between the program, NSWC/DD and other organizations.

Since the DAI study was conducted, two (2) of the Program Office vacancies have been filled (one program analyst and one business manager).

VII. REPORT PREPARATION

This report was prepared using the October 19, 2007 NSWC/DD G/ATOR Independent Assessment Final Report; the August 5, 2007 Dayton Aerospace, Inc. Manpower/Staffing Study of PEO Land Systems; and a August 20, 2007, ICF International Marine Corps Acquisition Workforce Health Study.

VIII. CONCLUSIONS

The G/ATOR system design provides optimal capability across a wide variety of operational mission profiles. The system is properly phased to provide the necessary air defense capabilities to Joint forces with performance that exceeds that of the five legacy systems it replaces. With the exception of a few gapped government and matrix support billets, the Program Office is adequately manned to execute this demanding program.

IX. RECOMMENDATIONS

1. Continue analysis of G/ATOR mobility requirements to reduce the risk associated with the systems weight margin and potential to operate from up-armored HMMWVs.
2. Continue development of an overarching Weapons Replacement ICD that will cover weapons engagement requirements.
3. Continue design analysis and tradeoff studies to address possible shortfalls in target detection at extreme elevations.
4. Continue efforts to fill all authorized Program Office billets with permanent government employees.

THE SECRETARY OF THE NAVY
WASHINGTON, D. C. 20350-1000

February 4, 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As required by Section 231 of Title 10, United States Code, the Secretary of Defense is required to submit with the Defense Budget an annual long-range plan for the construction of Naval vessels, and certification that both the budget for that fiscal year and the Future Years Defense Plan (FYDP) funds this plan.

The enclosed Annual Long-Range Plan for Construction of Naval Vessels for Fiscal Year (FY) 2009 details the construction of combatant and support vessels over the next 30 fiscal years. Funding in the FY 2009 budget and the current FYDP supports this plan.

The FY 2008 Senate Armed Services Committee Report 110-77 directed the Secretary of Defense to include an addendum providing the hull numbers and planned disposition of ships that are to be dismantled, sunk, or decommissioned in the FYDP, along with resulting gaps in capability that may occur upon the decommissioning of each ship. An addendum outlining the requested information is provided accordingly.

The Department of the Navy (DON) is retaining ships in active service as long as practicable to reduce recapitalization requirements, while maintaining effectiveness across the spectrum of critical naval missions. Additionally, DON is continuing actions to reduce the cost of building ships. As an example, the VIRGINIA Class cost reduction effort is still on track to meet its \$400 million cost reduction goal (FY 2005 dollars) by FY 2012.

I would like to highlight two future issues facing the Navy. First, the Milestone A decision planned for CG(X) in 2008, will consider nuclear propulsion among the options. The results of this decision will be reflected in our FY 2010 report. The second is the cost of recapitalizing the OHIO Class SSBN, which requires lead ship procurement in FY 2019. Its cost will have a profound impact on the Navy's ability to maintain a balanced shipbuilding plan if special funding for this important national strategic capability is not provided.

A similar letter has been sent to Chairmen Inouye, Murtha, and Skelton. As always, if I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter". The signature is fluid and cursive, with the first name being the most prominent.

**Report to Congress on
Annual Long-Range Plan for
Construction of
Naval Vessels for FY 2009**

Prepared by:
Director, Warfare Integration (OPNAV N8F)
Office of the Chief of Naval Operations
2000 Navy Pentagon
Washington, DC 20350-2000

February 2008

Annual Long-Range Plan for Construction of Naval Vessels for FY 2009

I. Reporting Requirement

This report is submitted in accordance with Chapter 9, Section 231 of Title 10 United States Code, which requires the Secretary of Defense to submit with the Defense Budget, an annual long-range plan for the construction of naval vessels that includes the following:

(a) ANNUAL NAVAL VESSEL CONSTRUCTION PLAN AND CERTIFICATION – The Secretary of Defense shall include with the defense budget materials for a fiscal year:

- (1) A plan for the construction of combatant and support vessels for the Navy developed in accordance with this section; and
- (2) A certification by the Secretary that both the budget for that fiscal year and the future-years defense program provide for funding of the construction of naval vessels at a level that is sufficient for the procurement of the vessels provided for in the plan.

(b) ANNUAL NAVAL VESSEL CONSTRUCTION PLAN – Each such naval vessel construction plan shall contain the following:

- (1) A detailed program for the construction of combatant and support vessels for the Navy over the next 30 fiscal years.
- (2) A description of the necessary naval vessel force structure to meet the requirements of the national security strategy of the United States or the most recent Quadrennial Defense Review (*QDR*).
- (3) The estimated levels of annual funding necessary to carry out the program, together with a discussion of the procurement strategies on which such estimated levels of annual funding are based.

(c) ASSESSMENT WHEN VESSEL CONSTRUCTION BUDGET IS INSUFFICIENT TO MEET APPLICABLE REQUIREMENTS – If the budget for a fiscal year provides for funding of the construction of naval vessels at a level that is not sufficient to sustain the naval vessel force structure specified in the naval vessel construction plan for that fiscal year under subsection (a), the Secretary shall include an assessment that describes and discusses the risks associated with the reduced force structure of naval vessels that will result from funding naval vessel construction at such a level.

Additionally, the Senate Armed Services Committee has requested an addendum to this report that addresses the Navy's plans for decommissioning ships during the Future Years Defense Plan. Accordingly, the Navy has added the following information to this report:

(i) hull numbers of ships that are to be disposed by dismantling or sinking within the future-years defense plan; (ii) hull numbers of ships that are to be decommissioned within the future-years defense plan; (iii) gaps in capability that will occur upon the decommissioning of each ship, including duration of that capability gap; and (iv) disposition proposed for each ship upon decommissioning.

II. Submission of the Report

The Navy's Fiscal Year (FY) 2009 report reflects the capabilities needed to meet the challenges the nation faces with a reasonable degree of risk. The Chief of Naval Operations has stated that the Navy's 313-ship force structure represents a floor – the minimum number of ships the Navy should maintain in its inventory to provide the global reach; persistent presence; and strategic, operational, and tactical effects expected of Navy forces.

III. Background

The Navy faces many challenges in procuring a force that will be effective over the broad spectrum of naval missions anticipated in the coming decades. At the same time, escalating shipbuilding costs demand that the Navy procure only those ships that are necessary to accomplish critical missions, with the minimum essential capabilities, and in the most efficient and cost effective manner possible. The following sections outline the key factors that the Navy considered in developing its 30-year shipbuilding plan.

The complex configuration and size of naval vessels results in design times that range from two to seven or more years. Similarly, construction time can span up to eight years, and acquisition costs range from hundreds of millions to billions of dollars. Given the capital investment required, principal naval vessels are procured in relatively low numbers which can cause high and low cycles in annual budget requirements. Additionally, because of their size, propulsion plant type, and warfare systems, most Navy ships can only be constructed at a limited number of shipyards. This makes the timing of ship procurement a critical matter to the shipbuilding and combat system industries. Finally, ships' service lives can range from 20 years for smaller ships to 50 years for nuclear-powered aircraft carriers, mandating that ships be designed to accommodate capability upgrades throughout their time in service. Emerging and constantly improving threats drive new requirements. For instance, to ensure success in the Maritime Domain, a capability for Ballistic Missile Defense and full spectrum Anti-Submarine Warfare needs to be incorporated in our new classes of ships.

The Navy's legacy ships, some procured at a rate of four to five ships of a single class per year in the 1980s, are projected to retire during the next 30 years. With the high cost of new construction ships, the Navy cannot recapitalize its legacy ships at the same rate at which they were originally procured and maintain an affordable, balanced procurement plan. This dynamic causes fluctuations in force structure.

Since the Navy's shipbuilding plan spans a long period, it is divided into two phases, *Near-* and *Far-Term*, each with a fundamentally different focus and unique assumptions. A description of each follows:

- **Near-Term:** This period includes the current budget year, Future Years Defense Plan (FYDP), and FY 2014-2020. This phase addresses the Navy's transformation to a 21st Century fighting force with the introduction of several new ship designs, with the objective of minimizing adjustments to the plan in order to balance the mix of ships, unit costs, budgeted resources, and industrial base concerns. The requirements underpinning this balance are based on Defense-wide planning scenarios that are informed by intelligence assessments of future threats and operating environments. Given known ship capability and quantity requirements, the cost estimates are judged reasonably accurate inside the FYDP. The accuracy of the cost estimates diminishes in the FY 2014-2020 timeframe.

- **Far-Term:** This phase encompasses FY 2021 through FY 2038. The requirements during this period are not as well defined as those for the near-term. The number, types and capabilities of ships are estimated based on anticipated Joint and Navy warfighting requirements, and cost estimates are notional due to increasing uncertainty of business conditions affecting the shipbuilding industry. In this report, the far-term phase largely addresses the recapitalization of today's legacy ships.

Overall affordability of the shipbuilding plan remains a challenge if the Navy is to introduce required 21st Century capabilities and maintain the minimum essential force structure necessary to accomplish critical missions of a global Navy over the long term.

IV. Force Structure Requirement

A. Quadrennial Defense Review

The *FY 2006 Quadrennial Defense Review (QDR 06)* developed operational guidance for the national defense and national military strategies and for shaping the future force to address four priorities:

- Defeat terrorist extremists
- Defend the homeland in depth
- Shape the choices of countries at strategic crossroads
- Prevent hostile state and non-state actors from acquiring or using weapons of mass destruction

QDR 06 emphasizes the unique operational demands associated with homeland defense and the Global War on Terror (GWOT), and remains the twenty-year planning basis for the Department of Defense. It focuses on building a Joint portfolio of capabilities with global reach, capability, capacity, and flexibility that can concentrate military power for deterrence, dissuasion, and major combat operations.

Additionally, *QDR 06* directs a transition from a force planning construct centered on global or major regional conflicts to one with more emphasis on GWOT and homeland defense - while maintaining the capability to prevail in major regional conflicts. The Navy's FY 2009 shipbuilding plan outlines the major ship construction investments necessary to support *QDR 06*.

B. Maritime Strategy

In October 2007, the Navy, Marine Corps, and Coast Guard issued a unified maritime strategy: *A Cooperative Strategy for 21st Century Seapower*. The new Maritime Strategy recognizes that the security, prosperity, and vital interests of the U.S. are increasingly linked to those of other nations by virtue of a global system comprised of interdependent networks of trade, finance, information, law, people, and governance. The Navy, in this context, must provide regionally concentrated, credible combat power and globally distributed mission-tailored maritime forces to achieve six key strategic imperatives:

- Limit regional conflict with forward deployed, decisive maritime power
- Deter major power wars
- Win our Nation's wars
- Contribute to homeland defense in depth
- Foster and sustain cooperative relationships with more international partners

- Prevent or contain local disruptions before they impact the global system

C. Force Structure

The 313-ship force structure shown in previous versions of this report was compliant with the *QDR 06* and *Strategic Planning Guidance*. In this President’s Budget, the Navy has also considered the Maritime Strategy, and concluded that some adjustments should be made to this structure to accommodate essential changes in rotational, amphibious lift and intra-theater mobility requirements. No single mission area is disadvantaged in favor of any other to ensure that the Navy has the correct balance of carriers, submarines, cruisers, destroyers, amphibious and support ships to achieve the effects desired by the Combatant Commanders. However, the force structure depicted in this plan incurs risk in the following areas:

- Sourcing Carrier Strike Group (CSG) /Expeditionary Strike Group (ESG) demands for peacetime presence and warfighting response
- Ballistic Missile Defense
- Sea Shield (Theater Air and Missile Defense, Anti-Submarine Warfare) for CSG/ESG's
- Sourcing attack submarine (SSN) presence to approach Combatant Commanders’ demand, and for Intelligence, Surveillance, and Reconnaissance (ISR).
- Meeting the stated Marine Corps Amphibious Lift Requirements
- Supporting the Long War/Global Maritime Security
- Providing a credible strategic deterrent force

Absent additional resources to procure, operate and maintain a larger fleet, the Navy will be compelled to accept the risk inherent in the current plan’s minimum essential force structure. While in the main this plan achieves the necessary raw numbers of ships and sustains the shipbuilding industrial base, there are certain time periods where the ship mix, and therefore inherent capability of the force, varies from that required as a result of funding constraints and the timing of legacy fleet service life limits. The proposed force balances risk across mission areas with affordability, probability of need, and time required to recover should the future trend in an unexpected direction.

Table 1. Future Naval Force Structure (FY 2020)

Type/Class	313-Ship Force Structure
Aircraft Carriers	11
Surface Combatants	88
Littoral Combat Ships	55
Attack Submarines	48
Cruise Missile Submarines	4
Ballistic Missile Submarine	14
Amphibious Warfare Ships	31*
Combat Logistics Force Ships	30
Maritime Prepositioning Force (Future) Ships	12
Support Vessels	20

* Note: The DoN is reviewing options to increase assault echelon amphibious lift to 33 ships to meet USMC requirements.

A. Near-Term Naval Vessel Construction Plans

- The near-term plan focuses on transformation of the Navy Force structure to address the warfighting requirements of the 21st Century. These transformational ships include DDG 1000, CG(X), LCS, SSN 774, T-AKE, MPF(F) MLP, MPF(F) LMSR, and JHSV.
- The Navy continues to move toward establishing a sustaining production rate for its ship classes to reduce funding peaks in the future. Sustaining production rates will supply new ships at the same rate at which legacy ships reach the end of their planned service lives and have been planned for aircraft carriers, attack submarines, and amphibious ships. Transition to a sustaining rate for other ships where appropriate is addressed in the far-term.
- The Department appreciates Congress' support in the FY 2007 National Defense Authorization Act to fund aircraft carriers over four years. This split funding permits more efficient use of resources and facilitates stability in other shipbuilding programs and the Navy has adopted it in the President's FY2009 budget submission.
- Regarding surface combatants, the planned procurement of the DDG 1000 class will be completed by FY 2013 with a total of seven ships. The CG(X) program procures its first ship in FY 2011 with follow-on construction in FY 2013. The FY 2008 National Defense Authorization Act requires all major combatant vessels of the United States Navy strike forces to be constructed with an integrated nuclear power plant, unless the Secretary of Defense determines this not to be in the best interest of the United States. A nuclear propulsion plant will add to the cost per unit. This increased cost is not included in the current budget. The Navy acknowledges that this statute applies to CG(X). Resulting requirements definition and acquisition plans, including schedule options and associated risks, are being evaluated in preparation for CG(X) Milestone A.
- Table 3 shows the Navy has integrated the changes to the Littoral Combat Ship procurement plan previously reported to Congress.
- The Navy increased procurement to two VIRGINIA class attack submarines per year starting in FY 2011 in an effort to reduce a future inventory shortfall.
- The Navy has delayed MPF(F) procurement (\$14 billion) in order to resolve the concept of operations.
- There are two support ship changes. Analysis indicates the T-ATF service life can be extended to 40 years. This permits the Navy to delay starting procurement of the T-ATF replacements until FY 2015. Additionally, beginning in FY 2009, the Navy plans to procure a total of seven Joint High Speed Vessels (JHSV) at a rate of one ship per year to meet Combatant Commanders' demands for intra-theater lift and Theater Security Cooperation support.

B. Far-Term Naval Vessel Construction Plans

- The far-term plan focuses on recapitalizing the Navy's legacy ship inventory. In the period from FY 2021 to 2038, 165 ships will reach the end of their expected service lives – twice the number planned for retirement during the near-term phase. The Navy must manage meticulously the service lives and modernization of legacy ships during this period to prevent block obsolescence from causing unacceptable gaps in capability and capacity. Starting procurement of the next generation ships earlier than might otherwise be needed is an imperative to level the replacement

inactivation of USS ENTERPRISE (CVN 65) in November 2012 and the delivery of GERALD R FORD (CVN 78) in September 2015. During this 33-month period, Navy will mitigate the operational impact of the shortfall through selective rescheduling of carrier maintenance availabilities and by applying the inherent flexibility of the Fleet Response Plan. This risk mitigation strategy will support presence and surge requirements during this short time period, although it is not sustainable over a long period of time.

- The Littoral Combat Ship procurement profile was adjusted based on a program assessment following LCS-1 and LCS-2 cost increases. Although this assessment resulted in the removal of 13 ships from the FY 2008 President's Budget FYDP, the plan continues procurement to reach the objective of 55 ships by FY 2023.
- New T-AKE ships will replace the aging combat cargo and ammunition ships (T-AFS and T-AE) by FY 2012. This will complete the Navy's transition to a three ship-type combat logistics force, which will improve the overall effectiveness of operational fleet support. The Navy has committed to procure the minimum number of T-AKEs necessary to meet the Combat Logistic Force (CLF) requirement, currently assessed to be 12 T-AKEs. When MPF(F) T-AKE assets are considered in logistics planning for major combat operations, the CLF requirement drops to 11 T-AKEs, enabling the transfer of the 12th CLF T-AKE to the MPF(F).
- Ultimately, the 14-ship MPF(F) squadron will preposition the equipment and supplies of a planned FY 2015 Marine Expeditionary Brigade and will be capable of conducting at sea arrival and assembly operations to combat configure, employ, deliver and sustain Joint forces from over the horizon. MPF(F) ships will also meet Combatant Commander tasking for Theater Security Cooperation, disaster relief and other contingencies. The current budget does not include the 13th or 14th T-AKEs required to meet the MPF(F) structure described above, pending completion of an ongoing MPF(F) concept of operations study. It is expected that the assessment will show that the MPF(F) will need these two T-AKEs .
- JHSV class ships will provide support for intra-theater lift and Theater Security Cooperation at a relatively low cost. Additionally, the inventory of T-AGOS ships has been increased to account for lower operational availability than anticipated which has increased the rotational requirements for this class.

B. Far-Term Naval Battle Force Inventory

- The demand for Aegis ships is expected to increase because of their BMD capability. Achieving full service life from CG 47 class ships, and performing additional maintenance to extend the service life of DDG 51 class ships, is imperative to reduce the impact of rapid post-FY 2020 retirements pending entry of sufficient DDG(X) class ships into active service. A single mid-life modernization is no longer adequate for CG 47 and DDG 51 class ships due to the evolving threat environment, mandating periodic updates to keep them effective and to sustain engineering plant capacity. The current CG and DDG modernization efforts are the foundation for this effort and will serve as the baseline for subsequent upgrades throughout the remainder of their service lives. The impact of extending the service life of DDG 51 class ships five years is reflected in Table 4.
- The Navy faces a shortfall in its attack submarine inventory from FY 2022 through FY 2033. The inventory will reach a minimum of 41 ships in FY 2028-2029. The Navy has identified a strategy to mitigate the impact of this shortfall to include the following: (a) reducing build time of Virginia class attack submarines to 60 months; (b) extending the service life of selected attack submarines based on

technical feasibility and affordability; and (c) extending, as needed, the length of attack submarine deployments from 6 to 7 months to meet operational requirements.

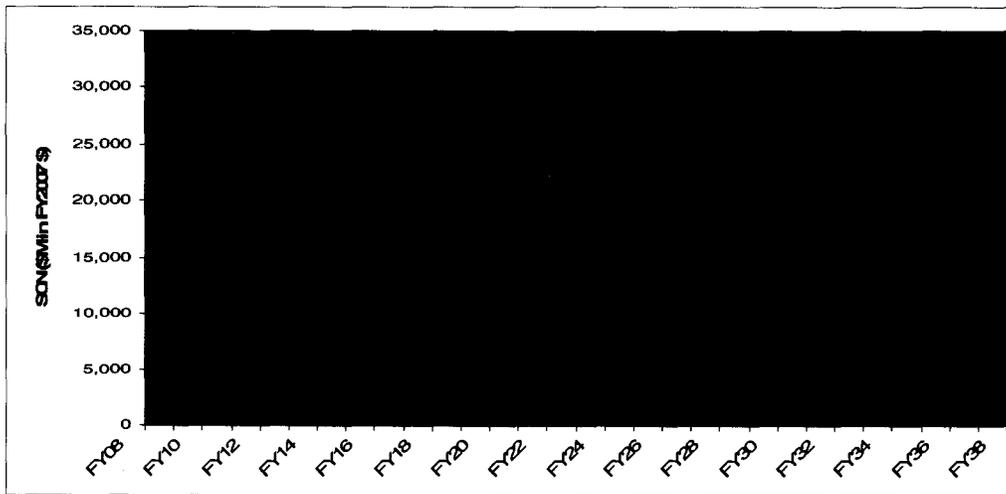

- OHIO class ballistic missile submarines start retiring in FY 2027, requiring construction of a replacement SSBN beginning in FY 2019. Any delay in construction will impact the Navy's ability to meet U.S. Strategic Command's (USSTRATCOM) Sea-Based Strategic Deterrent requirement.
- The Marine Corps requires sufficient Assault Echelon amphibious lift to support 2.0 Marine Expeditionary Brigades (MEB). MPF(F) will reinforce and support a 2.0 MEB Assault Echelon within a Marine Expeditionary Force-level operation by projecting a brigade and its associated support, and by providing the interface between operational and tactical logistics support from the Sea Base.
- Mine warfare ships will be replaced by Littoral Combat Ships configured with the mine warfare mission package. Legacy mine warfare ships will be phased out gradually by FY 2024.

VIII. Estimated Levels of Annual Funding Required for the Long-Range Shipbuilding Program

A. Overall

Figure 1 provides the estimated annual new construction funding requirements in FY 2007 dollars. The Navy recognizes that building the required force structure will largely depend on controlling shipbuilding costs (including combat systems) within an affordable range. This will require the combined efforts of the Navy, and the shipbuilding and combat systems industries. Working with Congress, the Navy is committed to procuring and sustaining the force structure necessary to deliver the effects expected of United States naval forces.

Figure 1. Annual Funding Required for Navy Long-Range Shipbuilding (FY 2009-2038)

Note:

This estimate shows funding required to support construction of the 313-ship minimum force structure over the period of the report. It does not include funding for SSBN recapitalization, CVN Refueling Complex Overhauls, SSBN/SSN Engineered Refueling Overhauls, other conversions, service life extension programs, small craft, or other costs associated with the Navy shipbuilding construction account. Per section VI.A., the estimate will be updated for FY 2010 based on CG(X) Milestone A decision, and in compliance with FY 2008 National Defense Authorization Act.

B. Near-Term Funding Requirements

The average steady-state annual shipbuilding funding required for achieving and sustaining the previous report's minimum 313-ship force structure was approximately \$13.4 billion per year in FY 2005 dollars (\$14.4 billion in FY 2007 dollars). The Navy's current cost estimate is affected in the near term by such factors as the FY 2006 Pension Protection Act, rising material costs, increasing labor rates, and the cost risk associated with developing and building new ship classes. Additionally, minimal first-tier shipbuilding capacity is devoted to commercial business, placing the overhead burden largely on Navy shipbuilding programs.

An additional complicating factor in ship procurement is the effect of the inflation rate experienced in the shipbuilding industrial sector compared to the Navy's budget. The shipbuilding industry's historical cost inflation rate is approximately 1.5 percent higher than the rate used by the Department of Defense to adjust the budget for year-to-year inflation. Consequently, the Navy's total obligation authority (TOA) has not paced the shipbuilding cost inflation rate. The net result of this mismatch is that resources available to support shipbuilding are eroding.

Accordingly, the Navy has revised the average steady-state annual shipbuilding funding requirement to \$15.8 billion per year in FY 2007 dollars through the near-term period (through FY 2020). The \$15.8 billion per year investment includes National Defense Sealift Funds (NDSF) and applies only to new construction battle force ships. It does not include funding for SSBN recapitalization, CVN Refueling Complex Overhauls, SSBN/SSN Engineered Refueling Overhauls, other conversions, service life extension programs, small craft, or other costs associated with the Navy shipbuilding construction account.

The Navy is experiencing some success in controlling and reducing shipbuilding costs. The VIRGINIA class SSN program is on track to reduce procurement cost by \$400 million per ship (FY 2005 dollars) by FY 2012 through an aggressive cost reduction program. Program elements facilitating this success include increasing production to two submarines per year under multi-year procurement authority, improving construction performance, investing in capital improvements, and implementing design changes to reduce construction costs.

To better control requirements, the Navy's Requirements and Resources Review Board (R3B) and newly instituted acquisition governance process changes are effectively managing adjustments to top-line requirements after programs have been initiated. Future process improvements will exert executive level control over shipbuilding and combat systems technical authority actions which have a large impact on program cost.

C. Far-Term Funding Requirements

The majority of procurement planned beyond FY 2020 is focused on recapitalizing retiring ship classes. Dramatically increased funding is required just to maintain Navy force levels during the post-FY 2020 period, without including funding that may be required to replace retiring non-battle force Strategic Sealift ships. Many of the new replacement ships identified as part of the Navy's 30-year shipbuilding program have not been designed. Cost estimates for these ships will remain a rough order of magnitude until conceptual designs are completed and more accurate cost estimating methods can be applied.

The Navy is emphasizing repeat builds of ships within the same class to reduce new construction costs, provided required warfighting capabilities can be fielded using this approach. This permits longer production runs and resultant cost reductions associated with production improvements and economies of scale. The Navy's shipbuilding plans include incorporation of open architecture for hardware and software systems and increased use of systems modularity. In addition, the Navy is aggressively pursuing opportunities to incorporate standardized components to reduce logistics support costs. These

initiatives will reduce the cost of maintenance and system upgrades, and will facilitate keeping Navy ships in service longer.

The Navy will consider several industrial factors as it pursues operational capability at reduced cost. First, level loading of ship procurements to help sustain minimum employment levels and skill retention will promote a healthy U.S. shipbuilding industrial base. Further, to achieve affordability goals, Navy program managers will make greater use of contract incentives, such as steep share lines combined with performance incentives, multi-year procurement, fixed price contracts (when and where appropriate), and increased use of competition to contribute to real shipbuilding cost containment.

IX. Naval Vessel Construction Risk

Funding for the Navy's shipbuilding requirements meets the needs of the Department and fully funds those ships included in the FY 2009 President's Budget and the Future Years Defense Plan through FY 2013.

X. Summary

Navy continues to analyze operational requirements, ship designs and costs, acquisition plans and tools, and industrial base capacity to further improve its shipbuilding plans, but the near-term shipbuilding plans have remained relatively stable. Although a larger force may reduce the significant major combat operations and Long War risks inherent in the 313-ship minimum force structure depicted, this plan represents an acceptable balance between capability, affordability, and the need to sustain the industrial base.

Full funding and support of this plan is crucial if the Navy is to maintain the minimum essential battleforce necessary to meet the maritime needs of the nation.

Addendum Report

Navy Plans for Decommissioning Ships during Future-Years Defense Plan (FYDP)

I. Introduction

This addendum report is in compliance with the Senate Armed Services Committee request for additional information regarding decommissioning and disposal of Naval vessels:

The Committee directs the Secretary of Defense to include, as an addendum to the annual report on the construction of naval vessels, commencing with submission of the report for fiscal year 2009, the future-years defense plan for the Navy's inactive ships. The addendum shall address: (i) hull numbers of ships that are to be disposed by dismantling or sinking within the future-years defense plan; (ii) hull numbers of ships that are to be decommissioned within the future-years defense plan; (iii) gaps in capability that will occur upon the decommissioning of each ship, including duration of that capability gap; and (iv) disposition proposed for each ship upon decommissioning.

The Secretary of the Navy approves the change in status of all ships, active or inactive, of the United States Navy (including Military Sealift Command) upon recommendations made by the Chief of Naval Operations (CNO). Annually, the CNO reviews the proposed ship decommissioning and deactivation plans, and the composition of the inactive fleet and its material condition, to reassess the number of ships to be held in the various categories of readiness and their disposition if not required for retention.

When determining which ships will be decommissioned or deactivated, several factors are taken into consideration. Maintaining a ship in inventory involves operational cost, manning requirements, maintenance, and system upgrades to ensure the continued interoperability and operational effectiveness. The ship's operational history, including particularly demanding operations in harsh environmental conditions, often impacts its viable service life. Other factors, such as design changes or modifications made to the ship, or a design that is not amenable to a subsequent operational system upgrade, may make it infeasible to continue its service. Since ships operate over periods of decades, sometimes the operational mission of the ship becomes obsolete and there is no continued operational purpose for the ship. Under these conditions, it may sometimes be advantageous to retire a ship despite the Navy's desire to maintain its numbers and avoid recapitalization costs.

The Navy's methods to reduce the inventory of deactivated or decommissioned ships, in priority order, include interagency transfers to the Maritime Administration, United States Coast Guard (USCG) or other government agencies; donations for memorial/museum use by the public; foreign military sales (FMS) transfers; dismantling or scrapping; experimental use; or by sinking in conjunction with critical fleet training exercises, weapons effectiveness testing, or forming artificial reefs. Nuclear-powered ships are dismantled by a special recycling process. Select ships that have completed their useful service lives may be retained in the inactive fleet for a period of time to be available for future mobilization or while awaiting disposal. The longer a ship remains in the inactive fleet, the less likely it will be operationally useful in the future and the more costly its reactivation or disposal becomes.

Two decisions are associated with the disposal of Navy ships. First is the decision to decommission or deactivate the ship from active service, including striking it from the Naval Register. The second is to determine its disposition following its retirement. This report outlines the Navy's plans for ship decommissioning and deactivation within the Future Years Defense Plan (FYDP), and further identifies those ships that will be either sunk or dismantled/disposed of in the same period.

II. Ships planned for decommissioning or deactivation during the Future Years Defense Plan

Table 1 lists, by year, the Navy ships that are to be decommissioned or deactivated within the FYDP. The table identifies the planned disposition for each ship. The description of any potential gap in warfighting capability that might occur when the ship is removed from service is included in the discussion below the table.

Table 1. Ships Planned for Decommissioning or Deactivation¹ during the FYDP

2009	USNS SATURN	T-AFS 10	SINKEX
	USNS CONCORD	T-AFS 5	SINKEX
	USNS SAN JOSE	T-AFS 7	SINKEX
	USNS HAYES	TAG 195	SINKEX
	USS JUNEAU	LPD 10	Inactive Fleet
	USS NASHVILLE	LPD 13	Inactive Fleet
	USS TARAWA	LHA 1	Inactive Fleet
	USS KITTY HAWK	CV 63	Inactive Fleet
2010	USNS KILAUEA	T-AE 26	SINKEX
	USNS MOUNT BAKER	T-AE 34	SINKEX
	USS MCINERNEY	FFG 8	Foreign Military Sales
	USS LOS ANGELES	SSN 688	Dismantle
	USS PHILADELPHIA	SSN 690	Dismantle
2011	USNS FLINT	T-AE 32	SINKEX
	USNS KISKA	T-AE 35	SINKEX
	USNS SHASTA	T-AE 33	SINKEX
	USS MEMPHIS	SSN 691	Dismantle
2012	USS BOONE	FFG 28	Foreign Military Sales
	USS STEPHEN W GROVES	FFG 29	Foreign Military Sales
	USS JOHN L HALL	FFG 32	Foreign Military Sales
	USS DUBUQUE	LPD 8	Inactive Fleet
	USS CLEVELAND	LPD 7	Inactive Fleet
2013	USS JARRETT	FFG 33	Foreign Military Sales
	USS UNDERWOOD	FFG 36	Foreign Military Sales
	USS CROMMELIN	FFG 37	Foreign Military Sales
	USS DOYLE	FFG 39	Foreign Military Sales
	USS KLAKRING	FFG 42	Foreign Military Sales
	USS DENVER	LPD 9	Inactive Fleet
	USS ENTERPRISE	CVN 65	Dismantle

Note:

1. Military Sealift Command ships are not commissioned ships. They are deactivated when removed from active service.

A. Aircraft Carriers (CV/CVN)

To maintain as constant a force structure as possible, the delivery of new aircraft carriers is planned to coincide with the scheduled decommissioning of carriers reaching the end of their expected service lives. USS KITTY HAWK (CV 63) will be decommissioned in the Spring of 2009, after nearly 48 years of service, at roughly the same time the Navy expects to take delivery of the last NIMITZ-class carrier, GEORGE H W BUSH (CVN 77). This schedule maintains the carrier fleet at 11 operational ships through early FY 2013. However, the delivery of GERALD R FORD (CVN 78) in September 2015 does not align with the inactivation of USS ENTERPRISE (CVN 65) after 51 years of service in November 2012. The Navy is requesting a waiver from Congress to allow the carrier force structure to decline to 10 ships during this 33-month period. Recognizing that this short-term carrier gap will result in increased stress on the remaining carrier force, the Navy has developed a workable strategy; using

deployment cycle lengths, Fleet Response Plan variations, and rescheduled ship maintenance availabilities; to mitigate the operational impacts of a 10-carrier force. The Navy remains committed to an 11 carrier force.

B. Surface Combatants

The FFG 7 class reaches the end of its service life prior to FY 2020. During the period of this report, nine guided missile frigates of the FFG 7 class will be retired at the end of their useful service lives and, provided the Littoral Combat Ships join the fleet as planned, there will be no capability gap.

C. Submarines

With the planned inactivation of USS LOS ANGELES (SSN 688), USS PHILADELPHIA (SSN 690), and USS MEMPHIS (SSN 691) at the end of their planned 33-year service lives, the Navy will have the required numbers of nuclear attack submarines until FY 2022. These SSN 688 class submarines are being replaced by the construction of VIRGINIA class attack submarines. The retirement of these ships will not exacerbate the long-term shortfall in submarine strength since their service lives do not permit their extension beyond FY 2022.

D. Amphibious Ships

The Commandant of the Marine Corps has determined that a minimum of 33 amphibious ships is necessary to support their assault echelon lift requirements; specifically, he has requested a force of 11 aviation capable amphibious ships, 11 LPDs and 11 LSDs. The Chief of Naval Operations supports the Commandant's determination. All of the ships in these classes will retire after 41-45 years of service. This addendum report reflects the service life extension of 2 AUSTIN class LPDs to 45 years and 47 years respectively, and 2 TARAWA class LHAs to 43 years. While the mix of the 33 ships reflected in this plan differs slightly from the USMC requirement, it represents acceptable risk considering the amphibious ships planned for decommissioning are not scheduled for dismantling or sinking to permit mobilization at a later date if required. The decommissioning ships are being replaced with newer more capable LPD 17 and LHA 6 class ships. The Navy will maintain the 33-ship requirement for amphibious shipping through the FYDP while these new ships are integrated into the battleforce. Consequently, there will be no amphibious ship capability gaps through at least FY 2019.

E. Combat Logistics Force (CLF) Ships (T-AFS and T-AE)

Navy has evolved its combat logistics support operational concept to reduce CLF ship requirements to three types, including the Fast Combat Support Ship (T-AOE), Fleet Oiler (T-AO), and Dry Cargo/Ammunition Ship (T-AKE). The Navy plans to retire aging combat cargo and ammunition ships (T-AFS and T-AE) as the new construction T-AKE class ships join active service, thereby maintaining CLF force levels. T-AKE will continue to replace the aging legacy CLF ships through FY 2011. No capability gap will exist within the Combat Logistics Force.

F. Support Ships.

Only one support ship, USNS HAYES T-AG 195, is planned for retirement during this FYDP. This ship is not required to support the Navy's 313-ship minimum force structure requirement.

III. Ships planned for disposal during the Future Years Defense Plan

The Navy recognizes that environmental and safety risks increase as inactive ships deteriorate and their disposal is delayed. The longer retired ships sit in the inactive fleet, the higher the environmental risks

and disposal costs. The Navy's inventory of inactive ships has been reduced from a high of 195 ships in 1997 to 62 ships today.

As indicated earlier, ships not identified for disposal are retained for possible future mobilization, transfer to other government organizations, foreign military sales, logistics support, or donation for use as museums or for public display. When these options are not appropriate, the two primary means of disposal of inactive ships are either by dismantling or sinking. Dismantling is one of the more costly options involving a commercial ship dismantling yard. The process for dismantling nuclear-powered ships is considerably more complex than conventionally-powered ships and requires special disposal of the propulsion plant components. For nuclear ships, dismantling through a special recycling process is the only viable option. Disposal of conventionally-powered ships by sinking will usually be conducted as part of an approved training exercise or to support weapons testing requirements. Inactive ships contribute significantly to the Navy in this role, as these exercises often result in cost savings for developmental programs requiring live-fire testing, provide key learning necessary to improve fleet tactics and weapons design, and provide on-going statistical data to assess weapons performance. Another option for sinking may be to provide an ocean bottom artifact to support fish and marine growth as an artificial reef. In both cases the Navy complies strictly with the Environmental Protection Agency directives of 1996 and 1999.

Specific ship disposition plans are made at the annual Ship Disposition Review Conference. The Ship Disposition Review Conference provides a forum for evaluating operational risk, inventory requirements and other issues to ensure the best possible recommendations for ship disposition are provided to Navy leadership. The Navy establishes its ship disposition plans based on the methods available that are most advantageous to the government.

Table 2. Ships Planned for Disposal by Dismantling

Ex-PUGET SOUND	AD 38	Ex-ANCHORAGE	LSD 36
Ex-CORONADO	AGF 11	Ex-FORT FISHER	LSD 40
Ex-SIMON LAKE	AS 33	Ex-TROUT	SS 566
Ex-L Y SPEAR	AS 36	USS LOS ANGELES	SSN 688
Ex-MCKEE	AS 41	Ex-DRUM	SSN 677
Ex-YORKTOWN	CG 48	Ex-OMAHA	SSN 692
Ex-VINCENNES	CG 49	Ex-CINCINNATI	SSN 693
Ex-THOMAS S GATES	CG 51	Ex-NEW YORK CITY	SSN 696
Ex-INDEPENDENCE	CV 62	Ex-GROTON	SSN 694
Ex-CONSTELLATION	CV 64	Ex-BIRMINGHAM	SSN 695
Ex-AUSTIN	LPD 4	Ex-PHOENIX	SSN 702
Ex-NEW ORLEANS	LPH 11	Ex-BALTIMORE	SSN 704

The Navy will dismantle the ships listed in Table 2 within the FYDP. Specific dates have not been determined as several factors dictate when the ships will be put under contract for their scrapping or recycling in the case of nuclear-powered ships. With the exception of nuclear-powered ships, dismantling is the lowest priority for disposal of ships and is used when other options are not feasible. For nuclear ships the dismantling through a special recycling process is the only viable option. The actual date of dismantlement depends on such factors as the timing of decommissioning or deactivation, the location of the ship and attendant requirements for hull cleaning and transfer to the dismantlement

facility, time available to strip the ship of any salvageable Navy components, any special holds placed on ships while reconsidering dismantlement, and availability of disposal funds.

Table 3. Ships Planned for Disposal by Sinking

FY	SHIP NAME	HULL NO.
2009	Ex-ACADIA	AD 42
	Ex-CONOLLY	DD 979
	USNS HAYES	TAG 195
2010	USNS CONCORD	T-AFS 5
	USNS SAN JOSE	T-AFS 7
	USNS SPICA	T-AFS 9
	USNS NIAGARA FALLS	T-AFS 3
2011	USNS KILAUEA	T-AE 26
	USNS SATURN	T-AFS 10
2012	USNS FLINT	T-AE 32
	USNS SHASTA	T-AE 33
	USNS MOUNT BAKER	T-AE 34
	USNS KISKA	T-AE 35
TBD	Ex-FORRESTAL	AVT 59
TBD	Ex-ARTHUR W RADFORD	DD 968

Table 3 lists the ships that the Navy plans for disposal by sinking as part of fleet training exercises during FY 2009 – 2012. All of these ships will be at or beyond their expected service lives when disposal is completed. Ex-FORRESTAL and Ex-ARTHUR W RADFORD are candidates for sinking to become artificial reefs. Specific dates for these two will not be set until all the prerequisite requirements and authorizations are obtained, and plans are appropriately coordinated with other agencies and Congress.

IV. Summary

This addendum outlines the Navy’s plans for retired or retiring ships developed as a result of an annual Ship Disposition Review conducted in December 2007. In developing this plan, the Navy’s focus has been on maintaining its 313-ship minimum force structure, cost avoidance by ensuring each ship operates for its full service life, and ensuring ships that might be required for future mobilizations remain in reserve. During the FYDP, the Navy will retire 29 ships with various dispositions including retention, logistics support assets, foreign military sales, donations for public displays, dismantling, and sinking. The Navy plans to dismantle 24 ships and sink 15 ships that have no further use for the Navy.

**Report to Congress on
Annual Long-Range Plan for
Construction of
Naval Vessels for FY 2009**

Prepared by:
Director, Warfare Integration (OPNAV N8F)
Office of the Chief of Naval Operations
2000 Navy Pentagon
Washington, DC 20350-2000

February 2008

Annual Long-Range Plan for Construction of Naval Vessels for FY 2009

I. Reporting Requirement

This report is submitted in accordance with Chapter 9, Section 231 of Title 10 United States Code, which requires the Secretary of Defense to submit with the Defense Budget, an annual long-range plan for the construction of naval vessels that includes the following:

(a) ANNUAL NAVAL VESSEL CONSTRUCTION PLAN AND CERTIFICATION – The Secretary of Defense shall include with the defense budget materials for a fiscal year:

- (1) A plan for the construction of combatant and support vessels for the Navy developed in accordance with this section; and
- (2) A certification by the Secretary that both the budget for that fiscal year and the future-years defense program provide for funding of the construction of naval vessels at a level that is sufficient for the procurement of the vessels provided for in the plan.

(b) ANNUAL NAVAL VESSEL CONSTRUCTION PLAN – Each such naval vessel construction plan shall contain the following:

- (1) A detailed program for the construction of combatant and support vessels for the Navy over the next 30 fiscal years.
- (2) A description of the necessary naval vessel force structure to meet the requirements of the national security strategy of the United States or the most recent Quadrennial Defense Review (*QDR*).
- (3) The estimated levels of annual funding necessary to carry out the program, together with a discussion of the procurement strategies on which such estimated levels of annual funding are based.

(c) ASSESSMENT WHEN VESSEL CONSTRUCTION BUDGET IS INSUFFICIENT TO MEET APPLICABLE REQUIREMENTS – If the budget for a fiscal year provides for funding of the construction of naval vessels at a level that is not sufficient to sustain the naval vessel force structure specified in the naval vessel construction plan for that fiscal year under subsection (a), the Secretary shall include an assessment that describes and discusses the risks associated with the reduced force structure of naval vessels that will result from funding naval vessel construction at such a level.

Additionally, the Senate Armed Services Committee has requested an addendum to this report that addresses the Navy's plans for decommissioning ships during the Future Years Defense Plan. Accordingly, the Navy has added the following information to this report:

(i) hull numbers of ships that are to be disposed by dismantling or sinking within the future-years defense plan; (ii) hull numbers of ships that are to be decommissioned within the future-years defense plan; (iii) gaps in capability that will occur upon the decommissioning of each ship, including duration of that capability gap; and (iv) disposition proposed for each ship upon decommissioning.

II. Submission of the Report

The Navy's Fiscal Year (FY) 2009 report reflects the capabilities needed to meet the challenges the nation faces with a reasonable degree of risk. The Chief of Naval Operations has stated that the Navy's 313-ship force structure represents a floor – the minimum number of ships the Navy should maintain in its inventory to provide the global reach; persistent presence; and strategic, operational, and tactical effects expected of Navy forces.

III. Background

The Navy faces many challenges in procuring a force that will be effective over the broad spectrum of naval missions anticipated in the coming decades. At the same time, escalating shipbuilding costs demand that the Navy procure only those ships that are necessary to accomplish critical missions, with the minimum essential capabilities, and in the most efficient and cost effective manner possible. The following sections outline the key factors that the Navy considered in developing its 30-year shipbuilding plan.

The complex configuration and size of naval vessels results in design times that range from two to seven or more years. Similarly, construction time can span up to eight years, and acquisition costs range from hundreds of millions to billions of dollars. Given the capital investment required, principal naval vessels are procured in relatively low numbers which can cause high and low cycles in annual budget requirements. Additionally, because of their size, propulsion plant type, and warfare systems, most Navy ships can only be constructed at a limited number of shipyards. This makes the timing of ship procurement a critical matter to the shipbuilding and combat system industries. Finally, ships' service lives can range from 20 years for smaller ships to 50 years for nuclear-powered aircraft carriers, mandating that ships be designed to accommodate capability upgrades throughout their time in service. Emerging and constantly improving threats drive new requirements. For instance, to ensure success in the Maritime Domain, a capability for Ballistic Missile Defense and full spectrum Anti-Submarine Warfare needs to be incorporated in our new classes of ships.

The Navy's legacy ships, some procured at a rate of four to five ships of a single class per year in the 1980s, are projected to retire during the next 30 years. With the high cost of new construction ships, the Navy cannot recapitalize its legacy ships at the same rate at which they were originally procured and maintain an affordable, balanced procurement plan. This dynamic causes fluctuations in force structure.

Since the Navy's shipbuilding plan spans a long period, it is divided into two phases, *Near-* and *Far-Term*, each with a fundamentally different focus and unique assumptions. A description of each follows:

- **Near-Term:** This period includes the current budget year, Future Years Defense Plan (FYDP), and FY 2014-2020. This phase addresses the Navy's transformation to a 21st Century fighting force with the introduction of several new ship designs, with the objective of minimizing adjustments to the plan in order to balance the mix of ships, unit costs, budgeted resources, and industrial base concerns. The requirements underpinning this balance are based on Defense-wide planning scenarios that are informed by intelligence assessments of future threats and operating environments. Given known ship capability and quantity requirements, the cost estimates are judged reasonably accurate inside the FYDP. The accuracy of the cost estimates diminishes in the FY 2014-2020 timeframe.

- Prevent or contain local disruptions before they impact the global system

C. Force Structure

The 313-ship force structure shown in previous versions of this report was compliant with the *QDR 06* and *Strategic Planning Guidance*. In this President’s Budget, the Navy has also considered the Maritime Strategy, and concluded that some adjustments should be made to this structure to accommodate essential changes in rotational, amphibious lift and intra-theater mobility requirements. No single mission area is disadvantaged in favor of any other to ensure that the Navy has the correct balance of carriers, submarines, cruisers, destroyers, amphibious and support ships to achieve the effects desired by the Combatant Commanders. However, the force structure depicted in this plan incurs risk in the following areas:

- Sourcing Carrier Strike Group (CSG) /Expeditionary Strike Group (ESG) demands for peacetime presence and warfighting response
- Ballistic Missile Defense
- Sea Shield (Theater Air and Missile Defense, Anti-Submarine Warfare) for CSG/ESG's
- Sourcing attack submarine (SSN) presence to approach Combatant Commanders’ demand, and for Intelligence, Surveillance, and Reconnaissance (ISR).
- Meeting the stated Marine Corps Amphibious Lift Requirements
- Supporting the Long War/Global Maritime Security
- Providing a credible strategic deterrent force

Absent additional resources to procure, operate and maintain a larger fleet, the Navy will be compelled to accept the risk inherent in the current plan’s minimum essential force structure. While in the main this plan achieves the necessary raw numbers of ships and sustains the shipbuilding industrial base, there are certain time periods where the ship mix, and therefore inherent capability of the force, varies from that required as a result of funding constraints and the timing of legacy fleet service life limits. The proposed force balances risk across mission areas with affordability, probability of need, and time required to recover should the future trend in an unexpected direction.

Table 1. Future Naval Force Structure (FY 2020)

Type/Class	313-Ship Force Structure
Aircraft Carriers	11
Surface Combatants	88
Littoral Combat Ships	55
Attack Submarines	48
Cruise Missile Submarines	4
Ballistic Missile Submarine	14
Amphibious Warfare Ships	31*
Combat Logistics Force Ships	30
Maritime Prepositioning Force (Future) Ships	12
Support Vessels	20

* Note: The DoN is reviewing options to increase assault echelon amphibious lift to 33 ships to meet USMC requirements.

A. Near-Term Naval Vessel Construction Plans

- The near-term plan focuses on transformation of the Navy Force structure to address the warfighting requirements of the 21st Century. These transformational ships include DDG 1000, CG(X), LCS, SSN 774, T-AKE, MPF(F) MLP, MPF(F) LMSR, and JHSV.
- The Navy continues to move toward establishing a sustaining production rate for its ship classes to reduce funding peaks in the future. Sustaining production rates will supply new ships at the same rate at which legacy ships reach the end of their planned service lives and have been planned for aircraft carriers, attack submarines, and amphibious ships. Transition to a sustaining rate for other ships where appropriate is addressed in the far-term.
- The Department appreciates Congress' support in the FY 2007 National Defense Authorization Act to fund aircraft carriers over four years. This split funding permits more efficient use of resources and facilitates stability in other shipbuilding programs and the Navy has adopted it in the President's FY2009 budget submission.
- Regarding surface combatants, the planned procurement of the DDG 1000 class will be completed by FY 2013 with a total of seven ships. The CG(X) program procures its first ship in FY 2011 with follow-on construction in FY 2013. The FY 2008 National Defense Authorization Act requires all major combatant vessels of the United States Navy strike forces to be constructed with an integrated nuclear power plant, unless the Secretary of Defense determines this not to be in the best interest of the United States. A nuclear propulsion plant will add to the cost per unit. This increased cost is not included in the current budget. The Navy acknowledges that this statute applies to CG(X). Resulting requirements definition and acquisition plans, including schedule options and associated risks, are being evaluated in preparation for CG(X) Milestone A.
- Table 3 shows the Navy has integrated the changes to the Littoral Combat Ship procurement plan previously reported to Congress.
- The Navy increased procurement to two VIRGINIA class attack submarines per year starting in FY 2011 in an effort to reduce a future inventory shortfall.
- The Navy has delayed MPF(F) procurement (\$14 billion) in order to resolve the concept of operations.
- There are two support ship changes. Analysis indicates the T-ATF service life can be extended to 40 years. This permits the Navy to delay starting procurement of the T-ATF replacements until FY 2015. Additionally, beginning in FY 2009, the Navy plans to procure a total of seven Joint High Speed Vessels (JHSV) at a rate of one ship per year to meet Combatant Commanders' demands for intra-theater lift and Theater Security Cooperation support.

B. Far-Term Naval Vessel Construction Plans

- The far-term plan focuses on recapitalizing the Navy's legacy ship inventory. In the period from FY 2021 to 2038, 165 ships will reach the end of their expected service lives – twice the number planned for retirement during the near-term phase. The Navy must manage meticulously the service lives and modernization of legacy ships during this period to prevent block obsolescence from causing unacceptable gaps in capability and capacity. Starting procurement of the next generation ships earlier than might otherwise be needed is an imperative to level the replacement

profile. In the far-term phase, about thirty percent more ships must be procured than in the near-term phase. This procurement, combined with the required sustaining-rate replacement of aircraft carriers, attack submarines and amphibious assault ships, will provide a more stable demand on industry and prevent this cyclic problem from recurring again in the future

- The replacement program for the OHIO class Ballistic Missile submarines is a strategic issue that merits immediate attention. Absent additional resources to recapitalize this national strategic capability, the Navy will be unable to concurrently replace the existing OHIO class submarines and the balance of its force structure requirements in accordance with this shipbuilding plan. In the interim, the Navy will continue to work with US Strategic Command to complete the requirements analyses and systems studies necessary to define the replacement program.
- Plans for recapitalization of the OHIO class submarines that have been converted to SSGN have been deferred until their warfighting utility can be assessed. Should their replacement be required, it will be necessary to integrate their procurement with other ship and submarine recapitalization efforts planned for the post-FY 2020 period.
- Amphibious ship procurement will transition to a sustaining rate in FY 2016, ultimately encompassing a single ship type that will replace today's LSD 41 and LPD 17 classes.

VII. 30-Year Naval Force Size

The 30-year shipbuilding construction plan presented above results in the projected ship inventory shown in Table 4 below. The total inventory of battle force ships and numbers of each type of ship will vary from year to year as a result of the complex relationship between retirements, procurement, affordability, design and construction times, industrial base capacity, warfighting priorities and service life limits of the legacy fleet. The projected numbers of ships in active service shown below are counted as of the end of each fiscal year.

Table 4. FY 2009-2038 Naval Battle Force Inventory

Fiscal Year	Near Term										Far Term																			
	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32	33	34	35	36	37	38

Total Naval Battle Force Inventory	295	297	297	299	292	283	277																							

The following sections describe the operational implications of ship inventories outlined in Near- and Far-Term phases over the 30-year span of this report.

A. Near-Term Naval Battle Force Inventory

- The minimum aircraft carrier force level requirement remains at 11 ships. However, the Navy is seeking a Congressional waiver to decrease the carrier force to 10 operational carriers between the

inactivation of USS ENTERPRISE (CVN 65) in November 2012 and the delivery of GERALD R FORD (CVN 78) in September 2015. During this 33-month period, Navy will mitigate the operational impact of the shortfall through selective rescheduling of carrier maintenance availabilities and by applying the inherent flexibility of the Fleet Response Plan. This risk mitigation strategy will support presence and surge requirements during this short time period, although it is not sustainable over a long period of time.

- The Littoral Combat Ship procurement profile was adjusted based on a program assessment following LCS-1 and LCS-2 cost increases. Although this assessment resulted in the removal of 13 ships from the FY 2008 President's Budget FYDP, the plan continues procurement to reach the objective of 55 ships by FY 2023.
- New T-AKE ships will replace the aging combat cargo and ammunition ships (T-AFS and T-AE) by FY 2012. This will complete the Navy's transition to a three ship-type combat logistics force, which will improve the overall effectiveness of operational fleet support. The Navy has committed to procure the minimum number of T-AKEs necessary to meet the Combat Logistic Force (CLF) requirement, currently assessed to be 12 T-AKEs. When MPF(F) T-AKE assets are considered in logistics planning for major combat operations, the CLF requirement drops to 11 T-AKEs, enabling the transfer of the 12th CLF T-AKE to the MPF(F).
- Ultimately, the 14-ship MPF(F) squadron will preposition the equipment and supplies of a planned FY 2015 Marine Expeditionary Brigade and will be capable of conducting at sea arrival and assembly operations to combat configure, employ, deliver and sustain Joint forces from over the horizon. MPF(F) ships will also meet Combatant Commander tasking for Theater Security Cooperation, disaster relief and other contingencies. The current budget does not include the 13th or 14th T-AKEs required to meet the MPF(F) structure described above, pending completion of an ongoing MPF(F) concept of operations study. It is expected that the assessment will show that the MPF(F) will need these two T-AKEs .
- JHSV class ships will provide support for intra-theater lift and Theater Security Cooperation at a relatively low cost. Additionally, the inventory of T-AGOS ships has been increased to account for lower operational availability than anticipated which has increased the rotational requirements for this class.

B. Far-Term Naval Battle Force Inventory

- The demand for Aegis ships is expected to increase because of their BMD capability. Achieving full service life from CG 47 class ships, and performing additional maintenance to extend the service life of DDG 51 class ships, is imperative to reduce the impact of rapid post-FY 2020 retirements pending entry of sufficient DDG(X) class ships into active service. A single mid-life modernization is no longer adequate for CG 47 and DDG 51 class ships due to the evolving threat environment, mandating periodic updates to keep them effective and to sustain engineering plant capacity. The current CG and DDG modernization efforts are the foundation for this effort and will serve as the baseline for subsequent upgrades throughout the remainder of their service lives. The impact of extending the service life of DDG 51 class ships five years is reflected in Table 4.
- The Navy faces a shortfall in its attack submarine inventory from FY 2022 through FY 2033. The inventory will reach a minimum of 41 ships in FY 2028-2029. The Navy has identified a strategy to mitigate the impact of this shortfall to include the following: (a) reducing build time of Virginia class attack submarines to 60 months; (b) extending the service life of selected attack submarines based on

technical feasibility and affordability; and (c) extending, as needed, the length of attack submarine deployments from 6 to 7 months to meet operational requirements.

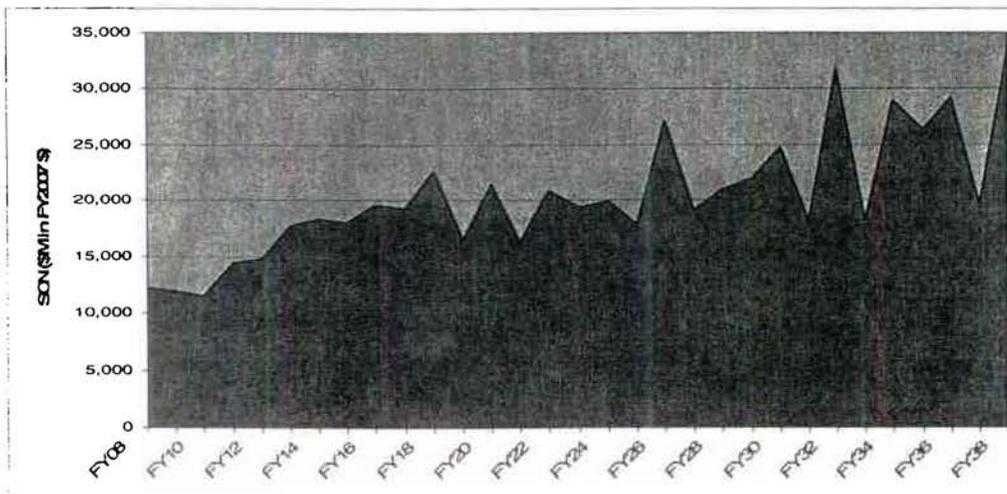

- OHIO class ballistic missile submarines start retiring in FY 2027, requiring construction of a replacement SSBN beginning in FY 2019. Any delay in construction will impact the Navy’s ability to meet U.S. Strategic Command’s (USSTRATCOM) Sea-Based Strategic Deterrent requirement.
- The Marine Corps requires sufficient Assault Echelon amphibious lift to support 2.0 Marine Expeditionary Brigades (MEB). MPF(F) will reinforce and support a 2.0 MEB Assault Echelon within a Marine Expeditionary Force-level operation by projecting a brigade and its associated support, and by providing the interface between operational and tactical logistics support from the Sea Base.
- Mine warfare ships will be replaced by Littoral Combat Ships configured with the mine warfare mission package. Legacy mine warfare ships will be phased out gradually by FY 2024.

VIII. Estimated Levels of Annual Funding Required for the Long-Range Shipbuilding Program

A. Overall

Figure 1 provides the estimated annual new construction funding requirements in FY 2007 dollars. The Navy recognizes that building the required force structure will largely depend on controlling shipbuilding costs (including combat systems) within an affordable range. This will require the combined efforts of the Navy, and the shipbuilding and combat systems industries. Working with Congress, the Navy is committed to procuring and sustaining the force structure necessary to deliver the effects expected of United States naval forces.

Figure 1. Annual Funding Required for Navy Long-Range Shipbuilding (FY 2009-2038)

Note:
 This estimate shows funding required to support construction of the 313-ship minimum force structure over the period of the report. It does not include funding for SSBN recapitalization, CVN Refueling Complex Overhauls, SSBN/SSN Engineered Refueling Overhauls, other conversions, service life extension programs, small craft, or other costs associated with the Navy shipbuilding construction account. Per section VI.A., the estimate will be updated for FY 2010 based on CG(X) Milestone A decision, and in compliance with FY 2008 National Defense Authorization Act.

B. Near-Term Funding Requirements

The average steady-state annual shipbuilding funding required for achieving and sustaining the previous report's minimum 313-ship force structure was approximately \$13.4 billion per year in FY 2005 dollars (\$14.4 billion in FY 2007 dollars). The Navy's current cost estimate is affected in the near term by such factors as the FY 2006 Pension Protection Act, rising material costs, increasing labor rates, and the cost risk associated with developing and building new ship classes. Additionally, minimal first-tier shipbuilding capacity is devoted to commercial business, placing the overhead burden largely on Navy shipbuilding programs.

An additional complicating factor in ship procurement is the effect of the inflation rate experienced in the shipbuilding industrial sector compared to the Navy's budget. The shipbuilding industry's historical cost inflation rate is approximately 1.5 percent higher than the rate used by the Department of Defense to adjust the budget for year-to-year inflation. Consequently, the Navy's total obligation authority (TOA) has not paced the shipbuilding cost inflation rate. The net result of this mismatch is that resources available to support shipbuilding are eroding.

Accordingly, the Navy has revised the average steady-state annual shipbuilding funding requirement to \$15.8 billion per year in FY 2007 dollars through the near-term period (through FY 2020). The \$15.8 billion per year investment includes National Defense Sealift Funds (NDSF) and applies only to new construction battle force ships. It does not include funding for SSBN recapitalization, CVN Refueling Complex Overhauls, SSBN/SSN Engineered Refueling Overhauls, other conversions, service life extension programs, small craft, or other costs associated with the Navy shipbuilding construction account.

The Navy is experiencing some success in controlling and reducing shipbuilding costs. The VIRGINIA class SSN program is on track to reduce procurement cost by \$400 million per ship (FY 2005 dollars) by FY 2012 through an aggressive cost reduction program. Program elements facilitating this success include increasing production to two submarines per year under multi-year procurement authority, improving construction performance, investing in capital improvements, and implementing design changes to reduce construction costs.

To better control requirements, the Navy's Requirements and Resources Review Board (R3B) and newly instituted acquisition governance process changes are effectively managing adjustments to top-line requirements after programs have been initiated. Future process improvements will exert executive level control over shipbuilding and combat systems technical authority actions which have a large impact on program cost.

C. Far-Term Funding Requirements

The majority of procurement planned beyond FY 2020 is focused on recapitalizing retiring ship classes. Dramatically increased funding is required just to maintain Navy force levels during the post-FY 2020 period, without including funding that may be required to replace retiring non-battle force Strategic Sealift ships. Many of the new replacement ships identified as part of the Navy's 30-year shipbuilding program have not been designed. Cost estimates for these ships will remain a rough order of magnitude until conceptual designs are completed and more accurate cost estimating methods can be applied.

The Navy is emphasizing repeat builds of ships within the same class to reduce new construction costs, provided required warfighting capabilities can be fielded using this approach. This permits longer production runs and resultant cost reductions associated with production improvements and economies of scale. The Navy's shipbuilding plans include incorporation of open architecture for hardware and software systems and increased use of systems modularity. In addition, the Navy is aggressively pursuing opportunities to incorporate standardized components to reduce logistics support costs. These

initiatives will reduce the cost of maintenance and system upgrades, and will facilitate keeping Navy ships in service longer.

The Navy will consider several industrial factors as it pursues operational capability at reduced cost. First, level loading of ship procurements to help sustain minimum employment levels and skill retention will promote a healthy U.S. shipbuilding industrial base. Further, to achieve affordability goals, Navy program managers will make greater use of contract incentives, such as steep share lines combined with performance incentives, multi-year procurement, fixed price contracts (when and where appropriate), and increased use of competition to contribute to real shipbuilding cost containment.

IX. Naval Vessel Construction Risk

Funding for the Navy's shipbuilding requirements meets the needs of the Department and fully funds those ships included in the FY 2009 President's Budget and the Future Years Defense Plan through FY 2013.

X. Summary

Navy continues to analyze operational requirements, ship designs and costs, acquisition plans and tools, and industrial base capacity to further improve its shipbuilding plans, but the near-term shipbuilding plans have remained relatively stable. Although a larger force may reduce the significant major combat operations and Long War risks inherent in the 313-ship minimum force structure depicted, this plan represents an acceptable balance between capability, affordability, and the need to sustain the industrial base.

Full funding and support of this plan is crucial if the Navy is to maintain the minimum essential battleforce necessary to meet the maritime needs of the nation.

Addendum Report

Navy Plans for Decommissioning Ships during Future-Years Defense Plan (FYDP)

I. Introduction

This addendum report is in compliance with the Senate Armed Services Committee request for additional information regarding decommissioning and disposal of Naval vessels:

The Committee directs the Secretary of Defense to include, as an addendum to the annual report on the construction of naval vessels, commencing with submission of the report for fiscal year 2009, the future-years defense plan for the Navy's inactive ships. The addendum shall address: (i) hull numbers of ships that are to be disposed by dismantling or sinking within the future-years defense plan; (ii) hull numbers of ships that are to be decommissioned within the future-years defense plan; (iii) gaps in capability that will occur upon the decommissioning of each ship, including duration of that capability gap; and (iv) disposition proposed for each ship upon decommissioning.

The Secretary of the Navy approves the change in status of all ships, active or inactive, of the United States Navy (including Military Sealift Command) upon recommendations made by the Chief of Naval Operations (CNO). Annually, the CNO reviews the proposed ship decommissioning and deactivation plans, and the composition of the inactive fleet and its material condition, to reassess the number of ships to be held in the various categories of readiness and their disposition if not required for retention.

When determining which ships will be decommissioned or deactivated, several factors are taken into consideration. Maintaining a ship in inventory involves operational cost, manning requirements, maintenance, and system upgrades to ensure the continued interoperability and operational effectiveness. The ship's operational history, including particularly demanding operations in harsh environmental conditions, often impacts its viable service life. Other factors, such as design changes or modifications made to the ship, or a design that is not amenable to a subsequent operational system upgrade, may make it infeasible to continue its service. Since ships operate over periods of decades, sometimes the operational mission of the ship becomes obsolete and there is no continued operational purpose for the ship. Under these conditions, it may sometimes be advantageous to retire a ship despite the Navy's desire to maintain its numbers and avoid recapitalization costs.

The Navy's methods to reduce the inventory of deactivated or decommissioned ships, in priority order, include interagency transfers to the Maritime Administration, United States Coast Guard (USCG) or other government agencies; donations for memorial/museum use by the public; foreign military sales (FMS) transfers; dismantling or scrapping; experimental use; or by sinking in conjunction with critical fleet training exercises, weapons effectiveness testing, or forming artificial reefs. Nuclear-powered ships are dismantled by a special recycling process. Select ships that have completed their useful service lives may be retained in the inactive fleet for a period of time to be available for future mobilization or while awaiting disposal. The longer a ship remains in the inactive fleet, the less likely it will be operationally useful in the future and the more costly its reactivation or disposal becomes.

Two decisions are associated with the disposal of Navy ships. First is the decision to decommission or deactivate the ship from active service, including striking it from the Naval Register. The second is to determine its disposition following its retirement. This report outlines the Navy's plans for ship decommissioning and deactivation within the Future Years Defense Plan (FYDP), and further identifies those ships that will be either sunk or dismantled/disposed of in the same period.

II. Ships planned for decommissioning or deactivation during the Future Years Defense Plan

Table 1 lists, by year, the Navy ships that are to be decommissioned or deactivated within the FYDP. The table identifies the planned disposition for each ship. The description of any potential gap in warfighting capability that might occur when the ship is removed from service is included in the discussion below the table.

Table 1. Ships Planned for Decommissioning or Deactivation¹ during the FYDP

FY	SHIP NAME	HULL NO.	PLANNED DISPOSITION
2009	USNS SATURN	T-AFS 10	SINKEX
	USNS CONCORD	T-AFS 5	SINKEX
	USNS SAN JOSE	T-AFS 7	SINKEX
	USNS HAYES	TAG 195	SINKEX
	USS JUNEAU	LPD 10	Inactive Fleet
	USS NASHVILLE	LPD 13	Inactive Fleet
	USS TARAWA	LHA 1	Inactive Fleet
	USS KITTY HAWK	CV 63	Inactive Fleet
2010	USNS KILAUEA	T-AE 26	SINKEX
	USNS MOUNT BAKER	T-AE 34	SINKEX
	USS MCINERNEY	FFG 8	Foreign Military Sales
	USS LOS ANGELES	SSN 688	Dismantle
	USS PHILADELPHIA	SSN 690	Dismantle
2011	USNS FLINT	T-AE 32	SINKEX
	USNS KISKA	T-AE 35	SINKEX
	USNS SHASTA	T-AE 33	SINKEX
	USS MEMPHIS	SSN 691	Dismantle

	USS STEPHEN W GROVES	FFG 29	Foreign Military Sales
	USS JOHN L HALL	FFG 32	Foreign Military Sales
	USS DUBUQUE	LPD 8	Inactive Fleet
	USS CLEVELAND	LPD 7	Inactive Fleet
2013	USS JARRETT	FFG 33	Foreign Military Sales
	USS UNDERWOOD	FFG 36	Foreign Military Sales
	USS CROMMELIN	FFG 37	Foreign Military Sales
	USS DOYLE	FFG 39	Foreign Military Sales
	USS KLAKRING	FFG 42	Foreign Military Sales
	USS DENVER	LPD 9	Inactive Fleet
USS ENTERPRISE	CVN 65	Dismantle	

Note:

1. Military Sealift Command ships are not commissioned ships. They are deactivated when removed from active service.

A. Aircraft Carriers (CV/CVN)

To maintain as constant a force structure as possible, the delivery of new aircraft carriers is planned to coincide with the scheduled decommissioning of carriers reaching the end of their expected service lives. USS KITTY HAWK (CV 63) will be decommissioned in the Spring of 2009, after nearly 48 years of service, at roughly the same time the Navy expects to take delivery of the last NIMITZ-class carrier, GEORGE H W BUSH (CVN 77). This schedule maintains the carrier fleet at 11 operational ships through early FY 2013. However, the delivery of GERALD R FORD (CVN 78) in September 2015 does not align with the inactivation of USS ENTERPRISE (CVN 65) after 51 years of service in November 2012. The Navy is requesting a waiver from Congress to allow the carrier force structure to decline to 10 ships during this 33-month period. Recognizing that this short-term carrier gap will result in increased stress on the remaining carrier force, the Navy has developed a workable strategy; using

deployment cycle lengths, Fleet Response Plan variations, and rescheduled ship maintenance availabilities; to mitigate the operational impacts of a 10-carrier force. The Navy remains committed to an 11 carrier force.

B. Surface Combatants

The FFG 7 class reaches the end of its service life prior to FY 2020. During the period of this report, nine guided missile frigates of the FFG 7 class will be retired at the end of their useful service lives and, provided the Littoral Combat Ships join the fleet as planned, there will be no capability gap.

C. Submarines

With the planned inactivation of USS LOS ANGELES (SSN 688), USS PHILADELPHIA (SSN 690), and USS MEMPHIS (SSN 691) at the end of their planned 33-year service lives, the Navy will have the required numbers of nuclear attack submarines until FY 2022. These SSN 688 class submarines are being replaced by the construction of VIRGINIA class attack submarines. The retirement of these ships will not exacerbate the long-term shortfall in submarine strength since their service lives do not permit their extension beyond FY 2022.

D. Amphibious Ships

The Commandant of the Marine Corps has determined that a minimum of 33 amphibious ships is necessary to support their assault echelon lift requirements; specifically, he has requested a force of 11 aviation capable amphibious ships, 11 LPDs and 11 LSDs. The Chief of Naval Operations supports the Commandant's determination. All of the ships in these classes will retire after 41-45 years of service. This addendum report reflects the service life extension of 2 AUSTIN class LPDs to 45 years and 47 years respectively, and 2 TARAWA class LHAs to 43 years. While the mix of the 33 ships reflected in this plan differs slightly from the USMC requirement, it represents acceptable risk considering the amphibious ships planned for decommissioning are not scheduled for dismantling or sinking to permit mobilization at a later date if required. The decommissioning ships are being replaced with newer more capable LPD 17 and LHA 6 class ships. The Navy will maintain the 33-ship requirement for amphibious shipping through the FYDP while these new ships are integrated into the battleforce. Consequently, there will be no amphibious ship capability gaps through at least FY 2019.

E. Combat Logistics Force (CLF) Ships (T-AFS and T-AE)

Navy has evolved its combat logistics support operational concept to reduce CLF ship requirements to three types, including the Fast Combat Support Ship (T-AOE), Fleet Oiler (T-AO), and Dry Cargo/Ammunition Ship (T-AKE). The Navy plans to retire aging combat cargo and ammunition ships (T-AFS and T-AE) as the new construction T-AKE class ships join active service, thereby maintaining CLF force levels. T-AKE will continue to replace the aging legacy CLF ships through FY 2011. No capability gap will exist within the Combat Logistics Force.

F. Support Ships.

Only one support ship, USNS HAYES T-AG 195, is planned for retirement during this FYDP. This ship is not required to support the Navy's 313-ship minimum force structure requirement.

III. Ships planned for disposal during the Future Years Defense Plan

The Navy recognizes that environmental and safety risks increase as inactive ships deteriorate and their disposal is delayed. The longer retired ships sit in the inactive fleet, the higher the environmental risks

and disposal costs. The Navy's inventory of inactive ships has been reduced from a high of 195 ships in 1997 to 62 ships today.

As indicated earlier, ships not identified for disposal are retained for possible future mobilization, transfer to other government organizations, foreign military sales, logistics support, or donation for use as museums or for public display. When these options are not appropriate, the two primary means of disposal of inactive ships are either by dismantling or sinking. Dismantling is one of the more costly options involving a commercial ship dismantling yard. The process for dismantling nuclear-powered ships is considerably more complex than conventionally-powered ships and requires special disposal of the propulsion plant components. For nuclear ships, dismantling through a special recycling process is the only viable option. Disposal of conventionally-powered ships by sinking will usually be conducted as part of an approved training exercise or to support weapons testing requirements. Inactive ships contribute significantly to the Navy in this role, as these exercises often result in cost savings for developmental programs requiring live-fire testing, provide key learning necessary to improve fleet tactics and weapons design, and provide on-going statistical data to assess weapons performance. Another option for sinking may be to provide an ocean bottom artifact to support fish and marine growth as an artificial reef. In both cases the Navy complies strictly with the Environmental Protection Agency directives of 1996 and 1999.

Specific ship disposition plans are made at the annual Ship Disposition Review Conference. The Ship Disposition Review Conference provides a forum for evaluating operational risk, inventory requirements and other issues to ensure the best possible recommendations for ship disposition are provided to Navy leadership. The Navy establishes its ship disposition plans based on the methods available that are most advantageous to the government.

Table 2. Ships Planned for Disposal by Dismantling

SHIP NAME	HULL NO.	SHIP NAME	HULL NO.
Ex-PUGET SOUND	AD 38	Ex-ANCHORAGE	LSD 36
Ex-CORONADO	AGF 11	Ex-FORT FISHER	LSD 40
Ex-SIMON LAKE	AS 33	Ex-TROUT	SS 566
Ex-L Y SPEAR	AS 36	USS LOS ANGELES	SSN 688
Ex-MCKEE	AS 41	Ex-DRUM	SSN 677
Ex-YORKTOWN	CG 48	Ex-OMAHA	SSN 692
Ex-VINCENNES	CG 49	Ex-CINCINNATI	SSN 693
Ex-THOMAS S GATES	CG 51	Ex-NEW YORK CITY	SSN 696
Ex-INDEPENDENCE	CV 62	Ex-GROTON	SSN 694
Ex-CONSTELLATION	CV 64	Ex-BIRMINGHAM	SSN 695
Ex-AUSTIN	LPD 4	Ex-PHOENIX	SSN 702
Ex-NEW ORLEANS	LPH 11	Ex-BALTIMORE	SSN 704

The Navy will dismantle the ships listed in Table 2 within the FYDP. Specific dates have not been determined as several factors dictate when the ships will be put under contract for their scrapping or recycling in the case of nuclear-powered ships. With the exception of nuclear-powered ships, dismantling is the lowest priority for disposal of ships and is used when other options are not feasible. For nuclear ships the dismantling through a special recycling process is the only viable option. The actual date of dismantlement depends on such factors as the timing of decommissioning or deactivation, the location of the ship and attendant requirements for hull cleaning and transfer to the dismantlement

facility, time available to strip the ship of any salvageable Navy components, any special holds placed on ships while reconsidering dismantlement, and availability of disposal funds.

Table 3. Ships Planned for Disposal by Sinking

FY	SHIP NAME	HULL NO.
2009	Ex-ACADIA	AD 42
	Ex-CONOLLY	DD 979
	USNS HAYES	TAG 195
2010	USNS CONCORD	T-AFS 5
	USNS SAN JOSE	T-AFS 7
	USNS SPICA	T-AFS 9
	USNS NIAGARA FALLS	T-AFS 3
2011	USNS KILAUEA	T-AE 26
	USNS SATURN	T-AFS 10
2012	USNS FLINT	T-AE 32
	USNS SHASTA	T-AE 33
	USNS MOUNT BAKER	T-AE 34
	USNS KISKA	T-AE 35
TBD	Ex-FORRESTAL	AVT 59
TBD	Ex-ARTHUR W RADFORD	DD 968

Table 3 lists the ships that the Navy plans for disposal by sinking as part of fleet training exercises during FY 2009 – 2012. All of these ships will be at or beyond their expected service lives when disposal is completed. Ex-FORRESTAL and Ex-ARTHUR W RADFORD are candidates for sinking to become artificial reefs. Specific dates for these two will not be set until all the prerequisite requirements and authorizations are obtained, and plans are appropriately coordinated with other agencies and Congress.

IV. Summary

This addendum outlines the Navy’s plans for retired or retiring ships developed as a result of an annual Ship Disposition Review conducted in December 2007. In developing this plan, the Navy’s focus has been on maintaining its 313-ship minimum force structure, cost avoidance by ensuring each ship operates for its full service life, and ensuring ships that might be required for future mobilizations remain in reserve. During the FYDP, the Navy will retire 29 ships with various dispositions including retention, logistics support assets, foreign military sales, donations for public displays, dismantling, and sinking. The Navy plans to dismantle 24 ships and sink 15 ships that have no further use for the Navy.

THE SECRETARY OF THE NAVY
WASHINGTON, D.C. 20350-1000

February 4, 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

Section 361 of the John Warner Fiscal Year (FY) 2007 National Defense Authorization Act directs the Secretary of Defense to submit to the congressional defense committees a written certification that the Navy has budgeted and programmed funding to fully meet the requirements in FY 2009 for: (1) ship steaming days per quarter for deployed and non-deployed ship operations; and (2) projected depot maintenance for ships and aircraft. This responsibility has been delegated to the Secretary of the Navy.

The Department of the Navy has budgeted and programmed sufficient funding in FY 2009 to meet baseline mission requirements in the areas of ship steaming days per quarter for deployed and non-deployed ship operations, and projected requirements for ship and aircraft depot maintenance.

Section 361 also directs submission to the congressional defense committees an annual report that sets forth the progress toward budgeting resources to sustain required readiness levels in support of the national military strategy without significant risk. The enclosed FY 2009 report provides assessments for deployed and non-deployed quarterly ship steaming days requirements, and projected ship and air depot maintenance programs. The report also provides documentation supporting the required certification.

A similar letter has been sent to Chairmen Skelton, Inouye and Murtha. As always, if I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

C2. Table summary of air depot maintenance by airframe units And location	6

REPORTING REQUIREMENT

Section 361 of the John Warner National Defense Authorization Act for Fiscal Year (FY) 2007 directed the Secretary of the Navy to submit an annual report setting forth the progress toward funding the requirements for the number of ship steaming days per quarter for Navy ship operations as well as projected depot maintenance for Navy ships and aircraft. The required report shows that the Navy has budgeted and programmed funding to fully meet the requirements for that fiscal year for each of the following:

- (a) The deployed and non-deployed quarterly ship steaming day requirements, itemized by active-duty component and reserve component.
- (b) The associated budget request for each of the following:
 - (1) Deployed and non-deployed ship steaming days per quarter.
 - (2) Chief of Naval Operations ship depot maintenance availabilities, shown by type of maintenance availability and by location.
 - (3) Air depot maintenance workload, shown by type of airframe and by location.

1. Steaming Day Requirement

A. Deployed and Non-deployed ship steaming days per quarter.

Active Component

The FY 2009 ship steaming day baseline requirement for the active duty component is 45 days per quarter deployed and 22 days per quarter non-deployed to meet mission requirements for presence and theatre security cooperation. The steaming day requirement incorporates the impact of higher demand on forces, due to the Global War on Terrorism (GWOT), on peacetime operational tempo. Funding in FY 2009 meets this requirement.

Reserve Component

The FY 2009 ship steaming day requirement for the reserve component is 35 days per quarter deployed and 18 days per quarter non-deployed. The identification of the 35 day per quarter requirement for the reserve component reflects the programming of 22 deployed operating months for the reserves in FY 2009. Funding in FY 2009 meets this requirement.

B. CNO Ship depot maintenance requirements.

The types of ship depot maintenance availabilities that will be conducted in FY 2009 are:

- Selected Restricted Availability (SRA)
- Planned Maintenance Availability (PMA)
- Planned Incremental Availability (PIA)
- Overhaul (OH)
- Service Craft Overhaul (SCO)

The number, type and location of the availabilities programmed during FY 2009 are delineated in the following table:

Planned Ship Availabilities

Location	FY 2009				
	Availability Count				
	SRA	PMA	PIA	OH	SCO
Jacksonville, FL	11	0	0	0	0
Newport News, VA	1	0	0	0	0
Norfolk, VA	18	8	0	1	0
Portsmouth, NH	1	0	0	1	0
Pearl Harbor, HI	6	1	0	1	0
Puget Sound, WA	4	0	1	0	0
San Diego, CA	3	4	0	0	0
FDNF	12	1	0	0	0
TBD	1	1	0	0	0
Total Availabilities	57	15	1	3	0

Typically, the Navy's budget for Ship Maintenance will reflect a small percentage for deferred maintenance. The amount programmed and budgeted in FY 2009 for Ship Maintenance is 97% of requirement and assumes an acceptable level of risk. This level of resources does not include the likely impact of the continuation of the GWOT. For example, in FY 2007, GWOT operations required an additional \$474M for ship maintenance above the baseline budgeted amount.

C. Air depot maintenance requirements.

The Air Depot Maintenance FY 2009 workload, shown by type of airframe / engine and location, is displayed below. The amount programmed and budgeted provides 100% of Primary Authorized Aircraft (PAA) for deployed squadrons, and 88% for non-deployed squadrons against a goal of 90% PAA. Engine Maintenance is funded to ensure that 100% of PAA and Basic Authorized Aircraft will have zero bare firewalls, and that ready-for-issue spares are at 90%. In FY 2009, 88% of engine Type/Model/Series meet the 90% spares goal. The variance to the goal is result of capacity constraints of the repair facilities, and not the result of the amount budgeted. However, these levels still fully support the Department's Fleet Response Plan requirements for FY 2009.

The following tables summarize air depot maintenance workload by airframe, engine units and by location.

Committee on Appropriations
United States House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

The conference agreement for appropriations for fiscal year 2008 appropriates \$295,689,000 for the Department of Defense Base Closure Account 1990, which includes an increase of \$50,000,000 above the budget requested by the Navy.

The enclosed report, required by the 110th Congress House of Representatives Conference Report 110-424, details the planned expenditure of the additional funds.

Sincerely,

A handwritten signature in black ink, appearing to read "Wayne Army", written in a cursive style.

REPORT TO CONGRESS
ON
CHARTERING OF FOREIGN-BUILT SHIPS

Prepared by:

Military Sealift Command
914 Charles Morris Court, SE
Washington Navy Yard, DC 20398-5540

March 2008

Report to Congress On Chartering of Foreign-Built Ships

I. Report Requirements

The Fiscal Year 2008 House Appropriations Committee Report 110-279 directs the Secretary of the Navy to submit a report not later than March 31, 2008 that outlines a plan to end the practice of leasing foreign-built ships to supplement the Navy fleet and institute the practice of utilizing only American-built ships within four years.

II. Background

The Navy's Military Sealift Command (MSC) charters vessels from the commercial market to meet the unique military requirements of Department of Defense (DoD) components, including the afloat prepositioning and ocean transportation of military cargo. Chartering allows DoD to respond efficiently in cases where the military requirement is immediate, subject to change, or of uncertain duration.

MSC is prohibited from chartering a vessel for a period of greater than five years, including option years, unless specifically authorized by law (10 USC §2401).¹ Ships that are time chartered for more than six months to meet military missions are U.S.-flagged and crewed by U.S. merchant mariners. MSC currently enters into contracts for firm periods of up to one year with four one-year options when it time charters such vessels.

When a foreign-built ship is used for these charters, the ship is required to be converted to U.S.-flag, and crewed by U.S. citizen mariners prior to the beginning of the charter. Any conversion work needed to bring the foreign-built ship up to U.S. flag standards and any modifications needed to meet contract requirements, by law, must be accomplished in U.S. shipyards (10 USC §2631(b)).

Few commercial ships with high military utility have been constructed in U.S. shipyards in the past 20 years. Consequently, when MSC has a requirement to charter a vessel, nearly all of the offers are for foreign-built ships.

Currently there are 32 vessels under time-charter for periods exceeding six months; seventeen of which are U.S.-flagged foreign-built ships.

¹ Congress recently imposed additional leasing restrictions by amending 10 U.S.C. §2401 to limit a Military Department's authority to enter into a contract for the lease a vessel, or the provision of a vessel through a charter or service contract, for a period greater than two years but less than five years. A Military Department may enter into such a contract only after providing notice of the proposed contract to the congressional defense committees and waiting for 30 days of continuous session of Congress to pass. *See* National Defense Authorization Act for Fiscal Year 2008 § 1011, Pub. L. No. 110-181, 122 Stat. 3 (2008).

III. Current Foreign-Built Ships Under Charter

Since 2002 the number of foreign-built ships under charter to MSC has declined from 22 to 17. The 17 foreign-built chartered ships include two special mission ships, 11 prepositioned ships, and four sealift ships.

The following table provides information on each of the 17 ships (see Enclosure 1 for additional information including detailed plans to meet future requirements):

Foreign-Built Ships Under Charter (Six Months or Greater) To Military Sealift Command

<u>Vessel Name</u>	<u>Vessel Type</u>	<u>Country of Origin</u> [^]	<u>DOD CUSTOMER / Mission</u>	<u>End Date</u>
SPECIAL MISSION SHIPS				
CORY CHOUEST*	Offshore Supply Vessel	Norway	USN/ Undersea Surveillance	31-Aug-08
HSV 2 SWIFT**	HSV	Australia	USN/ High Speed Vessel	14-Jul-08
PREPOSITIONING SHIPS				
WESTPAC EXPRESS**	HSV	Australia	USMC/ Dry Cargo and PAC Japan and S. Korea	30-Sep-11
CPL LOUIS J. HAUGE JR*	Multipurpose Container/RoRo	Denmark	USMC/ Prepo Cargo Guam and Saipan	6-Sep-09
PFC WILLIAM B. BAUGH*	Multipurpose Container/RoRo	Denmark	USMC/ Prepo Cargo Diego Garcia	27-Oct-09
PFC JAMES ANDERSON JR*	Multipurpose Container/RoRo	Denmark	USMC/ Prepo Cargo Guam and Saipan	25-Mar-10
1ST LT. ALEX BONNYMAN*	Multipurpose Container/RoRo	Denmark	USMC/ Prepo Cargo Guam and Saipan	25-Sep-10
PVT FRANKLIN J. PHILLIPS*	Multipurpose Container/RoRo	Denmark	USMC/ Prepo Cargo Diego Garcia	11-Sep-10
LTC JOHN U.D. PAGE	Container	S. Korea	USA/ Prepo Cargo Diego Garcia	31-Dec-10
SSG EDWARD A. CARTER JR.	Container	S. Korea	USA/ Prepo Cargo Diego Garcia	30-Jun-11

BAFFIN STRAIT	Multi-Purpose Container	China	USN/ Diego Garcia Dry Cargo Shuttle	30-Sep-09
AMERICAN TERN	Multi-Purpose Container	Germany	NSF & USAF / Dry Cargo for Antarctica and Greenland	30-Sep-10
VIRGINIAN	Heavy Lift Container	Germany	JOINT MUNITIONS CMD/ Dry Cargo Operations	15-Oct-11
TRANSPACIFIC	Tanker	Turkey	DESC/ Far East Petroleum Shuttle	22-Oct-11

No Continued Chartering Requirement

Continued Chartering Requirement

TBD

* Charter specifically authorized by Congress

** Bridge charters planned to provide interim capability until a Navy-funded U.S.-built JHSV is delivered (First delivery planned for mid-FY12)

[^] All ships are U.S.-flagged. Work necessary to meet U.S.-Flag standards was performed in U.S. shipyards

IV. Future Requirements

Special Mission Ships:

In Fiscal Year 2008, the CORY CHOUEST, an ocean surveillance vessel chartered as a Surveillance Towed Array Sensor System (SURTASS) and Low Frequency Array (LFA) platform, will be redelivered to her owner. Navy will retain the surveillance capability through use of a modified government-owned USNS vessel.

Prepositioning Ships:

Upon expiration of its contract in Fiscal Year 2008, the requirement for a High Speed Vessel (HSV) currently being met by HSV 2 SWIFT will transfer from the Special Mission Ship Program to the Prepositioning Program. MSC has issued a Request for Proposals (RFP) for a follow-on contract that will provide an interim capability until new U.S.-built Joint High Speed Vessels (JHSVs) are delivered. The Fiscal Year 2009 President's Budget Request includes Navy funding for the procurement of one JHSV in each of Fiscal Years 2009-2013, and Army funding for one JHSV in each of Fiscal Years 2008-2012. These new ships will replace capability provided by the follow-on HSV contract and may serve as a future replacement for the WESTPAC EXPRESS following delivery of the second vessel in Fiscal Year 2013.

Navy plans to further reduce the number of foreign-built vessels under charter in Fiscal Year 2009 and 2010, by eliminating the five Maersk (foreign-built) vessels that are part of the USMC Maritime Prepositioning Ship (MPS) program. The President's Budget Request for Fiscal Year 2009 includes funding to terminate the capital leases on three Maersk ships. Capabilities provided through the Maersk charters will be replaced by utilization of three government-owned U.S.-built Large Medium-Speed Roll-on/Roll-off (LMSR) ships.

The CARTER and the PAGE are under contract through Fiscal Year 2011 to satisfy U.S. Army prepositioned ammunition requirements. The Army anticipates a continuing requirement for vessels chartered to meet prepositioned containerized ammunition requirements, but that requirement has yet to be fully defined and validated.

Three of the foreign-built vessels in the Prepositioning Program are chartered to meet U.S. Air Force (USAF) prepositioned containerized ammunition requirements. USAF is currently reevaluating their future requirements and is expected to reduce the number of vessels required to be prepositioned.

Sealift Ships:

The VIRGINIAN was chartered to provide additional sealift of ammunition to U.S. forces in Operation Iraqi Freedom and Operation Enduring Freedom. The Joint Munitions Command does not anticipate a requirement beyond the expiration of the current contract in Fiscal Year 2011.

Military resource sponsors are currently evaluating the continued requirement for the BAFFIN STRAIT a small resupply shuttle serving Diego Garcia. Several options are under consideration, including replacing a chartered vessel with regularly scheduled liner service.

Future requirements are anticipated for the ice-strengthened containership AMERICAN TERN and the TRANSPACIFIC, a small tanker currently operating in the Far East.

V. Options to Meet Future Requirements

Time Charters of Existing U.S.-Built Vessels:

Due to scarcity in the marketplace, MSC has not recently had a new construction U.S.-built containership under long-term charter. There are only four containerships built in the U.S. in the last 10 years.² These ships were specifically built for the domestic market and are fully employed and unavailable for charter. Looking at the industry as a whole, not a single containership is under construction in the United States at this time.³

There is the potential for greater availability in the commercial tanker market. The current Jones Act tanker fleet consists of 55 vessels.⁴ Nineteen of these vessels are not double hulled and will be phased out over the next ten years as a result of the Oil Pollution Act of 1990 (OPA 90) regulations. Given the number of vessels that will need to be replaced in the next ten years, the likelihood of new U.S.-built tankers being available for charter is higher than that of U.S.- built dry cargo ships.

Build and Charter of U.S.-built Ships:

Assessing the cost of a five-year build and charter program for a given class of ships is difficult because of the range of legal and regulatory barriers that currently exist. Among these restrictions are Office of Management and Budget scoring rules on leasing, Title 10 restrictions on charters, and government restrictions on multi-year funding.

As mentioned above, MSC receives and obligates customer funding annually. Beyond the current fiscal year, funding is subject to the availability of future appropriations to customer accounts.

A recent market review conducted by MSC revealed extremely limited interest in construction of purpose-built vessels using charters of five-years or less, particularly in the containership market. Because there is little demand for U.S.-built container ships in the commercial market, owners of such ships would be forced to amortize the entire additional

³ Current U.S. Shipbuilding Contracts. ShipbuildingHistory.com. February 25, 2008 <<http://www.shipbuildinghistory.com/today/contracts.htm>>.

⁴ U.S. Maritime Administration. March 17, 2008 <http://marad.dot.gov/MARAD_statistics/2007%20STATISTICS/us-flag%202006.xls>

cost of U.S. construction over the term of the DoD charter. This would result in significantly increased charter rates for DoD during the contract period.

Construction of a new purpose-built containership to meet military requirements is estimated to cost approximately \$250M. Estimates are based on the 2006 publically-released cost for containerships built in the Aker Philadelphia Shipyard, and adjusted to reflect the additional costs of military modifications.⁵

Aker Philadelphia Shipyard constructed the last U.S. containerships. Of note, in its 2006 annual report, the Company states that it will in the future focus solely on the construction of product carriers.⁶ News reports indicate that this will keep Aker's order books full until 2012, delaying any further new construction starts for at least four years.⁷ There are other U.S. Shipyards which could be considered for the construction of container ships. Only one of the first-tier shipyards (GD/NASSCO) includes a large portfolio of commercial construction. As previously stated however, the business case for these U.S. shipyards to build containerships in order to charter them for periods of five years or less, would not likely be compelling.

In contrast, there is a viable commercial market for new U.S.-built tankers such that tanker owners can anticipate commercial demand for their tankers after the end of the DoD charter period. As a result, owners have proven willing to enter into a one-year firm agreement with options to charter new U.S.-built product tankers to MSC, and in July 2007, MSC awarded a contract to USS Product Carriers LLC for the time charter of two new-build, U.S.-flagged, tankers. Total value of the contract if all options are exercised is \$211.1 million. The tankers are being constructed at National Steel and Shipbuilding Company in San Diego, and will replace the current government-owned T-5 tankers which were constructed in a U.S. shipyard in the mid-1980s and will be phased out of their current service in 2010. The new tankers will deliver in 2010 and 2011.

Construction of Government-Owned U.S.-Built Vessels:

In certain cases where the military has identified a long-term firm requirement, the Navy, upon authorization by Congress, has established and funded new ship construction programs. New construction programs can take up to five years for delivery of the first vessel - two years for preliminary/contract design; one year for detail design; and two-plus years for construction.

Ship construction programs currently underway include the T-AKE Dry Cargo/Ammunition Ship Acquisition Program that will replace the aging fleet of cargo and ammunition ships in the Navy's Combat Logistics Force, and the JHSV Acquisition Program, that will provide high-speed intra-theater sealift mobility. The President's Fiscal

⁷ Aker American Shipping. "First Product Tanker Delivered from Aker Philadelphia Shipyard." February 25, 2008 <<http://www.akership.com/text.cfm?Id=3-14-40-94>>.

Year 2009 Budget request includes \$962.4 million for the procurement of two T-AKEs, and \$174.8 million for the procurement of one JHSV.

VI. Conclusion

Current DoD plans call for further decreases in the number of foreign-built ships under charter in future years. Absent emergent requirements, the total number of chartered foreign-built ships will decline over 50 percent between 2004 and 2012. Because of shifting requirements and modifications to existing DoD assets, a substantial portion of this decrease will come without requiring the construction of new vessels.

Construction of U.S.-built vessels to replace foreign-built ships under charter would require a firm long-term commitment from DoD customers. As evidenced in the Afloat Prepositioning program, evolving military requirements often necessitate changes in the size and type of vessel used for prepositioning. Therefore, there is not a compelling business case for the government or the private sector to invest in the construction of new vessels that have little commercial utility when the new vessel might not be the most appropriate platform for the mission within five to ten years of delivery.

A determination to replace the remaining U.S.-flag foreign-built vessels with new U.S.-built ships would come at a high price – through costly new ship construction and the costs associated with maintaining these ships over their service life. DoD anticipates a continued need for time chartered vessels in order to provide cost-effective flexibility in meeting those DoD requirements which do not warrant long-term commitments.

ENCLOSURE 1:

Inventory of Foreign-Built Vessels Under Contract

Ship Information

Ship Name: CORY CHOUEST

Ship Type: Ocean Surveillance Vessel

Owner/Country: Alpha Marine Services, USA

Year Ship Built: 1974

Country of Origin: Norway

Builder: Ulstein Hatlo

Documentation Country: USA

Conversion Shipyard: Larose, LA

DOD Customer: Navy Undersea Surveillance Command

Mission: Platform for Surveillance Towed Array Sensor System (SURTASS) and Low Frequency Array (LFA)

Contract Information:

Contract Number: N0003304C2000

Commencement of Contract: OCT 2003

Option Periods: one-year firm period, three one-year options and one 11-month option

Redelivery Date: 31 AUG 2008

Total Contract Costs: \$52M

Future Plans:

The CORY CHOUEST is an Ocean Surveillance Ship in MSCs Special Mission Ships Program. While ocean surveillance remains a continuing requirement, the Navy does not intend to enter into a follow-on charter upon the expiration of the current contract. A government-owned, contract-operated vessel which has been specifically modified to meet the military mission will replace the CORY CHOUEST.

Ship Information

Ship Name: HSV 2 SWIFT

Ship Type: High Speed Vessel (HSV)

Owner/Country: Bollinger/Incat, USA

Year Ship Built: 2003

Country of Origin: Australia

Builder: Incat

Documentation Country: USA

Conversion Shipyard: NA

DOD Customer: U.S. Fleet Forces Command

Mission: Support Navy experimentation and real world operations

Contract Information:

Contract Number: N0003303C2006

Commencement of Contract: 15 AUG 2003

Option Periods: one-year firm period, three one-year options and one 11-month option

Redelivery Date: 14 JUL 2008

Total Contract Costs: \$70M

Future Plans:

U.S. Fleet Forces Command has determined that there is a continued requirement for a High Speed Vessel (HSV) to support the Global War on Terrorism and emerging operational concepts including Seabasing and Global Fleet Station.

MSC issued an RFP for a time charter vessel to replace the HSV 2 SWIFT on 17 JAN 2008. This charter will be awarded under a full and open competition and is expected to be a one-year firm contract with options totaling 59 months if all options are exercised. Beginning in Fiscal Year 2009, the Navy plans to procure a total of five Joint High Speed Vessels (JHSV) at a rate of one ship per year. The new JHSVs are expected to provide the necessary capability to meet future requirements.

Ship Information

Ship Name: WESTPAC EXPRESS

Ship Type: High Speed Vessel (HSV)

Owner/Country: Austal Hull 130 Chartering LLC, USA

Year Ship Built: 2000

Country of Origin: Australia

Builder: Austal Ships

Documentation Country: USA

Conversion Shipyard: Unknown, Reflagged prior to MSC charter

DOD Customer: USMC

Mission: Movement of PAX and Cargo in Japan and South Korea area

Contract Information:

Contract Number: N0003306C3308

Commencement of Contract: OCT 2005

Option Periods: seven-month firm period and four one-year options

Redelivery Date: 30 SEPT 2011

Total Contract Costs: \$60.5M

Future Plans:

USMC anticipates a continuing requirement for a High-Speed Vessel (HSV) in the MSC Prepositioning Program. In future years the capability may be filled with a government-owned U.S.-built Joint High Speed Vessel (JHSV). A bridge contract will be necessary to meet the requirement until a determination is made and future JHSVs join the fleet.

The Navy plans to procure a total of five JHSVs at a rate of one ship per year, beginning in Fiscal Year 2009. These new vessels are expected to provide the necessary capability to meet future requirements.

Ship Information

Ship Name: CPL LOUIS J. HAUGE JR.

Ship Type: Roll-On Roll-Off (RORO) containership

Capacity: 122,000 sq. ft. of RORO and 380 TEU

Owner/Country: Wilmington Trust Company, USA

Year Ship Built: 1979

Country of Origin: Denmark

Builder: Odense Steel Shipyard LTD

Documentation Country: USA

Conversion Shipyard: Baltimore, MD

DOD Customer: U.S. Marine Corps

Mission: Preposition RORO Cargo and Containerized Ammunition and Supplies

Contract Information:

Contract Number: N0003382C1007

Commencement of Contract: SEPT 1984

Option Periods: five year firm period with four five-year options

Redelivery Date: 06 SEPT 2009

Total Contract Costs: \$524.1M

Future Plans:

The CPL LOUIS J. HAUGE JR. is part of the Maritime Prepositioning Force. While prepositioning remains a continuing requirement, the USMC intends to reduce the number of leased vessels used to meet this requirement. The USMC will replace leased vessels with government-owned Large Medium-Speed Roll-On/Roll-Off (LMSR) ships which are better suited to accommodate the growth in USMC equipment size over the last 20 years.

Ship Information

Ship Name: PFC WILLIAM B. BAUGH

Ship Type: Roll-On Roll-Off (RORO) containership

Capacity: 122,000 sq. ft. of RORO and 380 TEU

Owner/Country: Wilmington Trust Company, USA

Year Ship Built: 1979

Country of Origin: Denmark

Builder: Odense Steel Shipyard LTD

Documentation Country: USA

Conversion Shipyard: Beaumont, TX

DOD Customer: U.S. Marine Corps

Mission: Preposition RORO Cargo and Containerized Ammunition and Supplies

Contract Information:

Contract Number: N0003382C1009

Commencement of Contract: OCT 1984

Option Periods: five-year firm period with four five-year options

Redelivery Date: 27 OCT 2009

Total Contract Costs: \$528.3 M

Future Plans:

The PFC WILLIAM B. BAUGH is part of the Maritime Prepositioning Force. While prepositioning remains a continuing requirement, the USMC intends to reduce the number of leased vessels used to meet this requirement. The USMC will replace leased vessels with government-owned Large Medium-Speed Roll-On/Roll-Off (LMSR) ships which are better suited to accommodate the growth in USMC equipment size over the last 20 years.

Ship Information

Ship Name: PFC JAMES ANDERSON JR.

Ship Type: Roll-On Roll-Off (RORO) containership

Capacity: 122,000 sq. ft. of RORO and 380 TEU

Commencement of Contract: SEPT 1985

Option Periods: five-year firm period with four five-year options

Redelivery Date: 11 SEPT 2010

Total Contract Costs: \$549.3M

Future Plans:

The PVT FRANKLIN J. PHILLIPS is part of the Maritime Prepositioning Force. While prepositioning remains a continuing requirement, the USMC intends to reduce the number of leased vessels used to meet this requirement. The USMC will replace leased vessels with government-owned Large Medium-Speed Roll-On/Roll-Off (LMSR) ships which are better suited to accommodate the growth in USMC equipment size over the last 20 years.

Ship Information

Ship Name: LTC JOHN U.D. PAGE

Ship Type: Containership

Capacity: 2,600 TEU

Owner/Country: Maersk Line LTD, USA

Year Ship Built: 1984

Country of Origin: South Korea

Builder: Daewoo

Documentation Country: USA

Conversion Shipyard: Norfolk, VA

DOD Customer: U.S. Army

Mission: Preposition Containerized Ammunition

Contract Information:

Contract Number: N0003306C3305

Commencement of Contract: APRIL 2006

Option Periods: seven-month firm period and four one-year options

Redelivery Date: 30 SEPT 2010

Total Contract Costs: \$53.7M

Future Plans:

The LTC JOHN U.D. PAGE is a munitions carrier in the Army Prepositioned Stocks-3 (APS-3). The Army anticipates a continued requirement for prepositioned ammunition.

A new vessel constructed in the United States to meet this mission would require a firm, long-term requirement from the Army. If a yard were available to construct a purpose-built vessel for the Army requirement, the total cost is estimated to be \$250M, using the

2006 publically-released cost for containerships built in the Aker Philadelphia Shipyard.⁸ The base price of \$145M is adjusted to reflect additional costs related to modifications required to adapt the commercial design to military specifications, increased material (e.g., steel) costs, and inflation. Per Bureau of Labor Statistics data, costs of new construction in the US shipbuilding industry (material and labor) have increased by approximately 25 percent during the 2003-2006 period.⁹

In terms of the cost to operate the container vessel, the commercial costs are estimated to be \$10.9M per year, based upon recent experience with operating government-owned contractor-operated vessels.

Following customer validation of a firm long-term requirement, the RFP to award process takes approximately one year and construction of the vessel is estimated to take another approximately two years. A bridge lease would be necessary to meet the Army requirement during the ship construction period.

Ship Information

Ship Name: CPT STEVEN L. BENNETT

Ship Type: Containership

Capacity: 1,900 TEU

Owner/Country: Sealift Inc., USA

Year Ship Built: 1984

Country of Origin: South Korea

Builder: Samsung

Documentation Country: USA

Conversion Shipyard: Mobile, AL

DOD Customer: USAF

Mission: Preposition Containerized Ammunition

Contract Information:

Contract Number: N0003307C3000

Commencement of Contract: JAN 2008

Option Periods: nine-month firm period, four one-year options and one two-month option

Redelivery Date: 01 DEC 2012

Total Contract Costs: \$48.9M

Future Plans:

The CPT STEVEN L. BENNETT is a munitions carrier in the USAF prepositioned fleet. USAF anticipates a continued requirement for this type of vessel and is currently reevaluating their future requirements in order to properly size the USAF prepositioned fleet.

A new ship constructed in the United States to meet this mission would require a firm, long-term requirement from the USAF. Recent reductions in the number of chartered vessels needed to carry a reduced volume of prepositioned ammunition demonstrates the difficulties faced in establishing a firm requirements.

To construct a purpose-built vessel for the USAF requirement, the total cost is estimated to be about \$225M. Cost estimates are derived using the 2006 publically-released cost for containerships built in the Aker Philadelphia Shipyard.¹² The base price of \$145M is adjusted to reflect additional costs related to modifications required to adapt the commercial design to military specifications, increased material (e.g., steel) costs, and inflation. Per Bureau of Labor Statistics data, costs of new construction in the US shipbuilding industry (material and labor) have increased by approximately 25 percent during the 2003-2006 period.¹³

In terms of the cost to operate the container vessel, the commercial costs are estimated to be \$10M per year, based upon recent experience with operating government-owned contractor-operated vessels.

Following customer validation of a firm long-term requirement, the RFP to award process takes approximately one year and construction of the vessel is estimated to take another approximately two years. A bridge lease would be necessary to meet the USAF requirement during the ship construction period.

Ship Information

Ship Name: A1C WM H. PITSENBARGER

Ship Type: Containership

Capacity: 1,670 TEU

Owner/Country: Red River Holdings, USA

Year Ship Built: 1983

Country of Origin: France

Builder: Atlantique

Documentation Country: USA

Conversion Shipyard: Charleston, SC

DOD Customer: USAF

Mission: Preposition Containerized Ammunition

Contract Information:

Contract Number: N0003306C3301

Commencement of Contract: APRIL 2007

Option Periods: six-month firm period, four one-year options and one five-month option

Redelivery Date: 10 MARCH 2012

Total Contract Costs: \$64.9M

Future Plans:

The A1C WM H. PITSENBARGER is a munitions carrier in the USAF prepositioned fleet. USAF does not anticipate a continuing requirement beyond the December 2011 redelivery date.

Ship Information

Ship Name: MAJ BERNARD F FISHER

Ship Type: Containership

Capacity: 2100 TEU

Owner/Country: Sealift Inc., USA

Year Ship Built: 1985

Country of Origin: Denmark

Builder: Odense Steel Shipyard LTD

Documentation Country: USA

Conversion Shipyard: Unknown, Reflagged prior to MSC charter

DOD Customer: USAF

Mission: Prepositioned Containerized Ammunition

Contract Information:

Contract Number: N0003304C3302

Commencement of Contract: OCT 2004

Option Periods: One-year firm period, three one-year options and one 11-month option

Redelivery Date: 15 SEPT 2009

Total Contract Costs: \$47.3M

Future Plans:

The MAJ BERNARD F FISHER is a munitions carrier in the USAF prepositioned fleet. USAF anticipates a continued requirement for this type of vessel and is currently reevaluating their future requirements in order to properly size the USAF prepositioned fleet.

A new vessel constructed in the United States to meet this mission would require a firm, long-term requirement from USAF. Recent reductions in the number of chartered vessels

needed to carry a reduced volume of prepositioned ammunition demonstrates the difficulties faced in establishing a firm requirements

To construct a purpose-built vessel for the USAF requirement, the total cost is estimated to be about \$225M. Cost estimates are derived using the 2006 publically-released cost for containerships built in the Aker Philadelphia Shipyard.¹⁴ The base price of \$145M is adjusted to reflect additional costs related to modifications required to adapt the commercial design to military specifications, increased material (e.g., steel) costs, and inflation. Per Bureau of Labor Statistics data, costs of new construction in the US shipbuilding industry (material and labor) have increased by approximately 25 percent during the 2003-2006 period.¹⁵

In terms of the cost to operate the container vessel, the commercial costs are estimated to be \$10M per year, based upon recent experience with operating government-owned contractor-operated vessels.

Following customer validation of a firm long-term requirement, the RFP to award process takes approximately one year and construction of the vessel is estimated to take another approximately two years. A bridge lease would be necessary to meet the USAF requirement during the ship construction period.

Ship Information

Ship Name: BAFFIN STRAIT

Ship Type: Containership

Capacity: 300 TEU

Owner/Country: TransAtlantic Lines Inc, USA

Year Ship Built: 1997

Country of Origin: China

Builder: Wuhu Shipyard

Documentation Country: USA

Conversion Shipyard: Unknown, Reflagged prior to MSC charter

DOD Customer: Navy Operational Logistics Support Command

Mission: Resupply shuttle ship for Diego Garcia

Contract Information:

Contract Number: N0003305C5500

Commencement of Contract: 11 DEC 2004

Option Periods: nine-month firm period and four one-year options

Redelivery Date: 30 SEPT 2009

Total Contract Costs: \$18.8 M

Future Plans:

The BAFFIN STRAIT is a containership in the Sealift Program that is chartered to support Navy Operational Logistics Support Command. The future of this chartering requirement is uncertain. Navy Operational Logistics Support Command is currently reviewing the requirement and considering other options for meeting this mission, including replacement of the charter vessel with a regularly scheduled liner service.

Ship Information

Ship Name: AMERICAN TERN

Ship Type: Containership (ice-strengthened)

Capacity: 1,100 TEU

Owner/Country: APL America, USA

Year Ship Built: 1990

Country of Origin: Germany

Builder: VEB Schiffswert Neptun

Documentation Country: USA

Conversion Shipyard: Unknown, Reflagged prior to MSC charter

DOD Customer: USAF and National Science Foundation (NSF)

Mission: Resupply of Thule Air Force Base, Greenland and McMurdo Base

Contract Information:

Contract Number: N0003305C5546

Commencement of Contract: 01 DEC 2005

Option Periods: 10-month firm period and four one-year options

Redelivery Date: 30 SEPT 2010

Total Contract Costs: \$52.9 M

Future Plans:

The AMERICAN TERN is the only ice-strengthened container ship in the MSC Sealift Program. The USAF and NSF anticipate a continuing requirement for a vessel to resupply government facilities in Antarctica and Greenland.

A new vessel constructed in the United States to meet this mission would require a firm, long-term requirement from the resources sponsors. To construct a purpose-built vessel for this requirement, the cost is estimated to be \$100 M, using the 2006 publically-released

cost for containerships built in the Aker Philadelphia Shipyard.¹⁶ Estimates include a 15 percent increase for ice strengthening, plus a \$2M adjustment for cranes and inflation. The cost was then adjusted to reflect the relative ship size.

In terms of the cost to operate the container vessel, the commercial costs are estimated to be \$6M per year, based upon recent experience with operating government-owned contractor-operated vessels.

The RFP to award process takes approximately one year and construction of the vessel is estimated to take another approximately two years. A bridge lease would be necessary to meet the requirement during the ship construction period.

¹⁶ Colton, Tim. "Containerships Built in U.S. Shipyards." ShipbuildingHistory.com. February 25, 2008 <<http://www.shipbuildinghistory.com/history/merchantships/containerships.htm>>.

Ship Information

Ship Name: VIRGINIAN

Ship Type: Containership

Capacity: 1,300 TEU

Owner/Country: Sealift, Inc., USA

Year Ship Built: 1984

Country of Origin: Germany

Builder: Bremer Vulkan Schiff

Documentation Country: USA

Conversion Shipyard: Anacortes, WA

DOD Customer: Joint Munitions Command, Rock Island, IL

Mission: DOD Munitions shipments in support of OIF/OEF

Contract Information:

Contract Number: N0003308C5500

Commencement of Contract: 01 OCT 2007

Option Periods: one-year firm period and three one-year options

Redelivery Date: 15 OCT 2011

Total Contract Costs: \$39.8 M

Future Plans:

The VIRGINIAN was chartered to provide additional sealift of ammunition to and from the Arabian Gulf in support of ongoing operations in Iraq and Afghanistan. The Joint Munitions Command does not anticipate having a requirement beyond the expiration of the current contract.

Ship Information

Ship Name: TRANSPACIFIC

Ship Type: Tanker

Owner/Country: Transatlantic Lines/USA

Year Ship Built: 2001

Country of Origin: Turkey

Builder: Celiktekne Shipyard

Documentation Country: USA

Conversion Shipyard: Guam Shipyard

DOD Customer: Defense Energy Support Center (DESC)

Mission: Far East Petroleum Shuttle

Contract Information:

Contract Number: N0003306C5409

Commencement of Contract: 22 NOV 2006

Option Periods: one year firm period, three one-year options and one 11-month option

Redelivery Date: 22 OCT 2011

Total Contract Costs: \$25.5 M

Future Plans:

The TRANSPACIFIC is a small, shallow draft product tanker that operates in the Far East providing fuel to military bases and supply depots with shallow port facilities for DESC.

A new vessel constructed in the United States to meet this mission would require a firm, long-term requirement from the DESC. To construct a purpose-built vessel for the DESC requirement, the cost is estimated to be between \$50-75 M. This is not a firm number as no oceangoing tankers of this small size have been constructed in US shipyards in more than three decades.

In terms of the cost to operate the tanker, the commercial costs are estimated to be \$3.5M per year, based upon recent experience with operating government-owned contractor-operated vessels.

The RFP to award process takes approximately one year and design and construction of the vessel is estimated to take another approximately one to two years. A bridge lease would be necessary to meet the DESC requirement during the ship construction period.

THE ASSISTANT SECRETARY OF THE NAVY

(RESEARCH, DEVELOPMENT AND ACQUISITION)

1000 NAVY PENTAGON

WASHINGTON DC 20350-1000

MAR 26 2008

The Honorable Ike Skelton
Chairman, Committee on
Armed Services
House of Representatives
Washington, DC 20515-6035

Dear Mr. Chairman:

The Fiscal Year 2008 House Appropriations Committee Report (110-279) directed the Department of Navy to submit a report that outlines a plan to end the practice of leasing foreign-built ships to supplement the Navy fleet and institute the practice of utilizing only American-built ships within four years.

The Military Sealift Command (MSC) currently has thirty-two ships under charter for periods exceeding six months; seventeen of which are U.S. flagged foreign-built ships. Under current DoD plans, this number will significantly decrease in the next four years as military requirements evolve, existing DoD assets are modified, and new purpose-built ships are constructed in U.S. shipyards. The enclosed report provides detailed information on the current charter contracts, the developing military requirements which will drive future charters, and estimated ship construction costs.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Levin, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink, appearing to read "J. Thackrah", is positioned above the printed name.

Dear Mr. Chairman:

The Fiscal Year (FY) 2008 Defense Authorization Conference Report 110-477 requested the Secretary of the Navy submit a report to the Congressional Defense Committees with the budget request for FY 2009 discussing several items related to the use of an integrated nuclear power system for the Navy's future CG(X) cruiser program. Specifically, the report is to discuss next generation cruiser characteristics, costs and schedule issues, industrial base impacts including the costs of certifying shipyards for conducting nuclear production work, impacts on the Navy's shipbuilding plan, operating and support issues, and a risk assessment.

The results of the Navy's Analysis of Alternatives (AoA) for the Maritime Air and Missile Defense of Joint Forces capability are currently within the Navy staffing process. Following approval of the AoA, the Navy will seek Milestone A approval for the CG(X) program from the Defense Acquisition Executive. Until this approval is provided, the information requested by Congress in this report is pre-decisional. As such, the Navy intends to submit this report upon completion of Milestone A, currently planned for FY 2008.

A similar letter has been sent to Chairmen Inouye, Skelton, and Murtha. If I can be of further assistance, please let me know.

Section 124 of Public Law (P.L.) 109-114, as amended by Section 5013 of P.L. 109-148, requires an annual report on the amount of funds that were derived under Sections 2601, chapter 403, chapter 603, or chapter 903 of title 10, United States Code in the previous year and were obligated for the construction, improvement, repair, or maintenance of any military facility or infrastructure.

During Fiscal Year 2007, a total of \$156,695 in gifts, accepted pursuant to Section 2601 of title 10, United States Code, were used on Department of the Navy facilities and infrastructure, all located at the United States Naval Academy Annapolis, Maryland. Details are as follows:

- Uriah P. Levy Center Landscaping, \$7,641;
- Columbarium EA, \$100,054; and
- Squash Courts Designs, \$49,000.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Skelton, Edwards, and Levin.

Sincerely,

A handwritten signature in black ink, appearing to read "BJ Penn", with a horizontal line extending to the right.

Dear Mr. Chairman:

The Fiscal Year 2008 Senate Armed Services Committee Report 110-077 requested the Secretary of the Navy to submit a report jointly with the Assistant Secretary of Defense for Networks and Information Integration; the Under Secretary of Defense for Acquisition, Technology and Logistics; and the Director of Operational Test and Evaluation of the Next Generation Enterprise Network (NGEN) system.

We have compiled the requested information for the NGEN Report to Congress. However, the joint report is currently within the Department's staffing process. As such, the Navy intends to submit this report by April 1, 2008.

A similar letter has been sent to Chairmen Levin, Skelton and Murtha. If I can be of further assistance, please let me know. In the interim, my point of contact on this matter is Dr. Gary A. Federici, DASN(C4I), at gary.federici@navy.mil.

Sincerely,

REPORT TO CONGRESS

ON

ANGEL FIRE

**Prepared by:
US Marine Corps
Marine Corps Combat Development Command
MCB Quantico, 22134-5000**

March 2008

FOUO – This document contains information exempt from mandatory disclosure under the FOIA. Exemptions(s) b(2) and b(4) apply.

REPORT REQUIREMENT

The Fiscal Year 2008 National Defense Authorization Conference Report 110-477 directed the Secretaries of the Army and Navy to provide program management plans for the Constant Hawk and Angel Fire programs, including respective budget detail to the congressional defense and intelligence committees within 60 days of enactment of this Act.

BACKGROUND

The US Marine Corps' Angel Fire program is a material solution deployed in response to US Central Command's Joint Urgent Operational Needs Statement (JUONS) CC-0154 and I Marine Expeditionary Force (Forward) Urgent Universal Needs Statement (UUNS) 0635UA identifying the need for dedicated, day/night, Wide Field of View Persistent Surveillance (WFOV-PS) capabilities at the tactical level. The currently deployed Angel Fire consists of a manned, airborne platform (King Air 90), a belly mounted Electro-Optical (EO) sensor providing dawn to dusk coverage, communications downlink, and ground receive equipment. Angel Fire provides a WFOV-PS, Near Real-Time (NRT) imagery downlink to a battalion Combat Operations Center (COC), greatly enhancing situational awareness within the unit's battlespace. Angel Fire is not a USMC acquisition program of record nor is it intended to become one. It is a response to urgently requested requirements in support of the Global War on Terror (GWOT).

DESCRIPTION

Angel Fire provides a near-real time, imagery downlink covering a wide-field of view of approximately 16km². This WFOV-PS capability provides battalion commanders a timely (i.e., near real-time) and unprecedented view of the battle space for planning, tactical overwatch, and effecting actions against the threat. Angel Fire imagery also supports forensic analysis and provides intelligence analysts a contextual backdrop within which disparate combat information and intelligence can be fused in both time and space.

STATUS

The currently deployed Angel Fire capability set, consisting of four contracted, EO capable King Air 90 platforms, was incrementally deployed between September and December 2007. A fifth aircraft remains in CONUS for system configuration management, testing, training, and demonstration/exercise support. For the deployed set, maintenance of sensors and communication downlink and ground receive equipment is presently provided by an Air Force Research Lab detachment of approximately twenty personnel. Technically and operationally, with the exception of occasional communications equipment malfunctions, Angel Fire has performed to expectations, and the four sensor platforms are operational. Supported units have reported Angel Fire provides significant utility for the tracking of vehicles/individuals from points of departure to location of event; determining origin of indirect fire events; overwatch of Iraqi Forces in response to significant activity reports; providing a better understanding of how anti-Iraqi Insurgents (AII) use time and space to plant IEDs; and how certain criminal elements perform black market activities. A WFOV-PS infrared (IR) sensor is now technically mature

FOUO – This document contains information exempt from mandatory disclosure under the FOIA. Exemptions(s) b(2) and b(4) apply.

and efforts are underway to develop and field an EO/IR capability supporting continuous day/night operations.

TRAINING

At the supported unit level, terminal operators (i.e., viewer client) consist of Marines and soldiers performing watch functions. Training of terminal operators is minimal, thirty minutes or less, as the graphic user interface is based on familiar screen displays (i.e., Google Earth, TIVO). Commanders and their staff can observe the imagery or have the field of imagery manipulated. To date, all training has occurred at home station, in a classroom, and during the unit's final pre-deployment exercise (MOJAVE VIPER) at Twenty-nine Palms, California. During conduct of MOJAVE VIPER for designated units, Angel Fire is also incorporated into the exercise and provides NRT WFOV-PS imagery downlink to a commander and his staff.

TECHNOLOGY

The major Angel Fire components (i.e., cameras, processors, communications links, servers, storage disks) are state of the art COTS and GOTS hardware. The uniqueness of Angel Fire lies within its software. Angel Fire is the only tactical WFOV-PS capability that takes imagery from independent camera heads, integrates them onboard, and downlinks a seamless, cohesive, meta-tagged, 16km² WFOV image to supported units within ten seconds of image capture. The second capability set, EO/IR, anticipated to be fielded in 2QFY09, is likewise leading edge technology and will incorporate a WFOV-PS IR imagery capability into the existing Angel Fire EO system. The gimbal on which the IR sensor resides is unique and allows for a stable platform in which the 16Mpx focal plane array sensor can step stare the field of view.

QUANTITY REQUIRED

Angel Fire was deployed in response to a UUNS and JUONS submitted by I MEF Fwd. The requirement for this capability remains, as expressed by a Marine Corps Forces Central Command (MARCENT) decision paper stipulating the requirement for two capability sets. The deployment of a second capability, consisting of five EO/IR capable King Air 90 aircraft, will extend coverage to 24/7. Both capability sets, WFOV-PS EO and EO/IR, will remain in support of Multi-National Force-West (MNF-W) until the capability is no longer needed. Upon deployment of the Angel Fire WFOV-PS EO/IR capability set, there will be a total of nine WFOV-PS King Air 90 platforms supporting MNF-W.

FUNDING (see Figure 1)

Most of the funding supporting the deployment of Angel Fire is through GWOT supplementals. GWOT funds have been used to purchase and maintain the air to ground data links, the airborne EO sensor package, the ground station, the leasing of aircraft and aircraft services, and commencing in August 2008, when management of Angel Fire shifts from AFRL to the USMC, the contracting of personnel to maintain sensors, ground data links, and the ground station.

FOUO – This document contains information exempt from mandatory disclosure under the FOIA. Exemptions(s) b(2) and b(4) apply.

<i>\$M</i>	<i>Prior</i>	<i>FY07</i>	<i>FY08</i>	<i>FY09**</i>	<i>FY10</i>	<i>Total</i>

Figure 1 – Angel Fire Funding Profile

SCHEDULE

Figure 2 represents the schedule based upon date funds are received.

TIMELINE FOR DEPLOYMENT OF ANGEL FIRE

Deployment of the second capability set, Angel Fire WFOV-PS EO/IR, depends upon when funding, for contracting aircraft/aircraft services and purchase/integration of WFOV-PS IR sensors, is received. Lead time for preparation of King Air 90 aircraft is approximately five months, followed by integration of sensors, mandated safety checks, and system testing. As with the first capability set, deployment of the second set will be incremental, with the fifth platform arriving in-theater approximately five months after the first.

FOUO – This document contains information exempt from mandatory disclosure under the FOIA. Exemptions(s) b(2) and b(4) apply.

Proposed Schedule (U)

Attack the Network – Defeat the Device – Train the Force

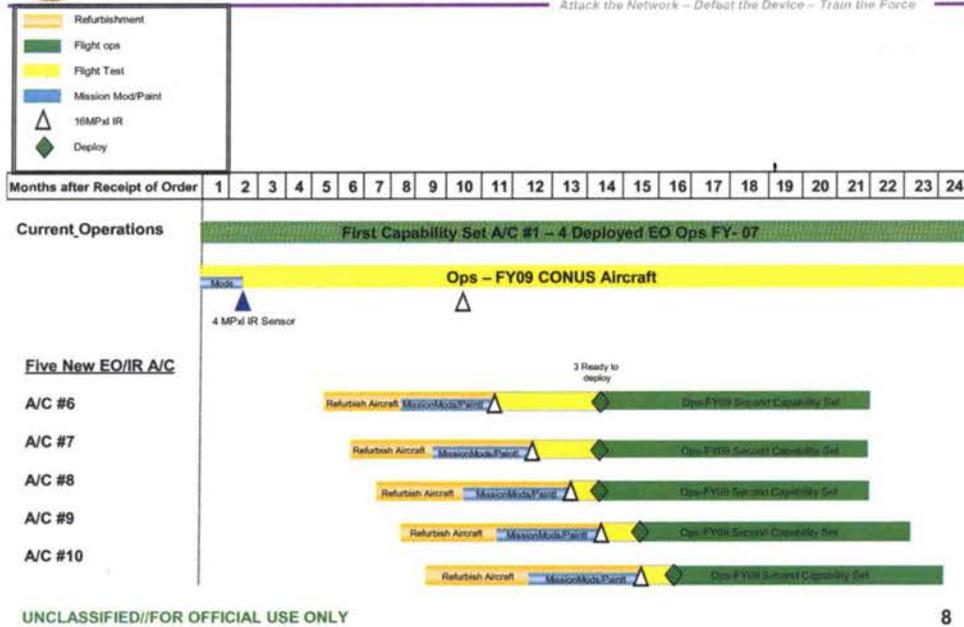

Figure 2 – Proposed Schedule for Angel Fire

WAY-AHEAD

The USAF Wide Area Airborne Surveillance Program, a new start in FY09, effectively bundles the enduring requirements of both the US Army and Marine Corps. The technical thresholds and objectives for each service’s requirements link back to respective urgent requirement solutions that spawned Constant Hawk and Angel Fire and also address service considerations beyond the immediate theater focus. Increment 1 will address the USAF podded requirements. Increment 2 addresses both US Army’s payload for the WARRIOR Unmanned Aircraft System (UAS) and the USMC payload for the SHADOW UAS. The fact that both the WARRIOR and SHADOW programs are managed by the same Army program office will further tie the two services together.

FOUO – This document contains information exempt from mandatory disclosure under the FOIA. Exemptions(s) b(2) and b(4) apply.

House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

House Report 110-186 on the Military Construction, Veterans Affairs, and Related Agencies Appropriations Bill, 2008 directs the Secretary of the Navy to provide a report identifying the military construction requirements and an estimated timetable for completion for making Mayport, Florida a nuclear carrier homeport. I am providing the enclosed response to House Report 110-186.

The Department of the Navy is considering a variety of factors, including operational, financial, and environmental, before making a decision regarding homeporting in Mayport. Thirteen alternatives are being evaluated in an environmental impact study, the draft of which was released to the public for review on March 28, 2008. Homeporting a nuclear carrier in Mayport is one of the alternatives under consideration.

A similar letter has been sent to Chairmen Skelton, Levin and Johnson. As always, if I can be of any further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "Donald C. Winter".

**Report to Congress
On
Carrier Basing**

--
Military Construction Requirements and
Estimated Timetable For Completion To
Make Mayport a Nuclear Carrier-Capable
Homeport

Prepared by
U.S. Fleet Forces Command
April 2008

I. Reporting Requirement

House Report 110-186 on the Military Construction, Veterans Affairs, and Related Agencies Appropriations Bill 2008 directs the Navy to provide a report to Congress identifying the military construction requirements and an estimated timetable for completion for making Naval Station Mayport a nuclear carrier-capable homeport. This report is due no later than 30 days after release of the draft Environmental Impact Statement (EIS) which occurred 28 March 2008. Specifically, House Report 110-186 stated:

Carrier Homeporting.—The Committee understands that it is the Navy's publicly stated policy to maintain two nuclear carrier-capable homeports on the east coast. The Committee further understands that the Navy is in the process of drafting an environmental impact statement (EIS) that includes the evaluation of the necessary infrastructure and dredging required to make Naval Station Mayport the second such homeport in addition to Naval Station Norfolk, and that a draft EIS will be released in early 2008. The Committee directs the Navy to provide a report to the Committee identifying the military construction requirements and an estimated timetable for completion for making Mayport a nuclear carrier-capable homeport no later than 30 days after release of the draft EIS.

II. Background

In January 2006 the Chief of Naval Operations directed Commander, U.S. Fleet Forces Command to prepare an Environmental Impact Statement (EIS) to review and assess a broad range of alternatives for homeporting additional surface ships at Naval Station Mayport. The EIS will evaluate the potential environmental impacts for each of the ship homeporting alternatives. Homeporting a nuclear-powered aircraft carrier is one of the alternatives being evaluated.

The purpose of the proposed action is to ensure effective support of Fleet operational requirements through efficient use of waterfront and shore side facilities at Naval Station Mayport.

The EIS will evaluate the potential environmental impacts for each of the ship homeporting alternatives that are under consideration:

- Cruiser/Destroyer (CRUDES) homeporting
- Amphibious Assault Ship (LHD) homeporting
- Nuclear-Powered Aircraft Carrier (CVN) capable
- CVN homeporting
- Seven different combinations of the above
- Amphibious Ready Group (ARG) homeporting
- No Action

The EIS timeline is as follows:

- 14 Nov 06: Notice of Intent (NOI) published in the Federal Register
- 5 Dec 06: Public Scoping Meeting held in Jacksonville, FL

- 14 Nov – 29 Dec 06: Public Scoping comment period
- 28 Mar 08: Draft EIS (DEIS) released to public
- 16 Apr 08: Public Hearing in Jacksonville, FL
- Nov 08: Final EIS (FEIS) released to public
- Dec 08: Record of Decision

A preferred alternative has not been identified.

III. Military Construction Requirements and an Estimated Timetable for Completion for Making Mayport a Nuclear Carrier Homeport

The DEIS states that the total of all estimated MILCON cost for alternative four, which is CVN homeporting, is \$260M. This total estimate is comprised of the following: CVN maintenance facilities estimated at \$177M, dredging at \$48M, wharf F repairs at \$19M, parking at \$11M, and road improvements at \$5M.

The \$260M cost estimate in the DEIS released on 28 March 2008 was based on MILCON project planning from existing construction models of similar projects, and was not updated prior to publication of the DEIS to take account of more recent cost estimates resulting from Mayport site-specific cost analysis. More detailed cost analysis and siting studies have been initiated and resulted in the updated costs contained in this report. The overall resulting cost estimate in this report of \$372-422M will continue to be refined as progress is made towards the Final EIS and subsequent Record of Decision in Dec 08. The Navy is in the process of refining its cost estimates (1391s), with an expected completion date of June 2008.

If an alternative is selected which homeports other classes of ships in addition to the CVN (i.e. alternatives 8, 10, or 12 of the EIS), construction costs will increase.

The estimated timetable for completion for making Mayport a nuclear carrier homeport depends on the desired date of initial operating capability (IOC), and the availability of military construction project authorization and appropriation. For example, in order to make a 2014 IOC date for CVN homeporting at Mayport, several supporting MILCON projects would need to be programmed beginning in the FY 2010 Budget.

The following details the individual MILCON projects required to support this homeporting action. Additional project details are available in the DEIS.

A. Dredging: A dredge project would be required in order to allow unrestricted access for a CVN under all ship loading and tidal conditions. The cost estimate provided in the DEIS was \$48M. The current cost estimate supported by most recent cost estimate analysis remains at \$48M.

B. Wharf F upgrades: Structural and utility upgrades would be required for Wharf F to serve as the maintenance berth for a CVN undergoing a Planned Incremental Availability (PIA). The cost estimate provided in the DEIS was \$19M. The current cost estimate supported by most

recent cost estimate analysis is \$30M based on actual detailed inspections and discovery of unforeseen structural degradation.

C. CVN propulsion plant maintenance facilities: These facilities include a Controlled Industrial Facility for inspection, modification, and repair of radiologically controlled equipment and components associated with naval nuclear propulsion plants, Ship Maintenance Facility where non-radiological depot-level maintenance on CVN propulsion plants will be performed, and a Maintenance Support Facility to house the primary administrative and technical staff offices supporting CVN propulsion plant maintenance and central area for receiving, inspecting, shipping, and storing materials.

The estimated cost provided in the DEIS is \$177M. This cost does not include the cost of outfitting the maintenance facilities. The current cost estimate supported by the most recent cost estimate analysis is \$250-300M. As noted above, the cost estimate used in the DEIS was based on MILCON project planning from the Navy's previous experience with similar MILCON projects at NAS North Island in 1995. The cost estimates in the DEIS did not include assessment of changes in DOD design requirements since 1995, nor site-specific differences between San Diego and Mayport. The more recent cost estimates include the following differences between the projects:

- Revised design requirements to limit/prevent water intrusion due to hurricane-induced storm surge;
- Increases in design wind loading requirements for all buildings;
- Site-specific differences in subsurface conditions requiring deeper pile driving for maintenance facility foundations;
- Site-specific reductions in design seismic loading requirements for all buildings; and
- Revised anti-terrorism standards (UFC4-010-01).

This cost estimate will continue to be refined until further detailed design work of the facility specific to Naval Station Mayport is completed.

D. Road Improvements: The main road serving the water front (Massey Avenue) would be improved to better accommodate traffic flow to and from the CVN propulsion plant maintenance facilities near Wharf F. The cost provided in the DEIS is \$5M. The current cost estimate supported by most recent cost estimate analysis is \$16M.

E. Parking Improvements: The laydown for the CVN propulsion plant maintenance facilities would displace existing parking. A parking garage would need to be built to replace that existing parking. The estimated cost provided in the DEIS is \$11M. The current cost estimate for a parking garage for homeporting a CVN is \$28M.

IV. Conclusion

The current total estimated military construction cost to make Mayport a CVN homeport is \$372-422M. The estimated timetable to have Mayport ready to homeport a CVN is dependent upon receiving appropriation for all required MILCON projects. The estimated elapsed time between initial receipt of military construction funding and initial CVN homeport operating capability is

approximately 57 months, with the CVN propulsion plant maintenance facility being the project with the longest design/construction period.

The Navy has not yet identified a preferred alternative for the Mayport EIS. The Navy will fully consider operational, financial, and environmental factors before making decisions regarding the homeporting alternatives being evaluated in the EIS.

The Final EIS will contain final cost estimates which will be the result of further data analysis and completion of all project documentation.

THE ASSISTANT SECRETARY OF THE NAVY

(RESEARCH, DEVELOPMENT AND ACQUISITION)

1000 NAVY PENTAGON

WASHINGTON DC 20350-1000

APR 14 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

Section 123 of the FY 2008 National Defense Authorization Act (Public Law 110-181) directed the Secretary of the Navy, in consultation with the Department of Labor (DOL), to provide a one-time report identifying the average number of H-2B visa workers employed by the major shipyards in the construction of United States ships during calendar year (CY) 2007, and the number of H-2B visa workers petitioned by the major shipbuilders for CY 2008, as of the first quarter of 2008.

Our April 1, 2008 report identified one of nine major shipbuilding contractors, Bollinger Shipyards of Lockport, Louisiana, who disclosed that they employed H-2B visa workers during the reporting period but information as to the number of H-2B visa workers was not yet available. Bollinger reports that they did not directly employ any H-2B visa workers during CY 2007, however, they disclosed that they had contracted for approximately 800 H-2B visa workers during CY 2007. Bollinger received authorization to hire up to 800 H-2B visa workers for CY 2008. Bollinger reports that, as of April 1, 2008, they have 674 H-2B visa employees in a total workforce of 2,416 employees. This is consistent with information verified in consultation with the DOL.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink, appearing to read "J. Thackrah", is written over the typed name.

Dear Mr. Chairman:

Section 123 of the FY 2008 National Defense Authorization Act (Public Law 110-181) directed the Secretary of the Navy, in consultation with the Department of Labor (DOL), to provide a one-time report identifying the average number of H-2B visa workers employed by the major shipyards in the construction of United States ships during CY 2007, and the number of H-2B visa workers petitioned by the major shipbuilders for CY 2008, as of the first quarter of 2008.

Based on responses provided by the shipbuilding contractors and verified in consultation with the DOL, there are no H-2B visa workers employed by eight of nine major shipbuilding contractors or first-tier subcontractors responsible for delivery of a vessel. Additionally, none of these contractors have submitted a petition for H-2B visa workers for CY 2008. This negative response covers the eight shipbuilding contractors identified in the enclosed list for the CY 2007 and CY 2008, as of the first quarter of 2008.

We have an affirmative response that Bollinger Shipyards has H-2B visa employees during the reporting period. This is consistent with information verified in consultation with the DOL. We have not yet confirmed Bollinger Shipyards' average number of H-2B visa workers and will provide the requested information by April 14, 2008.

Please let me know if I can be of further assistance. A similar letter is also being provided to Chairmen Skelton, Inouye, and Murtha.

(INSTALLATIONS AND ENVIRONMENT)
1000 NAVY PENTAGON
WASHINGTON, D.C. 20350-1000

MAY 1 2008

The Honorable Daniel K. Inouye
Chairman, Subcommittee on Defense
Committee on Appropriations
United States Senate
Washington, DC 20510-6028

Dear Mr. Chairman:

As directed by the Fiscal Year 2008 National Defense Authorization Committee Report 110-77, the enclosed report provides the Navy's assessment of the shipboard personal locator beacon.

A similar letter has been sent to Chairmen Levin, Skelton, Murtha, Byrd, and Obey. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to be "BJ Penn", with a horizontal line extending to the right.

U. S. NAVY REPORT TO CONGRESS

ON

SHIPBOARD PERSONAL LOCATOR BEACON

May 2008

I. REPORT REQUIREMENT

The Fiscal Year 2008 Senate Armed Services Committee Report 110-77 for the Department of Defense included language that directs the Secretary of the Navy to submit a report to the congressional defense committees that provides the Navy's assessment of the potential feasibility and impact of using shipboard personal locating beacons. Specifically the language inquires about the feasibility of such technology, the potential benefits of such a system, the cost associated with integrating this technology to current ships, and an estimate of the potential cost savings associated with the use of such a system.

II. BACKGROUND

The purpose of the Sailor personal locator beacon as originally conceived was to aid in the monitoring of the location of Sailors on board ships. For example, in the event of a shipboard casualty situation, the location of each individual could be automatically reported to help identify any missing personnel. The goal of such a system would be to monitor manpower locations onboard ship.

In Fiscal Year 2005, the Office of Naval Research (ONR) began researching technologies that could be used to track and monitor Sailors onboard ships. This effort was supported by a total of \$2.4 million in congressionally directed RDT&E,N funding to ONR for "Shipboard Personal Locator Beacon" research in Fiscal Years 2006 and 2007. The goal of the research was to develop and demonstrate an inexpensive and simple system for improving safety and monitoring of Sailors. Communications technologies were researched that could be integrated with existing onboard communications systems and provide information without the need to install additional onboard infrastructure.

There is no present Navy requirement for Sailors to be continually located aboard ship. Sailors are mustered for the following reasons:

- Daily muster. Known as "quarters for muster, instruction and inspection." This muster is combined with other administrative and training requirements.
- Special evolutions. Sailors have specific assignments for special evolutions, such as flight quarters for helicopter operations or underway replenishment operations. When these evolutions are called away, assigned Sailors proceed to pre-designated watch stations. Watch stations report to the designated control station when they are 'manned and ready' to commence the evolution. 'Manned and ready' means that the watch station has adequate personnel on station, adequate equipment on station, adequate communications, and the personnel and equipment is ready to begin the operation.
- Warfare or shipboard casualty conditions. Similar to special evolutions, when necessary, ships call away conditions that require Sailors to proceed to pre-designated watch stations, such as setting General Quarters. Watch stations report to the designated control station when they are 'manned and ready.'
- Man Overboard. When a man overboard is called away all Sailors proceed to pre-designated mustering locations. Results are reported to a central control station. This

muster is usually completed in 7 to 10 minutes for surface combatants and small amphibious ships.

This report is based in part on the results of this ONR research, the work of the Naval Research Advisory Committee, previous reports to Congress on the subject of safety and manpower reduction, and the Navy's assessment of the relative merits of a shipboard personal locator beacon.

III. ASSESSMENT OF THE FEASIBILITY AND IMPACT OF USING SHIPBOARD PERSONAL LOCATING BEACONS

1. Feasibility of developing an automated personal location and monitoring system

Location and monitoring systems are available commercially in numerous forms and could feasibly be procured and installed, or developed. Several systems exist in industry that could track Sailor location inside an existing ship. However, on existing ships these technology solutions have been found to be cost prohibitive due to the number and configuration of different communication systems, onboard interferences, and complexity of transmitting information wirelessly through the ship hull and superstructure compartments, and are deemed of questionable value. Installation of the system would require a complete retrofit with an existing onboard wired and local area network communication system. The key issue on the feasibility of the development and fielding of this system would be on the cost effectiveness of communication and local area network interfaces, approval cycle with the Space and Naval Warfare Systems Command (SPAWAR) for this type of technology, and ensuring that there are no electronic interferences to other shipboard systems. The Navy sought to apply an existing technology to design an affordable automated personal location and monitoring system for retrofits that was not cost prohibitive and extremely complicated.

ONR's technology development and testing investments have resulted in the Shipboard Personal Locator Beacon (S-PLB) system design. S-PLB uses existing communications and safety systems already installed fleetwide to provide both safety monitoring and locating of Sailors. The research has shown that it is technically feasible to install an automated personal location monitoring system.

2. Benefits to shipboard operations and safety

The benefit of a personal locator system to shipboard operations and safety is questionable. The Navy currently has no requirement for such a system. Knowing the location of all personnel at all times does not, in and of itself, improve operations and safety. Current mustering evolutions are incorporated into the operations of the ship and are not good candidates for replacement by electronic means. For example, merely seeing, on a monitor, that all of the assigned personnel have arrived at their watch station does not inform leadership that the station is ready to commence the operation. The station will still need to follow procedures, prepare the personnel and equipment, and report 'manned and ready.' Theoretically an automated muster could provide situational awareness when a Sailor is believed to be unaccounted for. However, with the frequent changes in crew composition and inability for any automated system to be as

full-proof as a sight muster, it is unlikely that mustering requirements could be eliminated. Navy surface ships are now being outfitted with man overboard indicator devices that are specific to this situation. Because mustering is integrated to other functions on a ship and is a relatively simple and rapid process, it is not believed that replacing mustering with an automated means will improve operations or safety.

The benefit of knowing the location of personnel during non-mustering situations is also questionable. Establishing the location of an individual in a non-emergency situation would not seem to justify the installation of a locator system. Ships have many communication means including fixed and portable telephones, portable radios and announcing systems. In addition, ships are finite and organized in such a way that a ship-wide search can be conducted in a short period of time. There are also privacy concerns to be considered in the use of a technology that allows someone to know the location and track the movements of another individual at any moment in time. The capability could be easily defeated by the Sailor simply removing the device and leaving it behind while the Sailor proceeded to another location on the ship.

Locating personnel in a shipboard casualty situation could have some benefit. For example, in a scenario where a ship sustains damage and personnel casualties, a personal locator system could show the location of personnel and possibly speed medical response to the scene. However, this scenario assumes that the locator system continued to operate ship-wide after damage and that the personnel were not already deceased and were still in need of care. A locator system is unlikely to provide the complete situational picture; fool-proof location of all casualties, best access to the casualties, and condition of the casualties. Therefore, it is unlikely that a personal locator system would completely replace current procedures and investigation after damage occurs. Ships are an enclosed environment, and the task of physically locating crew members via currently existing methods is not unduly difficult or time-consuming in non-emergency or casualty situations. More analysis would be required to determine if a personal locator system could benefit operations and safety to support use in a shipboard casualty environment.

3. Estimate of the cost to develop and integrate

Because ONR has already funded development of the S-PLB, the costs associated with development and improvement of this technology should be minimal. These costs have already been incurred with support of a variety of efforts throughout the Navy and ONR. The current system could be evaluated by temporary installation on a few active ships to determine the usability of the specific hardware and the challenges associated with shipboard environment and onboard systems interfaces in interferences. Additional costs could be generated based on the results of operational testing if modifications are necessary.

The cost of integrating this system with existing ship's systems and installing on ships will vary from class to class. Typical evaluations of equipment are conducted under temporary alterations of the ship (TEMPALT). It is estimated that the evaluation installation of individual Sailor personal locator beacon systems onboard four sample ships within a class of ships for a period to include one full deployment and associated training would be:

- Hardware including individual locator beacons and required shipboard displays with network interfaces = \$250k per ship;
- Contractor supported installation of localization modules and display =\$80K per ship;
- Fleet support and Navy planning yards = \$180K for four ships;
- Engineering support of evaluation = \$250K for four ships; and
- Total estimated cost for fleet evaluation on four ships for 18 months = \$1.75M.

4. Estimate of the potential reduction to manpower costs or workload

The Navy has no requirement for a personal locator system. The Navy has implemented numerous automation systems to reduce ship operating costs; however those examples replaced existing personnel or functions. There are no personnel or systems currently assigned to continually locate personnel. Therefore, there are no known efficiencies or cost savings if a personal locating system were developed and installed. Depending on the support requirement of the installed system, there is a potential that additional manpower would be required for system maintenance.

IV. SUMMARY

The technology for a personal monitoring system exists and developmental work for a ship-board application has been done. Continued integration work and shipboard testing could be conducted. However, the Navy currently has no requirement for such a system and the potential savings and benefit to operations and safety are questionable.

THE ASSISTANT SECRETARY OF THE NAVY

(RESEARCH, DEVELOPMENT AND ACQUISITION)

1000 NAVY PENTAGON

WASHINGTON DC 20350-1000

MAY 05 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

The Fiscal Year 2008 Senate Armed Services Committee Report 110-77 directed the Secretary of the Navy "to submit a report to the congressional defense committees, commencing with the fiscal year 2009 budget request, to be updated quarterly, that outlines the Navy's plan and progress with implementing Open Architecture (OA)."

Enclosed is the second quarterly report. The report is an update to the first report submitted in February 2008 and further addresses the concerns of the Senate Armed Services Committee as identified in Senate Report 110-77; reviews progress and accomplishments related to Naval OA from January 1, 2008 through March 31, 2008; and describes the Navy's upcoming activities for implementing OA.

Please let me know if I can be of further assistance. A copy of the Navy report is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink, appearing to read "J. Thackrah", is written over the typed name.

**SECOND QUARTERLY
REPORT TO CONGRESS
ON
NAVAL OPEN ARCHITECTURE (NOA)**

Prepared by:

**Open Architecture Enterprise Team
Program Executive Office, Integrated Warfare Systems
Washington, DC 20376**

May 2008

Table of Contents

I. Report Requirement.....	3
II. NOA Accomplishments: January 2008 through March 2008.....	3
Goal 1 – Change Naval processes and business practices	4
Goal 2 – Provide Naval OA systems engineering leadership	20
Goal 3 – Change Navy and Marine Corps cultures	24
III. Summary	25

I. Report Requirement

As directed by the Fiscal Year 2008 Senate Armed Services Committee Report 110-77, this document serves as the Second Quarterly Report to Congress on Open Architecture (OA). The scope of this report includes noteworthy Naval Open Architecture (NOA) accomplishments of the Open Architecture Enterprise Team (OAET) and individual Domains (Air; Command, Control, Communications and Intelligence (C4I); Space; Submarines; Surface; and Marine Corps) and the Anti-submarine Warfare (ASW) Community of Interest (CoI) from January 2008 through March 2008. Significant future events that are planned through December 2008 are also discussed.

The Surface Domain consists of the Program Executive Offices (PEOs) for Carriers, Littoral and Mine Warfare (LMW), Integrated Warfare Systems (IWS), and Ships. The Air Domain consists of the PEOs for Tactical Aircraft (T), Unmanned Aviation and Strike Weapons (U&W), Air ASW, Assault and Special Mission Programs (A), and Program Management (NAVAIR 1.0). The Domains for Submarines, C4I, Space, are represented by PEOs Submarines (SUBS), C4I and Space, respectively. The Marine Corps Domain is represented by Marine Corps Systems Command and includes the PEO for Land Systems (LS).

II. NOA Accomplishments: January 2008 through March 2008

The accomplishments during this period are mapped to the three NOA strategic goals which were established in the Naval OA Strategy in December 2006 and reaffirm objectives from the Assistant Secretary of Navy (Research, Development and Acquisition) (ASN(RD&A)) OA Policy of August 5, 2004 and Deputy Chief of Naval Operations (Warfare Requirements and Programs) (OPNAV N6/N7) OA Requirements letter of December 23, 2005. The strategy is comprised of three overarching goals, addressing the business, technical, and cultural aspects of OA transformation. These goals are:

Goal 1 – Change Naval processes and business practices to utilize open systems architectures in order to rapidly field affordable, interoperable systems. This goal includes addressing governance challenges; creating policy and guidance materials; developing new business models (such as the Acoustic Rapid Commercial-off-the-Shelf Insertion or A-RCI program); incorporating OA principles and practices in programs and acquisition materials such as contracts; and encouraging competition and improving interoperability by making information and design artifacts available for reuse by programs.

Goal 2 – Provide Naval OA systems engineering leadership to field common, interoperable capabilities more rapidly at reduced costs. Included in this goal are collaborative efforts in systems engineering; process standardization; leveraging OA to provide quick wins and proofs-of-concepts that provide new capabilities to the Fleet; and providing performance enhancements to fielded systems and development projects.

Goal 3 – Change Navy and Marine Corps cultures to institutionalize OA principles. The primary mechanisms for achieving cultural change are formal training and communications and outreach.

These goals are supported by efforts performed either across the Naval Enterprise by the OAET or within individual Domains (by PEOs, CoIs, Programs, or System Commands (SYSCOMs)). This report summarizes those efforts.

Goal 1 – Change Naval processes and business practices to utilize open systems architectures in order to rapidly field affordable, interoperable systems (e.g. policies, assessments, contracts, design disclosure, reuse of components, etc.)

a. Governance

- The OAET membership was expanded to include the LMW, Ships, and Carriers Program Executive Offices (PEOs), along with the Marine Corps Systems Command (MARCORSYSCOM), Naval Air Systems Command (NAVAIR), Naval Sea Systems Command (NAVSEA), Space and Naval Warfare Systems Command (SPAWAR), and the ASW CoI. This membership expansion was enacted to place a direct representative from these organizations in the OAET, rather than being collectively represented as was the case in the original OAET structure.
 - Established the OA Lead Council (OALC) and convened the first meeting on March 20, 2008 to discuss enterprise collaboration. The OALC consists of the PEOs from Carriers, C4I, IWS, LMW, Ships, Submarines, Space, Submarines and Tactical Aircraft (representing the Air Domain). Collectively, PEO IWS, PEO Ships and PEO Carriers comprise the Surface Domain. Other members include MARCORSYSCOM, the NAVSEA and NAVAIR OA Technical Authorities, the Deputy Assistant Secretary of the Navy for Integrated Warfare Systems (DASN IWS), NAVSEA Contracts, and the Offices of the Chief of Naval Operations (OPNAV N6F, N6R, N85, N86, N87, N88, and N091 / Office of Naval Research). The OALC will meet again in June 2008.

b. Policies / Guidance

OAET:

- In February 2008, the Secretary of the Navy established the Six Gate, Two Pass Review Process to improve Naval Acquisition Oversight. The OAET has since developed OA relevant questions to incorporate as part of program gate reviews. Incorporating questions into the review process ensures OA is addressed at appropriate milestones throughout the lifecycle. The OAET is also working to incorporate OA requirements into future revisions of the SECNAVINST 5000 series.
- As part of improving the acquisition process, System Design Specifications (SDS) was implemented concurrently with the Gate Review process. In support of this effort, the OAET provided OA language for incorporation into the SDS Guidebook.
- The OAET is actively participating in the Enterprise Data and Governance Strategy (EDGS) Integrated Project Team (IPT). The EDGS IPT was established in response to guidance from Deputy Chief of Naval Operations for Communication Networks (OPNAV N6), and Deputy

Department of the Navy (DoN) Chief Information Office, to develop actionable recommendations for presentation to the 3-Star Navy Information Technology Management Council (ITMC) for decision and Navy-wide policy implementation. A key focus of this IPT is data sharing, but the IPT will also address architectures, standards and other Information Technology (IT) and information management areas which are under OPNAV N6 / DoNCIO and ITMC cognizance. This effort will link NOA with Service Oriented Architecture (SOA) pilot projects and related acquisition efforts across the Naval Enterprise. The OAET is also coordinating with OPNAV N6 and the ITMC to extend NOA principles and practices into the acquisition and management of systems beyond National Security Systems.

Domains:

- C4I Domain
 - PEO C4I and SPAWAR 02 collaborated to add Contract Data Requirements List (CDRL) language related to OA assessment and component reuse into the Procurement Desktop Defense (PD2) system used to prepare acquisition documents. PD2 is the system used to generate Requests For Proposals (RFPs) and contract documents. This capability will enable the enterprise reuse of OA-related CDRLs.

- Surface Domain
 - (i) Expeditionary Warfare
 - PEO LMW is responsible for the management of many programs covering wide-ranging missions from Naval Special Warfare to Mine Warfare. The variety of systems in development within PEO LMW supported the addition of a separate PEO LMW representative on the OAET. Participation on the leadership council by PEO LMW, as well as addition of an LMW Domain Action Officer and Representative to the OAET has been effected in the last quarter.

 - (ii) PEO IWS
 - PEO IWS is working with NAVSEA Code 02 (Contracting) to include OA language in SYSCOM guidance such as the NAVSEA Acquisition Planning Guide and Acquisition Strategy Guide. Additionally, PEO IWS is developing a *Surface Navy Combat Systems Strategy for Achieving Open Architecture Acquisition Management Plan* that will include substantial OA guidance and serve as a master strategy for combat system development. It is expected to be completed in June 2008.

- Space Domain
 - PEO Space is collaborating with OPNAV N6 and SPAWAR to explore the potential for Software Reconfigurable Payloads (SRP) on future space missions. SRP has the potential to avoid the need to launch new satellites to achieve responsiveness to evolving threats and satisfy operational needs in a timely manner at nominal cost.

- Submarine Domain
 - The Submarine Domain has initiated training for all submarine Program Offices on the Open Architecture Assessment Tool v1.1 (OAAT v1.1). The assessment tool includes the Modular Open System Approach (MOSA) Program Assessment and Rating Tool (PART) review (required for Milestone Decision Authority Review). All Submarine Domain Program Offices are expected to complete assessments using the OAAT v1.1 by July 2008. The assessments will include PMS 415 (Counter Measures) and PMS 404 (Torpedoes). The addition of these two Program Offices will bring Submarine Domain's assessment number from six major programs to eight.
- Marine Corps Domain
 - MARCORSSYSCOM updated the Marine Corps Statement of Work (SOW) and CDRL and Tracking Tool (SCATT) to incorporate language contained in the *Naval Open Architecture Contract Guidebook for Program Managers* in March 2008. SCATT is a contracting support tool available to all Marine Corps project officers, and is used as SOW and CDRLs are being generated. Automated tools provide ability to provide advice, timed for when that advice is most likely to be needed.
- ASW CoI
 - The ASW CoI is defining OA-driven software development and reuse governance policies and metrics. The CoI is also developing ASW Family of Systems capabilities under the guidance of the Navy Enterprise Architecture and Data Strategy Policy and EDGS IPT.

c. **New Business Models Developed**

- Air Domain
 - The program manager for Advanced Tactical Aircraft Protection Systems (PMA 272) is responsible for providing Electronic Warfare (EW) self-protection systems for all Marine Corps and Navy combat aircraft. PMA 272 currently manages the acquisition of 16 different radio-frequency (RF) countermeasure and infrared countermeasure products used to protect 29 types of fixed- and rotary-wing aircraft. PMA 272 is applying OA principles to facilitate a reduction in the diverse number of fielded stand-alone self-protection systems. Every 24 months, legacy systems will be incorporated into one of two integrated EW suites with common components, one for strike aircraft and one for assault and larger aircraft which will replace the current panoply of systems. The goal is to field EW equipment that is modular and scalable and uses common hardware and software across a range of different aircraft to counter a variety of future threats.
 - In concert with the common component approach, PMA 272 has implemented an OA approach to EW systems called Common Aircraft Protection System. This system provides a common infrastructure for all of the aircraft on which to "hang" different EW

components. It will be achieved by developing a set of specifications that defines the interfaces, services and supporting formats required for a component, such as a missile warning system or RF jammer, to be able to plug into the EW system. This 'plug and protect' approach will provide the ability to add a new component or function to each different aircraft's EW system and have it work automatically without having to do any technical analysis or manual reconfiguration. The Interface Control Documents embodying the specifications will be based on widely supported industry standards, especially for key interfaces, and suppliers will be able to engineer their EW components to comply with these standards.

- C4I Domain

- Integrated Shipboard Network System (ISNS) (Fiscal Years 2008 through 2010) and Consolidated Afloat Network and Enterprise Services (CANES) (Fiscal Year 2010 and out years) – The common theme throughout PEO C4I's Master Plan is the reduction, or necking down, of systems in every enclave across the C4I Domain and reusing the same terminal, network, computing environment for all functions and security levels. This approach is expected to reduce development, test, procurement, installation, training, and support costs. ISNS will deliver a Common Computing Environment (CCE) (over Fiscal Years 2008 through 2010) and begin a migration toward CANES (beginning in Fiscal Year 2010 and continuing in the out years) which will build on ISNS, and deliver CCE, Cross Domain Solutions across multiple security levels, and core SOA services beginning in Fiscal Year 2011.
- By moving C4I programs to a CCE architecture with smaller, CoI service capabilities riding on that infrastructure, PEO C4I intends to make the spiral development cycle much shorter for the Command and Control and Intelligence / Surveillance applications. In addition, by using an incremental build approach, mature technologies can be rapidly fielded at lower risk. In Fiscal Year 2008, there are three ISNS / CANES migration efforts to highlight: Risk Reduction Experimentation, the CANES Early Adopter Process and the planning of Early Adopter installations in operational strike group ships.
 - As a way to reduce risk, the ISNS program will put its software, products and services in Limited Technical Experimentation and Limited Objective Experiment events in which ISNS and CANES migration developmental products are used by operational forces from both the Navy and Joint Services. In Fiscal Year 2008, the experimentation will be Maritime Operations Center-based and focus on Joint / Maritime operational-to-tactical command and control challenges, and rapid, smooth, dynamic, agile Joint / Maritime Force integration.
 - An Early Adopter is an application or system that is a 'stepping stone' to CANES migration and will be worked through ISNS in Fiscal Years 2008 through 2010. Presently, 21 potential candidate programs have been identified from existing applications and more candidates are expected. The Early Adopter Process is another CANES migration risk reduction effort that will be essential to a seamless capability transition. The Early Adopter process is also integrated with the CANES Joint Capabilities Integration Development System (JCIDS) process; Early Adopter inputs are currently

- feeding the CANES Capability Description Document (CDD).
 - OPNAV challenged PEO C4I to install ISNS / CANES migration Early Adopters on an Expeditionary Strike Group or Carrier Strike Group in Fiscal Year 2009. A Cross Enterprise Strike Team was established to address the Fiscal Year 2009 Strike Group selection and recommended the Lincoln Strike Group for the first Early Adopter network installation. Planning efforts are underway to support the successful Fiscal Year 2009 USS Lincoln Strike Group Early Adopter installations as part of the ISNS / CANES migration risk reduction efforts.
 - CANES epitomizes the necking down approach by migrating four shipboard network programs down to one common shipboard network and common services; it meshes with the Defense Information System Agency's Net Centric Enterprise Services as well as the PEO IWS's efforts towards a common computing environment and the PEO Enterprise Information Systems' Next Generation Enterprise Network. The business approach to the CANES program is based on a Competitive Business Model which mirrors industry's movement towards SOA, which is expected to result in lower costs for Future Capability. CANES Increment One Initial Operational Capability is scheduled for Fiscal Year 2011; Low Rate Initial Production will be in Fiscal Year 2012 and Full Rate Production will start in Fiscal Year 2013. CANES Increment Two Milestone C is expected in Fiscal Year 2015.
 - PEO C4I recently held the second CANES Industry Day (March 19, 2008) attended by over 500 industry attendees from more than 160 companies. The objective of the event was to prepare industry for a draft RFP release this summer. Industry attendees submitted approximately 120 questions that will be evaluated and addressed.
- Surface Domain
 - (i) Expeditionary Warfare
 - PEO LMW has initiated development of a Mission Module OA Business Model Guide. The purpose of this document is to provide an overview of the Mission Module OA Business Model, and document organizational relationships, reporting responsibilities and required deliverables. This guide is in the early stages of review and will be released in Fiscal Year 2009.
 - The Joint Counter Radio Controlled Improvised Explosive Device Electronic Warfare (JCREW) spirals 3.1 and 3.2 leveraged modular open system architecture contract language to minimize cost and maximize performance and upgrade ability. The first Spiral 3.1 system is to be delivered in November 2008. JCREW Spiral 3.3, next generation suite, will promote open business and architecture concepts with contractual language.
 - PEO LMW Mine Warfare Program Office (PMS 495) is developing Organic Post Mission Analysis for Mine Countermeasure systems, integrating five legacy software components into a common architecture and graphical user interface. The program office is also developing requirements for a Life Cycle Sustainment facility (integration lab) and is establishing processes for technology insertion (TI) utilizing open business and open technical architecture principles.

(ii) PEO IWS and PEO Ships

- DDG 1000 (USS Zumwalt) Open Systems Management Plan (OSMP) was completed in March 2008. This plan captures the architectural, technical, process, and business practices in support of open systems development. Its creation is consistent with the recommendation of the Naval OA Contract Guidebook for Program Managers that such a plan be a deliverable required in the CDRL.
 - PEO IWS is developing a Surface Navy Combat Systems Architecture Description Document (ADD) detailing the framework for guiding the PEO's transformation from delivering uniquely designed systems for U.S. Navy surface ships to a combat system product line. This objective architecture will be released to the Surface Navy Community in 4th Quarter Fiscal Year 2008. The ADD will align with, and be managed in concert with, other Naval and Joint enterprise architecture and standards initiatives, as they are defined, to support reuse of common core assets across the larger Naval, Joint and coalition community and interoperability with other Naval, Joint and coalition in a net-centric environment. This is being done in an evolutionary fashion with ultimate instantiation of forward-fit in CG(X) and back-fit in other platforms.
 - PEO IWS initiated a Value Stream Analysis in January 2008 with the goal to develop a Future State Process for Enterprise Software Development and Delivery. The first session resulted in a baselined "As Is" state set of metrics for CG modernization. The focus of the follow-on session is on defining a software development process that can deliver Advanced Capability Builds (ACB) to the Surface Navy every two years and identify challenges in making the ACB process a reality for the Surface Navy community. The ability to deploy new capabilities more rapidly to the Fleet is a foundational step for the *Surface Navy Combat Systems Strategy for Achieving Open Architecture Acquisition Management Plan* being developed.
 - PEO IWS is responsible for the Common Display Services (CDS) and Common Processing Services (CPS) programs that provide core Display and Processing services in support of the common objective architecture for combat systems and Surface OA Way Ahead. The CDS contract was awarded in November 2007 while the CPS RFP was released in March 2008. Both CDS and CPS provide component elements to the objective architecture being defined in the ADD.
- Space Domain
 - Exploring SRP systems engineering efforts as potential solutions for the development of future space systems. SRP could be embedded on a satellite, in its ground infrastructure system or in both. It is designed in a modular, flexible, and extensible manner such that it efficiently utilizes size, weight, and power allocations that are available on the spacecraft or other payload / platforms. SRP is a promising concept and the feasibility of implementing it for the Mobile User Objective System (MUOS) ground infrastructure is being explored. SRP could offer the ability to expand competition in satellite development and maintenance by allowing separate vendors to construct the spacecraft and develop or upgrade the payload. Without the complexity of building the entire spacecraft, more companies will be able to compete, program or upgrade the SRP,

increasing innovation and reducing costs. SRP technology could also be used on other Naval platforms like Unmanned Autonomous Vehicles to improve communications and the performance of other missions in a dynamic battlefield environment.

- **Submarine Domain**

- PEO SUBS began updating its OA implementation business model three years ago with the goal of increasing focus on the Fleet's Training, Tactics and Procedures requirements. Instead of introducing major capability improvements on an annual basis, PEO SUBS will now provide bi-annual capability improvements while delivering "service packs" every other year to afford more time to "train the trainers" on the new capabilities. The first submarine to be delivered under the new service pack model will be the USS Boise (SSN 764) in August 2009.
- PEO SUBS has also embarked on a common procurement approach for all "dry end" processing systems, featuring the established OA standards in a SOA that promotes the sharing of processing resources among subsystems. This also enables increased Operational Availability while reducing Life Cycle Costs. Similarly, a common contracting approach to the "wet end" sensor contract approaches without inboard processing requirements, leaving that development work to the inboard subsystems.
- PMS 435 is migrating Imaging, Electronics Surveillance Measures and Photonics programs to the A-RCI business model for TIs and Advanced Processing Builds (APB). PMS 435 developed a hybrid business model that combines elements of the Submarine Domain's TI and APB business models to address some of the unique requirements within these programs. PMS 435 will institute a TI every four years with a Capability Insertion (CI) every two years. TIs will include major hardware investments with new software builds (i.e., APB) while a CI can include hardware and/or software builds (i.e., APB). CIs are dependent on current and proven technology within the market, program funding, and submarine installation requirements. PMS 435 is now synchronizing the CI / TI business model with PMS 425 AN/BYG-1 and PMS 401's A-RCI TI/APB business model.
- Designs for Virginia Class submarines TI-08 modernization started last quarter. PEO SUBS is addressing the migration or merging of Virginia Class submarines into the TI / APB modernization cycle. The migration of Virginia Class submarines is relatively easy; however, there are inherently unique requirements with bringing a new class and design to the existing business model. TEAMSUB Program Offices and other Program Acquisition Resource Managers within the PEO IWS, C4I, and Contractor Furnished Equipment communities are working together to insure that Virginia Class submarines maintain an OA approach during their TI-08 modernization cycle.

d. Programmatic Changes

- **Air Domain**

- The Air Domain Technical Authority (NAVAIR 4.5) conducted a MOSA PART Assessment on the Joint Precision Approach and Landing System (JPALS) ACAT 1D program. The results from this assessment provided valuable information and insight

into the program's approach and maturity in support of the upcoming Milestone B decision process (scheduled for June 2008). A senior analyst at Deputy Undersecretary of Defense (Acquisition and Technology) Systems and Software Engineering / Assessments and Support stated the "JPALS program documentation reflects an exemplary degree of awareness, understanding, and planning for effective MOSA/OA application." Additionally, it was noted that the JPALS contract strategy included requirements drawn from the *OA Contract Guidebook for Program Managers*.

- PEO Tactical Aircraft (PEO T) is collaborating with OPNAV N88 and Headquarters Marines Corps regarding the development of an EW OA self-protection system for light aircraft.
- C4I Domain
 - In addition to the CANES effort mentioned earlier, PMW 770 conducted an OA Assessment on a Science and Technology Program titled 'Communications at Speed and Depth' during the quarter. The results and knowledge learned from this assessment will provide valuable information to support the program's upcoming Milestone B meeting, scheduled for April 2008. Engaging this program early in the acquisition life cycle has identified areas within the program where openly available interface standards can be utilized more extensively during the system design and development phase.
- Surface Domain
 - (i) Expeditionary Warfare
 - PMS 495 (Mine Warfare Program Office) completed an OA Assessment of one ACAT I and four ACAT II organic mine warfare programs in August 2007. The study assessed the extent that OA practices were used and the degree to which open business processes were implemented. In response to recommendations contained in the assessment, PMS 495 is transitioning from a system-centric to a mission-centric (enterprise) view where product improvement and TI decisions will be applied to optimize mission performance.
 - (ii) PEO IWS
 - PEO IWS has implemented Program Manager-to-Program Manager Agreements that are designed to result in an alignment of the configuration process for the Surface Fleet's combat systems. The following agreements have been reached to date:
 - PEO SHIPS / PEO IWS: FOR CG AND DDG MODERNIZATION, June 5, 2007. Establishes roles, responsibilities, and deliverables between PEO Ships and PEO IWS for the execution of the CG and DDG Modernization programs in accordance with alterations approved within the Navy Modernization Process.
 - PEO IWS / NAVSEASYSKOM, SEA 21: FOR IN-SERVICE MINE / AMPHIBIOUS / AUXILIARY (MAAC) SHIP COMBAT SYSTEM MANAGEMENT, July 27, 2007. Establishes roles, responsibilities, and deliverables between NAVSEA SEA 21, MAAC Ship Program Manager

(PMS 470) and PEO IWS 1.0 for life cycle management of MAAC ship Combat Systems (CS) to include sustainment and modernization of applicable CS elements.

- PEO SHIPS / PEO IWS: FOR NEW CONSTRUCTION AMPHIBIOUS SHIP COMBAT SYSTEM MANAGEMENT, July 27, 2007. Describes the roles, responsibilities, and deliverables between Program Executive Office, Ships (PMS 317 and PMS 377) and PEO IWS 1.0 in the planning and execution applicable to Combat System Government Furnished Equipment and Information in support of New Construction Amphibious Ship Programs.
- PEO CARRIERS / PEO IWS: FOR CARRIER COMBAT SYSTEM MANAGEMENT, July 31, 2007. Establishes roles, responsibilities, and deliverables between PEO Carriers (PMS 312 and PMS 378) and PEO IWS 1.0.
- PEO SHIPS / PEO IWS: FOR DDG 1000 Zumwalt Combat System Management, November 7, 2007. Describes the roles, responsibilities, and deliverables between PMS 500 and PEO IWS 1.0 for planning and execution of the DDG 1000 Zumwalt Class destroyer program.
- PEO SHIPS / PEO IWS: FOR CG(X) Combat System Management, November 7, 2007. Establishes and allocates the roles, responsibilities, and deliverables between PMS 502 and PEO IWS 1.0 for the planning, requirements development, design and execution applicable to support the CG(X) Program.
- PEO SHIPS / PEO IWS Memorandum to ASN RD&A: STATUS OF LITTORAL COMBAT SHIP (LCS) PM-TO-PM AGREEMENT, November 7, 2007. This memorandum documents the intention of PEO IWS and PEO Ships to pursue a future Program Manager-to-Program Manager Agreement for LCS after the follow-on ship plan is determined.

As a result of this alignment, the Navy should realize better development and fielding cycles while retaining its ability to produce preeminent combat systems. There were no new agreements signed between January 1st and March 31st.

- PEO IWS is collaborating with other communities including PEO C4I, PEO Ships, the ASW CoI, and NAVAIR to achieve greater commonality and efficiencies in how combat systems are developed and evolved in a net centric environment. A PEO IWS / PEO C4I Technical Interchange Meeting (TIM) was conducted in January 2008 to begin the process of integrating the Surface Combat Systems Architecture and PEO C4I Roadmap efforts. As a result of the TIM, PEO IWS is exploring opportunities to achieve alignment with the PEO C4I CANES effort through common displays and processing solutions.
 - PEO IWS, MARCORSYSCOM and PEO LS are presently assessing the feasibility of sharing common components between Ship Self Defense System (SSDS) MK 2 and Marine Corps Common Aviation Command and Control System (CAC2S) computer programs in order to leverage Service investments in required system upgrades and reduce overall life cycle costs.
- Submarine Domain
 - PEO SUBS received new requirements from the Submarine Tactical Requirements Group

that realigned APB-09 advanced development efforts to better meet fleet priorities and schedules and improve execution of training prior to introduction of the upgrades. Additionally, PEO SUBS created a new billet – Team Submarine Deputy Technical Director – with the expected result to improve submarine combat system engineering practices and strengthen coordination across all submarine systems.

- PEO SUBS has also restructured its near and far term procurement actions to feature Open Systems Architecture breaking out imaging processing from its wet end sensor based procurement with emphasis on a SOA to be issued as Full and Open Competitions. PEO SUBS will be using a similar approach on future procurements as well.

- Marine Corps

- Subsequent to the assessment submitted in the 1st Quarter of Fiscal Year 2008, the Distributed Common Ground System-Marine Corps (DCGS-MC) program modified its Technical Development Strategy and MOSA approach as a result of increased awareness of OA. Program Management Office training plans are being developed to ensure the staff completes the appropriate training through the Defense Acquisition University (DAU) and other on-line Department of Defense sources.

- ASW CoI

- The ASW CoI is developing software governance policies modeled after the Software Engineering Institute's Software Product Line concept. These policies are being tailored to the defense acquisition environment with multiple programs, software developers and users from different organizations working together. The ASW CoI is also working with the Surface Combat Systems Objective Architecture as well as the Department of Defense CoI Forum and with other CoIs working in related areas.
- PEO IWS and PEO C4I collaboratively identified core services and hardware for near term (Fiscal Year 2009) implementation of ASW Command and Control Undersea Warfare Decision Support System (USW DSS) applications as a CANES early adopter. This agreement confirms PEO IWS and C4I's commitment to SOA and open, agile, service based solutions.

e. Contracts Targeted / Changed to Include OA Requirements

- Air Domain

- PMA 290, the Maritime Patrol and Reconnaissance Aircraft program office, inserted OA language into the CDD and in a Broad Agency Announcement (BAA) released to industry in January 2008 for the EP-X program. EP-X, the proposed replacement for the current EP-3 aircraft, is at a pre-technology development phase. Three companies are on contract. The purpose of the BAA is to allow vendors to look at the Navy requirements and develop a preferred systems concept. OA language was inserted into the BAA from a rapid reconfigurability perspective. A final vendor deliverable is expected in the mid-July timeframe.
- The Presidential Helicopters program office, PMA 274, is identifying key interfaces for

the VH-71 helicopter from an OA perspective. The contract documentation for the VH-71 is also being assessed to determine what OA contract language can be inserted into the program to support Increment 2, starting in Fiscal Year 2009.

- The Aerial Target Systems Program Office (PMA 208) has included OA contracts language in the RFP, Statement of Objectives and Performance Specification for the Multi-Stage Supersonic Target ACAT IV M program.
- PMA 272 is including OA language in the acquisition documentation for Joint Allied Threat Awareness System.
- The program manager for the Hawkeye, Advanced Hawkeye and Greyhound Program Office (PMA 231) is including OA language in the E2 Hawkeye Core OA Functional Component Interface RFP, SOW, and Performance Specification.

- C4I Domain

- Future Command and Control: Inserted OA language into the Request for Information (RFI) to promote competition and utilization of open standards. Modular design and life cycle affordability are critical factors.
- Automated Digital Network System (ADNS) Increment III: Program assessment and reuse CDRLs were incorporated into the Low Rate Initial Production planning phases.
- Global Positioning System Based Positioning, Navigation and Timing Service: OA language inserted into the RFI to promote competition and utilization of open standards. Modular design and life cycle affordability are critical factors.
- Naval Integrated Tactical Environmental Subsystem Next Generation (NITESNext): Inserted OA language into the SOW identifying modular design and design disclosure as critical factors in evaluation. Existing NITES and other meteorological software components to be evaluated by vendors as potential reuse candidates.
- Distributed Information Operations – Services: Inserted an approach for migrating deployed applications to greater degrees of net-centricity and interoperability into the SOW.
- Distributed Common Ground System ((DCGS) Information Backbone (DIB): Net-centric program assessment completed; results helping to refine DIB SOW to further promote interoperability and secure information exchange.
- Digital Modular Radio: OA language in SOW to promote competition and utilization of open standards. Modular design and life cycle affordability are critical factors
- Submarine High Data Rate: Global broadcasting precision navigation timing system – included OA language in SOW to promote competition and utilization of open standards. Modular design and life cycle affordability are critical factors. Program assessment and re-use CDRL requirements were incorporated into the acquisition strategy / acquisition planning efforts.

- Surface Domain

- (i) PEO IWS

- Common Display System (CDS) Display Consoles – Two contracts were awarded to provide CDS Display Consoles in support of the DDG 1000 and Aegis

Modernization. The CDS is a family of displays that will be implemented across platform systems on Navy surface ships, submarines, and aircraft. Display consoles provide a common human machine interface to the Platform OA Computing Environment. The contracts were competitively procured via full and open competition.

- DDG 1000 (USS Zumwalt Class) new contracts, Detailed Design Integration Mod and Mission System Equipment, have implemented the Naval OA Contract Handbook language and went through an OAET review for compliance; expected contract definitization is in the 3rd Quarter of Fiscal Year 2008.
 - A task order under a previous openly-competed contract was issued to the OA Track Manager Systems Integrator / Design Agent to develop a common track manager and common system track server for all Surface combat systems. Additionally, an RFP for CPS was released on March 28, 2008.
- Space Domain
 - PEO Space Systems is working to better define and streamline its Small Business Innovative Research (SBIR) topic development processes, which includes the incorporation of OA language and alignment with the PEO investment strategy. Updated processes are expected to be in place for the SBIR in Fiscal Year 2009 solicitation cycles.
- Submarine Domain
 - PEO SUBS plans to re-compete its Sonar, Tactical Control, Weapons Control, Imaging, Torpedo, and Next-generation Countermeasure in the next 18 months. PEO SUBS is structuring each competition in a common manner that implements the OA guidance language and will re-use as much as possible from one program to the other. The expected effect is less work for both the Navy and industry contracting and programmatic units.
 - An Industry Day was held to address the Integrated Submarine Imaging System and another for the overall Team SUBS that introduced industry to planned procurements in PEO SUBS.
 - Future Industry days will be held for Tactical / Weapons Control and Acoustics procurements.
 - A draft RFP will be released for each individual procurement to solicit industry's feedback to build a better understanding of the requirements and to refine the approach being implemented.
 - PEO SUBS has extended its OA by awarding the MK 54 Lightweight Torpedo's Advanced Development to a small business.
 - PEO SUBS incorporated the OA guidance language on a Sole Source Photonics Mast Procurement. PEO SUBS also has incorporated the OA guidance language into its common procurements that are in process for Imaging and other Submarine Combat Subsystem competitions.

- Marine Corps
 - A contract modification to support Joint Tactical Common Operational Picture Workstation Client and Gateway was implemented in March 2008. This modification provides engineering support to partially re-architect the Command and Control Personal Computer. All new development and re-architecting will be consistent with OA requirements.

f. Artifacts Published / Disclosed to Improve Interoperability and Encourage Competition

OAET:

- PEO C4I Net-Centric Enterprise Solutions for Interoperability (NESI) is collaborating with the PEO IWS Software, Hardware Asset Re-use Enterprise (SHARE)) Team to develop a common federated search capability for the NESI Collaboration Site and SHARE Repository; this will facilitate the discovery of existing software assets and ongoing developmental efforts by program offices desiring to reuse software.

Domains:

- Air Domain
 - The E-2C Hawkeye Early Warning and Control Aircraft program is in the process of submitting Multi-Sensor Integration (MSI) and Automatic Identification System (AIS) artifacts to SHARE auditors for preliminary intellectual property scans prior to submission into SHARE in April 2008. For the MSI component, the following artifacts will be added to the SHARE Repository: Interface Description Document, System Segment Specification, Software Requirements Specifications (SRS), the component's white paper, master requirements listing, and the component source code. For the AIS component, the following artifacts will be added to the SHARE repository: Software Project Management Plan, Software Development Plan, SRS, presentation material, financial progress reports, component model repository, and the component source code. All of the artifacts provided to the SHARE repository are government owned property.
- C4I Domain
 - Facilitated the release of the Joint Tactical Radio System (JTRS) Information Repository Scan Tool suite which contains 113 artifacts available for reuse via access to the NESI Collaboration Site and SHARE repository. Posted 198 more artifacts in the NESI Collaboration Site during January and February of 2008.

- Surface Domain

- (i) PEO IWS

- The following actions have been taken related to the SHARE repository and in re-using assets and artifacts during the period of January through March 2008:¹
 - Updated the SHARE license agreements based on user experience;
 - Designed, implemented and installed automated metadata description sheet on SHARE to facilitate future search capabilities;
 - Evaluated a commercial scanning tool, PowerGrep to reduce time auditing assets (tool is being installed in near future for use by audit team);
 - A total of 63 assets (containing over 18,018 artifacts) have been made available in SHARE;
 - Processed 35 registration applications (January - March 2008);
 - Total registrants to date = 200 government / industry;
 - Conducted three audits on asset submissions (two in process);
 - Processed two requests for assets (January - March 2008);
 - Received 25 requests for assets (January - March 2008);
 - Total requests for SHARE assets to date = 260; and
 - Total number of assets submitted for availability on SHARE = three.
- PMS 500, PEO IWS 1A3 and the Office of Naval Research collaborated with PEO IWS-7 and submitted the Composite Combat Identification, Common Reasoning Algorithm into the SHARE repository process in January 2008 for future ship class consideration.
- PEO IWS-6 is currently processing 27 Common Network Interface Flight 0 Software design artifacts for inclusion into SHARE. Late in the 1st Quarter Fiscal Year 2008, PEO IWS 6 processed the check out of 28 Aegis software design specifications for Single Integrated Air Picture (SIAP) Systems Integrator / Design Agent (SIDA) use. Also processed the addition of 20 SIDA software design and code assets resulting from the use of the retrieved SHARE artifacts mentioned above. As a follow-on effort, also for SIAP SIDA use, PEO IWS-6 is processing check out request for Aegis Display Systems B5 spec.
- PEO IWS-6 has submitted the Cooperative Engagement Capability (CEC) Baseline 2.1 USG x-A software specifications into SHARE. This CEC baseline upgrade incorporates decoupling of the system hardware and software providing greater ease of upgrade and computer processing expansion.
- PEO IWS-7C (Training Systems Directorate) submitted applications and artifact documentation for the Multi-Mission Team Trainer system to SHARE during this period.

¹ **Artifact:** Products of a system/software development life cycle, including requirements, design documents, test cases, code, source files, executables, test reports, prototypes, user manuals, use case models, design models, and contract language. **Asset:** Any cohesive collection of artifacts that provide a solution to a user's need.

(ii) PEO Ships

- The Zumwalt OSMP was completed and reviewed on March 18, 2008. This plan, prepared in accordance with the *Naval OA Contract Guidebook for Program Managers*, and delivered as a CDRL item, captures the architectural, technical, process and business practices in support of open systems development.
- Space Domain
 - Made the MUOS waveform available to other JTRS contractors within the JTRS Information Repository. The waveform software is approximately two million software lines of code.
- Submarine Domain
 - PEO SUBS is establishing a common Technical Information Center to support the in process procurements for Imaging, Tactical Control, Weapons Control, and Sonar Systems.
 - Developed web-based tools, located within the Contractor Integrated Technical Information System, to be used to support interoperability among subsystems within the Submarine, PEO IWS and C4I domains:
 - Web Integration and Test Tool (WITT), is based on the Open System Interface model for an expandable environment. Features include automated test procedures with built-in reuse; early Systems Test and Integration planning suite; universal interface debug tools; online test pass / fail recording with automated Verification and Validation; and Dashboard style, drill down technical and programmatic metrics tool.
 - Web Interface Product Tool (WIPT), works closely with the WITT to produce Group Requirements List, Group Data Dictionary, Interface Definition Language, and Interface Integration Database for subsystem integration to the tactical network.
- Marine Corps
 - Encouraged review of assets available in SHARE and NESI at DCGS-MC Systems Engineering Working Integrated Product Team and at Army / Marine Corps Command and Control / Situation Awareness Convergence study meeting sequences. System capabilities such as CAC2S and the emerging Marine Air Ground Task Force Command and Control systems rely in part on re-use of systems developed both by other Naval Enterprise Domains and by other military services.
 - Established initial contact between Product Group 10 / Total Force Information Technology Systems / Electronic Business Systems Team and the PEO IWS SHARE Team to discuss possible interface of a MARCORSSYSCOM Information Technology system with SHARE and NESI.

- ASW CoI
 - The ASW CoI has recently employed the Advanced Interactive Management Technology Center facility at the Naval Underwater Warfare Center to publish Increment One of the ASW CoI Data Model via web services. USW DSS has already placed artifacts on this website.

g. Components Reused to Reduce Cycle Time, Risk and Increase Affordability

- C4I Domain
 - Reused 128k lines of Navy-owned code and 25k lines of code from a U.S. Army program to deliver two new capabilities for the Automated Digital Network System.

- Surface Domain

(i) Expeditionary Warfare

- The LCS's Mission Package Computing Environment (MPCE), being developed by PMS 420, is an open system in accordance with the IWS Objective Architecture. The MPCE utilizes a modular design with standard interfaces that enables integration with two distinct combat systems. The ASW Mission Package utilizes 85 percent imported code from existing sources.
- PEO LMW (PMS 495) has selected the expendable Archerfish mine neutralizer as the common neutralizer for both airborne and surface mine neutralization applications.
- PEO LMW (PMS 480) designed the Shipboard Protection System (SPS) with an OA integration capability allowing it to more easily integrate peripheral system components (such as Acoustic Hailing Device and Electro-Optical / Infrared or EO/IR).
- PEO LMW (PMS 485) has implemented OA principles in developing the Integrated Common Processor (ICP) for the Integrated Undersea Surveillance System. ICP has capitalized on much of the effort undertaken by the Navy's A-RCI program. ICP and A-RCI share common software modules, hardware components, acoustic / geographic displays and system architecture. OA relies on well defined interfaces to allow for more efficient, timely and economic integration of improved / increased capability. Common acoustic / geographic displays assist in user / operator training efficiency.

(ii) PEO IWS and PEO Ships

- During this reporting period, the Zumwalt program's use of an OA design approach has driven successful completion of the fourth of six major software releases. This software release was 1.03 million lines of code and was developed on schedule and within cost goals in 31 months.
- Reuse of Zumwalt OA software products will provide cost saving opportunities for future shipbuilding and ship modernization. Zumwalt and CVN fleet OA alignment is ongoing. Total Ship Computing Environment Infrastructure services were incorporated into SSDS OA baseline for 2008 fielding aboard CVN 68.

- Submarine Domain
 - A-RCI, Tactical Control, and Weapons Control Subsystems all reuse software from one TI Baseline to another. Furthermore, these programs all reuse APB-07 software developed by PEO IWS 5 to support APBs. Once the subsystems fully integrate capability improvements into their respective baselines, the decision is made as to how the improvements will be applied to the Virginia Class with nearly 100 percent software reuse. Hardware within Submarine Combat Systems is common among subsystems at the TI level, further reducing life cycle costs.
 - TI-08 capabilities are designed for commonality. Examples of commonality within the TI-08 design are AIS, On-Board Tactical Trainer, Acoustic Intercept and Ranging and Embedded National Tactical Receiver. Each of these will be installed on multiple classes of submarines.
 - TI-08 baseline hardware was established giving a 2X increase in processing power. This baseline is used commonly amongst Integrated Submarine Imaging System, Acoustics, Tactical Control, Weapons Control, and IWS 5 Developmental assets and is further applied to Virginia Class and the Royal Australian Navy's Collins Class Submarine Combat System Equipment as appropriate.

- ASW CoI
 - Working with Joint Command and Control and Net-Enabled Command Capability to reuse Universal Core, Common Core and Track components in ASW Command and Control.
 - The USW DSS, which is the Command and Control component for the ASW CoI, is modifying software to improve operability and software portability. These modifications will make use of Universal and Command and Control Common Core components as they become available. The program is conducting Limited Technical Experiments to verify that interoperability and portability goals are being met while still providing the required functionality.
 - Mid-frequency active sonar capability developed by the surface combatant community is being reused on submarine sonar.

Goal 2 – Provide Naval OA systems engineering leadership to field common, interoperable capabilities more rapidly at reduced costs

a. Systems Engineering Collaboration

- Submitted Fiscal Year 2007 OA/FORCEnet experiment artifacts to the Navy Collaborative Engineering Environment; in the process of submitting artifacts to SHARE auditors for preliminary intellectual property scans prior to submission into SHARE along with a draft copy of the report.
- Issued the Fiscal Year 2007 OA/FORCEnet Experiment Results on common data modeling efforts. The ASW data standardization working group is leveraging the results to build the

ASW extension to the Joint Track Manager / CANES data model.

- The Space Domain introduced Software Reprogrammable Payload engineering as a potential candidate for collaboration across domains.

b. Standardization of Processes

- NAVAIR began definition of a process to define the NOA CDRL for OSMPs. A Lean Six-Sigma project is being conducted to define a process that supports Industry, OPNAV, PEOs and Program Managers that will be completed later this year.

c. Quick wins / Near-term proofs of concept

- Air Domain
 - Network Centric Waveform – A small business, Twin Oaks Computing Company, Inc. developed and demonstrated a software device driver (VMNet) that enables OA data transfer over common backplanes (VME and cPCI). It also supports Remote Direct Memory Access (RDMA). The benefits of this SBIR contract include:
 - Open Standards Based Architecture (Open Fabrics),
 - High Performance Solution,
 - Clear upgrade path as hardware options increase (e.g., RDMA Capabilities),
 - Hardware neutral solution - applications port easily,
 - Supports Data Distribution Service over RDMA,
 - Utilizes backplane data transport, leaving Ethernet bandwidth available, and
 - RDMA requires no reassembly; buffer is pre-allocated with known size, zero-copy; data is placed directly in consumer's memory buffer.
- C4I Domain
 - ISNS Common Core Services will field a collection of open source software packages on USS Lincoln Strike Group platforms and the U.S. Pacific Fleet's Maritime Headquarters / Maritime Operations Center in support of the Early Adopters initiative in November 2008.
 - The Early Adopter process has succeeded in virtualizing the following systems in support of the rapid capability insertion process:
 - Navy Information / Application Product Suite;
 - Theater Medical Information Program-Maritime;
 - Composable FORCEnet;
 - AIS; and,
 - Defense Message System.
- Surface Domain
 - (i) Expeditionary Warfare
 - PEO LMW (PMS 480) is including rigorous application of OA principles in Ship Protection System software design permitting technology introduction in edge devices

(EO/IR, gun mount, acoustic hailing device, spotlight, etc.) PMS 480 is utilizing OA Subject Matter Experts from Naval Surface Warfare Center (NSWC) Dahlgren Division to validate the "openness" of the SPS system design.

(ii) PEO IWS

- Developing Periscope Detection Radar using a SBIR firm (3Phoenix). Benefits:
 - Reduced development time to 25 months for Radar Data Processor, and
 - Significantly reduced costs (by approximately \$75 million).

d. Performance Improvements in Development or Fielded Systems

• Air Domain

- Initial products defining an OA for Light Aircraft Survivability (EW Systems) have been drafted. The products include a DoDAF Integrated Architecture and Interface Control Documents for the EW System components.
- E-2C OA Computing Mission Computer Processor Functional Configuration Items (FCI). Code Conversion metrics:
 - 2,200 Software Lines of Code (SLOC) of Ada code converted to C++,
 - 1,861 Engineering Hours to convert,
 - ~\$200k to convert,
 - 0.85 hrs/SLOC, 1.18 SLOC/hr, 9.5 SLOC/day,
 - 1 defect discovered during system-level integration,
 - < 0.5 errors / Thousand SLOC (KSLOC), 4.8 sigma (99.95% yield).
- E-2C OA Computing MUX N-BUS FCI. Code Conversion metrics:
 - 3,850 SLOC of Ada code converted to C++,
 - 1,467 Engineering Hours to convert,
 - ~\$160k to convert,
 - 0.38 hrs/SLOC, 2.62 SLOC/hr, 20.9 SLOC/day,
 - 10 defects discovered during system-level integration, and
 - < 2.6 errors / KSLOC, 4.3 sigma (99.74% yield).
- Automatic Identification System Functional Configuration Items (AIS FCI) Prototype Development. Code Conversion metrics:
 - 6,195 lines (SLOC) of Model code (2,250 new / 3,945 reuse),
 - 21,330 generated lines (GSLOC) of C++ code (~3.5x conversion factor),
 - 2,100 lines (SLOC) of new or modified Advanced Control Indicator Set (ACIS) code,
 - \$224K Requirements Analysis / \$157K Code Development (4,350 new SLOC),
 - 0.31 hrs/new SLOC, 3.26 SLOC/hr, 26.0 SLOC/day,
 - 2 defects discovered during system-level integration, and
 - 0.46 errors / KSLOC, 4.8 sigma (99.95% yield).

The focus on up-front systems software engineering and requirements analysis created a higher degree of confidence in the product quality, while retaining a greater degree of flexibility to adapt to future requirements. The E2C AIS Prototype Development demonstrated that a new modeled software capability can be added to the legacy Operational

Flight Program. The result was an Integrated AIS Capability with reduced risk for Fiscal Year 2009 AIS efforts.

- C4I Domain

- CANES is expected to have greatly increased computing power over today's shipboard networks, with the number of server instances in the vicinity of a 4:1 average virtualization ratio. This means that a CANES network server would be able to host up to four virtual Common PC Operating System Environment Servers that are installed on Naval ships today. Additionally, CANES is also expecting to have a greatly reduced footprint aboard the ship with the physical number of servers decreasing by about 20 percent and the number of server racks decreasing by at least 50 percent.
- Functional capabilities for the ADNS have been increased by reusing Navy developed software (127,976 SLOC) to increase ADNS management of routers, switches, packet shapers and servers; additionally, 25,422 SLOC of Army-developed software was reused to increase the system's ability to manage network Quality of Service.

- Surface Domain

- (i) Expeditionary Warfare

- PEO LMW is developing requirements to establish a Life Cycle Sustainment facility and is also establishing processes for TIs.

- Submarine Domain

- As part of the APB-07 upgrade which completed lab testing, PEO SUBS and PEO IWS conducted interviews with submarine Commanding Officers and watch teams to determine what they required to better operate their ships in the contact-rich littoral waters. Those interviews resulted in three primary improvements: the Interactive Battlespace Awareness Layout Display that brings together sonar, visual, and electronic contacts on to one screen; the Rapid Periscope Observation Support that is expected to provide for quick periscope observation to maintain a fast pace of contacts; and the Common Passive Broadband with Improved Parameter Evaluation Plot that ensures that a submarine's command, fire control, and sonar see the same first data from which they base their contributions to the safe operation of their ship.
- PEO SUBS has successfully integrated ten APBs in A-RCI and eight into the Tactical Control Subsystem and shared these same capabilities with the Collins Class and Virginia Class programs as applicable.
- TI-06 will field the following capabilities this year.
 - Weapons Control upgrades provide improved targeting and strike capability. Provide Joint Interoperability for the strike mission.
 - Tactical Control upgrades provide the war fighter with improved contact management / decision making, and situational awareness. Benefits include a 10 to 25 percent improvement in targeting containment accuracy and a 1 to 50 percent reduction in track break. Sonar and Tactical Control displays will be

consolidated and simplified to support reduction of footprint and manning. Begin formulation in support of track manager / solution concepts.

- Sonar improvements provide the war fighter with expanded search capability through enhanced passive signal processing and track algorithm capabilities. A new active processing string based on the current Surface Ship processing will be assessed for post-APB06 applicability within the BQQ-10 sonar to increase commonality with the Surface Ship applications. Digital acoustic communication, part of the baseline processing string will be enhanced through the application of a new Tactical Decision Aid.
 - Information Assurance and data distribution format changes will be implemented to enable the ability to operate with other military forces in a joint mission environment.
 - Electronic Support Measures improvements provide the war fighter with an extended reach capability to understand the electromagnetic environment beyond the range of the platform's organic sensors, enhancing the platform's situational awareness. The platform will also gain the ability to detect and identify low power high threat radar that current systems are not capable of handling. The addition of the Improved Communications Acquisition and Direction Finding system provides the platform with the capability to take tactical advantage of modern communications signals.
- ASW CoI
 - The USW DSS software modifications described above will facilitate software upgrades and tech refreshes, with the intent to improve operational capability and reduce detect to engage timelines.

Goal 3 – Change Navy and Marine Corps cultures to institutionalize OA principles

a. Training

- DAU OA Training Module – 36 students completed module in 2nd Quarter of Fiscal Year 2008. As of April 7, 2008, 588 students have completed the module since its inception in August 2006 of which 206 students have completed the course in Fiscal Year 2008. 40 students are presently enrolled.
- C4I Domain held a two-day OA workshop (March 5-6, 2008) and trained 12 senior managers on OA.
- PEO IWS conducted a training session on OA for NSWC Panama City, attended by approximately 100 individuals. This session also covered the contents of the OA Contract Guidebook. Additionally, IWS-7B representatives individually met with a broad range of project management teams to discuss how they were incorporating OA principles into their efforts. There are a number of “lessons learned” and other feedback that will be very useful when provided to the Naval Enterprise during the revision of the *OA Contract Guidebook for Program Managers* in July 2008.

b. Communications / Outreach

- OA Website - Received 27,556 hits (<https://acc.dau.mil/oa>) in the 2nd Quarter of Fiscal Year 2008, bringing the total number of hits for Fiscal Year 2008 to 140,672.
- Conferences
 - Air Domain - participated in The Technical Cooperation Program in London, England, held on January 22-25, 2008. The five coalition nations that participated were: U.S., England, Australia, Canada and New Zealand. The Aviation's OA collaboration work is being conducted under the Aerospace Systems', Airborne Mission Systems Technical Panel (AMS-TP). The AMS-TP supports three key technical areas (KTA) supporting numerous working programs-projects. The OA efforts will be conducted under the KTA titled as 'Technology for obsolescence avoidance, sustainment and enhancement of Airborne Mission Systems.'
 - IWS Domain presented the Naval OA efforts to industry and Navy representatives at three conferences in January (Surface Navy Association Conference, DoN Information Management / Information Technology (IM/IT) Conference, and the Armed Forces Communications Electronics Association West Conference).
- Briefings
 - C4I Domain briefed delegates from the French Navy and the Japanese Maritime Self Defense Force on Naval OA and how PEO C4I is using Naval OA as a top-level approach for the technical and business considerations across all domain programs.
- Publications
 - Air Domain – The March 2008 *Journal of Electronic Defense* provides an article titled “PLUG ‘N’ PROTECT EW” which describes PEO (T)’s approach to the development of an OA for Navy and Marine Corps EW self-protection systems. The approach which features the use of standardized Interface Control Documents is to enable the mix and match of individual EW system components without the significant integration challenges typically encountered. The objectives of the EW OA are to increase competition, reduce costs, and increase effectiveness in a timely manner.

III. Summary

The Second NOA Report to Congress provides a NOA program accomplishment update since the First Report was submitted to Congress in February 2008, focusing on the period of January 1 to March 31, 2008. The Naval Enterprise continues to make significant progress in the implementation of OA. Through the use of appropriate policies and guidance, business and programmatic changes, the Department of the Navy is establishing a culture that is capable of delivering warfighting improvements at reduced costs. Continued progress is anticipated next quarter and will be reported in subsequent Quarterly Reports to Congress.

Dear Mr. Chairman,

As directed by the FY08 Defense Appropriations Conference Report 110-434, the enclosed report provides the requested information regarding the Navy's efforts to address the life-threatening infections that are increasingly resistant to currently used antibiotics found in service members returning from theater. Specifically, the report states that despite the lack of new antibiotics available for the treatment of the multi drug resistant infections, the Navy uses all of the available antibiotic regimens to treat these infections, and describes their active engagement and participation in DoD Infectious Disease community efforts to address the complex issues associated with the treatment of these life threatening multi drug resistant infections. Congressional funding and authorization, is critical to our long term success in the treatment of these devastating infections.

Please let me know if I may be of further assistance. A copy of this letter is also being provided to Chairmen Levin, Murtha and Inouye.

Sincerely,

A handwritten signature in black ink that reads "Adam Robinson".

Report to Congress

On

MULTI DRUG RESISTANT ORGANISMS

PREPARED BY:
Bureau of Medicine and Surgery
Washington, DC 20376-2401

March 2008

I. Report Requirements

The Conference Committee on Appropriations FY2008 Department of Defense Appropriations report (110-434) directed the Service Surgeons General to report to the congressional defense committees on the antibiotic regimen being used to treat service members with these infections, what new antibiotics are available but currently not being used by the military, what research is being conducted in this area, and what is needed to ensure that the service members receive the necessary treatment to reduce these lifethreatening infections.

II. Background

Treating patients with multidrug resistant organisms is a worldwide issue and many intensive care units in the US, Canada and Europe are facing the same issues. Navy Medicine works closely with our Army and Air Force Infectious Disease colleagues in this area. Since there are currently no new drugs available for these infections, the most important strategy is to try and prevent the infections in the first place and to employ all efforts to minimize their transmission in health care settings. This effort includes the rigorous implementation of the Centers for Disease Control guidelines for prevention of the spread of organisms to other patients as well as research into the types of organisms and their environmental locations in theater.

Navy Medicine has access to the latest drugs and/or treatments for multidrug resistant organisms in the care of military beneficiaries. Current treatment regimens are individualized to the specific organism, disease site, patient responses/requirements to treatment, and appropriate patient isolation. Among a number of antibiotics, carbapenems such as imipenem, quinolone such as ciprofloxacin, cephalosporins such as ceftazadime and aminoglycosides such as amikacin are included in the standard of care in U.S. medical centers. They are utilized extensively and appropriately in the DoD. Additionally, the DoD is on the cutting edge of treatment in the use of colistin, an older drug that generally had not been used for many years but has maintained activity against some of the most resistant *Acinetobacter* organisms causing infections. Colistin is not generally available in most civilian hospitals, but is extensively used in the military treatment facilities caring for most of the war injured who return to the U.S.

III. Assessment of the ongoing and proposed DoD Infectious Disease Community Efforts to address the treatment of the life-threatening increasingly resistant infections found in service members returning from theater.

The DoD Infectious Disease community has been approaching war related infections in a TriService fashion. The Armed Forces Infectious Diseases Society has focused on war related infections, as well as methicillin resistant *Staph aureus* (MRSA), at their meetings twice annually in order to respond to these threats in a consistent manner and to determine research priorities in the DoD. Military infectious diseases protocols are addressing multiple aspects of these infections including the molecular characterization of resistant bacterial isolates to determine their source, optimizing drug levels in infected

burn patients, decreasing colonization and skin infections with MRSA and even administration of an MRSA vaccine.

During this calendar year, the Infectious Diseases Clinical Research Program (IDCRP) at the Uniformed Services University, is starting a multicenter Trauma Infectious Disease Outcomes Study (TIDOS) that will follow war injured patients from Landstuhl through the National Navy Medical Center, Walter Reed Army Medical Center, and Brooke Army Medical Center. The IDCRP will collect bacterial isolates from the war injured and following the patients' clinical course for five years after their injury. The goal is to determine which factors (antibiotics used, procedures performed, site of care, etc.) are associated with better or worse outcomes. The results of this study will provide physicians objective data to improve patient care and minimize risk of infections thereby optimizing patient outcomes (life, limb salvage, increased functionality, decreased pain, etc). This project is being funded through the National Institutes of Health (NIH) and the IDCRP and is a multiyear study.

The Navy participated in a multinational study that is ongoing and under statistical analysis at the University of Leiden Netherlands. The study is looking for clonality compared to European isolates. Data is expected late this year.

The Navy participated in study with the James Haley VA hospital in Tampa. Of the 91 patients enrolled, 45 had Acinetobacter infections, and approximately 70% were multidrug resistant Acinetobacter. The length of hospital care from time of injury to discharge from rehabilitation was, longer in patients with Acinetobacter infections.

The Navy is participating in a DoD Multicenter Cohort Study evaluating Infection-Associated Clinical Outcomes in Hospitalized Medical Evacuees following Traumatic Injury. The study is planned for five years. Enrollment has not yet begun.

IV. Conclusion

The research efforts of the DoD Infectious Disease community and the Navy to address these serious life threatening infections and the various parameters that influence resistance is a complex but critical effort that will provide physicians objective data to improve patient care and minimize risk of infections thereby optimizing patient outcomes (life, limb salvage, increased functionality, decreased pain, etc). Congressional support of these efforts is critical to our long term success in the treatment of these devastating infections. The results of our concerted efforts have the potential to benefit both our military medical system as well as the world wide health care systems.

Dear Mr. Chairman,

As directed by the FY08 Defense Appropriations Conference Report 110-434, the enclosed report provides the requested information regarding the Navy's efforts to address rising incidences of food allergies and anaphylaxis among service members and their families. The report also examines any current research to address this epidemic and the need to establish a national program on food allergy and anaphylaxis that will work in coordination with other federal agencies.

Specifically, the report states current literature does not clearly demonstrate supporting evidence for an increase in the United States of anaphylaxis specifically caused by food allergies. In addition, inpatient admissions for anaphylactic shock indicate no apparent increase in trends.

The Food Allergy Research Consortium, supported by Naval Institute of Health, is organizing clinical trials on a peanut allergy therapy. The Food Allergy Anaphylactic Network is an established national program to support research efforts, to promote legislation and regulation, and public education for food allergies and anaphylaxis.

Please let me know if I may be of further assistance. A copy of this letter is also being provided to Chairmen Levin, Murtha and Skelton.

THE ASSISTANT SECRETARY OF THE NAVY

(RESEARCH, DEVELOPMENT AND ACQUISITION)

1 000 NAVY PENTAGON

WASHINGTON DC 20350-1000

APR 03 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As directed by the Fiscal Year 2008 Senate Armed Services Committee Report 110-077, the enclosed report on the Department of the Navy's (DON) Next Generation Enterprise Network (NGEN) initiative was jointly developed by the Secretary of the Navy; the Assistant Secretary of Defense for Networks and Information Integration; Under Secretary of Defense for Acquisition, Technology and Logistics; and Director of Operational Test and Evaluation.

The report describes the plans, schedule, and planned funding for the NGEN initiative. The report also addresses the follow-on efforts to replace the Navy Marine Corps Intranet (NMCI) contract and provides the DON with the basic computing and communications infrastructure and core services for the continental United States and selected locations overseas, similar to those currently provided by the NMCI contract. The planning process for NGEN continues to evolve while the DON currently defines NGEN requirements for building a firm basis for development of an acquisition strategy and an oversight methodology. A well considered concept of operations and firm requirements are key to the acquisition strategy which will provide the roadmap for the appropriate level of oversight. These key elements will be completed before the end of Fiscal Year 2008, at which time an update will be provided.

A copy of the report is also being sent to Chairmen Skelton, Inouye and Murtha. As always, if I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "John S. Thackrah".

Background

The FY 2008 National Defense Authorization Act Senate Armed Services Committee Report (110-77) directed “the Secretary of the Navy, jointly with the Assistant Secretary of Defense for Networks and Information Integration/Department of Defense Chief Information Officer; the Under Secretary of Defense for Acquisition, Technology, and Logistics; and the Director of Operational Test and Evaluation; to produce a report for Congress describing the plans and schedule, including planned funding for the NGEN initiative. The report should include a description of NGEN’s compliance with the policies and architectures of the Business Transformation Agency, testing plans and procedures, and review and coordination mechanisms with all relevant oversight agencies. The report should be delivered to the congressional defense committees no later than March 1, 2008.” Each of the Department of Defense elements called out in the committee report - the Secretary of the Navy; the Under Secretary of Defense for Acquisition, Technology; and Logistics the Assistant Secretary of Defense for Networks and Information Integration/Department of Defense Chief Information Officer; and the Director of Operational Test and Evaluation - are working together to ensure the NGEN effort is on a success oriented path, and have collaborated in the development of this report. Other OSD organizations will be joining the team as their specific skills and expertise are needed.

This report provides the actions taken to date, the planned actions and timeline for the NGEN solicitation and award, and a description of the review and coordination mechanisms to be followed.

Discussion

The Department of the Navy (DON) Next Generation Enterprise Network (NGEN) will be, for the Continental United States (CONUS) and Outside Continental United States (OCONUS), the Department’s future vision of a comprehensive Naval Networking Environment (NNE) for the Navy and Marine Corps. Because of the near-term need to replace the Navy Marine Corps Intranet (NMCI) contract and the diversity and complexity of OCONUS support agreements, the NGEN/NNE capability will evolve over time through an incremental block upgrade approach. NGEN Block 1 will be the follow-on contract(s) to replace the NMCI contract and provide the DON with the basic communications, computing infrastructure and core services.

NGEN Block 1 will be the first step in achieving the NNE vision, which will transform the existing enterprise and legacy networks of the Department into a secure, fully interoperable and integrated world-wide environment (CONUS and OCONUS, ashore and afloat), where data and services are ubiquitously available to DON users no matter their physical location. The NNE capability will evolve over time through multiple, complementary acquisitions.

NGEN Block 1 will be the follow-on to NMCI and a key enabler for the warfighting (command and control functions) and warfighting support (business) operations of the DON ashore. NGEN Block 1 must be operational on October 1, 2010.

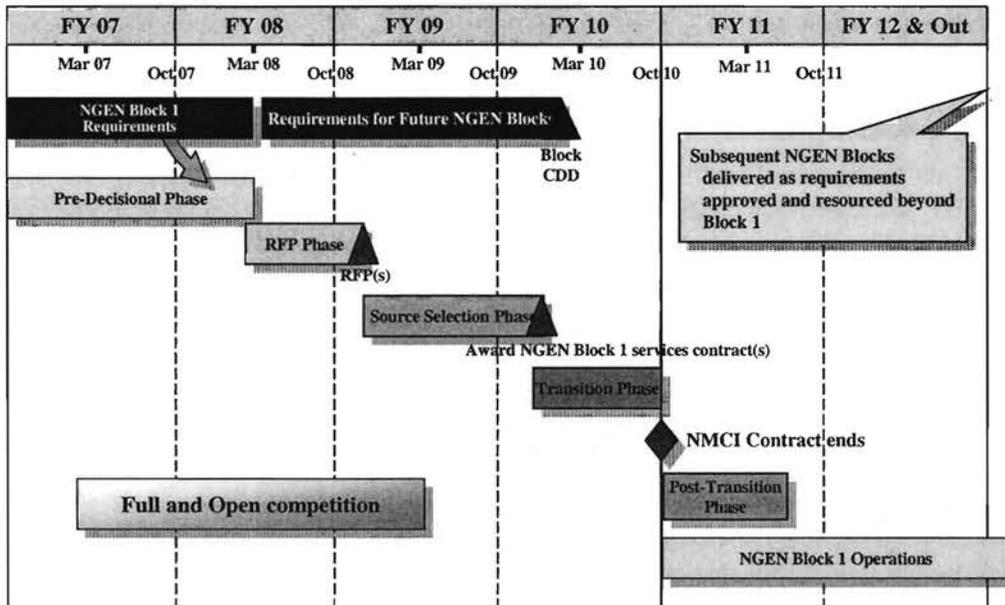

Plans and schedule

Preparation for NGEN has been a comprehensive effort, conducted with the participation of a broad spectrum of DON commands, including representation from the operational, acquisition, readiness and logistics, engineering, program management and network operator communities. Representatives from the Office of the Secretary of Defense (OSD), the Assistant Secretary of Defense (Networks and Information Integration) (ASD (NII)/DOD CIO), the Joint community, the Director, Operational Test and Evaluation (DOT&E) and the Defense Information Systems Agency (DISA) have participated in the process as well, either through the DON Deputy Chief Information Officer (CIO) Navy/DON Deputy CIO Marine Corps-led Requirements Task Force or a Program Office Integrated Product Team (IPT). DON leadership has been actively engaged throughout, primarily through the DON Information Executive Committee (IEC), the senior information management/information technology (IM/IT) forum for the DON. The Secretary of the Navy has been personally involved, receiving frequent briefings on the progress of efforts to date and providing direction as necessary.

Planning efforts for NGEN have proceeded in three primary areas. Requirements definition has been led by the DON Deputy CIO Navy/DON Deputy CIO Marine Corps Requirements Task Force. An NNE Concept of Operations effort has been led by the DON CIO. Acquisition planning has been led by the NGEN Program Office. These efforts have been guided by several high-level tenets:

- The NMCI contract expires on September 30, 2010; any follow-on to the functionality provided by NMCI must be operational by that date.
- NGEN may employ a Block Upgrade strategy to achieve the ultimate operational capability eventually envisioned by the DON's NNE strategy.
- The Office of the Secretary of Defense (OSD) oversight of the effort will be spearheaded by the Assistant Secretary of Defense (Network Integration and Information) (ASD (NII)/DOD CIO) and the Under Secretary of Defense for Acquisition, Technology, and Logistics (USD (AT&L)) through an NGEN Oversight Team.
- The transition from NMCI to NGEN Block 1 "do no harm"; i.e., the provision of critical services to users cannot be put at risk by the transition from NMCI.

The figure below represents the notional planning sequence of events for the NGEN acquisition.

The requirements definition effort began in May 2006 with a letter from the Assistant Secretary of the Navy (Research, Development and Acquisition) (ASN (RD&A)) to the DON CIO, requesting that the process of defining requirements for the follow-on to NMCI be established. In October 2006 the scope of these efforts was expanded, and the Center for Naval Analysis was tasked by DON to lead an effort to identify the overarching capabilities that NGEN would need to provide in the 2010 to 2020 time frame, as well as to identify feasible material solutions to provide those capabilities. This effort subsequently became part of the DON Deputy CIO Navy/DON Deputy CIO Marine Corps-led Requirements Task Force charged with producing the comprehensive NGEN Requirements document.

A survey of a broad range of users of current DON networks, which included representation from warfighting and business commands and organizations in the DON, DoD, and Joint communities, was conducted to determine these required capabilities. A review of top-level DoD and Joint documentation related to requirements for operating in a network-centric environment followed. The Task Force assessed gaps relative to both the performance of today's networks and to the projected performance of NMCI in 2010, at the point that Block 1 of NGEN must be operational. This projected performance, combined with mandated Office of Management and Budget and DoD requirements, as well as critical improved capabilities for network reliability, adaptability, security, governance and support to the warfighter, formed the fiscally unconstrained baseline requirement for NGEN Block 1.

Concurrently, the DON CIO led an effort to define the vision, scope, strategy, and concept of operations for the DON NNE, a capability to be realized in the 2016 timeframe. As the planning for NGEN Block 1 progresses, the NNE~2016 effort will continue to analyze the needs, requirements and funding for future Block Upgrades that will bring NGEN closer to fully achieving NNE~2016 objectives.

An NGEN Program Office (PM NGEN) was established in July, 2007 under the Program Executive Officer – Enterprise Information Systems (PEO-EIS). A Program Manager (PM) and Deputy PM were assigned; staffing was initiated and work begun on the pre-decisional phase to develop an Acquisition Strategy, Acquisition Plan, Acquisition Program Baseline, and list of required technical documents. Four IPTs - Network Operations, Architecture/Engineering, Program Management and Transition - were established to analyze the requirements, develop strategies and plans and prepare the solicitation materials for NGEN Block 1. Membership for the IPTs was drawn from across a broad spectrum of DON commands, including representation from the acquisition, readiness and logistics, engineering, program management, user and network operator communities.

The process for developing the NGEN solicitation(s) from the requirements is event-driven, vice schedule-driven. At the conclusion of the requirements definition phase and approval of the requirements document by DON leadership, the PM NGEN will begin an assessment of the requirements based on environmental, resource/funding, technology, statutory and regulatory constraints. This assessment will define the expectations of the solicitation(s). It will also allow for a selection of preferred system requirements for NGEN Block 1 consideration. A System Requirements Review will then be conducted, chaired by the PM, to include headquarters, Fleet and Marine Forces, network operators, and other user participation. This review will ascertain the progress in defining system technical requirements and determine the direction and progress of the systems engineering effort.

The System Specification will then be developed. This will define the required system functions, performance parameters, all other requirements and constraints, and the sub-services to be allocated to each service function. The DON IEC will conduct a review of the System Baseline, in order to confirm that the recommended solution will meet the requirements within cost, schedule, performance and risk parameters. This is currently under assessment with other approaches, with expected completion in April 2008. A review will then be scheduled with ASN (RD&A) to present the NGEN Block 1 Service Baseline, along with the Acquisition Strategy, Acquisition Plan, Acquisition Program Baseline, and other required programmatic documents. The DON and OSD leadership will work closely together to develop the required programmatic documentation.

The Request for Proposal (RFP) Development phase will then start. DON will notify ASD (NII)/DOD CIO and the Director, Defense Procurement and Acquisition Policy (OUSD (AT&L) DPAP) of its intent to issue the NGEN solicitation. A decision

authority review, chaired by ASD (NII)/DOD CIO and Under Secretary of Defense (Acquisition, Technology and Logistics) USD (AT&L), will be scheduled to present the proposed acquisition strategy; this review is planned for September 2008. This meeting will include representation from other elements of DoD, to include the Joint Staff, PA&E, DISA and DOT&E. The desired outcome will be approval of the Acquisition Strategy document. Approval of the acquisition strategy will permit DON's issuance of the RFP(s) for NGEN Block 1. Release of the NGEN RFP(s) is planned for November 2008.

It is anticipated that a full and open competitive source selection approach will be used. The NGEN Block 1 contract(s) will be awarded on the basis of Best Value to the Government, with the evaluation factors nominally expected to include Technical Approach, Management Approach, Past Performance and Cost. The Source Selection Authority will then make a determination and the Source Selection Report will be drafted for inclusion in the Post-Award Business Clearance Memorandum (BCM). The Chief of Naval Information will then announce the contract(s) award; this announcement is planned for January, 2010. Debriefs will be provided to unsuccessful offerors that request one. Any protests will be adjudicated through established procedures.

The transition (technical and process) from the current "as is" state of NMCI services to a new "to be" state of NGEN Block 1 services will involve multiple transition efforts. These could include transition from the incumbent NMCI service provider to the NGEN Block 1 service provider(s), a "phase in" by the NGEN Block 1 service provider(s) from the incumbent NMCI service provider, or a transition from the incumbent NMCI service provider to the Government for those services that might be determined to be Government provided services. The over-riding principle for the transition strategy will be to "do no harm", meaning to effect as seamless a transition/phase-in as possible while changing from the existing service provider model to another.

The transition will conclude on October 1, 2010, with the expiration of the NMCI contract and the Initial Operational Capability of NGEN Block 1. Steady state NGEN Block 1 operations will then commence as per the new service provider model.

Planned funding

Initial funding for the transition to NGEN is programmed within NMCI funding lines. It is anticipated that funding for NGEN, similar to NMCI, will utilize a centralized approach for program management, incentives and communications circuits. The funding approach for seat and/or other information services will ultimately be dependent on strategies decided upon for NGEN Block 1 acquisition, contracting and operations.

Development of cost estimates for NGEN Block 1 is ongoing through the process outlined above and will be included in the President's Budget for Fiscal Year 2010.

FOR OFFICIAL USE ONLY

(This may contain information exempt from mandatory disclosure under the Freedom of Information Act (FOIA))

Compliance with the policies and architectures of the Business Transformation Agency

NGEN Block 1 will be the DON's ashore IT infrastructure in CONUS and at select OCONUS locations. It will provide the transport infrastructure required by the business and warfighting-support systems of the Department.

As infrastructure, NGEN Block 1 will not perform any specific DoD business process; therefore, it will not be governed by the Department's Business Mission Area (BMA). Likewise, there are no investment criteria applicable to NGEN Block 1 in the Business Enterprise Architecture, which is managed by the Defense Business Transformation Agency and focuses on business functions such as financial management, personnel management and logistics. As future NGEN blocks are developed, applicability of the BMA will be considered.

The Department's IT infrastructure is governed at the Enterprise level by the DoD CIO, which has investment review and compliance criteria analogous, yet not identical, to that of the BMA. NGEN Block 1, and all subsequent blocks, will be compliant with the policies, plans, architecture, procedures and certification requirements of the Defense Information Enterprise Architecture (DIEA), and will operate as an integral part of the GIG enterprise, including use of DISN services.

Testing plans and procedures

The DON will develop and implement an integrated plan for the test, assessment and evaluation of NGEN Block 1. Planning will be closely coordinated with Office of the Secretary of Defense staff, the Director, Operational Test and Evaluation (DOT&E), and DON testing commands. The details of this coordination will be documented by a chartered NGEN Test and Evaluation IPT. The objective will be to have a strategy in place to reflect the RFP(s).

Review and coordination mechanisms with all relevant oversight agencies

The ultimate oversight structure of the NGEN program has not been decided at this point, it is anticipated that it will be overseen as either a Major Defense Acquisition Program (MDAP)/Major Automated Information System (MAIS) or as an Acquisition of Services per the USD (AT&L) Acquisition of Services policy of October 2, 2006.

Formal coordination of NGEN planning began with OSD in February, 2007 with a meeting between ASN (RD&A) and ASD (NII)/DOD CIO. It was agreed that NGEN could be viewed as two parts – information transport service, and applications. It was also agreed that the Joint Capabilities Integration and Development System (JCIDS) process should govern fielding applications, but procurement of information transport services did not need to enter the JCIDS process. This view was subsequently confirmed to Navy by Joint Staff J8 in July, 2007.

FOR OFFICIAL USE ONLY

(This may contain information exempt from mandatory disclosure under the Freedom of Information Act (FOIA))

Within DON, the DON IEC (comprised of DON CIO, DON Deputy CIO Navy, DON Deputy CIO Marine Corps, ASN (RD&A), and ASN Financial Management & Comptroller (FM&C)), through its primary and advisory members, is the senior DON information management / information technology (IM/IT) forum. The DON IEC is responsible for strategic direction, programmatic oversight, validation of requirements and capabilities and appropriate resourcing of NGEN.

An NGEN Oversight Team, under the leadership of the Department of Defense Chief Information Officer (DoD CIO), has been established to ensure coordination, effective test and evaluation planning, comprehensive architectural compliance, and continued and responsive oversight of the program. The Oversight Team includes representation from the USD (AT&L), ASD (NII)/DOD CIO, the Office of Program Analysis and Evaluation (PA&E), the Joint Staff, DOT&E, DISA and DON leadership.

To ensure that NGEN delivers required capabilities in compliance with the DIEA, DON is partnering with ASD NII/DOD CIO and both organizations are leveraging each other's ongoing enterprise architecture efforts led by DOD CIO. This collaborative effort will be supplemented by DOD CIO enterprise architecture compliance reviews of requirements and specification documents to ensure NGEN capabilities are delivered in accordance with DoD CIO Architectures, Standards, and policies.

Summary

NMCI was a revolutionary approach for obtaining data and video communications and computing capabilities within DON, acquiring IT capabilities via a fixed price, multi-year, performance-based services contract. Preparation for the transition to NGEN Block 1 as the follow-on to NMCI is well underway. DON has developed and implemented a robust, comprehensive planning process for NGEN. Funding will be planned for through the Planning, Programming, Budgeting, and Execution System. The requirement for NGEN's compliance with the policies and architectures of the BTA has been determined and agreed upon. Testing plans and procedures are being formulated to reflect the solicitation(s). Finally, an effective oversight framework is being established to ensure the successful transition from NMCI to NGEN Block 1.

REPORT TO CONGRESS

ON

USE OF EXCLUSION FROM AUTHORIZED OFFICER STRENGTHS

IN THE CASE OF PERMANENT MILITARY PROFESSORS

Prepared by:
United States Navy
Deputy Chief of Naval Operations
(Manpower, Personnel, Training and Education)
Washington DC

March 2008

Report Requirement

Subsection 508 of the National Defense Authorization Act for Fiscal Year 2008 directed the following in regards to Permanent Military Professors of the Navy:

"(d) USE OF EXCLUSIONS FROM AUTHORIZED OFFICER STRENGTHS - Not later than March 31, 2008, the Secretary of the Navy shall submit to the congressional defense committees a report describing the plans of the Secretary for utilization of authorized exemptions under section 523(b)(8) of title 10, United States Code, and a discussion of the Navy's requirement, if any, and projections for use of additional exemptions by grade."

Authorized Exemptions

Under section 523(b)(8) of title 10, United States Code, Permanent Professors of the United States Naval Academy, as well as career military professors at the United States Military Academy and the United States Air Force Academy, shall be excluded in determining authorized strengths in the grades of lieutenant commander, commander or captain (or service equivalent), at a level not to exceed 50 from any such academy. The terms Career Military Professor, Permanent Military Professor (PMP), and Permanent Professor are used interchangeably.

Navy's Requirements

The Navy's Permanent Military Professor (PMP) program was created to establish a cadre of career naval officers with both doctoral degrees and extensive operational experience to instruct at the United States Naval Academy, the Naval Postgraduate School and the Naval War College. The Navy's PMP requirements are at the grades of commander and captain as follows:

a. The United States Naval Academy (USNA) has a requirement for 50 PMPs. The Navy is in the process of building its cadre of USNA PMPs to meet this requirement.

b. The Naval Postgraduate School ~~(NPS)~~ has a requirement for four PMPs.

c. The Naval War College (NWC) has a requirement for two PMPs, with the flexibility to meet instructor requirements with a third PMP if necessary.

d. The Navy has a requirement for an average of 24 to 29 PMP selectees to be enrolled in doctoral study at any given time to support maintaining a full complement of 50 PMPs instructing at the USNA, four instructing at the NPS and ~~two instructing~~ at the NWC. The career changing nature of the PMP program requires the right role models who are attracted and motivated to serve the remainder of their careers in academia. It is essential that the Navy invest in doctoral education of these officers to meet its instructional requirements. The Navy accomplishes this through enrollment of PMP selectees at the NPS or civilian educational institutions in programs ranging from three to four years depending upon academic discipline. For example, the Mechanical Engineering PhD in Propulsion Systems is earned through NPS in three years whereas the Naval Architecture PhD is earned through Massachusetts Institute of Technology in four years. A viable PMP career field depends on having the educational program in place to prepare fleet officers to obtain the credentials necessary to assume PMP responsibilities.

Utilization of Exemptions

The Navy applies exemptions to USNA PMPs only, per section 523(b)(8) of title 10, United States Code. Currently, the number of exemptions is 39 with deliberate plans to reach 50 by summer 2009. However, this exemption authority does not account for all PMP requirements, which in addition to the USNA include those instructing at the NPS and the NWC, as well as those enrolled in PhD programs required to provide PMPs the necessary academic credentials. Current and projected total Navy PMP requirements and exemptions by grade are provided in Table 1.

Table 1. Total Navy PMP requirements and exemptions by grade. Current exemptions highlighted in yellow. Projections for use of additional exemptions highlighted in blue. Steady state of both existing and proposed grade exemption is expected in FY11.

Enrollment in doctoral study*	26	0	26	29	0	29	29	0	29
Totals	67	15	82	69	16	85	69	16	85

* Note: Reflects an upper limit that is not to be exceeded.

Conclusion

The Navy would welcome authority that would allow exemption for PMP requirements at the United States Naval Academy, the Naval Postgraduate School, and the Naval War College, and accommodate enrollment in doctoral education to obtain the necessary academic credentials to assume PMP responsibilities.

DEPARTMENT OF THE NAVY
OFFICE OF THE SECRETARY
1000 NAVY PENTAGON
WASHINGTON, D.C. 20350-1000

MAY 31 2008

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

As directed by the National Defense Authorization Act for Fiscal Year 2008, Section 533, Public Law 110-181, the Department of the Navy submits the Navy and Marine Corps "Reports on Utilization of Tuition Assistance by Regular and Reserve Components." I am responding on behalf of the Secretary of the Navy.

In Fiscal Year 2007 the Department of the Navy funded 263,913 courses for 96,911 Sailors and Marines. The Department funds Tuition Assistance for the active component which includes reserve Sailors and Marines activated for over 120 days or called to active duty under Presidential Call Up or Title 10. Separate records are not maintained for Reservists requesting or receiving Tuition Assistance.

Sailors may take 15 to 20 credit hours (five courses) without an approved education plan. Subsequent courses must be in an approved education plan in order to receive funding through Tuition Assistance or Navy College Program Afloat College Education. Marines may take up to 12 credit hours before obtaining an approved Educational Plan.

The Department of the Navy appreciates the Committee's interest in Tuition Assistance, a vital tool for maintaining a ready force. As always, if I can be of further assistance, please let me know. A similar response has been sent to Chairman Skelton.

Sincerely,

A handwritten signature in black ink, appearing to read "Anita K. Blair".

REPORT TO CONGRESS

UTILIZATION OF TUITION ASSISTANCE BY MEMBERS OF THE NAVY

1. POLICY

Provide instructions/regulations/policy number and web link if available for the following policies in effect in FY07.

OPNAVINST 1560.9, Navy Voluntary Education Programs (Navy Campus) of 4 April 1988, was under extensive revision in FY07. Pending release of the updated instruction, NAVADMINs 166/06 and 161/07 provided updated guidance. OPNAVINST 1560.9A, Voluntary Education (VOLED) for Navy Sailors, was released on 4 March 2008 and cancelled OPNAVINST 1560.9.

SECNAVINST 1560.4A, Department of the Navy Voluntary Education (VOLED) Program, of 1 Dec 2005

MILPERSMAN 1160-040 of 4 Jan 2008

OPNAV and SECNAV instructions are available on-line at:
<http://doni.daps.dla.mil>. NAVADMINs are available on-line at:
<http://www.npc.navy.mil> within the reference library.

In addition to Tuition Assistance (TA), Navy provides college tuition to Sailors forward deployed on ships or in remote areas through the Navy College Program Afloat College Education (NCPACE). Policy for NCPACE and TA are the same except where noted.

a. List of policies regarding utilization of tuition assistance and NCPACE.

- (1) TA and NCPACE are components of the Navy's off-duty, voluntary education program. They provide tuition assistance to regular component active duty members, reservists on continuous active duty, and reservists ordered to active duty for 120 days or more.
- (2) TA and NCPACE provide funds that assist in payment of tuition costs for high school completion; and associates, bachelors, masters or doctoral degrees.
- (3) Regular and Reserve Commissioned Officers, including Limited Duty and Chief Warrant Officers, must agree to remain on active duty for at least two years after completion of, or withdrawal from, the last course funded by TA or through NCPACE.

- (4) The policy in 2007 requiring enlisted Sailors with less than 19 years to have one year remaining on active duty to use TA or NCPACE was revised by NAVADMIN 042/08.
 - (5) Enlisted Sailors, regardless of time in service may request a one-time conditional extension per enlistment contract for the purpose of continuing education.
 - (6) TA and NCPACE may only be paid to educational institutions accredited by accrediting organizations recognized by the Department of Education.
 - (7) In the case of enlisted Sailors, courses must be completed while participants are on active duty.
- b. List of policies regarding the limits of tuition assistance and NCPACE.
- (1) TA and NCPACE will be provided for courses listed in a Sailor's approved education plan.
 - (2) Education plans shall be progressive. Expected progression is associates, bachelors, masters, doctoral. TA and NCPACE will not be used for education plans which lead to an additional degree at the same or lower level. Lower division or prerequisite courses may be funded if the courses are part of the next higher level education plan.
 - (3) Sailors may take up to five courses prior to developing their education plan. Subsequent courses must be in an approved education plan in order to receive funding through TA or NCPACE.
 - (4) TA and NCPACE may not be used to fund Continuing Education Units (CEUs).
 - (5) Advancement eligible enlisted Sailors must have taken and passed the most recent advancement exam to be authorized TA or NCPACE.
 - (6) Sailors must have passed the most recent Physical Fitness Assessment to be authorized TA or NCPACE.
 - (7) Sailors must be recommended for promotion or advancement on their most recent evaluation or fitness report to be authorized TA or NCPACE.
 - (8) Sailors will typically not receive TA while in a training status.
 - (9) Sailors found guilty of court martial, sentenced to punitive discharge or confinement, on appellate leave or pending an administrative separation will not receive TA or NCPACE.

(10) Sailors must maintain a "C" average (2.0 on a 4.0 scale) or better to continue to receive TA or NCPACE.

c. List of policies regarding funding of tuition assistance and NCPACE.

(1) TA covers 100% of tuition up to the maximum limit directed by the Office of Secretary of Defense.

(2) Tuition will not exceed \$250.00 per semester hour or \$166.67 per quarter hour.

(3) Navy uses a 16 semester hour or 24 quarter annual cap. Sailors may be granted waivers to this cap based on Commanding Officer endorsement and Sailors proven ability to balance professional, personal and academic requirements.

(4) Navy funds only those course fees required to enroll in and complete a specific course. Navy does not fund non-course fees such as application fees, health fees, parking fees, etc.

(5) Navy does not fund cost of books and materials.

(6) NCPACE is a contracted program and provides 100% tuition for eligible Sailors. There are no semester hour caps for NCPACE.

2. FUNDING

a. Number of Active members funded.

(1) TA provided funding for 61,694 Sailors to take 170,900 courses.

(2) NCPACE provided funding for 10,476 Sailors to take 22,486 courses.

b. Number of Reserve members funded.

(1) Navy policy funds active duty reservists on continuous active duty, and reservists ordered to active duty 120 days or more, both ashore and at sea. Courses must be completed while the Sailor is on active duty. Statistics for Reserves are not tracked separately and are included in the Active member's data.

c. Number of Reserve members unfunded.

(1) Based on current policy, Reserves who meet the requirements listed above will be given assistance through TA or NCPACE.

3. FUNDING POLICY

a. FY07 Navy obligated \$99,746,880 for TA.

b. FY07 Navy obligated \$12,784,329 for NCPACE.

REPORT TO CONGRESS

UTILIZATION OF TUITION ASSISTANCE BY MEMBERS OF THE NAVY

1. POLICY

Provide instructions/regulations/policy number and web link if available for the following policies in effect in FY07.

OPNAVINST 1560.9, Navy Voluntary Education Programs (Navy Campus) of 4 April 1988, was under extensive revision in FY07. Pending release of the updated instruction, NAVADMINs 166/06 and 161/07 provided updated guidance. OPNAVINST 1560.9A, Voluntary Education (VOLED) for Navy Sailors, was released on 4 March 2008 and cancelled OPNAVINST 1560.9.

SECNAVINST 1560.4A, Department of the Navy Voluntary Education (VOLED) Program, of 1 Dec 2005

MILPERSMAN 1160-040 of 4 Jan 2008

OPNAV and SECNAV instructions are available on-line at:
<http://doni.daps.dla.mil>. NAVADMINs are available on-line at:
<http://www.npc.navy.mil> within the reference library.

In addition to Tuition Assistance (TA), Navy provides college tuition to Sailors forward deployed on ships or in remote areas through the Navy College Program Afloat College Education (NCPACE). Policy for NCPACE and TA are the same except where noted.

a. List of policies regarding utilization of tuition assistance and NCPACE.

- (1) TA and NCPACE are components of the Navy's off-duty, voluntary education program. They provide tuition assistance to regular component active duty members, reservists on continuous active duty, and reservists ordered to active duty for 120 days or more.
- (2) TA and NCPACE provide funds that assist in payment of tuition costs for high school completion; and associates, bachelors, masters or doctoral degrees.
- (3) Regular and Reserve Commissioned Officers, including Limited Duty and Chief Warrant Officers, must agree to remain on active duty for at least two years after completion of, or withdrawal from, the last course funded by TA or through NCPACE.

- (4) The policy in 2007 requiring enlisted Sailors with less than 19 years to have one year remaining on active duty to use TA or NCPACE was revised by NAVADMIN 042/08.
 - (5) Enlisted Sailors, regardless of time in service may request a one-time conditional extension per enlistment contract for the purpose of continuing education.
 - (6) TA and NCPACE may only be paid to educational institutions accredited by accrediting organizations recognized by the Department of Education.
 - (7) In the case of enlisted Sailors, courses must be completed while participants are on active duty.
- b. List of policies regarding the limits of tuition assistance and NCPACE.
- (1) TA and NCPACE will be provided for courses listed in a Sailor's approved education plan.
 - (2) Education plans shall be progressive. Expected progression is associates, bachelors, masters, doctoral. TA and NCPACE will not be used for education plans which lead to an additional degree at the same or lower level. Lower division or prerequisite courses may be funded if the courses are part of the next higher level education plan.
 - (3) Sailors may take up to five courses prior to developing their education plan. Subsequent courses must be in an approved education plan in order to receive funding through TA or NCPACE.
 - (4) TA and NCPACE may not be used to fund Continuing Education Units (CEUs).
 - (5) Advancement eligible enlisted Sailors must have taken and passed the most recent advancement exam to be authorized TA or NCPACE.
 - (6) Sailors must have passed the most recent Physical Fitness Assessment to be authorized TA or NCPACE.
 - (7) Sailors must be recommended for promotion or advancement on their most recent evaluation or fitness report to be authorized TA or NCPACE.
 - (8) Sailors will typically not receive TA while in a training status.
 - (9) Sailors found guilty of court martial, sentenced to punitive discharge or confinement, on appellate leave or pending an administrative separation will not receive TA or NCPACE.

(10) Sailors must maintain a "C" average (2.0 on a 4.0 scale) or better to continue to receive TA or NCPACE.

c. List of policies regarding funding of tuition assistance and NCPACE.

(1) TA covers 100% of tuition up to the maximum limit directed by the Office of Secretary of Defense.

(2) Tuition will not exceed \$250.00 per semester hour or \$166.67 per quarter hour.

(3) Navy uses a 16 semester hour or 24 quarter annual cap. Sailors may be granted waivers to this cap based on Commanding Officer endorsement and Sailors proven ability to balance professional, personal and academic requirements.

(4) Navy funds only those course fees required to enroll in and complete a specific course. Navy does not fund non-course fees such as application fees, health fees, parking fees, etc.

(5) Navy does not fund cost of books and materials.

(6) NCPACE is a contracted program and provides 100% tuition for eligible Sailors. There are no semester hour caps for NCPACE.

2. FUNDING

a. Number of Active members funded.

(1) TA provided funding for 61,694 Sailors to take 170,900 courses.

(2) NCPACE provided funding for 10,476 Sailors to take 22,486 courses.

b. Number of Reserve members funded.

(1) Navy policy funds active duty reservists on continuous active duty, and reservists ordered to active duty 120 days or more, both ashore and at sea. Courses must be completed while the Sailor is on active duty. Statistics for Reserves are not tracked separately and are included in the Active member's data.

c. Number of Reserve members unfunded.

(1) Based on current policy, Reserves who meet the requirements listed above will be given assistance through TA or NCPACE.

3. FUNDING POLICY

a. FY07 Navy obligated \$99,746,880 for TA.

b. FY07 Navy obligated \$12,784,329 for NCPACE.

THE ASSISTANT SECRETARY OF THE NAVY

(RESEARCH, DEVELOPMENT AND ACQUISITION)

1000 NAVY PENTAGON

WASHINGTON DC 20350-1000

SEP 30 2008

The Honorable John P. Murtha
Chairman, Subcommittee on Defense
Committee on Appropriations
House of Representatives
Washington, DC 20515-6018

Dear Mr. Chairman:

On April 3, 2008, the Department of Defense, pursuant to the Fiscal Year 2008 Senate Armed Services Committee Report 110-077, provided the congressional defense committees a report on the Department of the Navy's Next Generation Enterprise Network (NGEN) initiative, the replacement for the Navy/Marine Corps Intranet contract. The letter indicated that an update would be provided by the end of Fiscal Year 2008.

The enclosed report describes the progress that has been made in the development of specifications as well as governance and the basic Acquisition Strategy for the program. The NGEN program continues to have a high level of executive engagement and oversight. The program specifications are nearing completion and the Department will begin the development shortly of contract statement of work and request for proposals.

A similar letter has been sent to Chairmen Inouye, Skelton and Levin. If I can be of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "SS", is positioned above the name Sean Stackley.

REPORT TO CONGRESS

Next Generation Enterprise Network (NGEN)

Prepared by:

**Office of the Assistant Secretary of the Navy
(Research, Development and Acquisition)
The Deputy Assistant Secretary of the Navy for C4I and Space Programs
Washington, DC 20350**

September 30, 2008

Introduction

On April 3, 2008, the Department of Defense (DoD), pursuant to the Fiscal Year 2008 Senate Armed Services Committee Report 110-077, provided to congressional defense committees a report on the Department of the Navy's (DON) Next Generation Enterprise Network (NGEN) initiative, the replacement for the Navy/Marine Corps Intranet (NMCI) contract. The following is an update to the report.

Discussion

Since the initial report on NGEN, significant progress has been made in the development of specifications as well as governance and the basic Acquisition Strategy for the program. The NGEN requirements document was signed by the Chief of Naval Operations and the Commandant of the Marine Corps in May 2008. The NGEN program continues to have a high-level of executive engagement and oversight.

The Office of the Assistant Secretary of Defense for Networks and Information Integration (ASD NII)/ DoD Chief Information Officer (DoD CIO), and the Department of the Navy CIO (DON CIO) jointly chair a monthly review of program progress. The Secretary of the Navy (SECNAV) has recently approved the formation of a NGEN System Program Office (SPO) as the single DON organization that will ensure an enterprise-wide approach for development, delivery, operations, and support of NGEN. The Department of Navy, with the guidance of the Office of the Secretary of Defense, Program Assessment and Evaluation (OSD PA&E) is also conducting an Analysis of Alternatives that will guide the Department with its final NGEN Acquisition Strategy.

Industry Day

We recently held our second Industry Day, on September 8, 2008, where we presented the high-level NGEN functional concept. The Program Executive Officer for Enterprise Information Systems (PEO-EIS) hosted the Industry Day, which included presentations by the DON CIO; Deputy CNO for Communications Networks; USMC Deputy Director, Headquarters Marine Corps, Command, Control, Communications and Computers; and the Deputy Naval Network Warfare Command. More than 390 participants from 217 different companies attended the Industry Day.

Information presented to industry representatives included the Department's future vision for a fully interoperable Naval Networking Environment (NNE) and the NGEN role within the NNE; the current NMCI operational environment; an overview of NGEN requirements; and the notional NGEN service segmentation approach. We also provided information as to which services in the notional approach would be considered "government retained" including: network operations and security, program management, contract management, technical authority, emerging technology insertion, and in-service engineering.

PEO EIS has requested industry comment on the notional NGEN segmentation approach, through a Request for Information posted on the Federal Business Opportunity website on September 10, 2008 (www.fedbizopps.gov). Industry was asked to comment on advantages

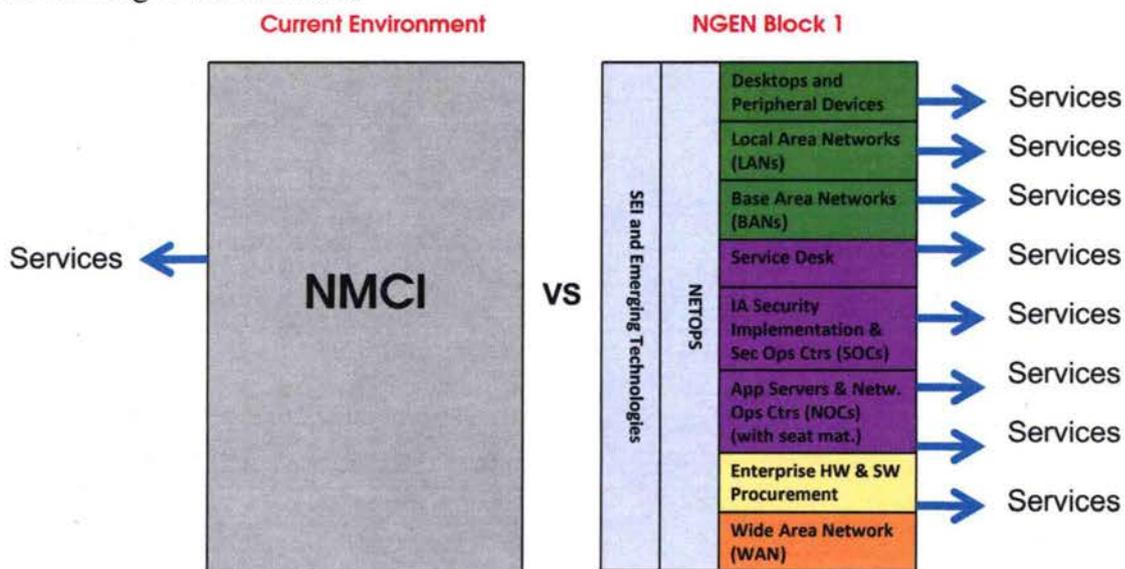

and/or disadvantages of this approach. Additionally, industry was asked to provide alternative approaches to segmentation, as well as alternative strategies for transitioning to NGEN.

NGEN Governance

On September 4, 2008, SECNAV approved the stand-up of an NGEN SPO to ensure an enterprise-wide approach for seamless oversight of the DON NGEN implementation. A charter for the NGEN SPO, which describes the mission, authority, responsibilities, and organizational relationships the NGEN SPO will have within the DON, is in the signature process and will be jointly signed by the Chief of Naval Operations, the Commandant of the Marine Corps, and the SECNAV. In addition to the seamless oversight of NGEN Programmatic efforts, the NGEN SPO shall synchronize NGEN implementation with pre-existing network operations to ensure continuity of service to all users throughout the transition. The NGEN SPO will also have the responsibility for DON transition from the NMCI environment to the NGEN environment, including responsibility for implementing appropriate risk mitigation strategies that will guarantee operational viability of affected Service networks. Finally, the NGEN SPO shall consist of a Director; Deputy Director; Executive Director; and three Divisions: Operations; Acquisition; and Programming, Planning, and Policy.

Acquisition Strategy

NGEN services will be acquired through full and open competitions to the maximum extent practicable. In order to achieve the primary requirements for government operational and design control of NGEN as well as ensure a reasonable level of competition across the entire spectrum of information technology service providers, the contemplated Acquisition Strategy is to separate NGEN services into industry recognizable segments. The figure below (presented at Industry Day) depicts a possible approach to segmentation of NGEN capabilities, as compared to the existing NMCI services.

1

Using guidance from OSD PA&E, the DON CIO is overseeing the execution of an Analysis of Alternatives focused on analyzing the cost, risk, and performance of three different approaches:

- *Status quo*: seats and services acquired through a services contract similar to the current NMCI contract
 - Network owned and operated by single vendor ,
 - Cost estimates based on NMCI contract
- Enhanced *status quo*: current NMCI contract updated and upgraded to address contract shortfalls identified in NGEN Functional Area Analysis (FAA), Functional Needs Analysis (FNA), Functional Solutions Analysis (FSA), and other lessons learned
- Replace status quo: seats and services acquired through multiple contracts
 - DISA to be considered as a potential vendor for services they can provide

The analysis is considering variations on the segmented approach as a means of understanding the best mix or grouping of segments to achieve competition and cost objectives while ensuring operational and design control requirements are achieved. The analysis is expected to be completed by December 2008 with the OSD PA&E review completed no later than early Spring 2009.

Government Workforce

The Department will necessarily require a modest increase in its IM/IT workforce in order to achieve its primary objectives with NGEN: Operational and Design Control. The Department is currently conducting detailed workforce analyses, based on the draft acquisition approach as well as the Concept of Operations and overall Naval Workforce Strategy to determine the best mix of military, civilian and contractor personnel that will achieve the necessary government control of NGEN.

The Department expects to continue to require a significant level of support from industry to execute critical functions across NGEN. This large group of industry personnel will be acquired via the contracts that will be awarded per the Acquisition Strategy and will be a major component of all segments of NGEN.

Transition Strategy

The Department will transition approximately 700,000 users assigned to nearly 370,000 seats from NMCI to NGEN. It is anticipated that the US Marine Corps will transition into NGEN prior to the US Navy. An aggressive transition for the US Marine Corps is required because of its high operational tempo and its large body of operators.

Depending on the final Acquisition Strategy for NGEN, the specific transition approach may vary. As discussed above, the Department is continuing to mature this strategy with an expectation that it will be completed and approved in the Spring 2009.

Critical to the success and timing of the transition are two important factors:

- Risk mitigation activities conducted pre-contract award; and,
- Transition support from the NMCI incumbent as needed by the Military Services to ensure no loss of services during the transition period.

Risk mitigation activities include development of industry standard Information Technology Services Management tools and processes for managing the seams between the NGEN segment vendors and the DON. Additionally, the Department will develop specific Network Operations processes and configuration management policies in order to achieve the necessary operational and design control. All of the current risk mitigation activities are required to begin in 2009 in order to support full transition start in 2010.

Schedule and the Critical Path

Given the complexity and magnitude of the development, contracting and transition activities as well as the inter-dependencies of each activity, the Department is developing a comprehensive integrated master schedule. The integrated master schedule development is a natural progression from previous top-level plans as detailed tasks are identified and understood. The schedule will include all activities by the Department as well as the necessary actions by external stakeholders that will necessarily influence and determine the pace of progress. A critical path of activities that must be managed closely to ensure timely success is emerging as the integrated master schedule is developed.

Key critical path items include:

- 1) Analysis of Alternatives – will guide the Department in its final Acquisition Strategy - required before the Department can release request for proposals to industry.
- 2) Independent Cost Estimates – will guide the Department in source selection and negotiations for NGEN service providers - required before the Department can complete the source selections and award NGEN segment contracts.
- 3) Transition Contract Negotiations – will be needed to ensure the relationships between the NMCI incumbent, the DON, and the new NGEN providers are well established, before the Department can complete the NGEN segment source selections and contract awards.
- 4) Risk Mitigation Activities – are necessary to ensure a smooth transition, minimizing the risk of service continuity loss and enabling government control of operations and design of NGEN; these activities also include early transition activities to reduce the transition risk from NMCI to NGEN.
- 5) Development of the NGEN Government Workforce – A committed effort will need to begin in Fiscal Year 2009 to hire and/or transfer and train government employees to conduct NGEN Network Operations (NETOPS) and NGEN System Engineering & Integration in concert with contractor transition operations and outsourced NGEN Segmented Services.

Cost and Funding Considerations

While the Department believes it has sufficiently programmed for NGEN costs, to include all transition and risk mitigation activities from 2010 and beyond, the budget request for

Fiscal Year 2009 was developed before definition of NGEN activities in 2009. To ensure the critical path is maintained to achieve competition and operational/design control objectives for NGEN, the Department embarked upon a learning process during 2008 as it developed the draft Acquisition Strategy and understood the complexity of transition for such a large enterprise network.

The aggressive US Marine Corps transition may provide opportunities for early investments by the Department of the Navy to reduce operational and security risks.

The Department is developing, and expects to request, a reprogramming of funds within the Department's budget sufficient to execute the necessary risk mitigation activities in Fiscal Year 2009. This reprogramming will likely exceed thresholds requiring Congressional approval, and therefore, will be developed with the appropriate oversight of Congressional Defense Committees.

Summary

NGEN is a significant undertaking for the Department of the Navy. It will transform how the Department operates and manages its networks as a critical element of the Department's future NNE. Transition from NMCI to NGEN is a cornerstone of enabling the Warfighter as well as supporting business operations across the Naval Enterprise.

The Honorable Carl Levin
Chairman, Committee on
Armed Services
United States Senate
Washington, DC 20510-6050

Dear Mr. Chairman:

The FY 2008 Senate Armed Services Committee (SASC) Report 110-77 directed the Secretary of the Navy (SECNAV) to submit a report to the congressional defense committees, commencing with the FY 2009 budget request, to be updated quarterly, that outlines the Navy's plan and progress with implementing Open Architecture (OA). In addition, the FY 2009 SASC Report 110-335 directed that no greater than 50 percent of the amounts authorized for FY 2009 for the surface combatant combat system engineering program (PE 64307N) may be obligated under a sole source contract until 30 days after submission by the SECNAV of a detailed program plan for implementing OA for the Aegis combat system.

Enclosed is the third quarterly report. This report reviews program accomplishments related to Naval OA from April 1, 2008 through June 30, 2008; and describes the Navy's upcoming activities for implementing OA. The next report will focus on surface combat systems and will address how incremental improvements will be made to those systems such that upgrades can be accomplished more frequently and at lower cost. This will also highlight where software will be partitioned and componentized in order to leverage system design modularity. This approach will enable the sought opportunities for innovation and competition which are fundamental to the value of OA. The next report will outline this plan in greater detail.

If I can be of further assistance, please let me know. A copy of the Navy report is also being provided to Chairmen Skelton, Inouye, and Murtha.

Sincerely,

A handwritten signature in black ink, appearing to read "Sean J. Stackley".

**THIRD QUARTERLY
REPORT TO CONGRESS
ON
NAVAL OPEN ARCHITECTURE (NOA)**

Prepared by:

**Open Architecture Enterprise Team
Program Executive Office, Integrated Warfare Systems
Washington, DC 20376**

August 2008

Table of Contents

I. Introduction.....	3
II. NOA Accomplishments: April 1, 2008 through June 30, 2008	4
III. OA Program Plan for the Surface Domain and Aegis Combat System.....	12
IV. Summary	20

I. Introduction

A. Reporting Requirement

As directed in the report of the Senate Armed Services Committee Report (SASC) on the National Defense Authorization Act for Fiscal Year 2008 (Report No. 110-77) the Navy submits this Third Quarterly Report to Congress on Open Architecture. The scope of this report includes noteworthy Naval Open Architecture (NOA) accomplishments of the Open Architecture Enterprise Team (OAET) and individual Domains (Air; Command, Control, Communications and Intelligence (C4I); Space; Submarines (SUBS); Surface; and Marine Corps) and the Anti-submarine Warfare (ASW) Community of Interest (CoI) from April 2008 through June 2008. Significant future events planned through December 2008 are also discussed.

SASC Report 110-77 stated that the “report shall include: (i) an integrated schedule outlining OA development and the related surface ship fielding plan; (ii) an assessment of OA development, test, procurement, installation, and operating and support costs; (iii) the Navy’s acquisition strategy for leveraging competition in software development; and (iv) the Navy’s performance to the OA plan. Additionally, the report shall: (i) identify software that is intended to be available for re-use by third parties in support of the OA implementation plan; (ii) describe the Navy’s progress in making that software and related documentation available through the Navy’s Software, Hardware Asset Re-use Enterprise (SHARE) Library; (iii) describe how the Navy is assuring quality and appropriate data rights for software and related documentation deposited in the SHARE Library; (iv) describe how the Navy is driving re-use of SHARE Library software; (v) outline contracts which have re-used third party software from the SHARE Library; and (vi) identify the impediments to entering outstanding Navy system software into the SHARE Library and the plan for managing these impediments.”

This report also addresses additional inquiries on NOA related to the Surface Domain and the Aegis combat system contained in the report of the SASC on the National Defense Authorization Act for Fiscal Year 2009 (Report No. 110-335). The additional information requested includes:

1. Detailed program plan for implementing OA for the Aegis combat system.
2. How program plans will ensure alignment between system development schedules, development contracts, Navy budget, program management structure, and the Aegis modernization program.
3. The methodology and scheduling for incrementally opening the Aegis combat system.
4. A plan for measuring discrete progress toward achieving a full open system commensurate with introduction of the 2012 Aegis baseline (formerly referred to as “Commercial-Off-the-Shelf (COTS) Refresh 3”).
5. Potential future benchmarks to govern the transition from sole source to competitive development during the period 2010 to 2013.

6. How the Surface Domain will transfer the lessons learned from this initiative to remaining surface ship combat system development programs.

The Surface Domain consists of Program Executive Offices (PEOs) representing Carriers, Expeditionary Warfare (Littoral and Mine Warfare or LMW), Integrated Warfare Systems (IWS), and Ships. The Air Domain consists of PEO Tactical Aircraft (T) representing PEOs for the Unmanned Aviation and Strike Weapons; Air ASW, Assault and Special Mission Programs, and Program Management (NAVAIR 1.0). The SUBS, C4I, and Space Domains are represented by PEO SUBS, C4I and Space, respectively.

B. Summary of First and Second Reports

The First Report to Congress described the history of NOA¹; the important role that the OAET, under the direction of the Assistant Secretary of the Navy (Research, Development and Acquisition) or ASN(RDA), plays in providing leadership for NOA; the Department of the Navy's (DON's) long-term focus for implementing OA; and the significant challenges that the Department faces in implementing OA. The First Report also contained information regarding the Navy's two main asset repositories (the PEO C4I Net-Centric Enterprise Solutions for Interoperability (NESI) and the PEO IWS Software, Hardware Asset Re-use Enterprise (SHARE)).

The Second Report to Congress documented the accomplishments of the Naval Enterprise and Domains during the period January 1 to March 31, 2008. These accomplishments were mapped to the three NOA strategic goals established in the Naval OA Strategy in December 2006. This report also provided updates on several of the questions contained in SASC Report 110-77.

II. NOA Accomplishments: April 1, 2008 through June 30, 2008

This report is framed in accordance with the overarching Naval OA Strategy established in December 2006. The strategy is comprised of three overarching goals, addressing the business, technical, and cultural aspects of OA transformation. These goals are supported by efforts performed either across the Naval Enterprise by the OAET or within individual Domains (by PEOs, CoIs, Programs, or System Commands).

A. Goal 1 Change Naval Processes and Business Practices

Goal 1 – Change Naval processes and business practices to use open systems architectures in order to rapidly field affordable, interoperable systems. This goal includes addressing governance challenges; creating policy and guidance materials; developing new business

¹ NOA is the confluence of business and technical practices yielding modular, interoperable systems that adhere to open standards with published interfaces. The Navy and Marine Corps have adopted OA as one way to reduce the rising cost of Naval warfare systems (also known as National Security Systems or NSSs) and platforms and to increase the capabilities of Naval systems.

models (such as the Acoustic-Rapid Commercial-off-the-Shelf Insertion (A-RCI) program; incorporating OA principles and practices in programs and acquisition materials including contracts; and encouraging competition and improving interoperability by making information and design artifacts available for reuse by programs.

- In May 2008, the OA Lead Council provided OA-related questions for incorporation into the Navy's Two-Pass, Six Gate Review Process. This Review Process provides a mechanism to coordinate the generation of operational requirements and acquisition of systems.
- PMA-272's Electronic Warfare (EW) Self-Protection Systems is applying the OA business model to the Air Force's Cost Effective Light Aircraft Missile Protection program – which is partially funded by the Navy – using Interface Control Documents (ICDs) as a key enabler. Working with common ICDs, an OA "plug & protect" approach can be used to protect Navy and Marine Corps aircraft. During live fire events at the Tonopah Test Range, NV, on April 22, 2008, this developmental system scored two successes in two trials. The use of common ICDs proved that fielding of these systems can be achieved at a much more affordable price and in much lighter configurations. These ICDs will be used in all current and future EW acquisition programs.
- The Broad Area Maritime Surveillance (BAMS) Unmanned Aircraft System (UAS) is a major Acquisition Category (ACAT) 1D program that successfully transitioned through the Milestone B decision this quarter. The Joint Precision Approach and Landing System (JPALS) is a major ACAT) 1D program that will be transitioning through its Milestone B decision next quarter. Both programs used the *OA Contract Guidebook* language in their request for proposal, specifications, and Contracts Data Requirements Lists (CDRLs). Both programs also used the Open Architecture Assessment Tool v1.1 which includes the Modular Open Systems Approach (MOSA) Program Assessment and Review Tool (PART).
- In May 2008, PEO IWS received Fiscal Year 2008 funds to pilot the OA / Maintenance Free Operating Process (MFOP) on a surface platform. The MFOP concept combines COTS hardware and software into a highly reliable computing platform that can be deployed without on-board spare parts or maintenance support. The goal of the Surface OA / MFOP pilot is to develop a capability, based on OA principles and an earlier submarine MFOP pilot, which can be reused and scaled across a variety of environments. Since the project started, efforts have focused on development of the functional requirements specification, initiation of the project repository and collaboration tool, establishment of the project management process, evaluation of OA software for re-use in the system, and the establishment of the schedule. Over the next two months, the OA software components will be extracted from SHARE and their platform requirements allocated supporting completion of the requirements analysis. In parallel, a hardware survey will be conducted among competing product lines/ vendors leading to an establishment of the system baseline.
- PEO C4I modified the Performance Work Specification for Net Enabled Command Capability to include OA and net-centric warfare language. Across the Domain, contracting strategies are being constructed such that the award fee structure will be heavily weighted

towards the end of the performance period in order to shift risk to the contractor and incentivize the contractor to perform at a high level throughout the period of performance. Contract award fee language is drawn heavily from the *OA Contract Guidebook*.

- PEO C4I, in collaboration with SPAWAR 2.0 Contracts, is developing a logical decision tree to determine appropriate requirements to insert OA Language into solicitations and re-use standard CDRLs. PEO C4I is also working to develop contract language that can be used in acquiring services associated with Service Oriented Architectures. Once completed, these products will be incorporated into the *OA Contract Guidebook*.
- PEO C4I significantly increased disclosure of design artifacts in the last quarter by submitting 641 artifacts and 10 assets on the NESI Collaboration Web Site.
- PEO C4I has embarked on a Design Budget Initiative in which the goal is to greatly narrow the capability gap between delivered and deployment-ready C4I systems on board surface ships. Design Budget is a Shipbuilding and Conversion, Navy integration process that allows the C4I baseline to evolve transparently to the shipbuilder. Capability delivery is phased to enable the implementation of the most current technology or functionality as close to fleet delivery as possible. Design Budget Components are:
 - Phased Government Furnished Information (GFI) Deliveries
 - ‘Just in Time’ Government Furnished Equipment (GFE) Deliveries
 - C4I Test and Integration Facility
 - Verbiage in Shipbuilding Contract

Design Budget has been used on LHA/LHD with great success. In the conventional approach used on LHD 7, 25 Engineering Change Proposals (ECPs) resulted from delivering the entire design package before contract award, which resulted in ECPs executed throughout the ship building process. In the case of LHD 8, information was provided in phases, greatly reducing the number of ECPs required, down to two. This saved over \$21 million in ECP and installation costs on LHD 8.

- PEO Space Systems (PEO SS) is an active participant in the Navy Space Cross Functional Team (CFT), which ensures war fighters, resource sponsors and acquisition personnel properly coordinate to meet current and future space needs. The Navy Space CFT developed and maintains the Navy Space Strategy and Roadmap and the Navy Space Needs Letter. Dovetailing with the CFT roadmap, the Office of Naval Research (ONR) has defined a new category of Future Naval Capability (FNC) for Space. PEO SS is a stakeholder in FNC gap definition and enabling capability prioritization and will bring OA principles to bear throughout this process.
- Software Reconfigurable Payloads (SRP) is one potential solution for the development of future space systems. PEO SS is using Science and Technology investment vehicles, such as the Small Business Innovative Research (SBIR) program, to explore the utility of SRP. SRP supports an OA business model by offering a mechanism for inserting new capabilities from new vendors to satellites already in orbit as well as supporting ground-based systems. In addition, PEO SS is collaborating with other programs pursuing this technology that are part of the Transformational Communications Architecture.

B. Goal 2 Provide Naval OA Systems Engineering Leadership

Goal 2 – Provide Naval OA systems engineering leadership to field common, interoperable capabilities more rapidly at reduced costs. Included in this goal are collaborative efforts in systems engineering; process standardization; leveraging OA to provide quick wins and proofs-of-concepts that provide new capabilities to the Fleet; and providing performance enhancements to fielded systems and development projects.

- On June 13, 2008, ASN(RDA) directed a Systems Engineering Technical Review (SETR) process to be applied within the DON. The Air Domain, under sponsorship of the OAET, is defining the OA checklist to be included with the DoN SETR process in guidance developed by ASN (RDA) Chief Systems Engineer (CHSENG). System Command inputs to this guidance are due in October; the new guidance will be issued in early 2009.
- PEOs C4I and IWS have collaboratively engineered a prototype federated search engine to support the OAET initiative promoting software reuse repositories. The federated search capability allows users in both the PEO C4I NESI Collaboration Site and the PEO IWS SHARE to effectively discover software related assets being developed by each PEO. The prototype was developed using open source software and leverages the respective open architecture models of each PEO. Next steps will include the orchestration of the federated search web service to allow for a single search accessing both reuse repositories and returning all results in a standardized manner.
- The C4I Domain is collaborating with Joint Program Executive Office (JPEO) Joint Tactical Radio System (JTRS) to reuse the results of a JTRS SBIR Phase II effort to develop an Artifact Assessment Tool Suite Infrastructure. This will provide both commands with the framework to plug-n-play a variety of scanning tools and other business process engines, thus automating capabilities such as data rights scan and measuring software quality assurance.
- PEO C4I, PEO IWS, JPEO JTRS, Defense Information Systems Agency, PEO SHIPs, PEO LMW, Air Force, PEO EIS and NAVAIR are developing a Navy Technical Reference Model (NTRM). The NTRM is a combination of the PEO C4I Reference Model and the PEO IWS Common Objective Architecture, which provides traceability and dependence from individual systems within one domain to architectural nodes and systems within another domain.
- OA is being implemented within the Air Domain for life cycle affordability and to manage change, not as a specific capability to be delivered, but as an overarching acquisition strategy. A detailed methodology for Key Open Sub-Systems (KOSS) is under development that will lead to appropriate, repeatable and consistent application of OA to all Air programs. KOSS are the modules that change most often and therefore will have the greatest impact on program cost over its life cycle. The methodology is currently in the demonstration phase of a Lean Six Sigma project. Upon successful completion of the

demonstration at the end of Fiscal Year 2008, the methodology will be replicated in all major ACAT aviation programs in Fiscal Year 2009.

After the KOSS are identified, the key interfaces can be designated, tracked and actively managed. Instead of managing every interface, those key interfaces that most impact cost are jointly managed by industry and the government. The key interfaces will then be managed to ensure consensus-based, widely used, open standards are selected for implementation and are maintained throughout the program's life cycle.

The KOSS OA subsystems can be overlaid on the program roadmap. This will enable a consistent process to ensure alignment between system development schedules, development contracts, the Navy budget, and program management. Currently program roadmaps do not estimate the cost to implement changes due to upgrades and obsolescence. Using the KOSS process, these out-year costs can be estimated beyond the Future Years Defense Program.

- Electronic Attack Squadron (VAQ) 129 at Naval Air Station Whidbey Island, WA, received the first fleet EA-18G Growler airborne electronic attack aircraft on June 2, 2008, ahead of schedule and within budget. The benefits of open systems and architecture allowed the integration of two major systems: the F/A-18G (the derivative of the two-seat F/A-18F Super Hornet), and the Integrated Capability III airborne electronic attack subsystem.
- VH-71, Presidential Helicopter Program (Development) – Initiated OA assessment of Preferred System Solution and alternatives to identify opportunities to potentially reduce Increment 2 fly-away and life cycle costs and weight. The NAVAIR OA independent team completed the initial business and technical analysis of both vendors' architectures and is currently addressing action items and clarification questions. The next phase is to perform a more detailed deep-dive exercise based on the KOSS process that will enable both Government and industry to extract and evaluate OA attributes down to the Shop Replaceable Assembly (SRA) and Integrated Circuit (IC) levels. Long-term capacity for making upgrades to avionics functionality is a key factor in the assessment.
- The Submarine Domain continues to execute its OA Implementation Plan using the A-RCI Technical Insertion (TI) and Advance Processing Builds (APB) business model for Sonar, Combat, and Imaging systems. New efforts include incorporating the VIRGINIA class submarine design into the TI/APB modernization schedule for TI-08 installation in Fiscal Year 2010.
- The Submarine Warfare Federated Tactical System modernization effort merges multiple configurations of subsystems installed on the LOS ANGELES, VIRGINIA, SEAWOLF, and SSGN submarines into common sets of subsystems. Commonality across platforms reduces hardware, software, Integrated Logistic Support, and training costs for NAVSEA and the Fleet. This architecture approach serves as a landing pad for new technologies developed through the APB model. The Submarine Domain will continue with this approach phasing out legacy systems. Current projections shows that over 75% of all LOS

ANGELES, VIRGINIA, SEAWOLF, and SSGN submarines will share a common baseline (TI-06/APB-06 or later) by July 2012.

- The Submarine Domain is modifying its System Engineering development schedule to incorporate an expanding list of submarine subsystems. The goal is to improve long-range planning, system of system level coordination, and phased requirements definition to reduce “churn” of immature capabilities, improve inter-subsystem communications, and implement a milestone or gate review process.
- There is an ongoing cooperative effort with Japan in Ballistic Missile Defense (BMD) OA Research (BMDOAR) (April 2008 – March 2009) that seeks to bilaterally share costs and technical knowledge in order to reduce risk for the planned U.S. Navy/MDA migration of Aegis BMD capabilities into an open architecture implementation. Under BMDOAR, PEO IWS and Aegis BMD Program Office (PD 452) participates in a cooperative project with the Japan Ministry of Defense's Technical Research and Development Institute (TRDI) on the application of OA technologies and systems engineering techniques to sea-based Ballistic Missile Defense. The U.S. and Japan teams cooperatively investigate OA systems engineering processes and methodologies as well as model and conduct requirements analyses on a notional OA Air and Missile Defense capable combat system. These analyses enable the PEO IWS, PD 452, and TRDI participants to execute trade studies of emerging COTS technologies expected to be available on the international market in the coming years that can support OA combat system computing infrastructure development and lifecycle sustainment. BMDOAR produced bilateral OA software component prototypes for computing infrastructure adaptive resource management and tactical display services.
- The following actions have been taken related to the SHARE repository and in re-using assets and artifacts during the period of March through June 2008:²
 - Updated the SHARE operations to have submitters prescreen assets for intellectual property markings as an efficiency measure.
 - Completed a Lean Six-Sigma Rapid Improvement Event to streamline the asset audit process.
 - A total of 71 assets (21,589 artifacts) have been made available in SHARE; this quarter the Surface Domain:
 - Processed 42 registration applications (242 total government / industry registrants to date)
 - Completed audits on 7 assets and input into SHARE
 - Conducted 9 audits on asset submissions (2 in process)
 - Processed 4 requests for assets (March-June 2008)
 - Received 10 requests for assets (March-June 2008)
 - Total requests for SHARE assets to date = 260
 - Total number of new assets submitted for availability on SHARE = 8
 - PEO IWS and PEO C4I have actively been developing an enterprise search

² **Artifact:** Products of a system/software development life cycle, including requirements, design documents, test cases, code, source files, executables, test reports, prototypes, user manuals, use case models, design models, and contract language. **Asset:** Any cohesive collection of artifacts that provide a solution to a user's need.

- mechanism using a normalized set of reuse asset search criteria and an XML implementation schema to search both the NESI Collaboration Site and the SHARE repository for reusable assets and then obtain access to those assets.
- The Marine Corps Systems Command (MARCORSYSCOM) TOPIC (The Online Project Information Center) team is participating in the PEO IWS SHARE and PEO C4I NESI collaboration teams to determine if the integration of TOPIC with SHARE and NESI is possible.
- MARCORSYSCOM has capitalized on opportunities for funding to make the most of all resources available. Examples of this leveraging of joint resources and reuse of specific system components, are:
 - Composite Tracking Network uses the same software as the Navy's Cooperative Engagement Capability re-hosted onto a set of hardware deployable in a High Mobility Multipurpose Wheeled Vehicle.
 - The Air Force-led Theater Battle Management Core System is the principal aviation command and control tool within the Marine Air Command and Control Systems for the development and execution of the Air Tasking Order.
 - Distributed Common Ground System-Marine Corps (DCGS-MC) is the Marine Corps instantiation of Department of Defense's DCGS Family of Systems concept. DCGS-MC will migrate Intelligence, Surveillance, and Reconnaissance information into a single, integrated net-centric baseline.
 - Deputy Commander, Systems Engineering, Interoperability, Architectures & Technology has chartered a government/industry team of subject matter experts to examine the various candidates available from other Services/organizations to fulfill the component level needs of the Marine Air/Ground Task Force Command and Control (Aviation). Some of the specific areas being considered for reuse of existing components are in the area of data link processing, track management and composite tracking.
 - ASW Common Data Model (ACDM) Version 1 was completed and published by the ASW COI and its Data Management Working Group. The ACDM is web accessible on a data base. The ACDM establishes a common format for ASW data to be shared and understood by multiple users of ASW data. The data model will evolve incrementally to include data exchange for sensor, training, weapons, and other aspects of the ASW COI. As it evolves, the use of a common data format will enable faster and more automated processes such as contact management, data fusion, and support decentralized decision making via a common tactical picture.
 - The ACDM was piloted in an Undersea Warfare – Decision Support System Limited Technical Experiment (LTE) conducted by ONR in April 2008. An outcome of this experiment was that the technical community was able to establish performance benchmarks and identify several areas for further experimentation. The ASW COI will continue to leverage the ONR LTE series as a test bed for incremental development.

C. Goal 3 Change Navy and Marine Corps Cultures to Institutionalize OA Principles

Goal 3 – Change Navy and Marine Corps cultures to institutionalize OA principles. The primary mechanisms for achieving cultural change are formal training and communications and outreach.

- In the area of communications and outreach, CAPT William Chubb, PMA-272, and Mr. Chris Miller, PEO C4I, participated in a *Defense Daily* OA “Webinar” moderated by Geoff Fein of *Defense Daily* on May 20, 2008. This Webinar was attended by representatives of both the Navy and industry and provided information on specific, OA efforts underway in both Domains, demonstrating concrete actions that the Navy was taking to implement OA.
- A finding from the MOSA PART assessment for JPALS was that the Defense Acquisition University (DAU) Continuous Learning Module (CLM) on MOSA as well as the CLM on Naval OA would be helpful for program office personnel as they begin the System Development and Demonstration (SDD) phase of an acquisition program. An overview of the principles and processes associated with OA was also presented to the BAMS UAS IPT Leads on April 16, 2008.
- The NAVAIR Technical Lead for OA participated in two international events related to OA. At the Aviation Safety Program 2008 Technical Conference, May 28-30, 2008, Munich Germany, the Navy provided a presentation on OA and Extended 1553 data bus. The Air Domain also participated in meetings in Canberra, Australia with Australian Deputy Chief of the Air Force (DCAF) and DCAF staff as part of a continuing dialog in the capacity of Coalition TEAM lead for The Technical Cooperation Program (TTCP), June 18, 2008. The TTCP includes the U.S., England, Canada, Australia and New Zealand.
- Using the OA curriculum that it developed in partnership with DAU, PEO C4I trained a total of 59 Assistant Program Managers, Contract Specialists and other personnel on OA. This training is provided to other domains on a “space available” basis. PEO C4I has also continued its outreach efforts briefing more than 40 members from the PMW 160 Networks, Information Assurance and Enterprise Services Program Office on OA, and participating in the *Defense Daily* OA Webinar held on May 20, 2008.
- The Air Domain is targeting the following programs over the next quarter (July 1 through September 30, 2008) to identify appropriate areas to apply OA principles:
 - Navy Undergraduate jet flight training system, T-45 Follow-on
 - Electronic Warfare Self-Protection Programs
 - Small Tactical Unmanned Aircraft System/Tier II Unmanned Aircraft System (STUAS/Tier II UAS)
 - Advanced Extended Echo Range Multi Static System
 - Presidential Helicopter, Increment 2
 - Congressional Action (Fiscal Year 2008): \$1.6M directed to Impact Technologies, Inc to develop OA technologies that use diagnostic reasoning to improve maintenance decisions at the Operational (O) and Intermediate (I) levels.

This is a significant cultural change because it represents focused efforts to address OA early in a program's life.

- PEO SS has brought OA principles to bear through their active involvement in the development of the Naval Space Strategy and Roadmap through the Naval Space Cross Functional Team, which has dovetailed into engagement in the definition and prioritization of gaps associated with the FORCENet and Space Future Naval Capabilities.
- The Submarine Domain is collaborating with the Surface Domain OA to assist them in transitioning to a Rapid COTS Insertion model. Examples of Team Submarine's business models, guidance, policy, and cultural documents have been provided to PEO IWS for their reference and use.
- Both the Spanish F105 program and the Australian Air Warfare Destroyer programs will be using the Aegis 7 Phase 1 OA programs as a basis for their Combat Systems. Both programs have contributed to the development of Radar Control OA which will be used on the Spanish Frigate, the Air Warfare Destroyer and USN Destroyers. These FMS efforts and follow on lifecycle support represent changes in culture that will contribute to sustaining the combat system engineering industrial base, the radar system industrial base and furthers interoperability with our allies.
- The Marine Corps held an "Acquisition Excellence Day" on June 4, 2008. The Marine Corps' OAET Action Officer supported a kiosk and answered questions on NOA, distributing more than 50 copies of the *OA Contract Guidebook* to attendees.
- NOA information resides within the System Engineering Knowledge Center of MARCORSSYSCOM's Total Information Gateway for Enterprise Resources (TIGER) intranet website. A "lessons learned" tab on the TIGER OA page allows users to enter/review any and all lessons learned regarding their experience with the OA assessment tool or any general lessons learned regarding OA.
- During this reporting period, seventy-three additional Navy/Marine Corps employees have completed the NOA Continuous Learning Module course that is hosted by the DAU.

III. OA Program Plan for the Surface Domain and Aegis Combat System

1. Detailed program plan for implementing OA for the Aegis combat system and Surface Domain.

The Surface Domain is implementing a combat system product line approach to the implementation of OA for the Aegis combat system. This will yield an open combat system based on government-owned architecture and authenticated interfaces.

The first step will decouple the computing hardware from the software, as the Aegis system was initially designed as an integrated and tightly coupled hardware and software Combat System. Converting legacy systems to a distributed, COTS computing environment with modular application software will serve as a foundation for OA implementation.

Affordability is the limiting factor in the rate of transitioning in-service systems to network-based open computing. CG 47 class ships complete transition to a network-based open architecture environment in 2016. The OA-based ACB08 / Technology Insertion (TI) 08 (formerly COTS Refresh (CR) 2³) hardware and software is being delivered to USS BUNKER HILL (CG 52) this fiscal year, Fiscal Year 2008. Planning estimates for the DDG 51 class show that by transitioning about three ships per year in Fiscal Years 2012 through 2016 and six ships per year from Fiscal Year 2017 onward, the 62-ship DDG 51 class will complete the transition to network-based open architecture environment by 2025. The actual rate of modernization will ultimately be driven by fleet availability and future budgets.

Alignment and Integration for Aegis Modernization (AMOD) concurrent development is illustrated on Figure 1. Figure 1 also depicts the weapon systems and capabilities to be integrated with AWS in ACB 12 and TI 12 (the related hardware upgrade), to create a Family of Systems (FoS). These capabilities include: (a) Naval Integrated Fire Control - Counter Air (NIFC-CA); (b) Single Integrated Air Picture (SIAP); (c) the Multi-Mission Signal Processor (MMSP); (d) BMD; and (e) Standard Missile 6 (SM-6). All of these parallel efforts, which are currently underway, must merge to support the Navy's requirement to complete initial installation on DDG 53 and CG 62 in Fiscal Year 2012. The FoS upgrades will be completed in incremental software releases between Fiscal Years 2008 and 2011, with final testing in Fiscal Years 2012 and 2013.

In order to integrate the FoS by 2012, the AMOD developer must provide the Platform System Engineering Agent (PSEA) contractor immediate and continuous insight into the various software modules under development. While the government will not have final software documentation and deliverables for these new AMOD software components until the development is complete and the software program is stable and tested, the Navy is working to have "early and often" access to interim releases to facilitate competition and the FoS engineering process.

³ ACB12 / TI12 corresponds to CR3.

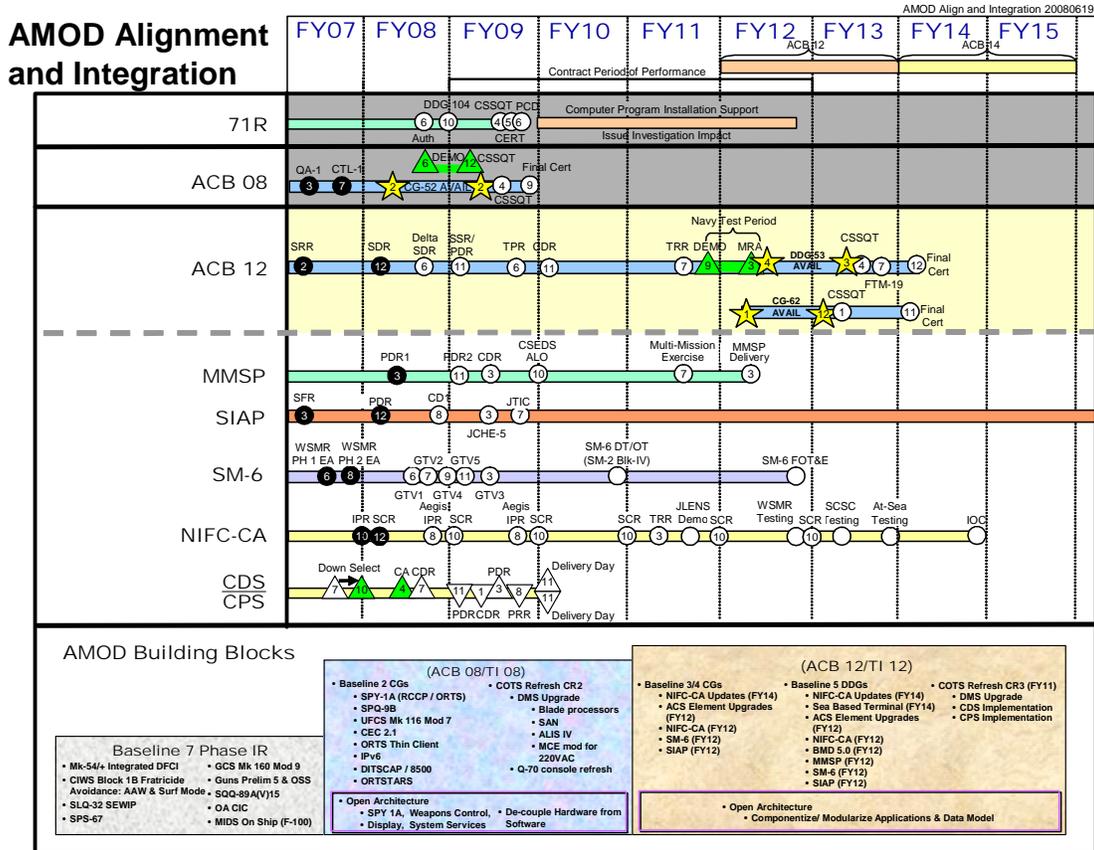

Figure 1

2. How will program plans ensure alignment between system development schedules, development contracts, Navy budget, program management structure, and the Aegis and Surface Navy Combat Systems modernization program?

Figure 1 provides the top-level System Engineering plan for the concurrent development of multiple programs which will culminate in the ACB 12 AMOD delivery on DDG-53 in Fiscal Year 2012.

Managing the roles and responsibilities between key players will ensure alignment across all facets of scheduling, development, personnel and budget for combat system modernization programs. The framework within which PSEAs, Combat System Manager, Warfare System Product Line contractors, and Developers must work requires collaboration among industry partners and the Government to achieve success. Table 1 provides a summary of the roles and responsibilities between Government and industry organizations.

Title	Responsibility	Organization
System Integration Program Manager (SIPM)	Leads systems engineering coordination and management of PEO IWS effort related to each ship program. Represents the systems PEO in creation of PM-to-PM agreements. Serves as primary interface to the manager of the ship program (SPM) (i.e. PEO Carriers, PEO Ships, etc). Coordinates requirements with OPNAV.	Government
Warfare System Product Line (WSPL) Program Manager	Accountable and responsible authority for PEO IWS product lines to include combat systems, sensors, weapons, and weapon systems.	Government (MPM)
Enterprise Systems Architect	Responsible for the establishment and management of enterprise architecture that supports all surface ship platforms. Responsible for establishment of enterprise "system" requirements and requirements allocations to architecture domains.	Government
Combat System Manager (CSM)	Accountable authority for the acquisition of all surface platform combat systems.	Government
Platform System Engineering Agent (PSEA)	Responsible for design, system engineering and managing integration of GFE capability upgrades and other Government furnished products into each ship class combat system with this Government-controlled architecture. Responsible for end-to-end combat system performance.	Industry Contractors
Developers	Responsible for development of technology capabilities and components.	Industry Contractors

Table 1: Program Management Roles and Responsibilities

3. Methodology and scheduling for incrementally opening the Surface Domain combat system.

Figure 2 presents the Navy’s vision of activities as it implements OA business practices to the Surface Navy.

While the in-service fleet will continue to be upgraded as cost and schedule allows, CG(X) will be the first full instantiation of Objective Architecture-based combat system. As such, CG(X)’s combat system will be based primarily on components taken from Surface Ship Defense System, Aegis, and DDG-1000. New components developed for CG(X) will be executed in alignment with the Surface Navy’s government-controlled architecture and validated interfaces. As such, CG(X) components will be available to the rest of the in-service fleet as the fleet is fitted with a network-based OA computing environment.

Evolution of Surface Combat System Open Architecture

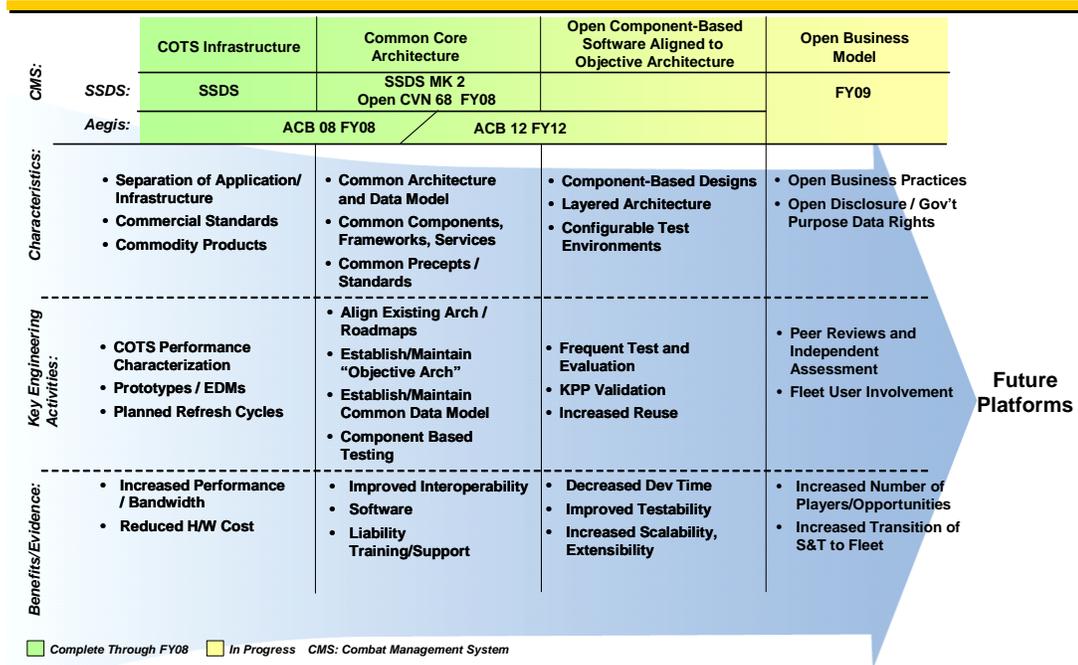

Figure 2

SSDS used modular design and development to fulfill self defense requirements across multiple platform types with existing combat system elements. SSDS Mk 2 OA has inherent flexibility to accommodate change (threat, sensors, weapons, requirements, and ship class modifications). SSDS Mk 2 network-based OA computing environment will complete in 2017 across the SSDS-equipped surface fleet of over 36 ships.

The Aegis system was initially designed as an integrated and tightly coupled hardware and software combat system. OA-based ACB08 / TI08 (formerly CR2) hardware and software being delivered in USS BUNKER HILL in Fiscal Year 2008 begins using modular design. As noted previously, the computing infrastructure will have a common middleware with SSDS. The Navy is presently evaluating the detailed plans to complete the DDG 51 class transition to a Network-based open architecture computing environment. Details will be provided with the President’s Budget request for Fiscal Year 2010.

4. Plan for measuring discrete progress toward achieving a fully open systems Surface Domain commensurate with the introduction of the 2012 Aegis Baseline (ACB 12).

Transition to an OA computing environment depends on balance between cost and schedule. The AMOD Alignment and Integration Plan (Figure 1) to the network-based OA computing environment provides key milestones to monitor programs and progress in achieving ACB 12. The basis for measuring our success in transitioning to full open systems Surface Domain is the completion of the work described by year in Figure 1 and the subsequent plans developed to equip CG(X) with a fully open combat system when it delivers.

5. Establishing potential future benchmarks to govern the transitions from sole source to competitive development during the period 2010 to 2013.

The Evolution of Aegis Combat Systems Development (Figure 3) provides the strategic approach to concurrently maintain and modernize the in-service fleet while developing the componentized combat system for ACB 12 and beyond.

Evolution of Aegis Combat System Development

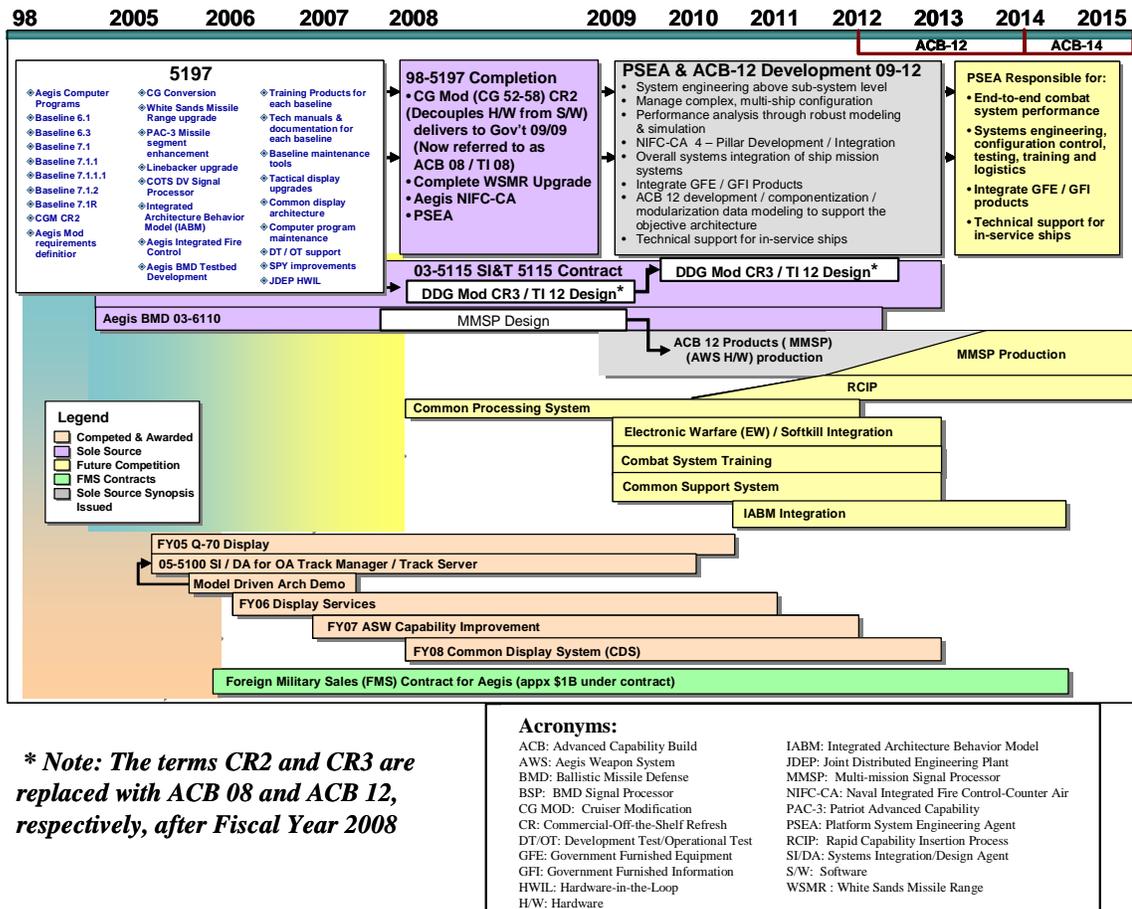

Figure 3

This modernization approach depends on common computer hardware refreshed on a defined cycle. The ACB cycle also allows for software maintenance updates and fielding of war fighting capability improvements to pace the threat.

Competition is being introduced as the combat system is being componentized. The documentation for componentization of the Aegis combat system software will be delivered with ACB 12. Subsequently, when a new development to a combat system component is

necessary, it can be competed. The Figure 3 legend indicates those components that have been completed, those that are sole source and those that will be competed in the future.

Surface Combat System Top Level Objective Architecture

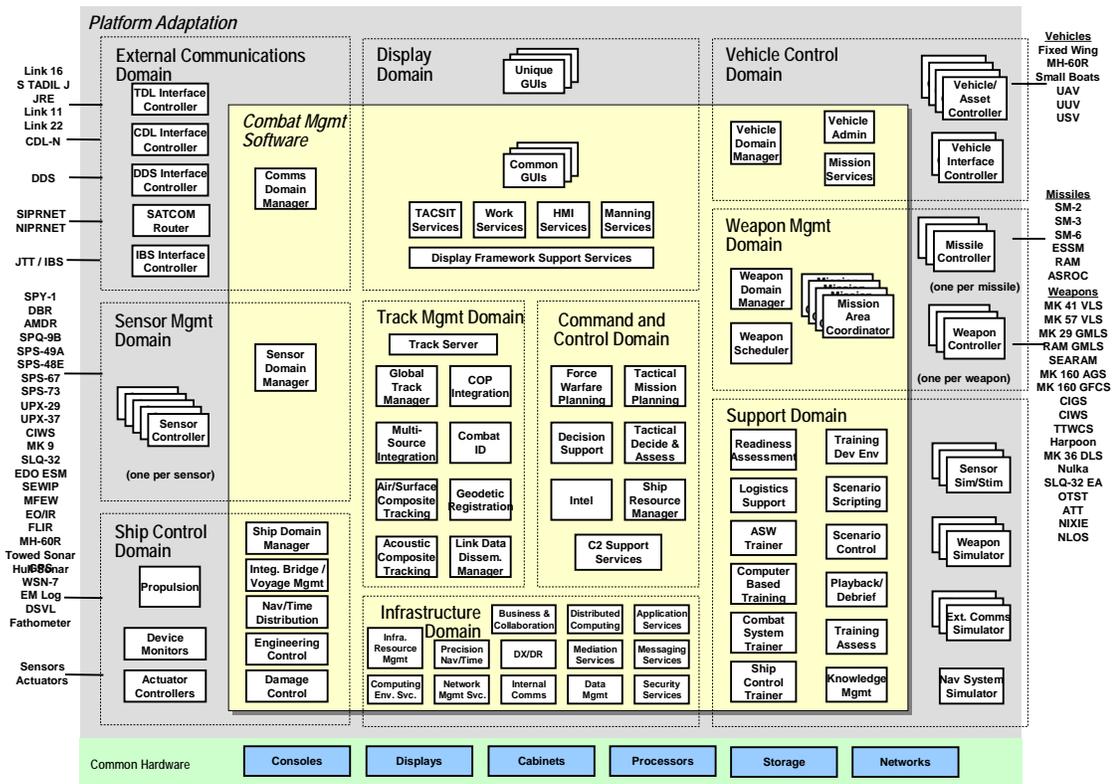

Figure 4

One of the keys to competition is having a government-defined architecture with validated interfaces to achieve the Surface Combat System Top Level Objective Architecture (Figure 4). An Architecture Description Document (ADD) is under development that will become the framework for future surface combat system software architectures. In the ADD, the Navy establishes the modular architecture for surface combat systems, describes system layering, and specifies the use of a publish/subscribe mechanism to exchange data that is defined in a common data model. The ADD incorporates the Domain's lessons learned to date and will be aligned with and supportive of related acquisition documents, including the Surface Navy Combat Systems Development Strategy Acquisition Management Plan. The ADD will define a common structure for allocating requirements to individual software components that can be reused across different combat systems using a software product line approach. A draft of the ADD will be released to industry for review and comment prior to it being baselined as an acquisition document.

Combat Systems Objective Architecture Component Phasing Plan to Achieve CG(X)

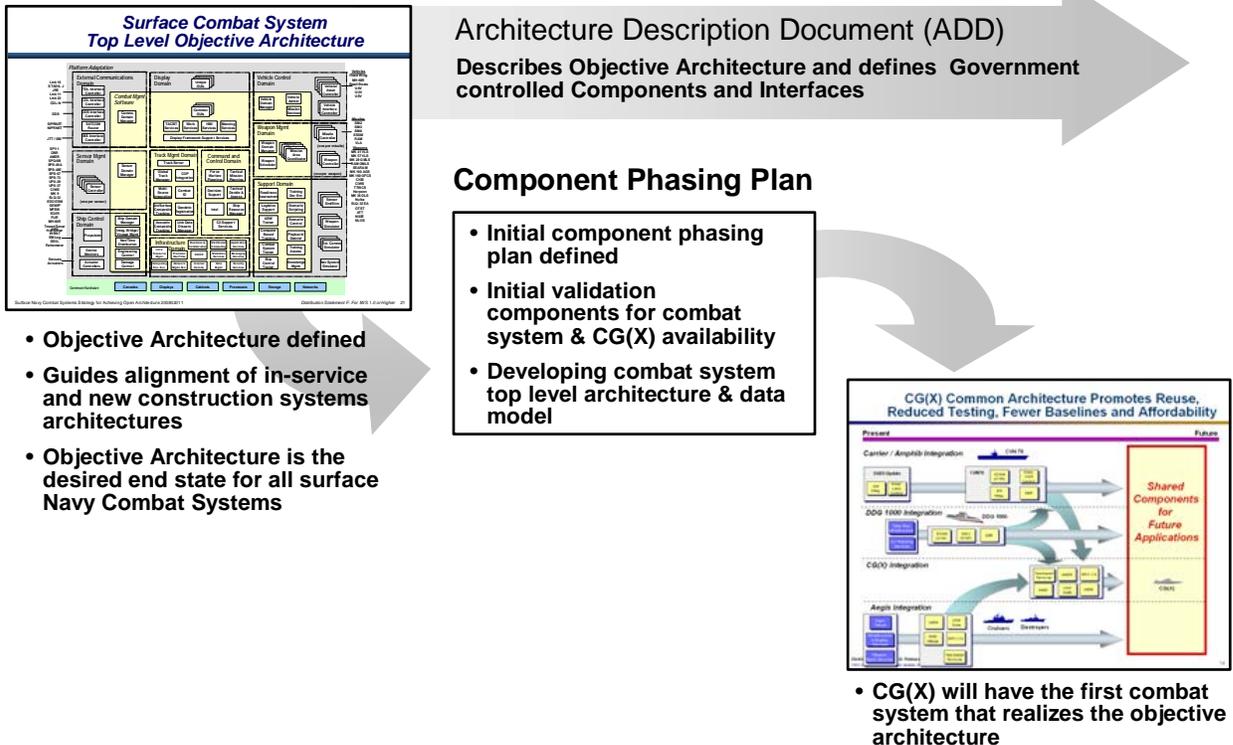

Figure 5

Today's architectures are specified in our program of records' architectural views; the component phasing plan shows when components can be incorporated into the new architecture, and the objective architecture shows the end state of components with government defined and authenticated interfaces. The top level architecture (Figure 5, top left) is the basis for the alignment of programs of record and the validation of components to government specified interfaces. The result is the creation of a set of components aligned to the Objective Architecture. This set is used to provide the combat system for CG(X) and is available for reuse across multiple platforms.

6. How the Surface Domain will transfer the lessons learned from this initiative to remaining surface ship combat system development programs.

Artifacts, documents, and lessons learned will be held in SHARE and future repositories for utilization in future combat system programs across the Navy Enterprise. Lessons learned will be formally captured in frequent updates to documents such as the ADD and Systems Engineering Plans.

7. Examples of or plans to address inter-domain collaboration/dependencies (such as re-use of other domain components, joint acquisition efforts using OA principles, etc.).

The Surface Domain is an active collaboration with other domains. For example, PEO C4I is involved with PEO IWS in developing Surface Combat System Architecture strategies. PEO IWS is also involved in PEO C4I's and SPAWAR's Early Adopters efforts in order to ensure alignment and integration between future C4I and combat systems. This collaboration has included creation of models that form a tangible, real-time basis to trade components from one domain to the other and simulate the effects. Several scenarios have been proposed with one of those scenarios run to date that illustrated that Early Adopters can assimilate the Display Local Area Network from the Combat System. These and similar models can prove the feasibility of architectures prior to codifying requirements. Additionally, the Surface Domain has used lessons learned from Team Submarine's A-RCI efforts to develop the Surface Navy Rapid Capability Insertion Process.

PEO IWS is responsible for the Common Display System (CDS) and Common Processing System (CPS) programs that provide core Display and Processing systems in support of the common objective architecture for combat systems and Surface OA Way Ahead. The CDS contract was awarded in November 2007 while the CPS Request for Proposals was released in March 2008. Both CDS and CPS provide component elements to the objective architecture being defined in the ADD; Aegis ACB12 and other programs will use items from these programs.

As future open combat systems are developed, the Surface Domain will continue to engage other domains, including the sharing of the Surface Domain ADD with other domains. This will help ensure component development alignment, where appropriate, for reuse in Surface Domain combat systems. Additionally, the SHARE repository is accessible to all other domains and witness to the collaborative environment the Surface Domain has fostered.

IV. Summary

The Third Naval Open Architecture Report to Congress provides an update of NOA program accomplishments since the Second Report was submitted to Congress in May 2008, focusing on the period of April 1 to June 30, 2008. It also provides the program plan for implementing OA for the Aegis Combat System and answers to the questions contained in the Fiscal Year 2009 Senate Armed Services Committee Report 110-335.

The Naval Enterprise continues to make significant progress in the implementation of OA. Through the use of appropriate policies and guidance, business and programmatic changes, the Department of the Navy is establishing a culture that is capable of delivering warfighting improvements at reduced costs. Continued progress is anticipated next quarter and will be reported in subsequent Reports to Congress.

DEPARTMENT OF THE NAVY
THE ASSISTANT SECRETARY OF THE NAVY
(INSTALLATIONS AND ENVIRONMENT)
1000 NAVY PENTAGON
WASHINGTON, D.C. 20350-1000

The Honorable Robert C. Byrd
Chairman,
Committee on Appropriations
United States Senate
Washington, DC 20510-6025

JUL 31 2008

Dear Mr. Chairman:

Section 2829 of the National Defense Authorization Act (NDAA) for Fiscal Year 2008 directs the Secretary of the Navy to submit "a report containing an assessment of Marine Corps' operational ranges used to support training and range activities of the Marine Corps." I am providing an interim response on behalf of the Secretary.

The Department is resolving final comments to fully address the NDAA requirements and will provide the final report by September 8, 2008. Please let me know if I can be of further assistance.

Sincerely,

A handwritten signature in black ink, appearing to read "BJ Penn".

ACTION MEMO

FOR: SECRETARY OF THE NAVY

FROM: BJ Penn, Assistant Secretary of the Navy (I & E) *BJP*

SUBJECT: Marine Corps Operational Ranges Report to Congress

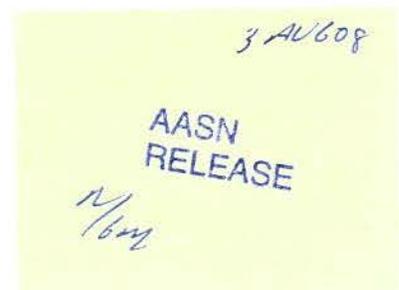

- TAB A contains the cover letters submitting the subject report the appropriate members of the United States Senate and United States House of Representatives.
- TAB B is USMC info Memo forwarding the subject report to SECNAV.
- TAB C is the revised Marine Corps Operational Range Report to Congress.
- The revised report answers the questions posed by Congress.
- Revisions were made to the discussion of Marine Corps Mountain Warfare Training Center (MCMWTC) and Marianas ranges in response to your earlier review comments. The revisions provide some insight into future needs and investments at MCMWT and Guam but do not present a substantial discussion of those issues because specific actions are still at the preliminary planning stage.

RECOMMENDATION: SECNAV sign the letters at TAB A.

COORDINATION: TAB D.

Dear Mr. Chairman:

Section 2829 of the National Defense Authorization Act (NDAA) for Fiscal Year 2008 directs the Secretary of the Navy to submit "a report containing an assessment of Marine Corps operational ranges used to support training and range activities of the Marine Corps."

The enclosed report entitled "Marine Corps Operational Ranges" addresses the information requested in the NDAA based on the Department of the Navy's current assessments and projections. It includes a description of current and future land requirements of Marine Corps operational ranges and the prioritization process and investment strategies to accommodate range expansion and modernization. Section 6 of this report addresses the proposed expansion of Twentynine Palms.

A copy this report is also being provided to Chairmen Skelton, Byrd, Obey, Johnson, and Edwards. As always, if I can of further assistance, please let me know.

Sincerely,

A handwritten signature in black ink, appearing to read "D. Winter", is positioned above the printed name.
